1.0 INTRODUCTION

The Proposed Project is referred to as the *BAE Systems San Diego Ship Repair Pier 1 North Dry Dock Project*. The project site is located on and adjacent to San Diego Bay at the BAE Systems San Diego Shipyard (BAE Systems) facility located at 2205 East Belt Street in San Diego, California (Figure 1-1). As described in detail in the separate Project Description, there are three separate components that comprise the Proposed Project:

1. Performing pier and landside upgrades, dredging, and installation of a new dry dock on the northern side of Pier 1 (Pier 1N);
2. Entering into a future, long-term real estate agreement with the San Diego Unified Port District (District) on the neighboring 2.0-acre land parcel and 4.0-acre water area that is currently leased by BAE Systems under a Tidelands Use and Occupancy Permit (TUOP); and
3. Performing a program level analysis for the potential removal of the intake/discharge tunnels that currently exist within the TUOP parcel as well as any associated soil or groundwater remediation efforts.

This Technical Report focuses on the hazards and hazardous materials (e.g., hazardous conditions or releases that could potentially occur) associated with installation of the new dry dock and removal of the of the intake/discharge tunnels that currently exist within the TUOP parcel. The removal of the cooling tunnels are considered on a programmatic level. There are no hazards and hazardous materials impacts associated with the future, long-term real estate agreement. The hazardous material impacts related to the potential remediation efforts associated with the removal of the intake/discharge tunnels are also discussed in a separate Phase I assessment report (Ninyo & Moore, 2014).

The major tasks that comprise the dry dock installation component of the Proposed Project include:

- Dredging of approximately 395,000 cubic yards (cy) of San Diego Bay bottom on the northern side of Pier 1 to accommodate the operation of the new dry dock;
- Aquatic (and potentially upland) disposal of the dredged materials;
- Installation of an underwater sheet pile wall and cantilevered king pile on the northern side of the existing Pier 1;
- Installation of new ramp wharf structures that will be used to access the dry dock;
- Installation of one new, one retrofitted, and one expansion of mooring dolphins to secure the dry dock;
- Final dry dock assembly work and deployment of the new dry dock on the northern side of Pier 1 (most of the dry dock assembly will be done offsite);
- Installation of new electrical and mechanical utilities to service the dry dock; and

63732 9

- Dry dock operation (e.g., loading and unloading of vessels; vessel repair and maintenance operations; dry dock maintenance).

The major tasks associated with the removal (and associated soil and/or groundwater remediation) of the intake/discharge tunnels and associated structures that currently exist within the TUOP parcel include:

- Excavation of soil
- Dewatering
- Installation of shoring to protect excavation
- Demolition and removal of tunnels (concrete) and remaining offshore separation structure[1]
- Backfill with clean structural fill and installation of a rock covered slope from the top of the submerged sheet-pile wall to the level landward parcel
- Potential soil and groundwater characterization and potential remediation (if required)
- Disposal of soils (if required)
- Replacement of numerous structures, equipment, and operating systems currently located over the tunnels
- Installation of shoreline revetment to protect backfill in tunnels.

The potential hazards and hazardous material associated with the major activities listed above are discussed in this Technical Report. Project-related hazards, such as the potential construction and/or operations-related release of hazardous materials into the environment, exposure of people to known sources of existing hazardous materials, and generation of hazardous materials, are presented in this report. In addition, mitigation measures are proposed, when necessary, to reduce impacts associated with the Proposed Project to a level less than significant.

Hazards and hazardous materials impacts associated with the dry dock installation component of the Proposed Project that might occur as a result of the following construction and operation activities include:

- Dredging and dredged material disposal;
- Construction activities during sheet pile and king pile installation;
- Construction activities during dry dock access ramp installation;
- Construction activities during mooring dolphin demolition and installation;

[1] The former tenant of the TUOP parcel (San Diego Gas & Electric) may decide to remove the cooling tunnels outside the District's jurisdiction. However, this environmental document only analyzes environmental impacts associated with removing the tunnels within the District's jurisdiction. Any proposal to remove the cooling tunnels outside the District's jurisdiction may necessitate additional permits and/or additional environmental analysis.

63732 PAGE 10

- Trenching and other construction activities related to installation of the electrical and mechanical utilities needed to service the new dry dock;
- Deployment of the new dry dock, including any onsite assembly and test activities; and
- Operations of the new dry dock, including ship loading and unloading, ship repair and maintenance activities, and long-term dry dock maintenance needs.

Hazards and hazardous materials impacts associated with the removal (and associated soil and/or groundwater remediation) of the intake/discharge tunnels and associated structures that currently exist within the TUOP parcel are:

- Release of potentially contaminated soil or water during construction or removal materials;
- Turbidity caused by runoff on exposed soil surfaces or other accidental release;
- Accidental fuel or oil spills by equipment during construction;
- Potential hazardous work environment associated with construction and demolition; and
- Potential impacts to groundwater.

Ongoing Activities within the Project Footprint

A portion of the Proposed Project area (the nearshore area on the northern side of Pier 1) is currently being managed under the San Diego Shipyard Sediment Remediation Project (Figure 1-2). The San Diego Shipyard Sediment Remediation Project is the approved remedial action in response to the Cleanup and Abatement Order (CAO) No. R9-2012-0024 of the San Diego Regional Water Quality Control Board (SDRWQCB, 2010a and 2010b).

The San Diego Shipyard Sediment Remediation Project consists of a planned cleanup for marine sediments that contain elevated levels of contaminants of concern above CAO cleanup levels. On July 16, 2013, the District's Board of Port Commissioners (Board) considered the Final Program Environmental Impact Report (PEIR) and post-Final PEIR certification documents (e.g., Waste Discharge Requirements [WDR] and Clean Water Act (CWA 401 Water Quality Certification [WQC]) prepared by the SDRWQCB; adopted the Findings of Fact (Findings) and Statement of Overriding Considerations (SOC); adopted the Mitigation Monitoring and Reporting Program (MMRP); and authorized District staff to file the Notice of Determination (NOD) for the San Diego Shipyard Sediment Remediation Project.

All current and future remedial activities associated with the San Diego Shipyard Sediment Remediation Project are planned to be completed prior to commencement of the Proposed Project; therefore, dry dock dredging activities will not overlap with the remediation activities. Consequently, this Technical Report does not address the potential hazards and hazardous materials impacts associated with the San Diego Shipyard Sediment Remediation Project dredging, as they have been thoroughly evaluated in a separate certified California Environmental Quality Act (CEQA) document (SDRWQCB, 2011) and associated Hazards and Hazardous Material Technical Report (Geosyntec, 2011).

2.0 PROJECT DESCRIPTION

The Proposed Project includes three main components: (1) installing a new dry dock on the northern side of Pier 1; (2) entering into a future, long-term real estate agreement with the District on the neighboring 2.0-acre land parcel and 4.0-acre water area that is currently leased by BAE Systems under a TUOP[2]; and (3) conducting a program-level analysis of potential remediation efforts associated with the removal of the intake/discharge tunnels that exist within the TUOP parcel. Each component is described in detailed in the separate Project Description under separate cover.

The tasks associated with each component include the following:

Component 1: Installing a New Dry Dock on the Northern Side of Pier 1

Tasks for this project component are depicted on Figure 2-1 and include:

- Dredging activities to accommodate the new dry dock down to -65 feet mean lower low water (MLLW) and removal of approximately 395,000 cubic yards (cy) of dredged material.
- Installation of a 700-foot-long sheet pile protection wall (i.e., underwater retaining wall) along the existing Pier 1 northern side and cantilevered king piles.
- Installation of over-water structure(s) (three independent structures over an area of approximately 18,692 square feet), two 26-foot by 33-foot mooring dolphins (344 feet and 890 feet offshore to the west of the U.S. Bulkhead Line) and one expansion of an existing mooring dolphin, in addition to the installation of electrical and mechanical utilities to support the dry dock.
- Installation (including some final assembly) of a new floating dry dock approximately 205 feet in width and 851 feet in length (174,455 square feet total) plus aprons (approximately 16,165 square feet total) attached to the dry dock on each end.

Figure 2-2 depicts before (existing) and after (proposed) conditions for the dry dock component of the Proposed Project. The dry dock component will be executed in multiple phases. These phases are discussed in greater detail in Section 1.4.2 of the Project Description (under separate cover).

Component 2: Entering into Future, Long-term Real Estate Agreement with the District on Land Currently Leased by BAE Systems

This project component includes:

[2] At the time of preparation of this Water Quality Technical Report, the Tidelands Use and Occupancy Permit (TUOP) with SDG&E, dated November 1, 2009 (Document No. 55689) expired on October 31, 2014. This parcel is currently leased to BAE Systems by the District via a 5-year TUOP.

63732 17

- Extension of the existing lease for 9.8 acres of land and 16.6 acres of water and entering into a new lease for the 2-acre landside and 4-acre waterside parcel currently leased by the District to BAE Systems through a Tidelands Use and Occupancy Permit (TUOP).

Component 3: Removing Intake/Discharge Tunnels on the TUOP Parcel.

A portion of the water quality impacts related to the potential remediation efforts associated with the removal of the intake/discharge tunnels are discussed in a draft Phase I Environmental Site Assessment (ESA) report (Ninyo & Moore, 2014). The location of the intake/discharge tunnels is depicted on Figure 2-3.

Tasks for this for project component include:

- Excavation of soil
- Dewatering
- Installation of shoring to protect excavation
- Demolition and removal of tunnels (concrete) and offshore excavation structures
- Backfill with clean structural fill and installation of a rock covered slope from the top of the submerged sheet-pile wall to the level landward parcel
- Potential soil and groundwater characterization and potential remediation (if required)
- Disposal of soils (if required)
- Replacement of numerous structures, equipment, and operating systems currently located over the tunnels
- Installation of shoreline revetment to protect backfill in tunnels.

This technical report evaluates hazards and hazardous materials associated with the new dry dock (Component 1) and provides a program level analysis of the proposed removal of the cooling tunnels (Component 3). The hazardous material impacts related to the potential remediation efforts associated with the removal of the intake/discharge tunnels are also discussed in a separate Phase I assessment report (Ninyo & Moore, 2014).

3.0 REGULATORY SETTING

The management of hazardous materials, worker safety, and safety of the public are regulated by both state and federal laws and regulations. These regulations are intended to mitigate risks related to handling, transport, and disposal of hazardous materials, and to provide a regulatory framework for the Proposed Project. Additionally, these regulations describe the management of potentially hazardous materials during project implementation. The following sections describe the federal and state laws and regulations applicable to the Proposed Project.

3.1 Federal Policies and Regulations

Hazardous Materials Transportation Act

The Hazardous Materials Transportation Act is the statutory basis for the extensive body of regulations aimed at ensuring the safe transport of hazardous materials on water, rail, or highways, through air, or in pipelines. It includes provisions for material classification, packaging, marking, labeling, placarding, and shipping documentation.

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) was enacted in 1976 as an amendment to the Solid Waste Disposal Act to address large volumes of municipal and industrial solid and hazardous waste being generated nationwide. It addresses hazardous waste generation, handling, transportation, storage, treatment, and disposal. It includes requirements for a system that uses hazardous waste manifests to track the movement of waste from its site of generation to its ultimate disposition. The 1984 amendments to RCRA created a national priority for waste minimization. It establishes national minimum requirements for solid waste disposal sites and practices. It requires states to develop plans for the management of wastes within their jurisdictions. It requires monitoring and containment systems for underground storage tanks that hold hazardous materials. Owners of tanks must demonstrate financial assurance for the cleanup of a potential leaking tank.

Toxic Substances Control Act

The Toxic Substances Control Act (TSCA) provides the United States Environmental Protection Agency (USEPA) with authority to require reporting, recordkeeping, and testing requirements, and restrictions relating to chemical substances and/or mixtures. Certain substances are generally excluded from TSCA, including, among others, food, drugs, cosmetics, and pesticides.

Federal Hazardous and Solid Waste Amendments

The Federal Hazardous and Solid Waste Amendments are the 1984 amendments to RCRA. They specifically target waste minimization and phasing out of land disposal of hazardous waste, and focus on corrective action for releases of hazardous waste. Other mandates include increased oversight and enforcement by the USEPA, more stringent hazardous waste

63732 PAGE 25

management standards and practices, and a comprehensive underground storage tank program.

Emergency Planning and Community Right-To-Know Act

The Emergency Planning and Community Right-to-Know Act (EPCRA) was enacted by Congress as the national legislation on community safety in 1986, under Title III of the Superfund Amendments and Reauthorization Act (SARA). This law was designed to help local communities protect public health, safety, and the environment from chemical hazards. To help implement EPCRA, Congress requires each state to appoint a State Emergency Response Commission. The State Emergency Response Commissions are required to divide their states into Emergency Planning Districts and to name a Local Emergency Planning Committee for each district. Fire fighters, health officials, government and media representatives, community groups, industrial facilities, and emergency managers help make sure that all necessary elements of the planning process are represented. EPCRA provides requirements for emergency release notification, chemical inventory reporting, and toxic release inventories for facilities that handle chemicals.

United States Department of Transportation

The United States Department of Transportation (US DOT) has the regulatory responsibility for the safe transport of hazardous materials by air, rail, highway, and water. The US DOT promulgated a national safety program to minimize the risks to life and property inherent in commercial transportation of hazardous waste. The US DOT also evaluates safety risks, develops and enforces standards for transporting hazardous materials, educates shippers and carriers on proper handling and documentation procedures, investigates hazardous materials incidents and failures, and provides assistance to improve emergency response to incidents.

Coastal Zone Management Act

The Coastal Zone Management Act provides authority for states with federally approved coastal management programs to review federal activities that have a reasonably foreseeable effect on any land use, water use, or natural resource of the coastal zone. Federal agencies provide a consistency determination for proposed federal agency activities, and non-federal applicants for federal license or permit activities provide states with a consistency certification. Federal activities are reviewed for consistency with enforceable policies of state management programs and states either concur with or object to the activity. If a state objects to a federal agency activity, the federal agency may not proceed unless it determines that it is prohibited from full consistency due to requirements of federal law. If a state objects to a federal license or permit activity, the activity may not be federally authorized unless the applicant appeals the state objection to the Secretary of Commerce and the Secretary overrides the state's objection.

For projects involving dredging, dredged disposal, and beneficial uses of dredged material affecting uses or resources within the coastal zone, consultation and coordination with state coastal zone agencies should begin early in the project planning process (USEPA, 2011).

National Dredging Policy

In 1993, the Secretary of Transportation convened an Interagency Workgroup on the Dredging Process. The Interagency Workgroup was charged with investigating and recommending actions to improve the dredging project review process. In 1994, the Interagency Workgroup released its report, *The Dredging Process in the United States: An Action Plan for Improvement* (1994 Interagency Workgroup Report). The 1994 Interagency Workgroup Report contained 18 recommendations and a proposed National Dredging Policy (USEPA, 1994).

On June 22, 1995, the President endorsed the National Dredging Policy and directed federal agencies to implement the report's recommendations. In response to Recommendation 9 of the report, the National Dredging Team (NDT) was established. The NDT serves as a forum for implementation of the National Dredging Policy and the report's recommendations. NDT members and participating agencies:

1. Promote national and regional consistency on dredging issues,
2. Provide a mechanism for conflict resolution, and
3. Provide a forum for information exchanges among federal, state, and local agencies and stakeholders.

In 2001, the NDT sponsored a workshop entitled Dredged Material Management: Issues and Needed Actions for the Next Decade. Workshop participants developed the Action Agenda for the Next Decade (2003 Action Agenda). The 2003 Action Agenda succeeds the 1994 Interagency Report and contains 22 recommendations to help address issues that impact the following areas:

1. Beneficial use of dredged material,
2. Sediment management,
3. Emerging issues, and
4. Strengthening of regional dredging teams.

Rivers and Harbors Act, Section 10

Section 10 of the Rivers and Harbors Act (33 United States Code [USC] 401 et. seq.) requires authorization from the United States Army Corps of Engineers (USACE) for the construction of any structure in or over any navigable water of the U.S., the excavation/dredging or deposition of material in these waters, or any obstruction or alteration in a navigable water. Structure or work outside the limits defined for navigable waters of the U.S. require a Section 10 permit if the structure or work affects the course, location, condition, or capacity of the water body.

63732 PAGE 27

Clean Water Act Section 404

Section 404 of the Clean Water Act (CWA) establishes a program to regulate the discharge of dredged material or fill material into waters of the U.S., including wetlands. Section 404 requires a permit before dredged or fill material may be discharged into waters of the U.S., unless the activity is exempt from Section 404 regulation. The basic premise of the program is that no discharge of dredged or fill material may be permitted if (1) a practicable alternative exists that is less damaging to the aquatic environment, or (2) the nation's waters will be significantly degraded. Proposed activities are regulated through a permit review process. An individual permit is required for potentially significant impacts. Individual permits are reviewed by the USACE, which evaluates applications under a public interest review, as well as the environmental criteria set forth in the CWA Section 404(b)(1) Guidelines, regulations promulgated by USEPA.

Marine Protection, Research, and Sanctuaries Act Section 103

Section 103 of the Marine Protection, Research, and Sanctuaries Act of 1972 (MPRSA), Public Law 92-532, specifies that all proposed operations involving the transportation and dumping of dredged material into ocean waters must be evaluated to determine the potential environmental impact of such activities. This evaluation is performed by the Secretary of the Army, using criteria developed by the Administrator of the USEPA. In accordance with Section 103 of the MPRSA, the USACE is the permitting authority for dredged material, subject to USEPA review. Environmental evaluations must be in accordance with applicable criteria published in Title 40, Code of Federal Regulations (CFR), Parts 220-228 (40 CFR 220-228). Proposed ocean disposal of dredged material also must comply with the permitting and dredging regulations, given that one of the main purposes of Section 103 of the MPRSA is to regulate and limit adverse ecological effects of ocean dumping of dredged material. Consequently, the regulations emphasize evaluative techniques such as bioassays and bioaccumulation testing, which provide relatively direct estimates of the potential for environmental impact.

3.2 State and Local Policies and Regulations

San Diego Regional Water Quality Control Board

The SDRWQCB regulates wastewater discharges to surface waters (rivers, ocean, etc.) and to groundwater (via land). They also regulate storm water discharges from construction, industrial, and municipal activities; discharges from irrigated agriculture; dredge and fill activities; the alteration of federal water body under the CWA Section 401 water quality certification program; and several other activities with practices that could degrade water quality.

San Diego County Air Pollution Control District

The San Diego County Air Pollution Control District strives to protect the public from the harmful effects of air pollution, achieve and maintain air quality standards, foster community involvement, and develop and implement cost-effective programs that meet state and federal mandates, considering environmental and economic impacts.

63732 PAGE 28

City of San Diego, Solid Waste Local Enforcement Agency

The City of San Diego Solid Waste Local Enforcement Agency (LEA) protects public health, safety, and the environment by ensuring safe and proper solid waste management practices through the enforcement of federal, state, and local laws and regulations within the jurisdiction of the City of San Diego.

County of San Diego Department of Environmental Health

The County of San Diego Department of Environmental Health (DEH) implements and enforces local, state, and federal environmental laws. DEH regulates onsite wastewater systems; provides oversight for aboveground and underground storage tanks and cleanup; and regulates medical and hazardous materials and waste.

San Diego Unified Port District

The District is the lead agency under CEQA for the proposed project and will be the certifying body for the EIR. The District will also issue the Coastal Development Permit and other entitlements for land and water areas within their jurisdiction. The San Diego Harbor Police have jurisdiction for enforcing statutes within the Harbors and Navigation Code throughout the five member cities of the District, including San Diego Bay. These regulations cover vessel operation, boat safety, and navigation rules.

Urban Storm Water Mitigation Plan

The District requires all new construction and redevelopment "priority projects" to comply with established Standard Urban Storm Water Mitigation Plan (SUSMP) requirements. If SUSMP requirements apply, for the project application to be considered complete, the project proponent must submit an Urban Storm Water Mitigation Plan (USMP) describing how the project will meet SUSMP requirements. In general, the USMP must clearly convey the process used to identify contaminants of concern, conditions of concern, and best management practices (BMPs) selected for the project and identify BMP maintenance requirements. The USMP must include storm water BMP maintenance provisions in an Operations and Maintenance Plan. The SUSMP requirements apply to the Proposed Project and therefore a USMP will be produced.

63732 PAGE 30

4.0 PROJECT SETTING

BAE Systems currently leases approximately 9.8 acres of land and 16.6 acres of water on District tidelands property on the eastern waterfront of central San Diego Bay (Figure 1-1). BAE Systems (formerly operating as Southwest Marine Shipyard) began occupancy of the site in September 1979. Shipyard facilities operated over the years have included concrete platforms used for steel fabrication, two floating dry docks, five piers, and two marine railways that, together with cranes, enable ships to be launched or repaired. An assortment of wastes have been generated at the facility, including spent abrasives, paint, rust, petroleum products, marine growth, sanitary waste, and general refuse. BAE Systems and former property owners at the site have historically performed ship repair and maintenance for the U.S. Navy and commercial customers (SDRWQCB, 2010b). In addition to area included within the District tidelands lease, BAE Systems also currently subleases an approximately 2-acre landside and 4-acre waterside parcel from the District via aTUOP.[3]

BAE Systems maintains industrial facilities (production shops, offices, and related utilities, and infrastructure) for the maintenance, repair, overhaul, and conversion of large naval and commercial vessels. Waterfront storm water collection tanks are located along the shoreline near the Pier 4 abutment, which is located at the southern end of the facility near Schley Street. Additionally, there are areas of pavement and ramps, as well as buried pipes, a valve vault, utility vaults, three underground sewage lift stations, electrical substations, concrete revetments, and shoreline riprap and rubble.

Three working piers exist at BAE Systems to moor vessels for ship repair activities. These piers (Piers 1, 3 and 4[4]) currently accommodate berthing of large, deep-draft U.S. Navy and (to a lesser extent) commercial vessels, and include a variety of crane and utility services. Currently, BAE Systems acts as the prime contractor for five classes of U.S. Navy vessels: cruisers, destroyers, amphibious transport docks, dock landing ships, and mine countermeasures vessels. The facility is designed to support both pier-side repair (including vessel berthing) and dry dock repair, under multi-ship, multi-option contracts.

4.1 Project Site Sediment Quality

The installation of a new dry dock on the northern side of Pier 1 will require dredging approximately 395,000 cy of San Diego Bay bottom. The purpose of the dredging is to create a deep hole (referred to as a dry dock sump) in the bay bottom into which the floating dry dock can be submerged during ship loading and unloading operations.

The design depth needed to accommodate new dry dock operations is -65 feet MLLW (Figure 4-1). The dry dock dimensions will be approximately 205 feet by 851 feet, plus an apron on each end. While most of the dry dock dredging will be performed east of the U.S. Pierhead Line within Port tidelands jurisdiction, dredging will also take place west of the U.S. Pierhead

[3] At the time of preparation of this Water Quality Technical Report, the Tidelands Use and Occupancy Permit (TUOP) with SDG&E, dated November 1, 2009 (Document No. 55689) expired on October 31, 2014. This parcel is currently leased to BAE Systems by the District via a 5-year TUOP.
[4] The replacement Pier 4 is currently under construction.

63732 PAGE 31

Line within the jurisdiction of the California State Lands Commission and the California Coastal Commission. In addition to Port District approvals, the Proposed Project will also require separate authorizations from these state agencies, as well as the USACE and the SDRWQCB.

Dry dock sump dredging will involve removal of bay sediments considerably deeper than the existing bottom grade. The vertical profile of the dredge footprint includes two different types of sediments: (1) unconsolidated, recently deposited sediments, and (2) dense, native materials that have never been dredged. Approximately 85 percent of the dredged material is native sediment deposits, with a smaller fraction of the dredged material, approximately 15 percent, being unconsolidated bay mud (Figure 4-2).

To identify suitable disposal locations for the approximately 395,000 cy of dry dock sump dredged material, an extensive sediment characterization study was conducted in accordance with USACE and USEPA testing guidelines. The dry dock sump sediment characterization program was performed according to a Sampling and Analysis Plan that was reviewed and approved by the USACE and USEPA (AMEC Environment & Infrastructure, Inc. [AMEC], 2014a). The results of the sediment characterization study are detailed in the report entitled *Draft Pier 1N Dry Dock Sump Dredging Project, Dredged Material Characterization Study, BAE Systems San Diego Ship Repair, San Diego, California* (AMEC, 2014b; Appendix A).

The sediment characterization study was conducted to evaluate the suitability of the dredged material for a range of disposal options, including disposal at the LA-5 Ocean Dredged Material Disposal Site (ODMDS) and/or beneficial reuse for mitigation or beach nourishment. Ocean disposal of dredged materials is regulated under Section 103 of the MPRSA, Title 33 CFR 320-330 and 335-338. Environmental evaluations of dredged materials proposed for ocean disposal must comply with applicable criteria published in Title 40 CFR 220–238. Discharges of fill (e.g., beneficial reuse such as beach nourishment or in-bay fill for mitigation) in waters of the U.S. are subject to Section 404 of the CWA. CWA Section 404 discharges of dredge material also require a CWA Section 401 WQC from the SDRWQCB.

The suitability of dredged material for unconfined aquatic disposal is determined by the USACE and USEPA on the basis of review of the multi-tiered sediment testing results. Any sediment deemed unsuitable for aquatic disposal by the USACE/USEPA will require placement in a designated upland landfill. The practice of dredging with upland landfill disposal of sediments has undergone considerable CEQA review and permitting for several recently completed and ongoing projects at the BAE Systems San Diego Ship Repair facility and other locations. Recent upland projects include the "Pride of San Diego" (POSD) Dry Dock Sump Maintenance Dredging Project and the Pier 4 Replacement Project. Ongoing upland landfill disposal activities are being implemented for the San Diego Shipyard Sediment Remediation Project. The dredging, treatment, transfer, and transportation methods employed for landfill disposal of contaminated dredged materials are well documented and are described in detail in the *San Diego Shipyard Sediment Remediation Project Remedial Action Plan* (RAP) (Anchor QEA, 2012).

4.1.1 Dredged Material Study Results

BAE Systems' testing program for the Proposed Project included collection of core samples in May 2014 at numerous locations throughout the unconsolidated, upper layers of the dry dock sump footprint. The sediment core samples were subjected to a battery of tests in accordance with the guidelines of the USEPA and the USACE, as outlined in (1) *Evaluation of Dredged Material Proposed for Ocean Disposal* (referred to as the "Green Book") (USEPA/USACE, 1991), and (2) *Evaluation of Dredged Materials Proposed for Discharge in Waters of the United States*, EPA-823-B-98-004 (Inland Testing Manual [ITM]) (USEPA/USACE, 1998).

The sediment testing program included the following analyses: (1) physical analyses to determine the grain size of the dredged materials (e.g., percentage of sand, percentage of fines); (2) chemical analyses for a suite of contaminants of concern, including heavy metals, petroleum hydrocarbons, chlorinated and pyrethroid pesticides, polychlorinated biphenyls, organotin compounds, polycyclic aromatic and petroleum hydrocarbons, and others; (3) sediment and water column toxicity analyses using sensitive marine organisms as indicators for acute and chronic toxicity (e.g., amphipods, bivalve larvae); and (4) long-term sediment exposures using worms and clams to assess the potential for organisms to bioaccummulate chemicals into their tissues.

Sediment samples found deeper in the footprint (i.e., native sediments) were collected using soil-boring equipment (a hollow-stem auger). The native sediments within the dredge footprint were collected during the geotechnical evaluation performed by TerraCosta Consulting Group in June 2014. A soil-boring device was needed to penetrate deep into the dense, consolidated native sediments found below the upper unconsolidated surface sediments. Because these deeper sediments have never been exposed to sources of contamination, the sediment testing regime for these samples was limited to physical and chemical analyses.

4.1.2 Dredged Material Study Results – Surface Sediments

Dredged material disposal location suitability is determined by comparing the chemical levels, toxicity, and bioaccumulation results from the project site sediment with guideline values (e.g., effects range-low [ERLs] and effects range-median [ERMs]) and statistical comparisons of the test results to reference sediment tests).

Results of the testing conducted on the unconsolidated dry dock sump sediment showed the following:

1. Comparison of the sediment chemistry results for sediments collected in the dry dock sump footprint with the ERL/ERM guideline values and the reference sediment results indicates, in general, that most of the test sediments collected within the dredge footprints contain low concentrations of chemical contaminants.
2. Results of the water column and sediment toxicity tests showed no significant effects on test organisms exposed to dredged material samples.

63732 PAGE 37

3. No significant bioaccumulation of chemicals was observed in clams or worms exposed to dry dock sump sediments.

4.1.3 Dredged Material Study Results – Native Sediments

Analysis of the native layer indicated little to no anthropogenic influence in the sediment chemistry below the unconsolidated-native sediment interface. This finding verifies that the native material is clean, native sediment that is free of chemical contaminants.

4.1.4 Dredged Material Study Results – Disposal Suitability Determination

Based upon low chemical levels, and lack of significant toxicity and bioaccumulation, it appears that the sediments within the dry dock footprint meet the limiting permissible concentration for unconfined aquatic disposal as outlined in the Ocean Dumping Law and CWA Section 404. The ultimate decision regarding disposal site suitability is made by the USACE in consultation with the USEPA. The agencies' determination of ocean disposal suitability will likely be finalized in November 2014[5].

Evaluation of beneficial reuse options for the Proposed Project dredged materials deemed suitable for unconfined aquatic disposal is being conducted by Merkel & Associates for BAE Systems. The final beneficial reuse option(s) will require approval by the USACE/USEPA and be permitted by all appropriate agencies prior to placement.

4.1.5 Dredged Material Study – Potential Additional Testing

As mentioned previously, the San Diego Shipyard Sediment Remediation Project (i.e., the CAO dredging project) will be completed before any of the dredging activities associated with the Proposed Project are initiated. For the CAO dredging project to be considered complete, post-dredge confirmation sediment testing is required. The confirmation testing will be conducted to verify that contaminant levels (i.e., concentration levels) in the post-dredge surface sediments meet the cleanup objectives contained in the RAP for all primary contaminants of concern.

Once the San Diego Shipyard Sediment Remediation Project CAO cleanup dredging has been deemed complete by the SDRWQCB, any remaining unconsolidated sediment in the CAO area of the Proposed Project footprint considered for unconfined aquatic disposal will need to be tested in accordance with USACE/USEPA guidance (i.e., Green Book and ITM) to determine disposal site suitability. To date, none of the unconsolidated surface sediments within the CAO

[5] In an e-mail dated November 17, 2014, from Robert Smith of the USACE to Shaun Halvax of BAE Systems SDSR, the USACE and USEPA provided their preliminary determination on the suitability of the Proposed Project dredged material for unconfined aquatic disposal. The USEPA concluded, "Overall, the proposed sediments from composite areas A and B appear to be suitable for unconfined aquatic disposal at LA-5 or other beneficial reuse options; there appear to be sandy sediments available from this project, particularly in the consolidated native sediments below the unconsolidated muddy layer." The USACE concurred by stating, "The Corps concurs with EPA in reference to the chemical contaminant concentrations being below the ERL and ERM screening levels under Item 3. The submitted bioassays also indicate the dredged material is suitable for unconfined aquatic disposal per Item 4. below." The agencies also requested additional information regarding beneficial reuse options for the material.

area have been tested for unconfined aquatic disposal suitability. The deeper native sediments in the CAO area, however, have been chemically tested and appear to meet the criteria for placement at LA-5.

Following completion of the CAO dredging and subsequent closure of the site, it is expected that any remaining residual unconsolidated sediments that are characterized will pass all required Green Book tests and be deemed suitable for unconfined aquatic disposal at the LA-5 ODMDS. However, if any portion of the dredged material does not meet Ocean Dumping Law criteria, the unsuitable sediment would need to be placed in an upland landfill. In the event that upland disposal is required, this activity would be conducted according to the standards and practices that were previously employed by BAE Systems for other CEQA-certified and agency-permitted projects (e.g. Pier 4 Replacement Project).

4.2 Existing Operations

BAE Systems currently has one floating dry dock—the "Pride of San Diego," which has been operating at the facility since 1984. BAE Systems formerly operated a second dry dock at the facility (the "Diligence"), but in 2010 it was sold and relocated to the South Bay. In 2013 the dry dock was removed from San Diego Bay. Over the past five years, BAE Systems has averaged four dry dockings per year.

The proposed location of the new dry dock eliminates one large vessel wet berth at Pier 1N (Figure 4-3). Similar to the existing dry dock, the new dry dock at Pier 1N will be used to conduct repair and maintenance activity that cannot normally be conducted while the vessel is submerged. These activities generally include exterior hull repair, preservation (abrasive blasting and/or hydro-blasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. Ships are docked by lowering (submerging) and then raising the dry dock by means of integral ballast tanks, which take in and discharge seawater. Once the dry dock is lowered, a vessel is positioned within the dock. The dry dock is then raised, and the ship is lifted out of the water.

Wastes generated during ship repair in dry dock may include spent abrasives, paint, rust, petroleum products, marine growth, and general refuse, all of which are contained and then transferred to shore facilities for disposal. Environmental protection related to dry dock operations includes complete encapsulation of the vessel to prevent fugitive particulate emissions, storm water collection, and zero discharge of industrial wastewater. In addition, BAE Systems enforces a stringent Best Management Practices (BMP) Manual (BAE Systems, 2013) and detailed standard operating procedures (SOPs) for its dry dock operations and hazardous material handling activities at the shipyard.

63732 PAGE 39

4.3 Intake/Discharge Cooling Tunnels

The 2-acre TUOP parcel currently has two subsurface intake/discharge water tunnels that were installed by San Diego Gas and Electric (SDG&E) and previously used for intake/discharge of cooling water for the SDG&E Silvergate Power Plant.[6] The intake/discharge tunnels consist of two tunnels for intake water and two tunnels for outbound water. San Diego Bay water was used as once-through, non-contact cooling water in the power plant. Each of the four tunnels is approximately 8 feet by 8 feet. Each tunnel is approximately 700 feet long with an 8-foot square opening. As depicted in Figure 2-3, the portions of the tunnels within the District's jurisdiction stretch from the southern curb of Belt Street to San Diego Bay and consist of approximately 490 feet of intake tunnels and approximately 450 feet of discharge tunnels. Outside the District's jurisdiction, the tunnels traverse for an additional 250 feet north of the existing leasehold beginning at East Belt Street, crossing underneath Burlington Northern Santa Fe Railway property, and extending into the existing SDG&E substation north of the Proposed Project site. The Silvergate power plant was removed in 2007 and the intake/discharge tunnels are no longer in operation. The removal of the existing intake/discharge tunnels within the TUOP parcel could occur during the construction of the proposed dry dock or at a future time. Figure 4-3 illustrates the conditions of the entrance to the intake/discharge water tunnels.

Subsurface Investigations

In December 2010, Ninyo & Moore performed a subsurface investigation that included conducting cone penetration testing (CPT) and Ultraviolet Optical Screening Tool (UVOST) analyses at 38 locations to depths ranging from 40 to 48 feet below ground surface (bgs); advancing 28 soil borings; and installing 15 temporary wells to collect groundwater samples (Ninyo & Moore, 2011). Ninyo & Moore also collected sediment samples from the cooling tunnels. Based on visual observation of the sediment extracted from the two cooling water tunnels, the sediment generally consisted of silty sands to sandy silts. Sediment samples from the discharge and intake tunnels had a slight hydrocarbon odor, and the samples were generally gray to black in color. The study found concentrations of total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), PAHs, PCBs, and metals above the laboratory detection limits in soil, groundwater, and the cooling tunnel sediment samples.

An additional Phase I Environmental Site Assessment was performed by Ninyo & Moore for the District in 2014 (Ninyo & Moore, 2014). Based on the findings of the draft Phase I ESA, there is a moderate to high probability that hazardous materials or wastes are present at the site.

In addition, the cooling tunnels currently have an opening to the San Diego Bay that would be removed following tunnel removal. This change would mean there is no longer a connection to San Diego Bay.

[6] The SDG&E Silvergate Power Plant ceased operations in 1984. In 2007, SDG&E completed the abatement, decontamination, and dismantlement of all interior equipment and demolition of the structure. (Cleveland Wrecking Company, http://clevelandwrecking.com/sdge-silvergate-power-2/, website accessed July 9, 2014.) However, the SDG&E cooling tunnels associated with the Silvergate Power Plant remain, but are required to be removed under existing agreements between the District and SDG&E.

63732 PAGE 42

Tunnel Removal and BAE Systems Operations

The removal of the cooling tunnels has the potential to adversely affect BAE Systems operations, but measures can be implemented to minimize the disruption and to assure ongoing operations. The southern ramp (for vehicles) will not impede removal of the tunnels and the intermediary wharf structure and proposed north ramp (for utilities and pedestrians) will not be installed until after the tunnels are removed. In addition, the current TUOP acknowledges that:

> *"Under no circumstances shall Tenant undertake any use of the Premises that increases the difficulty or cost of Existing Improvement Removal. Tenant shall be responsible for all costs and expenses associated with breach of this provision. Notwithstanding the above, and at no additional cost to the District, the District and BAE Systems shall work collaboratively to minimize the impact to BAE Systems operations as a result of the proposed demolition work."*

To minimize impacts, operations can be directed on the southern side portion of the 2.0 TUOP parcel, as well as the 9.8-acre land parcel leased to BAE Systems.

63732 PAGE 44

5.0 ENVIRONMENTAL ANALYSIS

This section describes the potentially significant impacts associated with installing and operating a new dry dock on the northern side of Pier 1. Mitigation measures to reduce any impacts found to be potentially significant in this hazards and hazardous materials analysis are described in Section 6.0.

5.1 Dry Dock Installation

The activities that may create hazards and hazardous materials during the construction and dry dock installation component of the Proposed Project include:

- Dredging and dredged material disposal activities;
- Sheet pile and king pile installation;
- Installation of the dry dock access ramp;
- Activities related to mooring dolphin demolition and installation;
- Installation of the electrical and mechanical utilities needed to service the new dry dock; and
- Activities associated with deployment of the new dry dock, including onsite assembly work.

The proposed hazards and hazardous materials associated with these activities are discussed below.

5.1.1 Dredging and Dredged Material Disposal

Potential environmental impacts associated with dredging and dredged material disposal are described in this section. Two dredged material disposal options are being considered for the Proposed Project: (1) unconfined aquatic disposal, and (2) upland disposal in a landfill.

To date, none of the sediment tested as part of the dry dock sump dredged material characterization study has been deemed unsuitable for unconfined aquatic disposal (i.e., requiring upland disposal); however, a final regulatory "suitable for unconfined aquatic disposal" (SUAD) determination is pending. As mentioned above, a portion of the dredge footprint has not yet been evaluated for unconfined aquatic disposal. It is possible that some of the sediment in the dredge footprint may require upland disposal. Consequently, the potential impacts associated with both aquatic and upland disposal are evaluated below.

Dredging – Aquatic Disposal

As discussed in Section 4.1 (Project Site Sediment Quality), a sediment characterization study was conducted in accordance with federal testing guidelines to determine the physical characteristics and chemical levels in the sediments within the Proposed Project dredge footprint. Specifically, the sediment was evaluated to determine its SUAD in accordance with the National Dredging Policy, the Ocean Dumping Law, and the CWA.

63732 PAGE 45

The sediment testing results show that the dry dock footprint dredged material is substantially free of chemical contamination, toxicity, and bioaccumulation potential. The test results are currently being evaluated by the USACE and USEPA to determine if they meet the Ocean Dumping Law and CWA Section 404 criteria for unconfined aquatic disposal. A SUAD determination by the USACE and USEPA would indicate that the Proposed Project dredged material would not pose a threat to the environment due to elevated contaminant levels at either the dredging site or the selected disposal site.

If a SUAD determination is made at this time, it will apply only to the unconsolidated surface sediments within the dredge footprint west of the Shipyard Sediment Remediation Project cleanup area as well as all the clean native materials deeper in the dredge footprint that span the Proposed Project footprint. As previously discussed, the Shipyard Sediment Remediation Project sediment removal will be completed prior to implementation of the Proposed Project. Any remaining sediments following remedial activities will need to undergo further analyses.

Potential Impacts:

Because the Proposed Project dredged materials have been shown to be substantially free of chemical contaminants and toxicity, the primary impact associated with dredging these materials is sediment resuspension. Dredging activities could cause sediments to enter the water column, which may cause increased turbidity. Increased turbidity (suspended and settleable solids) is deleterious, or harmful, to benthic organisms and may cause the formation of anaerobic conditions, which can clog fish gills and interfere with respiration in aquatic fauna. It also can screen out light, hindering photosynthesis and normal aquatic plant growth and development (SDRWQCB, 1994). Dredging activities that could cause resuspension of sediments include:

- Over-filling of the dredge bucket during the sediment removal operations
- Debris preventing the dredge bucket from closing completely
- Barge repositioning (vessel propeller wash)
- Silt curtain placement
- Damage of silt curtain during dredging
- Spillage of sediment, resulting from overloading the material barge
- Contact with sediment on or around the material barge during loading
- Cable snap of the loading bucket during loading procedures
- Shear pin breakage, allowing the bucket to open prematurely during loading procedures
- Material barge or tugboat collision with another vessel

63732 PAGE 46

Dredging – Upland Disposal

All of the sediment tested to date according federal guidelines and evaluated by the USACE and USEPA has been deemed suitable for unconfined aquatic disposal. As discussed in Section 4.1.5 (Dredged Material Study – Potential Additional Testing), however, a portion of the sediment within the project footprint still requires disposal suitability testing. This untested sediment is composed of any residual unconfined material that remains following completion of CAO cleanup dredging activities. As discussed in the Project Description under separate cover, it is assumed that a small portion of the project dredged material may require upland disposal. An upland disposal contingency factor of approximately 2,500 to 10,000 cubic yards (3,500 to 14,000 tons) of dredged material has been identified for purposes of this analysis.

Any sediment not approved for ocean disposal or beneficial reuse will be disposed of outside of the tidelands (upland) at an appropriately permitted landfill. Any sediment designated for upland disposal will be tested, waste classified, and approved by the landfill operator for landfill disposal. Should upland disposal become necessary, the proposed disposal site will be Otay Landfill located at 1700 Maxwell Road in Chula Vista, California. Alternative landfills may also be considered.

In the unlikely event that any portion of the dredged materials is classified as hazardous waste, those materials will require transport to a hazardous waste disposal facility (a Class I facility). None of the previous dredging projects conducted at BAE Systems that required landfill disposal (e.g., the San Diego Shipyard Sediment Remediation Project; the POSD Dry Dock Sump Maintenance Dredging Project; Pier 4 Replacement Project dredging) uncovered any sediments that were classified as hazardous wastes. All sediments from these projects meet Otay Landfill's waste classification requirements to be disposed of as non-hazardous solid waste.

Upland disposal of dredged material will require dredging, processing onsite (i.e., dewatering and thickening), transfer to a truck, and transport to and disposal at the Otay Landfill. Assuming a carrying capacity of 23 tons per truckload, approximately 110 to 610 truckloads will be required for upland disposal of these dredged materials. The disposal process, including truck routes, will be conducted using the same transportation logistics used for recent landfill disposal projects conducted by BAE Systems.

It is estimated that the dredging operation, which may be performed to remove the 2,500 to 10,000 cy of sediment requiring upland disposal, will take approximately 1 month to complete. Dredging equipment will include the dredge crane barge, two dredge barges (scows), a large excavator for mixing cement (i.e., thickening) into the dredge material within the dredge scow and for offloading dredged material into trucks, pumps and hoses to capture supernatant water from the dump scow that can be transferred on-shore for disposal, and other miscellaneous equipment.

During upland disposal days (anticipated to be 17 days during the month), approximately 30 to 40 trucks per day will be required to haul off the treated dredged sediments. In addition, approximately 10 to 35 cement trucks will be required to dry all of the upland dredged material. The cement trucks will arrive on approximately 5 to 6 separate days during this period. Approximately 10 workers will be onsite each day that this dredging is being conducted.

63732 PAGE 47

The sediment will be sampled by the removal contractor for landfill profiling in accordance with the landfill's acceptance criteria. . Sediment samples will be collected by the removal contractor from the containment barge. Once it is determined that the sediment has met the analytical and water content requirements of the disposal facility, the material will be certified for disposal (by the landfill operator), manifested, loaded into on-road trucks (typically using a large-wheeled front-end loader), weighed to document compliance with California Department of Transportation (Cal-DOT) regulations, transported, and deposited at the selected disposal facility.

Potential Impacts:

Potential hazards and hazardous materials impacts associated with the dredging and upland landfill disposal of dredged materials include:

- Resuspension of contaminated sediments during dredging activities (same as those listed above under Dredging – Aquatic Disposal)
- Overfilling of the dump scow, causing sediment and supernatant water (i.e., water that rises to the surface in the dredge barge during loading operations) to overflow the sides
- Leaks in the supernatant water handling system, causing releases of contaminated water to the bay
- Accidental spills of 1) the cement used as a thickening agent during on-scow treatment of the upland disposal sediments or 2) the resultant wet slurry mixture
- Spilling of upland disposal sediments during the transfer process from the dump barge to land for removal
- Discharge of spilled materials back into the bay during storm events

Dredging Equipment Operations

In addition to dredging, hazards and hazardous materials are also associated with dredging equipment (e.g., clamshell dredge and barge, dump scows, tender boats, cement trucks, and dump trucks) that will be used during construction. In particular, these pieces of equipment will use hazardous materials such as fuels and lubricants.

The potential for petroleum product leaks or spills is low, but the potential for long-term impacts is moderate to high if a leak or spill occurs. Use of dredging equipment and the support vessel for construction activities may also result in potentially hazardous conditions in the project area as well as in the vicinity of sediment dump barges as the vessels move between the dredging site and the disposal location(s).

Potential Impacts:

Potential impacts associated with dredging equipment operations include:

- Accidental oil or fuel spills that could occur during the dredging operations and impair and/or degrade water quality in the bay

63732 PAGE 48

- Navigation hazards associated with dredging equipment, tugs, dump scows, support vessels, and silt curtains

5.1.2 In-water Construction Activities

In addition to dredging-related activities associated with installation of the new dry dock, the Proposed Project will also include additional in-water construction activities. These include:

Sheet pile and king pile installation – To prevent undermining of the existing Pier 1, the Proposed Project will include an underwater wall and cantilevered king pile installation. These underwater improvements will allow for dredging adjacent to the pier without adversely impacting the strength and integrity of the pier.

Access ramp installation – Two ramp wharfs (north and south) designed for accessing the dry dock are proposed adjacent to and westward of the bulkhead and will extend from approximately the current bulkhead line to 125 feet into San Diego Bay. The ramp wharfs will be designed to support heavy vehicle and equipment loads and will consist of a reinforced concrete deck supported by precast concrete piles anchored along the shoreline.

Intermediary wharf structure - Material delivery staging area for the drydock must be with reach of cranes. An intermediary wharf structure is planned for installation between the two access ramps. The intermediary wharf will be constructed in similar fashion as the ramps and abut the ramps to the north and south.

Mooring dolphin expansion and replacement – To accommodate the mooring of the proposed dry dock, one new and one retrofitted mooring dolphin are proposed to be constructed approximately 344 feet and 890 feet offshore (west) of the U.S. Bulkhead Line. The dolphins are necessary to provide a fixed mooring structure to secure the dry dock. Additionally, the current Pier 1 mooring dolphin would be expanded.

Dry dock assembly – Installation of a new floating dry dock approximately 205 feet in width and 851 feet in length (174,455 square feet total) plus aprons (approximately 16,165 square feet total) attached to the dry dock on each end is proposed. It is anticipated that most of the dry dock will be assembled offsite. However, there will likely be some additional dry dock assembly work occurring once the dry dock has been towed to the shipyard.

Potential Impacts:

Potential environmental impacts that may result from these in-water construction activities include:

- Resuspension of sediments during pile removal and installation activities
- Routine use, transport, or disposal of potentially hazardous materials (e.g., fuels, oils, lubricants) by construction equipment

63732 PAGE 45

- Spills of fuels or oils during construction activities and refueling operations
- Noise associated with pile-driving activities

5.1.3 Land-side Construction Activities

A small portion of the construction activities associated with installation of the new dry dock will occur on land. Electrical and mechanical utilities to support the dry dock will need to be installed. These utilities will be similar to the types and capacities currently utilized within the existing shipyard. The proposed electrical utilities include a 12,000-volt, 500-amp feeder cable to the proposed new wharf; new load interrupt switches for the distribution of the 12,000-volt circuit; shore and pier 480-volt and 208/110-volt distribution systems, including 400-amp shore power mounds on the shore at two locations for barges and for ship repair operations; convenience receptacles on shore and on the pier and power to new infrastructure where needed (sewage lift station, storm water collection systems, etc.) and shore and pier lighting, including pole lights and embedded light fixtures in the wharf structure that will be located on the shore and wharf; and shore and wharf data, telephone, and television systems for use by vessels in dry dock.

Potential Impacts:

The potential impacts associated with utility installation include:

- Discovery of contaminated soils and/or groundwater during trenching operations
- Routine use, transport, or disposal of potentially hazardous materials (e.g., fuels, oils, lubricants) by construction equipment
- Spills of fuels or oils during construction activities

5.2 New Dry Dock Operations

Operational activities currently conducted at BAE Systems facility include non-nuclear ship repair, modernization, conversion, and overhaul for government and commercial customers. Operations in the new dry dock will be similar to existing operational conditions at the current Pier 1N wet berth, but with the addition of the new dry dock. The new dry dock will be used to conduct repair and maintenance activity that cannot normally be conducted while the vessel is afloat. In a typical year, it is anticipated that two DDG-class vessels, one LPD-class vessel, one CG-class vessel, and one LCS-class vessel will utilize the dry dock.

Operational activities in the new dry dock (ship loading and unloading, ship repair and maintenance activities, and long-term dry dock maintenance needs) will be similar to existing activities for the POSD dry dock currently in use at the facility. Adding the second dry dock will create no new conditions at the site that could result in the accidental release of hazardous materials. Operations for the new dry dock will be subject to the same and/or similar permit and operational requirements and conditions. Dry dock operational activities are conducted in accordance with the following permits and procedures:

63732 PAGE 50

- BAE Systems San Diego Ship Repair Industrial User Discharge Permit (No. 11-0217) issued by the City of San Diego Public Utilities Department Industrial Wastewater Control Program
- National Pollutant Discharge Elimination [NPDES] Permit No. CA0109151 (Order No. R9-2009-0080 modified by No. R9-2010-0090) – Waste Discharge Requirements, BAE Systems San Diego Ship Repair, Inc., Discharge to San Diego Bay
- Best Management Practices (BMP) Program Manual SOPs for dry dock operations at BAE Systems San Diego Ship Repair (BAE, 2013). The BMP Program Manual contains two major objectives:
  - Identify and evaluate potential pollutant sources and pathways associated with ship modification, repair, and maintenance; and
  - Identify and implement site-specific BMPs to reduce or prevent the discharge of wastes and pollutants to waters of the state, and, more specifically, San Diego Bay.

BAE Systems has the following SOPs in place to mitigate the potential impacts of shipyard operations on water quality. These SOPs provide specific details with regard to regulations and permits, responsibilities (of BAE employees as well as subcontractors), procedures, and record keeping/documentation for various shipyard activities and systems that may affect water quality:

- BAE Systems San Diego Ship Repair (SDSR) Procedure 1210-02M (Revised 3/5/14) – Industrial Wastewater Discharge: The purpose of Procedure 1210-02M is to establish SOPs for discharge and recordkeeping of industrial wastewater discharges to the BAE SDSR sewer system.
- BAE Systems SDSR Procedure 1210-03K (Revised 9/12/13) – Dry Dock Submergence Cleaning: This procedure establishes requirements and coordinates activities of BAE Systems SDSR work groups and subcontractors to ensure that dry dock washdown is conducted in a manner that is both efficient and protective of natural resources.
- BAE Systems SDSR Procedure 1210-04K (Revised 6/6/14) – Oil-Water Separator Operation: The purpose of Procedure 1210-04K is to describe acceptable methods of operation, maintenance, and BMPs for Oil-Water Separators used at BAE Systems SDSR for treatment of bilge, ballast, and other oily wastewater sources.
- BAE Systems SDSR Procedure 1220-02J (Revised 1/6/14) – Abrasive Blasting and Spay Painting Containment Procedures: This procedure establishes operational controls and BMPs to ensure that hydroblasting, pressure washing, abrasive blasting, and spray painting operations are conducted in a manner that is protective of the environment.
- BAE Systems SDSR Procedure 1230-02L (Revised 5/5/14) – Hazardous Wastes Manifest: This SOP establishes standard practices for manifesting hazardous waste.
- BAE Systems SDSR Procedure 1230-03C (Revised 7/31/14) – Disposal of Oil from Vessels: This procedure establishes requirements and coordinates activities of BAE Systems SDSR work and subcontractors to ensure that oil removed from vessels is disposed of appropriately, including supporting documentation.

63732 PAGE 51

- BAE Systems SDSR Procedure 1230-04C (Revised 1/27/14) – Scrap Metal Recycling Procedures: This SOP defines the procedures for the segregation, handling, and recycling of scrap metal to ensure that no heavy metals are introduced into the environment.

Specific activities related to dry dock operation and water quality control measures are described below.

Loading and Unloading Vessels

Ships are docked by lowering (submerging) and then raising the dry dock by means of integral ballast tanks, which take in and discharge seawater. Once the dry dock is lowered, a vessel is positioned within the dock. The dry dock is then raised, and the ship is lifted out of the water. Prior to submergence, the dry dock will be cleaned and free of any hazardous material wastes (spent abrasives, paint, petroleum products, sanitary waste, and general refuse and debris) associated with ship repair or maintenance activities taking place within the dry dock. All wastewater from the wash-down process is captured and held at the facility prior to discharge into the City of San Diego Metropolitan Sanitary Sewer System for disposal to a publically owned treatment works (POTW) according to the requirements of Industrial User Discharge Permit (No. 11-0217).

Ship Repair and Maintenance in the Dry Dock

Ship repair and maintenance includes exterior hull repair, preservation (abrasive blasting and/or hydroblasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. Wastes generated during ship repair in dry dock may include spent abrasives, paint, rust, petroleum products, marine growth, and general refuse, all of which are contained and then transferred to shore facilities for disposal.

Environmental protection related to dry dock operations includes complete encapsulation of the vessel to prevent fugitive particulate emissions, storm water collection, and actions to ensure zero discharge of industrial wastewater. In addition, hazardous waste will not be stored on the dry dock for extended periods, the dry dock will be monitored regularly for cleanliness, and other housekeeping procedures will be performed (i.e., waste removal, regular meetings and training sessions, and spill kit supplies checks). Any ship repair activity that presents a spill potential shall be controlled with structural control measures such as curtains, tarps, and shrink-wrap approved and periodically inspected by Environmental Services personnel.

Long-term Dry Dock Maintenance

The dry dock requires long-term maintenance, including repairs and painting, that is similar to the ship repair and maintenance currently being performed. All ship repair and maintenance activities should be considered as pertaining to the dry dock itself when evaluating impact significance.

Storm Water Discharges

The new dry dock will be designed to capture all storm water runoff and waste water, and to monitor flows in a manner similar to the method currently used at the POSD dry dock at BAE Systems (i.e., via a similar NPDES monitoring program). For the current NPDES program,

63732 PAGE 52

ballast water, miscellaneous waste water, and surface runoff are captured and maintained in a robust drainage system with several levels of engineering controls to ensure that all runoff at the shipyard is captured, except in the case of a catastrophic event. Storm water collected at BAE Systems is held in a storm water diversion system (SWDS) and subsequently discharged to the POTW in accordance with BAE Systems' Industrial User Discharge Permit or trucked waste permit.

Potential Impacts:

Potential hazards and hazardous materials associated with the operations of the new dry dock include:

- Release of hazardous materials to surface waters when the dry dock is submerged for loading and unloading of vessels
- Spills of fuels, oils, lubricants, or other liquids or powers during ship repair activities
- Release of hazardous materials during routine dry dock repair and maintenance activities
- Release of hazardous materials associated with the dry dock's ballast water system
- Navigation materials associated when loading or unloading vessels from the dry dock

5.3 Removal of Intake/Discharge Tunnels

The removal of the cooling tunnels would require the following activities:

- Soil and groundwater characterization
- Excavation of soil
- Soil dewatering
- Potential remediation of contaminated soils
- Disposal of the soils
- Installation of shoring to protect the excavation
- Demolition and removal of tunnels (concrete)
- Backfill of the tunnel area with clean structural fill
- Replacement of numerous structures, equipment, and operating systems located over the tunnels
- Shoreline revetment
- Removal of remaining off-shore structure

Based on the findings of the draft Phase I ESA, there is a moderate to high probability that hazardous materials or wastes are present at the site (Ninyo & Moore, 2014). Any soil or

63732 PAGE 53

groundwater generated may result in a short-term increase of hazardous waste disposal. If hazardous materials or wastes are encountered during construction activities (e.g., contaminated soil and groundwater), there is low likelihood that the disturbance would create a significant hazard to the public or the environment, by way of direct contact or leeching into groundwater or the San Diego Bay, with the implementation of mitigation measures outlined in Section 6.0, Mitigation Measures.

In addition, the cooling tunnels currently have an opening to the San Diego Bay that would likely be removed to (at least) the mean high tide line following tunnel removal. This change would mean there is no longer a connection to San Diego Bay.

As outlined in the geotechnical report under separate cover, construction dewatering will need to occur to enable removal of the cooling tunnels followed by backfilling (TerraCosta, 2014). Using a shoring system such as sheet piling or secant piling may be generally effective at reducing groundwater infiltration into the excavation, but infiltration cannot be eliminated. As such, dewatering pumps will be required to further remove groundwater from the excavation. Depending upon the volume of water produced, and the water quality, water may possibly be treated and discharged accordingly, or may have to be hauled to an appropriate facility. Dewatering volumes, means and methods, water treatment, and the need for appropriate permits, should be assessed during the project level or design phase assessment of the cooling tunnel removal project.

As with the land-side construction activities, the shoreline will remain covered in impervious surfaces (similar to current conditions); therefore, future conditions on the project site will not alter water quality with regard to storm water flow or drainage patterns. In addition, a 67-foot long sheet-pile wall will be installed in two segments (one 85 foot section and one 15 foot section) along the shoreline in support of the Shipyard Sediment CAO. This sheet-pile wall will help prevent contaminated sediment release into San Diego Bay during tunnel removal and will seal the mouth to the tunnels during construction and replacements of revetment. Installation of this wall will facilitate the removal and regrading of the existing slope to allow for the proposed sump. A new rock covered slope extending from the top of the submerged sheet-pile wall to the level landward parcel will also be installed. Construction level details regarding proposed removal of the cooling tunnels shall be addressed during the design stage for that project and/or during the preparation of the project level EIR for that phase.

Potential Impacts:

Similar to the dredging and construction activities listed above, impacts to San Diego Bay water quality could be observed during demolition and removal of the cooling tunnels. The potential impacts include:

- Release of potentially contaminated soils, groundwater, and/or debris from the tunnel demolition into San Diego Bay waters via surface runoff or tunnel excavation and removal activities
- Contamination of groundwater resources

63732 PAGE 54

- Potential accidental release of hazardous materials (e.g., oils and fuels) during tunnel removal construction activities

5.4 Cumulative Impacts

The Proposed Project is not anticipated to degrade the quality of the bay floor surface in the local area. However, the potential cumulative impacts resulting from the implementation of this project with respect to other projects in and around San Diego Bay require evaluation. Other projects that are anticipated to be implemented before, during, or after the Proposed Project include the Pier 4 Replacement Project, Pier 3 dredging, and the San Diego Shipyard Sediment Remediation Project, as well as any routine maintenance dredging that may occur before or after the Proposed Project is implemented.

Because of the close proximity between the San Diego Shipyard Sediment Remediation Project location and the Proposed Project location, concurrent implementation of these projects is not feasible. Therefore, there is no increase in the risk of, or potential impacts from, increased vessel traffic in San Diego Bay or from concurrent dredge activities in close proximity. The Pier 4 Replacement Project dredging was completed in September 2014; therefore, the dredging, upland, and ocean disposal of material for the Pier 4 Replacement Project will not affect the Proposed Project. No Pier 3 dredging will be conducted at the same time as the Proposed Project.

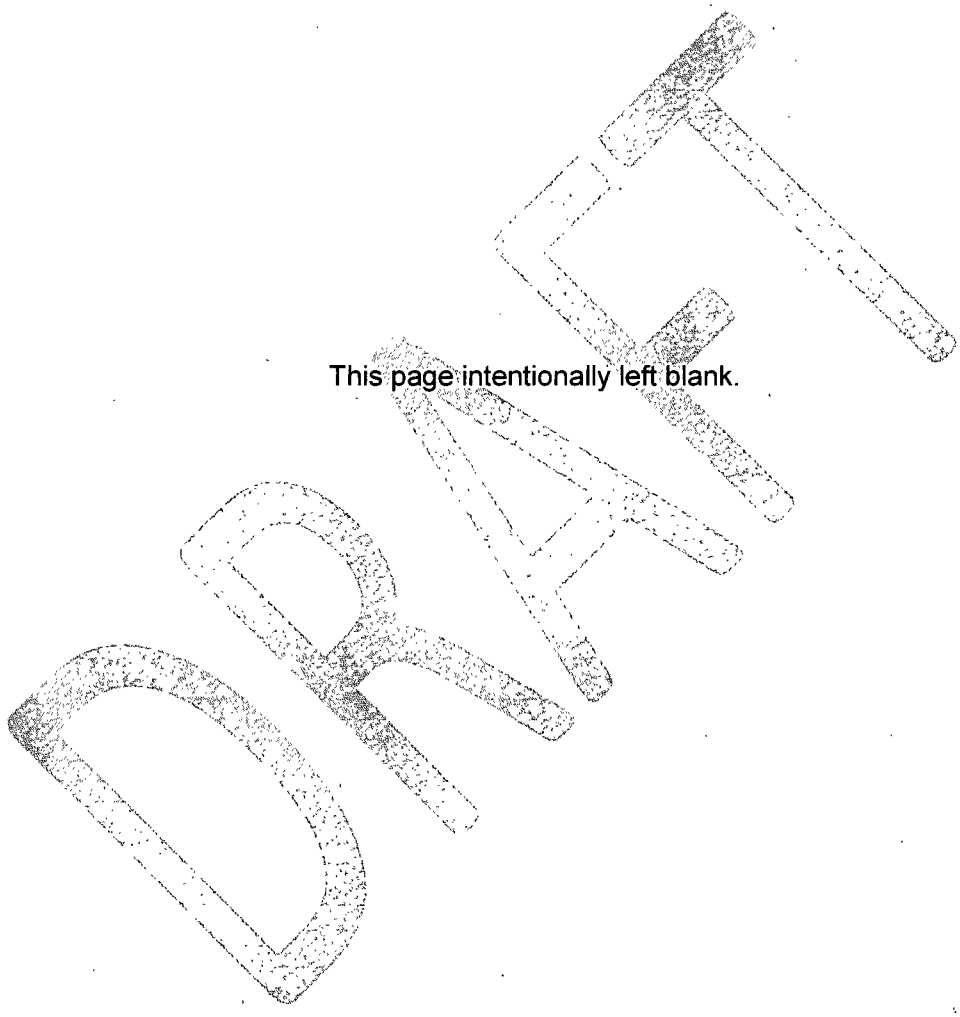
63732 PAGE 55



This page intentionally left blank.

63732 PAGE 56

6.0 MITIGATION MEASURES

This section presents mitigation measures that correspond to Proposed Project impacts described in Section 5.0.

The potential hazards and hazardous material impacts associated with the Proposed Project are reduced to levels less than significant with mitigation incorporated. The Proposed Project will be subject to implementation of BMPs and to oversight by regulatory permitting agencies, including the SDRWQCB, the USACE, and the USEPA. Therefore, the Proposed Project will not result in significant hazards or hazardous materials impacts with compliance and with the mitigation measures described in this section.

6.1 Dredging Activities

Mitigation measures associated with dredging activities are described below.

6.1.1 Mitigation Measure 1: Dredging Management Plan

Prior to commencement of dredging operations, the contractor shall prepare a dredging management plan (DMP) for review and approval by the District and SDRWQCB. The DMP shall contain SOPs that are developed for the Proposed Project prior to initiation of dredging and are implemented for the duration of the dredging activity. The DMP will include the following measures to prevent release of hazardous materials during dredging activities:

1. Personnel involved with dredging and handling of the dredged material will be given training on their specific task areas, which will be identified in the Health and Safety Plan (HASP). The training shall be approved by the District and carried out by BAE Systems per Occupational Safety and Health Administration (OSHA) requirements. The training materials include:
   - Potential hazards resulting from accidental oil and/or fuel spills;
   - Potential impacts to water quality associated with turbidity; and
   - Proper operation of dredging equipment.
2. Required instrumentation to avoid spillage of dredged material will be identified for each piece of equipment used during dredging operations.
3. Personnel will be required to visually monitor for oil or fuel spills during construction activities.
4. In the event that a sheen or spill is observed, the equipment will be immediately shut down and the source of the spill identified and contained. Additionally, the spill will be reported to the applicable agencies presented in the DMP.
5. All personnel associated with dredging activities will be trained as to where to find oil/fuel spill kits, how to deploy the oil-absorbent pads, and how to dispose of the materials properly. The dredging barge shall have a sufficient quantity of oil/fuel spill kits onboard to allow for quick and timely spill containment.

63732 PAGE 57

6. Barge load limits and loading procedures will be identified, and the appropriate draft level will be marked on the materials barge hull.
7. Water discharges (supernatant water from sediment and storm water) to San Diego Bay are prohibited.

During dredging, the District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis; and (2) periodic site inspections.

Dredging activities could create a potential hazard; however, a DMP will be implemented that includes (1) measures to minimize sediment spillage, (2) a Contingency Plan to address equipment and operational failures that could occur during dredging operations and cause sediment resuspension, (3) a HASP and Communication Plan to train workers to prevent and respond to incidents, and (4) prior to dredging, preparation of operational guidelines that address the safe movement of project vessels. These measures will reduce the impacts of dredging activities to levels less than significant. Specific mitigation measures related to dredging will include the following:

1. The contractor will remove dredge material and will not stockpile material on the San Diego Bay floor, and will not sweep or level the bottom surface with the digging bucket.
2. The contractor will not overfill the digging bucket because overfill results in material overflowing back into the water.
3. When dredging sediments that have been deemed unsuitable for unconfined aquatic disposal by the USACE/USEPA, the contractor will deploy and maintain inner- and outer-boundary floating silt curtains fully around the dredging area at all times. Double silt curtains will be utilized for containment of the dredge area; silt curtain configurations, technologies, and actual locations in relation to the dredge barge will be finalized during the design phase of the project.
4. The contractor will not overfill the material barge to a point where overflow or spillage could occur. Each material barge will be clearly marked to allow the operator to visually identify the maximum load point.
5. If the contractor proposes to use weirs as a means to dewater the scow during dredging approved for unconfined aquatic disposal, the use of silt curtains shall be deployed to minimize turbidity. Decanting of dredge scow return water during dredging of material determined to be unsuitable for unconfined aquatic disposal is prohibited.
6. The contractor will place material in the material barge to minimize splashing or sloshing that could send sediment back into the water. Splashing can be controlled by restricting the drop height from the bucket.
7. If the use of a grate to collect debris is required, the contractor will not allow material to pile up on the grate and flow or slip from the grate back into the water. The debris scalper will be positioned to be totally contained on the shore side of the unloading operations.

63732 PAGE 58

8. The dredge operator will visually monitor for debris build-up and alert the support personnel on the barge to assist in clearing the debris, as necessary. Debris that is derived from dredging activities will be removed from the grate by the dredge clamshell bucket and placed in a contained area on the dredge barge or in a second material barge for subsequent removal and disposal.
9. The contractor will restrict barge movement and work boat speeds (i.e., reducing propeller wash) in the dredge area.

6.1.2 Mitigation Measure 2: Contingency Plan

The contractor shall prepare and submit to the District for approval a Contingency Plan prior to initiation of dredging and will implement it for the duration of the dredging activity; the plan will address equipment and operational failures that could occur during dredging operations. The Contingency Plan will include the following measures to prevent a release of hazardous materials in the event of equipment failure, repair, or silt curtain breach:

1. Procedures for communication to project personnel;
2. Installation of proper signage and/or barriers alerting others of potentially unsafe conditions;
3. Specification for repair work to be conducted on land and not over water;
4. Identification of proper spill containment equipment (e.g., spill kit);
5. Identification of other equipment or subcontracting options;
6. Emergency procedures to follow in the event of equipment failure or release;
7. Incident reporting and review procedure to evaluate the causes of an accidental release and steps to avoid further incidents;
8. Response procedures in the event of barge overfill; and
9. Procedures for prompt notification of the District and all other regulatory agencies.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.3 Mitigation Measure 3: Health and Safety Plan for Dredging Activities

The contractor shall prepare and submit to the District for approval a HASP prior to the initiation of dredging and will implement it for the duration of the dredging activity. The HASP will be prepared in general accordance with Federal Occupational Safety and Health Administration Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120) and Title 8 California Code of Regulations (CCR) Section 5192. The HASP will be reviewed and approved by a Certified Industrial Hygienist approved by the District and at the contractor's expense.

63732 PAGE 59

The HASP will include the following requirements at a minimum:

1. Training for operators to prevent and respond to releases;
2. Identification of appropriate personal protection equipment for all construction activities, including personal floatation devices, hard hats, and work shoes/clothing;
3. Training in the safe operation of cranes, barges, tugs, and support craft;
4. Site evacuation and emergency first aid response; and
5. Documentation that certifies that required health and safety procedures have been implemented.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

The handling of hazardous materials in accordance with BAE Systems' Hazardous Materials Business Emergency Plan (HMBEP) as required by applicable local, state, and federal standards, ordinances, and regulations will ensure that impacts associated with environmental and health hazards related to an accidental release of hazardous materials during operation are at levels that are less than significant.

6.1.4 Mitigation Measure 4: Communication Plan

Prior to the initiation of dredging activities, the contractor shall prepare and submit to the District for approval a Communication Plan and operational guidelines for communications between the U.S. Coast Guard and all vessel operators to ensure the safe movement of project vessels from the dredge site to the unloading area. Features of the Communication Plan will include, at a minimum:

1. Identification of vessel speed limitations (e.g., wake/no wake); and
2. Notification to project personnel using air horns as necessary.

6.1.5 Mitigation Measure 5: Supernatant and Storm Water Containment

This mitigation measure only applies in the event that a portion of the dredged material is deemed unsuitable for unconfined aquatic disposal (i.e., upland disposal becomes necessary). The contractor shall ensure that the supernatant and storm water collected from the scow are transported to landside containers. These containers are to be sealed when not in use to avoid overflow during a storm event. Storm water management in the project footprint during all phases of the project will be in compliance with the Statewide General Construction Permit and District requirements. Secondary containment features will be in place around the scows (silt curtains) and holding tanks (berms).

63732 PAGE 60

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.6 Mitigation Measure 6: Sediment Unloading

This mitigation measure only applies in the event that a portion of the dredged material is deemed unsuitable for unconfined aquatic disposal (i.e., upland disposal becomes necessary). If upland disposal of sediment is required, the contractor shall reduce water column impacts by controlling the swing radius of the unloading equipment. A spillage plate will be used to prevent the offloaded sediments from falling into the water beneath the swing radius of the unloading equipment at the offload location, which will limit spillage from removal of the wet sediment slurry falling directly into the water. All equipment used to move sediments from the scow to the trucks as well as the trucks used to transport sediments to the landfill will be properly cleaned and any waste water will be properly contained and disposed.

The contractor shall use a power wash unit to reduce impacts related to spillage from the excavator arm onto transport vehicles. In the event that sediment is spilled onto the transport vehicle, it can be quickly washed and the water directed into the collection sump. The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.7 Mitigation Measure 7: Overfilling Transport Vehicles, Increasing Potential to Spill onto the Roadway

If dredging of sediment deemed to be unsuitable for unconfined aquatic disposal is necessary, the contractor shall ensure that truck volumes are limited to prevent spillage and will be based on visual observations, and that trucks will be covered and secured per Cal-DOT regulations during transport to the disposal facility. The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.8 Mitigation Measure 8: Operator Error Spilling Sediment during Loading

If dredging of sediment deemed to be unsuitable for unconfined aquatic disposal is necessary, the contractor shall ensure that trucks are loaded within a constructed loading zone to confine sediment spilled during the loading process. Prior to entering the roadway, the vehicles will be power washed to prevent cross-contamination onto the roadways. The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

63732 PAGE 61

6.2 Construction Activities

Mitigation measures associated with construction activities are described below.

6.2.1 Mitigation Measure 9: Secondary Containment

Prior to the commencement of dredging, demolition, or construction activity, the contractor shall install a secondary containment structure for the storage of all fuel, oil, and other petroleum products, as required by the USMP (District, 2010), the BAE BMP Manual (BAE Systems, 2013), and current or updated BAE Systems Environmental SOPs. At all times during construction and operation of the Proposed Project, the contractor shall house all oil and fuel in a secondary containment structure to ensure that spilled or leaked oil or fuel will be prevented from entering the water column. The District will verify implementation of this measure through (1) periodic site inspections to verify that a secondary containment structure is in place and functioning, and (2) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis.

6.2.2 Mitigation Measure 10: Health and Safety Plan for Land-side Construction Activities

Although no significant ground disturbance is anticipated with the Proposed Project component evaluated for this technical report, this mitigation measure is included to ensure that appropriate precautions are taken should contaminated groundwater or soils be encountered during any trenching activities. Implementation of this project feature requires compliance with safety measures required by OSHA and will adequately address potential impacts related to contaminated groundwater or soils, should any be encountered during limited landside construction activities:

During all excavation and trenching activities for utilities, BAE Systems shall require that all construction subcontractors address site safety requirements by complying with the appropriate health and safety measures required by the OSHA-applicable specifications in regard to earth resources (Section 29 Code of Federal Regulations [CFR] Part 1926), which are focused on worker safety in excavations. In the event that suspicious odors are detected in soil, construction shall be terminated until the soil is properly characterized for hazardous waste content. Appropriate measures shall be taken in compliance with all applicable regulations for the characterization and disposal of hazardous materials.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.2.3 Mitigation Measure 11: Soil Management Plan

Prior to commencing any on-shore construction activities, a Soil Management Plan will be prepared that describes the procedures to be implemented in the event that contaminated soils are discovered during installation of utilities, seawalls, and other landside features. The plan will

63732 PAGE 62

describe contaminants that may be encountered during ground disturbance activities, sample collection and analytical techniques that will be employed to screen contaminant in the soils, segregation and handling of contaminated soils, and procedures for the proper transportation and disposal of any identifies wastes. Appropriate measures shall be taken in compliance with all applicable regulations for the characterization and disposal of hazardous materials.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.3 Dry Dock Operations

Mitigation measures associated with dry dock operations are described below.

6.3.1 Mitigation Measure 12: Update Dry Dock Operations Permits, BMP Manual, and SOPs

Operations of the new dry dock (ship loading and unloading, ship repair and maintenance activities, and long-term dry dock maintenance needs) will be similar to existing operational activities for the POSD dry dock currently in use at the BAE Systems facility. Adding the second dry dock will not create new conditions at the facility that could result in impairments to water quality. Operations for the new dry dock will be subject to the operational requirements that are the same as or similar to those of the existing dry dock.

As soon as practicable, BAE Systems will update and modify the permits and operational BMPs and SOPs that mitigate the impacts to water quality during the normal operations and maintenance of the new dry dock.

6.4 Intake/Cooling Tunnel Removal

6.4.1 Mitigation Measure 13: Environmental Controls During Intake/Discharge Tunnel Removal

According to the Intake/Discharge Tunnel Phase I ESA prepared by Ninyo & Moore, subsurface disturbance activities (e.g. soil excavation) should include the preparation and implementation of a Soil and Groundwater Management Plan. The plan would address the possibility of encountering areas of potential environmental concern as well as control measures in place to mitigate potential environmental and human health impacts (Ninyo & Moore, 2014). The plan should be prepared by a qualified environmental consultant and should be implemented during subsurface disturbance activities by the contractor under the oversight of an environmental professional on behalf of the project proponent. The plan should address soil and groundwater monitoring, handling, stockpiling, characterization, reuse, export, and disposal protocols. The objective of the plan is to assist the contractor in the excavation, notification, monitoring, segregation, characterization, handling, and reuse and/or disposal (as appropriate) of waste that may be encountered during earthwork activities.

63732 PAGE 63

The project-specific Soil and Groundwater Management Plan shall follow the guidelines and procedures prescribed by the County of San Diego Department of Environmental Health (DEH) Site Assessment and Mitigation Program. Specific components of the plan would follow the guidance outlined in the current Site Assessment and Mitigation (SAM) Manual. Prior to excavation of site soils, preparation of a Corrective Action Plan (CAP) may be required if there is evidence that surface water or groundwater has been or may be affected by the unauthorized release, or there is evidence that contaminated soils are or could come in contact with surface water or groundwater. A CAP includes the following four basic elements:

1. Assessment of impacts
2. Determination of applicable cleanup levels
3. Feasibility study and corrective action work plan
4. Plan to monitor and report the effectiveness of the corrective action

If contaminated soils are encountered during the tunnel removal process, they will need to be evaluated for off-site disposal. Contaminated soils are assumed to require disposal at a Class I landfill. The nearest Class I landfill to the project site is Clean Harbors Buttonwillow LLC facility located in Buttonwillow, California. Documentation of proper disposal of the soil (bill of lading, weigh tickets, manifests, etc.) must be submitted to DEH.

In addition, measures should be taken to prevent any potentially contaminated soil or water from entering the San Diego Bay during the tunnel removal and associated construction. To ensure that no contaminants from the tunnels or the construction area enter San Diego Bay, appropriate BMPs should be put in place. BMPs may include a silt curtain or other containment device used during tunnel removal or construction to prevent any activities from impacting bay waters outside the immediate area. Any water generated during construction should be captured prior to release into the storm sewer system.

In addition, tunnel removal activities would need to comply with various regulations, including (but not limited to):

- Requirements of the statewide National Pollutant Discharge Elimination System (NPDES) Construction General Permit.
- SWRCB Statewide General Waste Discharge Requirements (WDRs) for discharges to land with a low threat to water quality (Order No. 2003–0003-DWQ).
- Requirements set forth in the *General Waste Discharge Requirements for Discharges from Temporary Groundwater Extraction and Similar Waste Discharges to San Diego Bay, Tributaries Thereto under Tidal Influence, and Storm Drains or Other Conveyance Systems Tributary Thereto Order No. R9-2007-0034 (NPDES No. CAG919001)*.
- San Diego Municipal Storm Water Permit (Order No. R9-2013-0001, NPDES No. CAS0109266).

63732 PAGE 64

- Requirements outlined in the SUSMP to prepare an Urban Storm Water Mitigation Plan (USMP). The USMP would include BMPs to reduce pollutants of concern and BMP maintenance provisions in an Operations and Maintenance Plan. The proposed project would also be required to comply with the Storm Water Management and Discharge Control Ordinance adopted by the District which sets forth requirements for dischargers and places of discharge to protect and enhance water quality

In accordance with the Construction General Permit, the Municipal Permit, and the Storm Water Management and Discharge Control Ordinance, prior to construction appropriate BMPs would be identified and implemented pursuant to a project-specific Stormwater Pollution Prevention Plan (SWPPP). Temporary or short-term BMPs identified in the Jurisdictional Urban Runoff Management Program (JURMP) that could be included in the project SWPPP include the following:

- Concrete waste management
- Desilting basin
- Erosion control mats and spray-on applications
- Fiber roll
- Gravel bag berm
- Material delivery and storage
- Paving and grading operations
- Sandbag barrier
- Silt fence
- Solid waste management
- Spill prevention and control
- Stabilized construction entrance/exit
- Stockpile management
- Storm drain inlet protection
- Street sweeping and vacuuming
- Vehicle and equipment maintenance
- Water conservation practices

1.0 INTRODUCTION

This document is the sediment characterization report for the proposed BAE Systems San Diego Ship Repair (BAE Systems) Pier 1 North (Pier 1N) Dry Dock Sump Dredging Project (Project). AMEC Environment & Infrastructure (AMEC) was contracted by BAE Systems to prepare a Project sampling and analysis plan (SAP), collect sediment samples at the Project site, and provide a sediment characterization report based on the results of the laboratory testing of samples. AMEC prepared the SAP and presented it to the United States Army Corps of Engineers (USACE) and U.S. Environmental Protection Agency (USEPA) for review on May 9, 2014. The SAP was then revised based on USACE and USEPA comments provided on May 13, 2014 and approved May 19, 2014.

A revised draft of this report was submitted to the agencies on 6 November 2014. The agencies commented on the draft 17 November 2014. This revision includes clarification and information requested by the agencies for their suitability for unconfined aquatic disposal determination. The comments and response are included as Section 9.0 of this report.

1.1 Project Location and Description

BAE Systems is located at 2205 East Belt Street, San Diego, California (Figure 1-1). The Project is to deepen the existing wet berth north of Pier 1 to accommodate a new dry dock (Figure 1-2). The purpose of the new dry dock is to increase the dry dock capacity of BAE Systems that is needed to provide maintenance support for existing and future United States Navy (Navy) ships. This Project also supports the Port's Master Plan (October 2013), which states that "...renovation and redevelopment of existing facilities will continue as industries respond to market demands and changes in the maritime industrial climate."

BAE Systems proposes the following tenant improvements by the Project:

- Dredging approximately 395,000 cubic yards (cy) of sediment;
- Installation of one new and one retrofitted dry dock mooring dolphin;
- Installation of ramp wharf structures designed for accessing the dry dock;
- Construction of a permanent sheet pile wall on the north side of Pier 1; and
- Upgrades of onshore utilities and associated infrastructure (including shoreline bulkhead).

The Project involves dredging of bay bottom sediment associated with the installation of a new dry dock at the ship repair facility located on San Diego Bay. The proposed dredge design depth is approximately -65 feet MLLW to accommodate the dry dock. The dry dock dimensions will be 205 ft by 851 ft, plus an apron on each end (Figure 1-2). Approximately 80 percent of the dredged material is expected to be native sediment deposits, with a smaller fraction of the dredged material, approximately 20 percent, expected to be unconsolidated bay mud (Figure 1-3). Most of the dry dock dredging will be performed east of the U.S. Pierhead Line, and within Port tidelands jurisdiction. Dredging west of the U.S. Pierhead Line is within the jurisdiction of the California State Lands Commission and the California Coastal Commission. In

63732 PAGE 78

addition to Port District approvals, the Project will also require separate authorizations from two state agencies, the USACE and the San Diego Regional Water Quality Control Board (SDRWQCB).

1.2 Sediment Characterization Study

The goal of the sediment characterization study is to evaluate the suitability of the dredged material within the Project footprint for a range of disposal alternatives including disposal at the LA-5 Ocean Dredged Material Disposal Site (ODMDS) and/or beneficial reuse. The LA-5 ODMDS is 5.4 nautical miles from Point Loma, on the ridged slope of the continental shelf at approximately 100 fathoms deep (Figure 1-4). Ocean disposal of dredged materials is regulated under Section 103 of the Marine Protection, Research, and Sanctuaries Act, Title 33 Code of Federal Regulations (CFR) 320–330 and 335–338. Environmental evaluations of dredged materials proposed for ocean disposal will comply with applicable criteria published in Title 40 CFR 220–238.

The objectives of the study are to (a) analyze the results of the sediment chemistry, toxicity, and bioaccumulation tissue tests for unconsolidated bay mud within the dredge footprint, and (b) to obtain approval for unconfined aquatic disposal using abbreviated modified Tier II Green Book testing scheme for the native sediment that is found in the deeper layers of the dredge footprint.

The installation of the new dry dock will require dredging a deeper dry dock sump into the bay bottom. The sump is needed when the dry dock is submerged to allow loading or unloading of ships. The estimated volume of dredged material for this project is 381,000 cubic yards (cy) to the proposed dredge depth of -65 feet (ft) mean lower low water (MLLW). The estimated volume of a 1-foot overdredge (to -66 ft MLLW) allowance is approximately 14,000 cy which increases the total dredged volume to approximately 395,000 cy. It is estimated that approximately 20 percent of the dredged material (or less) will be unconsolidated bay mud (approximately 79,000 cy), while the vast majority (80 percent) of the dredged material (approximately 316,000 cy) will consist of undisturbed, native sediments.

1.2.1 Sediment Characterization Study Approach

The disposal location for the Project will be selected in consultation with the USACE and USEPA, based on the results of this sediment characterization. This study uses a tiered approach to sampling and analysis that streamlines the disposal determination process. To assess the suitability of the dredged material for ocean disposal, the sediments within the proposed dredge footprint were characterized in accordance with the guidelines of the USEPA and the USACE, as outlined in *Evaluation of Dredged Material Proposed for Ocean Disposal* (Green Book) (USEPA/USACE, 1991) and *USEPA Region 9 General Recommendations for Sediment Testing of Dredged Material Proposed for Ocean Disposal* (USEPA, 1991).

The Green Book outlines a tiered, effects-based testing protocol to determine the acceptability of dredged material for disposal at designated ocean disposal sites. The Green Book Tier III analysis (physical, chemical, and biological testing) was selected as the most appropriate level of evaluation for this study for unconsolidated sediment, while abbreviated modified Tier II analysis was performed to evaluate native material within the Project footprint.

Geotechnical evaluations were also performed as part of this sediment characterization study to evaluate the native sediment layer across the entire proposed Project footprint (including Area C). The geotechnical evaluation was performed by TerraCosta Consulting Group, Inc. (TerraCosta) in June 2014.

Tiered Testing Approach

The suite of bioassay tests used to determine ocean disposal acceptability are (a) suspended particulate-phase (SPP) analyses to determine water column effects; (b) solid-phase (SP) tests to determine whole sediment benthic toxicity effects; and (c) bioaccumulation-phase (BP) tests to analyze potential food web impacts.

Tests were conducted according to the regulations contained in Title 40 CFR Parts 220–228, and all applicable methods guidelines as described in the Project-specific SAP (AMEC, 2014).

Iterative Approach to Testing and Analysis

Because of the two distinct types of sediment found within the dredge footprint (unconsolidated and native), this dredged material study employed multiple characterization approaches. This iterative approach was designed to streamline the disposal decision process.

For the unconsolidated bay mud, the first step in the iterative approach was sediment chemical analyses and a SP toxicity test with amphipods. The results of this step indicated that chemical analyses and toxicity test results appeared favorable for unconfined aquatic disposal of the dredged material in the ocean or San Diego Bay. Consequently, the second step in the iterative approach, consisting of additional toxicity testing and bioaccumulation exposures, was conducted.

Phased Sampling Approach

It is important to note that portions of the Project footprint are within an area regulated by Cleanup and Abatement Order (CAO) R9-2012-0024 of the SDRWQCB (SDRWQCB, 2012c). Therefore, the sediment characterization study described in this report will be performed during two separate sampling events (Phase 1 and 2, Figure 1-5). The CAO area is discussed in Section 2.2 and details of the sampling approach are outlined in Section 3.1.

To characterize the native sediments found deeper in the dredge footprint, samples collected during a geotechnical evaluation performed by TerraCosta were analyzed for physical and chemical characteristics. TerraCosta's investigation also details geotechnical information about the native material that makes up the majority of the dredge footprint (including that which underlies Composite Area C; TerraCosta, 2014). This detailed information, in addition to chemical and physical analysis of the geotechnical samples, is used in this report to support an exclusion from additional testing for unconfined aquatic disposal for the native sediments within the proposed Project footprint.

63732 PAGE 88

1.2.2 Detailed Study Information

This report provides information on:

- Sample collection methods and locations;
- Sediment chemistry, toxicity, and bioaccumulation testing methods;
- Sediment chemistry, toxicity, and bioaccumulation testing results;
- Data analysis;
- Comparison of the results and the data analysis to available guidelines and databases for sediment and water quality;
- Quality assurance and quality control (QA/QC) evaluations of all results and deliverables for the proposed project; and
- Project-specific recommendations based on the limiting permissible concentration (LPC) criteria for disposal suitability as defined in the Green Book.

Vibracore logs, chemistry reports, and field photographs are appended to this report for reference. In addition, detailed geotechnical boring logs and data are also included as part of Appendices A and B.

2.0 SITE HISTORY

BAE Systems maintains industrial facilities (production shops, offices, and related utilities, and infrastructure) for the maintenance, repair, overhaul, and conversion of large naval and commercial vessels. BAE Systems is currently the prime contractor for five classes of Navy vessels: cruisers, destroyers, amphibious transport docks, dock landing ships, and mine countermeasures. The BAE Systems facility encompasses approximately 13 acres of land and 20 acres of water. The facility is designed to support both pier-side repair (including vessel berthing) and dry dock repair, under multi-ship, multi-option contracts.

Three working piers exist at BAE Systems to moor vessels for ship repair activities. These piers (Piers 1, 3 and 4) currently accommodate berthing of large, deep-draft Navy and (to a lesser extent) commercial vessels, and include a variety of crane and utility services.

BAE Systems currently has one floating dry dock—the "*Pride of San Diego*," which has been operating at the site since 1984. BAE Systems formerly operated a second dry dock at the site, but in 2010 it was sold and relocated to the South Bay. In 2013, the dry dock was again sold and removed from San Diego Bay. The proposed location of the new dry dock eliminates one large vessel wet berth at Pier 1N as illustrated on Figure 2-1.

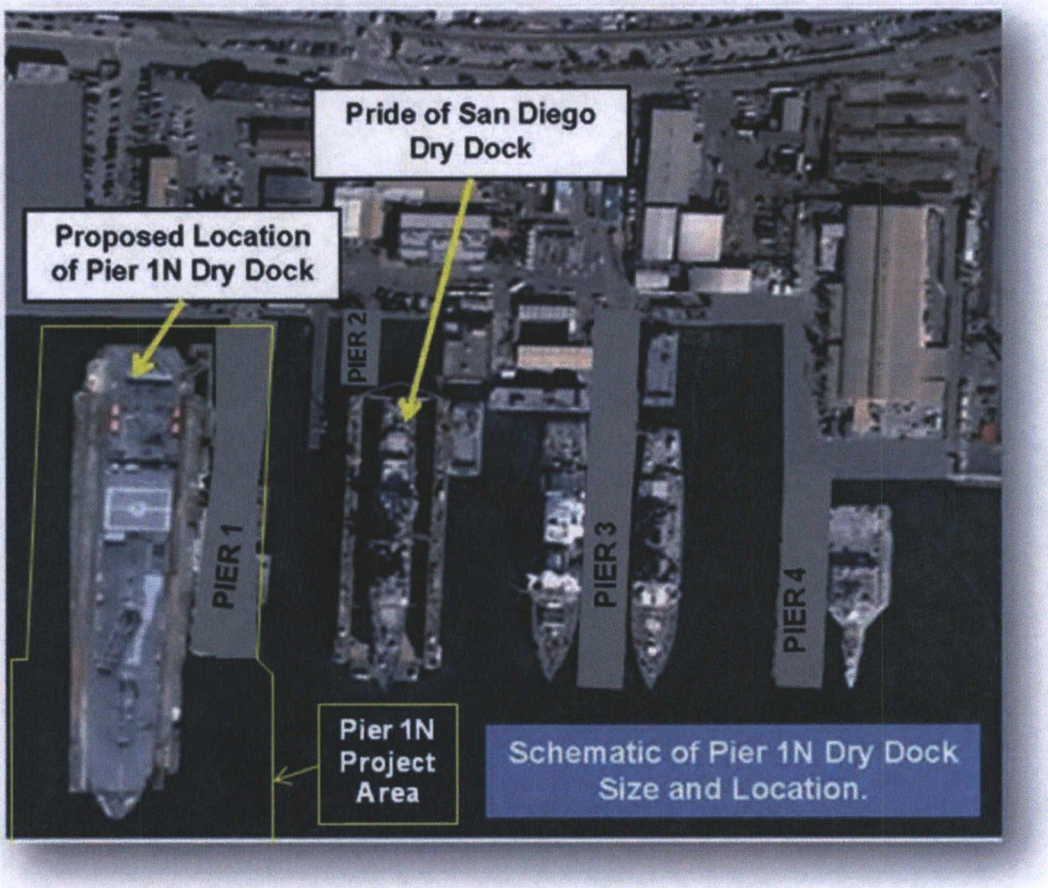
2.1 Recent Sediment Characterization Studies

BAE Systems has performed two dredged material characterization studies since 2010 (i.e., *Pride of San Diego* Dry Dock Sump dredging and Pier 4 Replacement dredging), both of which included dredging and facility upgrades. In addition, portions of the BAE Systems leasehold are included in the "Shipyard Sediment Cleanup and Abatement Area" that is subject to requirements of the CAO (SDRWQCB, 2012c). Since 2001, two sediment characterization studies have been performed at BAE Systems to support the Shipyard Sediment CAO. These studies are discussed in Section 2.2.

Figure 2-2 shows the locations of all samples collected within the BAE Systems Shipyard since 2001. Sampling types include vibracore, push core, and grab samples collected to evaluate various disposal options including ocean, upland, landfill classification and approval, and in support of the CAO. A table of sampling points and dates for all projects at BAE Systems, in addition to summaries of all analytical chemistry data collected on the north side of Pier 1 (only) are included in Appendix A of the Project-specific SAP (AMEC, 2014).

63732 PAGE 92

Figure 2-1. New Dry Dock Schematic



2.1.1 Dry Dock Sump Dredging Project

In December 2010 and January 2011, BAE Systems performed maintenance dredging of the dry dock sump area between Piers 2 and 3 (AMEC, 2011a, b). This area was dredged to −70 ft MLLW, with a 2 ft overdredge allowance (a total depth of −72 ft MLLW). The dredging removed approximately 7,000 cy of sediments that had slowly built up in the dry dock sump since its construction in 1984. Prior to dredging, the deposited sediments had prevented the dry dock from fully submerging, which impaired ship dry docking capability.

In addition to evaluating the material for disposal approval and permitting, the dry dock sediment characterization study tested the resultant post-dredge sediment quality of the new bay bottom following dredging (i.e., the Z-layer), particularly within the CAO area. The resultant surface layer post-dredging was clean, native hard-pan material. In 2011, BAE Systems was granted landfill acceptance of the dry dock sump dredging material. The material was dredged by R.E. Staite and transported to the Otay Mesa Landfill, in Chula Vista, California.

93732 PAGE 95

2.1.2 Pier 4 Replacement Project

In 2013 and 2014, BAE Systems demolished its outdated and seismically unsound Piers 4 and 5 and made plans to replace them with one new, modern Pier 4. The replacement project included deepening the approach and berthing areas at the new Pier 4. To evaluate the acceptable disposal options for the proposed dredged material, two sediment characterization studies were conducted: Phase A and B.

Phase A.
Phase A evaluated sediments within the area between the end of the new Pier 4 and the San Diego Bay Navigation Channel (the approach area). The study results are in the *Final Pier 4 Replacement Project Phase A Dredged Material Characterization Study, BAE Systems San Diego Ship Repair, San Diego Bay, San Diego California,* October 2011 (AMEC, 2011c). Most of the Phase A sediment (approximately 32,650 cy) was determined by the USACE and USEPA to be suitable for ocean disposal. A smaller portion (2,355 cy), in the northeastern area of the dredge footprint, was not acceptable for ocean disposal because there were elevated concentrations of total polychlorinated biphenyl (PCB) congeners in the sediment. It is important to note that the area of the Pier 4 Phase A footprint approved for ocean disposal is approximately the same distance off shore as portions of the proposed Project footprint (Figure 2-2). Ocean disposal dredging for the Pier 4 Replacement Project was completed in September 2014.

Phase B.
Phase B evaluated sediment in a dredge footprint on the north side of Pier 4, extending from approximately one quarter of the length of the pier southwest to the U.S. Pierhead Line. The Phase B study site covers approximately 35,300 square feet. The results are in the *Final Pier 4 Replacement Project Phase B Dredged Material Characterization Study, BAE Systems San Diego Ship Repair, San Diego Bay, San Diego California,* August 2012 (AMEC, 2012). The final dredge depth of the Phase B area is −35 ft MLLW, yielding a dredge volume of approximately 8,370 cy of sediment. For dredged material characterization, a 2-ft overdredge allowance was added to the proposed project design depth, which was an approximate overdredge volume of 2,950 cy.

The field sampling for the Phase B sediment characterization was completed in December 2011. The test results revealed that the Pier 4 Phase B dredged material did not meet the limiting permissible concentration (LPC) for unconfined aquatic disposal at the LA-5 ODMDS because of (a) total PCB congener concentrations; (b) amphipod survival; and (c) bivalve larvae toxicity. Sediments dredged as part of the Pier 4 Phase B project were approved for placement in the Otay Landfill. These sediments were dredged and transported to the landfill between April 20, 2013 and June 14, 2013.

BAE Systems' Pier 4 replacement project is currently ongoing and final completion of all construction activities is planned for February 2015.

63732 PAGE 96

2.2 Cleanup and Abatement Order

As noted previously, a portion of the sediment in the BAE Systems proposed new dry dock sump is included in SDRWQCB CAO Number R9-2012-0024. Prior to initiating dredging for the proposed dry dock Project, all sediments within the CAO area will be remediated by the Shipyard Sediment Site Group. Project dredge material outside of the remedial footprint will be characterized prior to dredging of the CAO, and the remainder will be characterized after, as discussed in Section 4.3. The CAO area dredging for the North Shipyard (BAE Systems) began in September 2014 and is scheduled to complete by March 2016. Dredging of the CAO area overlying the proposed dry dock sump characterized during this study is planned to be completed by the third quarter of 2015. Dredging for the South Shipyard (NASSCO) was completed in January, 2014. All CAO Area dredging is planned to be completed by December, 2015.

The CAO chemicals of concern (COCs) and their cleanup levels are in Table 2-1. The dredging design depths for sediment management units (SMUs) in the CAO are based on the results of several earlier sediment characterization studies, performed between 2001 and 2013. The SMUs and their design depths and are shown in Figure 2-1.

The proximity of the proposed Project to the CAO area is depicted in Figure 2-1. Details of the CAO cleanup are in (a) the revised *Remedial Action Plan for the San Diego Shipyard Site* (Anchor QEA, October 2012); (b) the *Technical Report for Cleanup and Abatement Order No. R9-2012-0024 for the Shipyard Sediment Site, San Diego Bay, March* (SDRWQCB, 2012a); and (c) the *Final Environmental Impact Report, Shipyard Sediment Site Project, San Diego Bay, California* (SDRWQCB, 2012b).

As part of the CAO remediation, several sediment evaluations were completed in the BAE Systems leasehold that included sample collection near Pier 1. These evaluations were performed by Exponent Engineering and Scientific Consulting (Exponent, 2003) in 2001–2002 and by AMEC in 2011 (AMEC, 2011a); and 2013.

2001–2002 Exponent Sediment Investigation.
Details of the sediment collection and full analytical results for 2001–2002 are in *NASSCO and Southwest Marine Detailed Sediment Investigation, Volumes I–III* (Exponent, 2003). Samples collected for the 2001–2002 study that are within the proposed Project area are SW01, SW02, SW03, SW04, SW05, SW06, SW07, SW29, and SW30. Analytical data and core logs for relevant samples are in Appendix A-1 to the Project specific SAP.

2011 Dry Dock Sump Dredging Project (Located between Piers 2 and 3).
A data report was provided to BAE Systems by AMEC (2011c) for pre- and post-dredge sampling for the 2011 dry dock sump dredging project. As part of that effort, several samples were collected within the proposed new dry dock Project footprint north of Pier 1, including four vibracore samples (C15, C16, C18, and C19) and eight grab samples (G1, G2, G3, G4, G5, G6, G29, and G30). The collection data for these samples are in Appendix A-2 of the Project-Specific SAP; additional data are available upon request.

Table 2-1.
CAO Sediment Chemicals of Concern
(SDRWQCB CAO Number R9-2012-0024 Post-Remedial Dredge Area Concentrations)

Primary Chemical of Concern	Post-Remedial Dredge Area Concentration (Background)
Copper	121 mg/kg
Mercury	0.57 mg/kg
High-Molecular-Weight Polycyclic Aromatic Hydrocarbons (HPAHs)[1]	663 µg/kg
Polychlorinated Biphenyls (PCBs)[2]	84 µg/kg
Tributyltin	22 µg/kg

Notes:
1. HPAHs = sum of six PAHs: fluoranthene, perylene, benzo(a)anthracene, chrysene, benzo(a)pyrene, and dibenzo(a,h)anthracene
2. PCBs = sum of 41 congeners: 18, 28, 37, 44, 49, 52, 66, 70, 74, 77, 81, 87, 99, 101, 105, 110, 114, 118, 119, 123, 126, 128, 138, 149, 151, 153, 156, 157, 158, 167, 168, 169, 170, 177, 180, 183, 187, 189, 194, 201, and 206

µg/kg = micrograms per kilogram; mg/kg = milligrams per kilogram

Additional 2011 post-dredge sampling results are in the technical report submitted by AMEC, *Final Technical Report Pre- and Post-Dredge Sediment Survey, BAE Systems San Diego Ship Repair, San Diego Bay, San Diego, California,* March 2011 (AMEC, 2011a). AMEC also performed post-dredge confirmation sampling in the portion of the dry dock sump that is within the CAO area, as reported in *BAE Systems San Diego Ship Repair Dry Dock Maintenance Dredging Project Post-Dredge Confirmation Report March* (AMEC, 2011b).

2013 Pre-Dredge Depth Verification Study and Landfill Approval.
In 2013, AMEC reported the analytical results of pre-dredge surveys (as part of the CAO remediation project) that were submitted to the landfill for approval. The submitted results package with data for the entire site will be provided upon request. Three samples collected in 2013 are within the proposed Project area (SD-N-P-BAE1, SD-N-P-BAE3, and SD-N-P-BAE14); analytical data and core logs for these samples are in Appendix A-3 of the Project-Specific SAP.

3.0 COLLECTION LOCATIONS AND METHODS

Sampling and analysis procedures for this study were designed to satisfy the testing requirements described in the Green Book. These procedures were outlined in the project-specific SAP approved by the USACE and EPA in May 2014 (AMEC 2014). This section summarizes the approved methods employed to determine the suitability of the proposed Project dredged material for unconfined aquatic disposal.

3.1 Sediment Collection

Sediment collection followed the guidance provided in *Methods for Collection, Storage and Manipulation of Sediments for Chemical and Toxicological Analyses: Technical Manual* (USEPA 2001), and detailed in the SAP Submitted by AMEC to BAE Systems before collecting and testing samples (AMEC 2014). The sample collection was documented using vibracore logs and photography. Vibracore logs are in Appendix A and photographs of cores are in Appendix B.

Two types of sediment collection methods were employed for this study.

1. The unconsolidated sediments above the depth of refusal (i.e., above the native sediment layer) were collected with a vibracore sampling device. The sediments collected underwent full Tier III Green Book testing.
2. The sediments below the depth of refusal were collected using a barge-mounted soil boring sampler. These deeper, native sediment samples were collected primarily for geotechnical evaluation, but also underwent modified Green Book Tier II analyses (physical and chemical analysis).

3.1.1 Phased Sampling Approach

Sediment sampling within the proposed Project sump area was designed to take place in two phases (Figure 1-5). Phases are outlined as follows.

Phase 1 – Sample Collection Prior to CAO Dredging

Phase 1 consisted of (a) collection of 8 unconsolidated sediment core samples in Composite Areas A and B (4 cores per composite area)[1] for Green Book Tier III testing and (b) geotechnical evaluations of all native sediments (for Composite Areas A, B, and C) within entire dredge footprint for modified Green Book Tier II testing. Phase 1 elements will be completed prior to CAO dredging for the following reasons:

- The vast majority of the material to be dredged in the proposed Project footprint is located within Composite Areas A and B (outside of the CAO area) and the native sediment layer in Composite Area C. For overall project scheduling, BAE Systems needs to identify acceptable disposal options for the dredged material as soon as possible (by late 2014).

[1] During Phase 1 of the sediment characterization study, an additional core sample was collected in Composite Area A for volume.

63732 PAGE 100

- Pier 1N improvements are planned to begin in late-2015. Disposal approvals for Composite Area A and B, and all native sediments are needed to begin permitting applications and support the environmental impact investigation.

Phase 2 – Sample Collection Following CAO Dredging

Due to the uncertainty associated with attempting to collect sediments between the bottom of the CAO cut depth and the proposed dry dock Project design depth, the remaining 4 core samples of the unconsolidated material will be collected in Composite Area C after CAO remediation dredging has been completed, if needed (Figure 4-1).[2] Composite Area C CAO area dredging of the unconsolidated sediment layer is estimated to begin in the third quarter of 2015.

- If a residual surface layer is left behind following CAO area dredging, 4 additional cores will be collected for Green Book Tier III analysis of the remaining unconsolidated material in Composite Area C. Once CAO area dredging is complete, a map and table showing the proposed Composite Area C sampling locations will be presented to the USACE and USEPA as an addendum to the Project SAP dated May 2014 (AMEC 2014).
- To supplement Composite Area C data, CAO area post-dredge sampling data and geotechnical information for Composite Area C will be included as part of the Composite Area C SAP addendum for agency consideration. Geotechnical data is also included in this report.

3.1.2 Sample Collection Locations

Vibracore Samples

Vibracore sample collection locations for Composite Areas A and B are listed in Table 3-1. To adequately characterize unconsolidated sediments within the two proposed dredge footprints for Phase 1 of the study, 9 vibracore samples in two separate composite areas were collected by AMEC from May 20 to May 21, 2014. Sediment sampling activities comprised sediment collection north of and bay ward of Pier 1 (Figure 3-1).

Vibracore sample collection stations were navigated to using a hand-held Trimble Juno® SB Series device aboard the survey vessel *M/V Early Bird II*. This device has a global positioning accuracy of approximately ±2–5 ft. The position of the *M/V Early Bird II* was anchored near each sampling location then adjusted on a fine scale until the desired position coordinates in Table 3-1 were reached. The vessel was secured over the collection location using the bow anchor and at least one stern line. Once the vessel was secure, AMEC scientists recorded the final sampling position and water depth (measured with a weighted fiberglass tape) in the Project field log. The water depth was corrected to MLLW using National Oceanographic and Atmospheric Administration (NOAA) tide tables and compared to the bathymetric data provided by BAE Systems to verify proper sampling locations.

[2] The TerraCosta geotechnical evaluation included in this report evaluates native material for the entire proposed Project footprint, including Composite Area C sediments.

Geotechnical Samples

Nine geotechnical borings were collected by TerraCosta between June 17 and June 27, 2014 using a Pacific Drilling Diedrich D50 drilling rig with 6-inch hollow-stem augers mounted to a R.E. Staite (RES) barge. Sampling locations were chosen for proposed Project engineering design purposes. Geotechnical boring locations were navigated to by a RES barge operator and adjusted on a fine scale according to a handheld GPS. TerraCosta scientists recorded the final sampling position and water depth (measured with a weighted fiberglass tape) in the Project geotechnical field log. The water depth was corrected to MLLW using predicted tides. Table 3-2 contains location information and penetration depths for the nine geotechnical borings.

Table 3-2.
Geotechnical Boring Locations and Depths

Boring Number	Latitude	Longitude	Maximum Penetration Depth (feet MLLW)
B-1	32°41.538	-117°08.721	-70.5

B-9	32° 41.487	-117°08.844	-61.5

Notes:
MLLW = mean lower low water.

3.1.3 Test Sediment Collection

Vibracore Samples

Vibracore logs are included as Appendix A-1. All vibracore collection locations were sampled as described in the SAP (BAE Systems, 2014). Vibracore samples were collected by TEG Oceanographic Services (TEG) staff. Trained TEG equipment technicians deployed the vibracore used to collect sediment samples. The vibracore uses a 4-inch-diameter aluminum tube connected to a stainless steel cutter. The aluminum-encased vibrating unit uses 240-volt, 3-phase, 26-ampere electricity to drive two counter-rotating concentric vibrators. For this Project, the vibracore and tube were lowered by a hydraulic winch and vibrated until penetration to the maximum allowable depth (refusal) was achieved. Vibracore penetration depth was determined using a tape measure attached to the vibracore head. After the vibracore was turned off, the sediment core was returned to the boat's deck for processing. Once onboard, vibracore samples were carefully extruded into clean, polyethylene-lined trays, photographed, and inspected for unique strata, color, odors, etc.

Geotechnical Samples

Geotechnical boring logs are included as Appendix A-2. Sampling specifics related to the geotechnical evaluation were provided to BAE Systems by TerraCosta under a separate cover (TerraCosta 2014). All geotechnical borings were penetrated to the project depth plus the overdredge allowance (-66 ft MLLW) or deeper in all three composite areas.

63732 PAGE 106

3.1.3.1 Sampling Limitations

Overall there were very few sampling limitations for this project; any limitations are described in this section.

Vibracore Collection Locations
Vibracore collection locations were proposed to avoid a U.S. Navy ship berthed for repairs at Pier 1N. In the field, extra precaution was taken by the boat captain to not enter the ships security perimeter. Final sampling locations were collected as close as possible to the proposed coordinates.

Vibracore Refusal
Vibracore sediment samples were collected to the depth of refusal, or the depth at which the vibracore could no longer penetrate. To account for this, the target penetration depth in Table 3-1 is listed as "refusal." It is common when performing vibracore operations in San Diego Bay to encounter a dense layer of consolidated native material, which the vibracore will not penetrate. This native material is often assumed to be part of the Bay Point Formation. The Bay Point Formation consists of poorly-cemented, light gray to brown cross-bedded fine and medium grain sands, sometimes with shell hash (Hertlein and Grant, 1939). When the Bay Point, or another native layer, is encountered, it typically leaves a plug of hard material in the core cutter and farther penetration is refused. The presence of the plug in the extracted core material verifies the native refusal depth. Native refusal typically represents the extent of recently deposited, mostly unconsolidated, bay muds and indicates that further attempts of collection to the design and OD depth are unnecessary.

During this sediment characterization study, all sediment samples were penetrated to the depth of refusal which was estimated at approximately 10 feet below the mudline based on prior studies performed in the vicinity of the proposed Project. Refusal depends upon the substrate encountered; usually harder, more compact, and dense material (such as clay or consolidated sand) causes refusal. The actual penetration depth in Table 3-1 is the actual penetration of the vibracore into the sediment for each attempt. Maximum penetration achieved during the proposed Project vibracore sampling event was 10.5 feet (Table 3-1).

To characterize material below the depth of refusal in all three Composite Areas, this study also analyzed supplemental samples collected during the geotechnical evaluation. These samples were collected within the dredge footprint as part of the engineering design for the Project. All geotechnical samples analyzed for this sediment characterization report were collected below the depth of vibracore refusal (Tables 3-1 and 3-2).

Vibracore Compaction and Recovery Length
Table 3-1 also contains an overview of positioning, sample collection times, mudline elevations, project depths, target penetration depths, actual penetration depths, analysis lengths, total volume collected, and general notes for each core sample.

Recovered core length refers to the length of the core extracted from the vibracore tube and subjected to chemical and bioassay analysis. This length represents the full vertical penetration length of the vibracore, but seldom exactly matches the target penetration depth. This is due to

63732 PAGE 107

several factors: (a) compaction in the core barrel because of unconsolidated material collected at the sediment surface, which is pressed down at its surface by the weight of the overlying water and pressed up by the sediment entering the barrel; (b) a hard plug in the core barrel, which acts as a hammer into the substrate and prevents sediment from entering the core barrel until a harder material is encountered; (c) friction between the sediments and the sides of the core barrel, which also cause smearing and compaction, primarily around the outside diameter of the core; and (d) settling of material due to the vibration of the vibracore during penetration.

As observed in other studies that used a vibracore for sediment collection, compaction within the core barrel is a common occurrence, and can be calculated based on a ratio between the recovered core length and actual penetration length.

Additional Core Sample Collected for Volume
Due to core compaction and poor recovery in Composite Area A, an additional vibracore sample was penetrated within the proposed Project footprint to obtain additional volume for bioassay and bioaccumulation analysis. This sample, BAE-A-C4A, was collected in the middle of the proposed Composite A area, to the west of sample BAE-A-C4.

3.1.3.2 Reference Sediment Collection

Reference sediment was collected by Seaventures, Inc. using a pipe dredge on May 19, 2014 at a designated reference sediment collection site (latitude 33° 46.00' North, longitude 117° 22.75' West) near the LA-5 ODMDS. This site has been used for numerous dredged material studies and has a sediment quality that is acceptable to the USACE and USEPA (Figure 1-4).

3.1.3.3 Control Sediment Collection

Negative control sediments were used for both the SP toxicity tests and the BP test. The negative control sediments ("home" sediments) were collected at the same location and time as the test organisms by the test organism supplier and sent to the toxicity testing laboratory, along with each batch of test organisms.

3.1.4 Sample Collection Documentation, Handling, and Delivery

Sample documentation followed procedures included in the Project SAP. Vibracore field logs are provided in Appendix A-1.

The integrity of each sample from the time of collection to the point of data reporting was maintained throughout the study by recording accurate core logs, filling out chain-of-custody forms at the time of sample collection, and photographically documenting each core and collection attempt. All samples were maintained at the appropriate temperature throughout transport.

Vibracore Samples
Individual composite samples and subcomposite samples were delivered to the analytical laboratory in labeled 16-ounce and 8-ounce glass jars and plastic bags. The samples were transferred from AMEC to Eurofins Calscience Environmental Laboratories (Eurofins

63732 PAGE 108

Calscience) in coolers on wet ice via courier. All sediment samples were held in a cold room maintained at 4 degrees Celsius (4°C) until analytical, toxicity, and bioaccumulation tests were initiated. Nautilus Environmental LLC. (Nautilus) is currently holding the remainder of the sediment in a 4°C room for up to one year in case further testing is required.

Geotechnical Samples

Geotechnical samples were delivered to AMEC by TerraCosta scientists at the end of each field day. The majority of the samples were delivered in jars or Shelby tubes on ice. Sample documentation included a daily field log recorded by TerraCosta and transferred to AMEC with each daily sample delivery.

Tissue Samples

Tissue samples were immediately frozen upon removal from the test organism. Archives of tissue samples are still frozen at Eurofins Calscience for the same purpose. Tissue samples from animals exposed to bioaccumulation test chambers were also sent on wet ice via courier from Nautilus to Eurofins Calscience for analytical testing after the 28-day exposure period.

3.1.5 Test Sediment Compositing

Vibracore Samples

On the survey vessel, each of the 9 sediment samples was logged and photographed separately. Once an individual core was extracted from the vibracore sampler and logged, the bottom 0.5 foot layer, representing the transition layer between the unconsolidated bay muds and the "native" material below the depth of refusal, was removed and archived separately from the remainder of the core. These samples (appended with a "Z" i.e. BAE-A-C1-Z) were archived until the end of the sample collection event so that they could be homogenized with other transition layer samples, as appropriate, for analysis.

At the end of the sampling event, the transition layer samples were composited based on similarity in grain size and other physical characteristics (i.e. the presence of shell hash). The four subcomposites were created as follows:

1. Subcomposite A1 = BAE-A-C2-Z and BAE-A-C4-Z,
2. Subcomposite A2 = BAE-A-C1-Z and BAE-A-C3-Z,
3. Subcomposite B1 = BAE-B-C2-Z and BAE-B-C4-Z,
4. Subcomposite B2 = BAE-B-C1-Z and BAE-B-C3-Z.

In addition, each of the sediment samples collected the 9 individual collection locations were homogenized separately in clean, non-contaminating stainless steel mixing vessels, and subsampled to create archives for potential future analysis. Individual core archives are being held at AMEC for up to 1 year (until May 22, 2015).

The remainder of sediment from each core was sealed into teflon bags and placed in coolers on wet ice to maintain the sample temperature at 4°C. Once all of the proposed samples were collected, the sediment was composited by qualified AMEC scientists aboard the *M/V Early Bird II*.

63732 PAGE 109

Two area composites were prepared, as follows:

1. Composite A = core samples BAE-A-C1, BAE-A-C2, BAE-A-C3, BAE-A-C4, and BAE-A-C4A,
2. Composite B = core samples BAE-B-C1, BAE-B-C2, BAE-B-C2, and BAE-B-C4

The two vibracore area composite samples were made by combining sediment collected at each of the individual core collection locations according to composite area and thoroughly homogenizing them using a cement mixer with a specialized stainless steel propeller attachment. The resulting composite sample was then subsampled for physical and chemical analyses as well as archiving, and the remainder was sent to Nautilus for bioassay testing.

Geotechnical Samples

At the end of the geotechnical evaluation, TerraCosta and AMEC scientists collaborated to determine which samples could be frozen to preserve the samples for potential chemical testing. Based on this discussion, AMEC froze a subset of the samples. If a sample had not been kept on ice immediately following collection, it was not considered for further analytical testing; however, all geotechnical samples provided by TerraCosta were subsampled for potential grain size analysis prior to freezing.

Once the geotechnical team provided draft boring logs (included as Appendix A-2), AMEC sorted the samples according to sediment type and approximate age (as determined by a TerraCosta registered geologist). After consideration of the geotechnical boring logs, three sample composites were proposed to and accepted by BAE Systems for additional chemical analysis as follows:

1. BAE-GT-Comp A – Recent Bay/Holocene Deposits to Young Quaternary Deposits
2. BAE-GT-Comp B – Young Quaternary Deposits to Older Quaternary Deposits
3. BAE-GT-Comp C – Older Quaternary Deposits to -65 ft MLLW.

Each geotechnical composite was created by Eurofins Calscience using boring samples that represented the vertical and horizontal limits for each native strata within the proposed Project dredge footprint. In addition, 17 geotechnical samples and all 9 individual vibracore samples were submitted for grain size analysis (Table 3-3). Grain size analysis will be used to determine beneficial reuse potential of the sediments within the proposed Project dredge footprint.

Table 3-3 is a list of samples collected for the geotechnical study that were submitted to Eurofins Calscience for chemical and physical testing.

3.1.6 Sample Analysis

AMEC coordinated the sediment analysis portion of this study using the tiered approach outlined in the Green Book. First, sediment chemistry and grain-size analysis on the two composite samples, four subcomposite samples, and the LA-5 reference sediment was evaluated. Second, bioassay testing and bioaccumulation exposures for all sediments in the

63732 PAGE 110

proposed Project footprint was performed by Nautilus. Finally, tissue bioaccumulation chemical analysis was performed by Eurofins Calscience and evaluated by qualified AMEC scientists.

Notes:
1. Additional samples were submitted for grain size and other geotechnical analysis by TerraCosta. These included samples B-1-3, B-1-7, B-1-11, B-2-1, B-2-3, B-2-9, B-3-5, B-3-7, B-3-9, B-4-1, B-4-4, B-4-9, B-4-11, B-8-4, B-8-6, B-8-11, and B-9-5.
2. Approximate sample collection depth represents the bottom of a 1.5 foot long sample collected approximately every 5 feet using either a 2-inch outside diameter "Standard Penetration Test" (SPT) sampler and a 3-inch outside diameter "California Sampler" (C).
MLLW = mean lower low water

63732 PAGE 111

3.1.7 Physical and Chemical Analyses

Eurofins Calscience, a California-accredited laboratory, conducted all physical and analytical chemical analyses on sediment and tissue samples. Samples were analyzed according to USEPA- and USACE-approved methods for the constituents listed in Table 3-4. Routine laboratory quality assurance/quality control (QA/QC) procedures included duplicate sample analyses, reagent blanks, and spiked samples according to EPA methods.

Grain-size analysis was also performed by Eurofins Calscience on each of the 8 proposed individual core samples, the two composite samples, the four subcomposite samples, and 17 individual geotechnical samples. Eurofins Calscience used an approved laser technique (American Society for Testing and Materials [ASTM] D4464) for grain-size analysis. The percentages of gravel, sand, silt, and clay were reported to 0.1 percent, along with the corresponding millimeter and phi sizes, and plotted on a cumulative grain-size distribution diagram.

All analytical laboratory reports for sediment analysis are in Appendix C; analytical laboratory reports for tissue are in Appendix E.

3.1.7.1 Toxicity and Bioaccumulation Exposure Tests

Environ conducted all toxicity and bioaccumulation testing following the USEPA- and USACE-approved methods outlined in the Green Book and the *Inland Testing Manual* (ITM) (USEPA/USACE, 1991, 1998). Per the Green Book and the ITM, the maximum holding time before beginning sediment toxicity and bioaccumulation testing is six to eight weeks. All sample testing was begun within the approved holding time.

The toxicity and bioaccumulation analyses and the testing periods were as follows:

- SPP toxicity testing:
  - Bivalve embryos, *Mytilus galloprovincialis* (June 12 through 14, 2014),
  - Fish larvae *Menidia beryllina* (June 10 through 14, 2014), and
  - Mysid shrimp *Americamysis bahia* (June 10 through 14, 2014);
- SP toxicity testing:
  - Marine amphipod *Ampelisca abdita* (June 3 through 13, 2014) and
  - Marine polychaete worm *Neanthes arenaceodentata* (May 30 through June 9); and
- 28-day BP testing (June 11 through July 8, 2014):
  - Bent-nose clam (*Macoma nasuta),* and
  - Marine polychaete worm (*Neanthes (*formerly *Nereis) virens).*

SP and BP tests were conducted on the two composite area samples, reference site sediment, and control site sediment. SPP tests were carried out on elutriates from the 2 composite areas and a filtered laboratory control water for comparison. Toxicity and bioaccumulation exposure tests were conducted in accordance with the proposed Project SAP. Further information on toxicity and bioaccumulation testing methods is in the Nautilus report, in Appendix D.

4.0 ANALYTICAL RESULTS

The sediment results of this study evaluate the potential for chemical contaminants in the sediment to cause adverse effects during dredging or disposal. Physical characteristics of the sediment are summarized in Tables 4-1 and 4-2. Sediment chemistry results reported in dry weight are summarized in Tables 4-3 and 4-4. Analytical laboratory results for physical and chemical analysis of sediments are included in the Eurofins Calscience reports in Appendix C.

4.1 Physical Analysis

Grain-size analysis was performed on individual vibracore samples, the vibracore composite area samples, all four subcomposite/transition layer samples, representative geotechnical boring samples, and three composite samples created of the native subsurface sediments (see Table 3-3 for a list of analyzed geotechnical samples). Mean grain sizes and grain size distribution percentages for each sample analyzed are detailed in Tables 4-1 and 4-2.

Vibracore Samples

Grain-size results for the two vibracore composite samples indicate that Composite A is dominantly sand (81.3 percent) while Composite B contains zero percent sand and is classified as silt (77.2 percent silt, 22.8 percent clay, Table 4-1). Conversely, the two subcomposite samples for Composite B both classify as coarse sand (mean grain size 0.559 millimeters [mm] and 0.652 mm for Subcomposite-B1 and B2, respectively), which may be partially due to the presence of shell hash and gravel in the transition layer between the unconsolidated (recent bay deposits) and native sediments within the Project footprint (Figure 4-1). Subcomposite samples for Composite Area A were both medium sand. All four of the subcomposite samples contain proportions of sand 83.2 percent or greater.

Seven of the nine individual core samples classify as very fine and fine sand commensurate on mean grain size, the remaining two samples (BAE-P1-A-C4A and BAE-P1-B-C4) classify as silt. Generally, sand percentages are less in the individual core samples than the transition layer samples, ranging between 0.00 and 80.4 percent (average 23.7 percent sand). The average sand content in the individual core samples is 23.7 percent (33.3 percent for Composite Area A, and 11.8 percent in Composite Area B). Core sample BAE-P1-A-C3 is the only sample containing greater than 80 percent sand.

Mean grain sizes from composite area samples are coarser than the LA-5 reference sediment (mean = 0.047 mm) for Composite Area A (mean = 0.217 mm), but finer for Composite Area B (mean = 0.014 mm). In addition, the mean grain size of all individual core samples (except BAE-P1-B-C4) are coarser than the LA-5 reference sediment (range 0.018 to 0.210 mm). Control sediment for *E. estuarius* and *M. nasuta/N. virens* home sediments are also coarser compared to the LA-5 reference sediment. The mean grain size of Composite A is similar to the control sediments, while the mean grain size for Composite B is much finer.

Geotechnical Samples

Approximately half of the geotechnical samples contain relatively low proportions of sand (less than 50 percent). Only one of the samples chosen for analysis, sample B-5-3, contains more

63732 PAGE 111

than 80 percent sand (Table 4-2). The average percent of sand in the geotechnical samples is 18.0 percent and the average percent of fines (silt and clay) is 79.3 percent. Mean grain sizes range between 0.006 and 0.900 mm. The samples with a mean grain size of 0.900 mm (B-7-8) and 0.531 mm (B-7-11; 15 feet deeper than B-7-8), contain high proportions of gravel (29.8 and 17.1 percent, respectively). All other samples analyzed for grain size from the geotechnical evaluation except B-5-3 contain little to no gravel, very coarse, coarse, or medium grained sand.

4.2 Bulk Sediment Chemistry Analysis

Samples were analyzed for the full suite of chemical analytes listed in Table 3-4. Once the sediment compositing proposed in the Project-specific SAP was completed (as described in Section 3.1.5), representative subsamples were sent to Eurofins Calscience for chemical analysis. Analytical chemistry results are summarized in Table 4-3 for vibracore sample composites and subcomposites, and Table 4-4 for geotechnical sample composites. Full sediment chemistry reports for all analysis are in Appendix C. In addition, Figures 4-2a, 4-2b, and 4-2c contain cross sections with analytical result summaries for both vibracore and geotechnical boring composite samples.

4.2.1 Sediment Quality Guidelines

The sediment chemical analysis results presented in Table 4-3 and 4-4 are compared to the effects range-low (ERL) and effects range-median (ERM) sediment quality guidelines as a relative measure of sediment quality (Buchman, 2008). These benchmark values for sediment quality were developed at NOAA, using a variety of guideline values to screen sediment results for evaluating potential effects on sediment-associated biota. The ERL and ERM guideline values were derived by matching chemical and biological data.

The ERL values represent the lower-tenth-percentile concentration, and ERM values represent the median concentration, at which statistically significant biological effects were reported. These values were calculated using a large database of study results, including laboratory- and field-generated data for many endpoints for species and biological effects. In summary, the ERL values are concentrations below which biological effects are rarely expected to occur and ERM values are concentrations above which biological effects are likely expected to occur (Buchman, 2008). Because of the wide range of site-specific factors that may influence the toxicity and bioavailability of any given compound in the sediment, these guidelines are not intended as strict criteria for regulatory application, but rather as a general screening gauge.

4.2.2 Vibracore Samples

Bulk sediment chemistry for the Project was evaluated for sediments that represent the most recent bay deposits. Vibracore penetration was between 4.0 and 10.5 feet below the bay floor surface (from approximately -29.1 to -41.81 feet MLLW) at various locations within the Project footprint) before refusal was met (Table 3-1, Figure 4-2a and 4-2b). Sample composites were created as per the SAP. Subcomposites (described in Section 3.1.5) of the transition layer between the recent bay deposits and the native sediments were created based on similarities in physical sample characteristics (e.g. grain size, shell hash, color).

DRAFT

93132 PAGE 137

Table 4-3 and Figure 4-2a and 4-2b are summaries of the analytical results for vibracore composite and subcomposite samples. Total solids range between 65.2 and 83.8 percent in test sediments and are greater than total solids in the LA-5 Reference sediment (60.3 percent). Composite B is the only sample that contains a percent of total organic carbon (TOC) which is comparable to the LA-5 Reference sediments (1.0 to 1.3 percent). The remaining samples contain much less TOC (ranging from <0.066 to 0.38 percent). Ammonia was also detected in Composite B sediments at an elevated level compared to other test sediments and the LA-5 Reference sample. The concentration of ammonia is 14.0 milligrams per kilogram (mg/kg) in the Composite B sediments. This is approximately four times that of the LA-5 Reference sediment. Conversely, total sulfides are much less in test sediments compared to the LA-5 Reference.

The majority of the constituents analyzed in Project vibracore sediment samples are below effects levels. In Composite B, exceptions include two metals - arsenic (14.5 mg/kg) and mercury (0.424 mg/kg); two PAHs - acenaphthylene (54 micrograms per kilogram [µg/kg]) and benzo (a) pyrene (510 µg/kg); and total PCB congeners (39.2 µg/kg) above ERL guidelines. In Composite A, the only exception is total PCB congeners (25.4 µg/kg) detected at a level just above the ERL guideline value (22.7 µg/kg). No other chemical analytes are above ERL guidelines. None of the subcomposites contain chemical analytes above ERL guidelines.

4.2.3 Geotechnical Samples

The geotechnical sample composites contain no analytes above effects levels (Table 4-4, Figure 4-2a, 4-2b, and 4-2c). The majority of the analytes are non-detect with the exception of ammonia, oil and grease, metals (arsenic, cadmium, chromium, copper, lead, and nickel), total petroleum hydrocarbons (TPH), total recoverable petroleum hydrocarbons (TRPH), and several PAHs in BAE-GT-Comp A (in the recent bay/Holocene deposits only). Additionally, the percent of total solids increases with depth into the native material. Total solids are 78.8, 82.3, and 87.2 percent for Comp A, B, and C, respectively. TOC was non-detect and ammonia concentrations are 0.71, 1.4, and 0.32 mg/kg for Comp A, B, and C, respectively. TOC concentrations are non-detect for all three composite samples. In general, sample results indicate there are more analytes detected in younger more recently deposited sediments compared to older.

5.0 TOXICITY EVALUATION RESULTS

SPP toxicity testing was conducted on an aqueous elutriate prepared from each composite area sediment sample. SP toxicity and BP exposure tests were also conducted on the composite area samples in addition to the LA-5 reference sample. Tissues of the organisms exposed to the samples were analyzed for contaminants of concern in all samples. Toxicity testing methods followed USACE- and USEPA-approved methods as outlined in the Project SAP.

All toxicity and bioaccumulation exposures were conducted at Nautilus. Control sediment used for the SP toxicity and BP tests consisted of native sediment collected at the same sites where organisms were collected for amphipods and clams. Clean seawater (zero percent elutriate) was used as the control in the SPP tests. The test species used, and endpoints assessed were:

- Suspended-particulate phase (SPP) tests:
  - Mysid shrimp (*Americamysis bahia*) 96-hr survival
  - Inland silverside fish (*Menidia beryllina*) 96-hr survival
  - Mussel larvae (*Mytilus galloprovincialis*) 48-hr survival and development
- Solid-phase (SP) tests:
  - Amphipod (*Eohaustorius estuarius*) 10-day survival
  - Marine polychaete worm (*Neanthes arenaceodentata*) 10-day survival
- Bioaccumulation phase (BP) test:
  - Polychaete (*Neanthes* [formerly *Nereis*] *virens)* 28-day bioaccumulation potential test
  - Bivalve (*Macoma nasuta)* 28-day bioaccumulation potential test

The SP organisms used for this study met the Green Book requirement that at least two of the benthic species tested be from filter-feeding, deposit-feeding, or burrowing species. *E. estuarius* is a burrowing filter feeder; *N. arenaceodentata* is a burrowing deposit feeder.

Results of the SPP, SP, and BP survival tests are provided in Tables 5-1, 5-2, and 5-3, respectively. A complete results report prepared by Nautilus is in Appendix D.

5.1 Suspended-Particulate-Phase Test

Results of the SPP tests for the Project are summarized in Table 5-1. SPP tests were initiated on June 10, 2014 for mysid shrimp and inland silversides, and June 12, 2014 for mussel embryos.[3] A statistically significant effect relative to a laboratory control was observed in the undiluted (100 percent) elutriate for mussel larvae exposed to sediment from Composite B. Mean combined survival/normal development for this sample is 0.0 percent and the median effects concentration (EC_{50}) is 73.3 percent. The effects observed in the development of mussel embryos may have been related to elevated ammonia levels (see Appendix D Section 4.5.1).

[3] Mussel testing was scheduled for 6/10/14, but adult mussel did not spawn and embryos were not available for test initiation. A separate elutriate was prepared for mussel testing two days after the other SPP tests.

63732 PAGE 140

The EC_{50} for all other tests is >100 percent and mean combined survival/normal development for organisms exposed to test sediments are not statistically different compared to organisms exposed to the control sample.

Table 5-1.
Summary of Toxicity Test Results—Suspended-Particulate Phase

Location	Elutriate Concentration (%)	Mysid Mean Survival (%)	Inland Silverside Mean Survival (%)	Mussel Mean Combined Survival/ Normal Development (%)
Laboratory Control	—	100	94	88
Composite A	1	—	—	93
	10	100	100	90
	50	96	96	79
	100	100	98	80
EC_{50} (% elutriate)[1]	—	>100	>100	>100
Composite B	1	—	—	84
	10	98	96	78
	50	100	86	87
	100	96	98	0.0*
EC_{50} (% elutriate)[1]	—	>100	>100	73.3[2]

Notes:
1. An EC_{50} of >100 percent indicates that there was greater than 50 percent survival/normal larvae in the 100 percent elutriate concentration.
2. According to the toxicity testing laboratory, the effects observed in the development of mussel embryos may have been related to elevated ammonia levels (see Appendix D Section 4.5.1).

* indicates a statistically significant decrease compared to the laboratory control.
% = percent; EC_{50} = median-effect concentration or the concentration estimated to cause an adverse effect to 50 percent of the organisms (calculated based on dose response); - = not tested.

5.2 Solid-Phase Test

Results of the SP tests for organisms exposed to sediments collected for the proposed Project are summarized in Table 5-2. Mean organism survival for organisms exposed to control samples for the SP tests met the acceptability criterion of ≥90 percent.

5.2.1 Amphipod Survival

The 10-day SP benthic test with *E. estuarius* was initiated on June 3, 2014. The test is validated by 97 percent survival in the native control sample.

Mean percent survival of *E. estuarius* in the reference sample is 92 percent compared to 94 and 81 percent in Composite A and B, respectively. Mean survival of amphipods exposed to Composite B is significantly less compared to organisms exposed to LA-5 reference sediment; however, the mean percent survival in all treatments (including Composite B) are within 20 percent of the reference. This indicates that the test treatments met the LPC for benthic toxicity, as defined in the Green Book (USEPA/USACE, 1991).

63732 PAGE 141

5.2.2 Polychaete Survival

The 10-day SP benthic test with *N. arenaceodentata* was initiated on May 30, 2014. Polychaete survival in control sediment is 100 percent. Survival for organisms exposed to the LA-5 reference sediment is 96 percent. Mean survival of polychaetes in the test sediments is 100 percent for Composite A and 96 percent for Composite B.

Mortality in the test sediments did not exceed that in the respective LA-5 reference sample by more than 10 percent; therefore, all samples meet the LPC for benthic toxicity, as defined in the Green Book. (USEPA/USACE, 1991)

Table 5-2.
Summary of Toxicity Test Results—Solid Phase

Location	*Neanthes arenaceodentata* Mean Survival (%)	*Eohaustorius estuarius* Mean Survival (%)
Laboratory Control[1]	100	97
LA-5 Reference	96	92
Composite A	100	94
Composite B[1]	96	81*

Notes:
1. Laboratory controls were native sediments collected at the same time as organism collection for *E. estuarius* and clean, rinsed beach sand collected near Scripps Pier for *N. arenaceodentata*. Both samples were sieved to 0.5 millimeters prior to test initiation.
* = value is statistically significant compared to the reference sediment (one-tailed Student's t-test, $p \leq 0.05$) but within 20 percent of the reference survival level.
% = percent

5.3 Bioaccumulation-Phase Test and Results

The 28-day bioaccumulation test was initiated on June 11, 2014; survival summaries are in Table 5-3. After 28-days of exposure to control and reference sediments, mean survival is 89 and 98 percent in control sediment, and 91 and 94 percent in LA-5 reference sediment for *M. nasuta* and *N. virens*, respectively. In addition, survival in test sediments was 88 and 81 percent for *M. nasuta*, and 92 and 84 percent for *N. virens* for Composite A and B, respectively. Polychaete survival is significantly less in Composite B compared to LA-5 reference ($p = 0.011$). Bioaccumulation potential for analytes is evaluated in Sections 5.3.1 and 7.4 of this report.

Table 5-3.
Summary of Bioaccumulation Phase Survival Results

Location	*Neanthes virens* Mean Survival (%)	*Macoma nasuta* Mean Survival (%)
Laboratory Control	98	89
LA-5 reference	94	91
Composite A	92	88
Composite B	84	81

Notes:
% = percent

63732 PAGE 142

5.3.1 Bioaccumulation-Phase Tissue Chemistry

All tissue results presented below are in wet-weight units. When results were reported as non-detect, or less than the reporting limit (RL) defined in the project specific SAP, the RL value was used for statistical comparison. One-tailed t-tests recommended by the Green Book and ITM (USACE/USEPA 1991, 1998) were used to statistically compare concentrations of contaminants in the tissue of organisms exposed to the test sediment to those of the reference tissues. [4]

Analytical reports from Eurofins Calscience for tissue chemistry are provided as Appendix E.

5.3.2 Metal Bioaccumulation in Clam and Worm Tissues

Results of the metal bioaccumulation analyses in clams and polychaete worm tissues are summarized in Table 5-4. The table shows the means and standard deviations of up to five replicates analyzed for each test treatment (i.e., LA-5 reference, Composite A, and Composite B).

5.3.3 Organic and Pesticide Bioaccumulation in Clam and Worm Tissues

Table 5-5 summarizes the concentrations of total DDTs, benzo(a)pyrene, total PAHs, and total PCB congeners in clam and worm tissues exposed to test and reference sediments for 28 days. Note that the concentrations of several individual PAHs and PCB congeners that were statistically greater in tissues exposed to test sediment, compared to tissues exposed to LA-5 reference sediment, are not listed in Table 5-5; results of these comparisons are in the summary tables in Appendix E.

DRAFT

[4] Results for PCB congener concentrations in tissue samples were re-evaluated by the analytical laboratory due to instrument contamination. Due to low sample mass available after initial testing; the analytical lab omitted results for three replicates from one replicate exposed to Composite A sediments and 2 replicates exposed to Composite B sediments.

6.0 DATA QUALITY ASSURANCE AND QUALITY CONTROL

A thorough QA/QC review was conducted by the analytical and toxicity laboratories as well as by internally qualified AMEC QA/QC specialists. All reported measures for physical, chemical, and biological testing were found acceptable for reporting purposes and are considered valid. Any deviations from specific QA/QC measures were considered minor, and are summarized below for sediment and tissue analytical chemistry samples. Further details are in the analytical chemistry and toxicity reports in Appendices C, D, and E.

6.1 Bulk Sediment Chemistry Data Quality

Bulk sediment chemistry was evaluated for vibracore sample composites and sub-composites approximately two months prior to the geotechnical samples. Vibracore sample composites were created by AMEC scientists in the field. Individual geotechnical samples were placed on ice and composited by the analytical laboratory for analysis.

6.1.1 Vibracore Samples

Vibracore samples were received under chain-of-custody on 5/22/2014 and were assigned work order 14-05-1754. Unless otherwise noted on the sample receiving form, all samples were received in good condition and within the recommended EPA temperature criteria for methods noted on the chain-of-custody. The chain-of-custody and sample receiving documents are integral elements of the analytical report and are presented at the back of the report in Appendix C.

Holding Times
All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Eurofins Calscience sample acceptance policy.

Calibration
Frequency and control criteria for initial and continuing calibration verifications were met.

Reporting Limits
All method detection limits (MDL) were met.

Blanks
Concentrations of target analytes in the method blank were found to be below reporting limits for all testing.

Laboratory Control Samples
A laboratory control sample (LCS) analysis was performed at the required frequencies and were within the established control limits.

Matrix Spikes
Matrix spike (MS) analyses were performed for each applicable analysis on project sample LA-5 reference. All parameters for the project sample MS were within the established control limits with the following exceptions.

63732 PAGE 146

- The TOC MS duplicate (D) recovery was just below the control limits. However, the MS, LCS and LCSD recoveries were in control so the results are released as-is.
- The TPH-Diesel (for Carbon Chain) MSD and relative percent difference (RPD) fell outside the control limits. The results have been flagged with the appropriate qualifiers and are released with no further action.
- The deltamethrin/tralomethrin MS and MSD recoveries were above the established control limits. However, the samples were ND for pyrethroids and the LCS recoveries were in control, so the results are released with no further action.
- Several of the EPA 8081A MS, MSD and/or were outside the established control limits. The results have been flagged with the appropriate qualifiers and are released with no further action since the associated LCS/LSCD recoveries were in control.

Surrogates
Surrogate recoveries for all applicable tests and samples were within the established control limits.

Laboratory Duplicate
A laboratory duplicate was created for Composite A and analyzed for all analyses except ammonia, total sulfide, and dissolved sulfide. The RPDs between the duplicates were acceptable.

6.1.2 Geotechnical Samples

Samples were received under chain-of-custody on 07/23/14. They were assigned to work order 14-07-1633 and 14-07-34. Unless otherwise noted on the sample receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the chain-of-custody. The chain-of-custody and sample receiving documents are integral elements of the analytical report and are presented at the back of the analytical report in Appendix C.

Holding Times
All samples were analyzed within prescribed HT or in accordance with the Eurofins Calscience sample acceptance policy except metals. However, the samples were frozen after collection (prior to holding time expiration) at -18°C, and remained frozen until received at the lab. Eurofins Calscience follows Surface Water Ambient Monitoring Program (SWAMP) criteria and the Puget Sound Protocol (USEPA/PSWQAT, 1997, Table 2) for holding times in sediment samples, which states holding times may be extended up to six months to one year (two years for metals) if stored frozen at -18°C after collection. Therefore, the sample results have not been flagged as exceeding the EPA Method recommended holding times.

Calibration
Frequency and control criteria for initial and continuing calibration verifications were met.

63732 PAGE 147

Reporting Limits
All Method Detection Limits were met.

Blanks
Concentrations of target analytes in the method blank were found to be below reporting limits for all testing.

Laboratory Control Samples
A LCS analysis was performed at the required frequencies, and unless otherwise noted, all parameters were within the established control limits.

Matrix Spikes
Matrix spike analyses were performed for each applicable analysis on Project samples. All parameters for the project sample matrix spikes were within the established control limits with the following exceptions.

- The TRPH and TPH-diesel (for carbon chain) MS and MSD recoveries were below the control limits. The results have been flagged with the appropriate qualifiers and are released with no further action.
- The mercury, arsenic, copper and zinc MS and/or MSD recoveries were outside the established control limits. However, LCS recoveries were in control, so the results are released with no further action.
- The tetrabutyltin and tributyltin RPD, MS and/or MSD results were outside the established control limits. The results have been flagged with the appropriate qualifiers and are released with no further action since the associated LCS/LSCD recoveries and RPDs were in control.

Surrogates
Surrogate recoveries for all applicable tests and samples were within the established control limits.

6.2 Toxicity Evaluation Data Quality

All of the data presented have been thoroughly reviewed and are deemed acceptable for reporting in accordance with our internal QA/QC program and relevant protocols. All toxicity and bioaccumulation tests were initiated within sediment holding time requirements. Any deviations with respect to test conditions and acceptability criteria are summarized below. All deviations were determined to be minor with no bearing on the data or its final interpretation.

Reference Toxicant Tests
Reference toxicant charts for Nautilus are provided in Appendix C of the toxicity report (Appendix D). All laboratory controls for reference toxicant tests met test acceptability criteria. All median lethal and effects concentrations were within 2 standard deviations of internal control chart limits for all species tested except *N. arenaceodentata* and the mysid shrimp. Comparisons to reference toxicant tests indicated that *N. arenaceodentata* was shown to be

63732 PAGE 148

less sensitive to cadmium than previously observed while mysid shrimp were more sensitive to copper than is typical.

Suspended-Phase Toxicity Tests

Fish and mysid survival exceeded the 90 percent criterion in all lab controls. Mussel survival and development met both criteria with greater than 70 percent survival and greater than 70 percent normal shell development of surviving embryos in laboratory controls. Water quality measurements were within specified ranges for the duration of the tests for all species. Twenty *M. beryllina* instead of 10 were added to all five replicates of the Composite A 50 percent elutriate concentration. Mean survival in the 50 percent test concentration was 96 percent, comparable to the control and other test concentrations; therefore this deviation did not appear to affect test results.

Subsamples for ammonia measurement in the bivalve elutriate concentrations were not collected at test initiation due to technician error; therefore 48 hour measurements were used to evaluate potential effects due to ammonia. The 48 hour ammonia reference toxicant test ammonia measurements were comparable to nominal concentration indicating that the 48 hour levels were representative of actual exposure. Therefore, interpretation of these results is deemed reliable.

Solid-Phase Toxicity Tests

Laboratory control performance for both SP tests met minimum test acceptability criteria. All other test acceptability criteria were met and water quality values were within acceptable ranges as defined by the test protocols for both species.

The overlying water was replaced for four days in the Composite B sample to purge ammonia from the sample prior to addition of amphipods. Guidance for this process is described in EPA 1994 for use when ammonia is present at toxicologically important levels. The total and unionized ammonia in the Composite B sample at sample receipt was 37.1 and 0.783 milligrams per liter (mg/L), respectively. The no effect concentrations published in EPA 1994 for *E. estuarius* are 60 and 0.8 mg/L for total and unionized ammonia. The amount of unionized ammonia (the more toxic form of ammonia) in the sample warranted ammonia purging prior to test initiation. After the four day purging, ammonia levels were reduced to 12.9 mg/L total ammonia and 0.232 mg/L unionized ammonia. Internal studies at Nautilus have shown that *N. arenaceodentata* are less sensitive to ammonia (February 2014 EC_{50} 272 mg/L total ammonia); therefore no ammonia purging was conducted for this species.

Bioaccumulation-Phase Tests

Mean clam and worm survival in laboratory control sediment was 89 and 98 percent, respectively, and the minimum tissue requirement for chemical analysis was met for all samples. Water quality parameters satisfied test protocol requirements and the data were considered valid without further qualification.

Potential Confounding Factors

The influence of several potential confounding factors on test performance and interpretation were assessed and are discussed below.

63732 PAGE 149

Ammonia

Total and un-ionized ammonia concentrations are summarized in Tables 12 through 15 of the Nautilus toxicity report in Appendix D. Unionized ammonia, the more toxic form of ammonia; values were calculated from total ammonia measurements (Hampson 1977). Ammonia concentrations were well below concentrations expected to be toxic in the Composite A tests. However, the Composite B sample was received with elevated ammonia levels and measures were taken to control ammonia as a confounding factor where appropriate (see Solid-Phase Toxicity Tests in this section of this document). The only SP test to show significant toxicity was the amphipod Composite B SP test, in which survival was significantly reduced from LA-5 reference.

Total and un-ionized ammonia concentrations in the sediment pore water were below published toxic thresholds for this species at the time of initiation. Additionally, the LC_{50} for the concurrent reference toxicant test was 162 mg/L total ammonia, well above 12.9 mg/L that was observed in the Composite B pore water at test initiation. Thus, the toxicity observed in the Composite B amphipod test is not likely attributable to ammonia. However, Composite B met the LPC for benthic toxicity in the amphipod test as defined in the Green Book (USEPA/USACE 1991).

Total and un-ionized ammonia was above threshold levels for *M. galloprovincialis* in the in the Composite B SPP test. Total ammonia in the undiluted elutriate sample was 10.9 mg/L; the EC_{50} for the concurrent reference toxicant test was 11.0. Thus, ammonia was likely a contributing factor for toxicity observed to mussel larvae.

6.3 Bioaccumulation Tissue Chemistry Data Quality

Thirty tissue samples were received by Eurofins Calscience for this Project on 14 July 2014. The samples were transferred to the laboratory in an ice-chest on ice, following strict chain-of-custody procedures. The temperature of the samples upon receipt at the laboratory was -3.7°C. All samples were given laboratory identification numbers, logged into the Laboratory Information Management System (LIMS) and then stored in freezers pending homogenization and chemistry testing.

Holding Times

All holding times were met.

Calibration

Frequency and control criteria for initial and continuing calibration verifications were met.

Reporting Limits

All MDLs were met.

Method Blanks

Concentrations of target analytes in the method blank were found to be below reporting limits for all testing.

63732 PAGE 150

Laboratory Control Samples
A LCS analysis was performed at the required frequencies, unless otherwise noted, all parameters were within the established control limits.

Matrix Spikes
MS analyses were performed for each applicable analysis on Project samples. All parameters for the MS were within the established control limits with the following exceptions.

- The zinc MS, MSD and/or RPD values were outside the control limits in both QC batches. The results have been flagged with the appropriate qualifiers and are released with no further action.
- For one of the two QC batches, the mercury MSD recovery was outside the control limits. The results are released with no further qualification since the LCS/LCSD values were within the control limits.
- For EPA 8081A, the beta-BHC and endrin aldehyde MS, MSD and/or RPD values were outside control limits in both QC batches. The results have been flagged with the appropriate qualifiers and are released with no further action since the LCS and LCSD recoveries and RPDs were in control.
- The MS/MSD recoveries and/or RPDs for one or more PAHs were outside the control limits in two QC batches. Since the LCS and LCSD recoveries and RPDs were in control, the results are released with no further action.

Surrogates
Surrogate recoveries for all applicable tests and samples were within the established control limits.

PCB Congeners
The initial report released showed unusually high levels of PCB congeners for several tissue samples, and the individual congeners reported did not necessarily match those found in the corresponding sediment data. However, since all raw data was re-checked and appeared to be correct, the data was released. Although there was nothing apparent in the analytical data or prep logs that would indicate a problem, upon further review of the data, PCB contamination from glassware was suspected as a possible cause of the unusually high PCB detections. As a result, the samples were re-extracted and reanalyzed for PCBs using new glassware. Because the subsequent testing showed dramatically different data versus the original data set, and the original PCB data has been replaced. Unfortunately, for three of the samples, there was insufficient sample remaining for re-extraction and since the original data is considered suspect, PCBs are not reported for these samples.

63732 PAGE 151

7.0 DISCUSSION OF RESULTS

To determine the quality of all Project sediments and their potential suitability for unconfined aquatic disposal, this sediment characterization study evaluated samples using varying degrees of analysis. The study was designed to gain an understanding of sediment quality for recent unconsolidated bay deposits as well as native material within the Project footprint. Table 7-1 is a summary of each sample type, collection method, and analysis; in addition to the Green Book test tier and reasoning for each level of evaluation.

7.1 Grain Size Results

Contrary to general rules for sediment transport, the results of the grain size analysis for the recent bay deposits (vibracore samples) indicate that sediments further from shore are coarser than those closer to the BAE Systems bulkhead (Table 4-1). Recent bay deposits collected from Composite Area A contain higher proportions of sand (range 7.86 to 80.4 percent; Composite A = 81.3 percent sand) than Composite Area B (range 0.0 to 36.5 percent sand; Composite B = 0.0 percent sand) and sand proportions are higher in the two cores closer to shore compared to the two further away in both composite areas. This trend agrees with bathymetric data that indicates a larger quantity of unconsolidated sediment accumulation closer to the BAE Systems bulkhead/shoreline.

In general, native sediment deposits (geotechnical samples) are predominantly fine grained (in the three composite samples). The percentage of fines range between 43.3 and 93.1 percent, while total sand percentages range between 6.9 and 56.7 percent) with low proportions of sand and high proportions of silt (Table 4-2). Conversely, the transition layer sediments collected using a vibracore are dominantly sand; likely due to higher proportions of shell hash and gravel (Figure 4-1). The only native sediment sample with more than 80 percent sand is sample B-5-3, which is considered a recent bay/Holocene deposit. In addition, the mean grain size of sediments decreases while the proportion of fines increases with depth into the Project footprint (deeper/older sediments).

7.2 Sediment Chemistry Results

Overall, general chemistry parameters (in particular, ammonia concentration in vibracore Composite B) are higher in composite area sediments, compared to the LA-5 reference sediments (Table 4-3). In addition, TOC concentrations were generally low (ranging from non-detect to 1.0 percent in test sediments). All of the analytes are present in concentrations well below ERM guideline values, and the vast majority of the analytes are below ERL guidelines (with the exception of two metals, two PAHs and total PCB congeners in Composite B and total PCB congeners in Composite A, Figures 4-2a and 4-2b). However, all of the analytes detected above these values in test sediments are less than 1.7 times greater than the ERL guideline.

In the geotechnical samples, total solids range between 78.8 and 87.2 percent, but the percent of TOC is non-detect for all three composite samples. Overall, the majority of the analytes evaluated for the geotechnical study were non-detect with the exception of several naturally occurring compounds including metals, PAHs, TPH, and TRPH (Table 4-3, Figures 4-2a through 4-2c). All of the analytes detected in the geotechnical samples are present in

63732 PAGE 152

concentrations well below ERL guideline values are generally not considered to be of concern when evaluating sediment disposal options.

Table 7-1.
Sample Types and Analysis

Sample Type[1]	Collection Method	Analysis	Green Book Testing Tier	Reason for Level of Evaluation
Recent Bay/ Unconsolidated Sediment Deposit	Vibracore	1. Chemical Analysis 2. Physical Analysis 3. Toxicity/Bioassay 4. Bioaccumulation Tissue Chemistry Analysis	Tier III	Recent Bay deposits may be influenced by current and recent historic uses and/or anthropogenic influence. Additional physical analysis on individual core samples for beneficial reuse consideration.
Recent Bay/ Unconsolidated Sediment Deposit – Transition Layer	Vibracore	1. Chemical Analysis 2. Physical Analysis 3. Toxicity/Bioassay 4. Bioaccumulation Tissue Chemistry Analysis	Tier III	Transition layer included with unconsolidated samples for full Tier III. Evaluated for additional analytical chemistry separately to determine if the top layer of native sediments are free of contaminants.
Recent Bay/Holocene Deposits	Geotechnical Boring	1. Chemical Analysis 2. Physical Analysis	Modified Tier II	Representative samples from across native deposit[1] were composited for chemical and physical testing to evaluate sediment quality. Additional physical analysis on individual randomized samples for beneficial reuse consideration.
Younger Quaternary Deposits	Geotechnical Boring	1. Chemical Analysis 2. Physical Analysis	Modified Tier II	Representative samples from across native deposit[1] were composited for chemical and physical testing to evaluate sediment quality. Additional physical analysis on individual randomized samples for beneficial reuse consideration.
Older Quaternary Deposits to -65 feet MLLW	Geotechnical Boring	1. Chemical Analysis 2. Physical Analysis	Modified Tier II	Representative samples from across native deposit[1] were composited for chemical and physical testing to evaluate sediment quality. Additional physical analysis on individual randomized samples for beneficial reuse consideration.

Notes:

63732 PAGE 153

7.3 Toxicity Evaluation Results

Toxicity evaluations were performed for vibracore samples that collected recent bay/unconsolidated sediments only. Overall, the results of the toxicity evaluation agree with the analytical results. There were a few instances where toxicity test results did not meet acceptable QA/QC criteria, including physical water quality parameters and reference toxicant test results. These deviations are discussed in detail in Section 6.2. However, required percent survival in all laboratory control samples were met, indicating the use of healthy organisms and proper test conditions. The results of the toxicity evaluation are discussed further in this section.

7.3.1 Suspended-Particulate-Phase Tests

Results of the SPP acute exposure tests indicated that EC_{50} values were >100 percent[5] for mysids and inland silversides. No significant toxicity was observed in either of these water column tests; however, the EC_{50} was 73 percent for mussel larvae exposed to Composite B sediments due to 0.0 percent survival in the 100 percent elutriate concentration. This result is likely due to a confounding factor, un-ionized ammonia. Un-ionized ammonia concentrations were present at levels similar to the maximum tolerance threshold in the concurrent reference toxicant test (10.9 and 11.0 mg/L for Composite B and the reference toxicant test, respectively).

These results indicate that the test sediments meet the LPC for water column tests, as defined in the Green Book (USEPA/USACE, 1991).

7.3.2 Solid-Phase Tests

Significant differences between survival in the project treatments and the reference were observed in sample Composite B for the *E. estuarius* test. However, while statistically significant differences were observed for this sample, the percent mortality in this treatment is not 20 percent or more greater than the percent mortality in the LA-5 reference sediment. Twenty percent is the accepted percent difference for exceeding the LPC for benthic toxicity in amphipods as defined in the Green Book (USEPA/USACE, 1991).

7.4 Bioaccumulation-Phase Tests and Results

To determine the potential for bioaccumulation, clam and worm tissues were analyzed for COCs following a 28-day exposure to the composited sediments from each dredge footprint. Compliance with ocean disposal requirements for bioaccumulation was then evaluated in four ways:

- Concentrations of chemical analytes detected in clams and worms exposed to test sediments were statistically compared to their counterparts exposed to LA-5 reference sediment;
- Metal and organic concentrations observed in the test tissue were compared to the U.S. Food and Drug Administration (FDA) action levels for chemicals in fish and shellfish;

[5] An LC_{50}/EC_{50} of >100 percent indicates that there was greater than 50 percent survival/normal larvae in the 100 percent elutriate concentration.

63732 PAGE 154

- Bioconcentration factors (BCFs) were calculated by dividing tissue concentrations by sediment concentrations; BCFs were calculated only for those constituents that were significantly elevated in the test sediments relative to those in the reference sediment; and
- Comparison of applicable chemical analytes (i.e. those found to be significantly greater in tissues exposed to test sediments compared to tissues exposed to reference sediments) to values in the Environmental Residue Effects Database (USACE/USEPA, 2009) (ERED). The ERED contains toxic effects levels for a variety of organisms and endpoints (i.e., survival, mortality, and growth) similar to those used for Green Book testing. Comparisons of test tissue results to the ERED were used to evaluate whether tissue concentrations in this study are above documented effects levels.

The bioaccumulation tissue test results are summarized below and a full tissue chemistry report from Eurofins Calscience and statistical test results are provided in Appendix E.

7.4.1 Bioaccumulation Exposure Statistical Comparisons

Statistical comparisons (one-tailed, unpaired t-tests) were used to determine whether the concentrations of chemicals in tissues exposed to test sediments are statistically greater ($p \leq 0.05$) than their counterparts exposed to ocean reference sediments. If analyte concentrations in test tissues were the same or lower than their corresponding LA-5 reference sample concentrations, no statistical comparison was necessary.

Statistically elevated constituents are presented in Section 5.3.2 and 5.3.3; Tables 5-5, 5-6, 7-2, and 7-3; and Appendix E. The concentrations that were statistically elevated in tissues from clams and worms exposed to selected test sediments, compared to the LA-5 reference sediment, are:

- Three metals (chromium, copper, and lead), and
- The organic compound totals for PAHs and PCB congeners in addition to several individual PAHs and PCB congeners (listed in Appendix E).

In clam tissues, statistically elevated metal concentrations are not more than 2.8 times higher in test tissues compared to those exposed to LA-5 reference sediments. In worm tissues, test site exposures not more than 1.5 times that of the LA-5 reference (Table 7-2). All statistically elevated metals were detected in both test and LA-5 reference sediments; none of the comparisons were made to a non-detect value.

Conversely, concentrations of individual PAHs and PCB congeners are mostly non-detect in organism tissues exposed to LA-5 reference sediments. Total PAHs and PCBs are also non-detect in clam tissues exposed to LA-5 reference sediments, but not in worm tissue. Where tissue concentration totals are non-detect, statistical analysis between test and LA-5 reference tissues is conducted using the RL for all five replicates. Therefore, all statistical comparisons to the LA-5 reference tissues are calculated using estimated concentration values. For total PAHs, concentrations detected in clam test tissues are 5.24 and 28.8 times the LA-5 reference tissue

63732 PAGE 155

concentration for Composite A and B, respectively. In worm test tissues, total PAHs are 3.87 times the LA-5 reference tissue concentration in Composite B; total PAHs in Composite A are not significantly greater. For total PCB congeners, detections in clam test tissues are 13.1 times the LA-5 reference tissue concentrations for Composite A; in worm test tissues, they are 6.45 and 4.71 times higher in Composite A and B, respectively (Table 7-3).

Table 7-2.
Test Tissues with Statistically Elevated Bioaccumulation of Trace Metals

Analyte	Composite	Test Organism	Unit (Wet Weight)	Average Concentration		Times Above Reference
				Reference Tissue	Test Tissue	
Copper	Composite A	Clam	mg/kg	0.966	1.31	1.4
Lead				0.129	0.253	2.0
Copper		Worm		1.24	1.76	1.4
Lead				0.117	0.145	1.2
Chromium	Composite B	Clam	mg/kg	0.212	0.321	1.5
Lead				0.129	0.363	2.8

Notes:
* Value is compared to a value less than the reporting limit.
mg/kg = milligrams per kilogram; ND = non-detect or value that was reported is less than the reporting limit

Table 7-3.
Test Tissues with Statistically Elevated Bioaccumulation of PAHs and PCBs

Analyte	Composite	Test Organism	Unit (Wet Weight)	Average Concentration		Times Above Reference
				Reference Tissue	Test Tissue	
Total PAHs	Composite A	Clam	µg/kg	ND (< 10)	52.4	5.24*
Total PCBs				ND (< 0.5)	6.54	13.1*
Total PCBs		Worm		5.58	36.0	6.45
Total PAHs	Composite B	Clam	µg/kg	ND (< 10)	288	28.8*
Total PAHs		Worm		11.0	42.6	3.87
Total PCBs				5.58	26.3	4.71

Notes:
* Value is compared to a value less than the reporting limit.
µg/kg = micrograms per kilogram; ND = non-detect, or value that was reported is less than the reporting limit; PAH = polycyclic aromatic hydrocarbon; PCB = polychlorinated biphenyl

To further evaluate the magnitude of bioaccumulation observed in test sediments that are statistically elevated relative to that in the reference sediments, analytes are further compared to available FDA action levels, as discussed in the next section. FDA guidelines are defined for the protection of human health from seafood consumption. However, these guidelines can also be a good indicator of potential impairment for other species in the food web and are a recommended comparison step in the Green Book.

63732 PAGE 156

7.4.2 Comparison with FDA Action Levels

Table 7-4 compares average metal, organic, and pesticide compound concentrations in clam and worm tissues to available FDA action levels. (Note that not all chemicals analyzed in tissue samples have FDA action levels). Although statistical significances were observed between test and LA-5 reference tissues, all chemicals analyzed in test tissue samples exposed to proposed dredged material are well below FDA action levels.

These results suggest that biomagnification of COCs would not exceed FDA action levels for human consumption in the Project dredge material proposed for disposal at LA-5 ODMDS.

Table 7-4.
Tissue Levels of Metals, Organics, and Pesticides Compared to Available FDA Action Levels

Analyte	Unit (wet weight)	FDA Action Level[1]	BAE Systems Pier 1N			
			Composite A Mean		Composite B Mean	
			Clams	Worms	Clams	Worms
Arsenic	mg/kg	86[2]	3.02	2.90	2.74	2.57

Accessed on September 19, 2014 at http://www.fda.gov/food/guidanceregulation/guidancedocumentsregulatoryinformation/seafood/ucm2018426.htm)
2. FDA action level for crustaceans and/or shellfish
3. FDA action level for all fish
4. FDA action level for methyl mercury (wet weight)

BOLD = exceeds FDA Action Level

µg/kg = micrograms per kilogram (parts per billion); FDA = U.S. Food and Drug Administration; mg/kg = milligrams per kilogram (parts per million); ND = non-detect, or value reported as less than the reporting limit; PCB = polychlorinated biphenyl

7.4.3 Bioconcentration Factor (BCF)

The third way in which bioaccumulation results are evaluated is comparison of tissue burdens with sediment loads (reported in wet weight) by calculating the bioconcentration factor (BCF). All BCF values are no more than 1.9, and the majority are much less than 1.0, indicating that the bioconcentration of these chemical analytes is very low in all of the composite area samples (Tables 7-5 and 7-6). According to EPA guidance, proposed dredged-material contaminants

with BCFs greater than 1,000 should be further evaluated for bioaccumulation potential. The BCF values of these analytes for all composites samples are considerably lower than this guidance value, which suggests the potential of the test sediments for bioaccumulation and biomagnification is minimal.

Table 7-5.
Bioconcentration Factors for Analytes Significantly Elevated in Clam Test Tissues Compared to Reference Tissue

Analyte	Units (wet weight)	Composite A			Composite B		
		Tissue Conc.	Sediment Conc.	BCF	Tissue Conc.	Sediment Conc.	BCF
Chromium	mg/kg	NA	NA	NA	0.321	13.4	0.0240
Copper	mg/kg	1.31	9.97	0.131	NA	NA	NA
Lead	mg/kg	0.253	4.46	0.0567	0.363	12.6	0.029
Total PAHs	µg/kg	52.4	182	0.288	288	2620	0.11
Total PCBs	µg/kg	6.54	18.9	0.346	NA	NA	NA

Notes:
µg/kg = micrograms per kilogram; BCF = bioconcentration factor; conc. = concentration; mg/kg = milligrams per kilogram; NA = not applicable; ND = not-detect or value was reported as less than the reporting limit

Table 7-6.
Bioconcentration Factors for Analytes Significantly Elevated in Worm Test Tissues Compared to Reference Tissue

Analyte	Units (wet weight)	Composite A			Composite B		
		Tissue Conc.	Sediment Conc.	BCF	Tissue Conc.	Sediment Conc.	BCF

Total PCBs	µg/kg	36.0	18.9	1.90	26.3	25.6	1.03

Notes:
µg/kg = micrograms per kilogram; BCF = bioconcentration factor; conc. = concentration; mg/kg = milligrams per kilogram; NA = not applicable; ND = not-detect or value was reported as less than the reporting limit

7.4.4 Environmental Residue Effects Database Comparison

To further evaluate the potential ecological effects related to the concentrations of significantly elevated analytes observed in clam and worm tissues as a result of exposure to the Project test sediments, the ERED was queried (http://el.erdc.usace.army.mil/ered/). This database specifies the following instructions for comparing tissue data, and cautions proper use when doing so.

1. *The ERED contains residue-effects information on many environmental contaminants of potential concern.*
2. *Although the database is the result of an extensive literature search of known residue-effects data, the search was not exhaustive.*
3. *When using the database for regulatory purposes, such as dredged material evaluations, consideration must be given to the nature of the biological effect associated with a particular residue level. The database contains information on a broad range of biological effects caused by the presence of a particular contaminant in the tissue of an*

63732 PAGE 158

organism, from the induction of particular enzymes or enzyme systems to whole-organism effects on survival, growth, or reproduction. A stronger inferential link exists between whole-organism toxicological effects (e.g., reduced survival) and ecological impacts on populations, communities, and ecosystems (i.e., effects the Marine Protection, Research and Sanctuaries Act and the Clean Water Act specifically state should be avoided). Cellular/subcellular responses are most appropriately used as biomarkers of exposure; they are biological indicators that the organism has been exposed to some type of stress. The causal relationship between the induction of such biomarkers and higher order effects such as whole-organism survival, growth, reproduction, or ecological impacts is unknown in most cases.

4. *Merely identifying the presence of a chemical substance in the tissues of an organism, for example, following a bioaccumulation test, is not sufficient information to conclude that the chemical will produce an adverse effect. All chemical substances have the potential to produce adverse effects (i.e., toxicity), including such diverse compounds as aspirin, zinc, and dioxin. The likelihood that a chemical substance in the tissues of an organism will produce an adverse effect is a function of the physical and chemical properties of the substance, the concentration of the chemical in the tissues of the organism, and the length of time the organism is exposed to the compound. Because environmental contaminants vary so widely in their potential to produce toxicity, contaminant-specific information must be used to reach a determination regarding the potential for a bioaccumulated substance to produce adverse effects.*

Based upon the instructions listed above, the following six criteria were established for queries of the Project tissue data using the ERED:

- The actual test species or an appropriate surrogate species was used;
- The whole body was the analysis unit;
- The chemical of concern in test tissues and the database matched exactly;
- An appropriate study endpoint (e.g., survival or growth) was selected;
- To be conservative, the lowest observed level of effect listed in the database was chosen for comparison with the analytical tissue results; and
- The toxicity or effects measurements were appropriate (e.g., no-observed-effect dose [NOED] or lowest-observed-effect dose [LOED]).

Table 7-7 summarizes the comparisons made between the appropriate ERED study results and the Project clam and worm bioaccumulation results for analytes that were significantly elevated in tissues exposed to test sediments, compared to those exposed to the LA-5 reference sediment.

In general, a comparison of the tissue chemistry results of the Project sediment characterization study with published study data in the ERED show that levels of chemicals in clam and worm tissues exposed to Project sediments would not be expected to have significant effects following unconfined aquatic disposal. However, one analyte, lead, was detected at a concentration

63732 PAGE 159

slightly greater than the lowest NOED value in the ERED (2.28 mg/kg) for the eastern oyster, *Crassostrea virginica*, in clam tissues exposed to Composite A sediments. However, the ERED contains a higher NOED for reproduction (2.6 mg/kg) for this species which is less than the concentration detected in tissues exposed to Composite A sediments.

Although the concentration of lead in tissues exposed to Composite A are greater than the lowest NOED for this species, it is uncertain whether any adverse effects due to dredged material from Composite A would be observed because of the following reasons:

1. The species evaluated for this study and the ERED study are not an exact match;
2. Relatively low concentrations of analytes in test sediments;
3. Comparable tissue results to LA-5 reference sediments;
4. No exceedance when compared to FDA Action levels;
5. Low BCFs; and
6. No other toxicity in any other level of evaluation for this composite area.

Overall the above reasoning indicates that any adverse effects are considered unlikely.

Table 7-7.
Summary of Statistically Elevated Clam and Worm Tissue Residues for Naval Amphibious Base Proposed Dredged Material

Analyte	Test Animal	Unit (Wet Weight)	Reporting Limit (RL)	Reference Mean Tissue Concentration[1]	Test Area Mean Tissue Concentration[1]	P Value	Test Area Mean: Reference Mean Ratio[2]	Comparison to Relevant Environmental Residue-Effects Database Values
Metals								
Chromium	Clam	mg/kg	0.100	0 212 ± 0.0.022	Composite B – 0.321 ± 0.0311	Composite B – <0.001	Composite B – 1.5	There were no relevant studies in the ERED for *Macoma nasuta* or the polychaete *Neanthes (*formerly *Nereis) virens*. However, there were two studies using *Neanthes arenaceodentata* for whole body behavior and reproduction with a no observed effects dose (NOED) and lowest observed effects dose (LOED) of 8.28 mg/kg chromium ([T.M. Dillon, U.S. Army Corps of Engineers Technical Report, D-84-2], [P S. Oshida and L S Word; Mar Environ Res 07:167-174]).
Copper	Clam	mg/kg	0 100	0.966 ± 0.166	Composite A – 1.31 ± 0 263	Composite A – 0 015	Composite A – 1.4	There are no relevant effects in the ERED for *Macoma nasuta.* However, the whole body lethal dose $(LD)_{45}$ for *Macoma balthica* according to one study was determined to be 12 mg/kg for survival (Absil MCP, M Berntssen, LJA Gerninga; Aquat Toxicol 34:13-29). Several polychaete worm studies are contained in the database; however, none were conducted using *Nereis virens* but there was one that used *Neanthes arenaceodentata* (the species used in the SP test for this study). This worm study contained in the ERED reports whole body mortality LDs that range from 54 to 292.8 mg/kg copper for *Neanthes arenaceodentata* (Pesch, C.E. Marine Biol. 052.237-245).
	Worm			1.24 ± 0.321	Composite A – 1 76 ± 0 108	Composite A – <0.014	Composite A – 1.4	
Lead	Clam	mg/kg	0 100	0.129 ± 0.0204	Composite A – 2.53 ± 0 0253 Composite B – 0.363 ± 0.0726	Composite A – <0.001 Composite B – <0.001	Composite A – 20 Composite B – 2.8	There were no specific studies found for the clam species used in the Project dredge characterization study (*Macoma nasuta*) for lead bioaccumulation However, a lead study using eastern oysters (*Crassostrea virginica*) resulted in a NOED for lead of 2.28, 2.28, and 2.6 mg/kg for growth, mortality, and reproduction, respectively. The concentration of lead detected in clam tissues during this study was less than the highest NOED concentration in the ERED There are no relevant effect studies in the ERED for *Neanthes (*formerly *Nereis) virens*, but a 2005 study of the oligochaete *Lumbriculus variegates* showed NOED ranging between 10 and 300 mg/kg of lead (J Aisemberg, D.E. Nahabedian, E A. Wider, and N.R.V. Guerrero, 2005, *Toxicology* 210:45-53) Comparison of the ERED results to the average (significantly greater) lead level observed in this study (0.145 mg/kg) indicated that no effects would be expected.
	Worm			0.117 ± 0.0191	Composite A – 0 145 ± 0.0146	Composite A – 0.025	Composite A – 1.24	
Polychlorinated Biphenyl (PCB) Congeners								
Total PCB Congeners	Clam	µg/kg	0.5	ND (<0.5)	Composite A – 6.5 ± 2 6	Composite A – <0 001	Composite A – 13	The ERED contains the results of a PCB study conducted using *Macoma nasuta*—a whole body NOED from a 1995 study of 1,700 µg/kg for three endpoints—mortality, growth, and behavior (B.L. Boese, M. Winsor, H Lee Li, S. Echols, J. Pelletier, and R. Randall; *Environ Tox & Chem* 14:303-310). There are no relevant effect studies in the ERED for *Neanthes (*formerly *Nereis) virens*, but a 2005 study of the oligochaete *Lumbriculus variegates* showed a whole body combined NOED ranging between 10,000 to 350,000 µg/kg of PCBs (Burton G.A. Jr, M.S. Greenberg, C.D. Rowland, C.A. Irvine, D.R. Lavioie, J.A. Brooker, L. Moore, D.F.N. Raymer, R.A. McWilliam, *Environ Pollut* 134.133-144). This is orders of magnitudes greater than the total PCBs detected in worm tissues during this study.
	Worm			5.6 ± 3.5	Composite A – 36 ± 8.6 Composite B – 26 ± 4.9	Composite A – 0.002 Composite B – 0.011	Composite A – 6.4 Composite B – 4.6

Ozertich, J.O. Lamberson, R.C Swartz, F.A. Cole, J. Pelletier, J. Jones, *Arch Environ Contam Toxicol* 36:270-280)
Benzo (e) Pyrene	Clam	µg/kg	10	ND (<10)	Composite B –.17.8 ± 3.19	Composite B – <0 001	Composite B – 1.8	There are no relevant effects in the ERED database for the related species for benzo (e) pyrene.
Benzo (g,h,i) Perylene	Clam	µg/kg	10	ND (<10)	Composite B – 14.0 ± 2.16	Composite B – 0 010	Composite B – 1.4	There are no relevant effects in the ERED database for the related species for benzo (g,h,i) perylene
Benzo (k) Fluoranthene	Clam	µg/kg	10	ND (<10)	Composite A – 12 6 ± 2.07 Composite B – 20.8 ± 3.19	Composite A – 0 010 Composite B – <0.001	Composite A – 1.3 Composite B – 2.1	There are no relevant effects in the ERED database for the related species for benzo (k) fluoranthene.
Chrysene	Clam	µg/kg	10	ND (<10)	Composite B – 15 8 ± 4.32	Composite B – 0.004	Composite B – 1.6	The database contains a 1999 chrysene study using the amphipod species *Rhepoxynius abronius* that found whole body mortality LD levels that range from 1,280 µg/kg to 3,150 µg/kg This effects level is well above the15 8 µg/kg average chrysene level observed in clam tissues during this study.
Fluoranthene	Clam	µg/kg	10	ND (<10)	Composite B – 50 2 ± 14.6	Composite B – <0.001	Composite B – 5.0	There are no relevant effects in the ERED database for *Macoma nasuta* or *Neanthes (*formerly *Nereis) virens* for fluoranthene The database does contain whole body mortality LD levels that range from 20,750 to 142,790 µg/kg from a 1999 study conducted using amphipods (*Rhepoxynius abronius*) (B.L. Boese, R.J. Ozertich, J O Lamberson, R.C. Swartz, F.A. Cole, J. Pelletier, J. Jones, *Arch Environ Contam Toxicol* 36: 270-280) These effect levels are magnitudes higher than the tissue levels of fluoranthene in the BAE study (50.2 µg/kg in clam tissue and 16.6 µg/kg in worm tissue).
	Worm				Composite B – 16 6 ± 5.32	Composite B – 0.006	Composite B – 1.7	
Indeno (1,2,3-c,d) Pyrene	Clam	µg/kg	10	ND (<10)	Composite B – 12.0 ± 1.0	Composite B – 0.034	Composite B – 1.2	NA—There are no relevant effects in the ERED database for *Macoma nasuta* or related species for indeno (1,2,3-c,d) pyrene
Pyrene	Clam	µg/kg	10	ND (<10)	Composite B – 89 0 ± 21.3	Composite B – <0.001	Composite B – 8.9	There are no effects in the database for survival for the species used in the bioaccumulation exposures; however, a PAH study for pyrene using *Mytilus galloprovincialis* showed a cellular LOED ranging between 3,399 to 3,407 µg/kg (Perez-Cadahia B, B Laffon, E Pasaro, J Mendez, *Comp Biochem Physiol* 138C.453-460). This level is much higher than the tissue levels of pyrene observed in the BAE study (an average of 89 0 µg/kg in clam tissues). There are no relevant effect studies in the ERED for *Neanthes (*formerly *Nereis) virens,* but a 1994 study of the oligochaete *Lumbriculus variegates* showed a mortality LOED of 465,000 µg/kg of pyrene (Kukkonen, J. and P.F. Landrum, *Environ Tox & Chem* 13(9):1457-1468) This is orders of magnitudes greater than concentration of pyrene detected in worm tissues during this study (26.0 µg/kg in worm tissues).
	Worm				Composite B – 26.0 ± 6.28	Composite B – <0.001	Composite B – 2.6	

Notes:
1 All concentrations are wet weight values.
2 The reporting limit (RL) is used as the concentrations for the ND values.
µg/kg = micrograms per kilogram; LD = lethal dose; LOED = lowest-observed-effects dose; mg/kg = milligrams per kilogram, NA = not applicable or no value; ND = non-detect; NOED = no-observed-effects dose; PCB = polychlorinated biphenyl

8.0 CONCLUSIONS

This report is the sediment characterization study to support future dredging at BAE Systems along their Pier 1N berthing area. The proposed Project will replace one wet berth with a dry dock to facilitate anticipated repairs associated with the future homeporting of Navy vessels into San Diego Bay. The purpose of this sediment characterization study is to gain approval for potential unconfined aquatic disposal at the LA-5 ODMDS or other beneficial reuse option. Dredged material sampling and testing for this purpose was performed according to the Project-specific SAP, approved by the USACE and USEPA May 19, 2014 (AMEC 2014).

Sediment evaluation included two types of collection and testing for proposed Project dredged materials as follows:

1. Unconsolidated sediment samples collected using a vibracore and subjected to a full Green Book Tier III analysis; and
2. Native, consolidated sediments collected during a geotechnical evaluation (performed by TerraCosta) and analyzed according to a modified Green Book Tier II testing scheme outlined in the SAP and approved by the agencies.

The results of the BAE Systems Pier 1N dredged material characterization study presented in this report indicate that the proposed Project dredged material complies with the ocean dumping suitability requirements outlined in Title 40 CFR Parts 220–238. These conclusions are supported by the following lines evidence.

- Grain size results indicate that the majority of the sediments are fine grained (≤80 percent sand) with the exception of the vibracore Composite A sample (81.3 percent sand); sample BAE-P1-A-C3 (80.4 percent sand); the transition layer sediments for the four Subcomposites (83.2 to 93.3 percent sand), and sample B-5-3 from the geotechnical evaluation (82.7 percent sand).
- Comparison of the sediment chemistry results for sediments collected for the proposed Project to the ERL/ERM guideline values and the reference sediment results indicates, in general, that the majority of the test sediments collected within the dredge footprints contain low concentrations of chemical contaminants.
  - For Composite A of the unconsolidated material, total PCB congeners are 1.1 times the ERL guideline value. No other analytes were detected above ERM or ERL guideline values and total PCB congeners were not above the ERL guideline value in the Composite A duplicate sample.
  - For Composite B of the unconsolidated material, none of the analytes are above ERM guidelines, but several are above ERL guidelines. These include arsenic (1.8 times), mercury (2.8 times), acenaphthylene (1.2 times), benzo (a) pyrene (1.2 times), and total PCB congeners (1.7 times).
  - None of the transition layer sediments or native sediments contains analytes above ERM or ERL guideline values and the majority of the analytes are non-detect.

63732 PAGE 166

- Native sediments from Composite Areas A, B, and C are relatively free of chemical contaminants and those detected may be naturally occurring and are well below below effects levels (ERL and ERM guidelines).

- Results of the SPP toxicity tests yielded EC_{50} values greater than 100 percent and no significant differences between test and reference sediments except for Composite B during the mussel embryo test (EC_{50} = 73.3 percent). This result was attributed to ammonia, a potential confounding factor.
  - These results indicate that Composite A elutriate samples meet the water column LPC for ocean disposal.
  - It is also likely that if Composite B sediments are disposed at LA-5 the sediments would not cause any adverse effect after the initial 4-hour mixing period.
    - If Composite B sediments are considered for a beneficial reuse alternative, additional Automated Dredging and Disposal Alternatives Modeling System (ADDAMS) short term fate (STFATE) modeling (Schroeder and Palermo, 1990) may be necessary to determine if there will be any adverse effects due to the disposal of sediments depending on the placement location.
- SP exposures were performed using the amphipod *E. estuarius*, and the polychaete worm *Neanthes arenaceodentata* showed a statistically significant difference for amphipod survival in Composite B sediments compared to the LA-5 reference.
  - However, the percent survival in Composite B sediments was not more than 20 percent less than survival in the reference, therefore the sediment meets the LPC for benthic toxicity as described in the Green Book.
- No clam or worm tissue chemical levels exceeded FDA action levels for substances poisonous and/or deleterious to fish and shellfish.
- After 28 days of exposure, several metals and organic compounds accumulated in tissues of test organisms at concentrations that were statistically greater than those in reference tissues. However, for the chemicals that were statistically greater in test tissues as compared to reference tissues, calculated BCFs were less than 1.9 for all Project samples, and were orders of magnitude less than the level that would require further studies of potential bioaccumulation exposure. These results suggest that the bioaccumulation and biomagnification potential of the proposed Project dredged material is minimal.
- Although lead concentrations detected in clam tissues exposed to Composite A sediments were found to be greater than the lowest NOED value published in the ERED database, it is uncertain if any adverse effects due to dredged material from Composite A would be observed because the species evaluated for this study and the ERED study are not an exact match. Furthermore, due to relatively low concentrations of analytes in Composite A sediments, and no other observed toxicity, any adverse effects are considered unlikely.
  - Overall, comparison of the tissue chemistry results of this sediment characterization study with published study data contained in the ERED shows that the levels of chemicals in clam and worm tissues exposed to Project sediments are well below any expected effects levels.

63732 PAGE 167

In summary, a review of the tiered data indicates that the Project dredge sediments meet the water column and benthic LPC for unconfined aquatic disposal and that long term effects to the aquatic environment are unlikely. However, further consultation with the USACE and USEPA is needed to determine the suitability for unconfined aquatic disposal of the Project sediments.

As mentioned, portions of material in the dredge footprint may be suitable for beneficial reuse. BAE Systems is currently working with the Port and regulatory agencies to identify potential beneficial reuse sites in San Diego Bay. Once specific sites have been identified, a separate beneficial reuse report will be prepared to specifically evaluate the feasibility (i.e. grain size compatibility and sediment chemistry) of placing material from the dry dock footprint at any or all of the proposed mitigation sites.

9.0 SUITABILITY FOR UNCONFINED AQUATIC DISPOSAL

As mentioned in Section 1.0, a revised draft of this report was submitted to the agencies on November 6, 2014. The agencies provided comments on the draft on November 17, 2014. This revision includes clarification and information requested by the agencies for the SUAD determination. Electronic mail correspondence between BAE Systems and the agencies is included as Appendix F of this report.

9.1 Response to USEPA Comments

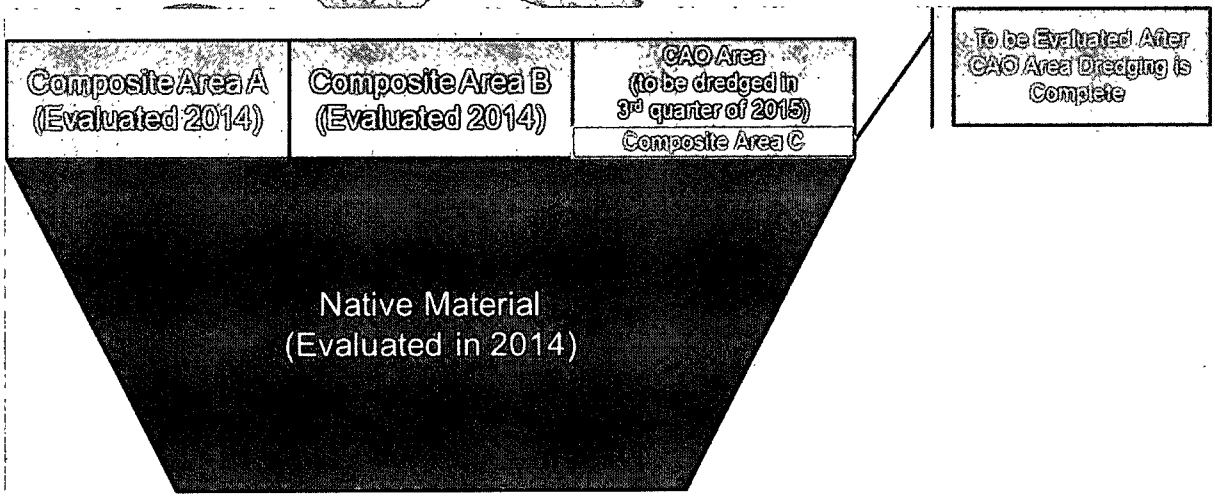
With regard to comments from the USEPA; dated November 14, 2014; BAE Systems agrees with the summary of understanding with the following exception.

Comment: Understanding item 6

- *Two composite areas (A and B) were sampled and analyzed; a third composite area (C) will be sampled after completion of remediation dredging of the contaminated upper layer.*

Response: This report also evaluates the consolidated, native layer of Composite Area C (see clarifications provided in this draft report in previous [highlighted] report sections and Figure 9-1). Figure 9-1 displays a clarification of the sediments evaluated and in need of SUAD approval. Only the unconsolidated area of Composite Area C, if any should be left following remediation dredging for the CAO area, and this area will be evaluated in a supplemental report.

Figure 9-1. Pier 1N Sediment Characterization Clarification Phase I Evaluation



BAE Systems agrees with USEPA comments 1 through 5 and 7 regarding the sediment testing results; no further response is provided.

63732 PAGE 170

9.2 Response to USACE Comments

With regard to USACE comments dated November 14, 2014, which expand upon the USEPA understanding and comments, BAE Systems submits the following response for consideration.

Comment: Item 1 (summarized):

- *...please include (other beneficial reuse options available [South Bay Sites])...in the SAPr...and the cubic yardages, if known.*

Response: The South Bay beneficial reuse site options available and their cubic yardages are provided in Table 9-1.

Table 9-1.
South Bay Beneficial Reuse Options

Location	Dredged Material Volume Needed (Cubic Yards)
Northern Alternative Mitigation	130,000
Southern Alternative Mitigation	65,000

A description of the beneficial reuse options, a summary of the need for material in these locations, maps, feasibility, and general plans for placement have been provided by Merkel & Associates and is included in Appendix F.

Comment: Item 3 *Upon review of the SAPr it would seem that some of the Area A areas below the unconsolidated muddy layer are sandy native formation sediments that could be available for beneficial reuse so maybe the SAPr could describe these areas and the potential yardages that could be available for reuse along with the alternatives available for beneficial reuse per Item 2. and 7.below.*

Response:
A portion of the sediments in the consolidated native layer of Composite Area A have been identified for potential beneficial reuse. Approximately 54,464 cy of material have been identified in this area as containing the appropriate proportion of sand for nearshore beneficial reuse. In addition, the unconsolidated portions of Composite Areas A and B are being evaluated for reuse. The unconsolidated portions of Composite Areas A and B represent approximately 65,961 cy of dredged material. As such, the total dredged material volume proposed for beneficial reuse is approximately 65,000 to 130,000 cy.

Figure 9-2 provides a generalized schematic for the breakdown of Pier 1N dredged material considered for beneficial reuse.

63732 PAGE 173

Table 9-2 provides general estimates of dredged material volumes available.[6] Supplemental grain size analysis of native sediments within the potential beneficial reuse area was also performed. The supplemental results are included in Appendix F and Table 9-3.

Table 9-2.
Estimated Dredged Material Volume Available for Beneficial Reuse

Area	Estimated Volume[1] (cubic yards)
Unconsolidated Area A - All	32,257
Unconsolidated Area B - All	33,704
Consolidated Native Formation - Sand Only	54,464
Consolidated Native Formation – Cemented Fines	274,575
Total	395,000

[1] - Estimated volumes are limited to the unconsolidated areas of Composite Areas A and B, and the consolidated material within the entire dredge footprint (including Composite Area C). All volumes are conceptual and are general estimates to be used for planning purposes only. Final volumes will need to be verified by a dredged material contractor or engineer prior to permitting and contracting. Volumes have been calculated to the estimated limits of the Project footprint. The estimated limits were determined by overlaying a georeferenced drawing of the Project area on an aerial map in ArcGIS.

Table 9-3.
Supplemental Grain Size Analysis

Sample Identifier	Gravel (%)	Coarse Sand (%)	Medium Sand (%)	Fine Sand (%)	% Sand	% Fines	USCS Classification
B-4-1	6.60	6.20	14.4	68.6	89.2	4.20	Poorly Graded Sand
B-4-2	1.30	0.50	3.50	89.7	93.7	5.00	Poorly Graded Sand
B-4-3	0.00	0.50	8.60	85.9	95.0	5.00	Poorly Graded Sand
B-4-4	0.30	0.60	7.80	85.2	93.6	6.10	Poorly Graded Sand/Silt
B-5-2	0.00	0.20	1.20	95.3	96.7	3.30	Poorly Graded Sand
B-5-4	3.00	2.50	30.2	55.6	88.3	8.70	Poorly Graded Sand/Silt
B-5-5	0.00	0.00	1.60	87.6	89.2	10.8	Poorly Graded Sand/Silt
B-5-7	0.40	0.90	21.4	69.0	91.3	8.30	Poorly Graded Sand/Silt

Notes:
USCS = Unified Soil Classification System; % = percent

BAE Systems agrees with USACE comments 2 and 4.

In summary, this supplemental evaluation satisfies all requests and addresses all comments from the USACE and USEPA provided on November 14, 2014.

[6] Note: These volumes are intended for planning purposes only. They are not intended for use in final permitting or design plans. New dredged material volumes will need to be developed by a qualified dredged material contractor or engineer.

1.0 INTRODUCTION

The Proposed Project is referred to as the *BAE Systems San Diego Ship Repair Pier 1 North Dry Dock Project*. The project site is located on and adjacent to San Diego Bay at the BAE Systems San Diego Ship Repair (BAE Systems) facility located at 2205 East Belt Street in San Diego, California (Figure 1-1). As described in detail in the Project Description (under separate cover), there are three separate components that comprise the Proposed Project:

- Performing pier and landside upgrades, dredging, and installation of a new dry dock on the northern side of Pier 1 (Pier 1N);
- Entering into a future, long-term real estate agreement with the San Diego Unified Port District (District) on the neighboring 2.0-acre land parcel and 4.0-acre water area that is currently leased by BAE Systems under a Tidelands Use and Occupancy Permit (TUOP); and
- Performing a program-level analysis for the removal of the intake/discharge tunnels that currently exist within the TUOP parcel as well as any associated soil or groundwater remediation efforts.

This Technical Report focuses on water quality and hydrology issues (e.g., impacts from construction or operations that may affect water quality or hydrology in the vicinity of the Proposed Project site) during the installation and operation of the proposed dry dock at the BAE Systems San Diego Ship Repair facility and the programmatic analysis for the removal of the intake/discharge tunnels. There are no water quality impacts associated with the future, long-term real estate agreement.

The major tasks that comprise the dry dock installation component of the Proposed Project include:

- Dredging of approximately 395,000 cubic yards (cy) of San Diego Bay bottom on the northern side of Pier 1 to accommodate the operation of the new dry dock;
- Aquatic (and potentially upland) disposal of the dredged materials, including possible pumping of the dredged material to a south bay mitigation site;
- Installation of an underwater sheet pile wall and cantilevered king pile on the northern side of the existing Pier 1;
- Installation of new ramp wharf structures that will be used to access the dry dock;
- Installation of one new, one retrofitted, and one expansion of mooring dolphins to secure the dry dock;
- Final dry dock assembly work and deployment of the new dry dock on the northern side of Pier 1 (most of the dry dock assembly will be done offsite);
- Installation of new electrical and mechanical utilities to service the dry dock; and
- Dry dock operation (e.g., loading and unloading of vessels; vessel repair and maintenance operations; dry dock maintenance).

63732 PAGE 190

The major tasks associated with the removal (and associated soil and/or groundwater remediation) of the intake/discharge tunnels and associated structures that currently exist within the TUOP parcel include:

- Excavation of soil
- Dewatering
- Installation of shoring to protect excavation
- Demolition and removal of tunnels (concrete) and remaining offshore separation structure
- Backfill with clean structural fill and installation of a rock covered slope from the top of the submerged sheet-pile wall to the level landward parcel
- Potential soil and groundwater characterization and potential remediation (if required)
- Disposal of soils (if required)
- Replacement of numerous structures, equipment, and operating systems currently located over the tunnels
- Installation of shoreline revetment to protect backfill in tunnels.

Specific water quality and hydrology impacts associated with the dry dock installation component of the Proposed Project that might occur as a result of the following construction and operation activities are:

- Dredging and dredged material disposal;
- Construction activities during sheet pile and king pile installation;
- Construction activities during dry dock access ramp installation;
- Construction activities during mooring dolphin demolition and installation;
- Trenching and other construction activities related to installation of the electrical and mechanical utilities needed to service the new dry dock;
- Deployment of the new dry dock, including any onsite assembly and test activities; and
- Operations of the new dry dock, including ship loading and unloading, ship repair and maintenance activities, and long-term dry dock maintenance needs.

Specific water quality and hydrology impacts associated with the removal (and associated soil and/or groundwater remediation) of the intake/discharge tunnels and associated structures that currently exist within the TUOP parcel are:

- Release of potentially contaminated soil or water during construction or removal materials;
- Turbidity caused by runoff on exposed soil surfaces or other accidental release;
- Accidental fuel or oil spills by equipment during construction; and
- Potential impacts to groundwater.

63732 PAGE 193

Proposed Project elements considered in this technical report that may potentially impact water quality and hydrology include both construction elements and operational elements:

Construction Elements

- Dredging and dredged material disposal
  - Potential pumping of dredged sediment (in slurry form) to a south bay mitigation site
- Dry dock associated in-water construction activities
  - Installation of an underwater sheet pile wall and cantilevered king piles
  - Demolition and installation of mooring dolphins and access ramps
  - Assembly and deployment of the new dry dock
- Dry dock associated land-side construction activities
  - Installation of electrical and mechanical utilities needed to service the new dry dock
  - Ramp wharf construction
  - Potential hazardous material spills
- Demolition/removal and backfill of the intake/discharge tunnels and associated structures on the existing TUOP parcel where they meet the mean high tide line and remain open
- Restoration and erosion protection of the site shoreline.

Operational Elements

- Dry dock operations
  - Ship loading and unloading (especially the intake and discharge of ballast waters)
  - Ship repair and maintenance activities
  - Long-term maintenance needs (i.e., cleaning/wash-down, repairs, and painting)
- Operations associated with the TUOP parcel after removal/demolition

The elements are consistent with the separate Project Description provided by LSA Associates, Inc. (LSA) under separate cover.

Ongoing Activities Within the Project Footprint

A portion of the Proposed Project area (the nearshore area on the northern side of Pier 1) is currently managed under the San Diego Shipyard Sediment Remediation Project (Figure 1-2). The San Diego Shipyard Sediment Remediation Project is the approved remedial action in response to the Tentative Cleanup and Abatement Order (CAO) No. R9-2012-0024 of the San Diego Regional Water Quality Control Board (SDRWQCB, 2010a and 2010b).

63732 PAGE 194

The San Diego Shipyard Sediment Remediation Project consists of a planned cleanup for marine sediments that contain elevated levels of contaminants of concern above CAO cleanup levels. On July 16, 2013, the District's Board of Port Commissioners (Board) considered the Final Program Environmental Impact Report (PEIR) and post-Final PEIR certification documents (e.g., Waste Discharge Requirements [WDR] and Clean Water Act [CWA] Section 401 Water Quality Certification [WQC]) prepared by the SDRWQCB; adopted the Findings of Fact (Findings) and Statement of Overriding Considerations (SOC); adopted the Mitigation Monitoring and Reporting Program (MMRP); and authorized District staff to file the Notice of Determination (NOD) for the San Diego Shipyard Sediment Remediation Project.

All current and future remedial activities associated with the San Diego Shipyard Sediment Remediation Project are planned to be completed prior to commencement of the Proposed Project; therefore, dry dock dredging activities will not overlap with the remediation activities. Consequently, this Technical Report does not address the potential water quality and hydrology impacts associated with the San Diego Shipyard Sediment Remediation Project dredging, as they have been thoroughly evaluated in a separate certified California Environmental Quality Act (CEQA) document (SDRWQCB, 2011) and associated Water Quality Technical Report (Geosyntec, 2011).

2.0 PROJECT DESCRIPTION

The Proposed Project includes three main components: (1) installing a new dry dock on the northern side of Pier 1; (2) entering into a future, long-term real estate agreement with the District on the neighboring 2-acre land parcel and 4-acre water area that is currently leased by BAE Systems under a TUOP[1]; and (3) conducting a program-level analysis of potential remediation efforts associated with the removal of the intake/discharge tunnels that exist within the TUOP parcel. Each component is described in detail below as well as in the Project Description under separate cover.

The tasks associated with each component include the following:

Component 1: Installing a New Dry Dock on the Northern Side of Pier 1

Tasks for this project component are depicted on Figure 2-1 and include:

- Dredging activities to accommodate the new dry dock down to -65 feet mean lower low water (MLLW) and removal of approximately 395,000 cubic yards (cy) of dredged material.
- Installation of a 700-foot-long sheet pile protection wall (i.e., underwater retaining wall) along the existing Pier 1 northern side and cantilevered king piles.
- Installation of over-water structure(s) (three independent structures over an area of approximately 18,692 square feet), two 26-foot by 33-foot mooring dolphins (one new and one retrofit) 344 feet and 890 feet offshore to the west of the U.S. Bulkhead Line and one expansion of an existing mooring dolphin, in addition to the installation of electrical and mechanical utilities to support the dry dock.
- Installation (including some final assembly) of a new floating dry dock approximately 205 feet in width and 851 feet in length (174,455 square feet total) plus aprons (approximately 16,165 square feet total) attached to the dry dock on each end.

Figure 2-2 depicts before (existing) and after (proposed) conditions for the dry dock component of the Proposed Project. The dry dock component will be executed in multiple phases. These phases are discussed in greater detail in Section 1.4.2 of the Project Description under separate cover.

Component 2: Entering into Future, Long-term Real Estate Agreement with the District on Land Currently Leased by BAE Systems

This project component includes:

- Extension of the existing lease for 9.8 acres of land and 16.6 acres of water and entering into a new lease for the 2.0-acre landside and 4.0-acre waterside parcel currently leased by the District to BAE Systems through a TUOP.

[1] At the time of preparation of this Water Quality Technical Report, the Tidelands Use and Occupancy Permit (TUOP) with SDG&E, dated November 1, 2009 (Document No. 55689) expired on October 31, 2014. This parcel is currently leased to BAE Systems by the District via a 5-year TUOP.

63732 PAGE 198

Component 3: Removing Intake/Discharge Tunnels on the TUOP Parcel.

A portion of the water quality impacts related to the potential remediation efforts associated with the removal of the intake/discharge tunnels are discussed in a draft Phase I Environmental Site Assessment (ESA) report (Ninyo & Moore, 2014). The location of the intake/discharge tunnels is depicted on Figure 2-3.

Tasks for this project component include:

- Excavation of soil
- Dewatering
- Installation of shoring to protect excavation
- Demolition and removal of tunnels (concrete) and remaining offshore separation structures
- Backfill with clean structural fill and installation of a rock covered slope from the top of the submerged sheet-pile wall to the level landward parcel
- Potential soil and groundwater characterization and potential remediation (if required)
- Disposal of soils (if required)
- Replacement of numerous structures, equipment, and operating systems currently located over the tunnels
- Installation of shoreline revetment to protect backfill in tunnels.

This Technical Report evaluates water quality and hydrology associated with installation of the new dry dock (Component 1) and the program-level assessment for the removal of the intake/discharge tunnels and any required soil and/or groundwater remediation at the point where it meets the mean high tide line and remains open (Component 3).

3.0 REGULATORY SETTING

The management of water resources and quality is regulated by both state and federal laws and regulations. These regulations are intended to mitigate risks related to the degradation of water quality. In addition to providing a regulatory framework for this Proposed Project, these regulations describe monitoring and reporting programs related to the preservation of water resources and quality. The following sections describe the federal and state laws and regulations that are applicable to the Proposed Project.

The Proposed Project will require compliance with all applicable regulatory requirements pertaining to storm water quality, including the District Jurisdictional Urban Runoff Management Plan (JURMP; District; 2008) and the District Standard Urban Storm Water Mitigation Plan (SUSMP). BAE Systems will comply with the requirements of its National Pollutant Discharge Elimination System (NPDES) Statewide General Construction Activities Storm Water Permit, including filing a Notice of Intent to the State Water Resources Control Board (SWRCB), implementing construction best management practices (BMPs), and performing ongoing monitoring during construction activities. BAE Systems will also prepare and submit an Urban Storm Water Mitigation Plan (USMP) to demonstrate how the Proposed Project will meet SUSMP requirements.

3.1 Federal Policies and Regulations

Clean Water Act

The federal Clean Water Act (CWA) (also known as the Water Pollution Control Act) is the cornerstone of surface water quality protection in the United States (U.S.). The statute employs a variety of regulatory and non-regulatory tools to sharply reduce pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff (33 United States Code [USC] 1251 et seq.). These tools are employed to achieve the broader goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's waters (United States Environmental Protection Agency [USEPA], 2014a).

According to the CWA, the only way pollutants can be discharged into water is if authorized by a NPDES permit (USEPA, 2014b). Originally, the NPDES permit focused on reducing pollutants from discharges from industrial process wastewater and municipal sewage treatment plants. In 1987, the CWA was amended to require the USEPA to regulate storm water discharges through the use of the NPDES storm water permits. The NPDES permit program is administered by authorized states, including California.

Pertinent sections of the CWA include the following:

- *Section 401.* Under section 401, every applicant for a federal permit or license for any activity that may result in a discharge to a water body must obtain State Water Quality Certification that the proposed activity will comply with state water quality standards. Most Certifications are issued in connection with U.S. Army Corps of Engineers (USACE) CWA Section 404 permits for dredge and fill discharges.

63732 PAGE 206

- *Section 404*. The USACE regulates discharge of dredged or fill material into waters of the U.S. under Section 404 of the CWA. Activities requiring Section 404 permits are limited to discharges of dredged or fill materials into the waters of the U.S.
- *Section 303(d)*. Section 303(d) of the CWA requires identification and listing of those water bodies that are water quality impaired. Once a water body has been deemed impaired, a total maximum daily load (TMDL) must be developed for each impairing water quality constituent. A TMDL is an estimate of the total load of pollutants from point, nonpoint, and natural sources that a water body may receive without exceeding applicable water quality standards (often with a "factor of safety" included that limits the total load of pollutants to a level well below that which could cause the standard to be exceeded). Once established, the TMDL is allocated among current and future dischargers into the water body. The receiving water for the project site, as described in greater detail below, is a Section 303(d) listed water body and is considered impaired for specific constituents.

Clean Water Act, Section 303, List of Water Quality Limited Segments

The SWRCB approved the 2010 Integrated Report (CWA Section 303(d) List/305(b) Report) on August 4, 2010 (SWRCB, 2014a). On November 12, 2010, the USEPA approved the 2010 California 303(d) List of Water Quality Limited Segments. San Diego Bay is listed as impaired for polychlorinated biphenyls (PCBs). The expected TMDL completion date is 2019. The San Diego Bay shoreline between Sampson Street and 28th Street is listed as impaired for copper, mercury, polycyclic aromatic hydrocarbons (PAHs), PCBs, and zinc. The expected TMDL attainment date is 2015 for copper and 2013 for all other constituents. San Diego Bay shoreline near the mouth of Chollas Creek is impaired for benthic community effects and sediment toxicity. The expected TMDL completion date is 2010. TMDLs for toxic pollutants in sediment at the mouth of Chollas Creek including PCBs, PAHs, and chlordane are currently being developed. Chollas Creek is listed as impaired for copper, diazinon, indicator bacteria, lead, phosphorous, total nitrogen as nitrogen, trash, and zinc. The expected TMDL completion date is 2004 for copper, lead, and zinc; 2005 for indicator bacteria; 2019 for phosphorous and total nitrogen as nitrogen; and 2021 for trash.

Oil Pollution Act

The Oil Pollution Act (OPA) was signed into law in August 1990, largely in response to rising public concern following the Exxon Valdez incident. The OPA improved the nation's ability to prevent and respond to oil spills by establishing provisions that expand the federal government's ability to respond to oil spills and to provide the funding and resources for these responses. The OPA also created the national Oil Spill Liability Trust Fund, which is available to provide funding to respond to spill incidents.

In addition, the OPA provided new requirements for contingency planning by both government and industry. The National Oil and Hazardous Substances Pollution Contingency Plan has been expanded in a three-tiered approach: (1) the federal government is required to direct all public and private response efforts for certain types of spill events; (2) Area Committees, composed of

63732 PAGE 207

federal, state, and local government officials, must develop detailed, location-specific Area Contingency Plans; and (3) owners or operators of vessels and certain facilities that pose a serious threat to the environment must prepare their own Facility Response Plans.

Finally, the OPA increased penalties for regulatory noncompliance, broadened the response and enforcement authorities of the federal government, and preserved state authority to establish laws governing oil spill prevention and response.

Federal Emergency Management Agency

Federal Emergency Management Agency (FEMA) is an agency of the U.S. Department of Homeland Security with the primary purpose to coordinate response to disasters that overwhelm the resources of local and state authorities (FEMA, 2014a). President Carter's 1979 Executive Order merged various functions of disaster assistance and civil defense (previously handled by multiple agencies) under the direction of a single agency, FEMA. FEMA was created to coordinate the federal government's role in preparing for, preventing, mitigating the effects of, responding to, and recovering from all domestic disasters, whether natural or manmade, including acts of terror.

On March 21, 2014, President Obama signed the Homeowner Flood Insurance Affordability Act of 2014 into law. This law repeals and modifies certain provisions of the Biggert-Waters Flood Insurance Reform Act, which was enacted in 2012. FEMA will continue to identify and publish special flood hazards and flood risk zones as authorized and required by Congress. More information on the new law and its impacts on the National Flood Insurance Program (NFIP) will be forthcoming.

The Federal Insurance and Mitigation Administration and the Mitigation Directorate, which are components of FEMA, manage the NFIP. NFIP has developed Flood Insurance Rate Maps (FIRMs) that indicate areas with low, moderate, or high risk for flooding (FEMA, 2014b). FIRMs specifically illustrate a community's floodplain boundaries, base flood elevations (BFEs), and flood zones. Floodplain boundaries are the areas of land that could be impacted by flooding from a nearby body of water. BFE is the computed elevation (or height) to which floodwater is anticipated to rise during a 100-year flood. A 100-year floodplain is not an area subject to floods every 100 years; instead, it is land bordering a river or channel that can expect to be flooded in a storm that has a 1 percent chance of occurring each year.

FIRMs show different zone designations for various floodplains, depending on the risk of flooding (FEMA, 2014b). For example, Zone A covers areas that are subject to inundation by a 100-year flood and includes six different types, such as Zone AE, which is a floodplain where a BFE has been provided. Another example is Zone VE, which is a coastal area subject to a velocity hazard (wave action) where BFEs are provided on the FIRM, and Zone X, which is an area of minimal flood hazard and outside the 500-year flood level.

63732 PAGE 208

Marine Protection, Research, and Sanctuaries Act of 1972, Section 103

Titles I and II of the Marine Protection, Research, and Sanctuaries Act (MPRSA), also referred to as the Ocean Dumping Act, generally prohibit (1) transportation of material from the U.S. for the purpose of ocean dumping; (2) transportation of material from anywhere for the purpose of ocean dumping by U.S. agencies or U.S.-flagged vessels; and (3) dumping of material transported from outside the U.S. into the U.S. territorial sea (USEPA, 2014c). A permit is required to deviate from these prohibitions.

Under MPRSA, the standard for permit issuance is whether the dumping will "unreasonably degrade or endanger" human health, welfare, or the marine environment. The USEPA is charged with developing ocean dumping criteria to be used in evaluating permit applications. The MPRSA provisions administered by the USEPA are published in Title 33 of the USC. The MPRSA provisions that address marine sanctuaries are administered by the National Oceanic and Atmospheric Administration and are published in Title 16 of the USC.

Rivers and Harbors Act, Section 10

Section 10 of the Rivers and Harbors Act (33 USC 401 et. seq.) requires authorization from the USACE for the construction of any structure in or over any navigable water of the U.S., the excavation/dredging or deposition of material in these waters, or any obstruction or alteration in a navigable water. Structure or work outside the limits defined for navigable waters of the U.S. require a Section 10 permit if the structure or work affects the course, location, condition, or capacity of the water body.

3.2 State and Local Policies and Regulations

Porter-Cologne Water Quality Act

In 1969, the California Legislature enacted the Porter-Cologne Water Quality Act (Porter-Cologne Act) to preserve, enhance, and restore the quality of the state's water resources (SWRCB, 2014c). The Porter-Cologne Act establishes water quality policies, enforces water quality standards for surface and ground water, and regulates discharges of pollutants. The Porter-Cologne Act establishes the SWRCB and nine Regional Water Quality Control Boards (RWQCBs) as the principal state agencies with the responsibility for controlling water quality in California.

State Water Resources Control Board/Regional Water Quality Control Boards

The SWRCB has the ultimate authority over state water rights and water quality policy. Nine RWQCBs are also established to oversee water quality on a day-to-day basis at the local and regional level. The SWRCB and RWQCBs are responsible for ensuring implementation and compliance with the provisions of the CWA and Porter-Cologne Act. The project site is located within SWRCB Region 9 under purview of the San Diego RWQCB (SDRWQCB).

63732 PAGE 209

California Regional Water Quality Control Board, San Diego Region

The SDRWQCB regulates wastewater discharges to surface water (rivers, ocean, etc.) and to groundwater (via land). It also regulates storm water discharges from construction, industrial, and municipal activities; discharges from irrigated agriculture; dredge and fill activities; the alteration of federal water body under the Section 401 certification program; and several other activities with practices that could degrade water quality.

California Ocean Plan

Section 13170.2 of the California Water Code directs the SWRCB to formulate and adopt a water quality control plan for ocean waters of California. The SWRCB first adopted this plan, known as the California Ocean Plan, in 1972 (Ocean Protection Council, 2012). The California Water Code also requires a review of the California Ocean Plan at least every three years to guarantee that current standards are adequate and are not allowing degradation to indigenous marine species or posing a threat to human health. The amendments to the California Ocean Plan are reviewed and approved by the USEPA under the CWA.

The California Ocean Plan establishes water quality objectives and beneficial uses for California's ocean waters and provides the basis for regulation of wastes discharged into the state's coastal waters. The plan applies to point and nonpoint source discharges. Both the SWRCB and the six coastal RWQCBs implement and interpret the California Ocean Plan.

Water Quality Control Plan for the San Diego Basin

RWQCBs are required to develop and periodically update a Water Quality Control Plan, also known as a Basin Plan (SDRWQCB, 2011). The Water Quality Control Plan establishes water quality objectives for the ground and surface waters of the region and includes an implementation plan describing the actions by the SDRWQCB and others that are necessary to achieve and maintain these water quality objectives. The project site falls under the Water Quality Control Plan for the San Diego Basin (SDRWQCB, 2011).

As defined in the Porter-Cologne Act, water quality objectives are the set limits or levels of chemical constituents allowable in water (SDRWQCB, 2011). The designation of water quality objectives must satisfy all of the applicable requirements of the Porter-Cologne Act and the CWA. Through water quality objectives, the SDRWQCB provides for the reasonable protection of beneficial uses, taking into account existing water quality, environmental, and economic considerations.

National Pollutant Discharge Elimination System General Construction Permit

Pursuant to the CWA Section 402(p), which requires regulations for permitting of certain storm water discharges, BAE Systems will need to acquire a statewide NPDES permit for storm water discharges from the construction site and the dry dock once operative. Under this Construction General Permit, storm water discharges from construction sites with a disturbed area of one or more acres are required to obtain individual NPDES permits for storm water discharges or to be

63732 PAGE 210

covered by the Construction General Permit. Coverage under the Construction General Permit is accomplished by completing and filing a Notice of Intent with the SDRWQCB. Each applicant under the Construction General Permit must ensure that a Storm Water Pollution Prevention Plan (SWPPP) is prepared prior to operations or construction. The primary objective of the SWPPP is to identify, construct, implement, and maintain best management practices (BMPs) to reduce or eliminate pollutants in storm water discharges and authorized non-storm water discharges from the construction site.

Municipal Permit

As delegated by the USEPA under the NPDES permit program, the SWRCB enforces the regulation of nonpoint source pollution and urban runoff in California, which uses a system of regional entities. A new Municipal Permit[2] was adopted by the SDRWQCB on May 8, 2013 that regulates discharges from Municipal Separate Storm Sewer Systems (MS4s) by establishing a new, watershed-based approach to plan and implement storm water programs (SDRWCB, 2013). The Municipal Permit includes 39 municipal, county government, and special district entities (referred to jointly as co-permittees) located in Southern Orange County, Southwestern Riverside County, and San Diego County. The co-permitees own and operate large MS4s that discharge storm water runoff and non-storm water runoff to surface waters throughout the San Diego region. The Municipal Permit requires each co-permittee to reduce discharges of pollutants and runoff flow during each of the following three major phases of urban development: planning, construction, and operation. New developments and redevelopment projects are required to identify and apply BMPs to reduce storm water pollutants to the maximum extent practicable (MEP). Elements of the Municipal Permit include the JRMP, and the post-construction BMPs.

Jurisdictional Runoff Management Plan

The NPDES permit program requires that each co-permittee implement a JRMP, which consists of the following components: land-use planning for new development and redevelopment; construction; existing development; education; illicit discharge detection and elimination; public participation; assessment of JRMP effectiveness; and fiscal analysis.

The primary objectives of the JRMP requirements are as follows:

- Ensure that discharges from municipal urban runoff conveyance systems do not cause or contribute to a violation of water quality standards;
- Effectively prohibit non-storm water discharges in urban runoff; and
- Reduce the discharge of pollutants from urban runoff conveyance systems to the MEP statutory standard.

[2] National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer System (MS4) Draining the Watersheds Within the San Diego Region (Municipal Permit) (Order Number R9-2013-0001, NPDES No. CAS0109266, Regional Board, 2013).

BMP Design Manual

The Municipal Permit requires co-permittees to incorporate a structural BMP performance requirements into their project approval process. The permitted parties are currently working on a BMP Design Manual which will be completed by June 2015. In the interim, the Standard Urban Stormwater Mitigation Plan (SUSMP) serves as the guidance document for BMP requirements for new development and redevelopment. The SUSMP, which was developed collaboratively by the co-permittees, addresses only land development and capital improvement projects. It is focused on project design requirements and related post-construction requirements, not on the construction process itself. Along with the detailed design procedure, the SUSMP includes design information and criteria for dispersal of runoff to landscaped areas and for pervious pavements, bioretention facilities, flow-through planters, infiltration trenches, infiltration basins, and cisterns (County of San Diego, 2011).

San Diego Bay Watershed Management Area Water Quality Improvement Plan

The new Municipal Permit requires that each jurisdictions' storm water program addresses priority receiving water conditions, focusing efforts toward measureable improvements in receiving water quality (District, 2014). To establish and implement these requirements, the new Municipal Permit requires that a Water Quality Improvement Plan (WQIP) be developed for the San Diego Bay Watershed Management Area (WMA). WMA responsible parties (RPs) included in the development of the WQIP are the County of San Diego, the Port of San Diego, the San Diego County Regional Airport Authority, and the Cities of Chula Vista, Coronado, Imperial Beach, La Mesa, Lemon Grove, National City, and San Diego. The California Department of Transportation (Caltrans) is also participating voluntarily in the development of the San Diego Bay WMA WQIP as a named party in the Chollas Creek TMDLs (District, 2014).

The final WQIP document will incorporate monitoring, assessment, and adaptive management processes for the Highest Priority Conditions and Focused Priority Conditions. The WQIP will develop final numeric goals for each Highest Priority Conditions and Focused Priority Conditions in addition to strategies that the RPs intend to implement to make measureable progress toward the goals. The document is currently in the second phase of development, and is intended to be finalized and submitted to the SDRWCB by June 2015 (District, 2014).

San Diego County Multi-Jurisdiction Hazard Mitigation Plan

The San Diego County Multi-Jurisdiction Hazard Mitigation Plan (County of San Diego, 2010) was prepared with input from responsible officials, the San Diego County Water Authority, the Rancho Santa Fe Fire Protection District, the California Emergency Management Agency, and FEMA. It was prepared in response to the Disaster Mitigation Act of 2000 and other federal legislation that reinforce the importance of mitigation planning and emphasize planning for disasters before they occur.

63732 PAGE 212

This plan is intended to serve many purposes, including enhancing public awareness and understanding; creating a decision tool for management; promoting compliance with state and federal program requirements; enhancing local polices for hazard mitigation capability; providing inter-jurisdictional coordinating mitigation-related programming; and achieving regulatory compliance.

General Waste Discharge Requirements for Construction Non-Storm Water Discharges

General Waste Discharge Requirements (WDRs) (Dewatering General Permit) will be issued by the SDRWQCB, which governs non-storm water, construction-related discharges from activities associated with the upland dewatering staging areas. This permit addresses discharges from activities such as dewatering, water line testing, and sprinkler system testing. The discharge requirements include provisions mandating notification, testing, and reporting of dewatering and testing-related discharges. The General WDRs authorize such construction-related discharges as long as all conditions of the permit are fulfilled.

3.2.1 San Diego Unified Port District Policies and Regulations

District Jurisdictional Urban Runoff Management Plan

The District, as a co-permittee on the Municipal Permit, has prepared a JURMP document (District, 2008) and annual reports (District, 2012).[3] As identified in the District JURMP, the document has been developed to assist the District in identifying causes or contributions to water quality impacts, tracking urban runoff related activities, and implementing to the MEP BMPs to reduce or eliminate pollutants from reaching receiving waters in the District's jurisdiction.

The main objectives of the District's JURMP are to:

- Improve water quality in San Diego Bay and adjacent receiving waters;
- Minimize the urban runoff discharges from District tidelands; and
- Improve program management efforts related to urban runoff.

To achieve these objectives, the District engages in a number of activities, including employee training, tenant and public education/outreach, source identification, water quality monitoring, BMP development and implementation, inspections, code enforcement, and coordination with adjacent cities. Finally, as required by the Municipal Permit, the District compiles an Annual Report documenting the program activities conducted for the year.

[3] The new 5-year Municipal Permit (2015) redefines the JURMP as a JRMP.

63732 PAGE 213

Standard Urban Storm Water Mitigation Plan[4]

The District, as a co-permittee on the Municipal Permit, jointly developed a model Jurisdictional SUSMP which meets the objectives of the JRMP (described in Section 3.2 under Municipal Permit) and can be used as a model for jurisdictional plans (District, 2011). The District SUSMP addresses post-construction urban runoff from new development and redevelopment projects that are considered to be "priority projects." The District SUSMP ensures to the maximum extent practicable that development will not increase pollutant loads and considers urban runoff flow rates, velocities, and durations. This may be achieved through site-specific controls and/or structural treatment controls. The District details specific steps for development projects to ensure adherence to the SUSMP. The District SUSMP includes a list of recommended BMPs, which are designed to remove pollutants to the maximum extent practicable.

Urban Storm Water Mitigation Plan

The District requires all new construction and redevelopment "priority projects" to comply with established SUSMP requirements. If SUSMP requirements apply, the project proponent must submit an USMP that describes how the project will meet SUSMP requirements. In general, the USMP must clearly convey the process used to identify pollutants of concern, conditions of concern, and BMPs selected for the project as well as to identify BMP maintenance requirements. The USMP must include storm water BMP maintenance provisions in an Operations and Maintenance Plan.

The SUSMP requirements apply to this project and therefore a USMP will be produced.

Storm Water Management and Discharge Control Ordinance

The District has adopted the Storm Water Management and Discharge Control Ordinance (Article 10), which sets forth requirements for dischargers to the District's storm water conveyance system and receiving waters. Article 10 also provides enforcement authorities to the District to implement its JRMP and any laws that provide protection and enhancement of water quality.

Specific objectives of Article 10 include the following:

- Reduce storm water runoff pollution;
- Reduce non-storm water discharge to the storm water conveyance system and receiving waters to the maximum extent practicable;
- Comply with all federal and state laws, lawful standards, and orders applicable to storm water and urban runoff pollution control;

[4] The permitted parties are currently working on a BMP Design Manual which will be completed by June 2015. In the interim, the District SUSMP serves as the guidance document for BMP requirements for new development and redevelopment.

- Prohibit any discharge that may interfere with the operation of, or cause damage to, the storm water conveyance system, or contribute to the impairment of the beneficial use or violation of a water quality objective of the receiving waters;
- Prohibit illegal discharges and illicit connections to the storm water conveyance system and receiving waters; and
- Develop and implement effective educational outreach programs designed to educate the public and District employees and tenants on issues of storm water and urban runoff pollution prevention.

This Ordinance requires compliance with general permits, including construction municipal permits or any general or individual storm water municipal permit, as well as compliance with BMPs, to reduce pollutants to the maximum extent practicable.

DRAFT

63732 PAGE 215

4.0 PROJECT SETTING

BAE Systems currently leases approximately 9.8 acres of land and 16.6 acres of water on District tidelands property on the eastern waterfront of central San Diego Bay (Figure 1-1). BAE Systems (formerly operating as Southwest Marine Shipyard) began occupancy of the site in September 1979. Shipyard facilities operated over the years have included concrete platforms used for steel fabrication, two floating dry docks, five piers, and two marine railways that, together with cranes, enable ships to be launched or repaired. An assortment of waste has been generated at the facility, including spent abrasives, paint, rust, petroleum products, marine growth, sanitary waste, and general refuse. BAE Systems and former property owners at the site have historically performed ship repair and maintenance for the U.S. Navy and commercial customers (SDRWQCB, 2010). In addition to area included within the District tidelands lease, BAE Systems also currently subleases an approximately 2-acre land-side and 4-acre water-side parcel from the District via a TUOP[5].

BAE Systems maintains industrial facilities (production shops, offices, and related utilities, and infrastructure) for the maintenance, repair, overhaul, and conversion of large naval and commercial vessels. Waterfront storm water collection tanks are located along the shoreline near the Pier 4 abutment, which is located at the southern end of the facility near Schley Street. Additionally, there are areas of pavement and ramps, as well as buried pipes, a valve vault, utility vaults, three underground sewage lift stations, electrical substations, concrete revetments, and shoreline riprap and rubble.

Three working piers exist at BAE Systems to moor vessels for ship repair activities. These piers (Piers 1, 3 and 4[6]) currently accommodate berthing of large, deep-draft U.S. Navy and (to a lesser extent) commercial vessels, and include a variety of crane and utility services. Currently, BAE Systems acts as the prime contractor for five classes of U.S. Navy vessels: cruisers, destroyers, amphibious transport docks, dock landing ships, and mine countermeasures vessels. The facility is designed to support both pier-side repair (including vessel berthing) and dry dock repair, under multi-ship, multi-option contracts.

4.1 San Diego Bay Watershed

The project site is located on and adjacent to San Diego Bay, which originated from the alluvial plains of the Otay, San Diego, and Sweetwater Rivers. The San Diego Bay watershed encompasses a 415-square-mile area that extends more than 50 miles to the east to the Laguna Mountains. The watershed lies at sea level at San Diego Bay and reaches a maximum elevation of approximately 6,000 feet above sea level at the eastern boundary. Most of the watershed land area generally lies north of the border with Mexico and south of Interstate Highway 8. The headwaters of the watershed begin in the unincorporated area of San Diego County and then transect all or portions of seven cities.

[5] At the time of preparation of this Water Quality Technical Report, the Tidelands Use and Occupancy Permit (TUOP) with SDG&E, dated November 1, 2009 (Document No. 55689) expired on October 31, 2014. This parcel is currently leased to BAE Systems by the District via a 5-year TUOP.

[6] The replacement Pier 4 is currently under construction.

63732 PAGE 216

Most of the freshwater input to San Diego Bay is from surface runoff from urban areas and intermittent flow from rivers and creeks during rainfall events. The major watercourses feeding San Diego Bay include the Sweetwater River, Otay River, Chollas Creek, Paleta Creek, Paradise Creek, and Switzer Creek. In winter, when San Diego County receives most of its precipitation, fresh water enters San Diego Bay via storm drains, urban runoff, streams, and flood control channels. In summer, freshwater flows into San Diego Bay are minimal, and evaporation of water from the surface of San Diego Bay increases. San Diego Bay is an "inverse" embayment, where evaporation exceeds freshwater inputs, creating a net inflow of ocean water.

Tides in San Diego Bay are classified as mixed diurnal/semi-diurnal, with the semi-diurnal component dominant. Generally, the tides in San Diego Bay consist of two low and two high tides per day on an approximately 2-week, spring-neap tidal cycle that is associated with the phase of the moon. Tides do not follow a 24-hour cycle, so some days experience only three of the four tides within a calendar day.

4.1.1 Pueblo San Diego Hydrologic Unit

As defined in the SDRWQCB Water Quality Control Plan for the San Diego Basin, watersheds are described as Hydrologic Units (HUs), Hydrologic Areas (HAs), and Hydrologic Subareas (SAs) (SDRWQCB, 2011). HUs are subdivided into HAs, which are divided into SAs. The purpose of hydrologic boundaries is to designate the area within a larger watershed that drains in a particular direction to a particular waterbody. HUs are the entire watershed of one or more streams, HAs are major tributaries and/or major groundwater basins within the HU, and SAs are major subdivisions of HAs, including both water-bearing and non-water-bearing formations.

According to the Water Quality Control Plan for the San Diego Basin, the project site is within the Pueblo San Diego HU, San Diego County's smallest HU (SDRWQCB, 2011). The Pueblo San Diego HU is a triangular-shaped area of about 60 square miles with no major stream system. It is bordered to the north by the watershed of the San Diego River and on the south, in part, by that of the Sweetwater River. The major population center is the City of San Diego. The unit is relatively dry with an annual precipitation of less than 11 to 13 inches. The San Diego Bay lies offshore of this unit.

The Pueblo San Diego HU comprises the following three HA boundaries: Point Loma, San Diego Mesa, and National City. The project site is specifically located within the San Diego Mesa HA boundary and Chollas HA boundary (SDRWQCB, 2011).

4.1.2 Surface Water Quality

Tidal exchange in San Diego Bay exerts control over the flushing of contaminants, salt and heat balance, and residence time of water. The ebb and flow of tides mix ocean and San Diego Bay waters. Tides produce currents, induce changes in salinity, and alternately expose and wet portions of the shoreline. Tidal flushing and mixing are important for dispersing pollutants, maintaining water quality, and moderating water temperature that has been affected by exchange with the atmosphere or heating.

63732 PAGE 217

Primarily, water quality in north-central San Diego Bay, where the project site is located, is affected by tidal flushing and currents. Water quality also is influenced locally by freshwater inflows. Major contaminants found in San Diego Bay include chlorinated hydrocarbons, toxic components of petroleum hydrocarbons, PAHs, PCBs, heavy metals, and organotins such as tributyltin.

As discussed in Section 3.1, San Diego Bay is impaired for several constituents. A total of 172 acres of San Diego Bay are designated as contamination hot spots that contain toxic sediments and degraded benthic communities due to both point and nonpoint sources. The San Diego Bay shoreline between Sampson Street and 28th Street is impaired for copper, mercury, PAHs, PCBs, and zinc.

Water quality characteristics (e.g., salinity, temperature, and dissolved oxygen) form a gradient within San Diego Bay: waters in northern San Diego Bay are similar to ocean conditions; waters in southern San Diego Bay are strongly affected by shallow depths, fresh water inflows, and insulation; and waters in central San Diego Bay are intermediate in character. The turbidity (i.e., the amount of particulate matter in suspension in the water column) of San Diego Bay waters is affected by phytoplankton blooms; inputs of fine sediments from surface runoff during and after storms; and sediment resuspension by winds, waves, and human activities. Consequently, an increase in turbidity can limit light penetration and the level of primary production. Turbidity in San Diego Bay varies both temporally and spatially.

4.1.3 Beneficial Uses

Beneficial uses are defined within the Basin Plan as the uses of water necessary for the survival or well-being of man, plants, and wildlife (SDRWQCB, 2011). The following beneficial uses, as defined statewide, are designated within the project area and are shown in Table 4-1:

- Municipal and Domestic Supply (MUN) – Includes uses of water for community, military, or individual water supply systems, including, but not limited to, drinking water supply.
- Water Contact Recreation (REC-1) – Includes uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses may include, but are not limited to, swimming, wading, water-skiing, skin and SCUBA diving, surfing, whitewater activities, fishing, and use of natural hot springs.
- Non-contact Recreation (REC-2) – Includes the uses of water for recreational activities involving proximity to water, but not normally involving body contact with water where ingestion of water would be reasonably possible. These uses may include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing, and aesthetic enjoyment in conjunction with the above activities.
- Warm Freshwater Habitat (WARM) – Includes the uses of water that support warm water ecosystems, including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, and fish or wildlife including invertebrates.

63732 PAGE 218

- Wildlife Habitat (WILD) – Includes the uses of water that supports wildlife habitats that may include, but are not limited to, the preservation and enhancement of vegetation and prey species used by waterfowl and other wildlife.
- Industrial Service Supply (IND) – Includes uses of water for industrial activities that do not depend primarily on water quality, including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, or oil well re-pressurization.
- Navigation (NAV) – Includes uses of water for shipping, travel, or other transportation by private, military, or commercial vessels.
- Commercial and Sport Fishing (COMM) – Includes the uses of water for commercial or recreational collection of fish, shellfish, or other organisms, including, but not limited to, uses involving organisms intended for human consumption or bait purposes.
- Estuarine Habitat (EST) – Includes uses of water that support estuarine ecosystems, including, but not limited to, preservation or enhancement of estuarine habitats, vegetation, fish, shellfish, or wildlife (e.g., estuarine mammals, waterfowl, shorebirds).
- Marine Habitat (MAR) – Includes uses of water that support marine ecosystems including, but not limited to, preservation or enhancement of marine habitats, vegetation such as kelp, fish, shellfish, or wildlife (e.g., marine mammals, shorebirds).
- Preservation of Biological Habitats of Special Significance (BIOL) – Includes uses of water that support designated areas or habitats, such as established refuges, parks, sanctuaries, ecological reserves, or Areas of Special Biological Significance (ASBS), where the preservation or enhancement of natural resources requires special protection.
- Rare, Threatened, or Endangered Species (RARE) – Includes uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.
- Migration of Aquatic Organisms (MIGR) – Includes uses of water that support habitats necessary for migration, acclimatization between fresh and salt water, or other temporary activities by aquatic organisms, such as anadromous fish.
- Spawning, Reproduction, and/or Early Development (SPWN) – Includes uses of water that support high-quality aquatic habitats suitable for reproduction and early development of fish. This use is applicable only for the protection of anadromous fish (e.g., those fish that transition between saltwater and freshwater conditions).
- Shellfish Harvesting (SHELL) – Includes uses of water that support habitats suitable for the collection of filter-feeding shellfish (e.g., clams, oysters, and mussels) for human consumption, commercial, or sport purposes.
- Aquaculture (AQUA) – Includes the uses of water for aquaculture or mariculture operations, including, but not limited to, propagation, cultivation, maintenance, or harvesting of aquatic plants and animals for human consumption or bait purposes.

4.1.4 Groundwater

Groundwater basins are defined in the Water Quality Control Plan for the San Diego Basin by the same HUs, HAs, and SAs as are surface waters. Groundwater at the project site has substantial saltwater intrusion and is unsuitable for use as drinking water (LSA, 2011). The existing shoreline where the bulkhead will be constructed is covered in impervious surfaces that do not support surface recharge of groundwater.

4.1.5 Drainage and Flood Control

The existing shoreline under the TUOP parcel is mostly flat and covered in impervious surfaces (primarily pavement). During construction activities (including potential future demolition of the cooling tunnels, installation of sheet piles, ramp wharf construction, installation of new utilities, demolition and installation of mooring dolphins, and deployment of the new dry dock), storm water will be contained onsite; therefore, no treatment control BMPs will be necessary.

The project site is located within Flood Insurance Rate Map (FIRM) panel number 06073C1884F (FEMA, 2014b). The shoreline is located in Zone X, which is an area determined to be outside the 500-year floodplain (Figure 4-1). The San Diego Bay is located within Zone AE, which is a special flood hazard area that would be inundated by a 100-year flood.

The San Diego County Multi-Jurisdiction Hazard Mitigation Plan used the FIRM data to determine hazard risk for floods in San Diego County. This plan also identified the project site, as well as most of the San Diego County coastal areas, as being within a coastal storm/erosion/tsunami hazard area. However, the project site is not within an identified FEMA VE Zone, which is a high-risk tsunami zone (County of San Diego, 2010).

4.2 Project Site Sediment Quality

Two components of the Proposed Project relate to project site sediment quality: 1) dredging associated with the installation of the new dry dock on the northern side of Pier 1; and 2) removal of the intake/discharge cooling tunnels from the TUOP parcel.

4.2.1 New Dry Dock Sump Dredging

The installation of a new dry dock on the northern side of Pier 1 will require dredging of approximately 395,000 cy of San Diego Bay bottom. The purpose of the dredging is to create a deep hole (referred to as a dry dock sump) in the bay bottom into which the floating dry dock can be submerged during ship loading and unloading operations.

The design depth needed to accommodate new dry dock operations is -65 feet MLLW (Figure 4-2). The dry dock dimensions will be approximately 205 feet by 851 feet, plus an apron on each end. While most of the dry dock dredging will be performed east of the U.S. Pierhead Line within Port tidelands jurisdiction, dredging will also take place west of the U.S. Pierhead Line within the jurisdiction of the California State Lands Commission and the California Coastal Commission. In addition to Port District approvals, the Proposed Project will also require separate authorizations from these state agencies, as well as the USACE and the SDRWQCB.

Dry dock sump dredging will involve excavation of bay sediments considerably deeper than the existing bottom grade. The vertical profile of the dredge footprint includes two different types of sediments: (1) unconsolidated, recently deposited sediments, and (2) dense, native materials that have never been dredged. Approximately 80 percent of the dredged material is native sediment deposits, with a smaller fraction of the dredged material, approximately 20 percent, being unconsolidated bay mud (Figure 4-3).

To identify suitable disposal locations for the approximately 395,000 cy of dry dock sump dredged material, an extensive sediment characterization study was conducted in accordance with USACE and USEPA testing guidelines. The dry dock sump sediment characterization program was performed in accordance with a Sampling and Analysis Plan that was reviewed and approved by the USACE and USEPA (AMEC Environment & Infrastructure, Inc. [AMEC], 2014a). The results of the sediment characterization study are detailed in the report entitled *Draft Pier 1N Dry Dock Sump Dredging Project, Dredged Material Characterization Study, BAE Systems San Diego Ship Repair, San Diego, California* (AMEC, 2014b).

The sediment characterization study was conducted to evaluate the suitability of the dredged material for a range of disposal options, including disposal at the LA-5 Ocean Dredged Material Disposal Site (ODMDS) and/or beneficial reuse for mitigation or beach nourishment. Ocean disposal of dredged materials is regulated under Section 103 of the MPRSA, Title 33 CFR 320-330 and 335-338. Environmental evaluations of dredged materials proposed for ocean disposal must comply with applicable criteria published in Title 40 CFR 220–238. Discharges of fill (e.g., beneficial reuse such as beach nourishment or in-bay fill for mitigation) in waters of the U.S. are subject to Section 404 of the CWA. CWA Section 404 discharges of dredge material also require a CWA Section 401 WQC from the SDRWQCB.

63732 PAGE 224

The suitability of dredged material for unconfined aquatic disposal is determined by the USACE and USEPA on the basis of review of the multi-tiered sediment testing results. Any sediment deemed unsuitable for aquatic disposal by the USACE/USEPA will require placement in a designated upland landfill. The practice of dredging with upland landfill disposal of sediments has undergone considerable CEQA review and permitting for several recently completed and ongoing projects at the BAE Systems San Diego Ship Repair facility and other locations. Recent upland projects include the "Pride of San Diego" (POSD) Dry Dock Sump Maintenance Dredging Project and the Pier 4 Replacement Project. Ongoing upland landfill disposal activities are being implemented for the San Diego Shipyard Sediment Remediation Project. The dredging, treatment, transfer, and transportation methods employed for landfill disposal of contaminated dredged materials are well documented and are described in detail in the San Diego Shipyard Sediment Remediation Project Remedial Action Plan (RAP) (Anchor QEA, 2012).

4.2.1.1 Dredged Material Study Results

BAE Systems' testing program for the Proposed Project included collection of core samples in May 2014 at numerous locations throughout the unconsolidated, upper layers of the dry dock sump footprint. The sediment core samples were subjected to a battery of tests in accordance with the guidelines of the USEPA and the USACE, as outlined in (1) *Evaluation of Dredged Material Proposed for Ocean Disposal* (referred to as the "Green Book") (USEPA/USACE, 1991), and (2) *Evaluation of Dredged Materials Proposed for Discharge in Waters of the United States*, EPA-823-B-98-004 (Inland Testing Manual [ITM]) (USEPA/USACE, 1998).

The sediment testing program included the following analyses: (1) physical analyses to determine the grain size of the dredged materials (e.g., percentage of sand, percentage of fines); (2) chemical analyses for a suite of contaminants of concern, including heavy metals, petroleum hydrocarbons, chlorinated and pyrethroid pesticides, polychlorinated biphenyls, organotin compounds, polycyclic aromatic and petroleum hydrocarbons, and others; (3) sediment and water column toxicity analyses using sensitive marine organisms as indicators for acute and chronic toxicity (e.g., amphipods, bivalve larvae); and (4) exposures using worms and clams to assess the potential for organisms to bioaccummulate chemicals into their tissues.

Sediment samples found deeper in the footprint (i.e., native sediments) were collected using soil-boring equipment (a hollow-stem auger). The native sediments within the dredge footprint were collected during the geotechnical evaluation performed by TerraCosta Consulting Group in June 2014. A soil-boring device was needed to penetrate deep into the dense, consolidated native sediments found below the upper unconsolidated surface sediments. Because these deeper sediments have never been exposed to sources of contamination, the sediment testing regime for these samples was limited to physical and chemical analyses.

4.2.1.2 Dredged Material Study Results – Surface Sediments

Dredged material disposal location suitability is determined by comparisons of the chemical levels, toxicity, and bioaccumulation results from the project site sediment with guideline values (e.g., effects range-low [ERLs] and effects range-median [ERMs]) and statistical comparisons of the test results with reference sediment tests.

63732 PAGE 229

Results of the testing conducted on the unconsolidated dry dock sump sediment showed the following:

1. Comparison of the sediment chemistry results for sediments collected in the dry dock sump footprint with the ERL/ERM guideline values and the reference sediment results indicates, in general, that most of the test sediments collected within the dredge footprints contain low concentrations of chemical contaminants.
2. Results of the water column and sediment toxicity tests showed no significant effects on test organisms exposed to dry dock sump dredged material samples.
3. No significant bioaccumulation of chemicals was observed in clams or worms exposed to dry dock sump sediments.

4.2.1.3 Dredged Material Study Results – Native Sediments

Analysis of the native layer indicated little to no anthropogenic influence in the sediment chemistry below the unconsolidated-native sediment interface. This finding verifies that the native material is clean, native sediment that is free of chemical contaminants.

4.2.1.4 Dredged Material Study Results – Disposal Suitability Determination

Based upon low chemical levels, and lack of significant toxicity and bioaccumulation, it appears that these sediments within the dry dock footprint meet the limiting permissible concentration for unconfined aquatic disposal as outlined in the Ocean Dumping Law and CWA Section 404. The ultimate decision regarding disposal site suitability is made by the USACE in consultation with the USEPA. The agencies' determination of ocean disposal suitability will likely be finalized in November 2014[7].

Evaluation of beneficial reuse options for the Proposed Project dredged materials that are deemed suitable for unconfined aquatic disposal is being conducted by Merkel & Associates for BAE Systems. The final beneficial reuse option(s) will require approval by the USACE/USEPA and be permitted by all appropriate agencies prior to placement.

4.2.1.5 Dredged Material Study Results – Potential Additional Testing

As mentioned previously, the San Diego Shipyard Sediment Remediation Project (i.e. the CAO Area dredging project) will be completed before any of the dredging activities associated with the Proposed Project are initiated. For the CAO Area dredging project to be considered complete, post-dredge confirmation sediment testing is required. The confirmation testing will be conducted to verify that the contaminant levels (i.e. concentration levels) in the post-dredge

[7] In an e-mail dated November 17, 2014, from Robert Smith of the USACE to Shaun Halvax of BAE Systems SDSR, the USACE and USEPA provided their preliminary determination on the suitability of the Proposed Project dredged material for unconfined aquatic disposal. The USEPA concluded, "Overall, the proposed sediments from composite areas A and B appear to be suitable for unconfined aquatic disposal at LA-5 or other beneficial reuse options; there appear to be sandy sediments available from this project, particularly in the consolidated native sediments below the unconsolidated muddy layer." The USACE concurred by stating, "The Corps concurs with EPA in reference to the chemical contaminant concentrations being below the ERL and ERM screening levels under Item 3. The submitted bioassays also indicate the dredged material is suitable for unconfined aquatic disposal per Item 4. below." The agencies also requested additional information regarding beneficial reuse options for the material.

63732 PAGE 230

surface sediments meet the cleanup objectives contained in the CAO for all primary contaminants of concern.

Once the San Diego Shipyard Sediment Remediation CAO Area dredging has been deemed complete by the SDRWQCB, any remaining unconsolidated sediment in the CAO area of the Proposed Project footprint considered for unconfined aquatic disposal will need to be tested in accordance with USACE/USEPA guidance (i.e., Green Book and ITM) to determine disposal site suitability. To date, none of the unconsolidated surface sediments within the CAO area have been tested for unconfined aquatic disposal suitability. The deeper native sediments in the CAO area, however, have been chemically tested and appear to meet the criteria for placement at LA-5 ODMDS.

Following completion of the CAO dredging and subsequent closure of the site, it is expected that any remaining residual unconsolidated sediments that are characterized will pass all required Green Book tests and be deemed suitable for unconfined aquatic disposal at the LA-5 ODMDS. However, if any portion of the dredged material does not meet Ocean Dumping Law criteria, the unsuitable sediment would need to be placed in an upland landfill. In the event that upland disposal is required, this activity would be conducted according to the standards and practices that were previously employed by BAE Systems for other CEQA-certified and agency-permitted projects (e.g. Pier 4 Replacement Project).

4.3 Existing Operations

BAE Systems currently has one floating dry dock—the "Pride of San Diego" (POSD), which has been operating at the facility since 1984. BAE Systems formerly operated a second dry dock at the facility (the "Diligence"), but in 2010 it was sold and relocated to the South Bay. In 2013, the dry dock was removed from San Diego Bay. Over the past five years, BAE Systems has averaged four dry dockings per year.

The proposed location of the new dry dock eliminates one large vessel wet berth at Pier 1N (Figure 4-4). Similar to the existing dry dock, the new dry dock at Pier 1N will be used to conduct repair and maintenance activity that cannot normally be conducted while the vessel is submerged. These activities generally include exterior hull repair, preservation (abrasive blasting and/or hydro-blasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. Ships are docked by lowering (submerging) and then raising the dry dock by means of integral ballast tanks, which take in and discharge seawater. Once the dry dock is lowered, a vessel is positioned within the dock. The dry dock is then raised, and the ship is lifted out of the water.

Wastes generated during ship repair in dry dock may include spent abrasives, paint, rust, petroleum products, marine growth, and general refuse, all of which are contained and then transferred to shore facilities for disposal. Environmental protection related to dry dock operations includes complete encapsulation of the vessel to prevent fugitive particulate emissions, storm water collection, and zero discharge of industrial wastewater. In addition, BAE Systems enforces a stringent Best Management Practices (BMP) Manual (BAE Systems 2013)

63732 PAGE 231

and detailed standard operating procedures (SOPs) for its dry dock operations and hazardous material handling activities at the shipyard.

4.4 Intake/Discharge Cooling Tunnels

The 2-acre TUOP parcel currently has two subsurface intake/discharge water tunnels that were installed by San Diego Gas and Electric (SDG&E) and previously used for intake/discharge of cooling water for the SDG&E Silvergate Power Plant.[8] The intake/discharge tunnels consist of two tunnels for intake water and two tunnels for outbound water. San Diego Bay water was used as once-through, non-contact cooling water in the power plant. Each of the four tunnels is approximately 8 feet by 8 feet. Each tunnel is approximately 700 feet long with an 8-foot square opening. As depicted in Figure 2-3, the portions of the tunnels within the District's jurisdiction stretch from the southern curb of Belt Street to San Diego Bay and consist of approximately 490 feet of intake tunnels and approximately 450 feet of discharge tunnels. Outside the District's jurisdiction, the tunnels traverse for an additional 250 feet north of the existing leasehold beginning at East Belt Street, crossing underneath Burlington Northern Santa Fe Railway property, and extending into the existing SDG&E substation north of the Proposed Project site. The Silvergate power plant was removed in 2007 and the intake/discharge tunnels are no longer in operation. The removal of the existing intake/discharge tunnels within the TUOP parcel could occur during the construction of the proposed dry dock or at a future time. Figure 4-5 illustrates the conditions of the entrance to the intake/discharge water tunnels.

Subsurface Investigations

In December 2010, Ninyo & Moore performed a subsurface investigation that included conducting cone penetration testing (CPT) and Ultraviolet Optical Screening Tool (UVOST) analyses at 38 locations to depths ranging from 40 to 48 feet below ground surface (bgs); advancing 28 soil borings; and installing 15 temporary wells to collect groundwater samples (Ninyo & Moore, 2011). Ninyo & Moore also collected sediment samples from the cooling tunnels. Based on visual observation of the sediment extracted from the two cooling water tunnels, the sediment generally consisted of silty sands to sandy silts. Sediment samples from the discharge and intake tunnels had a slight hydrocarbon odor, and the samples were generally gray to black in color. The study found concentrations of total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), PAHs, PCBs, and metals above the laboratory detection limits in soil, groundwater, and the cooling tunnel sediment samples.

An additional Phase I Environmental Site Assessment was performed by Ninyo & Moore for the District in 2014 (Ninyo & Moore, 2014). Based on the findings of the draft Phase I ESA, there is a moderate to high probability that hazardous materials or wastes are present at the site. Any soil or groundwater generated may result in a short-term increase of hazardous waste disposal. If hazardous materials or wastes are encountered during construction activities (e.g., contaminated soil and groundwater), there is low likelihood that the disturbance would create a

[8] The SDG&E Silvergate Power Plant ceased operations in 1984. In 2007, SDG&E completed the abatement, decontamination, and dismantlement of all interior equipment and demolition of the structure. (Cleveland Wrecking Company, http://clevelandwrecking.com/sdge-silvergate-power-2/, website accessed July 9, 2014.) However, the SDG&E cooling tunnels associated with the Silvergate Power Plant remain, but are required to be removed under existing agreements between the District and SDG&E.

63732 PAGE 232

significant hazard to the public or the environment, with the implementation of mitigation measures outlined in Section 6.0, Mitigation Measures.

In addition, the cooling tunnels currently have an opening to the San Diego Bay that would be removed following tunnel removal. This change would mean there is no longer a connection to San Diego Bay.

5.0 ENVIRONMENTAL ANALYSIS

This section describes the potentially significant impacts to water quality and hydrology associated with the following Proposed Project components:

- Installation of a new dry dock on the northern side of its Pier 1; and
- Preliminary program-level assessment of the removal of the intake/discharge tunnels that currently exist within the TUOP parcel as well as any soil and/or groundwater remediation efforts associated with tunnel removal.

The Proposed Project elements considered in this technical report that may potentially impact water quality and hydrology include both construction elements and operational elements:

Construction Elements

- Dry Dock Installation
  - Dredging and dredged material disposal
    - Potential pumping of dredged sediment (in slurry form) into mitigation sites
  - Dry dock associated in-water construction activities
    - Installation of an underwater sheet pile wall and cantilevered king piles
    - Demolition and installation of mooring dolphins and access ramps
    - Assembly and deployment of the new dry dock
  - Dry dock associated land-side construction activities
    - Installation of electrical and mechanical utilities needed to service the new dry dock
    - Ramp wharf construction
    - Potential hazardous material spills
- Demolition/removal and backfill of the intake/discharge tunnels on the existing TUOP parcel and shoreline revetment
- Demolition of remaining offshore structure

Operational Elements

- Dry dock operations
  - Ship loading and unloading (especially the intake and discharge of ballast waters
  - Ship repair and maintenance activities
  - Long-term maintenance needs (i.e., cleaning/wash-down, repairs, and painting)
- Operations associated with the TUOP parcel after removal/demolition of the intake/discharge tunnels

63732 PAGE 238

Mitigation measures identified to reduce any impacts found to be potentially significant in this water quality and hydrology analysis are described in Section 6.0.

5.1 Dry Dock Installation

This section describes potential impacts to water quality due to the Proposed Project during construction and installation of the new dry dock.

5.1.1 Dredging and Dredged Material Disposal

Potential environmental impacts associated with dredging and dredged material disposal are described in this section. Two dredged material disposal options are being considered for the Proposed Project: (1) unconfined aquatic disposal, and (2) upland disposal in a landfill.

To date, none of the sediment tested as part of the dry dock sump dredged material characterization study has been deemed unsuitable for unconfined aquatic disposal (i.e., requiring upland disposal); however, a final regulatory suitability for unconfined aquatic disposal (SUAD) determination is pending. As mentioned above, a portion of the dredge footprint has not yet been evaluated for unconfined aquatic disposal. It is possible that some of the sediment in the dredge footprint may require upland disposal. Consequently, the potential impacts associated with both aquatic and upland disposal are evaluated below.

Dredging – Aquatic Disposal
As discussed in Section 4.2 (Project Site Sediment Quality), a sediment characterization study was conducted in accordance with federal testing guidelines to determine the physical characteristics and chemical levels in the sediments within the Proposed Project dredge footprint. Specifically, the sediment was evaluated to determine its suitability for unconfined aquatic disposal in accordance with the National Dredging Policy, the Ocean Dumping Law, and the CWA.

The sediment testing results show that the dry dock footprint dredged material is substantially free of chemical contamination, toxicity, and bioaccumulation potential. The test results are currently being evaluated by the USACE and USEPA to determine whether they meet the Ocean Dumping Law and CWA Section 404 criteria for unconfined aquatic disposal. A SUAD determination by the USACE and USEPA would indicate that the Proposed Project dredged material would not pose a threat to the environment due to elevated contaminant levels at either the dredging site or the selected disposal site.

The SUAD determination made at this time will apply only to the unconsolidated surface sediments within the dredge footprint west of the San Diego Shipyard Sediment Remediation Project cleanup area as well as all the clean native materials deeper in the dredge footprint that span the Proposed Project footprint. As previously discussed, the San Diego Shipyard Sediment Remediation Project sediment removal will be completed prior to implementation of the Proposed Project. Any remaining sediments following remedial activities will need to undergo further analyses.

63732 PAGE 239

Potential Impacts:

Because the Proposed Project dredged materials have been shown to be substantially free of chemical contaminants and toxicity, the primary impact associated with dredging and dredged material disposal of the materials is sediment resuspension. Dredging and disposal activities could cause sediments to enter the water column, which may cause increased turbidity. Increased turbidity (suspended and settleable solids) is deleterious, or harmful, to benthic organisms and may cause the formation of anaerobic conditions, which can clog fish gills and interfere with respiration in aquatic fauna. It also can screen out light, hindering photosynthesis and normal aquatic plant growth and development (SDRWQCB, 1994). Dredging activities that could cause resuspension of sediments include:

- Over filling of the dredge bucket during the sediment removal operations
- Debris preventing the dredge bucket from closing completely
- Barge repositioning (vessel propeller wash)
- Silt curtain placement
- Damage of silt curtain during dredging
- Spillage of sediment resulting from overloading the material barge
- Contact with sediment on or around the material barge during loading
- Cable snap of loading bucket during loading procedures
- Shear pin breakage, allowing the bucket to open prematurely during loading procedures
- Material barge or tugboat collision with another vessel
- Dredge slurry movement offsite of disposal area if the option chosen is in-bay beneficial reuse for eelgrass habitat

Although dredging, disposal, and construction (such as pile driving and sheet pile wall construction) could result in temporary increases in turbidity and suspended particulates at the dredging and disposal site, these water quality changes usually do not persist more than approximately 20 to 50 meters from the dredge site (Thackston and Palermo, 2000). Suspended particulates would increase turbidity and could reduce dissolved oxygen concentrations in the water column. These effects are expected to be localized and transient. The length of time it takes for the suspended material to settle, combined with the current direction and velocity, would determine the size and duration of the turbidity plume. Turbidity can be expected to dissipate in a period of 20 to 30 minutes, as was demonstrated at the Dredged Material Management Program Pilot Capping Project in Long Beach (USACE, 2002). Additionally, dredging would be conducted in accordance with applicable regulations to prevent impacts to water quality during Proposed Project dredging.

Resuspension of sediments within the Proposed Project area may also cause sediment re- deposition near the dredge and/or disposal areas or, depending on the environmental conditions and controls, cause sediment to be transported to other locations in the water body. Furthermore, resuspension of potentially contaminated sediments and release of constituents of

63732 PAGE 240

concern from the areas of the Proposed Project that underlie the CAO area could impact water quality by decreasing dissolved oxygen, changing pH, increasing turbidity, and increasing contaminant levels to levels that are toxic to aquatic receptors. Changes in water quality could degrade and/or impair the beneficial uses in San Diego.

Spray disposal operations can be modified to target specific locations and avoid sensitive areas (Ray, 2007) and it has been reported that water from the liquid slurry tends to rapidly drain off, quickly leaving the deposited sediment without producing unusually high levels of turbidity (Cahoon and Cowan, 1987 and 1988). The Proposed Project dredged materials consist of a mixture of silt, sand, and clay. This sediment has a moderate potential for localized increases in turbidity should material move off this site; however, mitigation to reduce the potential for turbidity (such as silt curtains) will be implemented during all dredging and disposal options. Mitigation will also consider BMPs that will limit potential impacts on nearby sensitive resources. In addition, much of the sediment to be dredged within the Proposed Project area is at least partially lithified, making increases in localized turbidity less likely because the sediment particulates are naturally cemented together.

In addition to water quality impacts due to turbidity, there is potential for accidental fuel or oil spills during the proposed dredging operations to impair and/or degrade water quality in San Diego Bay. Such events are likely to be localized spills of lighter, refined diesel fuels, gasoline, and lubricating oils that are highly toxic to marine life. The potential for the occurrence of petroleum product leaks or spills is low, but the potential for significant impacts to marine resources is moderate to high should a spill occur.

Dredging – Upland Disposal

All of the sediment tested to date according federal guidelines and evaluated by the USACE and USEPA has been deemed suitable for unconfined aquatic disposal. As discussed in Section 4.2.1.5 (Dredged Material Study – Potential Additional Testing), however, a portion of the sediment within the project footprint still requires disposal suitability testing. This untested sediment is composed of any residual unconfined material that remains following completion of CAO cleanup dredging activities. As discussed in the Project Description under separate cover, it is assumed that a small portion of the project dredged material may require upland disposal. An upland disposal contingency factor of approximately 2,500 to 10,000 cubic yards (3,500 to 14,000 tons) of dredged material has been identified for purposes of this analysis.

Any sediment not approved for ocean disposal or beneficial reuse will be disposed of outside of the tidelands (upland) at an appropriately permitted landfill. Any sediment designated for upland disposal will be tested, waste classified, and approved by the landfill operator for landfill disposal. Should upland disposal become necessary, the proposed disposal site will be Otay Landfill located at 1700 Maxwell Road in Chula Vista, California. Alternative landfills may also be considered.

In the unlikely event that any portion of the dredged materials is classified as hazardous waste, those materials will require transport to a hazardous waste disposal facility (a Class I facility). None of the previous dredging projects conducted at BAE Systems that required landfill disposal (e.g., the San Diego Shipyard Sediment Remediation Project; the POSD Dry Dock Sump

Maintenance Dredging Project; Pier 4 Replacement Project dredging) uncovered any sediments that were classified as hazardous wastes. All sediments from these projects meet Otay Landfill's waste classification requirements to be disposed of as non-hazardous solid waste.

Upland disposal of dredge material will require dredging, processing onsite (i.e., dewatering and thickening), transfer to a truck, and transport to and disposal at the Otay Landfill. Assuming a carrying capacity of 23 tons per truckload, approximately 110 to 610 truckloads will be required for upland disposal of these dredged materials. The disposal process, including truck routes, will be conducted using the same transportation logistics used for recent landfill disposal projects conducted by BAE Systems.

It is estimated that, for the dredging operation to remove the 2,500 to 10,000 cy of sediment requiring upland disposal, dredging equipment will include the dredge crane barge, two dredge barges (scows), a large excavator for mixing cement (i.e., thickening) into the dredge material within the dredge scow and for offloading dredged material into trucks, pumps and hoses to capture supernatant water from the dump scow that can be transferred on-shore for disposal, and other miscellaneous equipment.

During upland disposal days (anticipated to be 17 days during the month), approximately 30 to 40 trucks per day will be required to haul off the treated dredged sediments. In addition, approximately 10 to 35 cement trucks will be required to dry all of the upland dredged material. The cement trucks will arrive on approximately 5 to 6 separate days during this period. Approximately 10 workers will be onsite each day that this dredging is being conducted.

The sediment will be sampled by the removal contractor for landfill profiling in accordance with the landfill's acceptance criteria. Sediment samples will be collected by the removal contractor from the containment barge. Once it is determined that the sediment has met the analytical and water content requirements of the disposal facility, the material will be certified for disposal (by the landfill operator), manifested, loaded into on-road trucks (typically using a large-wheeled front-end loader), weighed to document compliance with California Department of Transportation (Cal-DOT) regulations, transported, and deposited at the selected disposal facility.

Potential Impacts:

Potential water quality and hydrology impacts associated with the dredging and upland landfill disposal of dredged materials include:

- Resuspension of contaminated sediments during dredging activities (same as listed above under Dredging – Aquatic Disposal)
- Overfilling of the dump scow, causing sediment and supernatant water (i.e., water that rises to the surface in the dredge barge during loading operations) to overflow the sides
- Leaks in the supernatant water handling system, causing releases of contaminated water to the bay

63732 PAGE 242

- Accidental spills of 1) the cement used as a thickening agent during on-scow treatment of the upland disposal sediments or 2) the resultant wet slurry mixture
- Spilling of upland disposal sediments during the transfer process from the dump scow
- Discharge of spilled materials back into the bay during storm events

Dredging Activities
The equipment (e.g., clamshell dredge and barge, dump scows, tender boats, cement trucks, and dump trucks) used during construction use fuels and oil that may be accidentally released to bay waters. The potential for petroleum product leaks or spills is low, but the potential for long-term impacts is moderate to high if a leak or spill occurs.

In-water construction for the Proposed Project may impact water quality by potentially changing surface water characteristics and current movements, as well as causing turbidity during activities such as pile driving for the sheet and king piles, and mooring dolphin demolition and replacement. In addition, possible storm events during construction may have impacts to water quality via runoff over new or exposed surfaces.

The project will require the handling and disposal of hazardous materials, including oils, gasoline, paints, solvents, concrete and asphalt products, and other potentially toxic materials, during construction activities. Use of these materials could contribute to polluted runoff leaving the project site. However, as previously discussed, the Proposed Project will be required to implement a USMP; therefore, the handling, storage, and disposal of hazardous materials will not increase runoff pollution into San Diego Bay.

Impacts to water quality due to turbidity and storm water associated with in-water construction activities are considered temporary.

Potential Impacts:

Potential impacts associated with dredging operations include:

- Accidental oil or fuel spills that could occur during the dredging operations and impair and/or degrade water quality in San Diego Bay
- Resuspension of contaminated bottom sediments

5.1.2 In-water Construction Activities

In addition to dredging-related activities associated with installation of the new dry dock, the Proposed Project will also include additional in-water construction activities. These include:

Sheet pile and king pile installation – To prevent undermining of the existing Pier 1, the Proposed Project will include an underwater wall and cantilevered king pile installation. These underwater improvements will allow for dredging adjacent to the pier without adversely impacting the strength and integrity of the pier.

63732 PAGE 243

Access ramp installation – Two ramp wharfs (north and south) designed for accessing the dry dock are proposed adjacent o and westward of the bulkhead and will extend from approximately the current bulkhead line to 125 feet into San Diego Bay. The wharfs will be designed to support heavy vehicle and equipment loads and will consist of a reinforced concrete deck supported by precast concrete piles anchored along the shoreline.

Intermediary wharf structure - Material delivery staging area for the dry dock must be with reach of cranes. An intermediary wharf structure is planned for installation between the two access ramps. The intermediary wharf will be constructed in similar fashion as the ramps and abut the ramps to the north and south.

Mooring dolphin expansion and replacement – To accommodate the mooring of the proposed dry dock, one new and one retrofitted mooring dolphin are proposed to be constructed approximately 344 feet and 890 feet offshore (west) of the U.S. Bulkhead Line. The dolphins are necessary to provide a fixed mooring structure to secure the dry dock. Additionally, the current Pier 1N mooring dolphin would be expanded.

Dry dock assembly – Installation of a new floating dry dock approximately 205 feet in width and 851 feet in length (174,455 square feet total) plus aprons (approximately 16,165 square feet total) attached to the dry dock on each end is proposed. It is anticipated that most of the dry dock will be assembled offsite. However, there will likely be some additional dry dock assembly work once the dry dock has been towed to the shipyard.

Potential Impacts:

Potential environmental impacts that may result from these in-water construction activities include:

- Resuspension of sediments during pile removal and installation activities
- Routine use, transport, or disposal of potentially hazardous materials (e.g., fuels, oils, lubricants) by construction equipment
- Spills of fuels or oils during construction activities and refueling operations

5.1.3 Land-Side Construction Activities

A small portion of the construction activities associated with installation of the new dry dock will occur on land. Electrical and mechanical utilities to support the dry dock will need to be installed. These utilities will be similar to the types and capacities currently utilized within the existing shipyard. The proposed electrical utilities include a 12,000-volt, 500-amp feeder cable to the proposed new wharf; new load interrupt switches for the distribution of the 12,000-volt circuit; shore and pier 480-volt and 208/110-volt distribution systems, including 400-amp shore power mounds on the shore at two locations for barges and for ship repair operations; convenience receptacles on shore and on the pier and power to new infrastructure where needed (sewage lift station, storm water collection systems, etc.) and shore and pier lighting, including pole lights and embedded light fixtures in the wharf structure that will be located on the

63732 PAGE 244

shore and wharf; and shore and wharf data, telephone, and television systems for use by vessels in dry dock.

The Proposed Project area is located in an industrialized area and the shoreline is currently covered in impervious surfaces such as concrete. Landside construction activities associated with the Proposed Project will have minimal effect on localized water quality; however, the discovery of contaminated soils and/or groundwater during trenching operations or storm water runoff related to land disturbance activities may result in a discharge of contaminated soil, groundwater, or storm water to the bay. The Proposed Project area is industrialized and the shoreline is currently covered in impervious surfaces. The Proposed Project will revise the layout of project site impervious surfaces by constructing the apron ramp wharf, but will not substantially alter storm water flows on the project site. Onsite storm water will be contained as described in BAE Systems BMP Manual (BAE Systems, 2013).

In addition, onshore construction activities may result in the accidental release of hazardous materials (e.g., oils and fuels) into bay waters.

Potential Impacts:

The potential impacts associated with utility installation include:

- Release of contaminated soils, groundwater, or storm water runoff during trenching operations
- Accidental spills of potentially hazardous materials (e.g., fuels, oils, lubricants) by construction equipment

5.2 Removal of Intake/Discharge Tunnels

The removal of the cooling tunnels would require the following activities:

- Soil and groundwater characterization
- Excavation of soil
- Soil dewatering
- Potential remediation of contaminated soils
- Disposal of the soils
- Installation of shoring to protect the excavation
- Demolition and removal of tunnels (concrete)
- Backfill of the tunnel area with clean structural fill beginning from the historic mean high tide line
- Replacement of numerous structures, equipment, and operating systems located over the tunnels
- Shoreline revetment

63732 PAGE 245

- Removal of remaining off-shore structure

Based on the findings of the draft Phase I ESA, there is a moderate to high probability that hazardous materials or wastes are present at the site (Ninyo & Moore, 2014). Any soil or groundwater generated may result in a short-term increase of hazardous waste disposal. If hazardous materials or wastes are encountered during construction activities (e.g., contaminated soil and groundwater), there is low likelihood that the disturbance would create a significant hazard to the public or the environment. The unlikely exposure routes include direct contact, leeching into groundwater, or release into the San Diego Bay.

In addition, the cooling tunnels currently have discharge to the San Diego Bay that would likely be removed to (at least) the mean high tide line. This change would mean there is no longer a connection to San Diego Bay.

As outlined in the geotechnical report under separate cover, construction dewatering will need to occur to enable removal of the cooling tunnels followed by backfilling (TerraCosta, 2014). Using a shoring system such as sheet piling or secant piling may be generally effective at reducing groundwater infiltration into the excavation, but infiltration cannot be eliminated. As such, dewatering pumps will be required to further remove groundwater from the excavation. Depending upon the volume of water produced, and the water quality, water may possibly be treated and discharged accordingly, or may have to be hauled to an appropriate facility. Dewatering volumes, means and methods, water treatment, and the need for appropriate permits, should be assessed during the project level or design phase assessment of the cooling tunnel removal project.

As with the land-side construction activities, the shoreline will remain covered in impervious surfaces (similar to current conditions); therefore, future conditions on the project site will not significantly alter water quality with regard to storm water flow or drainage patterns. In addition, a sheet-pile wall will be installed in two segments (one 5 foot section and one 15 foot section) along the shoreline in support of the Shipyard Sediment CAO. This sheet-pile wall will help prevent contaminated sediment release into San Diego Bay during tunnel removal and will seal the mouth to the tunnels during construction and replacements of revetment. Installation of this wall will facilitate the removal and regrading of the existing slope to allow for the proposed sump. A new rock covered slope extending from the top of the submerged sheet-pile wall to the level landward parcel will also be installed. In addition, drainage patterns will not be significantly altered because all stormwater will be captured similar to current landside conditions. Construction level details regarding proposed removal of the cooling tunnels shall be addressed during the design stage for that project and/or during the preparation of the project level EIR for that phase.

Potential Impacts:

Similar to the dredging and construction activities listed above, impacts to San Diego Bay water quality could be observed during demolition and removal of the cooling tunnels. The potential impacts include:

- Release of potentially contaminated soils, groundwater, and/or debris from the tunnel demolition into San Diego Bay waters via surface runoff or tunnel excavation and removal activities
- Contamination of groundwater resources
- Potential accidental release of hazardous materials (e.g., oils and fuels) during tunnel removal construction activities

5.3 New Dry Dock Operations

Operational activities currently conducted at the BAE Systems facility include non-nuclear ship repair, modernization, conversion, and overhaul for government and commercial customers. Operations in the new dry dock will be similar to existing operational conditions at the current Pier 1N wet berth, but with the addition of the new dry dock. The new dry dock will be used to conduct repair and maintenance activity that cannot normally be conducted while the vessel is afloat. In a typical year, it is anticipated that two DDG-class vessels, one LPD-class vessel, one CG-class vessel, and one LCS-class vessel will utilize the dry dock.

Operational activities in the new dry dock (ship loading and unloading, ship repair and maintenance activities, and long-term dry dock maintenance needs) will be similar to existing activities for the POSD dry dock currently in use at the facility. Adding the second dry dock will create no new conditions at the site that could result in significant impairment to water quality. Operations for the new dry dock will be subject to the same and/or similar permit and operational requirements and conditions. Dry dock operational activities are conducted in accordance with the following permits and procedures:

- BAE Systems San Diego Ship Repair Industrial User Discharge Permit (No. 11-0217) issued by the City of San Diego Public Utilities Department Industrial Wastewater Control Program
- National Pollution Discharge Elimination [NPDES] Permit No. CA0109151 (Order No. R9-2009-0080 modified by No. R9-2010-0090) – Waste Discharge Requirements, BAE Systems San Diego Ship Repair, Inc., Discharge to San Diego Bay[9]
- Best Management Practices (BMP) Program Manual SOPs for shipyard activities (including dry dock operations) at BAE Systems San Diego Ship Repair (BAE 2013). The BMP Program Manual contains two major objectives:
  - Identify and evaluate potential pollutant sources and pathways associated with ship modification, repair, and maintenance; and

[9] A new or modified NPDES permit will need to be written to include the new Pier 1 North Dry Dock. The current NPDES permit covers discharge from numerous locations at BAE Systems including dry dock ballast water from the POSD dry dock, fire protection water, potable water leaks from hoses, steam condensate leaks from hoses, and water weight test bag effluent. Contact storm water is generally not discharged to San Diego Bay, but may be treated on-site and then discharged to a municipal treatment plant for disposal. However, discharges of storm water may occur at the Facility to the San Diego Bay when the on-site holding capacity is exceeded or the storm water collection and treatment system is not operating properly.

63732 PAGE 247

- Identify and implement site-specific BMPs to reduce or prevent the discharge of wastes and pollutants to waters of the state, and, more specifically, San Diego Bay.

BAE Systems has the following SOPs in place to mitigate the potential impacts of shipyard operations on water quality. These SOPs provide specific details with regard to regulations and permits, responsibilities (of BAE employees as well as subcontractors), procedures, and recordkeeping/documentation for various shipyard activities and systems that may affect water quality:

- BAE Systems San Diego Ship Repair (SDSR) Procedure 1210-02M (Revised 3/5/14) – Industrial Wastewater Discharge: The purpose of Procedure 1210-02M is to establish SOPs for discharge and record keeping of industrial wastewater discharges to the BAE SDSR sewer system.
- BAE Systems SDSR Procedure 1210-03K (Revised 9/12/13) – Dry Dock Submergence Cleaning: This procedure establishes requirements and coordinates activities of BAE Systems SDSR work groups and subcontractors to ensure that dry dock washdown is conducted in a manner that is both efficient and protective of natural resources.
- BAE Systems SDSR Procedure 1210-04K (Revised 6/6/14) – Oil-Water Separator Operation: The purpose of Procedure 1210-04K is to describe acceptable methods of operation, maintenance, and BMPs for Oil-Water Separators used at BAE Systems SDSR for treatment of bilge, ballast, and other oily wastewater sources.
- BAE Systems SDSR Procedure 1220-02J (Revised 1/6/14) – Abrasive Blasting and Spay Painting Containment Procedures: This procedure establishes operational controls and BMPs to ensure that hydroblasting, pressure washing, abrasive blasting, and spray painting operations are conducted in a manner that is protective of the environment.
- BAE Systems SDSR Procedure 1230-02L (Revised 5/5/14) – Hazardous Wastes Manifest: This SOP establishes standard practices for manifesting hazardous waste.
- BAE Systems SDSR Procedure 1230-03C (Revised 7/31/14) – Disposal of Oil from Vessels: This procedure establishes requirements and coordinates activities of BAE Systems SDSR work and subcontractors to ensure that oil removed from vessels is disposed of appropriately, including supporting documentation.
- BAE Systems SDSR Procedure 1230-04C (Revised 1/27/14) – Scrap Metal Recycling Procedures: This SOP defines the procedures for the segregation, handling, and recycling of scrap metal to ensure that no heavy metals are introduced into the environment.

Specific activities related to dry dock operation and water quality control measures are described below.

Loading and Unloading Vessels

Ships are docked by lowering (submerging) and then raising the dry dock by means of integral ballast tanks, which take in and discharge seawater. Once the dry dock is lowered, a vessel is

63732 PAGE 248

positioned within the dock. The dry dock is then raised, and the ship is lifted out of the water. Prior to submergence, the dry dock will be cleaned and free of any hazardous material wastes (spent abrasives, paint, petroleum products, sanitary waste, and general refuse and debris) associated with ship repair or maintenance activities taking place within the dry dock. All wastewater from the wash-down process is captured and held at the facility prior to discharge into the City of San Diego Metropolitan Sanitary Sewer System for disposal to a publically owned treatment works (POTW) in accordance with the requirements of Industrial User Discharge Permit (No. 11-0217).

Ship Repair and Maintenance in the Dry Dock

Ship repair and maintenance includes exterior hull repair, preservation (abrasive blasting and/or hydroblasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. Wastes generated during ship repair in dry dock may include spent abrasives, paint, rust, petroleum products, marine growth, and general refuse, all of which are contained and then transferred to shore facilities for disposal.

Environmental protection related to dry dock operations includes complete encapsulation of the vessel to prevent fugitive particulate emissions, storm water collection, and actions to ensure zero discharge of industrial wastewater. In addition, hazardous waste will not be stored on the dry dock for extended periods, the dry dock will be monitored regularly for cleanliness, and other housekeeping procedures will be performed (i.e., waste removal, regular meetings and training sessions, and spill kit supplies checks). Any ship repair activity that presents a spill potential shall be controlled with structural control measures such as curtains, tarps, and shrink-wrap approved and periodically inspected by Environmental Services personnel.

Long-term Dry Dock Maintenance

The dry dock requires long-term maintenance, including repairs and painting, that is similar to the ship repair and maintenance currently being performed. All ship repair and maintenance activities should be considered as pertaining to the dry dock itself when evaluating impact significance.

Storm Water Discharges

The new dry dock will be designed to capture all storm water runoff and waste water, and to monitor flows in a manner similar to the method currently used at the POSD dry dock at BAE Systems (i.e., via a similar NPDES monitoring program). For the current NPDES program, ballast water, miscellaneous waste water, and surface runoff are captured and maintained in a robust drainage system with several levels of engineering controls to ensure that all runoff at the shipyard is captured, except in the case of a catastrophic event. Storm water collected at BAE Systems is held in a storm water diversion system (SWDS) and subsequently discharged to the POTW in accordance with BAE Systems' Industrial User Discharge Permit or trucked waste permit.

The SWDS includes a series of drains, piping, and tanks that collect storm water from areas of industrial activity, including the hazardous waste storage area, solid waste reclamation area, POSD (dry dock) wharf, Piers 1 through 4, the POSD dry dock, and outdoor storage and manufacturing areas. When the amount of rainfall exceeds the storage or treatment throughput

capacity of the SWDS, at any one of the shipyard's six drain outfalls into San Diego Bay may be opened to release the excess runoff to prevent catastrophic flooding of the shipyard.

The current capacity of the SWDS is approximately 500,000 gallons, or just over 1 inch of rainfall. Currently, the first 0.25 inch of rainfall may be discharged directly to the sanitary sewer during a rain event. The remaining storm water must be held for 24 hours prior to discharge to the sanitary sewer.

Discharge into surface waters should not occur during dry dock operations and all storm water from the dry dock will be contained and held before discharging into the storm sewer system (BAE Systems, 2013). If discharge from the dry dock must occur, it will be regulated in accordance with an NPDES permit similar to that currently outlined for the POSD Dry Dock.

Potential Impacts:

Potential water quality impacts associated with the operations of the new dry dock include:

- Release of contaminants to surface waters when the dry dock is submerged for loading and unloading of vessels
- Spills of fuels, oils, lubricants, or other liquids or powers during ship repair activities
- Release of contaminants to San Diego Bay waters during routine dry dock repair and maintenance activities
- Release of contaminated water associated with the dry dock's ballast water system
- Release of contaminated water associated with the wet weather runoff

5.4 Cumulative Impacts

This section explains and evaluates potential significant cumulative impacts resulting from the Proposed Project. A cumulative impact is defined in Section 15355 of the CEQA Guidelines as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts."

5.4.1 Cumulative Impact Analysis

Cumulative water quality impacts result from projects that combine to either pollute the quality or increase the turbidity of water. Cumulative hydrology impacts result from projects that combine to alter the course of surface water flow or to increase flood hazards in a particular area, either through diverting floodways or constructing structures within the floodways.

San Diego Bay is currently a CWA Section 303(d)-listed impaired water body for PCBs, and the shoreline of San Diego Bay between Sampson Street and 28th Street is listed as an impaired water body for PCBs, PAHs, zinc, mercury, and copper. This listing is, in itself, a cumulative impact, as past projects occurring for decades throughout the watershed have contributed pollutants to San Diego Bay.

63732 PAGE 250

However, similar to the Proposed Project, each cumulative project is subject to CWA and NPDES compliance, as well as state and local regulatory standards and ordinances that must be achieved or complied with during construction and operation to reduce or avoid polluted runoff. These regulations are designed to prevent impacts on water quality throughout the District and at a regional level. Accordingly, adherence to regulatory standards would reduce cumulatively significant impacts on water quality to reduce impacts to less than significant levels.

Additionally, as stated previously, the Proposed Project will not result in cumulative hydrology impacts with respect to flooding or surface water flows. Therefore, the Proposed Project, in conjunction with past, present, and reasonably foreseeable future projects, is not anticipated to result in a cumulative impact to water quality or turbidity.

DRAFT

63732 PAGE 251

6.0 MITIGATION MEASURES

This section presents mitigation measures that correspond to Project impacts described in Section 5.0.

The potential water quality and hydrology impacts associated with the Proposed Project are reduced to levels less than significant with mitigation incorporated. The Proposed Project will be subject to implementation of BMPs and to oversight by regulatory permitting agencies, including the SDRWQCB, the USACE, and the USEPA. Therefore, the Proposed Project will not result in significant water quality or hydrology impacts with compliance and with the mitigation measures described in this section.

6.1 Dredging Activities

Mitigation measures associated with dredging are described below.

6.1.1 Mitigation Measure 1: Dredging Management Plan

Prior to commencement of dredging operations, the contractor shall prepare a dredging management plan (DMP) for review and approval by the District and SDRWQCB. The DMP shall contain SOPs that are developed for the Proposed Project prior to initiation of dredging and are implemented for the duration of the dredging activity. The DMP will include the following measures to prevent release of hazardous materials that could affect water quality during dredging activities:

1. Personnel involved with dredging and handling of the dredged material will be given training on their specific task areas, which will be identified in the Health and Safety Plan (HASP). The training shall be approved by the District and carried out by BAE Systems per Occupational Safety and Health Administration (OSHA) requirements. The training materials include:
   - Potential hazards resulting from accidental oil and/or fuel spills;
   - Potential impacts to water quality associated with turbidity; and
   - Proper operation of dredging equipment.
2. Required instrumentation to avoid spillage of dredged material will be identified for each piece of equipment used during dredging operations.
3. Personnel will be required to visually monitor for oil or fuel spills during construction activities.
4. In the event that a sheen or spill is observed, the equipment will be immediately shut down and the source of the spill identified and contained. Additionally, the spill will be reported to the applicable agencies presented in the DMP.

63732 PAGE 252

5. All personnel associated with dredging activities will be trained as to where to find oil/fuel spill kits, how to deploy the oil-absorbent pads, and how to dispose of the materials properly. The dredging barge shall have a sufficient quantity of oil/fuel spill kits onboard to allow for quick and timely spill containment.
6. Barge load limits and loading procedures will be identified, and the appropriate draft level will be marked on the materials barge hull.
7. Water discharges (supernatant water from sediment and storm water) to San Diego Bay are prohibited.

During dredging, the District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis; and (2) periodic site inspections.

Specific mitigation measures in the DMP related to dredging will include the following:

1. The contractor will remove dredge material and will not stockpile material on the San Diego Bay floor, and will not sweep or level the bottom surface with the digging bucket.
2. The contractor will not overfill the digging bucket because overfill results in material overflowing back into the water.
3. When dredging sediments that have been deemed unsuitable for unconfined aquatic disposal by the USACE/USEPA, the contractor will deploy and maintain inner- and outer-boundary floating silt curtains fully around the dredging area at all times. Double silt curtains will be utilized for containment of the dredge area; silt curtain configurations, technologies, and actual locations in relation to the dredge barge will be finalized during the design phase of the project.
4. The contractor will not overfill the material barge to a point where overflow or spillage could occur. Each material barge will be clearly marked to allow the operator to visually identify the maximum load point.
5. If the contractor proposes to use weirs as a means to dewater the scow during dredging approved for unconfined aquatic disposal, the use of silt curtains shall be deployed to minimize turbidity. Decanting of dredge scow return water during dredging of material determined to be unsuitable for unconfirned aquatic disposal is prohibited.
6. The contractor will place material in the material barge to minimize splashing or sloshing that could send sediment back into the water. Splashing can be controlled by restricting the drop height from the bucket.
7. If the use of a grate to collect debris is required, the contractor will not allow material to pile up on the grate and flow or slip from the grate back into the water. The debris scalper will be positioned to be totally contained on the shore side of the unloading operations.

63732 PAGE 253

8. The dredge operator will visually monitor for debris build-up and alert the support personnel on the barge to assist in clearing the debris, as necessary. Debris that is derived from dredging activities will be removed from the grate by the dredge clamshell bucket and placed in a contained area on the dredge barge or in a second material barge for subsequent removal and disposal.
9. The contractor will restrict barge movement and work boat speeds (i.e., reducing propeller wash) in the dredge area.

6.1.2 Mitigation Measure 2: Contingency Plan

The contractor shall prepare and submit to the District for approval a Contingency Plan prior to initiation of dredging and will implement it for the duration of the dredging activity; the plan will address equipment and operational failures that could occur during dredging operations. The Contingency Plan will include the following measures to prevent a release of dredged materials into the marine environment in the event of equipment failure, repair, or silt curtain breach:

1. Procedures for communication to project personnel;
2. Installation of proper signage and/or barriers alerting others of potentially unsafe conditions;
3. Specification for repair work to be conducted on land and not over water;
4. Identification of proper spill containment equipment (e.g., spill kit);
5. Identification of other equipment or subcontracting options;
6. Emergency procedures to follow in the event of equipment failure or release;
7. Incident reporting and review procedure to evaluate the causes of an accidental release and steps to avoid further incidents;
8. Response procedures in the event of barge overfill; and
9. Procedures for prompt notification of the District and all other regulatory agencies.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.3 Mitigation Measure 3: Dredge and Disposal Site Water Quality Monitoring

The District and the SDRWQCB shall coordinate water quality monitoring efforts and share water quality monitoring data with other dredging projects in San Diego Bay throughout the duration of the project. Considerations for the issuance of dredge permits or General Waste Discharge Requirements shall include distance(s) between sites and proposed timing of in-water activities that shall involve potential impacts to water quality, selection of appropriate water quality reference sampling locations in San Diego Bay, and coordination of expected commercial and recreational vessel traffic.

63732 PAGE 254

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the Port on a twice-monthly basis, and (2) periodic site inspections, as needed.

In addition, if in-bay beneficial reuse is chosen as a disposal option to support eelgrass mitigation and habitat enhancement, water quality monitoring will be implemented according to the mitigation requirements outlined in the EIR and CWA 401 water quality certification requirements. Proper BMPs will be utilized during all phases of the Proposed Project. BMPs may include 1) periodic inspection for leaks in the slurried sediment pipeline (if used) by the contractor to place the material at the disposal site; 2) appropriate turbidity control BMPs such as silt curtains to protect nearby sensitive resources, and 3) visual monitoring by the contractor for excessive turbidity near the transport pipeline or containment barge and associated sediment placement apparatus. If a substantial leak is identified in the slurry pipeline, a silt curtain or similar mitigation measure shall be employed to capture and retain the source of the leak and the affected pipeline segment shall be immediately repaired or replaced.

Visual monitoring of sediment movement and turbidity levels shall be performed by the contractor during and after sediment placement. Movement of sediment on the site shall be adaptively managed until adequately compacted to ensure that movement of sediment off the site is minimized.

6.1.4 Mitigation Measure 4: Storm Water Impacts

The Proposed Project will be required to prepare a construction SWPPP as well as an operation SWPPP (USEPA, 2009). The SWPPP will:

- Identify potential sources of storm water pollution at the facility;
- Describe storm water control measures that are used to reduce or eliminate pollutants in storm water discharges from the industrial facility; and
- Identify procedures the operator will use to comply with the terms and conditions of the most recent state general industrial storm water permit.

In addition, the SWPPP will identify the facility's storm water pollution prevention team and responsibilities and develop procedures for conducting required inspection/monitoring activities and regular maintenance of control measures.

6.1.5 Mitigation Measure 5: Supernatant and Storm Water Containment

This mitigation measure only applies in the event that a portion of the dredged material is deemed unsuitable for unconfined aquatic disposal (i.e., upland disposal becomes necessary). The contractor shall ensure that the supernatant and storm water collected from the scow are transported to landside containers. These containers are to be sealed when not in use to avoid overflow during a storm event. Storm water management in the project footprint during all phases of the project will be in compliance with the Statewide General Construction Permit and

63732 PAGE 255

District requirements. Secondary containment features will be in place around the scows (silt curtains) and holding tanks (berms).

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.6 Mitigation Measure 6: Sediment Unloading

This mitigation measure only applies in the event that a portion of the dredged material is deemed unsuitable for unconfined aquatic disposal (i.e., upland disposal becomes necessary). If upland disposal of sediment is required, the contractor shall reduce water column impacts by controlling the swing radius of the unloading equipment. A spillage plate will be used to prevent the offloaded sediments from falling into the water beneath the swing radius of the unloading equipment at the offload location, which will limit spillage from removal of the wet sediment slurry falling directly into the water. All equipment used to move sediments from the scow to the trucks as well as the trucks used to transport sediments to the landfill will be properly cleaned and any waste water will be properly contained and disposed.

The contractor shall use a power wash unit to reduce impacts related to spillage from the excavator arm onto transport vehicles. In the event that sediment is spilled onto the transport vehicle, it can be quickly washed and the water directed into the collection sump. The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.7 Mitigation Measure 7: Overfilling Transport Vehicles, Increasing Potential to Spill onto the Roadway

If dredging of sediment deemed to be unsuitable for unconfined aquatic disposal is necessary, the contractor shall ensure that truck volumes are limited to prevent spillage and will be based on visual observations, and that trucks will be covered and secured per Cal-DOT regulations during transport to the disposal facility. The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.1.8 Mitigation Measure 8: Operator Error Spilling Sediment during Loading

If dredging of sediment deemed to be unsuitable for unconfined aquatic disposal is necessary, the contractor shall ensure that trucks are loaded within a constructed loading zone to confine sediment spilled during the loading process. Prior to entering the roadway, the vehicles will be power washed to prevent cross-contamination onto the roadways. This will ensure that no contaminants are released and potentially re-introduced into the aquatic environment via runoff. The District will verify implementation of this measure through (1) review of a mitigation

63732 PAGE 256

implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.2 Construction Activities

Mitigation measures associated with construction activities are described below.

6.2.1 Mitigation Measure 9: Preconstruction Meeting

The BAE Systems Environmental Manager or designee will ensure that the contractor shall hold a preconstruction meeting to review all construction mitigation requirements for impacts to water quality and the environmentally sensitive areas with the construction crew. Pertinent sections of the DMP related to protection of water quality or the environment will also be presented at this meeting (see Mitigation Measure 1). The District shall be invited to send a representative to the preconstruction meeting. The purpose of the meeting will be to review the relevant project features, regulatory requirements, and mitigation measures to ensure implementation, and to review mitigation monitoring tracking program and log requirements.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the Port on a twice-monthly basis, and (2) periodic site inspections, as needed.

6.2.2 Mitigation Measure 10: Health and Safety Plan for Land-side Construction Activities

Although no significant ground disturbance is anticipated with the Proposed Project component evaluated for this technical report, this mitigation measure is included to ensure that appropriate precautions are taken should contaminated groundwater or soils be encountered during any trenching activities. Implementation of this project feature requires compliance with safety measures required by OSHA and will adequately address potential impacts related to contaminated groundwater or soils, should any be encountered during limited landside construction activities:

During all excavation and trenching activities for utilities, BAE Systems shall require that all construction subcontractors address site safety requirements by complying with the appropriate health and safety measures required by the OSHA-applicable specifications in regard to earth resources (Section 29 Code of Federal Regulations [CFR] Part 1926), which are focused on worker safety in excavations. In the event that suspicious odors are detected in soil, construction shall be terminated until the soil is properly characterized for hazardous waste content. Appropriate measures shall be taken in compliance with all applicable regulations for the characterization and disposal of hazardous materials.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

63732 PAGE 257

6.2.3 Mitigation Measure 11: Soil Management Plan

Prior to commencing any on-shore construction activities, a Soil Management Plan will be prepared that describes the procedures to be implemented in the event that contaminated soils are discovered during installation of utilities, seawalls, and other landside features. The plan will describe contaminants that may be encountered during ground disturbance activities, sample collection and analytical techniques that will be employed to screen contaminant in the soils, segregation and handling of contaminated soils, and procedures for the proper transportation and disposal of any identifies wastes. Appropriate measures shall be taken in compliance with all applicable regulations for the characterization and disposal of hazardous materials. In addition, BMPs such as silt curtains (if applicable), land-side containment/covering or engineering controls to prevent runoff, excess water capture and proper disposal, and visual monitoring will be used to prevent release and impact to water quality at the Proposed Project site.

The District will verify implementation of this measure through (1) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis, and (2) periodic site inspections.

6.2.4 Mitigation Measure 12: Secondary Containment

Prior to the commencement of dredging, demolition, or construction activity, the contractor shall install a secondary containment structure for the storage of all fuel, oil, and other petroleum products, as required by the USMP (District, 2010), the BAE BMP Manual (BAE Systems, 2013), and current or updated BAE Systems Environmental SOPs. At all times during construction and operation of the Proposed Project, the contractor shall house all oil and fuel in a secondary containment structure to ensure that spilled or leaked oil or fuel will be prevented from entering the water column. The District will verify implementation of this measure through (1) periodic site inspections to verify that a secondary containment structure is in place and functioning, and (2) review of a mitigation implementation and monitoring tracking log maintained by BAE Systems and submitted to the District on a twice-monthly basis.

6.2.5 Mitigation Measure 13: Environmental Controls During Intake/Discharge Tunnel Removal

According to the Intake/Discharge Tunnel Phase I ESA prepared by Ninyo & Moore, subsurface disturbance activities (e.g. soil excavation) should include the preparation and implementation of a Soil and Groundwater Management Plan. The plan would address the possibility of encountering areas of potential environmental concern as well as control measures in place to mitigate potential environmental and human health impacts (Ninyo & Moore, 2014). The plan should be prepared by a qualified environmental consultant and should be implemented during subsurface disturbance activities by the contractor under the oversight of an environmental professional on behalf of the project proponent. The plan should address soil and groundwater monitoring, handling, stockpiling, characterization, reuse, export, and disposal protocols. The objective of the plan is to assist the contractor in the excavation, notification, monitoring,

63732 PAGE 258

segregation, characterization, handling, and reuse and/or disposal (as appropriate) of waste that may be encountered during earthwork activities.

The project-specific Soil and Groundwater Management Plan shall follow the guidelines and procedures prescribed by the County of San Diego Department of Environmental Health (DEH) Site Assessment and Mitigation Program. Specific components of the plan would follow the guidance outlined in the current Site Assessment and Mitigation (SAM) Manual. Prior to excavation of site soils, preparation of a Corrective Action Plan (CAP) may be required if there is evidence that surface water or groundwater has been or may be affected by the unauthorized release, or there is evidence that contaminated soils are or could come in contact with surface water or groundwater. A CAP includes the following four basic elements:

1. Assessment of impacts
2. Determination of applicable cleanup levels
3. Feasibility study and corrective action work plan
4. Plan to monitor and report the effectiveness of the corrective action

If contaminated soils are encountered during the tunnel removal process, they will need to be evaluated for off-site disposal. Contaminated soils are assumed to require disposal at a Class I landfill. The nearest Class I landfill to the project site is Clean Harbors Buttonwillow LLC facility located in Buttonwillow, California. Documentation of proper disposal of the soil (bill of lading, weigh tickets, manifests, etc.) must be submitted to DEH.

In addition, measures should be taken to prevent any potentially contaminated soil or water from entering the San Diego Bay during the tunnel removal and associated construction. To ensure that no contaminants from the tunnels or the construction area enter San Diego Bay, appropriate BMPs should be put in place. BMPs may include a silt curtain or other containment device used during tunnel removal or construction to prevent any activities from impacting bay waters outside the immediate area. Any water generated during construction should be captured prior to release into the storm sewer system.

In addition, tunnel removal activities would need to comply with various regulations, including (but not limited to):

- Requirements of the statewide National Pollutant Discharge Elimination System (NPDES) Construction General Permit.
- SWRCB Statewide General Waste Discharge Requirements (WDRs) for discharges to land with a low threat to water quality (Order No. 2003–0003-DWQ).
- Requirements set forth in the *General Waste Discharge Requirements for Discharges from Temporary Groundwater Extraction and Similar Waste Discharges to San Diego Bay, Tributaries Thereto under Tidal Influence, and Storm Drains or Other Conveyance Systems Tributary Thereto Order No. R9-2007-0034 (NPDES No. CAG919001)*.

63732 PAGE 259

- San Diego Municipal Storm Water Permit (Order No. R9-2013-0001, NPDES No. CAS0109266).
- Requirements outlined in the SUSMP to prepare an Urban Storm Water Mitigation Plan (USMP). The USMP would include BMPs to reduce pollutants of concern and BMP maintenance provisions in an Operations and Maintenance Plan. The proposed project would also be required to comply with the Storm Water Management and Discharge Control Ordinance adopted by the District which sets forth requirements for dischargers and places of discharge to protect and enhance water quality

In accordance with the Construction General Permit, the Municipal Permit, and the Storm Water Management and Discharge Control Ordinance, prior to construction appropriate BMPs would be identified and implemented pursuant to a project-specific Stormwater Pollution Prevention Plan (SWPPP). Temporary or short-term BMPs identified in the Jurisdictional Urban Runoff Management Plan (JRMP) that could be included in the project SWPPP include the following:

- Concrete waste management
- Desilting basin
- Erosion control mats and spray-on applications
- Fiber roll
- Gravel bag berm
- Material delivery and storage
- Paving and grading operations
- Sandbag barrier
- Silt fence
- Solid waste management
- Spill prevention and control
- Stabilized construction entrance/exit
- Stockpile management
- Storm drain inlet protection
- Street sweeping and vacuuming
- Vehicle and equipment maintenance
- Water conservation practices

6.3 Dry Dock Operations

Mitigation measures associated with dry dock operations are described below.

6.3.1 Mitigation Measure 14: Update Permits, BMP Manual, and SOPs

Operations of the new dry dock (ship loading and unloading, ship repair and maintenance activities, and long-term dry dock maintenance needs) would be similar to existing operational activities for the POSD dry dock currently in use at the BAE Systems facility. Adding the second dry dock would not create new conditions at the facility that could result in impairments to water quality. Operations for the new dry dock would be subject to the operational requirements that are the same as or similar to those of the existing dry dock.

As soon as practical, BAE Systems will update and modify the permits and operational BMPs and SOPs that mitigate the impacts to water quality during the normal operations and maintenance of the new dry dock.

SUMMARY OF FINDINGS

This noise impact analysis has been prepared to evaluate the potential noise impacts and mitigation measures associated with the proposed Pier 1 North Dry Dock Project (project) in the City of San Diego (City), California.

BAE Systems proposes to site a new drydock on the north side of its Pier 1 and extend the existing lease term based on its investments in the leasehold. Additionally, BAE Systems proposes to enter into a real estate agreement with the San Diego Unified Port District (District) on the neighboring two-acre land parcel and four-acre water area that is currently leased by a Tidelands Use and Occupancy Permit (TUOP). The TUOP tideland parcel contains two existing intake/discharge tunnels that would be removed either during the new dry dock construction or during a later phase of the project. Potential remediation efforts associated with the removal of the intake/discharge tunnels would be identified and disclosed. The primary existing noise sources in the project area are port operations, including shipyard repair activities, within the District and traffic noise along Harbor Drive and other local streets in the project vicinity.

Construction activities will comply with the hours set by the City's Municipal Code. Construction noise levels measured at or beyond the property lines of any property zoned residential shall not exceed an average sound level greater than 75 decibels (dB) during the 12-hour period from 7:00 a.m. to 7:00 p.m. In addition, construction activity is prohibited between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day, or on legal holidays as specified in Section 21.04 of the San Diego Municipal Code, with the exception of Columbus Day and Washington's Birthday, or on Sundays, that would create disturbing, excessive, or offensive noise unless a permit has been applied for and granted beforehand by the Noise Abatement and Control Administrator, in conformance with San Diego Municipal Code Section 59.5.0404.

INTRODUCTION

This report is intended to satisfy the San Diego Unified Port District's (District's) requirement for the Pier 1 North Dry Dock Project (project) and evaluate the effectiveness of mitigation measures incorporated as part of the project designs.

PROJECT DESCRIPTION

The proposed project involves construction of a new drydock (dry berth) on the north side of Pier 1 at the BAE Systems facility. The drydock would support the current and future planned home-porting of United States Naval ships in the harbor and allow greater flexibility in the utilization of dry-docking facilities. The proposed drydock would replace an existing wet berth used for ship repair and maintenance with a dry berth. BAE Systems also proposes to enter into a future, long-term real estate agreement with the District on the neighboring 2-acre land parcel and 4-acre water area that is currently leased by BAE Systems under a Tidelands Use and Occupancy Permit (TUOP). The TUOP parcel (formerly known as the SDG&E parcel) contains two existing underground intake/discharge ("cooling") tunnels that could be removed during project construction or at a later date. For purposes of this noise impact study, removal of the cooling tunnels has been assumed to occur during project construction.

Please refer to a full Project Description under separate cover for more information (provided as Appendix A). Figure 1 illustrates the project location. BAE Systems will schedule approximately 93 new employees at the Pier 1 North (1N) project site for work shifts that begin and end outside of the a.m. peak-hour and p.m. peak-hour periods (7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m.). Based on discussion with BAE Systems, 20 percent of employees currently utilize alternative means of transportation such as bus or train and/or carpool. Therefore, it is anticipated that 20 percent of the 93 new employees will also utilize transit or carpool. The remaining 80 percent will drive themselves to and from the project site. Therefore, 93 employees would generate approximately 149 average daily trips (ADT) and 0 peak-hour trips. Figure 2 shows the project's preliminary site plan.

Pier 1 North Drydock Project

Preliminary Site Plan

METHODOLOGY RELATED TO NOISE IMPACT ASSESSMENT

Evaluation of noise impacts associated with the proposed project includes the following:

- Determination of the noise impacts associated with short-term construction of the proposed project on adjacent noise-sensitive uses;
- Determination of the long-term mobile and stationary source noise impacts on noise-sensitive uses adjacent to the site; and
- Determination of the required mitigation measures to reduce short-term and long-term noise impacts.

This noise impact analysis utilizes the City's noise standards, including the City's Progress Guide and General Plan (which are summarized in Significance Determination Thresholds California Environmental Quality Act, City of San Diego Development Services Department Land Development Review Division Environmental Analysis Section, April 2004) and San Diego Municipal Code Chapter 5 Article 9.5: Noise Abatement and Control, as thresholds against which potential noise impacts are evaluated.

CHARACTERISTICS OF SOUND

Sound is increasing in the environment and can affect quality of life. Noise is usually defined as unwanted sound. Noise consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

To the human ear, sound has two significant characteristics: pitch and loudness. Pitch is generally an annoyance, while loudness can affect the ability to hear. Pitch is the number of complete vibrations, or cycles per second, of a wave, resulting in the tone's range from high to low. Loudness is the strength of a sound and describes a noisy or quiet environment; it is measured by the amplitude of the sound wave. Loudness is determined by the intensity of the sound waves, combined with the reception characteristics of the human ear. Sound intensity refers to how hard the sound wave strikes an object, which in turn produces the sound's effect. This characteristic of sound can be precisely measured with instruments. The analysis of a project defines the noise environment of the project area in terms of sound intensity and its effect on adjacent sensitive land uses.

MEASUREMENT OF SOUND

Sound intensity is measured through the A-weighted scale to correct for the relative frequency response of the human ear. That is, an A-weighted noise level de-emphasizes low and very high frequencies of sound similar to the human ear's de-emphasis of these frequencies. Unlike linear units, such as inches or pounds, decibels are measured on a logarithmic scale representing points on a sharply rising curve.

For example, 10 decibels (dB) are 10 times more intense than 1 dB, 20 dB are 100 times more intense, and 30 dB are 1,000 times more intense. Thirty dB represent 1,000 times more acoustic energy than 1 dB. The decibel scale increases as the square of the change, representing the sound pressure energy. A sound as soft as human breathing is about 10 times greater than 0 dB. The decibel system of measuring sound gives a rough connection between the physical intensity of sound and its perceived loudness to the human ear. A 10 dB increase in sound level is perceived by the human ear as only a doubling of the loudness of the sound. Ambient sounds generally range from 30 (very quiet) to 100 A-weighted decibels (dBA) (very loud).

Sound levels are generated from a source, and their decibel level decreases as the distance from that source increases. Sound dissipates exponentially with distance from the noise source. For a single point source, sound levels decrease approximately 6 dB for each doubling of distance from the source. This drop-off rate is appropriate for noise generated by stationary equipment. If noise is produced by a line source, such as highway traffic or railroad operations, the sound decreases 3 dB for each doubling of distance in a hard site environment. Line source noise, when produced within a relatively flat environment with absorptive vegetation, decreases 4.5 dB for each doubling of distance.

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans also accounts for the annoyance effects of sound. Equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human communities in the State of California are the L_{eq} and Community Noise Equivalent Level (CNEL) or the day-night average level (L_{dn}) based on A-weighted decibels. CNEL is the time-varying noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as relaxation hours) and 10 dBA weighting factor applied to noise occurring from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during the evening hours. CNEL and L_{dn} are within 1 dBA of each other and are normally exchangeable. The noise adjustments are added to the noise events occurring during the more sensitive hours.

Other noise rating scales of importance when assessing the annoyance factor include the maximum noise level (L_{max}), which is the highest exponential time-averaged sound level that occurs during a stated time period. The noise environments discussed in this analysis are specified in terms of maximum levels denoted by L_{max} for short-term noise impacts. L_{max} reflects peak operating conditions and addresses the annoyance aspects of intermittent noise.

Another noise scale often used together with the L_{max} in noise ordinances for enforcement purposes is noise standards in terms of percentile noise levels. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

Noise impacts can be described in three categories. The first is audible impacts, which refers to increases in noise levels noticeable to humans. Audible increases in noise levels generally refer to a change of 3 dB or greater, since this level has been found to be barely perceptible in exterior

environments. The second category, potentially audible, refers to a change in the noise level between 1 and 3 dB. This range of noise levels has been found to be noticeable only in laboratory environments. The last category is changes in noise level of less than 1 dB, which are inaudible to the human ear. Only audible changes in existing ambient or background noise levels are considered potentially significant.

PHYSIOLOGICAL EFFECTS OF NOISE

Physical damage to human hearing begins at prolonged exposure to noise levels higher than 85 dBA. Exposure to high noise levels affects the entire system, with prolonged noise exposure in excess of 75 dBA increasing body tensions and thereby affecting blood pressure and functions of the heart and the nervous system. In comparison, extended periods of noise exposure above 90 dBA would result in permanent cell damage. When the noise level reaches 120 dBA, a tickling sensation occurs in the human ear even with short-term exposure. This level of noise is called the threshold of feeling. As the sound reaches 140 dBA, the tickling sensation is replaced by the feeling of pain in the ear. This is called the threshold of pain. A sound level of 160 to 165 dBA will result in dizziness or loss of equilibrium. The ambient or background noise problem is widespread and generally more concentrated in urban areas than in outlying, less developed areas.

Table A lists "Definitions of Acoustical Terms;" Table B shows "Common Sound Levels and Their Noise Sources;" and Table C shows "City of San Diego Noise Land Use Compatibility Chart."

VIBRATION

Vibration refers to groundborne noise and perceptible motion. Groundborne vibration is almost exclusively a concern inside buildings. It is rarely perceived as a problem outdoors where the motion may be discernible, but without the effects associated with the shaking of a building, there is less adverse reaction. Vibration energy propagates from a source through intervening soil and rock layers to the foundations of nearby buildings. The vibration then propagates from the foundation throughout the remainder of the structure. Building vibration may be perceived by occupants as the motion of building surfaces, the rattling of items on shelves or hanging on walls, or a low-frequency rumbling noise. The rumbling noise is caused by the vibrating walls, floors, and ceilings that are radiating sound waves. Annoyance from vibration often occurs when the vibration exceeds the threshold of perception by 10 dB or less. This is an order of magnitude below the damage threshold for normal buildings.

Typical sources of groundborne vibration are construction activities (e.g., blasting, pile driving, and operating heavy-duty earthmoving equipment), steel-wheeled trains, and occasional traffic on rough roads. Problems with groundborne vibration and noise from these sources are usually localized to areas within approximately 100 feet (ft) from the vibration source, although there are examples of groundborne vibration causing interference out to distances greater than 200 ft (Federal Transit Administration [FTA] 2006). When roadways are smooth, vibration from traffic, even heavy trucks, is rarely perceptible. It is assumed for most projects that the roadway surface will be smooth enough that groundborne vibration from street traffic will not exceed the impact criteria; however, both construction of the project and the freight train operations could result in groundborne vibration that

Table A: Definitions of Acoustical Terms

Term	Definition
Decibel, dB	A unit of level that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
Frequency, Hz	Of a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., number of cycles per second).
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this report are A-weighted, unless reported otherwise.
L_{02}, L_{08}, L_{50}, L_{90}	The fast A-weighted noise levels that are equaled or exceeded by a fluctuating sound level 2 percent, 8 percent, 50 percent, and 90 percent of a stated time period, respectively.
Equivalent Continuous Noise Level, L_{eq}	The level of a steady sound that, in a stated time period and at a stated location, has the same A-weighted sound energy as the time-varying sound.
Community Noise Equivalent Level, CNEL	The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 5 decibels to sound levels occurring in the evening from 7:00 p.m. to 10:00 p.m. and after the addition of 10 decibels to sound levels occurring in the night between 10:00 p.m. and 7:00 a.m.
Day/Night Noise Level, L_{dn}	The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 10 decibels to sound levels occurring in the night between 10:00 p.m. and 7:00 a.m.
L_{max}, L_{min}	The maximum and minimum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging.
Ambient Noise Level	The all-encompassing noise associated with a given environment at a specified time, usually a composite of sound from many sources at many directions, near and far; no particular sound is dominant.
Intrusive	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

could be perceptible and annoying. Groundborne noise is not likely to be a problem because noise arriving via the normal airborne path usually will be greater than groundborne noise.

Groundborne vibration has the potential to disturb people as well as damage buildings. Although it is very rare for train-induced groundborne vibration to cause even cosmetic building damage, it is not uncommon for construction processes such as blasting and pile driving to cause vibration of sufficient amplitudes to damage nearby buildings (FTA 2006). Groundborne vibration is usually measured in terms of vibration velocity, either the root-mean-square (RMS) velocity or the peak particle velocity (PPV). RMS is best for characterizing human response to building vibration and PPV is used to characterize the potential for damage. Decibel notation acts to compress the ranges of numbers required to describe vibration. Vibration velocity level in decibels is defined as:

$$L_v = 20 \log_{10} [V/V_{ref}]$$

where L_v is the velocity in decibels (VdB), "V" is the RMS velocity amplitude, and "V_{ref}" is the reference velocity amplitude, or 1×10^{-6} inches/second used in the United States.

Factors that influence groundborne vibration and noise include the following:

- **Vibration Source:** Vehicle suspension, wheel types and condition, railroad track/roadway surface, railroad track support system, speed, transit structure, and depth of vibration source.
- **Vibration Path:** Soil type, rock layers, soil layering, depth to water table, and frost depth.
- **Vibration Receiver:** Foundation type, building construction, and acoustical absorption.

Among the factors listed above, there are significant differences in the vibration characteristics when the source is underground compared to at the ground surface. In addition, soil conditions are known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil and the depth to bedrock.

Experience with groundborne vibration indicates that (1) vibration propagation is more efficient in stiff clay soils than in loose sandy soils, and (2) shallow rock seems to concentrate the vibration energy close to the surface and can result in groundborne vibration problems at large distances from a railroad track. Factors such as layering of the soil and depth to water table can have significant effects on the propagation of groundborne vibration. Soft, loose, sandy soils tend to attenuate more vibration energy than hard, rocky materials. Vibration propagation through groundwater is more efficient than through sandy soils.

SETTING

EXISTING SENSITIVE LAND USES IN THE PROJECT AREA

Sensitive receptors include residences, schools, hospitals, and similar uses that are sensitive to noise. There are existing residences located to the northwest of the project site, along Main Street and South Evans Street, that are approximately 1,000 ft from the project boundary. Existing residences to the northeast along South 26th Street and Boston Avenue are approximately 1,200 ft from the project site. Existing residences to the north along Sicard Street and Newton Avenue are approximately 1,000 ft from the project site. Cesar Chavez Park is located approximately 1,800 ft to the northwest of the project site. A college, Woodbury School of Architecture, is located approximately 1,600 ft to the north of the project site. These sensitive land uses are separated from the project site by existing intervening buildings and structures.

EXISTING NOISE ENVIRONMENT IN THE PROJECT AREA

The primary existing noise sources in the project area are port activities, including shipyard repair activities, and other transportation facilities (e.g., existing roadways). Noise associated with port operations occurs intermittently. Traffic on Harbor Drive, Sampson Street, Sicard Street, and other local streets in the project vicinity is the steady source of ambient noise. The existing ADT volumes for roadway segments in the project vicinity are obtained from the *Traffic Impact Study* (LSA Associates, Inc. [LSA], March 2015) prepared for this project.

The Federal Highway Administration (FHWA) *Highway Traffic Noise Prediction Model* (FHWA RD-77-108) was used to evaluate highway traffic-related noise conditions in the vicinity of the project site. This model requires various parameters including traffic volumes, vehicle mix, vehicle speed, and roadway geometry to compute typical equivalent noise levels during daytime, evening, and nighttime hours. The resultant noise levels are weighted and summed over 24-hour periods to determine the CNEL values. Table D provides the existing traffic noise levels adjacent to roadway segments in the project vicinity. These noise levels represent worst-case scenarios, which assume that no shielding is provided between the traffic and the location where the noise contours are drawn. The specific assumptions used in developing these noise levels and the model printouts are provided in Appendix A. Traffic noise is generally moderate along all existing street segments in the project vicinity, with the 70 dBA CNEL noise contour confined within the roadway rights-of-way.

Table D: Existing Traffic Noise Levels

Roadway Segment	ADT	Centerline to 70 CNEL (ft)	Centerline to 65 CNEL (ft)	Centerline to 60 CNEL (ft)	CNEL (dBA) 50 Ft from Centerline of Outermost Lane
Logan Avenue from I-5 southbound Off-Ramp to Cesar Chavez	6,500	< 50	< 50	100	62.7
Cesar Chavez Parkway from Kearney Avenue to Logan Avenue	14,500	< 50	80	169	66.2
Cesar Chavez Parkway from Logan Avenue to Harbor Drive	11,600	< 50	70	146	65.2

Note: Traffic noise within 50 ft of the roadway centerline should be evaluated with site-specific information.
ADT = average daily trips
CNEL = community noise equivalent level
dBA = A=weighted decibel(s)
ft = feet/foot
I-5 = Interstate 5
SR-94 = State Route 94

THRESHOLDS OF SIGNIFICANCE

A project will normally have a significant noise-related effect on the environment if it substantially increases the ambient noise levels in adjoining areas or conflicts with adopted environmental plans and goals of the community in which it is located. The project site is governed by the San Diego Unified Port District. However, neither the Port Master Plan nor the Port's Rules and Regulations provides any noise level restriction guidelines. Therefore, noise standards included in the City's Progress Guide and General Plan (which are summarized in Significance Determination Thresholds California Environmental Quality Act, City of San Diego Development Services Department Land Development Review Division Environmental Analysis Section, 2007) and San Diego Municipal Code, Chapter 5, Article 9.5: Noise Abatement and Control are used in this noise impact analysis. Although the project site is within the Barrio Logan Community Plan, it stated that "The General Plan provides sufficient policy direction for noise-related issues; therefore minimal additional policies have been provided specifically for Barrio Logan." Therefore, no specific noise policies or standards have been identified from the Barrio Logan Community Plan for the noise impact analysis for this project.

City of San Diego Progress Guide and General Plan, Significance Determination Thresholds California Environmental Quality Act

The City has adopted traffic noise significance thresholds for various land uses. Noise standards for the proposed project are as follows:

- Noise-sensitive uses such as public parks and multifamily residences are considered significantly affected by traffic noise in excess of 65 dBA CNEL in their required exterior usable space. For interior noise-sensitive space, the noise standard is 45 dBA CNEL per Title 24 of the California Code of Regulations.
- If a nonresidential use, such as a commercial, industrial, or school use, is proposed to abut an existing residential use, the decibel level at the property line should be the arithmetic mean of the decibel levels allowed for each use as set forth in Section 59.5.0401 of the Municipal Code. Although the noise level above could be consistent with the City's Noise Ordinance Standards, a noise level above 65 dBA CNEL at the residential property line could be considered a significant environmental impact. For an existing use, any expansion or repair/maintenance activity would be required to comply with this noise policy.
- Temporary construction noise that exceeds 75 dBA $L_{eq}(1)$ at a sensitive receptor would be considered significant. Construction noise levels measured at or beyond the property lines of any property zoned residential shall not exceed an average sound level greater than 75 dB during the 12-hour period from 7:00 a.m. to 7:00 p.m. In addition, construction activity is prohibited between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day, or on legal holidays as specified in Section 21.04 of the San Diego Municipal Code, with the exception of Columbus Day and Washington's Birthday, or on Sundays, that would create disturbing, excessive, or offensive noise unless a permit has been applied for and granted beforehand by the Noise Abatement and Control Administrator, in conformance with San Diego Municipal Code Section 59.5.0404.

City of San Diego Noise Abatement and Control Ordinance

The City of San Diego Municipal Code, Chapter 5, Article 9.5, Noise Abatement and Control, governs stationary sources and operational noise. The applicable sound level is a function of the time of day and land use zone. Sound levels are measured at the property line of the noise source. As stated in the City's Noise Abatement and Control ordinance:

> It shall be unlawful for any person to cause noise by any means to the extent that the one-hour average sound level exceeds the applicable limit given in the following table (see Table E), at any location in the City of San Diego on or beyond the boundaries of the property on which the noise is produced. The noise subject to these limits is that part of the total noise at the specified location that is due solely to the action of said person.

Table E: Applicable Noise Limits

Zone	Time	1-Hour Average Sound Level, $L_{eq}(1)$, dBA
Single-Family Residential	7:00 a.m.–7:00 p.m.	50
	7:00 p.m.–10:00 p.m.	45
	10:00 p.m.–7:00 a.m.	40
Multifamily Residential (up to a maximum density of 1/2000)	7:00 a.m.–7:00 p.m.	55
	7:00 p.m.–10:00 p.m.	50
	10:00 p.m.–7:00 a.m.	45
All other Residential	7:00 a.m.–7:00 p.m.	60
	7:00 p.m.–10:00 p.m.	55
	10:00 p.m.–7:00 a.m.	50
Commercial	7:00 a.m.–7:00 p.m.	65
	7:00 p.m.–10:00 p.m.	60
	10:00 p.m.–7:00 a.m.	60
Industrial or Agricultural	Anytime	75

Source: City of San Diego Municipal Code Noise Abatement and Control Ordinance.
dBA = A-weighted decibels
$L_{eq}(1)$ = equivalent continuous noise level over 1 hour

Table E summarizes the applicable hourly noise limits for various receiving land uses. For the proposed project, the multifamily dwellings are subject to the noise standards of 55 dBA $L_{eq}(1)$ from 7:00 a.m. to 7:00 p.m., 50 dBA $L_{eq}(1)$ from 7:00 p.m. to 10:00 p.m., and 45 dBA $L_{eq}(1)$ from 10:00 p.m. to 7:00 a.m. The commercial/retail uses are subject to the noise standards of 65 dBA $L_{eq}(1)$ from 7:00 a.m. to 7:00 p.m., 60 dBA $L_{eq}(1)$ from 7:00 p.m. to 10:00 p.m., and 60 dBA $L_{eq}(1)$ from 10:00 p.m. to 7:00 a.m.

The sound level limit at a location on a boundary between two zoning districts is the arithmetic mean of the respective limits for the two districts. For example, at the dividing line between a commercial property and an industrial use property, the noise standard would be (75 + 65 = 140, then 140/2 =) 70 dBA between the hours of 7:00 a.m. and 7:00 p.m.

California Building Code

Title 24 of the California Code of Regulations, also referred to as the California Building Code, requires that interior noise levels in multifamily residences caused by exterior sources not exceed 45 dBA CNEL. This is also considered a desirable noise exposure standard for single-family residences. Title 24 further specifies that if exterior noise levels exceed 60 dBA CNEL for multifamily residential uses, an acoustical analysis shall be required to demonstrate that the design would achieve the prescribed interior noise standard.

The noise level of 65 dBA CNEL is also the threshold where noise interferes noticeably with the ability to carry on a quiet conversation. Therefore, exterior noise exposure of 65 dBA CNEL is the most common noise/land use compatibility guideline for new residential construction in California.

Vibration Impact Criteria

The criteria for environmental impact from groundborne vibration and noise are based on the maximum levels for a single event. Hydroacoustic analysis pertaining to underwater vibration impacts are addressed separately in the Hydroacoustics Analysis prepared by TerraData (January 2015).

Federal Transit Administration and Federal Railroad Administration. Due to the lack of vibration standards developed for projects similar to the proposed project, vibration standards included in FTA's *Transit Noise and Vibration Impact Assessment* (FTA, May 2006) are used in this analysis for groundborne vibration impacts, as shown in Table F. The criteria presented in Table F account for variation in project types as well as the frequency of events, which differ widely among transit projects. Most experience is with the community response to groundborne vibration from rail rapid transit systems, with typical headways in the range of 3 to 10 minutes and each vibration event lasting less than 10 seconds. It is intuitive that when there will be fewer events per day, as is typical for commuter rail projects, it should take higher vibration levels to evoke the same community response. This is accounted for in the criteria by distinguishing between projects with frequent and infrequent events, where the term "frequent events" is defined as more than 70 vibration events from the same source per day. "Occasional events" is defined as between 30 and 70 vibration events from the same source per day. "Infrequent events" is defined as fewer than 30 vibration events of the same kind per day.

Table G illustrates the human response to various vibration levels, as described in the FTA *Transit Noise and Vibration Impact Assessment* (FTA, May 2006).

FTA guidelines show that a vibration level of up to 102 VdB (an equivalent to 0.5 inch/sec in RMS) (FTA, May 2006) is considered safe and would not result in any construction vibration damage. For a nonengineered timber and masonry building, the construction vibration damage criterion is 94 VdB (0.2 inch/sec in RMS). The RMS values for building damage thresholds referenced above are shown in Table H, taken from the *Transportation- and Construction-Induced Vibration Guidance Manual* (prepared by Jones & Stokes, for the California Department of Transportation [Caltrans], June 2004).

Table F: Groundborne Vibration (GBV) and Groundborne Noise (GBN) Impact Criteria for General Assessment

Land Use Category	GBV Impact Levels (VdB re 1 micro-inch/sec)			GBN Impact Levels (dB re 20 micro-Pascals)		
	Frequent[1] Events	Occasional[2] Events	Infrequent[3] Events	Frequent[1] Events	Occasional[2] Events	Infrequent[3] Events
Category 1: Buildings where low ambient vibration is essential for interior operations.	65 VdB[4]	65 VdB[4]	65 VdB[4]	N/A[4]	N/A[4]	N/A[4]
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB	40 dBA	43 dBA	48 dBA

Source: Federal Transit Administration (2006).

1 Frequent events are defined as more than 70 vibration events from the same source per day.

2 Occasional events are defined as between 30 and 70 vibration events from the same source per day.

3 Infrequent events are defined as fewer than 30 vibration events of the same kind per day.

4 This criterion limit is based on levels that are acceptable for most moderately sensitive equipment, such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.

5 Vibration-sensitive equipment is generally not sensitive to groundborne noise.

dB = decibels
dBA = A-weighted decibels
HVAC = heating, ventilation, and air conditioning
inch/sec = inches per second
VdB = vibration velocity decibels

Table G: Human Response to Different Levels of Groundborne Noise and Vibration

Vibration Velocity Level	Noise Level		Human Response
	Low Frequency[1]	Mid Frequency[2]	
65 VdB	25 dBA	40 dBA	Approximate threshold of perception for many humans. Low-frequency sound usually inaudible; mid-frequency sound excessive for quiet sleeping areas.
75 VdB	35 dBA	50 dBA	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find transit vibration at this level unacceptable. Low-frequency noise acceptable for sleeping areas; mid-frequency noise annoying in most quiet occupied areas.
85 VdB	45 dBA	60 dBA	Vibration acceptable only if there are an infrequent number of events per day. Low-frequency noise unacceptable for sleeping areas; mid-frequency noise unacceptable even for infrequent events with institutional land uses such as schools and churches.

Source: Federal Transit Administration (2006).
[1] Approximate noise level when vibration spectrum peak is near 30 Hz.
[2] Approximate noise level when vibration spectrum peak is near 60 Hz.
dBA = A-weighted decibels
Hz = Hertz
VdB = vibration velocity decibels

Table H: Construction Vibration Damage Criteria

Building Category	PPV (inch/sec)	Approximate Lv[1]
Reinforced-concrete, steel or timber (no plaster)	0.5	102
Engineered concrete and masonry (no plaster)	0.3	98
Non-engineered timber and masonry buildings	0.2	94
Buildings extremely susceptible to vibration damage	0.12	90

Source: Transit Noise and Vibration Impact Assessment (May 2006).
[1] RMS velocity in decibels (VdB) re 1 micro-inch/second.
inch/sec = inches per second
L_V = vibration velocity level
PPV = peak particle velocity
RMS = root mean square

The criteria in Tables G and H are related to groundborne vibration causing human annoyance or interfering with the use of vibration-sensitive equipment. Table I lists the guideline vibration potential threshold criteria from the Caltrans *Transportation- and Construction-Induced Vibration Guidance Manual* (Caltrans, June 2004).

Table I: Guideline Vibration Potential Threshold Criteria

Structure and Condition	Maximum PPV (inch/sec)	
	Transient Sources[1]	Continuous/Frequent Intermittent Sources[2]
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old buildings	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial buildings	2.00	0.50

Source: Caltrans *Transportation- and Construction-Induced Vibration Guidance Manual* (June 2004).

[1] Transient sources create a single, isolated vibration event, such as blasting or drop balls.

[2] Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

inch/sec = inches per second

PPV = peak particle velocity

PROJECT IMPACTS

CONSTRUCTION NOISE

Short-term noise impacts would be associated with dredging, pile driving, and installation of dry dock on site during construction of the proposed project. Construction-related, short-term noise levels would be higher than existing ambient noise levels in the project area, but would cease once construction activities have been completed.

Two types of short-term noise impacts could occur during the construction of the proposed project. First, construction crew commutes and the transport of construction equipment and materials to and from the site would incrementally increase noise levels on adjacent access roads. To analyze conservative, worst case construction conditions, the simultaneous construction of the Pier 1N Drydock (overlapping Phases I through VI) and the removal of the cooling tunnels (Phase III) have been assumed. As such, a total of approximately 89 workers and 58 trucks could be destined to the project site on the busiest day. Construction-related truck traffic to and from the site would occur along Harbor Drive south to I-5 or Civic Center Drive for in and outbound routes. Construction deliveries will be directed not to traverse the local Barrio Logan community neighborhoods. There will be a relatively high single-event noise exposure potential at a maximum level of 87 dBA L_{max} with trucks passing at 50 ft. As a rule of thumb, it takes doubling of the traffic volumes to increase the traffic noise by 3 dBA, which is the minimum human perceptible noise level increase. These worker trips would occur during the non-peak hours and would be dispersed throughout the road network. The projected construction traffic will not be more than the existing traffic volumes on street segments in the project vicinity. Table J lists the traffic noise levels under the existing with project construction traffic scenario. Table J shows that construction traffic would add at most 0.1 dBA to the traffic noise on roadways in the project vicinity. Therefore, short-term construction-related worker commutes and equipment transport noise impacts would not be significant.

The second type of short-term noise impact results from noise generated during dredging, pile driving, and construction of the proposed project features. Construction is performed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site. Therefore, the noise levels vary as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table K lists maximum noise levels recommended for noise impact assessments for typical construction equipment based on a distance of 50 ft between the equipment and a noise receptor, taken from the FHWA *Roadway Construction Noise Model* (FHWA *Highway Construction Noise Handbook*, August 2006). Equipment noise levels collected in this document represent the latest information available for construction equipment that would be used. Typical maximum noise levels range up to 91 dBA L_{max} at 50 ft during the noisiest construction phases. The noisiest construction equipment is pile driving activity. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 or 4 minutes at lower power settings.

Equipment in **Bold** is expected to be used on the project site.
dBA = A-weighted decibels
ft = foot/feet
ft-lb/blow = foot-pounds per blow
L_{max} = maximum instantaneous noise level
N/A = Not Applicable
Spec. 721.560 L_{max} at 50 ft (dBA Slow)=The specification "Spec" limit for each piece of equipment expressed as an L_{max} level in dBA "slow" at a reference distance of 50 ft from the loudest side of equipment
Actual Measured L_{max} at 50 ft (dBA, slow)(Samples Averaged)=The measured "Actual" emission level at 50 ft for each piece of equipment based on hundreds of emission measurements performed on CA/T work sites

The following construction noise impact discussion focuses on the maximum noise-producing construction equipment that are likely to be used concurrently at a given time. If the removal of the cooling tunnels occurs at the same time, noise from on-site construction activity would not increase substantially due to the distance between these two construction areas. Construction traffic noise impacts on off-site areas were discussed in the discussion for Table J.

Construction of the proposed project is expected to require the use of a floating crane barge, a land-based crawler crane, deck barges, a tug boat, trucks, forklifts, a drilling rig, an impact hammer, a vibratory hammer, and concrete trucks. Based on Table K, the maximum noise level generated by each crane on the proposed project site is assumed to be 81 dBA L_{max} at 50 ft from the crane. Each dump truck would generate 76 dBA L_{max} at 50 ft. The maximum noise level generated by pickup trucks is also 75 dBA L_{max} at 50 ft from these vehicles. Each doubling of a sound source with equal strength increases the noise level by 3 dBA. Assuming that each piece of construction equipment operates at some distance from the other equipment, the worst-case combined noise level at each individual residence during this phase of construction would be 90 dBA L_{max} at a distance of 50 ft from the active construction area (with 8 pieces of equipment generating 81 dBA each or higher number of equipment with lower individual source noise levels). Pile driving, when used, would potentially result in a noise level of 93 dBA L_{max} at a distance of 50 ft (taken from Noise Control for Buildings and Manufacturing Plants, Bolt, Beranek & Newman, 1987).

There are existing residences located to the northwest of the project site, along Main Street and South Evans Street that are approximately 1,920 ft from the project boundary. Existing residences to the northeast along South 26th Street and Boston Avenue are approximately 2,250 ft from the project site. Existing residences to the north along Sicard Street and Newton Avenue are approximately 1,960 ft from the project site. Cesar Chavez Park is located approximately 1,940 ft to the northwest of the project site. A college, Woodbury School of Architecture, is located approximately 1,600 ft to the north of the project site. Figure 3 depicts these off-site sensitive receiver locations. Table L lists these sensitive receptors and their respective distances to the project site.

Table L: Nearest Off-site Noise Sensitive Receivers

Receiver Location	Direction	Distance (feet)
Main Street and South Evans Street	Northwest	1,670
South 26th Street and Boston Avenue	Northeast	2,250
Sicard Street and Newton Avenue	North	1,960
Cesar Chavez Park	Northwest	1,940

R:\PTO1402\GIS\SensitiveReceptors.mxd (12/12/2014)

The closest residences that are approximately 1,670 ft from the project boundary may be subject to short-term noise below 60 dBA L_{max} that is generated by construction activities (except pile driving, which is 3 dBA higher than standard construction equipment) near the project boundary at Pier 1 due to distance attenuation alone, which would decrease by 6 dBA per doubling of the distance (e.g., from 100 ft to 200 ft, or from 200 ft to 400 ft) under the soft site condition. Table M lists the distance attenuation for these off-site receivers under the soft site condition. Intervening commercial and/or industrial buildings and structures between the project site and these off-site sensitive uses would function as noise barriers and provide 10 to 20 dBA reduction depending on the shielding coverage by the intervening buildings/structures. Total noise reduction from distance attenuation and shield effect by intervening buildings/structures would be 40 to 50 dBA and reduce the on-site construction noise to 50 dBA L_{max} or lower at the off-site receivers that are 1,600 ft away. Noise from pile driving activity would potentially reach 53 dBA L_{max} at the nearest residences to the northeast. Cesar Chavez Park, approximately 1,940 ft from the project boundary, would receive 32 dBA from distance attenuation and at least 15 dBA of shielding effect from intervening buildings/structures. Construction noise from on-site activity would be reduced to 43 dBA L_{max} or lower from general construction activity and 46 dBA L_{max} from pile driving at the Cesar Chavez Park.

Table M: Noise Reduction at Off-site Noise Sensitive Receivers

Land Use/Receiver Location	Pile Driving Noise Level at 50 feet (dBA L_{max})	Shielding by Intervening Buildings* (dBA)	Distance (feet)	Total Reduction in Noise (dBA)	Resulting Noise Level (dBA L_{eq})[1]	City Noise Standard (dBA L_{eq})
Residences/Main Street and South Evans Street	93	10	1,670	40	53	75

Source: LSA Associates, Inc.
* Shielding by intervening buildings assumes the minimum 10 dBA only. It could be higher depending on the density of the buildings and/or structures between the receiver and the project site.
[1] Assumes that the maximum noise would last for more than 30 minutes in an hour so it becomes L_{eq} level.

This range of maximum construction noise would occur only intermittently when construction activity occurs near the project's boundary. As stated previously, typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 or 4 minutes at lower power settings. It would be rare for the equipment to operate at full power continuously over an entire hour. Therefore, the above analysis shows that, even if under the worst-case scenario of the equipment operating at full power continuously, the maximum hourly noise level at the off-site receiver locations would be 53 dBA $L_{eq}(1)$ or lower, and would be below the 75 dBA $L_{eq}(1)$ noise standard over a 1-hour period. Traffic noise in the immediate vicinity of these

noise-sensitive uses would be higher than the projected construction noise and would generally mask any project-related construction noise. Compliance with the construction hours and maximum noise levels specified in the City's Noise Abatement and Control Ordinance is a standard requirement of all development/construction in the project area and would further limit construction-related noise impacts to off-site sensitive receptors.

The ocean disposal of excavated dredged materials at the off-shore disposal site would not result in any perceptible noise for the sensitive land uses to the north (residences and college) and west (Cesar Chavez Park) of the project site. No significant construction noise impacts would occur during the ocean disposal of the excavated dredge materials.

The removal of cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, demolition and removal of tunnels (concrete), and backfill with clean structural fill. These construction activities are similar to the above discussion for the proposed dry dock installation. Therefore, no significant construction noise impacts would occur during the removal of the cooling tunnels. The cumulative conditions when the removal of cooling tunnels occurs at the same time as the construction of the Pier 1 Dry Dock have been discussed above for both on-site (areas adjacent to the project site) and off-site (along access routes) receptors.

CONSTRUCTION VIBRATION IMPACT

Groundborne noise and vibration from construction activity would be mostly low to moderate except if pavement breaking or sheet pile vibration is used on site. Heavy-tracked construction equipment generates approximately 92 VdB of groundborne vibration when measured at 50 ft, based on the *Transit Noise and Vibration Impact Assessment* (FTA, May 2006). This level of groundborne vibration exceeds the threshold of human perception, which is approximately 65 VdB. Based on the Caltrans *Transportation Related Earthborne Vibration, Technical Advisory* (Rudy Hendricks, July 24, 1992), the vibration level decreases by 6 VdB for every doubling of the distance between the source and the receiver. Therefore, receptors at 50 ft and 100 ft from the construction activity may be exposed to groundborne vibration of up to 92 VdB and 86 VdB, respectively. Groundborne vibration levels at the nearest residences approximately 1,000 ft from the project construction activity would be reduced to 66 VdB from distance attenuation alone. This range of vibration would be slightly over the 65 VdB human perception threshold, but would not cause any damage to the buildings. Construction vibration, similar to vibration from other sources, would not have any significant effects on outdoor activities such as those in Cesar Chavez Park, approximately 1,940 ft to the northwest of the project site, that would experience vibration level up to 60 VdB.

Table N lists the potential vibration level from construction equipment in terms of the peak particle velocity (PPV), or inch/sec. As shown in the table, pile driving would result in 0.644 inch/sec of PPV at 25 ft. This vibration level quickly drops to 0.124 inch/sec at 75 ft from the vibration source. At the nearest sensitive uses that are 1,600 ft or more from the project boundary (Cesar Chavez Park, Woodbury School of Architecture, and existing residences to the northwest, north, and northeast), the vibration from pile driving at the project site would be reduced to less than 0.001 inch/sec, which would not be perceptible by occupants at these nearest sensitive uses. Likewise, no structural damage would occur at these off-site sensitive uses. In addition, no structural damage would occur at the nearest industrial/commercial buildings that are more than 200 ft away since construction vibration on

Table N: Vibration Source Amplitudes for Construction Equipment

Equipment	Reference PPV at 25 ft (inch/sec)	
	at 25 ft (inch/sec)	at 75 ft (inch/sec)
Pile Driver (Impact), Typical	0.644	0.124
Pile Driver (Sonic), Typical	**0.170**	**0.033**
Vibratory Roller	0.210	0.041
Large Bulldozer	0.089	0.017
Caisson Drilling	0.089	0.017
Loaded Trucks	**0.076**	**0.015**
Jackhammer	0.035	0.007
Small Bulldozer	0.003	0.001
Crack-and-Seat Operations	2.400	0.462

Sources: Federal Transit Administration (2006), except Hanson 2001 for vibratory rollers and Caltrans 2000 for crack-and-seat-operations.
Equipment in **Bold** is expected to be used on the project site.
Caltrans = California Department of Transportation
ft = feet
inch/sec = inches per second
PPV = peak particle velocity

the project site would drop to below 0.5 inch/sec at these nearest off-site buildings (see previously referenced Table I).

Any construction activity occurring on the ocean side of the project site would result in lower vibration levels to the sensitive land uses (residences, a college, and a park) in the project vicinity. As a receiver moves away from the project site, the perceived vibration level would decrease proportionally. Therefore, no construction vibration impacts would occur as a result of the construction activity in the ocean.

OPERATIONAL STATIONARY SOURCE NOISE IMPACT

Operational/Stationary Source Noise. While the expansion of drydock capabilities and supporting facilities would accommodate large vessels, the industrial marine repair activities taking place at the project site would be similar to existing conditions. During the peak operational day with implementation of the project, there may be up to 93 more employees (which would include customer visits) to the project site, with two-thirds of new employees assigned to the first shift (6:00 a.m.–2:30 p.m.) The surrounding community is subject to various stationary noise sources including existing shipyard activities. Noise associated with these activities includes various types of outdoor mechanical equipment, warning horns and truck deliveries. The noise level associated with these activities varies. Delivery trucks produce a maximum noise level of approximately 75–85 dBA at a distance of 50 feet depending in part on the speed of the truck. The truck back-up alarms typically generate 65–75 dBA at 50 feet. It is anticipated that noise associated with shipyard operations would continue to range from 70 to 80 dBA L_{eq} at a distance of 50 feet from the shipyard. The incremental

increase in peak operational day activities is not expected to substantially alter the nature of daily shipyard activities; therefore, no substantial change in the nature of shipyard noise is anticipated.

Residential. The closest residences are located along Main Street/South Evans Street and Sicard Avenue/Newton Avenue approximately 1,670 feet from the drydock. Assuming an operational noise level of 80 dBA at 50 feet, distance divergence would provide an approximate 30 dBA in noise attenuation. Additionally, with the line-of-sight between the noise source and a receptor blocked by intervening structures, would provide an additional noise reduction from 10 to 20 dBA. Project-related operational noise at the nearest residential uses would range from 30 to 40 dBA.

School. The Woodbury School of Architecture is located along Main Street in a commercial area approximately 1,600 feet from the drydock. At this location, the school would receive 30 dBA noise attenuation from distance divergence. Intervening structures would provide additional noise reduction of up to 20 dBA. Project-related operational noise at the institutional use would range from 30 to 40 dBA.

Cesar Chavez Park. Located approximately 1,940 feet from the drydock, this park would receive 32 dBA attenuation from distance divergence and at least 15 dBA attenuation from intervening structures. Assuming a noise level of 80 dBA at 50 feet, project-related operational noise would be reduced to 33 dBA.

Based on the foregoing discussion, continuing shipyard activities associated with the proposed project would not permanently increase noise levels at noise-sensitive uses in excess of established standards. A less than significant impact would occur; therefore, no mitigation is required.

Table O lists the distance attenuation for these off-site receivers under the soft site condition. Intervening commercial and/or industrial buildings and structures between the project site and these off-site sensitive uses would function as noise barriers and provide 10 to 20 dBA reduction depending on the shielding coverage by the intervening buildings/structures. Total noise reduction from distance attenuation and shield effect by intervening buildings/structures would be 30 to 50 dBA and reduce the on-site construction noise to 40 dBA L_{max} or lower at the off-site receivers that are 1,600 ft or more away. Therefore, noise from project operations would not exceed thew City's operational noise standards at the single family residences and other noise-sensitive uses in the project vicinity. No mitigation measures are required.

Table O: Operational Noise Reduction at Off-site Noise Sensitive Receivers

Land Use/Receiver Location	Project Operations Noise Level at 50 feet (dBA L_{max})	Shielding by Intervening Buildings* (dBA)	Distance (feet)	Total Reduction in Noise (dBA)	Resulting Noise Level (dBA L_{eq})[1]	City Noise Standard (dBA L_{eq})

Source: LSA Associates, Inc.
* Shielding by intervening buildings assumes the minimum 10 dBA only. It could be higher depending on the density of the buildings and/or structures between the receiver and the project site.
1 Assumes that the maximum noise would last for more than 30 minutes in an hour so it becomes L_{eq} level.
2 7:00 a.m.-7:00 p.m., 50 dBA Leq(1h); 7:00 p.m.-10:00 p.m., 45 dBA Leq(1h); 10:00 p.m.-7:00 a.m., 40 dBA Leq(1h).

TRAFFIC NOISE IMPACT

The primary existing noise sources in the project area are transportation facilities and shipyard repair operations. Traffic on local streets in the project vicinity is the source of ambient noise. The projected future ADT volumes for roadway segments in the project vicinity are obtained from the *Traffic Impact Study* (LSA, March 201) prepared for this project.

The FHWA *Highway Traffic Noise Prediction Model* (FHWA RD-77-108) was used to evaluate highway traffic-related noise conditions in the vicinity of the project site. Tables P, Q, and R provide the existing with project, the 2017 cumulative without project, and the 2017 cumulative with project scenarios, respectively, along roadway segments in the project vicinity. These noise levels represent worst-case scenarios, which assume that no shielding is provided between the traffic and the location where the noise contours are drawn. The specific assumptions used in developing these noise levels and the model printouts are provided in Appendix A. Traffic noise levels would remain similar to the

baseline, no project scenario along street segments in the project vicinity. Project-related traffic noise level increases would be 0.2 dBA or less along all roadway segments in the project vicinity.

Off-Site Noise Impacts

As a rule of thumb, a doubling of the traffic volumes would increase the traffic noise levels by 3 dBA. Based on traffic volumes presented in Tables P and R, project-related traffic noise level increases would be 0.2 dBA or less and would be less than the 3 dBA increase in the threshold of human ear perception along roadway segments in the project vicinity. This range of traffic noise level increases is not perceptible by the human ear in an outdoor environment. The proposed project would not result in residential uses along affected roadway segments being exposed to traffic noise levels from below 65 dBA to levels above 65 dBA CNEL. Therefore, no significant traffic noise impacts would occur.

On-Site Noise Impacts

The City does not have exterior noise standard for industrial uses for CEQA review purposes. The noise evaluation is based on the project's preliminary building footprints. Since there would be no active outdoor use areas such as lunch patios within the noise impact area along Harbor Drive, no significant traffic noise impacts would occur. In addition, the proposed project is not considered noise-sensitive. No mitigation measures are required for traffic noise.

Long-Term Groundborne Noise and Vibration from Vehicular and Ship Traffic

Because the rubber tires and suspension systems of buses and other on-road vehicles provide vibration isolation and reduce noise, it is unusual for on-road vehicles to cause groundborne noise or vibration problems. When on-road vehicles cause effects such as rattling of windows, the source is almost always airborne noise. Most problems with on-road vehicle-related noise and vibration can be directly related to a pothole, bump, expansion joint, or other discontinuity in the road surface. Smoothing the bump or filling the pothole will usually solve the problem. The proposed project would have roads with smooth pavement and would not result in significant groundborne noise or vibration impacts from vehicular traffic. Since the project site is approximately 800 ft or more from the nearest noise-sensitive land uses, vibration associated with on-site operations would have no measurable effect on these off-site land uses. No significant vibration impacts would occur, and no mitigation measures would be required.

Ships traveling to and from the project site via the ocean side of the project would not result in any vibration impacts on the land-side uses, especially for sensitive uses that are 800 ft or more from the project site. No significant vibration impacts would occur from the ocean-side activity, and no mitigation measures would be required.

MITIGATION MEASURES

CONSTRUCTION NOISE AND VIBRATION IMPACTS

Construction activities must comply with the hours set by the City's Municipal Code. Construction noise levels measured at or beyond the property lines of any property zoned residential shall not exceed an average sound level greater than 75 dB during the 12-hour period from 7:00 a.m. to 7:00 p.m. In addition, construction activity is prohibited between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day, or on legal holidays as specified in Section 21.04 of the San Diego Municipal Code, with exception of Columbus Day and Washington's Birthday, or on Sundays, that would create disturbing, excessive, or offensive noise unless a permit has been applied for and granted beforehand by the Noise Abatement and Control Administrator, in conformance with San Diego Municipal Code Section 59.5.0404.

LONG-TERM NOISE IMPACTS

No mitigation is required.

LONG-TERM VIBRATION IMPACTS

No mitigation is required.

LEVEL OF SIGNIFICANCE AFTER MITIGATION

No significant short-term or long term noise impacts have been identified. Compliance with the City of San Diego Municipal Code, which is a standard condition for all construction activity within the C would ensure that short-term impacts remain less than significant. Therefore, no mitigation measures are warranted. Impacts are less than significant.

APPENDIX A

PROJECT DESCRIPTION

Technical Studies

Project Description

In order to assess a project's potential effect on the environment, a description of the project is necessary and required pursuant to Section 15124 of the CEQA Guidelines. The following Project Description, to be used for the preparation of required technical studies, discusses the construction and operational characteristics of the reasonably foreseeable phases of the Proposed Project (which consists of three project components as described later in this section), the geographic setting and location, San Diego Unified Port District (District) Port Master Plan designations for the Proposed Project site, and the discretionary actions required to implement the Proposed Project. The Project Description will be used as the basis for analyzing the Proposed Project's impacts on the existing environment in the Environmental Impact Report (EIR).

BAE Systems proposes to site a new drydock (dry berth) on the north side of its Pier 1 and extend its existing lease-term based on its investments from the proposed project on the leasehold. The drydock would support the current and planned future home-porting of United States (US) Naval assets (ships) in San Diego and allow greater flexibility in the utilization of drydocking facilities. The proposed drydock would replace an existing wet berth, used for ship repair and maintenance, with a dry berth. Although the majority of the proposed project is within the District's jurisdiction, approvals from the California State Lands Commission (CSLC) and the California Coastal Commission (CCC) are required for actions associated with the portion of the drydock that is outside of the District's jurisdiction. The proposed project would also be required to obtain building permits from the City of San Diego for on-shore utility and fire protection.

BAE Systems also proposes to enter into a future, long-term real estate agreement with the District on the neighboring 2-acre land parcel and 4-acre water area under a Tidelands Use and Occupancy Permit (TUOP).[1] The future, long-term real estate agreement may include, but is not limited to, an amendment to BAE Systems' existing lease[2] with the District. The TUOP parcel (formerly known as the San Diego Gas and Electric [SDG&E] parcel) contains two existing underground intake/discharge tunnels which could be removed during or at a later phase of the proposed project.[3] Preliminary potential remediation efforts associated with the removal of the intake/discharge tunnels that exist within the District tidelands is identified and analyzed as part

[1] At the time of preparation of this Project Description, the Tidelands Use and Occupancy Permit (TUOP) with SDG&E, dated November 1, 2009 (Document No. 55689) expired on October 31, 2014. This parcel is currently leased to BAE Systems by the District via a 5-year TUOP.

[2] Lease dated September 1, 1979 (as Document No. 12223), as amended.

[3] The drydock component and the cooling tunnel component are independent of one another (i.e., the removal of the cooling tunnels are not dependent on the construction of the proposed drydock and vice versa).

of the EIR. These three project components are collectively referred to as the proposed project throughout the EIR.

1.1 PROJECT LOCATION

The BAE Systems' existing facility (i.e., leasehold) is situated along the eastern shoreline of central San Diego Bay located at 2205 East Belt Street in the City of San Diego (Figure 1). The proposed project site is bounded to the west by the San Diego Bay, to the north by R.E. Staite Engineering, to the east by the existing BAE Systems facility and other marine-related industries, and to the south by the NASSCO/General Dynamics ship building facility. The entire area is developed and/or leased to marine-related industrial businesses.

The proposed project site includes the existing 9.8 acre (landside) and 16.6-acre (waterside) BAE Systems leasehold within the District and approximately 74,300 square feet (sf) in jurisdiction of the District and is located within the jurisdiction of the CSLC. The proposed project site also includes an approximately 2-acre (landside) and 4-acre (waterside) parcel currently leased by BAE Systems through a TUOP. This TUOP parcel is located at 400 East Belt Street. Figure 2 provides an overview of the proposed project area and the applicable jurisdictional boundaries within the proposed project area. BAE Systems currently has a lease allowing for operations occurring in the portion of the project site within the CSLC's jurisdiction; however, for the portion of the drydock to be located outside of the District's jurisdiction, BAE Systems would apply directly to the CSLC for a lease amendment as well as apply to the CCC for permits and entitlements.

1.2 PROJECT SETTING

1.2.1 Existing Site Conditions

1.2.1.1 Landside Conditions

Existing facilities within the landside area of the existing BAE Systems leasehold include production shops, offices and office facilities, and related utilities and infrastructure necessary for the maintenance, repair, overhaul, and conversion of large US Naval and commercial vessels. Waterfront storm water collection tanks are located throughout the facility. Additionally, there are areas of pavement and ramps, as well as buried pipes, a valve vault, utility vaults, three underground sewage lift stations, electrical substations, and concrete revetments. Figure 3 illustrates the conditions of the existing Pier 1 and the entrance to the intake/discharge water tunnels.

BAE Systems currently leases the neighboring, northwestern 2-acre (landside) parcel from the District for parking and storage of materials. The 2-acre TUOP parcel currently has two subsurface intake/discharge water tunnels that were installed by SDG&E and previously used for intake/discharge of cooling water for the SDG&E Silvergate Power Plant.[1] The intake/

[1] The SDG&E Silvergate Power Plant ceased operations in 1984. In 2007, SDG&E completed the abatement, decontamination, and dismantlement of all interior equipment and demolition of the structure. (Cleveland Wrecking Company, website:

63732 PAGE 317

discharge tunnels consist of two tunnels for intake water and two tunnels for outbound water. Each tunnel is approximately 700 feet (ft) long with an 8 ft square opening. As depicted in Figure 4, the portion of the tunnels within the District's jurisdiction stretch from the south curb of Belt Street to the San Diego Bay and consist of approximately 490 ft of intake tunnels and approximately 450 ft of discharge tunnels. Outside the District's jurisdiction, the tunnels traverse for an additional 250 ft north of the existing leasehold beginning at East Belt Street, crossing underneath Burlington Northern Santa Fe (BNSF) Railway property, and extending into the existing SDG&E substation north of the proposed project site. The Silvergate power plant was removed in 2007 and the intake/discharge tunnels are no longer in operation. Although removal of the cooling tunnels is anticipated to occur after installation of the drydock, in order to analyze conservative worst-case construction conditions, the simultaneous construction of the Pier 1 North Drydock (overlapping Phases 1 through 6) and the removal of the cooling tunnels (Phase 3) was analyzed in the traffic analysis for this EIR.

1.2.1.2 Waterside Conditions

Existing facilities within the waterside area include BAE Systems Piers 1, 3, and 4 and a floating drydock. The removal of Pier 2 is currently ongoing and is not associated with the proposed project. The removal of Pier 2 is covered by US Army Corps of Engineers (USACE) Permit No. SPL-2013-00146-RRS in conjunction with the Shipyard Sediment Remediation Project. These existing facilities are all located within jurisdiction of the District along the eastern shoreline of the San Diego Bay in an area that is developed with marine terminals and other piers. The three working piers are used to moor vessels during maintenance, repair, overhaul and conversion activities; are designed to accommodate berthing for large deep-draft US Navy and commercial vessels; and include a variety of crane and utility services to support these maintenance activities.

BAE Systems currently operates one floating drydock at the project site. This floating drydock ("Pride of San Diego" or "POSD") has been operating at the site since 1984. A second drydock (AFDL/Diligence) was in operation at the BAE Systems facility until 2010, at which time it was sold and relocated to the South Bay. The second drydock was subsequently resold in 2013, and was removed from San Diego Bay.

As depicted in Figure 2, approximately 10.5 acres within the existing BAE Systems leasehold and the TUOP parcel (waterside only) would be affected by the ongoing and future remediation activities associated with the Shipyard Sediment Remediation Project. The Shipyard Sediment Remediation Project consists of a cleanup plan for marine sediments in the bottom bay waters that contain elevated levels of pollutants above San Diego Bay background conditions. The Shipyard Sediment Remediation Project was approved by the San Diego Regional Water Quality Control Board (San Diego RWQCB) on March 14, 2012, in response to the Cleanup and Abatement Order (CAO) No. R9-2012-0024. The District issued a Coastal Development Permit (CDP) for the project on August 1, 2013. On July 10, 2013, the San Diego RWQCB adopted Waste Discharge Requirements (WDR) Order No. R9-2013-0093401 and Water Quality Certification (401 WQC), which allowed for implementation of the remediation activities required

by the CAO. The purpose of the CAO is to restore the beneficial uses of San Diego Bay within the Shipyard Sediment Remediation Project site.

Pier 1 North Drydock Project

Cooling Tunnels

THIS PAGE INTENTIONALLY LEFT BLANK

On July 16, 2013, the District's Board of Port Commissioners (Board) considered the Final Program EIR (PEIR) and post Final PEIR certification documents (e.g., WDR and 401 WQC) prepared by the San Diego RWQCB, adopted the Findings of Fact (Findings) and Statement of Overriding Considerations (SOC), adopted the Mitigation Monitoring and Reporting Program (MMRP), and authorized District staff to file the Notice of Determination (NOD) for the Shipyard Sediment Remediation Project. At the same hearing, the Board also granted concept approval and authorized issuance of a non-appealable CDP (CDP-2013-06) to BAE Systems for the Shipyard Sediment Remediation Project. The CDP was issued on August 1, 2013. On September 24, 2013, the Board granted BAE Systems the First Amendment to CDP-2013-06, which modified Special Provisions 5 and 6 of the CDP but remained consistent with the Water Board's final adopted WDR and 401 WQC.

In a letter dated May 22, 2014, the San Diego Bay Environmental Restoration Fund – North has identified that remedial activity in the vicinity of the proposed project associated with the CAO will be completed prior to any dredging activity associated with the proposed project.[1]

1.2.1.3 Site Operations

BAE Systems provides services for both commercial and government customers and has serviced a myriad of commercial vessels including, but not limited to, cruise ships, tankers, barges, research vessels, reefer and container ships, and kelp cutters. The existing BAE Systems facility is used for non-nuclear ship repair, modernization, conversion, and overhaul in support of its primary customer, the US Navy.

BAE Systems is currently the prime contractor for five classes of US Navy vessels: CGs (Cruisers), DDGs (Destroyers), LPD-17 (Amphibious Transport Docks), LSD-41/49 (Dock Landing Ships), and MCMs (Mine Countermeasures). BAE Systems maintain Multi-Ship, Multi-Option (MSMO) contracts that include vessel berthing and drydocking.[2] These contracts may include pier-side repair, drydock repair, or both. The average number of ships moored and/or serviced at the BAE Systems facility ranges from 10 to 20 vessels per year. As shown on Table A, the vessel stay at the facility ranges from 11 days to 294 days, with an average stay of 89 days for drydock vessels[3] and 104 days for berthed vessels. To a lesser extent, BAE Systems performs pier-side and drydock repairs for commercial customers as well. Over the past five years, BAE Systems has accomplished an average of four drydockings per year.

The existing drydock is used to conduct repair and maintenance activity which cannot normally be conducted while the vessel is afloat. These activities generally include exterior hull repair, preservation (abrasive blasting and/or hydroblasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. Ships are docked by lowering (submerging) and then raising the drydock by means of integral ballast

tanks, which take in and discharge seawater. Once the drydock is lowered a vessel is positioned within the dock. The drydock is then raised, raising the ship out of the water. Wastes generated during ship repair in drydock may include spent abrasive, paint, rust, petroleum products, marine growth and general refuse, all of which are contained and then transferred to shore facilities for disposal. Environmental protection related to drydock operations includes complete encapsulation of the vessel to prevent fugitive particulate emissions, stormwater collection, and zero discharge of industrial wastewater.

Water Quality Facilities

BAE Systems operates and maintains a Storm Water Diversion System (SWDS) to eliminate and/or reduce the volume of pollutants discharged to receiving waters (San Diego Bay). This system consists of 31 catch basins (drains) and associated piping, as well as secondary containment. The system is designed to capture at least the first 1.0 inch of storm water that has fallen upon the facility. Rain gauges are utilized to determine when 1.0 inch of rainfall has been achieved.

Following the first 1.0 inch of storm water recovery to the SWDS, remaining storm water may be redirected to San Diego Bay through nine outfalls enumerated SW1 through SW9. Visual observations and sample collection occur upon discharge to the receiving water. Collected storm water is held in 11 tank systems (DS1 through DS11) and is managed in accordance with the BAE Systems Industrial User Discharge (IUD) Permit issued by the City of San Diego. Once storm water is determined to meet IUD permit parameters, it is discharged to the sewer. Discharge to San Diego Bay may occur if on-site storage capacity is exceeded. San Diego Bay discharge requirements are delineated in Regional Board Order No. R9-2002-0161.

1.3 PORT MASTER PLAN DESIGNATIONS

The majority of the proposed project site is within the jurisdiction of the District and is located in Planning District 4 ("Tenth Avenue Marine Terminal"), Planning Subarea 43 (Belt Street Industrial) of the Port Master Plan (PMP). As illustrated in Figure 5, land uses at the proposed project site within Planning Subarea 43 include *Marine Related – Industrial* over the land portion of the proposed project site and *Specialized Berthing* over the water portion of the proposed

63732 PAGE 326

project site. Within the Marine Related-Industrial designation, the PMP calls for the modernization of existing marine-oriented facilities in order to reduce the need for future dredging or filling activities; however, the PMP does allow for dredging and filling in new areas under certain circumstances where alternative locations are infeasible or where curtailment of the project would result in adverse impacts to the public. Within the Marine Related-Specialized Berthing designation, the PMP allows for commercial and industrial uses, including ship building and repairing activities, water intake and discharge, and activities associated with the operation of drydocks. Because the proposed project includes the demolition of an existing pier-side berth and the construction of a new drydock, the proposed project would be consistent with the existing PMP and would not require a Port Master Plan Amendment.

Land to the east of the proposed project site is within the City of San Diego (City) and is currently designated in the City's General Plan as Industrial Employment and is zoned as Barrio Logan Planned District: SubDistrict D (BLPD-SUBD-D). Approximately 159,450 sf of water area west of the US Pierhead Line (outside District Jurisdiction) is held by the CSLC and is under the California Coastal Act jurisdiction of the CCC. Table B provides a summary of on-site and adjacent land use designations identified in the PMP.

Table B: On-Site and Adjacent Land Use Designations

Location	Current Land Uses	Port Master Plan Land Uses
On-site	Ship Repair	Marine Related – Industrial/Specialized Berthing – Industrial
North	Industrial/Marine Industrial	Marine Related – Industrial
South	Open Water	Marine Related – Industrial/Specialized Berthing – Industrial
East	Ship Repair	Marine Related – Industrial
West	Ship Repair	Marine Related – Specialized Berthing[1]

Source: San Diego Unified Port District, Port Master Plan (October 2012).
Note: Areas beyond (west) the US Pierhead Line are within the jurisdiction of the California State Lands Commission, a department of the Resources Agency of California. Based on information provided in the Resources Agency of California's *California's Ocean Resources: An Agenda for the Future* (March 1997), the areas within California State Lands Commission jurisdiction are designated at "State Tidelands and Submerged Lands." State Tidelands and Submerged Lands are defined as the area from the shoreline to three (3) nautical miles offshore.

3.2 Project Purpose and Objectives

The future needs for drydocking of US Naval vessels positioned in San Diego exceeds current drydock capacity. The purpose of the proposed project is to (1) increase BAE Systems' drydock capacity to facilitate required maintenance of existing and future US Naval assets and (2) provide additional capacity for commercial vessel drydock needs that cannot currently be met by existing drydock capacity.

63732 PAGE 327

The proposed project objectives include the following:

- Construct and operate shipyard repair facilities that maximize the use of existing waterways, available shoreline, and existing land;
- Retain and expand current ship repair business operations by BAE Systems, in order to provide economic and employment benefits to the District and the San Diego region;
- Modernize the BAE Systems shipyard by providing a new drydock facility, including associated improvements, and ship repair services, to meet the needs of the current and anticipated ship fleet of military and commercial customers;
- Invest in new shipyard infrastructure that will enhance the short- and long-term attractiveness and viability of San Diego Bay and the region to military and commercial ship operators for construction and repair;
- Impose current terms of the SDG&E TUOP that require removal of the cooling tunnels;
- Ensure the long-term health, safety, and sustainability of the project site and surrounding tidelands area by removing the SDG&E cooling tunnels in a manner that minimizes environmental impacts, including the potential to release hazardous materials into the environment; and,
- Obtain real estate agreement(s) necessary to achieve the aforementioned project objectives.

1.4 Project Characteristics

The proposed project consists of two major phases – Phase 1 and Phase 2. Phase 1 includes the installation of the floating drydock component and the proposed BAE Systems real estate agreement component. Extensive preliminary design studies and schematic plans have been developed for the floating drydock component and details associated with the proposed real estate agreement component are known.

Phase 2 includes the cooling tunnels component of the proposed project. Although the proposed project would result in the ultimate removal of the cooling tunnels, at this time, the funding, phasing, timing, and design details of the cooling tunnels removal are only known at a conceptual level of detail. However, this analysis is based on all known data and facts, as well as reasonable investigations regarding the tunnels and project site.

1.4.1 Proposed Improvements

The proposed project would provide for the current and anticipated drydocking needs of BAE Systems, extension of its existing lease term based on its investments in the leasehold, a future real estate agreement on the neighboring TUOP parcel (2-acre landside and 4-acre waterside), and the eventual removal of the underwater intake/discharge tunnels and surface improvements on the TUOP parcel. These project components are summarized below.

1.4.1.1 Floating Drydock and Associated Activities/Improvements

The proposed drydock would be located on the north side of existing BAE Systems Pier 1 and would extend onto the neighboring TUOP parcel and approximately 350 ft west into CSLC jurisdiction. The drydock component of the proposed project includes dredging activities (the extent of dredging is illustrated in Figure 6), the installation of the drydock, a sheet pile protection wall along the existing Pier 1 north, over-water structure(s) (apron ramp wharves [south] and the future north ramp wharf and intermediary wharf structure), two new mooring dolphins (one stand-alone and one integrated into the existing Pier 1 structure) and expansion of one existing mooring dolphin, and installation of utilities as detailed in Figure 7. Figure 8 depicts before and after proposed project conditions for the proposed Pier 1 drydock component. A more detailed description of the proposed drydock and associated improvements is provided as follows.

- **Underwater Improvements.** To prevent undermining of the existing Pier 1, the proposed project will include an underwater wall and cantilevered king pile installation. These underwater improvements will allow for dredging adjacent to the pier without adversely impacting the strength and integrity of the pier, which will continue to moor large US Navy vessels on the south side of that pier. The overall length of these underwater improvements is approximately 700 ft from the US Bulkhead Line[1] to the US Pierhead Line.[2]
- **Dredging.** Dredging is planned to provide sufficient water depth to submerge the floating drydock. The drydock will require a Bay bottom elevation of -65 ft Mean Lower Low Water (MLLW). Additionally, to provide a route to enter the drydock, some minor dredging may be required between the end of the dock and the Bay channel as illustrated in Figure 6. The majority of the dredging is located east the US Pierhead Line within District tidelands. Dredging west of the US Pierhead Line is within the jurisdiction of the CSLC and the CCC.

  Based on preliminary bathymetric survey data, dredging is anticipated to generate approximately 395,000 cubic yards (cy) of sediment. Following testing and approval by the USACE and the US Environmental Protection Agency (EPA), the sediment would be disposed of by barge at the EPA approved ocean disposal site commonly known as LA-5, which is located approximately 13 miles west from the proposed project site.

  Any sediment not approved for ocean disposal or beneficial reuse will be disposed of outside of tidelands (upland) at an appropriately permitted landfill. Any sediment designated for upland disposal will be tested, characterized, and profiled for disposal approval. For purposes of this analysis, it is anticipated that between 2,500 and 10,000 cy (3,500–14,000 tons) of dredge material would require treatment and upland disposal. This figure is based upon preliminary testing which determined that approximately 2,500 cy of dredge material will not be suitable for ocean disposal or beneficial use.[3] The 10,000 cy figure is a

[1] The US Bulkhead Line refers to a line marking the limit to which piers or wharves may project along a waterfront.
[2] The US Pierhead Line refers to a line delineating the limit of jurisdiction of the San Diego Unified Port District.

THIS PAGE INTENTIONALLY LEFT BLANK

worst-case condition that is four times the expected dredge quantity based on preliminary testing. The actual cubic yardage of dredge material required for upland disposal will be determined prior to project dredging activities, but following completion of remediation dredging in the area. Should upland disposal for any sediment become necessary, the proposed disposal site is Otay Landfill, located at 1700 Maxwell Road in Chula Vista. Alternative landfills may also be considered. In the event that sediment testing determines that any portion of the dredge spoils are hazardous, those materials would require transport to a hazardous waste facility (a Class I facility). The nearest Class I disposal facility to the project site is the Buttonwillow Landfill located in Buttonwillow, California, approximately 250 miles north.

In addition to the dredged sediment that is proposed for ocean and upland disposal, some portion of the dredged sediment may be utilized for beneficial reuse in San Diego Bay or a near-shore ocean environment. Specifically, as described further in Chapter 6.0, Alternatives, there are two potential beneficial reuse sites: the Northern and the Southern Alternative Mitigation Sites. The Northern Alternative Mitigation Site is located south of the Sweetwater River Flood Control Channel within the San Diego Bay National Wildlife Refuge, and the Southern Alternative Mitigation Site is located further south and adjacent to a channel within the District.

- **Ramp Wharf.** A ramp wharf designed for accessing the drydock is proposed adjacent to and westward of the bulkhead and would extend from approximately the current bulkhead line to 125 ft into the Bay. The ramp wharf will be constructed of three independent structures with the northernmost structure measuring approximately 125 by 35 ft, the intermediary structure measuring approximately 134 by 76 ft, and the southernmost structure measuring approximately 125 by 70 ft, with a combined total area of approximately 22,088 sf (including pedestrian and vehicle ramps). However, because the removal of the cooling tunnels is anticipated to occur after construction of the drydock, and due to the location of the tunnel openings relative to the proposed ramp structures, the future northern ramp wharf and intermediary structure will not be constructed until the cooling tunnels are removed. Construction of the future northern ramp wharf and intermediate structure after the cooling tunnel removal will ensure that improvements associated with the drydock do not need to be disturbed and/or removed to access the tunnels. The drydock can operate in the interim with only the southernmost ramp wharf installed. The ramp wharf structures will be designed to support heavy vehicle and equipment loads and constructed of a reinforced concrete deck supported by precast concrete piles will be anchored along the shoreline. The elevation of the wharf will be approximately +13 ft MLLW. This elevation is 12 inches higher than existing piers at the BAE Systems site and has been designed to account for some rise in sea level.

  The ramp wharf decks will be a composite structure consisting of precast planks topped with cast-in-place reinforced concrete and reinforcing bar. The deck support system will require pile driving and will consist of both vertical and batter piles. The batter piles will provide lateral resistance to seismic loads. Along the perimeter of the ramp wharf a concrete curb will be constructed that will control storm water runoff and divert it to existing onshore stormwater collection facilities. Electrical conduits will be located within the pier deck and will

63732 PAGE 337

be cast in place when the pier deck is poured. Other utility piping, such as mechanical and electrical will also be installed from the shore to the drydock. Additional information associated with the ramp wharf decks is provided under the construction subsection.

- **Mooring Dolphins.**[1] To accommodate the mooring of the proposed drydock, two mooring dolphins (one new and one retrofit) are proposed to be constructed approximately 344 ft and 890 ft offshore (west) of the US Bulkhead Line. Dimensions of each dolphin would be 26 ft by 33 ft in size and include a 4-ft thick concrete deck. Each dolphin will be supported by 24 concrete 24-inch octagonal piles and outfitted with two 100-ton double bitts. The square footage of the proposed new western drydock dolphin is 714 sf. The easternmost mooring dolphin is proposed to be retrofitted into the existing Pier 1 structure, adding approximately 194 sf of area. The new dolphins are necessary to provide a fixed mooring structure to secure the drydock. One of these dolphins is in the CSLC jurisdiction, and an amendment to the existing BAE Systems CSLC Lease may be needed. The existing western Pier 1 mooring dolphin will be expanded from an existing area of 345 sf to 483 sf (for a total increase of 138 sf). This expansion entails the installation of three additional 24-inch octagonal piles on the south side of the mooring dolphin. Pile driving will occur as part of the mooring dolphin construction.
- **Floating Drydock.** Installation of a new floating drydock approximately 205 ft in width and 851 ft in length (174,455 sf in total) plus aprons (approximately 16,165 sf in total) attached to the drydock on each end. It is anticipated that the majority of the drydock would be assembled off site. However, there will be some additional drydock assembly work occurring once the drydock is towed in to the shipyard. In a typical year, it is anticipated that two DDG-class vessels, one LPD-class vessel, one CG-class vessel and one LCS-class vessel may utilize the drydock.
- **Utilities.** Electrical and mechanical utilities to support the drydock are similar to the types and capacities currently utilized within the existing shipyard. The proposed electrical utilities include:
    - A 12,000-volt, 500-amp feeder cable to the proposed new wharf;
    - New load interrupt switches for the distribution of the 12,000-volt circuit;
    - Shore and pier 480-volt and 208/110-volt distribution systems including 400-amp shore power mounds on the shore at two locations for barges and for ship repair operations;
    - Convenience receptacles on shore and on the pier and power to new infrastructure where needed (storm water collection systems, etc.)
    - Shore and pier lighting, including pole lights and imbedded light fixtures in the wharf structure, that will be located on the shore and wharf; and,
    - Shore and wharf data, telephone and television systems for use by vessels in drydock.

[1] A mooring dolphin is a manmade marine structure that extends above the water level and provides a fixed structure at which to moor ships when the ship length exceeds the length of the berth or pier.

The proposed mechanical utilities for the proposed project are detailed in Table C and are further described below:

Utility and mechanical services necessitating piping would be installed underground or in trenches that extend from their existing systems at various locations on shore. These piping systems will be routed to penetrate the shoreline and run to the wharf where they will be mounted on the side and underside of the wharf. Some electrical conduits will also run under and through the wharf.

Expansion joints will be installed where appropriate. For each service, single or manifold type service risers may be installed for servicing messing/berthing barges moored alongside the drydock. All risers will be rugged, corrosion-resistant and outfitted with steel guards. Each point of connection will be a valve suitable for the service and location. Branches for electric service, salt water, potable water and sewage will be installed for provision to barge berths.

Table C: Mechanical Utilities

System	Location	Size (inches)	Material
Saltwater[1]	Drydock	10	Galvanized Steel
Potable Water	Existing Infrastructure	4	Steel, FBE
Compressed Air	Existing Infrastructure	8	Steel, FBE
Sewage[2]	Sewage discharge piping from the drydock to the existing City of San Diego sewer service	4	Fiberglass
Stormwater	New stormwater diversion tanks, piping, and drain inlets	3 and 4	PVC
Natural Gas	Existing Infrastructure	3	Steel, FBE
Carbon Dioxide	Weld shielding gas tanks (CO_2 and Argon) will be located on the wharf	3/4	Rental tanks and coated aluminum hose
Argon	Weld shielding gas tanks (CO_2 and Argon) will be located on the wharf	3/4	Rental tanks and coated aluminum hose
Telecommunications/Cable	--	--	--
Fire Hydrant Supply	--	6-inch	--

Source: BAE Systems (2014).
[1] Saltwater system allows for repair work to be done to saltwater system piping on ships while docked at the facility. The system saves electricity and eliminates water discharged into the San Diego Bay.
[2] Sewage system is to accommodate pumping sewage holds from the vessels docked at the drydock.
CO_2 = carbon dioxide
FBE = fusion-bonded epoxy
HDPE = high density polyethylene
PVC = polyvinyl chloride

Stormwater that falls on the wharf and adjacent shore will be captured in tanks and disposed of in a controlled manner. Wharves and finished grades will be designed to lead stormwater into drainage piping that leads into sumps that will pump the water into stormwater collection tanks and managed in accordance with the BAE Systems Industrial User Discharge Permit.

Two weld shielding gas systems (carbon dioxide and argon) will be installed to service the ship repair work in drydock. Both systems will emanate from tanks onshore or on the wharf.

- **Bay Coverage and Shading.** The proposed drydock ramp wharves (including the intermediary wharf structure) will be constructed of concrete, supported by concrete pier piles and anchored along the shoreline. These structures would extend from approximately the current bulkhead line 125 ft into the Bay. The surface area of the proposed drydock ramp wharves, intermediary structure, and vehicle ramp and pedestrian walkways is 22,088 sf. The square footage of the proposed western drydock mooring dolphin is 714 sf, the proposed retrofitted mooring dolphin is 194 sf, and the proposed expanded mooring dolphin is 138 sf. Together with the proposed drydock, the proposed project would shade approximately 213,754 sf of San Diego Bay in the location where vessels currently berth.

1.4.1.2 BAE Systems Real Estate Agreements

BAE Systems currently leases approximately 9.8 acres of land and 16.6 acres of water from the District. This lease is scheduled to expire on August 31, 2034. Based on its investments proposed as part of the proposed project, BAE Systems proposes to extend the lease term of its existing leasehold with the District. This action will require an amendment to the existing lease term by 24 years, extending the year of expiration to 2058. Additionally, BAE Systems proposes to lease, on a long-term basis, the approximately 2-acre (landside) and 4-acre (waterside) parcel currently leased (5-year term) by the District to BAE Systems through a TUOP set to expire on October 31, 2019. This action will require terminating the TUOP and adding an amendment to the existing lease term by 43 years, extending the year of expiration to 2058. The lease amendment for the TUOP parcels would roll the approximately 2-acre (landside) and 4-acre (waterside) parcel into the BAE Systems' leasehold area. As a result, BAE Systems will ultimately be leasing approximately 11.8 acres of land area and approximately 20.6 acres of water area from the District. This component would result in the continuation of existing uses, as permitted, on the existing leasehold and neighboring TUOP parcels.

1.4.1.3 Removal of Cooling Tunnels

Two sets of intake/discharge cooling tunnels that were previously installed by SDG&E and used by the former SDG&E Silvergate Power Plant currently exist beneath the TUOP parcel. As previously stated, the underground tunnels traverse underneath properties owned by Kelco, Burlington-Northern Santa Fe railroad and the District and underneath the Belt Street right-of-way. The portion of the cooling tunnels within the District's jurisdiction stretch from the south curb of Belt Street to the San Diego Bay and consists of approximately 490 ft of intake tunnels and approximately 450 ft of discharge tunnels. Outside the District's boundaries, the tunnels traverse for an additional 250 ft underneath the Belt Street right-of-way and the Burlington-Northern Santa Fe railroad properties. The proposed project includes the removal of the cooling tunnels within the BAE Systems leasehold. The timing for the removal of the tunnels is unknown; however, removal of the tunnels will occur after the installation of the drydock and southern ramp wharf. As noted above, construction of the future northern ramp wharf and intermediate structure would occur after the cooling tunnel removal to ensure that access to the

tunnels to remove them is adequately provided. Please refer to Figure 4 for the location of the existing cooling tunnels.

The removal of the cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, installation of a coffer dam, demolition and removal of tunnels (concrete) and backfill with clean structural fill. Soil and groundwater characterization would be performed and potential remediation may also be conducted. Disposal of the soils, if required, would be at the appropriate landfill facilities depending on the sediment characterization. Numerous structures, equipment and operating systems are located over the tunnels. Temporary relocation of these structures and uses are anticipated.

1.4.2 Construction Activities and Schedule

1.4.2.1 Floating Drydock and Associated Activities/Improvements

Upon completion of the design and permitting phase, the drydock component of the proposed project consists of six phases of construction: (1) Pier 1 North submerged wall, (2) Retrofitting of existing Pier 1 mooring dolphin, (3) upland dredging, (4) ocean dredging (5) wharf and mooring dolphin construction, and (6) shoreline and utilities construction. Construction for the drydock component of the proposed project is scheduled to begin in 2016 and projected to be completed in 2017. Project construction-related truck traffic to and from the site during construction would occur along Harbor Drive south to I-15 or Civic Center Drive for in and outbound routes. Construction deliveries will be directed not to traverse the local Barrio Logan neighborhood and will be specified in the project's construction documents and in the proposed District-issued CDP.

Construction equipment anticipated for Phase 1 include a floating crane barge, 80-ton land based crawler crane, two deck barges for delivery and storage of materials, one tug boat, trucks for delivery of sheetpile and construction materials, forklifts for on-pier support, a drilling rig, impact hammer, and vibratory hammer. Construction equipment for the installation of the mooring dolphins and ramp wharves include a crane to drive concrete piles, concrete trucks for pouring concrete structures, trucks to deliver construction materials (rebar, tools, equipment), and an impact hammer.

Table D identifies construction details, including the duration of each phase and crew size and Table E provides the anticipated construction schedule. A description of each phase of work for the drydock component follows.

63732 PAGE 341

Table D: Construction Phases

Phase	Duration[1] (20 Working Days Per Month)	Crew Size Per Day	Number of Total Trucks Per Phase
Phase 1: Pier 1 North Submerged Wall	8 months	20 people	38
Phase 2: Retrofit of Existing Pier 1 Mooring Dolphin	1 month	6 people	17
Phase 3: Dredging (Upland Disposal)	1 month	10 people	610
Phase 4: Dredging (Ocean Disposal)	6 months	8 people	N/A
Phase 5: Wharf and Mooring Dolphin Construction	6 months	20 people	72
Phase 6: Shoreline and Utilities Construction	3 months	15 people	24

Source: BAE Systems (August 2014).
[1] Durations are "time of task" rather than start-to-finish dates.
N/A = not applicable

Table E: Construction Schedule

Phase	Approximate Schedule
Pier 1 North Submerged Wall Construction	January 2016 – August 2016
Dredging	September 2016 – March 2017
Wharf and Mooring Dolphin Construction	October 2016 – March 2017
Shoreline and Utilities Construction	January 2017 – March 2017
Drydock arrives to project site	March 2017
Drydock Testing and Outfitting	March 2017 – May 2017
Drydock Operational	June 2017

Source: BAE Systems (August 2014).

Phase 1: Pier 1 North Submerged Wall

The first element of construction consists of the installation of an underwater wall adjacent to Pier 1 to enable the sump to be dredged to a depth of –65 ft MLLW. The existing fender pile and whaler system on the north side of Pier 1 will be demolished in way of the new under water retaining wall. Approximately 21 tons or 600 linear feet of double 12-inch treated timber fender material will be removed and disposed.[1] It is anticipated that this material may be reused on site for repair/maintenance of existing/replacement fender systems. However, if the timber requires disposal, an additional 3 to 4 truckloads would be taken to the Otay landfill for disposal.

The existing timber fender system also consists of approximately 75, 14-inch steel H-piles driven approximately 15 ft into the Bay bottom. These H-piles, once removed, may also be

[1] BAE Systems, August 2014. A total of 35 pounds per linear feet of timber = 21 tons of timber to be removed and disposed.

reused on-site for repair/maintenance of existing/replacement fender systems. If the H-piles are unusable, they will be transported to a local scrap company and recycled as scrap metal. This would require an additional 8 to 10 trucks trips to the local scrap company for disposal.

Overall, this phase is anticipated to require a 20-person workforce and 38 trucks over approximately 8 months. However, a worst-case assumption of 38 truck trips over the entire phase has been included in the traffic analysis as this would still equate to less than 1 truck trip per day, on average, during the 8-month phase.

Phase 2: Retrofit of Existing Pier 1 Sections and Mooring Dolphin

The demolition of two sections of the existing Pier 1 deck would occur in order to provide clearance for the retrofitted eastern mooring dolphin concrete piles. The demolition/concrete disposal volumes for the existing two sections of the existing Pier 1 are identified in Tables F and G, below.

Table F: Pier 1 Mooring Dolphin Concrete for Disposal

Component	Length (feet)	Quantity	Pounds/Foot	Weight (tons)	Volume (cy)	Number of Trucks
20-inch Square Pile	70	8	418	117.2	57.8	5.1
Dolphin Cap	15 x 23	345	150	25.9	12.8	1.1
			Total	143	71	7

Source: BAE Systems (August 2014).
cy = cubic yards

Table G: Pier 1 Sections Concrete for Disposal

Component	Width (feet)	Length (feet)	Volume (cubic feet)[1]	Weight (tons)	Volume (cy)	Number of Trucks
Pier 1 Sections	30	40	3,000	225	111.1	9.8
			Total	225	111.1	10

Source: BAE Systems (August 2014).
[1] Concrete weight by cubic foot = 150 pounds.

Based on the tables above, the demolition activities associated with the removal of the existing two sections of the existing Pier 1 would result in a total of 368 tons of material that would require approximately 17 haul trucks for disposal.

Overall, this phase is anticipated to require a 6-person workforce and 17 trucks over approximately 1 month.

Phase 3: Dredging (Upland Disposal)

Upland disposal of the soils during dredging, if required, would be at the appropriate landfill facilities depending on the sediment characterization. As previously stated, for purposes of this analysis, it is assumed that no more than 10,000 cy (14,000 tons) of dredge material will require dredging, transport and disposal upland to the Otay Landfill in Chula Vista[1]. Assuming a carrying capacity of 23 tons per truckload, approximately 610 truckloads would be required for upland disposal of these dredged materials. The preferred truck route to Otay Landfill is Interstate 5 south, to State Route 54 east, to Interstate 805 south.

It is estimated that upland dredging would take approximately one month to complete. Dredging equipment would include the dredge crane barge, two dredge barges (scows), a large excavator for mixing cement into the dredge material within the dredge scow and for offloading dredge material into trucks, and other miscellaneous equipment. During disposal days (anticipated to be 17 days during the month), approximately 30 to 40 trucks would be required to haul off the treated dredged sediments. In addition, approximately 35 cement trucks will be required to dry all of the upland dredge material. The cement trucks would arrive on approximately 5 to 6 separate days during this period. Approximately 10 workers will be on site each day that this dredging is being conducted.

Overall, this phase is anticipated to require a 10-person workforce and 610 trucks over approximately 1 month.

Phase 4: Dredging (Ocean Disposal)

It is anticipated that the vast majority of dredged sediment will be found suitable for unconfined aquatic disposal (SUAD). As such, none of the SUAD dredge material would be transported upland in trucks. This dredge material is expected to be approved for disposal at the EPA LA-5 Ocean Disposal Site located approximately 7 miles off shore. The same or similar dredge crane barge used for upland disposal would be utilized for ocean disposal. In addition, a digging bucket (clam shell) would be required, as the majority of the material is native and therefore, more difficult to dredge.

Tug boats will be used to transport this dredged material (barge scows) to the ocean disposal site. A single tug boat and escort vessel will be required for each trip. Approximately 132 vessel round trips will be required to move 395,000 cy (assumes a carrying capacity of 3,000 cy per scow). It is estimated that this dredging will take 6 months to complete. Approximately eight workers will be required each day to support this dredging.

Overall, this phase is anticipated to require an 8-person workforce with no trucks over approximately 6 months.

---

[1] AMEC. *Pier 1 North Drydock Project Hazards and Hazardous Materials Technical Report, BAE Systems San Diego Ship Repair, San Diego, California*, January 2015 (Appendix D of this EIR).

Phase 5: Wharf and Mooring Dolphin Construction

Ramp Wharves. Ramp wharves designed for accessing the drydock is proposed adjacent to and westward of the bulkhead. The ramp wharves will be made up of three independent structures with the northern most structure measuring approximately 125 by 35 ft, the intermediary structure measuring approximately 130 by 49 ft, and the southernmost structure measuring approximately 125 by 70 ft with a combined total area of approximately 22,088 sf (including pedestrian and vehicle ramps). The construction of the future northern ramp wharf and intermediary wharf structure will occur after the removal of the cooling tunnels. A total of eighty-four 24-inch concrete octagonal vertical and batter piles are anticipated to be required to support the two new ramp wharves (36) and intermediary structure (48).

Mooring Dolphins. New concrete structures will be installed for the purposes of mooring the new drydock. The concrete structures consist of a concrete deck supported by an array of vertical and battered piles. The western mooring dolphin will consist of a new free-standing structure situated approximately 150 ft west of the US Pierhead Line. This mooring dolphin is expected to consist of twenty-six 24-inch octagonal concrete piles driven 35 to 45 ft beyond the dredged elevation. The piles will support a concrete deck of approximately 6 to 8 ft of thickness. The eastern mooring dolphin will be constructed such that it is retrofitted (i.e., integrated) into the deck of the current Pier 1. This will involve the demolition of two sections of the deck to provide clearance for the installation of approximately twenty 24-inch octagonal concrete piles. The existing western mooring dolphin will include an expansion requiring the installation of three additional 24-inch octagonal piles on the south side of the mooring dolphin.

Overall, this phase is anticipated to require a 20-person workforce and 72 trucks over approximately 6 months.

Phase 6: Shoreline and Utilities Construction

Installation of the proposed drydock will result in the reduction of an existing vessel berth (Pier 1 North), such that there is a relatively minor increase in net utility demand. The electrical and mechanical utilities for this project will be similar to the existing systems found at the BAE Systems' shipyard as well as on most heavy-duty piers that service US Navy and commercial ships. It is anticipated that on-shore utilities will require a 15-person workforce with 24 total trucks over approximately 3 months.

BAE Systems Real Estate Agreements: As previously stated, BAE Systems currently leases approximately 9.8 acres of land and 16.6 acres of water from the District. This lease is scheduled to expire on August 31, 2034. Based on its investments proposed as part of the proposed project, BAE Systems proposes to extend the lease term of its existing leasehold with the District by 24 years. Additionally, BAE Systems proposes to lease, on a long-term basis, the TUOP parcel currently leased (5-year term) by the District to BAE Systems. The TUOP between the District and BAE Systems is set to expire on October 31, 2019. The long-term lease may include, but would not be limited to, an amendment to BAE Systems existing lease. No changes in existing uses on the TUOP parcel are anticipated to occur and would be leased, on a long-term basis, to BAE Systems through a real estate agreement for a continuation of those uses

63732 PAGE 345

once the existing TUOP between the District and BAE Systems expires in October 2019. No construction activities are anticipated or associated with the real estate agreements between the District and BAE Systems.

Removal of Cooling Tunnels: As previously stated, the removal of the cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, installation of a coffer dam, demolition and removal of tunnels (concrete) and backfill with clean structural fill. In addition, numerous structures, equipment and operating systems are located over the tunnels. Temporary relocation of these structures and uses are anticipated. There are no project-level details available at this time that identifies the demolition/removal scheduling or phasing for this component. For purposes of this analysis, it is assumed that a total of 490 ft of intake tunnels and 450 ft of discharge tunnels would be removed within the District's jurisdiction.

1.4.2 Operational Activities

Floating Drydock and Associated Activities/Improvements: Drydocks are used to conduct repair and maintenance activity which cannot normally be conducted while the vessel is waterborne. These activities generally include exterior hull repair, preservation (abrasive blasting and/or hydroblasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. These activities are currently conducted within the existing POSD drydock at the site. While numerous industrial processes are currently conducted at the existing Pier 1 North berth on the same classes and types of vessels, some of those processes are more extensive once the vessel is dry-berthed, as opposed to wet-berthed (e.g., pierside verses in drydock). In addition, BAE Systems currently subcontracts hull preservation to several local contractors.

Implementation of the drydock component would result in a need for additional employees on the BAE Systems facility. For purposes of this analysis, it is anticipated that an addition 25–30 workers may be required for a large hull preservation job (abrasive blasting and painting). An additional 40–50 workers may be needed for other drydock operations related to hull repair, welding, and mechanical repair. It is also expected that additional project management requirements will add two to three BAE Systems ship superintendents to manage this ship repair and maintenance work and that as many as ten additional customer-related staff will visit the site as a result of the drydock operation. Therefore, a total of 77 to 93 new employees are anticipated to be required with implementation of the drydock. These new employees will be staggered throughout the three existing work shifts at BAE Systems. Table H provides the distribution of potential new employees among the three work shifts.

Table H: Drydock Employment Distribution

Work Type	Number of New Employees/Visitors	1st Shift (6:00 a.m. – 2:30 p.m.)	2nd Shift (2:30 p.m. – 10:30 p.m.)	3rd Shift (10:30 p.m. – 6:00 a.m.)
Hull Preservation (subcontractor)[1]	25–30	19	9	2
Welding, Machinery, Other Drydock Operations (BAE Systems)[2]	40–50	32	15	3
Project Management (BAE Systems)[3]	2–3	3	0	0
Customer Visits	10	10	0	0
Total	77–93	64	24	5

Source: BAE Systems (August 2014).

1 Hull preservation activities (blasting and painting) are conducted primarily during the daylight hours and generally follow the shipyards work shifts (65 percent, 1st shift; 30 percent, 2nd shift; and 5 percent, 3rd shift).

2 Worker distribution for these activities is anticipated to be consistent with existing shipyard work shifts (65 percent, 1st shift; 30 percent, 2nd shift; and 5 percent, 3rd shift).

3 Ship superintendents are anticipated to all work during the 1st work shift.

Operational Parking and Traffic. BAE Systems currently controls 1,304 parking spaces for use by employees, subcontractors, customers, and visitors. As previously discussed, the drydock component will not substantially modify the existing numbers and types of ships currently utilizing the BAE Systems facility. Based on the above increase in shipyard personnel, it is anticipated that operation of the drydock will require 64 additional parking spaces on 1st shift, 24 spaces on 2nd shift, and 5 spaces on 3rd shift. Based on information provided by BAE Systems, 20 percent of employees currently utilize an alternative means of transportation such as bus, trolley, and/or carpool. BAE Systems currently subsidizes 10 vanpools, with each van having an 11-person capacity with an average ridership of 7 per van during the first shift. In addition, BAE Systems runs a shuttle to and from the Barrio Logan Trolley Station during the first shift, with a ridership of 40 to 55 persons each day, and many more walking to the facility when the vans are full. Bicycle racks and motorcycle parking are also available at BAE Systems and are utilized by 40 to 50 persons each day during the first shift. Therefore, it is anticipated that 20 percent of the new employees will also utilize alternative transportation.

The expected additional 93 drydock employees as identified in Table H are assumed to follow the existing parking/traffic demographics, including assumptions on carpooling and municipal transportation (existing trolley and bus service). It is estimated that the siting of a new drydock at the BAE Systems shipyard could cause an increase of 93 one-way vehicle trips and parking spaces for all shifts. Those vehicle trips are anticipated to occur consistent with the shift differentials, which would equate to the following:

- 1st Shift: 64 vehicles arriving 5:30 a.m.–6:30 a.m. and departing 2:30 p.m.–3:00 p.m.
- 2nd Shift: 24 vehicles arriving 2:00 p.m.–2:30 p.m. and departing 10:00 p.m.–10:30 p.m.
- 3rd Shift: 5 vehicles arriving 10:00 p.m.–10:30 p.m. and departing 6:00 a.m.–6:30 a.m.

Operational Delivery Truck Traffic. BAE Systems' main distribution center/warehouse is located on Market Street near State Route 94 (SR-94). BAE Systems controls traffic flow for material deliveries to the site and only delivers materials when they are needed. Based on the

anticipated vessel repair work to be conducted within the proposed drydock, it is estimated that 1–2 additional delivery truck trips per week from the BAE Systems warehouse to the proposed drydock may be required. The truck route used by BAE Systems for site deliveries from its warehouse is Harbor Drive to 32nd Street/I-15 North.

BAE Systems Real Estate Agreements: Based on its investments proposed as part of the proposed project, BAE Systems proposes to extend the lease term of its existing lease with the District by 24 years. Therefore, it is assumed that operation of the proposed project would continue through the year 2058. Additionally, BAE Systems proposes to lease, on a long-term basis, the TUOP parcel currently leased (5-year) by the District to BAE Systems. The TUOP between the District and BAE Systems is set to expire on October 31, 2019. The long-term lease may include, but would not be limited to, an amendment to BAE Systems existing lease. No changes in existing uses on the TUOP parcel are anticipated to occur and would be leased to BAE Systems through a real estate agreement for a continuation of those uses once the existing TUOP between the District and BAE Systems expires in October 2019.

Removal of Cooling Tunnels: As previously stated, the removal of the cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, installation of a coffer dam, demolition and removal of tunnels (concrete) and backfill with clean structural fill. Once the removal of the cooling tunnels occurs, the project site would be restored to its existing condition. Therefore, no operational activities are associated with the removal of the cooling tunnels component.

1.5 Required Discretionary Actions and Permits

The District is the Lead Agency for CEQA and will be the certifying body for the EIR. The District will also issue the CDP and other entitlements for land and water areas within their jurisdiction. Outside of District jurisdiction, the CSLC and the CCC will issue permits for leaseholds within their jurisdiction. The following discretionary actions by the District are necessary for implementation of the proposed project:

- Certification of the Final Environmental Impact Report (UPD No. EIR-2014-31);
- Approval of the proposed BAE Systems Pier 1 North Drydock Project;
- Approval of a CDP for the portion of the proposed project in the District's jurisdiction;
- Approval of Engineering Plans; and
- Approval of lease amendment or other real estate agreements.

Various federal, State and local laws, regulations, and permit requirements will apply to the proposed project. Table I identifies potential required permits and approvals that would be required for the BAE Systems Pier 1 North Drydock Project.

Table I: Potential Permits and Approvals

Agency/Department	Permit/Approvals	Action Associated With or Required For
Federal Agencies		
US Army Corps of Engineers	Individual/Nationwide Section 404 Permit (CWA, 33 USC 1341)	Responsible for issuing Section 404 permits for dredged or fill material into waters of the US (up to higher high water line in tidal waters) and into wetlands in compliance with EPA regulations.
	Section 10, Rivers and Harbors Act Permit	Regulates construction, excavation, and deposition in navigable waters (up to mean high water in tidal waters).
	Marine Protection, Research, and Sanctuaries Act of 1972, Section 103	Regulates dumping and transport for dumping of material into US waters.
	40 CFR, Part 227 – Criteria for the Evaluation of Permit Applications for Ocean Dumping of Materials	Regulates dumping of materials into US waters and evaluates the need for ocean disposal.
US Environmental Protection Agency	Ocean Dumping Permit	Ocean Disposal
US Coast Guard	Concurrence with Ocean Dumping Permit	Ocean Disposal
National Marine Fisheries Service and US Fish and Wildlife Service	Concurrence with Ocean Dumping Permit	Ocean Disposal
State Agencies		
State Water Resources Control Board, Regional Water Quality Control Board	401 Certification (CWA, 33 USC 1341, if the project requires USACE 404 Permit) Water Discharge Requirements (WDRs) for dredging	Discharge into waters and wetlands during demolition, construction, and dredging activities.
California Coastal Commission	Coastal Development Permit	Development outside the District's jurisdiction.
State Lands Commission (SLC)	Obtain a lease for dredging outside District tidelands, and operation of the drydock outside District's tidelands	Development within the State Land Commission's jurisdiction.
California Department of Fish and Wildlife	Concurrence with Ocean Dumping Permit	Ocean Disposal
Local Agencies		
San Diego Unified Port District	Certification of Final EIR; approval of Pier 1 North Drydock Project; Coastal Development Permit for the portion of the proposed project beyond the US Pierhead in the District's jurisdiction; Coastal Act approval, approval of Engineering Plans; and approval of lease amendment and other real estate agreements.	As Lead Agency under CEQA; for development within the District's jurisdiction.
City of San Diego	Building permits	On-shore utilities and fire protection

CEQA = California Environmental Quality Act
CFR = Code of Federal Regulations
CWA = Clean Water Act
District = San Diego Unified Port District
EIR = Environmental Impact Report
EPA = Environmental Protection Agency
PRC = Public Resource Code
USC = United States Code

INTRODUCTION

LSA Associates, Inc. (LSA) is pleased to provide this Traffic Impact Study (TIS) for the proposed BAE Systems San Diego Shipyard Repair (BAE Systems) Pier 1N Drydock, Associated Real Estate Agreements, and Removal of Cooling Tunnels Project. The purpose of the following analysis is to identify the short-term and long-term traffic impacts associated with project buildout. This TIS has been prepared in accordance with the methodologies and procedures outlined in the City of San Diego (City) *Traffic Impact Study Manual*, San Diego Traffic Engineers' Council/Institute of Transportation Engineers (SANTEC/ITE) *Guidelines for Traffic Impact Studies* in the San Diego Region, the Highway Capacity Manual 2010 (HCM) published by the Transportation Research Board, and applicable provisions from the California Environmental Quality Act (CEQA).

PROJECT DESCRIPTION

The proposed project involves construction of a new drydock (dry berth) on the north side of Pier 1 at the BAE Systems facility. The drydock would support the current and future planned home-porting of United States (US) Naval ships in the harbor and allow greater flexibility in the utilization of dry-docking facilities. The proposed drydock would replace an existing wet berth used for ship repair and maintenance with a dry berth. BAE Systems also proposes to enter into a future, long-term real estate agreement with the San Diego Unified Port District (District) on the neighboring 2-acre land parcel and 4-acre water area that is currently leased by San Diego Gas & Electric (SDG&E) under a Tidelands Use and Occupancy Permit (TUOP). The TUOP parcel (formerly known as the SDG&E parcel) contains two existing underground intake/discharge ("cooling") tunnels which could be removed during project construction or at a later date. For purposes of this TIS, removal of the cooling tunnels has been assumed to occur during project construction.

Please refer to a full Project Description under separate cover for more information (provided as Appendix A). Figure 1 illustrates the project location. BAE Systems will schedule approximately 93 new employees at the Pier 1N project site for work shifts that begin and end outside of the a.m. peak-hour and p.m. peak-hour periods (7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m.).

ENVIRONMENTAL ANALYSIS

Regulatory Setting

Regional Transportation Plan. The Regional Transportation Plan (RTP), prepared and adopted by the San Diego Association of Governments (SANDAG), is the region's long-range mobility plan. The RTP plans for and identifies projects for multiple modes of transportation in order to achieve a balanced regional system. It establishes the basis for State funding of local and regional transportation projects and is a prerequisite for federal funding. SANDAG prioritizes and allocates the expenditure of regional, State, and federal transportation funds to implement RTP projects.

Congestion Management Program. The region's Congestion Management Program (CMP), also prepared by SANDAG, serves as a short-term element of the RTP. It focuses on actions that can be implemented in advance of the longer-range transportation solutions contained within the RTP.

FIGURE 1

Pier 1 North Drydock Project

Project Location and Study Area Intersections

The CMP establishes programs for mitigating the traffic impacts of new development and monitoring the performance of system roads relative to level of service (LOS) standards. It links land use, transportation, and air quality concerns.

Bayshore Bikeway Plan. The Bayshore Bikeway is a designated 24-mile (mi) bikeway route around San Diego Bay. Planning for the Bikeway began in 1975 with a feasibility study prepared by the California Department of Transportation (Caltrans) and funded by National City. The stated objective of the study was "to determine an acceptable route for bicyclists to traverse the southern regions of San Diego Bay." The final study, released in 1976, recommended 11 mi of bicycle paths and 14 mi of bike lanes and bike routes, providing convenient and scenic bicycle transportation and recreation around the Bay. Currently, the Bayshore Bikeway route consists of approximately 12 mi of off-street bicycle paths and approximately 12 mi of on-street sections designated as either bicycle lanes or bicycle routes. SANDAG is developing additional improvements to the bikeway based on the Bayshore Bikeway Plan, which was adopted by SANDAG in 2006, to identify opportunities to improve the bikeway along the east side of the Bay. The bikeway along Harbor Drive between 32nd Street and Park Boulevard designated to serve Barrio Logan and downtown San Diego is in the planning phase, expected to be completed in December 2014. The preliminary engineering and environmental analysis are expected to be completed by June 2016.

City of San Diego Mobility Element. The Mobility Element of the City General Plan, the RTP, and the CMP all highlight the importance of integrating transportation and land use planning decisions and using multimodal strategies to reduce congestion and increase travel choices. However, the Mobility Element more specifically plans for the City's transportation goals and needs. An overall goal of the Mobility Element is to further the attainment of a balanced, multimodal transportation network that also minimizes environmental and neighborhood impacts. A balanced network is one in which each mode, or type of transportation, is able to contribute to an efficient network of services meeting varied user needs.

Barrio Logan Community Plan. Community Plans in the City establish individual communities' land use designations and policies guiding development. The Barrio Logan Community Plan ensures consistency with overall guiding principles, land use policies, and other goals found in the City General Plan. The original Barrio Logan/Harbor 101 Community Plan was adopted in 1978. Because of the community's geographical location on the San Diego waterfront, its proximity to downtown San Diego, and its older urban and mixed-use characteristics, transportation plays a major role in the community's development. Practically all known forms of transportation have an important role in the community and its future development. Transportation modes for the Barrio Logan community fall into the following categories:

- Automobile transportation (freeways, major streets, collector streets, and local streets)
- Public transportation in the form of rail (Metropolitan Transit Development Board [MTDB]) and bus transportation
- Industry-related transportation (rail, trucking, and shipping)

- Pedestrian/bicycle open space-related transportation (complete streets, recreational transit, bicycle, and pedestrian)

The Environmental Impact Report for the update to the Barrio Logan Community Plan was approved by the City Council in October 2013. However, the Barrio Logan Community Plan update was overturned by referendum spearheaded by the Protect Our Jobs Coalition on June 3, 2014.

Senate Bill 743. In an effort to promote multimodal transportation, reduce greenhouse gas (GHG) emissions, and create a diversity of land uses, the State has enacted a bill that will alter the way that transportation impacts are evaluated under CEQA. Senate Bill 743 (SB 743) eliminates the traditional LOS impact analysis and directs the Governor's Office of Planning and Research (OPR) to prepare draft CEQA guidelines to implement the goals of SB 743.

Under the proposed guidelines, the analysis of the transportation impacts of proposed development will use vehicle miles traveled (VMT) as the measuring method, rather than the LOS measure commonly used today. For the guidelines, VMT measures "the amount and distance that a project might cause people to drive," whereas LOS focuses on congestion and delay. Changing the methodology is intended to result in more-sustainable communities.

Proposed guidelines were released in August 2014 as a "Discussion Draft." The comment period on that "Discussion Draft" ended on November 21, 2014. Recent communications with OPR staff indicate they will complete their review within approximately two months, at which time they are suggesting a new set of revised guidelines for review. When the revised guidelines are released, another cycle of comment and review will occur. After OPR completes its guideline preparation, the draft final guidelines will be submitted to the Natural Resources Agency, which will make modifications and hold public meetings/hearings.

After the final recommendation from the Natural Resources Agency, the guidelines will then move into the Administrative Law process, at which point they will be codified into law. Based on recent estimates, the applicability of this law to a project within a "transit priority area" (i.e., an area within a 0.5-mile radius of an existing or planned major transit stop) and "high-quality transit corridor" (i.e., a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours) will not take effect until late 2015 or early 2016. As the proposed project is within a 0.5-mile radius of a "transit priority area" (i.e., Barrio Logan Station) and a "high quality transportation corridor" (i.e., Main Street), it is likely that the project will be exempt from the SB 743 requirements and be found to have less than significant impacts on circulation.

The application of SB 743 and the specific CEQA Guideline amendments are not complete and will not take effect until some period after the project's review and certification. The CEQA guidelines address amendments and state such amendments apply prospectively. New requirements under the amendments will apply to steps in the CEQA process not yet undertaken by the date that agencies must comply with the amendments {Section 15007 (b)}. Therefore, a VMT analysis for SB 743 consistency purposes is not applicable at this time, as the specific analysis requirements have yet to be identified. The project CEQA review process will likely be completed prior to the ultimate adoption of final rules by Natural Resources and Administrative Law. However, a VMT analysis has been included in the GHG analysis as part of the overall Air Quality assessment within the project environmental analysis.

Environmental Setting

Existing Circulation System. Key roadways in the vicinity of the proposed project are as follows:

- **Interstate 5.** Interstate 5 (I-5) is located to the east of the project site and is classified and functions as an eight-lane freeway with four main lanes of traffic in each direction. Access to the project site from I-5 is provided via southbound on-/off-ramps at Logan Avenue, northbound on-/off-ramps at National Avenue, a southbound off-ramp at 28th Street, and a southbound on-ramp at Boston Avenue.
- **Harbor Drive.** Harbor Drive functions as an east-west four-lane major arterial between Sigsbee Street and Vesta Street. The road has a raised or landscaped median along the entire length of the segment. Harbor Drive is a designated truck route and has a Class II bikeway with bike lanes along each side of the road. The street has intermittent curbs, sidewalks, and parallel parking along the northern side of the road. The southern side of Harbor Dive has limited curbs and sidewalks. Parallel parking is intermittently permitted between Schley Street and 32nd Street. The posted speed limit is 40 and 45 miles per hour (mph).
- **28th Street.** 28th Street is located southeast of the project site and functions as a north-south, four-lane collector between Boston Avenue and Main Street and as a four-lane with raised median major arterial between Main Street and Harbor Drive. Between National Avenue and Boston Avenue, 28th Street functions as a three-lane collector with two northbound lanes and a southbound lane. This street is a designated truck route. Sidewalks and curbs line each side of the street for the entire length of the segment. Parallel parking is available on each side of the street between Main Street and Harbor Drive. The National Steel and Shipbuilding Company (NASSCO) shipyard is located at the southern end of 28th Street. South of Main Street, US Naval Base San Diego fronts on the east side of 28th Street, including an access gate to the base. I-5 on- and off-ramps connect 28th Street to I-5 near the northern end of the segment. The Traffic Study for the proposed Barrio Logan Community Plan Update recommends that 28th Street between Harbor Drive and the I-5 ramps be classified as a four-lane major arterial.
- **Kearney Avenue.** Kearney Avenue is a one-way (westbound), single-lane collector between 19th Street and 27th Street. This road has sidewalks, curbs, and parallel parking spaces on each side of the street. Trucks above 5 tons are prohibited by signage from traveling along Kearney Avenue. The posted speed limit is 25 mph.
- **Logan Avenue.** Logan Avenue functions as a north-south two-lane collector with a two-way left-turn lane between Commercial Street and 26th Street. This road has sidewalks, curbs, and parallel parking spaces on each side of the street. A southbound I-5 off-ramp is located at the intersection with Beardsley Street.
- **Boston Avenue.** Boston Avenue functions as an east-west two-lane collector between 28th Street and 32nd Street. This road has sidewalks, curbs, and parallel parking spaces on each side of the street. A southbound I-5 on-ramp is located at the intersection with 29th Street.
- **National Avenue.** National Avenue functions as an east-west two-lane collector between Commercial Street and 27th Street. A two-way left-turn lane is provided between Commercial Street and Beardsley Street and between Dewey Street and 27th Street. Trucks above 5 tons are prohibited by signage to travel along National Avenue. An eastbound State Route 75 (SR-75)

off-ramp is located along National Avenue between Cesar Chavez Parkway and Evans Street. This segment of National Avenue has sidewalks, curbs, and parallel parking on each side of the road. Diagonal parking is provided on National Avenue on the south side of the street for portions of the segment between Beardsley Street and Evans Street.

- **Sampson Street.** Sampson Street functions as a north-south two-lane collector between I-5 and Harbor Drive. Sidewalks, curbs, and parallel parking spaces are located on each side of the road. Trucks above 5 tons are prohibited by signage to travel along Sampson Street.
- **Cesar Chavez Parkway.** Cesar Chavez Parkway functions as a north-south four-lane collector between Logan Avenue and National Avenue and between Main Street and Harbor Drive. This road functions as a three-lane collector between Logan Avenue and Kearney Avenue and between National Avenue and Main Street. Cesar Chavez Parkway is lined with sidewalks and curbs on both sides of the road for the entire length of the street. Parallel parking is available on the west side of the street between National Avenue and Main Street. Signs prohibit trucks above 5 tons from traveling along Cesar Chavez Parkway. A northbound I-5 on-ramp is located at the intersection of Cesar Chavez Parkway and Kearney Avenue. A westbound SR-75 on-ramp is located at the intersection of Cesar Chavez Parkway and Logan Avenue.
- **Main Street.** Main Street functions as an east-west two-lane collector between Beardsley Street and 26th Street. A two-way left-turn lane is provided between Rigel Street and Yama Street. Main Street functions as a three-lane collector between 26th Street and 27th Street and between 29th Street and 32nd Street and a four-lane collector between 27th Street and 29th Street and between 32nd Street and Rigel Street. Curbs and sidewalks are located on each side of the road along the entire length of the segment. Signs prohibit trucks over 5 tons from traveling on Main Street west of 26th Street. A northbound State Route 15 (SR-15) on-ramp and a southbound SR-15 off-ramp are located between 32nd Street and Rigel Street. Southbound I-5 on- and off-ramps are also located near the intersection with Yama Street. Main Street is a designated Class III bikeway. Parallel parking is intermittently permitted along each side of the road.

Project Study Area. The study area analyzed in this report includes the following intersections and roadway segments. In addition to the project location, previously referenced Figure 1 also shows the locations of the study area intersections and roadway segments analyzed in this report.

Study Area Intersections

1. I-5 Southbound Off-Ramp/Logan Avenue
2. Cesar Chavez Parkway/Kearney Avenue
3. Cesar Chavez Parkway/Logan Avenue
4. Cesar Chavez Parkway/Harbor Drive
5. Sampson Street/Kearney Avenue
6. Sampson Street/Harbor Drive
7. 28th Street/State Route 94 (SR-94) Westbound Ramps
8. 28th Street/SR-94 Eastbound Ramps

9. 28th Street/National Avenue
10. 28th Street/Boston Avenue
11. 28th Street/Harbor Drive
12. I-5 Northbound Ramps/National Avenue
13. I-5 Southbound On-Ramp/Boston Avenue

Study Area Roadway Segments

1. Logan Avenue between I-5 Southbound On-Ramp and Cesar Chavez Parkway
2. Cesar Chavez Parkway between Kearney Avenue and Logan Avenue
3. Cesar Chavez Parkway between Logan Avenue and Harbor Drive
4. Kearney Avenue between Cesar Chavez Parkway and Sampson Street
5. Harbor Drive between Cesar Chavez Parkway and Sampson Street
6. Harbor Drive between Sampson Street and 28th Street
7. Sampson Street between 28th Street and Kearney Avenue
8. Sampson Street between Kearney Avenue and Harbor Drive
9. 28th Street between SR-94 Eastbound Ramps and Sampson Street
10. 28th Street between National Avenue and Boston Avenue
11. 28th Street between Boston Avenue and Harbor Drive
12. National Avenue between 28th Street and I-5 Northbound Ramps
13. Boston Avenue between 28th Street and I-5 Southbound On-Ramp

A.m. peak-hour (7:00–9:00 a.m.), p.m. peak-hour (4:00–6:00 p.m.), and daily traffic counts were collected by National Data and Surveying Services (NDS) in December 2013 for the study area intersections and roadway segments. The existing traffic counts are provided as Appendix B. The existing study area intersection geometrics and traffic control are illustrated in Figure 2.

Methodology. The following traffic analysis was conducted according to the methodologies and procedures outlined in the City *Traffic Impact Study Manual*, SANTEC/ITE *Guidelines for Traffic Impact Studies in the San Diego Region*, the HCM 2010 published by the Transportation Research Board, and applicable provisions from CEQA.

Intersection Level of Service Methodology. The HCM 2010 methodology has been used to determine the intersection LOS within the study area. The resulting delay is expressed in terms of LOS, where LOS A represents free-flow activity and LOS F represents overcapacity operation. LOS is a qualitative assessment of the quantitative effects of such factors as traffic volume, roadway geometrics, speed, delay, and maneuverability on roadway and intersection operations.

Legend
Signal
Stop Sign

Pier 1N Drydock

Existing Intersection Geometrics and Traffic Control

P:\PTO1402\Traffic\xls\g30- Geo_Exist.xlsx 10/15/2014

The relationship between delay and LOS at unsignalized and signalized intersections is summarized below. LOS D is considered the upper limit of satisfactory conditions.

LOS	Unsignalized Intersection Delay (seconds)	Signalized Intersection Delay (seconds)
A	≤10.0	≤10.0
B	>10.0 and ≤15.0	>10.0 and ≤20.0
C	>15.0 and ≤25.0	>20.0 and ≤35.0
D	>25.0 and ≤35.0	>35.0 and ≤55.0
E	>35.0 and ≤50.0	>55.0 and ≤80.0
F	>50.0	>80.0

Source: Highway Capacity Manual (2010).
LOS = level of service

Roadway Segment LOS Methodology. Roadway segments were analyzed on a daily basis by comparing the average daily traffic (ADT) volume to the City's adopted LOS standards and ADT thresholds. These standards are provided in Appendix C and provide LOS estimates based on traffic volumes and roadway characteristics. This analysis focuses on the performance of Major Arterial and Collector roadways; therefore, the daily volumes for specific Major Arterial and Collector roadways are summarized below.

Street Classification	Lanes	Capacity (LOS A)	Capacity (LOS B)	Capacity (LOS C)	Capacity (LOS D)	Capacity (LOS E)
Major Arterial	4	15,000	21,000	30,000	35,000	40,000
Collector (w/TWLT)	4	10,000	14,000	20,000	25,000	30,000
Collector (w/TWLT)	3	7,500	10,500	15,000	18,750	22,500
Collector (no TWLT)	3	3,750	5,250	7,500	9,750	11,250
Collector (no TWLT)	2	2,500	3,500	5,000	6,500	8,000

Sources: City of San Diego *Traffic Impact Study Manual*, San Diego Traffic Engineers' Council/Institute of Transportation Engineers (SANTEC/ITE) *Guidelines for Traffic Impact Studies in the San Diego Region.*
LOS = level of service
TWLT = two-way left-turn lane

The following table identifies threshold changes in delay or volume-to-capacity (v/c) ratios that define an impact for intersections and roadway segments. Changes in delay or v/c ratios are only considered significant if the existing LOS is E or F. If the project does not result in LOS E with a delay increase of more than 2 seconds (or LOS F with a delay increase of more than 1 second) at a study area intersection, then a significant impact would not occur. Similarly, if the project does not result in LOS E with a v/c increase of more than 0.02 (or LOS F with a v/c increase of more than 0.01) at a study area roadway segment, then a significant impact would not occur.

LOS With Project	Intersection Delay (seconds)	Roadway Segments v/c Increase
E	>2.0	>0.02
F	>1.0	>0.01

Sources: City of San Diego *Traffic Impact Study Manual*, San Diego Traffic Engineers' Council/Institute of Transportation Engineers (SANTEC/ITE) *Guidelines for Traffic Impact Studies in the San Diego Region.*
LOS = level of service
v/c = volume-to-capacity ratio

The District does not have thresholds for determining significance of project impacts. Therefore, it is typical for the District to utilize underlying/adjacent City provisions for such analyses.

Existing No Project Conditions and LOS Analysis. Figure 3 presents the existing a.m. and p.m. peak-hour volumes from Appendix B. These peak-hour volumes are used to calculate (or determine) the existing LOS. The existing LOS calculation worksheets are provided as Appendix D. Table A summarizes the results of the existing a.m. and p.m. peak-hour LOS analysis for the study area intersections. As this table indicates, all study area intersections operate at an acceptable LOS (D or better) in the a.m. and p.m. peak hours, with the exception of the following:

- 28th Street/SR-94 Westbound Ramps (LOS F during the p.m. peak hour)
- 28th Street/SR-94 Eastbound Ramps (LOS F during the p.m. peak hour)
- I-5 Southbound On-Ramp/Boston Avenue (LOS F during the p.m. peak hour)

Figure 4 presents the existing ADT at the study area roadway segments. Table B summarizes the ADT volumes and v/c ratios for the study area roadway segments in the existing condition from Appendix B. As shown on Table B, all study area roadway segments operate at an acceptable LOS (LOS D or better), with the exception of the following:

- 28th Street between SR-94 Eastbound Ramps and Sampson Street (LOS E)
- National Avenue between 28th Street and the I-5 Northbound Ramps (LOS F)
- Boston Avenue between 28th Street and the I-5 Southbound Ramp (LOS F)

Project Impacts

Project Trip Generation. To determine the project traffic destined to/from the project site, BAE Systems provided operational data that included the anticipated number of new employees. Approximately 93 new employees at the Pier 1N project site will be scheduled for work shifts that begin and end outside of the a.m. peak-hour and p.m. peak-hour periods (7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m.). The specific work shifts are as follows: 6:00 a.m. to 2:30 p.m., 2:30 p.m. to 10:30 p.m., and 10:30 p.m. to 6:00 a.m.

☐ Exceeds level of service (LOS) criteria

V/C = volume-to-capacity ratio

Based on discussions with BAE Systems, 20 percent of employees currently utilize alternative means of transportation such as bus or train and/or carpool. Other transportation options available to BAE Systems include subsidized vanpools, a shuttle service between the shipyard and the Barrio Logan trolley station (located at the intersection of Cesar Chavez Parkway/Harbor Drive), and bicycles. BAE Systems-subsidized vanpools consist of 10 eleven-passenger vans. San Diego Trolley ridership includes individuals transported by BAE Systems shuttles to/from the Barrio Logan trolley station. However, many employees walk from the trolley station to the shipyard when the shuttles are full, as the shipyard is located less than a half mile from the station. In addition, the shipyard provides secured parking areas for up to 20 bicycles and 30 motorcycles. Therefore, it is anticipated that 20 percent of the 93 new employees will also utilize transit, carpool, or other alternative means of transportation. The remaining 80 percent will drive themselves to/from the project site. As such, 93 employees would generate approximately 149 ADT and zero peak-hour trips, as shown in Table C.

Table C: Project Trip Generation Summary

Description	Employees	ADT	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Trip Generation								
Pier 1N Drydock [1]	93	149	0	0	0	0	0	0

[1] Approximately 20 percent of employees are anticipated to utilize transit, carpool, or other alternative means of transportation. 93 employees x 0.80 employees who will drive to/from the site x 2 daily trips = 149 ADT

For construction-related project trip generation for the Pier 1N Drydock and Cooling Tunnel Removal components, please see Table K on page 37.

ADT = average daily traffic

Project Trip Distribution. Directions of approach to and departure from the project site were based on operational data (employee numbers, zip codes, and schedules) supplied by BAE Systems. This operational data allowed LSA to identify the trip distribution percentages for the proposed project. Approximately 25 percent of the project trips are to/from the north (via I-5 and Harbor Drive), 50 percent are to/from the south (via I-5 and Harbor Drive), and 25 percent are to/from the east (via SR-94 and National Avenue). Figure 5 illustrates the project trip distribution and assignment.

Existing Plus Project Conditions and LOS Analysis. Project traffic was added to the existing traffic volumes at the study area intersections and roadway segments. Figure 6 presents the existing plus project a.m. and p.m. peak-hour volumes. Table D summarizes the results of the existing plus project a.m. and p.m. peak-hour LOS analysis for all study area intersections. The LOS worksheets are provided as Appendix E. As Table D indicates, all study area intersections will continue to operate at an acceptable LOS (D or better) in both peak hours with implementation of the proposed project, with the exception of the following:

- 28th Street/SR-94 Westbound Ramps (LOS F during the p.m. peak hour)
- 28th Street/SR-94 Eastbound Ramps (LOS F during the p.m. peak hour)
- I-5 Southbound On-Ramp/Boston Avenue (LOS F during the p.m. peak hour)

☐ Exceeds level of service (LOS) criteria

However, the project will not generate vehicle trips or increase intersection delay during the a.m. or p.m. peak hour. As such, the project traffic will not create a significant intersection impact in the existing plus project condition, based on the City's and the SANTEC/ITE significance criteria.

Figure 7 presents the existing plus project ADT. Table E summarizes the ADT volumes and v/c ratios for the study area roadway segments in the existing condition with the addition of project traffic. As shown on Table E, all study area roadway segments are forecast to operate at an acceptable LOS (LOS D or better) with the addition of project traffic, with the exception of the following:

- 28th Street between SR-94 Eastbound Ramps and Sampson Street (LOS E)
- National Avenue between 28th Street and the I-5 Northbound Ramps (LOS F)
- Boston Avenue between 28th Street and the I-5 Southbound Ramp (LOS F)

The addition of project traffic will not increase the v/c ratio greater than 0.01 along any of these segments. Therefore, implementation of the project would not cause a significant impact along a study area roadway segment in the existing condition.

Bayshore Bikeway. The Bayshore Bikeway consists of bike routes along Harbor Drive. Based on the results of the roadway segment analysis, Harbor Drive is forecast to operate at acceptable LOS (LOS A or B) with implementation of the proposed project. Therefore, bike safety and bike routes would not be significantly affected with the addition of project traffic.

Parking Analysis. BAE Systems currently has 1,888 individuals (BAE Systems employees, US Navy personnel, and customers) reporting to the shipyard across three shifts. The peak parking demand is generated during the first shift with 1,637 individuals. However, not all 1,637 individuals drive their own vehicles to the site. As previously discussed, 20 percent of employees (as well as other individuals reporting to the shipyard) utilize transit, carpool, or other alternative means of transportation. Therefore, approximately 1,310 individuals drive to/from the shipyard each day during the first shift. BAE Systems is currently pursuing a long-term parking agreement with SDG&E for a new parking lot that would provide an additional 184 parking spaces. The proposed lot would be located on SDG&E property that includes unoccupied buildings and a former substation. SDG&E is in the process of evaluating the property to make the land available for BAE Systems parking. The existing and proposed project parking locations are illustrated on Figure 8.

With completion of the Pier 1N Drydock project, 93 new employees are anticipated to work on site with 64 employees working the first shift. Applying the 20 percent alternative transportation/carpool reduction to these 64 employees, approximately 51 new employees will drive to/from the site each day during the first shift. With a total project parking demand of 1,361 spaces during the first shift (1,310 current personnel vehicles and 51 new employee vehicles), the existing 1,304-space parking supply would have a deficit of 57 spaces. Once the proposed SDG&E parking lot is secured, an additional 184 spaces would be available and adequate parking would be provided for BAE Systems employees and personnel during the peak parking demand (first shift). However, in order to address the 57-space deficiency prior to securing the SDG&E lot, mitigation would be required to ensure that 57 employees are provided alternative transportation to the site. Measures to alleviate the parking deficiency are recommended later in this TIS.

Cumulative Impacts

According to the project applicant, the proposed project will be opened in year 2017. To present a cumulative (2017) traffic condition, a two-step volume development process was used. A regional ambient growth rate was determined and traffic volumes for cumulative (approved/pending) projects were developed, both of which were added to the existing traffic counts. To reflect regional growth in the study area, a growth rate of 1 percent per year (total of 4 percent) was applied to the existing traffic volumes. Traffic volumes from cumulative projects in the project vicinity and study area were then added. A list of cumulative projects was obtained from the City's Development Services Department Project Tracking System and the Port, as described below and provided in Appendix F.

- **Cesar Chavez Education Center (1901 Main Street)** – Construction of a three-story continuing education facility
- **COMM 22 (2101 Commercial Street)** – Construction of 252 residential units (130 affordable family rental units, 70 affordable senior rental lofts, 35 market-rate lofts, and 17 for-sale townhomes) and 25,000 square feet (sf) of commercial/retail use
- **Jack-in-the-Box (2890 National Avenue)** – Construction of a 2,588 sf Jack-in-the-Box drive-through restaurant
- **Albert Einstein Academy (446 26th Street)** – Splitting two hospital buildings (i.e., converting one building to a middle school and the other building to remain as a hospital)
- **Shipyard Sediment Remediation Project** – Dredging of sediment adjacent to shipyards in the San Diego Bay (eastern shore of San Diego Bay, extending from Sampson Street to Chollas Creek)
- **New Lease to San Diego Refrigerated Services (SDRS) at Tenth Avenue Marine Terminal (TAMT)** – Provision of a new lease to extend the lease expiration from 2025 to 2036 and to allow for increased throughput in refrigerated storage operations
- **TAMT Redevelopment Plan** – Provision of infrastructure investments and improvements to increase operational capabilities and capacity

The cumulative project locations are illustrated in Figure 9. The cumulative projects and their respective trip generations are shown in Table F. Trips generated by the cumulative projects were added to the existing traffic volumes at the study area intersections and roadway segments after the ambient growth rate (4 percent total growth) was applied.

It should be noted there are several projects within the City and the Port; however, cumulative projects were selected based on project type/size, location/proximity to the project site, and available information. For example, a residential development of fewer than 10 units is excluded. The trips generated by this type of project are nominal, and the ambient growth rate of 1 percent per year would account for the trip generation of all small-scale projects within the project vicinity. Therefore, LSA included all other active projects within a 1-mile radius of the project site that would generate trips within the study area. Projects that are inactive, located farther away from the project site, or outside the study area were not included in the cumulative analysis. Projects that would only generate temporary construction trips were also removed from consideration. The Dole Fresh Fruit Refrigerated Rack Improvement project was considered as a cumulative project, but LSA is unable to estimate the trip generation because detailed project information is not available at this time.

[1] Trip rates referenced from the Institute of Transportation Engineers *Trip Generation*, 9th Edition (2012).

[2] Trip generation referenced from San Diego Convention Center Expansion: Phase 3 Draft Environmental Impact Report (Fehr & Peers) - Approved 2013.

[3] Trip generation referenced from the Shipyard Sediment Project Traffic Impact Analysis (LSA Associates, Inc.) - Approved 2012

DU = dwelling unit

TSF = thousand square feet

Therefore, this project was not included in the cumulative analysis. However, the total ambient growth of 4 percent would include trips generated by this project.

Cumulative No Project Conditions and LOS Analysis. The resulting cumulative a.m. and p.m. peak-hour traffic volumes are shown in Figure 10. Table G summarizes the results of the cumulative a.m. and p.m. peak-hour LOS analysis for the study area intersections. The cumulative LOS calculation worksheets are provided as Appendix G. As Table G indicates, all study area intersections are forecast to operate at an acceptable LOS (D or better) in the a.m. and p.m. peak hours, with the exception of the following:

- 28th Street/SR-94 Westbound Ramps (LOS F during the p.m. peak hour)
- 28th Street/SR-94 Eastbound Ramps (LOS F during the p.m. peak hour)
- I-5 Southbound On-Ramp/Boston Avenue (LOS F during the p.m. peak hour)

Figure 11 presents the cumulative ADT at the study area roadway segments. Table H summarizes the ADT volumes and v/c ratios for the study area roadway segments in the cumulative condition. As shown on Table H, all study area roadway segments are forecast to operate at an acceptable LOS (LOS D or better), with the exception of the following:

- 28th Street between SR-94 Eastbound Ramps and Sampson Street (LOS E)
- National Avenue between 28th Street and the I-5 Northbound Ramps (LOS F)
- Boston Avenue between 28th Street and the I-5 Southbound Ramp (LOS F)

Cumulative Plus Project Conditions and LOS Analysis. Project traffic was added to the cumulative traffic volumes at the study area intersections and roadway segments. Figure 12 presents the cumulative plus project a.m. and p.m. peak-hour volumes. Table I summarizes the results of the cumulative plus project a.m. and p.m. peak-hour LOS analysis for all study area intersections. The LOS worksheets are provided as Appendix H. As Table I indicates, all study area intersections are forecast to operate at an acceptable LOS (D or better) in both peak hours with implementation of the proposed project, with the exception of the following:

- 28th Street/SR-94 Westbound Ramps (LOS F during the p.m. peak hour)
- 28th Street/SR-94 Eastbound Ramps (LOS F during the p.m. peak hour)
- I-5 Southbound On-Ramp/Boston Avenue (LOS F during the p.m. peak hour)

However, the project will not generate vehicle trips or increase intersection delay during the a.m. or p.m. peak hour. As such, the project traffic will not create a significant intersection impact in the cumulative plus project condition, based on the City's and the SANTEC/ITE significance criteria.

Figure 13 presents the cumulative plus project ADT. Table J summarizes the ADT volumes and v/c ratios for the study area roadway segments in the cumulative condition with the addition of project traffic.

☐ Exceeds level of service (LOS) criteria

V/C = volume-to-capacity ratio

As shown on Table J, all study area roadway segments are forecast to operate at an acceptable LOS (LOS D or better) with the addition of project traffic, with the exception of the following:

- 28th Street between SR-94 Eastbound Ramps and Sampson Street (LOS E)
- National Avenue between 28th Street and the I-5 Northbound Ramps (LOS F)
- Boston Avenue between 28th Street and the I-5 Southbound Ramp (LOS F)

The addition of project traffic will not increase the v/c ratio greater than 0.01 along these segments. Therefore, implementation of the project would not cause a significant impact along a study area roadway segment in the cumulative condition.

Construction Impacts

Construction Trip Generation. Construction activities will consist of the Pier 1N Drydock construction and removal of the cooling tunnels on the neighboring TUOP parcel. To determine the average construction traffic destined to/from the project site on a typical day, the project applicant provided data that included the duration and total number of workers and trucks for each phase of Pier 1N Drydock construction and removal of the cooling tunnels. The six phases of Pier 1N Drydock construction (including duration and daily workers and trucks) are as follows.

Construction

- Phase I – Pier 1N Submerged Wall (8 months): 20 workers and 1 truck
- Phase II – Demolition of Existing Pier 1 Mooring Dolphin (1 month): 6 workers and 1 truck
- Phase III – Dredging (Upland Disposal) (1 month): 10 workers and 31 trucks
- Phase IV – Dredging (Ocean Disposal) (6 months): 8 workers
- Phase V – Wharf and Mooring Dolphin Construction (6 months): 20 workers and 1 truck
- Phase VI – Shoreline and Utilities Construction (3 months): 15 workers and 1 truck

Based on this data, a total of approximately 79 workers and 35 trucks could be destined to the project site on the busiest day, which is during the potential overlap of all six phases of Pier 1N Drydock construction.

The four phases of cooling tunnel removal (including duration and daily workers and trucks) are as follows.

Cooling Tunnel Removal

- Phase I – Coferdam Installation (1 month): 20 workers and 1 truck
- Phase II – Removal of Concrete Debris and Soil (5 months): 10 workers and 15 trucks
- Phase III – Infill of Clean Soil (Upland Disposal) (5 months): 10 workers and 23 trucks
- Phase IV – Coferdam Removal (Ocean Disposal) (1 month): 20 workers and 1 truck

Each phase of cooling tunnel removal must occur in succession. A phase cannot begin unless a previous phase has been completed. Therefore, none of the phases will overlap. As such, the busiest day of cooling tunnel removal would occur during Phase III. Based on this information, approximately 10 workers and 23 trucks could be destined to the project site for removal of the cooling tunnels.

To analyze conservative, worst-case construction conditions, the simultaneous construction of the Pier 1N Drydock (overlapping Phases 1 through VI) and the removal of the cooling tunnels (Phase III) have been assumed. As such, a total of approximately 89 workers and 58 trucks could be destined to the project site. Table K provides the trip generation to and from the project site for each individual construction/removal phase, as well as the total trip generation for the simultaneous construction and removal phases.

As previously discussed, 20 percent of BAE employees utilize transit, carpool, or other alternative means of transportation. Therefore, it is anticipated that 20 percent of construction workers will also utilize transit or carpool. The remaining 80 percent will drive themselves to/from the project site. During construction of the Pier 1N Drydock and removal of the cooling tunnels, 89 workers would generate approximately 143 ADT and zero peak-hour trips.

Truck trips will occur during a 10-hour period between 6:00 a.m. and 4:00 p.m. (i.e., truck trips would not occur during the p.m. peak hour). Each truck represents 2 ADT (i.e., 1 inbound trip and 1 outbound trip). To convert the daily trucks to peak-hour truck traffic, LSA divided the trucks by 10 hours and split the ingress and egress evenly since it is anticipated that trucks will travel back and forth throughout the day. Of the 58 trucks, approximately five will access the site during the a.m. peak hour. For purposes of this analysis, the truck trips were converted to passenger car equivalent (PCE) trips at a ratio of 2.5 passenger cars per truck, consistent with the guidance in the HCM. During construction of the Pier 1N Drydock and removal of the cooling tunnels, 58 trucks would generate approximately 290 PCE ADT and 26 PCE a.m. peak-hour trips (13 inbound and 13 outbound).

As shown on Table K, a total of 433 ADT (143 worker ADT and 290 truck PCE ADT) and 26 a.m. peak-hour trips (13 inbound and 13 outbound) would be generated to and from the project site.

Construction Trip Distribution. The trip distribution for workers and trucks is approximately 60 percent destined to the north and 40 percent destined to the south along I-5. However, sediment that is dredged during Phase III (Dredging [Upland Disposal]) will be transported to the Otay Landfill. Phase III haul trucks would access the I-5 south, via the designated truck route of E. Harbor Drive. The preferred route to Otay Landfill is I-5 south, to State Route 54 east, to Interstate 805 south. Therefore, for purposes of construction, it is assumed that 100 percent of the haul truck trips are destined to the south via I-5.

Existing Plus Construction Conditions and LOS Analysis. Construction traffic was added to the existing traffic volumes at the study area intersections and roadway segments. Figure 14 presents the existing plus construction a.m. and p.m. peak-hour volumes. Table L summarizes the results of the existing plus construction a.m. and p.m. peak-hour LOS analysis for all study area intersections.

[1] Approximately 20 percent of employees/construction workers are anticipated to utilize transit or carpool. Construction workers will arrive prior to 7:00 a.m. and depart prior to 4:00 p.m. (i.e., outside both peak hours)

[2] Truck trips would occur between 6:00 a.m. and 4:00 p.m. (i.e., outside the p.m. peak hour)

PCE = passenger car equivalent. An employee vehicle has a PCE of 1 and a construction truck has a PCE of 2.5

ADT = average daily traffic

☐ Exceeds level of service (LOS) criteria

The LOS worksheets are provided as Appendix I. As Table L indicates, all study area intersections will continue to operate at an acceptable LOS (D or better) in both peak hours with implementation of the proposed project, with the exception of the following:

- 28th Street/SR-94 Westbound Ramps (LOS F during the p.m. peak hour)
- 28th Street/SR-94 Eastbound Ramps (LOS F during the p.m. peak hour)
- I-5 Southbound On-Ramp/Boston Avenue (LOS F during the p.m. peak hour)

However, project construction will not generate vehicle trips or increase intersection delay during the p.m. peak hour. As such, construction traffic will not create a temporary intersection impact in the existing plus project condition, based on the City's and the SANTEC/ITE significance criteria.

Figure 15 presents the existing plus construction ADT. Table M summarizes the ADT volumes and v/c ratios for the study area roadway segments in the existing condition with the addition of construction traffic. As shown on Table M, the roadway segments are forecast to operate at an acceptable LOS (LOS D or better) with the addition of construction traffic, with the exception of the following:

- 28th Street between SR-94 Eastbound Ramps and Sampson Street (LOS E)
- National Avenue between 28th Street and the I-5 Northbound Ramps (LOS F)
- Boston Avenue between 28th Street and the I-5 Southbound Ramp (LOS F)

The addition of construction traffic will not increase the v/c ratio greater than 0.01 along these segments. Therefore, project construction would not cause a temporary impact along a study area roadway segment in the existing condition.

MITIGATION

Significant impacts were not determined at study area intersections and roadway segments with implementation of the project. Therefore, mitigation measures for the existing circulation system are neither required nor recommended.

In order to address a parking deficiency of 57 spaces at project completion, BAE Systems shall provide the means to increase alternative transportation ridership by 65 persons during the first shift prior to obtaining a new 184-space parking lot from SDG&E and project operation. This shall be achieved through a combination of the following alternative transportation options:

- Increasing the number of subsidized vanpools to increase the vanpool ridership
- Increasing the number of shuttles transporting employees/personnel from the Barrio Logan trolley station (located at the intersection of Cesar Chavez Parkway/Harbor Drive) and/or the Harborside trolley station (located at the intersection of 28th Street/Bay Avenue) to encourage trolley ridership
- Provision of subsidized trolley passes for existing vehicle commuters

☐ Exceeds level of service (LOS) criteria

V/C = volume-to-capacity ratio

CONCLUSION

Based on the results of this TIS, typical operations of the Pier 1N Drydock project (i.e., 93 new workers) will not create significant impacts to study area intersections or roadways segments based on worker schedules (arrival/departure times outside of the a.m. and p.m. peak hours). In addition, the anticipated construction traffic to and from the project site can be accommodated without causing a temporary impact to the study area locations.

Evaluation of the study area intersection and roadway LOS shows that the addition of project traffic to the existing and cumulative traffic volumes will not cause a significant increase in delay at the intersections or an increase in v/c ratio on the roadway segments, according to the City's and the SANTEC/ITE significance criteria. As a result, no circulation improvements are warranted.

Implementation of the project would result in a deficit of 57 parking spaces. However, BAE Systems intends to secure a 184-space parking lot from SDG&E. Until this lot is secured, measures have been recommended to address this parking shortage. These alternative transportation options include increasing the number of subsidized vanpools, increasing the number of shuttles to/from trolley stations in the project vicinity, and provision of subsidized trolley passes.

APPENDIX A

PROJECT DESCRIPTION

Technical Studies

Project Description

In order to assess a project's potential effect on the environment, a description of the project is necessary and required pursuant to Section 15124 of the CEQA Guidelines. The following Project Description, to be used for the preparation of required technical studies, discusses the construction and operational characteristics of the reasonably foreseeable phases of the Proposed Project (which consists of three project components as described later in this section), the geographic setting and location, San Diego Unified Port District (District) Port Master Plan designations for the Proposed Project site, and the discretionary actions required to implement the Proposed Project. The Project Description will be used as the basis for analyzing the Proposed Project's impacts on the existing environment in the Environmental Impact Report (EIR).

BAE Systems proposes to site a new drydock (dry berth) on the north side of its Pier 1 and extend its existing lease-term based on its investments from the proposed project on the leasehold. The drydock would support the current and planned future home-porting of United States (US) Naval assets (ships) in San Diego and allow greater flexibility in the utilization of drydocking facilities. The proposed drydock would replace an existing wet berth, used for ship repair and maintenance, with a dry berth. Although the majority of the proposed project is within the District's jurisdiction, approvals from the California State Lands Commission (CSLC) and the California Coastal Commission (CCC) are required for actions associated with the portion of the drydock that is outside of the District's jurisdiction. The proposed project would also be required to obtain building permits from the City of San Diego for on-shore utility and fire protection.

BAE Systems also proposes to enter into a future, long-term real estate agreement with the District on the neighboring 2-acre land parcel and 4-acre water area under a Tidelands Use and Occupancy Permit (TUOP).[1] The future, long-term real estate agreement may include, but is not limited to, an amendment to BAE Systems' existing lease[2] with the District. The TUOP parcel (formerly known as the San Diego Gas and Electric [SDG&E] parcel) contains two existing underground intake/discharge tunnels which could be removed during or at a later phase of the proposed project.[3] Preliminary potential remediation efforts associated with the removal of the intake/discharge tunnels that exist within the District tidelands is identified and analyzed as part

[1] At the time of preparation of this Project Description, the Tidelands Use and Occupancy Permit (TUOP) with SDG&E, dated November 1, 2009 (Document No. 55689) expired on October 31, 2014. This parcel is currently leased to BAE Systems by the District via a 5-year TUOP.

[2] Lease dated September 1, 1979 (as Document No. 12223), as amended.

[3] The drydock component and the cooling tunnel component are independent of one another (i.e., the removal of the cooling tunnels are not dependent on the construction of the proposed drydock and vice versa).

of the EIR. These three project components are collectively referred to as the proposed project throughout the EIR.

1.1 PROJECT LOCATION

The BAE Systems' existing facility (i.e., leasehold) is situated along the eastern shoreline of central San Diego Bay located at 2205 East Belt Street in the City of San Diego (Figure 1). The proposed project site is bounded to the west by the San Diego Bay, to the north by R.E. Staite Engineering, to the east by the existing BAE Systems facility and other marine-related industries, and to the south by the NASSCO/General Dynamics ship building facility. The entire area is developed and/or leased to marine-related industrial businesses.

The proposed project site includes the existing 9.8 acre (landside) and 16.6-acre (waterside) BAE Systems leasehold within the District and approximately 74,300 square feet (sf) in jurisdiction of the District and is located within the jurisdiction of the CSLC. The proposed project site also includes an approximately 2-acre (landside) and 4-acre (waterside) parcel currently leased by BAE Systems through a TUOP. This TUOP parcel is located at 400 East Belt Street. Figure 2 provides an overview of the proposed project area and the applicable jurisdictional boundaries within the proposed project area. BAE Systems currently has a lease allowing for operations occurring in the portion of the project site within the CSLC's jurisdiction; however, for the portion of the drydock to be located outside of the District's jurisdiction, BAE Systems would apply directly to the CSLC for a lease amendment as well as apply to the CCC for permits and entitlements.

1.2 PROJECT SETTING

1.2.1 Existing Site Conditions

1.2.1.1 Landside Conditions

Existing facilities within the landside area of the existing BAE Systems leasehold include production shops, offices and office facilities, and related utilities and infrastructure necessary for the maintenance, repair, overhaul, and conversion of large US Naval and commercial vessels. Waterfront storm water collection tanks are located throughout the facility. Additionally, there are areas of pavement and ramps, as well as buried pipes, a valve vault, utility vaults, three underground sewage lift stations, electrical substations, and concrete revetments. Figure 3 illustrates the conditions of the existing Pier 1 and the entrance to the intake/discharge water tunnels.

BAE Systems currently leases the neighboring, northwestern 2-acre (landside) parcel from the District for parking and storage of materials. The 2-acre TUOP parcel currently has two subsurface intake/discharge water tunnels that were installed by SDG&E and previously used for intake/discharge of cooling water for the SDG&E Silvergate Power Plant.[1] The intake/

[1] The SDG&E Silvergate Power Plant ceased operations in 1984. In 2007, SDG&E completed the abatement, decontamination, and dismantlement of all interior equipment and demolition of the structure. (Cleveland Wrecking Company, website:

discharge tunnels consist of two tunnels for intake water and two tunnels for outbound water. Each tunnel is approximately 700 feet (ft) long with an 8 ft square opening. As depicted in Figure 4, the portion of the tunnels within the District's jurisdiction stretch from the south curb of Belt Street to the San Diego Bay and consist of approximately 490 ft of intake tunnels and approximately 450 ft of discharge tunnels. Outside the District's jurisdiction, the tunnels traverse for an additional 250 ft north of the existing leasehold beginning at East Belt Street, crossing underneath Burlington Northern Santa Fe (BNSF) Railway property, and extending into the existing SDG&E substation north of the proposed project site. The Silvergate power plant was removed in 2007 and the intake/discharge tunnels are no longer in operation. Although removal of the cooling tunnels is anticipated to occur after installation of the drydock, in order to analyze conservative worst-case construction conditions, the simultaneous construction of the Pier 1 North Drydock (overlapping Phases 1 through 6) and the removal of the cooling tunnels (Phase 3) was analyzed in the traffic analysis for this EIR.

1.2.1.2 Waterside Conditions

Existing facilities within the waterside area include BAE Systems Piers 1, 3, and 4 and a floating drydock. The removal of Pier 2 is currently ongoing and is not associated with the proposed project. The removal of Pier 2 is covered by US Army Corps of Engineers (USACE) Permit No. SPL-2013-00146-RRS in conjunction with the Shipyard Sediment Remediation Project. These existing facilities are all located within jurisdiction of the District along the eastern shoreline of the San Diego Bay in an area that is developed with marine terminals and other piers. The three working piers are used to moor vessels during maintenance, repair, overhaul and conversion activities; are designed to accommodate berthing for large deep-draft US Navy and commercial vessels; and include a variety of crane and utility services to support these maintenance activities.

BAE Systems currently operates one floating drydock at the project site. This floating drydock ("Pride of San Diego" or "POSD") has been operating at the site since 1984. A second drydock (AFDL/Diligence) was in operation at the BAE Systems facility until 2010, at which time it was sold and relocated to the South Bay. The second drydock was subsequently resold in 2013, and was removed from San Diego Bay.

As depicted in Figure 2, approximately 10.5 acres within the existing BAE Systems leasehold and the TUOP parcel (waterside only) would be affected by the ongoing and future remediation activities associated with the Shipyard Sediment Remediation Project. The Shipyard Sediment Remediation Project consists of a cleanup plan for marine sediments in the bottom bay waters that contain elevated levels of pollutants above San Diego Bay background conditions. The Shipyard Sediment Remediation Project was approved by the San Diego Regional Water Quality Control Board (San Diego RWQCB) on March 14, 2012, in response to the Cleanup and Abatement Order (CAO) No. R9-2012-0024. The District issued a Coastal Development Permit (CDP) for the project on August 1, 2013. On July 10, 2013, the San Diego RWQCB adopted Waste Discharge Requirements (WDR) Order No. R9-2013-0093401 and Water Quality Certification (401 WQC), which allowed for implementation of the remediation activities required

by the CAO. The purpose of the CAO is to restore the beneficial uses of San Diego Bay within the Shipyard Sediment Remediation Project site.

THIS PAGE INTENTIONALLY LEFT BLANK

On July 16, 2013, the District's Board of Port Commissioners (Board) considered the Final Program EIR (PEIR) and post Final PEIR certification documents (e.g., WDR and 401 WQC) prepared by the San Diego RWQCB, adopted the Findings of Fact (Findings) and Statement of Overriding Considerations (SOC), adopted the Mitigation Monitoring and Reporting Program (MMRP), and authorized District staff to file the Notice of Determination (NOD) for the Shipyard Sediment Remediation Project. At the same hearing, the Board also granted concept approval and authorized issuance of a non-appealable CDP (CDP-2013-06) to BAE Systems for the Shipyard Sediment Remediation Project. The CDP was issued on August 1, 2013. On September 24, 2013, the Board granted BAE Systems the First Amendment to CDP-2013-06, which modified Special Provisions 5 and 6 of the CDP but remained consistent with the Water Board's final adopted WDR and 401 WQC.

In a letter dated May 22, 2014, the San Diego Bay Environmental Restoration Fund – North has identified that remedial activity in the vicinity of the proposed project associated with the CAO will be completed prior to any dredging activity associated with the proposed project.[1]

1.2.1.3 Site Operations

BAE Systems provides services for both commercial and government customers and has serviced a myriad of commercial vessels including, but not limited to, cruise ships, tankers, barges, research vessels, reefer and container ships, and kelp cutters. The existing BAE Systems facility is used for non-nuclear ship repair, modernization, conversion, and overhaul in support of its primary customer, the US Navy.

BAE Systems is currently the prime contractor for five classes of US Navy vessels: CGs (Cruisers), DDGs (Destroyers), LPD-17 (Amphibious Transport Docks), LSD-41/49 (Dock Landing Ships), and MCMs (Mine Countermeasures). BAE Systems maintain Multi-Ship, Multi-Option (MSMO) contracts that include vessel berthing and drydocking.[2] These contracts may include pier-side repair, drydock repair, or both. The average number of ships moored and/or serviced at the BAE Systems facility ranges from 10 to 20 vessels per year. As shown on Table A, the vessel stay at the facility ranges from 11 days to 294 days, with an average stay of 89 days for drydock vessels[3] and 104 days for berthed vessels. To a lesser extent, BAE Systems performs pier-side and drydock repairs for commercial customers as well. Over the past five years, BAE Systems has accomplished an average of four drydockings per year.

The existing drydock is used to conduct repair and maintenance activity which cannot normally be conducted while the vessel is afloat. These activities generally include exterior hull repair, preservation (abrasive blasting and/or hydroblasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. Ships are docked by lowering (submerging) and then raising the drydock by means of integral ballast

1 Letter from San Diego Bay Environmental Restoration Fund – North regarding Response to Comments on Permit Modification Letter (No. CDP-2013-06) San Diego Shipyard Sediment Site – North Shipyard, May 22, 2014.

2 In certain cases, a particular vessel may be worked on at US Naval Base San Diego or another local shipyard and not at the BAE Systems facility.

3 Not including short-duration small commercial vessels.

Table A: Average Vessels per Year at BAE Systems San Diego

Serviced Vessels (2010–2013)		
	Drydocked Vessels	Berthed Vessels
Average Ships Per Year	4	12
Minimum Number of Days	14	11
Maximum Number of Days	176	294
Average Number of Days	89	104

Source: BAE Systems (March 2014).

tanks, which take in and discharge seawater. Once the drydock is lowered a vessel is positioned within the dock. The drydock is then raised, raising the ship out of the water. Wastes generated during ship repair in drydock may include spent abrasive, paint, rust, petroleum products, marine growth and general refuse, all of which are contained and then transferred to shore facilities for disposal. Environmental protection related to drydock operations includes complete encapsulation of the vessel to prevent fugitive particulate emissions, stormwater collection, and zero discharge of industrial wastewater.

Water Quality Facilities

BAE Systems operates and maintains a Storm Water Diversion System (SWDS) to eliminate and/or reduce the volume of pollutants discharged to receiving waters (San Diego Bay). This system consists of 31 catch basins (drains) and associated piping, as well as secondary containment. The system is designed to capture at least the first 1.0 inch of storm water that has fallen upon the facility. Rain gauges are utilized to determine when 1.0 inch of rainfall has been achieved.

Following the first 1.0 inch of storm water recovery to the SWDS, remaining storm water may be redirected to San Diego Bay through nine outfalls enumerated SW1 through SW9. Visual observations and sample collection occur upon discharge to the receiving water. Collected storm water is held in 11 tank systems (DS1 through DS11) and is managed in accordance with the BAE Systems Industrial User Discharge (IUD) Permit issued by the City of San Diego. Once storm water is determined to meet IUD permit parameters, it is discharged to the sewer. Discharge to San Diego Bay may occur if on-site storage capacity is exceeded. San Diego Bay discharge requirements are delineated in Regional Board Order No. R9-2002-0161.

1.3 PORT MASTER PLAN DESIGNATIONS

The majority of the proposed project site is within the jurisdiction of the District and is located in Planning District 4 ("Tenth Avenue Marine Terminal"), Planning Subarea 43 (Belt Street Industrial) of the Port Master Plan (PMP). As illustrated in Figure 5, land uses at the proposed project site within Planning Subarea 43 include *Marine Related – Industrial* over the land portion of the proposed project site and *Specialized Berthing* over the water portion of the proposed

Existing Land Use Designations

THIS PAGE INTENTIONALLY LEFT BLANK

project site. Within the Marine Related-Industrial designation, the PMP calls for the modernization of existing marine-oriented facilities in order to reduce the need for future dredging or filling activities; however, the PMP does allow for dredging and filling in new areas under certain circumstances where alternative locations are infeasible or where curtailment of the project would result in adverse impacts to the public. Within the Marine Related-Specialized Berthing designation, the PMP allows for commercial and industrial uses, including ship building and repairing activities, water intake and discharge, and activities associated with the operation of drydocks. Because the proposed project includes the demolition of an existing pier-side berth and the construction of a new drydock, the proposed project would be consistent with the existing PMP and would not require a Port Master Plan Amendment.

Land to the east of the proposed project site is within the City of San Diego (City) and is currently designated in the City's General Plan as Industrial Employment and is zoned as Barrio Logan Planned District: SubDistrict D (BLPD-SUBD-D). Approximately 159,450 sf of water area west of the US Pierhead Line (outside District Jurisdiction) is held by the CSLC and is under the California Coastal Act jurisdiction of the CCC. Table B provides a summary of on-site and adjacent land use designations identified in the PMP.

Table B: On-Site and Adjacent Land Use Designations

Location	Current Land Uses	Port Master Plan Land Uses
On-site	Ship Repair	Marine Related – Industrial/Specialized Berthing – Industrial
North	Industrial/Marine Industrial	Marine Related – Industrial
South	Open Water	Marine Related – Industrial/Specialized Berthing – Industrial
East	Ship Repair	Marine Related – Industrial
West	Ship Repair	Marine Related – Specialized Berthing[1]

Source: San Diego Unified Port District, Port Master Plan (October 2012).
Note: Areas beyond (west) the US Pierhead Line are within the jurisdiction of the California State Lands Commission, a department of the Resources Agency of California. Based on information provided in the Resources Agency of California's *California's Ocean Resources: An Agenda for the Future* (March 1997), the areas within California State Lands Commission jurisdiction are designated at "State Tidelands and Submerged Lands." State Tidelands and Submerged Lands are defined as the area from the shoreline to three (3) nautical miles offshore.

3.2 Project Purpose and Objectives

The future needs for drydocking of US Naval vessels positioned in San Diego exceeds current drydock capacity. The purpose of the proposed project is to (1) increase BAE Systems' drydock capacity to facilitate required maintenance of existing and future US Naval assets and (2) provide additional capacity for commercial vessel drydock needs that cannot currently be met by existing drydock capacity.

The proposed project objectives include the following:

- Construct and operate shipyard repair facilities that maximize the use of existing waterways, available shoreline, and existing land;
- Retain and expand current ship repair business operations by BAE Systems, in order to provide economic and employment benefits to the District and the San Diego region;
- Modernize the BAE Systems shipyard by providing a new drydock facility, including associated improvements, and ship repair services, to meet the needs of the current and anticipated ship fleet of military and commercial customers;
- Invest in new shipyard infrastructure that will enhance the short- and long-term attractiveness and viability of San Diego Bay and the region to military and commercial ship operators for construction and repair;
- Impose current terms of the SDG&E TUOP that require removal of the cooling tunnels;
- Ensure the long-term health, safety, and sustainability of the project site and surrounding tidelands area by removing the SDG&E cooling tunnels in a manner that minimizes environmental impacts, including the potential to release hazardous materials into the environment; and,
- Obtain real estate agreement(s) necessary to achieve the aforementioned project objectives.

1.4 Project Characteristics

The proposed project consists of two major phases – Phase 1 and Phase 2. Phase 1 includes the installation of the floating drydock component and the proposed BAE Systems real estate agreement component. Extensive preliminary design studies and schematic plans have been developed for the floating drydock component and details associated with the proposed real estate agreement component are known.

Phase 2 includes the cooling tunnels component of the proposed project. Although the proposed project would result in the ultimate removal of the cooling tunnels, at this time, the funding, phasing, timing, and design details of the cooling tunnels removal are only known at a conceptual level of detail. However, this analysis is based on all known data and facts, as well as reasonable investigations regarding the tunnels and project site.

1.4.1 Proposed Improvements

The proposed project would provide for the current and anticipated drydocking needs of BAE Systems, extension of its existing lease term based on its investments in the leasehold, a future real estate agreement on the neighboring TUOP parcel (2-acre landside and 4-acre waterside), and the eventual removal of the underwater intake/discharge tunnels and surface improvements on the TUOP parcel. These project components are summarized below.

1.4.1.1 Floating Drydock and Associated Activities/Improvements

The proposed drydock would be located on the north side of existing BAE Systems Pier 1 and would extend onto the neighboring TUOP parcel and approximately 350 ft west into CSLC jurisdiction. The drydock component of the proposed project includes dredging activities (the extent of dredging is illustrated in Figure 6), the installation of the drydock, a sheet pile protection wall along the existing Pier 1 north, over-water structure(s) (apron ramp wharves [south] and the future north ramp wharf and intermediary wharf structure), two new mooring dolphins (one stand-alone and one integrated into the existing Pier 1 structure) and expansion of one existing mooring dolphin, and installation of utilities as detailed in Figure 7. Figure 8 depicts before and after proposed project conditions for the proposed Pier 1 drydock component. A more detailed description of the proposed drydock and associated improvements is provided as follows.

- **Underwater Improvements.** To prevent undermining of the existing Pier 1, the proposed project will include an underwater wall and cantilevered king pile installation. These underwater improvements will allow for dredging adjacent to the pier without adversely impacting the strength and integrity of the pier, which will continue to moor large US Navy vessels on the south side of that pier. The overall length of these underwater improvements is approximately 700 ft from the US Bulkhead Line[1] to the US Pierhead Line.[2]
- **Dredging.** Dredging is planned to provide sufficient water depth to submerge the floating drydock. The drydock will require a Bay bottom elevation of -65 ft Mean Lower Low Water (MLLW). Additionally, to provide a route to enter the drydock, some minor dredging may be required between the end of the dock and the Bay channel as illustrated in Figure 6. The majority of the dredging is located east the US Pierhead Line within District tidelands. Dredging west of the US Pierhead Line is within the jurisdiction of the CSLC and the CCC.

  Based on preliminary bathymetric survey data, dredging is anticipated to generate approximately 395,000 cubic yards (cy) of sediment. Following testing and approval by the USACE and the US Environmental Protection Agency (EPA), the sediment would be disposed of by barge at the EPA approved ocean disposal site commonly known as LA-5, which is located approximately 13 miles west from the proposed project site.

  Any sediment not approved for ocean disposal or beneficial reuse will be disposed of outside of tidelands (upland) at an appropriately permitted landfill. Any sediment designated for upland disposal will be tested, characterized, and profiled for disposal approval. For purposes of this analysis, it is anticipated that between 2,500 and 10,000 cy (3,500–14,000 tons) of dredge material would require treatment and upland disposal. This figure is based upon preliminary testing which determined that approximately 2,500 cy of dredge material will not be suitable for ocean disposal or beneficial use.[3] The 10,000 cy figure is a

[1] The US Bulkhead Line refers to a line marking the limit to which piers or wharves may project along a waterfront.
[2] The US Pierhead Line refers to a line delineating the limit of jurisdiction of the San Diego Unified Port District.

worst-case condition that is four times the expected dredge quantity based on preliminary testing. The actual cubic yardage of dredge material required for upland disposal will be determined prior to project dredging activities, but following completion of remediation dredging in the area. Should upland disposal for any sediment become necessary, the proposed disposal site is Otay Landfill, located at 1700 Maxwell Road in Chula Vista. Alternative landfills may also be considered. In the event that sediment testing determines that any portion of the dredge spoils are hazardous, those materials would require transport to a hazardous waste facility (a Class I facility). The nearest Class I disposal facility to the project site is the Buttonwillow Landfill located in Buttonwillow, California, approximately 250 miles north.

In addition to the dredged sediment that is proposed for ocean and upland disposal, some portion of the dredged sediment may be utilized for beneficial reuse in San Diego Bay or a near-shore ocean environment. Specifically, as described further in Chapter 6.0, Alternatives, there are two potential beneficial reuse sites: the Northern and the Southern Alternative Mitigation Sites. The Northern Alternative Mitigation Site is located south of the Sweetwater River Flood Control Channel within the San Diego Bay National Wildlife Refuge, and the Southern Alternative Mitigation Site is located further south and adjacent to a channel within the District.

- **Ramp Wharf.** A ramp wharf designed for accessing the drydock is proposed adjacent to and westward of the bulkhead and would extend from approximately the current bulkhead line to 125 ft into the Bay. The ramp wharf will be constructed of three independent structures with the northernmost structure measuring approximately 125 by 35 ft, the intermediary structure measuring approximately 134 by 76 ft, and the southernmost structure measuring approximately 125 by 70 ft, with a combined total area of approximately 22,088 sf (including pedestrian and vehicle ramps). However, because the removal of the cooling tunnels is anticipated to occur after construction of the drydock, and due to the location of the tunnel openings relative to the proposed ramp structures, the future northern ramp wharf and intermediary structure will not be constructed until the cooling tunnels are removed. Construction of the future northern ramp wharf and intermediate structure after the cooling tunnel removal will ensure that improvements associated with the drydock do not need to be disturbed and/or removed to access the tunnels. The drydock can operate in the interim with only the southernmost ramp wharf installed. The ramp wharf structures will be designed to support heavy vehicle and equipment loads and constructed of a reinforced concrete deck supported by precast concrete piles will be anchored along the shoreline. The elevation of the wharf will be approximately +13 ft MLLW. This elevation is 12 inches higher than existing piers at the BAE Systems site and has been designed to account for some rise in sea level.

  The ramp wharf decks will be a composite structure consisting of precast planks topped with cast-in-place reinforced concrete and reinforcing bar. The deck support system will require pile driving and will consist of both vertical and batter piles. The batter piles will provide lateral resistance to seismic loads. Along the perimeter of the ramp wharf a concrete curb will be constructed that will control storm water runoff and divert it to existing onshore stormwater collection facilities. Electrical conduits will be located within the pier deck and will

be cast in place when the pier deck is poured. Other utility piping, such as mechanical and electrical will also be installed from the shore to the drydock. Additional information associated with the ramp wharf decks is provided under the construction subsection.

- **Mooring Dolphins.**[1] To accommodate the mooring of the proposed drydock, two mooring dolphins (one new and one retrofit) are proposed to be constructed approximately 344 ft and 890 ft offshore (west) of the US Bulkhead Line. Dimensions of each dolphin would be 26 ft by 33 ft in size and include a 4-ft thick concrete deck. Each dolphin will be supported by 24 concrete 24-inch octagonal piles and outfitted with two 100-ton double bitts. The square footage of the proposed new western drydock dolphin is 714 sf. The easternmost mooring dolphin is proposed to be retrofitted into the existing Pier 1 structure, adding approximately 194 sf of area. The new dolphins are necessary to provide a fixed mooring structure to secure the drydock. One of these dolphins is in the CSLC jurisdiction, and an amendment to the existing BAE Systems CSLC Lease may be needed. The existing western Pier 1 mooring dolphin will be expanded from an existing area of 345 sf to 483 sf (for a total increase of 138 sf). This expansion entails the installation of three additional 24-inch octagonal piles on the south side of the mooring dolphin. Pile driving will occur as part of the mooring dolphin construction.
- **Floating Drydock.** Installation of a new floating drydock approximately 205 ft in width and 851 ft in length (174,455 sf in total) plus aprons (approximately 16,165 sf in total) attached to the drydock on each end. It is anticipated that the majority of the drydock would be assembled off site. However, there will be some additional drydock assembly work occurring once the drydock is towed in to the shipyard. In a typical year, it is anticipated that two DDG-class vessels, one LPD-class vessel, one CG-class vessel and one LCS-class vessel may utilize the drydock.
- **Utilities.** Electrical and mechanical utilities to support the drydock are similar to the types and capacities currently utilized within the existing shipyard. The proposed electrical utilities include:
    - A 12,000-volt, 500-amp feeder cable to the proposed new wharf;
    - New load interrupt switches for the distribution of the 12,000-volt circuit;
    - Shore and pier 480-volt and 208/110-volt distribution systems including 400-amp shore power mounds on the shore at two locations for barges and for ship repair operations;
    - Convenience receptacles on shore and on the pier and power to new infrastructure where needed (storm water collection systems, etc.)
    - Shore and pier lighting, including pole lights and imbedded light fixtures in the wharf structure, that will be located on the shore and wharf; and,
    - Shore and wharf data, telephone and television systems for use by vessels in drydock.

[1] A mooring dolphin is a manmade marine structure that extends above the water level and provides a fixed structure at which to moor ships when the ship length exceeds the length of the berth or pier.

The proposed mechanical utilities for the proposed project are detailed in Table C and are further described below:

Utility and mechanical services necessitating piping would be installed underground or in trenches that extend from their existing systems at various locations on shore. These piping systems will be routed to penetrate the shoreline and run to the wharf where they will be mounted on the side and underside of the wharf. Some electrical conduits will also run under and through the wharf.

Expansion joints will be installed where appropriate. For each service, single or manifold type service risers may be installed for servicing messing/berthing barges moored alongside the drydock. All risers will be rugged, corrosion-resistant and outfitted with steel guards. Each point of connection will be a valve suitable for the service and location. Branches for electric service, salt water, potable water and sewage will be installed for provision to barge berths.

Table C: Mechanical Utilities

System	Location	Size (inches)	Material
Saltwater[1]	Drydock	10	Galvanized Steel
Potable Water	Existing Infrastructure	4	Steel, FBE
Compressed Air	Existing Infrastructure	8	Steel, FBE
Sewage[2]	Sewage discharge piping from the drydock to the existing City of San Diego sewer service	4	Fiberglass
Stormwater	New stormwater diversion tanks, piping, and drain inlets	3 and 4	PVC
Natural Gas	Existing Infrastructure	3	Steel, FBE
Carbon Dioxide	Weld shielding gas tanks (CO_2 and Argon) will be located on the wharf	3/4	Rental tanks and coated aluminum hose
Argon	Weld shielding gas tanks (CO_2 and Argon) will be located on the wharf	3/4	Rental tanks and coated aluminum hose
Telecommunications/Cable	--	--	--
Fire Hydrant Supply	--	6-inch	--

Source: BAE Systems (2014).
[1] Saltwater system allows for repair work to be done to saltwater system piping on ships while docked at the facility. The system saves electricity and eliminates water discharged into the San Diego Bay.
[2] Sewage system is to accommodate pumping sewage holds from the vessels docked at the drydock.
CO_2 = carbon dioxide
FBE = fusion-bonded epoxy
HDPE = high density polyethylene
PVC = polyvinyl chloride

Stormwater that falls on the wharf and adjacent shore will be captured in tanks and disposed of in a controlled manner. Wharves and finished grades will be designed to lead stormwater into drainage piping that leads into sumps that will pump the water into stormwater collection tanks and managed in accordance with the BAE Systems Industrial User Discharge Permit.

Two weld shielding gas systems (carbon dioxide and argon) will be installed to service the ship repair work in drydock. Both systems will emanate from tanks onshore or on the wharf.

- **Bay Coverage and Shading.** The proposed drydock ramp wharves (including the intermediary wharf structure) will be constructed of concrete, supported by concrete pier piles and anchored along the shoreline. These structures would extend from approximately the current bulkhead line 125 ft into the Bay. The surface area of the proposed drydock ramp wharves, intermediary structure, and vehicle ramp and pedestrian walkways is 22,088 sf. The square footage of the proposed western drydock mooring dolphin is 714 sf, the proposed retrofitted mooring dolphin is 194 sf, and the proposed expanded mooring dolphin is 138 sf. Together with the proposed drydock, the proposed project would shade approximately 213,754 sf of San Diego Bay in the location where vessels currently berth.

1.4.1.2 BAE Systems Real Estate Agreements

BAE Systems currently leases approximately 9.8 acres of land and 16.6 acres of water from the District. This lease is scheduled to expire on August 31, 2034. Based on its investments proposed as part of the proposed project, BAE Systems proposes to extend the lease term of its existing leasehold with the District. This action will require an amendment to the existing lease term by 24 years, extending the year of expiration to 2058. Additionally, BAE Systems proposes to lease, on a long-term basis, the approximately 2-acre (landside) and 4-acre (waterside) parcel currently leased (5-year term) by the District to BAE Systems through a TUOP set to expire on October 31, 2019. This action will require terminating the TUOP and adding an amendment to the existing lease term by 43 years, extending the year of expiration to 2058. The lease amendment for the TUOP parcels would roll the approximately 2-acre (landside) and 4-acre (waterside) parcel into the BAE Systems' leasehold area. As a result, BAE Systems will ultimately be leasing approximately 11.8 acres of land area and approximately 20.6 acres of water area from the District. This component would result in the continuation of existing uses, as permitted, on the existing leasehold and neighboring TUOP parcels.

1.4.1.3 Removal of Cooling Tunnels

Two sets of intake/discharge cooling tunnels that were previously installed by SDG&E and used by the former SDG&E Silvergate Power Plant currently exist beneath the TUOP parcel. As previously stated, the underground tunnels traverse underneath properties owned by Kelco, Burlington-Northern Santa Fe railroad and the District and underneath the Belt Street right-of-way. The portion of the cooling tunnels within the District's jurisdiction stretch from the south curb of Belt Street to the San Diego Bay and consists of approximately 490 ft of intake tunnels and approximately 450 ft of discharge tunnels. Outside the District's boundaries, the tunnels traverse for an additional 250 ft underneath the Belt Street right-of-way and the Burlington-Northern Santa Fe railroad properties. The proposed project includes the removal of the cooling tunnels within the BAE Systems leasehold. The timing for the removal of the tunnels is unknown; however, removal of the tunnels will occur after the installation of the drydock and southern ramp wharf. As noted above, construction of the future northern ramp wharf and intermediate structure would occur after the cooling tunnel removal to ensure that access to the

tunnels to remove them is adequately provided. Please refer to Figure 4 for the location of the existing cooling tunnels.

The removal of the cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, installation of a coffer dam, demolition and removal of tunnels (concrete) and backfill with clean structural fill. Soil and groundwater characterization would be performed and potential remediation may also be conducted. Disposal of the soils, if required, would be at the appropriate landfill facilities depending on the sediment characterization. Numerous structures, equipment and operating systems are located over the tunnels. Temporary relocation of these structures and uses are anticipated.

1.4.2 Construction Activities and Schedule

1.4.2.1 Floating Drydock and Associated Activities/Improvements

Upon completion of the design and permitting phase, the drydock component of the proposed project consists of six phases of construction: (1) Pier 1 North submerged wall, (2) Retrofitting of existing Pier 1 mooring dolphin, (3) upland dredging, (4) ocean dredging (5) wharf and mooring dolphin construction, and (6) shoreline and utilities construction. Construction for the drydock component of the proposed project is scheduled to begin in 2016 and projected to be completed in 2017. Project construction-related truck traffic to and from the site during construction would occur along Harbor Drive south to I-15 or Civic Center Drive for in and outbound routes. Construction deliveries will be directed not to traverse the local Barrio Logan neighborhood and will be specified in the project's construction documents and in the proposed District-issued CDP.

Construction equipment anticipated for Phase 1 include a floating crane barge, 80-ton land based crawler crane, two deck barges for delivery and storage of materials, one tug boat, trucks for delivery of sheetpile and construction materials, forklifts for on-pier support, a drilling rig, impact hammer, and vibratory hammer. Construction equipment for the installation of the mooring dolphins and ramp wharves include a crane to drive concrete piles, concrete trucks for pouring concrete structures, trucks to deliver construction materials (rebar, tools, equipment), and an impact hammer.

Table D identifies construction details, including the duration of each phase and crew size and Table E provides the anticipated construction schedule. A description of each phase of work for the drydock component follows.

Table D: Construction Phases

Phase	Duration[1] (20 Working Days Per Month)	Crew Size Per Day	Number of Total Trucks Per Phase
Phase 1: Pier 1 North Submerged Wall	8 months	20 people	38
Phase 2: Retrofit of Existing Pier 1 Mooring Dolphin	1 month	6 people	17
Phase 3: Dredging (Upland Disposal)	1 month	10 people	610
Phase 4: Dredging (Ocean Disposal)	6 months	8 people	N/A
Phase 5: Wharf and Mooring Dolphin Construction	6 months	20 people	72
Phase 6: Shoreline and Utilities Construction	3 months	15 people	24

Source: BAE Systems (August 2014).
[1] Durations are "time of task" rather than start-to-finish dates.
N/A = not applicable

Table E: Construction Schedule

Phase	Approximate Schedule
Pier 1 North Submerged Wall Construction	January 2016 – August 2016
Dredging	September 2016 – March 2017
Wharf and Mooring Dolphin Construction	October 2016 – March 2017
Shoreline and Utilities Construction	January 2017 – March 2017
Drydock arrives to project site	March 2017
Drydock Testing and Outfitting	March 2017 – May 2017
Drydock Operational	June 2017

Source: BAE Systems (August 2014).

Phase 1: Pier 1 North Submerged Wall

The first element of construction consists of the installation of an underwater wall adjacent to Pier 1 to enable the sump to be dredged to a depth of –65 ft MLLW. The existing fender pile and whaler system on the north side of Pier 1 will be demolished in way of the new under water retaining wall. Approximately 21 tons or 600 linear feet of double 12-inch treated timber fender material will be removed and disposed.[1] It is anticipated that this material may be reused on site for repair/maintenance of existing/replacement fender systems. However, if the timber requires disposal, an additional 3 to 4 truckloads would be taken to the Otay landfill for disposal.

The existing timber fender system also consists of approximately 75, 14-inch steel H-piles driven approximately 15 ft into the Bay bottom. These H-piles, once removed, may also be

[1] BAE Systems, August 2014. A total of 35 pounds per linear feet of timber = 21 tons of timber to be removed and disposed.

reused on-site for repair/maintenance of existing/replacement fender systems. If the H-piles are unusable, they will be transported to a local scrap company and recycled as scrap metal. This would require an additional 8 to 10 trucks trips to the local scrap company for disposal.

Overall, this phase is anticipated to require a 20-person workforce and 38 trucks over approximately 8 months. However, a worst-case assumption of 38 truck trips over the entire phase has been included in the traffic analysis as this would still equate to less than 1 truck trip per day, on average, during the 8-month phase.

Phase 2: Retrofit of Existing Pier 1 Sections and Mooring Dolphin

The demolition of two sections of the existing Pier 1 deck would occur in order to provide clearance for the retrofitted eastern mooring dolphin concrete piles. The demolition/concrete disposal volumes for the existing two sections of the existing Pier 1 are identified in Tables F and G, below.

Table F: Pier 1 Mooring Dolphin Concrete for Disposal

Component	Length (feet)	Quantity	Pounds/Foot	Weight (tons)	Volume (cy)	Number of Trucks
20-inch Square Pile	70	8	418	117.2	57.8	5.1
Dolphin Cap	15 x 23	345	150	25.9	12.8	1.1
			Total	143	71	7

Source: BAE Systems (August 2014).
cy = cubic yards

Table G: Pier 1 Sections Concrete for Disposal

Component	Width (feet)	Length (feet)	Volume (cubic feet)[1]	Weight (tons)	Volume (cy)	Number of Trucks
Pier 1 Sections	30	40	3,000	225	111.1	9.8
			Total	225	111.1	10

Source: BAE Systems (August 2014).
[1] Concrete weight by cubic foot = 150 pounds.

Based on the tables above, the demolition activities associated with the removal of the existing two sections of the existing Pier 1 would result in a total of 368 tons of material that would require approximately 17 haul trucks for disposal.

Overall, this phase is anticipated to require a 6-person workforce and 17 trucks over approximately 1 month.

Phase 3: Dredging (Upland Disposal)

Upland disposal of the soils during dredging, if required, would be at the appropriate landfill facilities depending on the sediment characterization. As previously stated, for purposes of this analysis, it is assumed that no more than 10,000 cy (14,000 tons) of dredge material will require dredging, transport and disposal upland to the Otay Landfill in Chula Vista[1]. Assuming a carrying capacity of 23 tons per truckload, approximately 610 truckloads would be required for upland disposal of these dredged materials. The preferred truck route to Otay Landfill is Interstate 5 south, to State Route 54 east, to Interstate 805 south.

It is estimated that upland dredging would take approximately one month to complete. Dredging equipment would include the dredge crane barge, two dredge barges (scows), a large excavator for mixing cement into the dredge material within the dredge scow and for offloading dredge material into trucks, and other miscellaneous equipment. During disposal days (anticipated to be 17 days during the month), approximately 30 to 40 trucks would be required to haul off the treated dredged sediments. In addition, approximately 35 cement trucks will be required to dry all of the upland dredge material. The cement trucks would arrive on approximately 5 to 6 separate days during this period. Approximately 10 workers will be on site each day that this dredging is being conducted.

Overall, this phase is anticipated to require a 10-person workforce and 610 trucks over approximately 1 month.

Phase 4: Dredging (Ocean Disposal)

It is anticipated that the vast majority of dredged sediment will be found suitable for unconfined aquatic disposal (SUAD). As such, none of the SUAD dredge material would be transported upland in trucks. This dredge material is expected to be approved for disposal at the EPA LA-5 Ocean Disposal Site located approximately 7 miles off shore. The same or similar dredge crane barge used for upland disposal would be utilized for ocean disposal. In addition, a digging bucket (clam shell) would be required, as the majority of the material is native and therefore, more difficult to dredge.

Tug boats will be used to transport this dredged material (barge scows) to the ocean disposal site. A single tug boat and escort vessel will be required for each trip. Approximately 132 vessel round trips will be required to move 395,000 cy (assumes a carrying capacity of 3,000 cy per scow). It is estimated that this dredging will take 6 months to complete. Approximately eight workers will be required each day to support this dredging.

Overall, this phase is anticipated to require an 8-person workforce with no trucks over approximately 6 months.

[1] AMEC. *Pier 1 North Drydock Project Hazards and Hazardous Materials Technical Report, BAE Systems San Diego Ship Repair, San Diego, California*, January 2015 (Appendix D of this EIR).

Phase 5: Wharf and Mooring Dolphin Construction

Ramp Wharves. Ramp wharves designed for accessing the drydock is proposed adjacent to and westward of the bulkhead. The ramp wharves will be made up of three independent structures with the northern most structure measuring approximately 125 by 35 ft, the intermediary structure measuring approximately 130 by 49 ft, and the southernmost structure measuring approximately 125 by 70 ft with a combined total area of approximately 22,088 sf (including pedestrian and vehicle ramps). The construction of the future northern ramp wharf and intermediary wharf structure will occur after the removal of the cooling tunnels. A total of eighty-four 24-inch concrete octagonal vertical and batter piles are anticipated to be required to support the two new ramp wharves (36) and intermediary structure (48).

Mooring Dolphins. New concrete structures will be installed for the purposes of mooring the new drydock. The concrete structures consist of a concrete deck supported by an array of vertical and battered piles. The western mooring dolphin will consist of a new free-standing structure situated approximately 150 ft west of the US Pierhead Line. This mooring dolphin is expected to consist of twenty-six 24-inch octagonal concrete piles driven 35 to 45 ft beyond the dredged elevation. The piles will support a concrete deck of approximately 6 to 8 ft of thickness. The eastern mooring dolphin will be constructed such that it is retrofitted (i.e., integrated) into the deck of the current Pier 1. This will involve the demolition of two sections of the deck to provide clearance for the installation of approximately twenty 24-inch octagonal concrete piles. The existing western mooring dolphin will include an expansion requiring the installation of three additional 24-inch octagonal piles on the south side of the mooring dolphin.

Overall, this phase is anticipated to require a 20-person workforce and 72 trucks over approximately 6 months.

Phase 6: Shoreline and Utilities Construction

Installation of the proposed drydock will result in the reduction of an existing vessel berth (Pier 1 North), such that there is a relatively minor increase in net utility demand. The electrical and mechanical utilities for this project will be similar to the existing systems found at the BAE Systems' shipyard as well as on most heavy-duty piers that service US Navy and commercial ships. It is anticipated that on-shore utilities will require a 15-person workforce with 24 total trucks over approximately 3 months.

BAE Systems Real Estate Agreements: As previously stated, BAE Systems currently leases approximately 9.8 acres of land and 16.6 acres of water from the District. This lease is scheduled to expire on August 31, 2034. Based on its investments proposed as part of the proposed project, BAE Systems proposes to extend the lease term of its existing leasehold with the District by 24 years. Additionally, BAE Systems proposes to lease, on a long-term basis, the TUOP parcel currently leased (5-year term) by the District to BAE Systems. The TUOP between the District and BAE Systems is set to expire on October 31, 2019. The long-term lease may include, but would not be limited to, an amendment to BAE Systems existing lease. No changes in existing uses on the TUOP parcel are anticipated to occur and would be leased, on a long-term basis, to BAE Systems through a real estate agreement for a continuation of those uses

once the existing TUOP between the District and BAE Systems expires in October 2019. No construction activities are anticipated or associated with the real estate agreements between the District and BAE Systems.

Removal of Cooling Tunnels: As previously stated, the removal of the cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, installation of a coffer dam, demolition and removal of tunnels (concrete) and backfill with clean structural fill. In addition, numerous structures, equipment and operating systems are located over the tunnels. Temporary relocation of these structures and uses are anticipated. There are no project-level details available at this time that identifies the demolition/removal scheduling or phasing for this component. For purposes of this analysis, it is assumed that a total of 490 ft of intake tunnels and 450 ft of discharge tunnels would be removed within the District's jurisdiction.

1.4.2 Operational Activities

Floating Drydock and Associated Activities/Improvements: Drydocks are used to conduct repair and maintenance activity which cannot normally be conducted while the vessel is waterborne. These activities generally include exterior hull repair, preservation (abrasive blasting and/or hydroblasting and painting), shaft repair, propeller and rudder repair, and repair/replacement of valves and fittings below the waterline. These activities are currently conducted within the existing POSD drydock at the site. While numerous industrial processes are currently conducted at the existing Pier 1 North berth on the same classes and types of vessels, some of those processes are more extensive once the vessel is dry-berthed, as opposed to wet-berthed (e.g., pierside verses in drydock). In addition, BAE Systems currently subcontracts hull preservation to several local contractors.

Implementation of the drydock component would result in a need for additional employees on the BAE Systems facility. For purposes of this analysis, it is anticipated that an addition 25–30 workers may be required for a large hull preservation job (abrasive blasting and painting). An additional 40–50 workers may be needed for other drydock operations related to hull repair, welding, and mechanical repair. It is also expected that additional project management requirements will add two to three BAE Systems ship superintendents to manage this ship repair and maintenance work and that as many as ten additional customer-related staff will visit the site as a result of the drydock operation. Therefore, a total of 77 to 93 new employees are anticipated to be required with implementation of the drydock. These new employees will be staggered throughout the three existing work shifts at BAE Systems. Table H provides the distribution of potential new employees among the three work shifts.

Table H: Drydock Employment Distribution

Work Type	Number of New Employees/Visitors	1st Shift (6:00 a.m. – 2:30 p.m.)	2nd Shift (2:30 p.m. – 10:30 p.m.)	3rd Shift (10:30 p.m. – 6:00 a.m.)
Hull Preservation (subcontractor)[1]	25–30	19	9	2
Welding, Machinery, Other Drydock Operations (BAE Systems)[2]	40–50	32	15	3
Project Management (BAE Systems)[3]	2–3	3	0	0
Customer Visits	10	10	0	0

Source: BAE Systems (August 2014).

1 Hull preservation activities (blasting and painting) are conducted primarily during the daylight hours and generally follow the shipyards work shifts (65 percent, 1st shift; 30 percent, 2nd shift; and 5 percent, 3rd shift).

2 Worker distribution for these activities is anticipated to be consistent with existing shipyard work shifts (65 percent, 1st shift; 30 percent, 2nd shift; and 5 percent, 3rd shift).

3 Ship superintendents are anticipated to all work during the 1st work shift.

Operational Parking and Traffic. BAE Systems currently controls 1,304 parking spaces for use by employees, subcontractors, customers, and visitors. As previously discussed, the drydock component will not substantially modify the existing numbers and types of ships currently utilizing the BAE Systems facility. Based on the above increase in shipyard personnel, it is anticipated that operation of the drydock will require 64 additional parking spaces on 1st shift, 24 spaces on 2nd shift, and 5 spaces on 3rd shift. Based on information provided by BAE Systems, 20 percent of employees currently utilize an alternative means of transportation such as bus, trolley, and/or carpool. BAE Systems currently subsidizes 10 vanpools, with each van having an 11-person capacity with an average ridership of 7 per van during the first shift. In addition, BAE Systems runs a shuttle to and from the Barrio Logan Trolley Station during the first shift, with a ridership of 40 to 55 persons each day, and many more walking to the facility when the vans are full. Bicycle racks and motorcycle parking are also available at BAE Systems and are utilized by 40 to 50 persons each day during the first shift. Therefore, it is anticipated that 20 percent of the new employees will also utilize alternative transportation.

The expected additional 93 drydock employees as identified in Table H are assumed to follow the existing parking/traffic demographics, including assumptions on carpooling and municipal transportation (existing trolley and bus service). It is estimated that the siting of a new drydock at the BAE Systems shipyard could cause an increase of 93 one-way vehicle trips and parking spaces for all shifts. Those vehicle trips are anticipated to occur consistent with the shift differentials, which would equate to the following:

- 1st Shift: 64 vehicles arriving 5:30 a.m.–6:30 a.m. and departing 2:30 p.m.–3:00 p.m.
- 2nd Shift: 24 vehicles arriving 2:00 p.m.–2:30 p.m. and departing 10:00 p.m.–10:30 p.m.
- 3rd Shift: 5 vehicles arriving 10:00 p.m.–10:30 p.m. and departing 6:00 a.m.–6:30 a.m.

Operational Delivery Truck Traffic. BAE Systems' main distribution center/warehouse is located on Market Street near State Route 94 (SR-94). BAE Systems controls traffic flow for material deliveries to the site and only delivers materials when they are needed. Based on the

anticipated vessel repair work to be conducted within the proposed drydock, it is estimated that 1–2 additional delivery truck trips per week from the BAE Systems warehouse to the proposed drydock may be required. The truck route used by BAE Systems for site deliveries from its warehouse is Harbor Drive to 32nd Street/I-15 North.

BAE Systems Real Estate Agreements: Based on its investments proposed as part of the proposed project, BAE Systems proposes to extend the lease term of its existing lease with the District by 24 years. Therefore, it is assumed that operation of the proposed project would continue through the year 2058. Additionally, BAE Systems proposes to lease, on a long-term basis, the TUOP parcel currently leased (5-year) by the District to BAE Systems. The TUOP between the District and BAE Systems is set to expire on October 31, 2019. The long-term lease may include, but would not be limited to, an amendment to BAE Systems existing lease. No changes in existing uses on the TUOP parcel are anticipated to occur and would be leased to BAE Systems through a real estate agreement for a continuation of those uses once the existing TUOP between the District and BAE Systems expires in October 2019.

Removal of Cooling Tunnels: As previously stated, the removal of the cooling tunnels would require excavation of soil, dewatering, installation of shoring to protect the excavation, installation of a coffer dam, demolition and removal of tunnels (concrete) and backfill with clean structural fill. Once the removal of the cooling tunnels occurs, the project site would be restored to its existing condition. Therefore, no operational activities are associated with the removal of the cooling tunnels component.

1.5 Required Discretionary Actions and Permits

The District is the Lead Agency for CEQA and will be the certifying body for the EIR. The District will also issue the CDP and other entitlements for land and water areas within their jurisdiction. Outside of District jurisdiction, the CSLC and the CCC will issue permits for leaseholds within their jurisdiction. The following discretionary actions by the District are necessary for implementation of the proposed project:

- Certification of the Final Environmental Impact Report (UPD No. EIR-2014-31);
- Approval of the proposed BAE Systems Pier 1 North Drydock Project;
- Approval of a CDP for the portion of the proposed project in the District's jurisdiction;
- Approval of Engineering Plans; and
- Approval of lease amendment or other real estate agreements.

Various federal, State and local laws, regulations, and permit requirements will apply to the proposed project. Table I identifies potential required permits and approvals that would be required for the BAE Systems Pier 1 North Drydock Project.

Table I: Potential Permits and Approvals

Agency/Department	Permit/Approvals	Action Associated With or Required For
Federal Agencies		
US Army Corps of Engineers	Individual/Nationwide Section 404 Permit (CWA, 33 USC 1341)	Responsible for issuing Section 404 permits for dredged or fill material into waters of the US (up to higher high water line in tidal waters) and into wetlands in compliance with EPA regulations.
	Section 10, Rivers and Harbors Act Permit	Regulates construction, excavation, and deposition in navigable waters (up to mean high water in tidal waters).
	Marine Protection, Research, and Sanctuaries Act of 1972, Section 103	Regulates dumping and transport for dumping of material into US waters.
	40 CFR, Part 227 – Criteria for the Evaluation of Permit Applications for Ocean Dumping of Materials	Regulates dumping of materials into US waters and evaluates the need for ocean disposal.
US Environmental Protection Agency	Ocean Dumping Permit	Ocean Disposal
US Coast Guard	Concurrence with Ocean Dumping Permit	Ocean Disposal
National Marine Fisheries Service and US Fish and Wildlife Service	Concurrence with Ocean Dumping Permit	Ocean Disposal
State Agencies		
State Water Resources Control Board, Regional Water Quality Control Board	401 Certification (CWA, 33 USC 1341, if the project requires USACE 404 Permit) Water Discharge Requirements (WDRs) for dredging	Discharge into waters and wetlands during demolition, construction, and dredging activities.
California Coastal Commission	Coastal Development Permit	Development outside the District's jurisdiction.
State Lands Commission (SLC)	Obtain a lease for dredging outside District tidelands, and operation of the drydock outside District's tidelands	Development within the State Land Commission's jurisdiction.
California Department of Fish and Wildlife	Concurrence with Ocean Dumping Permit	Ocean Disposal
Local Agencies		
San Diego Unified Port District	Certification of Final EIR; approval of Pier 1 North Drydock Project; Coastal Development Permit for the portion of the proposed project beyond the US Pierhead in the District's jurisdiction; Coastal Act approval, approval of Engineering Plans; and approval of lease amendment and other real estate agreements.	As Lead Agency under CEQA; for development within the District's jurisdiction.
City of San Diego	Building permits	On-shore utilities and fire protection

CEQA = California Environmental Quality Act
CFR = Code of Federal Regulations
CWA = Clean Water Act
District = San Diego Unified Port District
EIR = Environmental Impact Report
EPA = Environmental Protection Agency
PRC = Public Resource Code
USC = United States Code

APPENDIX C

CITY OF SAN DIEGO ROADWAY LOS STANDARDS

TABLE 2
Roadway Classifications, Levels of Service (LOS) and Average Daily Traffic (ADT)

STREET CLASSIFICATION	LANES	CROSS SECTIONS	LEVEL OF SERVICE A	B	C	D	E
Freeway	8 lanes		60,000	84,000	120,000	140,000	150,000
Freeway	6 lanes		45,000	63,000	90,000	110,000	120,000
Freeway	4 lanes		30,000	42,000	60,000	70,000	80,000
Expressway	6 lanes	102/122	30,000	42,000	60,000	70,000	80,000
Primary Arterial	6 lanes	102/122	25,000	35,000	50,000	55,000	60,000
Major Arterial	6 lanes	102/122	20,000	28,000	40,000	45,000	50,000
Major Arterial	4 lanes	78/98	15,000	21,000	30,000	35,000	40,000
Collector	4 lanes	72/92	10,000	14,000	20,000	25,000	30,000
Collector (no center lane) continuous left-turn lane)	4 lanes 2 lanes	64/84 50/70	5,000	7,000	10,000	13,000	15,000
Collector (no fronting property)	2 lanes	40/60	4,000	5,500	7,500	9,000	10,000
Collector (commercial-industrial fronting)	2 lanes	50/70	2,500	3,500	5,000	6,500	8,000
Collector (multifamily)	2 lanes	40/60	2,500	3,500	5,000	6,500	8,000
Sub-Collector (single-family)	2 lanes	36/56	—	—	2,200	—	—

LEGEND:

XXX/XXX = Curb to curb width (feet)/right-of-way width (feet): based on the City of San Diego Street Design. Manual

XX/XXX= Approximate recommended ADT based on the City of San Diego Street Design Manual.

NOTES:

1. The volumes and the average daily level of service listed above are only intended as a general planning guideline.

2. Levels of service are not applied to residential streets since their primary purpose is to serve abutting lots, not carry through traffic. Levels of service normally apply to roads carrying through traffic between major trip generators and attractors.

APPENDIX F

CUMULATIVE PROJECTS LIST

	Project Name	Approval ID	Project ID	Address	Development Type	Project Contact
1	Cesar Chavez Education Center	788543	221413	1901 Main St.	Coastal Development Permit to retroactively permit demolition already taken place + to constuct a 3 story continuing educational facility on a vacant 1.16 acre site at 1901 Main Street in the Redevelopment Subdistrict of Barrio Logan Planned District, Coastal Overlay (non-appealable), FAA Part 77, Transit Area. Council District 8. Notice Cards=2.	PJ Fitzgerald (619) 446-5107 pfitzgerald@sandiego.gov
2	COMM 22	454297	122002	2101 Commercial St.	Permit to construct 252 residential units (130 affordable family rental units, 70 affordable senior rental lofts, 35 market rate lofts, 17 for-sale townhomes) w/25,000 square feet commercial-retail on a 4.58 acre site at 2101 Commercial St within the Southeastern San Diego Community Plan, Transit Area. Council District 8. Notice Cards=3.	John Fisher (619) 446-5231 jsfisher@sandiego.gov www.comm22.org
3	Jack in the Box	1294028	366524	2890 National Ave.	Amend Site Development Permit and Planned Development Permit (Process 4) to construct a 2,588 sq ft Jack-in-the-Box drive-thru restaurant on a vacant building pad at 2890 National Ave. The 1.93 developed site is in the Southeastern San Diego Planned District-CSR-2 zone of the Southeastern San Diego Community Plan area; (PTS 1531 - SDP 9200 No. 9200 & PDP No. 9201.) Council 8. Notice Cards=3.	Renee Mezo (619) 446-5001 rmezo@sandiego.gov
4	Albert Einsten Academy	1100118	296407	446 26th St.	Amend CUP No. 266-PC to split ex two hospital bldgs and lot in half (total 2 CUP/SDP), 1 bldg to remain as hospital and other bldg to be converted into a middle school on a 2.85-acre site at 446 & 458 26th St in the MF-3000 Zone of the SESDPD within the SESD Community Plan, FAA Part 77 for SDIA & North Island NAS, Transit Area Overlay, CD 8, Notice Cards=3	Jeff Peterson (619) 446-5237 japeterson@sandiego.gov
5	Shipyard Sediment Remediation Project, San Diego Bay (North Sedimentation Remediation Area scheduled for completion in March 2016; South Sedimentation Remediation Area scheduled for completion in April 2014)			Eastern shore of central San Diego Bay, extending approximately from the Sampson Street extension on the northwest to Chollas Creek on the southeast, and from the shoreline out to the San Diego Bay main shipping channel to the west	Dredging of sediment adjacent to shipyards in the San Diego Bay; dewatering, solidification of the dredged material (onshore or on a barge); potential treatment of decanted water (anticipated disposal to the sanitary sewer system); and transport of the removed material to an appropriate landfill for disposal. This project was addressed in the Shipyard Sediment Remediation Project Environmental Impact Report. (http://www.waterboards.ca.gov/sandiego/water_issues/programs/shipyards_sediment/)	
6	San Diego Refrigerated Services at Tenth Avenue Marine Terminal			802 Terminal St.	New Lease Provisions: Project Trip Generation: 148 ADT, 24 a.m. peak-hour trips (16 in and 8 out), and 24 p.m. peak-hour trips (8 in and 16 out)	
7	Tenth Avenue Marine Terminal Redevelopment Plan			687 Switzer St.	The TAMT Redevelopment Plan "would replace an existing 2008 Maritime Business Plan to meet current and future market conditions at the terminal. Depending on market opportunities, some improvements identified in the Plan may occur within a 5- to 10-year (Year 2025) planning horizon, whereas others may not occur until the 10- to 20-year (Year 2035) planning horizon...One component of the project would be analyzed at the project level." This component is referred to as the "Demolition and Initial Rail Component." "The Demolition and Initial Rail Component is anticipated to occur in 2016...and will take approximately 29 weeks to complete...Total excavation would be 40,683 cy...approximately 12,443 cy would be exported off-site...Phasing would include demolition, grading, and phasing...Employment during construction is anticipated to result in...a total of 232 construction-related jobs."

GEOTECHNICAL REPORT
PIER 1 DRY DOCK EIR
BAE SYSTEMS SAN DIEGO SHIP REPAIR
SAN DIEGO, CALIFORNIA

Dear Mr. Atwater:

TerraCosta Consulting Group, Inc. (TCG) is pleased to submit this report presenting the results of our geotechnical analyses for the proposed Pier 1 North improvements including a new mooring dolphin, ramp wharves, a king pile wall system, and dredged slopes in support of a new large floating dry dock at the BAE Systems San Diego Ship Repair in San Diego, California. These analyses have been prepared in support of the Environmental Impact Report for the proposed project.

We appreciate the opportunity to be of service and trust this information meets your needs. If you have any questions or require additional information, please give us a call.

Very truly yours,
TERRACOSTA CONSULTING GROUP, INC.

GEOTECHNICAL REPORT
PIER 1 DRY DOCK EIR
BAE SYSTEMS SAN DIEGO SHIP REPAIR
SAN DIEGO, CALIFORNIA

1 INTRODUCTION AND PROJECT DESCRIPTION

The proposed project is located north of Pier 1 at the northwest corner of the BAE Systems Ship Repair (shipyard) at 2205 East Belt Street in San Diego, California. Figure 1, the Vicinity Map/Regional Geology map, indicates the approximate location of the subject site.

The proposed project consists of three components: dry dock, real estate agreement, and cooling tunnels. As we understand, the proposed dry dock component improvements will include construction of an underwater king pile wall for support of the foundation soils underlying Pier 1; dredging of the Pier 1 North basin to a depth of -65 feet MLLW; construction of two new mooring dolphins, one bayward of the existing mooring dolphin and one integrated into Pier 1; construction of two new ramp wharves and one intermediary wharf; and upgrades to strengthen the existing Pier 1. We also understand that limited landside improvements including electrical and mechanical utilities are also proposed. The above improvements will facilitate the placement of a new 55,000-ton dry dock, which is expected to be approximately 200-feet wide and 850-feet long. Prior to the construction of the dry dock improvements, we understand that a new submerged 80-foot-long sheet-pile wall will be installed along the shoreline in support of the Shipyard Sediment Cleanup and Abatement Order No. R9-2012-0024 (CAO).

The real estate agreement component does not include any physical improvements and, as a result, requires no geotechnical input.

The cooling tunnels component conceptually consists of the removal of existing cooling tunnels that are located below the 2.0 acre landside SDG&E parcel and were part of the Silvergate power plant that was removed in 2007 and was located on the opposite side of Belt Street from the subject parcel.

The proposed dry dock improvements and the location of the existing cooling tunnels are shown on the Site Plan (Figure 2).

2 PURPOSE AND SCOPE OF INVESTIGATION

The purpose of this report is to provide geologic and geotechnical information for input to the project EIR.

Our geotechnical report addresses the following:

- Existing subsurface soil conditions;
- Geotechnical characteristics of the on-site soils;
- Site seismicity;
- Geologic hazards;
- A geotechnical assessment for the dry dock component improvements; and
- A geotechnical assessment for the cooling tunnels component.

3 PREVIOUS STUDIES

Previous site studies at or in the vicinity of the subject project include a draft report prepared by TerraCosta titled "Geotechnical Investigation, Pier 1 North, Large Dry Dock, BAE Systems San Diego Ship Repair, San Diego, California" dated September 5, 2014. That report included a geotechnical subsurface investigation, analyses, and laboratory testing for the dry dock improvements described above. We have also reviewed an April 26, 1983, geotechnical investigation prepared by Woodward-Clyde Consultants for renovations to the Southwest Marine shipyard (now owned by BAE Systems). That report contains geotechnical information in the project vicinity. Additionally, we reviewed our study report for Pier 4 titled, "Geotechnical Investigation, Pier 4 Replacement Project, BAE Systems San Diego Ship Repair, San Diego, California," dated October 18, 2011, as well as other relevant published and unpublished reports, maps, and documents. We have also reviewed the report prepared by Triton Engineering, Inc. in January 2014 titled "BAE Systems San Diego Ship Repair, 55,000 LT Floating Dry Dock Study," which provided information on the proposed site improvements. Additional reports and resources have been included in the report references. A list of documents reviewed is provided at the end of this report.

4 EXISTING SURFACE CONDITIONS AND GEOLOGIC SETTING

From north to south, the subject study area includes approximately 210 feet of revetted shoreline, an approximately 65-foot-long seawall, and the existing Pier 1. The existing revetment appears to consist of stacked remnants of concrete pilings, pieces of concrete flatwork, and rock rubble. Although no specific measurements were taken, the revetment slopes appear to generally be inclined at approximate slopes of 1:1 to 1.5:1 (horizontal to vertical). Onshore surface elevations generally range from 12 to 14 feet MLLW. Existing offshore improvements include the approximately 700-foot-long concrete pile-supported Pier 1, a mooring dolphin bayward of Pier 1, and remnants of two old sheet-pile jetties extending into the bay.

4.1 Geologic and Geomorphic Setting

The project site is located on the central east side of San Diego Bay. From a geomorphic standpoint, the site is located within the Peninsular Ranges Geomorphic Province. Easterly of the site lies the dissected San Diego coastal plain, which abuts the San Ysidro and Jamul Mountains. Carved out along the westerly margin of Otay Mesa (and the San Diego coastal plain) is a series of coastal terraces formed at various sea level still stands during Pleistocene time. Regional uplift, faulting, and erosion have modified these distinctive erosional features. Over the last million years, the San Diego region is estimated to have risen at an average rate of about 5.5 inches per 1,000 years (Abbott, 1999). In the last 80,000 years, the rate of uplift has increased to nearly 12 inches per 1,000 years northwest of the Rose Canyon fault zone, and approximately 18 inches per 1,000 years southwest of the Rose Canyon fault zone.

Conversely, these tectonic forces have also caused down-dropping of the region within San Diego Bay. Following the Rose Canyon fault zone southerly, tectonic forces are spread across three major faults (and quite possibly other unidentified faults) that underlie San Diego Bay. These faults (the Silver Strand, Coronado, and Spanish Bight Faults) are believed to transfer tectonic forces to the Descanso Fault, which extends from offshore of Point Loma and continues southerly into Mexico. The right step that occurs between the Rose Canyon and the Descanso fault zones creates a releasing bend that causes the rocks underlying the bay to be stretched and down-dropped to accommodate the movement caused by these tectonic forces. Typical movements along the faults that underlie the bay are observed to experience a significant vertical or normal component to their movement.

From the standpoint of the overall geologic structure, San Diego Bay is a down-dropped faulted trough lying just west of a stable hinterland-coastal plain. Bedrock on the east side of the zone has been slightly deformed as opposed to that on the west side. Faults to the east (i.e., La Nacion-Sweetwater Faults) display down-to-the-west normal displacement. The Rose Canyon system exhibits right-slip (lateral) displacement and is believed to represent a portion of the motion between the North American and Pacific Tectonic Plates. The normal faults that parallel the margins of the bay are likely a result of subsidence and compaction within the sedimentary deposits of the Pliocene-age San Diego Embayment.

4.2 Site Geology

Shown on the geologic map (Figure 1), an approximately 750- to 1,000-foot-wide strip of artificial fill has been placed adjacent to the bayshore, inclusive of the existing Pier 1 area. The fill was most likely derived from dredging of the harbor floor; however, this has not been documented. The thickness of the fill is estimated to be very thin at its distal eastern edge, but thickness toward the bay end reaches 8 to 10 feet near the westernmost edge at the water's edge. Underlying the fill are estuarine and Holocene-age unconsolidated sediments extending to an approximate elevation of -10 to -15 feet MLLW in the site vicinity.

Over the millennia, as subsidence occurred in the bay, sediment was continually flushed out of the uplands and slowly deposited over older Pleistocene-age sediments, leaving the terrace deposits (including the Bay Point Formation), which mantle the coastal terraces around San Diego Bay.

As shown in Figure 3, which depicts the local shoreline in 1930 and present day, the subject site appears to be located within an estuary area that previously existed at the mouth of Chollas Creek. As the site is likely located within the pre-development Chollas Creek mouth, we believe that the geologic contact between terrace deposits and San Diego Formation likely deepens locally relative to areas further north of the mouth of Chollas Creek.

Overlying the late Pliocene/early Pleistocene San Diego Formation are Quaternary-age terrace deposits. These nearshore marine and non-marine deposits are generally composed of interbedded fine- to medium-grained, poorly to moderately consolidated silts, sands, and conglomerates deposited on the wave-cut platforms (terraces) eroded into the Pliocene-age San Diego Formation. This old surface is estimated to extend offshore to a depth locally in

excess of 150 feet below present sea level. Where exposed inland, the San Diego Formation consists of semi-consolidated fossiliferous fine-grained yellow-white/gray sandstone, with lenses of well rounded cobble conglomerate. As the San Diego Formation extends southerly to Mexico, it reaches an estimated thickness of 300 feet. On the basis of a shear wave velocity profile (performed in conjunction with the adjacent Pier 4 subsurface investigation) and geomorphic projections of the shore platform, we estimate that the top of San Diego Formation is near elevation -150 feet MLLW.

4.3 Stratigraphy (Soil Conditions)

Generalized geologic cross-sections of the stratigraphic conditions within the study area are presented on Figures 4, 5, and 6, with the locations of those sections indicated on Figure 2. The materials encountered at Pier 1 within the depths explored consist of recent bay deposits, Holocene nearshore marine deposits, younger Quaternary terrace deposits (also referred to as Bay Point Formation), and older Quaternary terrace deposits, all of which are in turn underlain by the San Diego Formation at depth. In general, these soils consist of loose to medium dense and stiff to hard sands and clays.

More detailed descriptions of the soil units encountered, from oldest to youngest, are presented below.

San Diego Formation: From our geophysical study for Pier 4, located approximately 1,000 feet to the south of the Pier 1 project, the top of the San Diego Formation in the area of the new pier is estimated to be near elevation -150 feet MLLW. The San Diego Formation typically consists of yellow-brown to gray-brown, fine- to medium-grained, poorly to moderately indurated sands and siltstones. The San Diego Formation is described in the literature as being late Pliocene to early Pleistocene in age, covering an area from the southerly flanks of Mount Soledad south to Rosarito Beach in Baja California, Mexico.

Older Quaternary Terrace Deposits: These terrace deposits generally consist of olive-brown to gray-brown, dense to very dense silty sands, and stiff to hard sandy silts and silty clays. These deposits are likely derived from the underlying San Diego Formation and were encountered at approximately -60 feet MLLW, and correspond with an approximately 1,500 ft/sec increase in shear wave velocity.

Younger Terrace Deposits: Younger terrace deposits, also locally known as Bay Point Formation, cover much of San Diego's coastline and generally include a series of middle to late Pleistocene-age paralic deposits derived from the local formational soils. Within the study area, these deposits generally consist of interbedded, medium dense, red-brown to red-gray sands, silty fine sands, and fine sandy to clayey silts.

Holocene Deposits: Medium dense to dense, interbedded gray silty sands with occasional shell were encountered in TCG Borings B-4, B-5, and B-9 down to elevations of -52 to -57 feet MLLW. These elevations appear to correlate with the elevation(s) of the contact between the Holocene and late Pleistocene, as determined by Kennedy and Clarke (OFR 97-10A and 10B, 1999).

Bay Deposits: Recent bay deposits encountered in the area of Pier 1 generally consist of loose to medium dense, gray, micaceous silty sand with occasional shell fragments and gravels and soft clayey silts. These bay deposits generally form a relatively thin (3- to 4-foot-thick) veneer covering the previously dredged surface of the bay floor. The previous dredging operations in the vicinity of Pier 1 have excavated through most of the Holocene-age bay deposits and into the underlying Bay Point Formation, except in the area of TCG Borings B-4, B-5, and B-9. These recent sediments have accumulated since the dredging operations that created the basin and berthing area.

Older bay deposits on the landward side within the SDG&E parcel are believed to be on the order of 10 to 15 feet in thickness and are underlain by younger terrace deposits.

Fill: Fill soils typically comprise the upper 8 to 15 feet of landside improvements, from the ground surface down to elevations on the order of +3 to -5 feet MLLW. Where described in nearby landside borings associated with separate studies, these soils generally consist of loose to medium dense, gray to brown, silty sands and sandy gravels. These soils were most likely locally derived during development around the bayshore.

4.4 Groundwater

We estimate that, due to tidal fluctuations, (landside) transient groundwater highs in the area may periodically reach a maximum of +8 feet MLLW (+7.89 feet NAVD88), particularly along the western margins of the property.

4.5 Faulting and Seismicity

4.5.1 *Regional Geology and Seismicity*

Pier 1 is located near the westerly edge of the approximately 10-mile-wide terraced coastal plain, which bounds the Peninsular Ranges geomorphic province of California. The Peninsular Ranges are a northwest/southeast-oriented complex of tectonic-related blocks separated by generally parallel fault zones (Norris and Webb, 1990). Geomorphically, this province is known for its long, low mountain ranges separated by alluvial-filled valleys. Geologically, the Peninsular Ranges province extends from the Los Angeles Basin to the north, through Baja California to the south.

Offshore from Southern California is an area known as the Continental Borderland. While this area is not officially designated as a geomorphic province, many of those who study the area consider it a separate province due to its complexity. The Continental Borderland is composed of elevated blocks and ridges, which form islands and banks separated by deep, often enclosed basins (Legg and Kennedy, 1991). The Continental Borderland extends from the Santa Barbara Basin to the north, south along the coastline into Mexico, and offshore approximately 160 miles out to the Patton Escarpment.

Movement between the North American and Pacific plates makes Southern California one of the more seismically active regions in the United States. Strain, caused by movement between the North American plate and the Pacific plate, is spread across a 150+ mile wide zone between the San Andreas fault zone located approximately 100 miles east of San Diego, out to and beyond the San Clemente fault zone located approximately 50 miles west of San Diego.

Nearing the end of the Miocene, approximately 5.5 million years ago, the boundary between the North American and Pacific plates moved eastward to its present-day position in the Gulf of California (Abbott, 1999). The resultant extension and stretching of the North American

continental crust formed a rift between the two plates, creating the Gulf of California, which continues opening through the present day. The San Andreas, San Jacinto, Elsinore, Rose Canyon/Newport-Inglewood, and San Clemente fault zones are just a few of the resultant strain features (faults) created by this tectonic movement. Today, there is an estimated 55 to 60 centimeters of relative plate motion per year between the North American and Pacific plates, spread across the faults within this 150+ mile wide zone, of which the Rose Canyon fault zone is estimated to contribute 1.5 mm/year (±0.5mm).

From a seismic standpoint, the site is located within a seismically active region that has experienced earthquakes in recent historic time. The site is located approximately 1,800 feet south-southeast of the Silver Strand Fault, which is considered active, having demonstrated fault activity during the last 10,000 years. Other sources have also identified numerous faults under San Diego Bay. Many of these faults express a normal component (up/down) of movement and are likely related to extensional forces that caused the opening of San Diego Bay.

5 GEOLOGIC HAZARDS

5.1 Introduction

Each project may be exposed to various risks associated with various geologic hazards. Many of those hazards are related to the actions of earthquakes and faulting. In addition to geologic hazards associated with earthquakes and faulting, there are other potential geologic hazards that may impact the proposed project. A brief description of the various geologic hazards and their impact on the project site is presented below.

5.2 Geologic Hazards Associated with Earthquakes

Geologic hazards generally associated with earthquakes include ground rupture, ground shaking, tsunamis, seiches, seismic-induced flooding, liquefaction, seismic-induced ground settlement, and seismic-induced slope instability. With respect to these hazards, we have the following comments.

5.2.1 *Ground Rupture*

An assessment of the potential risk and magnitude of potential fault rupture is beyond the scope of this report. However, a review of USGS and CGS maps indicates that a number of small faults exist underlying San Diego Bay. These smaller faults are likely related to the opening of the San Diego Embayment Graben. No known active faults are mapped as passing or trending through the site. However, there is an apparent offset between Holocene and younger Quaternary sediments located off the end of Pier 1, discovered during our exploratory program. The inferred fault associated with this offset is depicted on Figure 2, as well as in cross-sections on Figures 4 through 6. At this time, it is uncertain whether or not this offset is due to faulting associated with the opening of San Diego Bay or whether it is an erosional feature formed when sea level was lower during the last glacial period. A more detailed study would be required to further assess this feature.

5.2.2 *Ground Shaking*

Historically, a number of larger earthquakes with magnitudes greater than 4.0 have occurred near the site within and around San Diego Bay. The most recent earthquake with magnitude 4.0 occurred in June 1985, with the epicenter located approximately 0.9 mile south of the site on the Silver Strand Fault. The closest and largest historically documented earthquake is reported to have occurred approximately 3.2 miles from the site. That earthquake, reported to have occurred on May 27, 1862, had an interpreted magnitude of 5.9. Using EQSEARCH, which contains a database of historical earthquakes from 1800 to 2007, and a Soil Class D, we estimate the likely historic peak ground acceleration at the site to have been on the order of 0.33g.

5.2.3 *Tsunamis and Seiches*

Tsunamis and seiches are considered likely hazards at this project site. A review of the Tsunami Inundation Map for Emergency Planning for San Diego Bay, dated June 1, 2009, shows the site as lying within a tsunami inundation area.

Recently, San Diego Bay experienced the effects of two tsunamis generated by large, distant earthquakes (the 2010 M8.8 Chilean earthquake and the 2011 M9.0 Japan earthquake). Measurements and observations indicated that areas around the bay experienced tsunami amplitudes on average of 2 feet (0.6 meter), with a maximum of approximately 3.9 feet (1.2

meters) observed at Shelter Island. Docks and boats in the bay experienced moderate damage caused by the unusually high current speeds associated with the water surface changes, estimated locally to be upwards of 12 to 15 knots.

5.2.4 *Liquefaction*

Three key components are required for liquefaction to occur: liquefaction-susceptible soils, groundwater, and strong ground shaking. Soils susceptible to liquefaction are generally loose to medium dense sands and non-plastic silt deposits below the water table. Many of the soil deposits underlying the site are comprised of loose to medium dense sands, non-plastic silts, and loose bay deposits of both Holocene and Quaternary age, most of which exist below the water table.

The risk for liquefaction at the site is dependent upon the location of interest. Results of our liquefaction assessment indicate that the Quaternary-age soils are not liquefiable. However, the fill soils below the groundwater and the bay deposits are potentially liquefiable. As such, once the area of the pier is dredged to elevation -65 feet MLLW, the risk associated with liquefaction of foundation soils is considered to be **negligible** north of the underwater bulkhead walls, whereas with respect to the bay deposit soils retained by the proposed king pile wall, the risk for liquefaction is considered to be **high**, depending upon the level of occurrence of an earthquake event. As indicated on Figure 4 and based on available topography at the time of this study, the majority of bay deposits are expected to be located within the eastern quarter of the existing Pier 1 footprint generally above elevation -22 feet (MLLW). Additionally, considering that near-surface soils landward of the bulkhead line are comprised of loose to medium dense fill soils and bay deposits, the risk for liquefaction for these soil is considered to be **high**.

With regard to the offshore environment pertaining to the Pier 1 improvements, we understand that much, if not all, of the potentially liquefiable soils will be removed by dredging where practical. As such, portions of the liquefiable soils located beneath the pier may not be removed. As such, the king pile will be designed to accommodate the remaining amounts of liquefiable soils. Regarding the landside cooling tunnel component of the project, we understand that liquefiable soils will be altered in-place via ground modifications, removed where necessary, or accommodated by the structural design of new structures. As such, impacts associated with liquefaction will be less than significant.

5.2.5 *Lateral Spreading*

Areas that are susceptible to liquefaction may also be subject to lateral spreading. It is anticipated that liquefiable soils seaward of the bulkhead line within the Pier 1 footprint located above the king pin wall and final dredge elevations will slough during a design level earthquake. In addition, those portions located below the top of the king pile wall and dredged elevation will generally be retained. As such, minor dredging of sloughed soils may be required to remove sloughed soils. In addition, piles located under the pier will need to be evaluated and strengthened if needed to accommodate lateral loads associated with the sloughing soils. In other areas of the project, those soils that are prone to lateral spreading will be altered in-place via ground modification, removed where necessary, or mitigated by structural design of new structures. As such, impacts associated with lateral spreading will be less than significant, given the actions taken above.

5.2.6 *Seismic-Induced Slope Instability*

We understand that the proposed dry dock basin will include slopes with inclinations ranging between 2.25 to 1 to 2.75 to 1 (horizontal to vertical), resulting in underwater slope heights ranging from approximately 32 to 55 feet. The slopes at the western end of the site will generally be comprised of Holocene and/or terrace deposits, and the slopes at the eastern end of the site will generally be comprised of relatively loose bay deposits over terrace deposits. As such, these slopes, particularly those containing loose bay deposits, may be subject to seismic-induced slope instability. Slope stability is discussed in greater detail in Section 6.5.1.

5.2.7 *Landslides*

A review of aerial photographs, published reports and geologic maps, and our site reconnaissance did not reveal any features indicative of ancient natural landslides on or adjacent to the proposed project site limits. In our opinion, the risk associated with landslides at the site is negligible.

6 DRY DOCK COMPONENT GEOTECHNICAL ASSESSMENT

We understand that the proposed dry dock component includes the following:

- Construction of 750-foot long king pile retaining wall along the north side and seaward end of the existing Pier 1. Conceptually, the king piles will be driven to a depth of -90 feet MLLW with intermediate sheets driven to a depth of -70 feet MLLW. The purpose of this wall is to facilitate dry-dock dredging adjacent to Pier 1.

- Construction of 2 new mooring dolphins and expansion of one existing mooring dolphin. One dolphin will be an independent system installed approximately 170 feet seaward of the end of Pier 1. A second dolphin will be installed in the middle portion of Pier 1 and integral with Pier 1 itself.

- Construction of 2 new ramp wharves and one intermediary wharf. These ramp wharves and intermediary wharf will be pile supported structures adjacent to the existing shoreline bulkhead line and will extend approximately 130-feet into the bay.

- Installation of new piles within Pier 1 to strengthen the Pier and to provide lateral support to the proposed king pile wall.

- Construction of a dry-dock sump to provide sufficient depth to accommodate the proposed floating dry-dock. Associated dredging will result in the removal of approximately 395,000 cubic yards of sediment. AMEC Environment & Infrastructure, Inc., in their December 2014 "Hazards and Hazardous Materials Technical Report," characterized the dredged materials as generally consisting of 80 percent native sediment deposits and 20 percent recent bay mud deposits. As such, it is anticipated that dredging efforts could be relatively characterized as 80 percent hard dredging and 20 percent soft dredging by volume.

- Installation of various landside improvements including electrical and mechanical utilities.

We understand that prior to the above construction that an approximately 80-foot long sheet-pile wall will be installed along the shoreline in support of the Shipyard Sediment Cleanup

and Abatement Order No. R9-2012-0024 (CAO). As we understand, the 80-foot-long sheet-pile bulkhead will consist of one 65-foot section and one 15-foot section.

6.1 King Pile Wall

Review of the conceptual layout of the 750-foot long king pile wall indicates that the system will consist of driven stiff steel piles (king piles) with intermediate sheet piles. We understand that the king piles will likely be driven to a depth of -90 feet MLLW with the intermediate sheets driven to a depth of -70 feet MLLW. After dredging of the dry-dock sump to a maximum elevation of -65 feet MLLW, it is anticipated that the retained soil height will be on the order of 35 to 45 feet.

The primary geotechnical issues associated with the proposed wall system will be the static and seismic stability of the wall, and wall construction, particularly with regard to pile driving operations.

6.1.1 *King Pile Wall Stability*

We understand that the proposed king pile wall system will have an embedment depth of 25 feet relative to the proposed dry-dock sump floor (-65 feet MLLW) and will retain a maximum soil height of approximately 45 feet. The wall will experience lateral loads associated with the retained soil and may indirectly experience transient loading associated with the dry dock or other boats tethered to Pier 1. It is anticipated that the proposed wall cannot accommodate lateral loads as an unsupported cantilever system. We understand that the proposed wall will be attached to the existing Pier 1 to acquire the necessary lateral support.

The proposed king pile wall may also experience seismic loading both in terms of loading from Pier 1, as well as increased soil loads. As indicated in Cross Section B (Figure 4), a layer of relatively loose bay deposits, primarily at the eastern end of the wall alignment under Pier 1, are susceptible to liquefaction. These liquefied soils would increase loading on the wall system. We understand that most, if not all, of these loose soils will be removed as part of the proposed dredging.

6.1.2 *King Pile Wall Construction*

We anticipate that the king pile wall will include pile driving of steel piles and steel sheet piles. Pile driving operations will cause soil disturbance, particularly near the ground surface, where temporary plumes of fine-grained sediment may be generated. Additionally, depending upon the contractor's means and methods for construction, pre-drilling or pre-jetting may also occur, also resulting in potential temporary plumes of fine-grained sediment. As such, contaminated soils may need to be excavated prior to pile driving operations. We understand that the excavated contaminated soils will be processed and disposed of in an upland facility and that any remaining contaminated soils will be capped with sand.

6.2 **Mooring Dolphins**

One independent mooring dolphin will be constructed approximately 170-feet seaward of the west end of Pier 1. This mooring dolphin would include a concrete deck supported by a series of vertical and battered piles. We understand that this dolphin will incorporate approximately 25 precast concrete piles embedded below the dredged elevation. An additional mooring dolphin will be constructed integrally with the existing Pier 1. In order to facilitate construction, sections of the existing pier deck will be demolished. After installation of the mooring dolphin piles, the demolished pier deck sections will be reconstructed. The existing western Pier 1 mooring dolphin will be expanded and entails the installation of three additional 24-inch octagonal piles on the south side of the mooring dolphin.

The primary geotechnical issues associated with the proposed mooring dolphins will be the axial and uplift capacity of piles, and dolphin construction, particularly with regard to pile driving operations.

6.2.1 *Mooring Dolphin Pile Capacity*

The proposed mooring dolphins will experience large lateral loads from the floating dry-dock. These lateral loads will be accommodated by both vertical and battered piles. Sufficient embedment into the underlying terrace deposits will be required to provide the necessary frictional and end bearing resistance needed to accommodate the axial and uplift forces associated with the anticipated lateral loading.

6.2.2 *Mooring Dolphin Construction*

We anticipate that mooring dolphin construction will include pile driving of precast concrete piles. Pile driving operations will cause soil disturbance, particularly near the ground surface, where temporary plumes of fine-grained sediment may be generated. Additionally, depending upon the contractor's means and methods for construction, pre-drilling or pre-jetting may also occur, also resulting in potential temporary plumes of fine-grained sediment. As such, contaminated soils may need to be excavated prior to pile driving operations. We understand that any of the excavated contaminated soils will be processed and disposed of in an upland facility.

Additionally, it is expected that a large amount of construction debris will be generated during the demolition of the existing pier deck to facilitate construction of the mooring dolphin that is integral with Pier 1. As such, preventative measures will need to be taken to preclude demolition debris from falling into the water below.

6.3 **Ramp Wharves and Intermediary Wharf**

We understand that each of the two proposed ramp wharves and intermediary wharf will consist of a reinforced concrete deck supported by pre-cast concrete piles.

The primary geotechnical issues associated with the wharves will be the axial capacity of piles which will be required to accommodate heavy vehicular loads, lateral loads from seismic events, and ramp wharf construction, particularly with regard to pile driving operations.

6.3.1 *Ramp Wharf Pile Capacity*

The ramp wharves will experience significant axial loads from heavy vehicles. Sufficient embedment into the underlying terrace deposits will be required to provide the necessary frictional and end bearing resistance needed to accommodate those forces. Piles will also be required to provide the necessary axial and uplift resistance to seismically-induced lateral loads.

6.3.2 *Ramp Wharf Construction*

We anticipate that ramp wharf construction will include pile driving of precast concrete piles. Pile driving operations will cause soil disturbance, particularly near the ground surface, where temporary plumes of fine-grained sediment may be generated. Additionally, depending upon the contractor's means and methods for construction, pre-drilling or pre-jetting may also occur, also resulting in potential temporary plumes of fine-grained sediment. As such, contaminated soils may need to be excavated prior to pile driving operations. We understand that any of the excavated contaminated soils will be processed and disposed of in an upland facility.

6.4 **Supplemental Pier 1 Piles**

We understand that additional piles may be added along the existing Pier 1 to provide additional support to the Pier 1 deck and to provide additional lateral support for the proposed king pile wall.

The primary geotechnical issues associated with the supplemental piles will be the achievement of sufficient axial and uplift capacity of piles which will be required to accommodate loads on the Pier 1 deck, lateral loads from the king pile wall and seismic events, and pile installation, particularly with regard to pile driving operations.

6.4.1 *Supplemental Pile Capacity*

The proposed supplemental Pier 1 piles may experience large lateral loads from the floating dry-dock, as well as from the proposed king pile wall system. These lateral loads will be accommodated by both vertical and battered piles. Sufficient embedment into the underlying terrace deposits will be required to provide the necessary frictional and end bearing resistance needed to accommodate the axial and uplift forces associated with the anticipated lateral loading.

6.4.2 *Supplemental Pile Construction*

We anticipate that installation of supplemental piles will include pile driving of precast concrete piles. Pile driving operations will cause soil disturbance, particularly near the ground surface, where temporary plumes of fine-grained sediment may be generated.

Additionally, depending upon the contractor's means and methods for construction, pre-drilling or pre-jetting may also occur, also resulting in potential temporary plumes of fine-grained sediment. As such, contaminated soils may need to be excavated prior to pile driving operations. We understand that any of the excavated contaminated soils will be processed and disposed of in an upland facility.

6.5 Dry-Dock Sump

We understand that a sump will be constructed to accommodate the proposed 55,000 ton dry-dock. The proposed dredged bottom will have approximate footprint of 215 feet by 876 feet with a bottom elevation of -65 feet MLLW. The portion of the sump adjacent to Pier 1 will be supported by the proposed king pile wall system. The remaining portions of the sump will incorporate dredged slopes.

The primary geotechnical issues associated with the sump will be static and seismic stability of the dredged slopes, and dredging operations.

6.5.1 *Sump Slope Stability*

We understand that the proposed dredged basin will have a bottom elevation of -65 feet MLLW with side slopes ranging in inclination between 2.25 to 1 and 2.75 to 1 (horizontal to vertical). Given the current site bathymetry, we estimate that the dredged slopes will have heights between approximately 32 and 55 feet. The slopes at the western end of the site are expected to consist of Holocene deposits overlying younger terrace deposits, and the slopes at the eastern end of the site will generally be comprised of relatively loose bay deposits over younger terrace deposits. As such, those portions of slope containing loose bay deposits may be subject to seismic-induced slope instability.

We have considered a 55-foot-tall slope with an inclination of 2.25 to 1 (horizontal to vertical), which we understand represents the most critical slope geometry for the proposed basin. Preliminary analyses indicate factors of safety for static slope stability to be greater than 1.5.

With regard to seismic slope stability, we anticipate that the dredged slope would be expected to experience some permanent displacement under the Maximum Considered Earthquake (CBC/ASCE 7-10). The estimated permanent displacement anticipated is less

than 3 inches. The 3-inch displacement threshold was used for this project as a screening measure to assess relative significance of potential impact. Displacements less than the screening value are considered less than significant. Under the MOTEMS Level 1 and Level 2 earthquakes, the slope would remain stable with negligible, if any, permanent displacement. We estimated permanent slope displacement using the methodology developed by Bray and Travasarou.

6.5.2 *Dredging*

We anticipate that sediments to be dredged will generally consist of loose and soft surface sediments (bay deposits), and medium dense to dense younger terrace deposits (Bay Point Formation), Holocene deposits and older Quaternary terrace deposits. From a geotechnical perspective, we anticipate that this dredging may be accomplished with conventional dredging methods, equipment, and operations as modified to accommodate environmental concerns. As previously mentioned, AMEC Environment & Infrastructure, Inc., in their November 2014 "Hazards and Hazardous Materials Technical Report," characterized the dredged materials as generally consisting of 80 percent native sediment deposits and 20 percent recent unconsolidated bay mud deposits. As such, it is anticipated that dredging efforts could be relatively characterized as 80 percent hard dredging and 20 percent soft dredging by volume. Dredging equipment and methods will largely be determined by the contractor performing the work. As such, depending upon the equipment used, a permit may need to be obtained through the San Diego County Air Pollution Control District (APCD). Furthermore, the condition of the dredged sediment will be analyzed, and the disposal, dewatering, and handling of dredged material should be discussed in a separate hazardous materials report.

It should be noted that there are two existing sheet pile jetties, presumably associated with the function of the existing cooling tunnels, which are located at the eastern end of the proposed sump. Those structures will need to be removed during or before the dredging process.

Facilities impacted by the dredging will include the proposed king pile wall and Pier 1 as well as existing and proposed bulkhead walls along the bulkhead line. As such, the inclinations of the dredged excavations and depths of removals may need to be adjusted to maintain the stability of surrounding structures. Removal of sediment below Pier 1 will impact the capacity of piles currently supporting the pier. Analysis of existing pile capacities

will need to consider the potential for reduced pile capacities as a result of dredging, and additional supplementary piles will need to be considered if additional capacity is required.

6.6 Additional Considerations for Offshore Improvements

As described in Sections 6.1 through 6.5, an anticipated result of pile driving and dredging will be temporary turbidity due to disturbance of sediment during the various underwater construction processes. It is recommended that turbidity be monitored throughout construction. Turbidity may be mitigated through implementation of silt curtains surrounding the impacted areas.

6.7 Landside Improvements

We understand that electrical and mechanical utilities will be installed to support dry-dock operations. Proposed utilities will be similar in nature to currently existing utilities. Necessary piping will be installed underground or in trenches from existing services.

Geotechnical issues associated with these landside improvements will pertain primarily to trench excavation, subgrade preparation, and backfill compaction.

6.7.1 *Utility Trench Construction*

Utility trench construction will include removal of existing surface pavements and excavation along the trench alignments. Backfill and compaction of clean structural backfill may be required. Additionally, excavated soils may need to be shipped to an appropriate landfill facility depending on sediment characterization.

7 COOLING TUNNELS COMPONENT GEOTECHNICAL ASSESSMENT

7.1 Introduction

The cooling tunnels component work includes the removal of two sets of existing cooling tunnels that were used by the former SDG&E Silvergate Power Plant.

For purposes of our discussion, we have assumed that removal of the cooling tunnels will be handled by excavating soils surrounding the cooling tunnels to expose the cooling tunnels for demolition; demolition of the cooling tunnels themselves in order to reduce the cooling tunnels into pieces of debris that can be transported from the site; and restoring site grades. Factors that affect removal of the cooling tunnels include the nature and stability of the soils covering the cooling tunnels, the presence of groundwater, the method of demolition of the cooling tunnels (will the operation be performed in the dry or in the wet), and the characteristics of the restored site.

Given that the existing cooling tunnels are buried and located below the groundwater table, there are conceptually two general approaches that can be taken to remove the cooling tunnels. The first approach is to create a dry environment within which the demolition and removal of the demolished cooling tunnels can take place. The second approach demolishes and removes the demolished cooling tunnels in the wet. The selection of the general approach to demolition of the cooling tunnels and removal of the demolished sections of the cooling tunnels directly impact how one approaches the excavation of overburden soils and the control of groundwater during construction.

As we understand, both the overburden soils and the groundwater may be contaminated to various extents. The handling and potential processing of the excavated materials, including both soil and the cooling tunnels, as well as the treatment and discharge of the encountered groundwater, must therefore adequately mitigate all hazardous materials concerns. Our assessment pertains only to the geotechnical issues related to the operations and does not address the handling of any hazardous materials associated with removal of the cooling tunnels.

Existing reports prepared by ENV America Incorporated and Ninyo & Moore indicate the potential for contaminated soils in the area of the cooling tunnel footprint. A project-level hazardous materials report will be required prior to the design phase of the cooling tunnels removal. The hazardous materials report should include appropriate means for testing, handling, and disposal of contaminated soil, as well as appropriate worker health and safety assurance in accordance with 29 CFR Part 120.

Within this understanding, the geotechnical issues associated with the demolition and removal of the cooling tunnels include:

1. Providing and maintaining access to the cooling tunnels for their demolition and removal;

2. Removal of demolished cooling tunnels; and

3. Backfilling the resulting ground void.

Brief discussions concerning these issues are presented in the following sections.

7.2 Description of Cooling Tunnels

The tunnel locations are indicated on Figures 2 and 6. Within the study area, the intake and discharge tunnels have lengths of 490 feet and 450 feet, respectively. We understand that each set of tunnels consists of four 8-foot by 8-foot chambers, with an overall rectangular section having an approximate width of 38 feet and a height of 11 feet. A total of four manholes provide access to the sets of tunnels. The invert elevation of the tunnels is at an approximate elevation of -12 feet (1941 datum), with localized low points at -14.5 feet (1941 datum) directly below the manholes. Schematic drawings of the tunnel structures indicate a tunnel wall thickness on the order of 1.33 feet. Ground surfaces generally range between elevation +10 and +14 feet, indicating that the bottom of the cooling tunnel structures may be located on the order of 23 to 28 feet below grade, depending upon local ground elevations.

As part of the aforementioned Shipyard Sediment Cleanup and Abatement Order, a sheet-pile bulkhead with a total length of 80 feet will be installed along the bulkhead line between the two existing cooling tunnel inlet/outlet structures. As we understand, this sheet-pile bulkhead will have one 65-foot section and one 15-foot section. Installation of this wall will facilitate the removal and regrading of the existing slope to allow for the proposed sump. A new rock-covered slope extending from the top of the submerged sheet-pile wall to the level landward parcel will also be installed. The existing and proposed shoreline bulkhead wall and slope treatment are shown on Figures 7 through 10.

7.3 Accessing Cooling Tunnels Assuming Demolition in the Dry

The two geotechnical issues associated with the demolition of the cooling tunnels in the dry include:

1. The excavation system required to get to the cooling tunnels, and

2. The dewatering and groundwater control system needed to maintain dry conditions for the demolition of the cooling tunnels.

Discussions concerning the excavation and dewatering are presented below.

7.3.1 *Excavation and Shoring*

Prior to excavation, it is anticipated that a number of existing utilities, structures, and equipment will likely need to be relocated. Based upon existing knowledge of the cooling tunnels, it is anticipated that excavations on the order of 30 feet in depth and 40 to 80 feet in width (depending upon the location) will need to be made to facilitate removal of the existing cooling tunnels. Excavations will primarily occur in fill soils and underlying bay deposits.

Throughout the tunnel alignments, the near-surface soils typically consist of 8 to 10 feet of fill soils that vary from relatively permeable sands to less permeable silts and clays. These materials are underlain by loose to medium dense, permeable sands with occasional gravels and silts extending down to the Bay Point Formation near elevation -15 feet, with the bottoms of the cooling tunnels at or near the contact with the Bay Point Formation. These younger terrace deposits within the study area also consist of interbedded medium dense sands, silty fine sands, and fine sandy to clayey silts that are also considered to be relatively permeable.

Given the consistency of these soil types and the need to restrict or minimize the amount of excavated soil, shoring will be required to make the excavations. Typical shoring types may include steel sheet piling or secant-pile walls. With shoring heights on the order of 30 feet, some form of lateral restraint will likely be required, with such lateral restraint being typically provided either by ground anchors or struts and walers to transfer the horizontal restraint across the shoring wall. However, one alternative method for laterally stabilizing the excavation is to employ deep-soil mixing to create a soil-cement modified zone adjacent

to the cooling tunnels. In addition, regardless of the system selected, the system will need to be effective at preventing the infiltration of groundwater into the excavation.

After the shoring system is in place, the excavation can proceed once the work area has been dewatered. In this case, the soils and materials removed from the excavation will have lower water contents and there will be less excavated water to treat, control, and process. The excavation of materials should not start until groundwater levels have been lowered to the desired level. This may not necessarily correspond to the excavation being completely dewatered, but dewatered sufficiently to permit the excavation to begin. The rate of excavation will be directly related to the rate of groundwater lowering.

7.3.2 *Construction Dewatering and Groundwater Control*

The anticipated bottom of excavation may be near elevation -15 feet MLLW, with a fluctuating groundwater table that may reach +8 feet MLLW. As such, in order to maintain a dry excavation, construction dewatering will be needed. When selecting a construction dewatering system, a determination should be made as to what requires dewatering. For example, does only the excavation need to be dewatered or does an area outside of the excavation also need to be dewatered?

Some projects require that a dewatering system be designed to lower groundwater around the exterior of the shoring to reduce the soil loading on the shoring system, thereby reducing shoring costs. Such an approach has potential consequences depending upon the location of adjacent structures and facilities. With upwards of 30 feet of near-surface soils, any significant dewatering outside of the excavation will also result in measurable ground settlement associated with increased effective stresses associated with a temporary reduction in the groundwater level. Groundwater-induced settlements in close proximity to the shoring may result in damage to any settlement-sensitive structures or other surface improvements. As such, to protect such facilities and structures, dewatering of only the excavation may be preferable.

In addition to potential induced ground settlement issues, the dewatering system needs to be designed to maintain the stability of the excavation subgrade. Given the relatively permeable stratigraphic section, the temporary shoring must penetrate the Bay Point Formation a sufficient distance to minimize groundwater flow from under the sheet piles, and importantly a sufficient distance to preclude heaving of the bottom of the excavation resulting from

excess uplift pressures associated with 21+ feet of differential head (assuming a static groundwater elevation of +6 feet and the groundwater within the excavation right at the elevation of the excavation at -15 feet).

Also, any construction activity within the excavation, including the compaction of imported fill soils to fill the excavation, would likely necessitate maintaining the groundwater level within the excavation a minimum of 2 to 3 feet below the bottom of the excavation, or near elevation -17 to -18 feet MLLW.

Given these highly permeable fill soils, bay deposits, and even the underlying terrace deposits, dewatering volumes may be rather large, with reductions achieved through deeper shoring. The dewatering volume may also contain contaminants requiring a water treatment system for its disposal. The need for treating and disposing of contaminated water, along with any contaminated soils, is discussed in more detail in the Water Quality and Hydrology technical report and the Hazards and Hazardous Materials technical report.

In any case, construction dewatering will need to occur to enable removal of the cooling tunnels, followed by backfilling. Using a shoring system such as sheet piling or secant piling, or even a soil-cement treated gravity mass, may be generally effective at reducing groundwater infiltration into the excavation, but infiltration cannot be eliminated. As such, dewatering pumps will be required to further remove groundwater from the excavation. Depending upon the volume of water produced, and the water quality, water may possibly be treated and discharged locally, or may have to be hauled to an appropriate facility. Dewatering volumes, means and methods, water treatment, and the need for appropriate permits, should be assessed during the project-level or design phase assessment of the cooling tunnels removal project.

Lastly, any dewatering system proposed should include a sufficient groundwater monitoring system, consisting of piezometers and wells, to verify that dewatering is being achieved and that the dewatering system is performing as designed. Oftentimes, dewatering systems need to be modified during the construction process in order to maintain project objectives.

7.4 Backfilling Operations in the Dry

Based upon available schematic drawings of the cooling tunnels and knowledge of ground surface elevations, it is estimated that approximately 40,000 cubic yards of soil will be

required to backfill the excavated area. It is recommended that a clean structural backfill be used to prevent differential settlement at the ground surface. Given that the backfilling operations would be performed in the dry, fill soils should be placed as a structural fill with the prerequisite compaction, observation, and testing. Construction means and methods with regard to backfilling should be assessed during the design phase of the cooling tunnel removal project.

7.5 Accessing Cooling Tunnels Assuming Demolition in the Wet

Given the many construction-period challenges associated with dewatering, contractors may also consider the possible removal of the cooling tunnels in the wet, with little or no dewatering proposed.

To illustrate, consider the following hypothetical operation. Once the temporary shoring is constructed, and depending upon the stiffness of the shoring system, a single row of struts or tiebacks could be installed near elevation +6 feet MLLW, remaining above the tidally influenced groundwater level most of the time. Since the tops of the cooling tunnels are near or slightly below Mean Lower Low Water, and given tidal fluctuations, all of the overburden soils within the shored excavations could be removed with conventional grading equipment, then the cooling tunnels cut up with hydraulically operated underwater chainsaws attached to an excavator, thereby minimizing any in-water work with construction personnel. The presence of the formational Bay Point terrace deposits around elevation -15 feet, or right below the bottom of the cooling tunnels, provides an easily recognized condition in the field once encountered. As such, no additional subgrade preparation is necessary. That said, and unlike construction in the dry, no fill soils can be adequately compacted underwater and this approach would require the use of a gravel backfill for all excavation fill below around elevation +3 or +4 feet MLLW. Once out of the tidal water, conventional fill operations can then proceed up to existing grade. Once grades are back up to around elevation +6 feet or so, if it is desirable to remove the shoring, steel sheet piles are relatively easy to extract with a vibratory hammer. However, a secant pile shoring system, in our estimation, would be nearly impossible to remove. That said, the as-built location of the secant-pile wall would be accurately known and the top portion of the secant-pile wall, say above elevation 6 feet, could be cut off, with the engineered fill then brought up to subgrade. Depending upon future development needs, the presence and elevation of the secant-pile wall could be incorporated into future site development plans. Lastly, it should also be noted that, in our

opinion, if construction were completed in the wet and a 15± foot thick gravel layer placed approximately 10 feet below grade, this subgrade condition should not pose a problem for most lightweight construction. Notably, a 15-foot-thick gravel mat may create certain construction challenges for future drilled pier foundations or installation of smaller pre-stressed concrete piles.

Given that construction in the wet is feasible, we note the following three geotechnical issues associated with the demolition of the cooling tunnels in the wet:

1. The excavation system required to get to the cooling tunnels,

2. The possibility of partial dewatering and groundwater control needed for the demolition of the cooling tunnels, and

3. The demolition and removal of cooling tunnels debris.

Discussions concerning these issues are presented below.

7.5.1 *Excavation and Shoring*

The issues associated with excavation and shoring are similar to the issues associated with performing the demolition of the cooling tunnels in the dry, with the primary differences being that materials excavated will be saturated and will likely require special handling to accommodate the excessive wetness of the materials, and that the demolition of the cooling tunnels will be performed underwater using remote equipment. As such, processing areas may be required to allow the excavated soils to drain before hauling them off the site.

7.5.2 *Construction Dewatering and Groundwater Control*

Little to no construction dewatering is anticipated for this approach, as groundwater levels are not required to be lowered to demolish the cooling tunnels. As such, the volume of groundwater that will need to be treated is anticipated to be limited.

7.5.3 *Demolition of Cooling Tunnels and Removal of Cooling Tunnels Debris*

The demolition of cooling tunnels in the wet is anticipated to require special excavating and demolition equipment to reduce and prepare the cooling tunnels structures for removal. Such operations will be conducted below water. We anticipate that excavators will be able to remove the demolished cooling tunnels debris from along the edges of the excavations. These operations will need to be structured to allow the dewatering of the debris as it is removed from the excavation. As such, temporary decanting areas or barges may be required to allow the debris to drain before loading and hauling from the site. In addition, divers may be needed to periodically inspect the underwater demolition of the cooling tunnels in order to assess completeness of demolition, as well as modification of operations. Depending upon the level of dewatering of the debris, special enclosed hauling trucks may be required to haul some of the debris.

7.6 **Backfilling Operations in the Wet**

Given that the excavation will still have water in it after the cooling tunnels have been removed, backfilling of the excavation will require the use of coarse-grained soils, such as gravel, quarry run, or other suitable materials sufficiently graded and permeable to allow placement underwater with self-consolidation properties. As an alternative, clean sands could be placed and then vibrated using vibro-compaction methods similar to the placement of stone columns in order to achieve suitable densification. Such operations will require special materials for use in the backfill operations.

Based upon available schematic drawings of the cooling tunnels and knowledge of ground surface elevations, it is estimated that approximately 40,000 cubic yards of materials will be required to backfill the excavated area for the wet construction alternative. Roughly two-thirds of the total volume, or 26,000 to 27,000 cubic yards, would consist of gravels or crushed rock. For the upper one-third of the excavation backfill, it is recommended that a clean structural backfill be used to prevent differential settlement at the ground surface. Given that the backfilling operations of the upper one-third of the excavation would be performed in the dry, fill soils should be placed as a structural fill with the prerequisite compaction, observation, and testing. Construction means and methods with regard to backfilling should be assessed during the design phase of the cooling tunnel removal project.

8 LIMITATIONS

Professional judgments presented herein are based partly on our evaluation of the technical information gathered, partly on our understanding of the proposed construction, and partly on our general experience in the geotechnical field. We have observed only a small portion of the pertinent soil and subsurface conditions at the proposed project site. The recommendations made herein are based on the assumption that soil conditions do not deviate appreciably from those found during our field investigation. If the plans for site development are changed, or if variations or undesirable geotechnical conditions are encountered during construction, the geotechnical engineer should be consulted for further recommendations.

3. RIP RAP SHALL BE 1/4 TON CLASS CONFORMING TO STATE OF CALIFORNIA DEPARTMENT OF TRANSPORTATION, STANDARD SPECIFICATIONS, SECTION 72. FILTER STONE SHALL BE No.3 BACKING CLASS TO THE SAME SPECIFICATION.
4. FILTER FABRIC (GEOTEXTILE) SHALL BE MANUFACTURED FROM POLYESTER, NYLON OR POLYPROPYLENE AND SHALL CONFORM TO THE STATE OF CALIFORNIA DEPARTMENT OF TRANSPORTATION, STANDARD SPECIFICATIONS, SECTION 88.
5. RIP RAP SHALL BE PLACED ON THE PREPARED BASE IN SUCH A MANNER TO PRODUCE A REASONABLY WELL-GRADED MASS OF ROCK WITH MINIMUM PRACTICABLE PERCENTAGE OF VOIDS. THE FINISHED SURFACE SHALL BE CONSTRUCTED TO THE LINES AND GRADES SHOWN ON THE DRAWINGS.
6. CONSTRUCTION OF RIP RAP SLOPE PROTECTION SHALL BE COORDINATED WITH THE TIDE LEVELS. THE CONTRACTOR SHALL SEQUENCE THE WORK TO MINIMIZE THE RISK OF INSTABILITY OF BOTH EXCAVATED SLOPES AND THE FINISHED ROCK.
7. ROCK AND FILTER STONE SHALL BE PLACED BY BUCKET, SKIP, FRONT END LOADER OR OTHER APPROVED MEANS TO THE GENERAL PROFILE SHOWN ON THE CROSS SECTIONS. TOLERANCE FOR PLACING RIP RAP SHALL BE MINUS 6 INCHES AND PLUS 9 INCHES WITH RESPECT TO THE NEAT LINES AND LEVELS AND MEASURED PERPENDICULAR TO THE SLOPE. FINISHED ROCK LEVEL SHALL NOT BE ABOVE THE EXISTING GRADE.
8. A VERIFICATION SURVEY SHALL BE MADE BY THE CONTRACTOR TO DETERMINE THAT THE SLOPE PROTECTION IS PLACED TO ACCEPTABLE LIMITS.

1.0 INTRODUCTION

Presented here is an analysis of the existing conditions of marine mammals, sea turtles, fish, and California least terns (CLT; *Sterna antillarum browni*) within the project area, and impact analysis of sound pressure levels (SPLs) likely to be generated from the BAE Systems Pier 1 Dry Dock replacement project (Proposed Project). The Proposed Project site includes the existing 9.8-acre (landside) and 16.6-acre (waterside) BAE Systems Leasehold within the San Diego Unified Port District (District). The Proposed Project site also includes an approximately 2.0-acre (landside) and 4.0-acre (waterside) parcel leased by BAE Systems via a five-year Tidelands Use and Occupancy Permit (TUOP).

As part of the Proposed Project, two mooring dolphins and three new ramp wharfs structures will be constructed toward the northern end of the BAE Systems leasehold in San Diego Bay (Bay) (Figure 1). Mooring dolphins provide a fixed structure to secure the proposed dry dock, and are outfitted with two 100-ton double bitts. One of the two mooring dolphins will be retrofitted into the north east end of the existing Pier 1, and the second mooring dolphin will be constructed west of the existing dolphins. Each mooring dolphin structure will be supported by twenty-four 24-inch octagonal precast concrete piles, with an overall mooring dolphin dimension of 26 feet (ft) by 33 ft in size and include a 4-ft thick concrete deck. The new western mooring dolphin is expected to consist of twenty-six 24-inch octagonal concrete piles driven 35 to 45 feet beyond the dredged elevation. The eastern mooring dolphin will be constructed such that it is integrated into the deck of the current Pier 1. This will involve the demolition of two sections of the deck to provide clearance for the installation of approximately twenty 24-inch octagonal concrete piles.

In addition to mooring dolphins, three new ramp wharfs structures will be constructed. The ramp wharf structures will require a total of eighty-four 24-inch octagonal concrete vertical and batter piles to support the two new ramp wharves (36) and intermediary structure (48). The ramp wharfs are independent structures measuring approximately 125 ft × 35 ft at the northern ramp wharf, 134 ft × 76 ft for the intermediate ramp wharf, and the southernmost structure measuring approximately 125 ft ×70 ft with a combined total area of approximately 22,088 square ft. The ramp wharf structures are designed to support heavy vehicle and equipment loads, and are constructed of a reinforced concrete deck supported by precast concrete piles anchored along the shoreline. To accommodate the removal of the cooling tunnels located within the TUOP parcel, the northern ramp wharf and intermediary structure will not be constructed until the cooling tunnels are removed. The elevation of the wharf will be approximately +13 ft Mean Lower Low Water (MLLW). This elevation is 12 inches higher than existing piers at the BAE Systems site and has been designed to account for some rise in sea level.

In-water activities for ramp wharf and mooring dolphin construction are estimated to begin during the Phase V of the Proposed Project schedule, after existing Pier 1 mooring dolphin demolition (Phase II) and dredging and disposal (Phases III and IV). The estimated duration of Phase V is six months, between October 2016 and March 2017. In-water construction activities includes pile

driving, conducted from a barge, which will be moved to various locations within the project area to support in-water construction activities. Construction activities during Phase V will be limited to ramp wharf and mooring dolphin construction.

Tierra Data Inc. (TDI), under contract to LSA-Associates (LSA), has been tasked with reviewing relevant documents related to the Proposed Project and develop a technical report summarizing sensitive marine biological receptors, and potential deleterious effects from in-water construction sound levels. Included within this review is a quantitative impact analysis of impacts from pile driving activities associated with the Proposed Project on the marine biological resources adjacent to the construction area. This report further presents a comprehensive analysis of the existing conditions of marine mammals, green sea turtles, fish, and California Least Tern (CLT), and project specific SPLs likely to be generated from proposed pile driving activities.

2.0 EXISTING CONDITIONS

The Existing Conditions section of this technical study describes species that may be directly or indirectly affected by sounds levels produced during construction. Information contained within this document is relative to those species that are listed and/or managed, and may experience some level of disturbance from in-water pile driving activities. In this way, the assessment can focus on special status indicators as a surrogate for populations as a whole. The sensitive receptors examined for the purposes of this technical study were the Eastern Pacific green sea turtle (GST; *Chelonia mydas*), fish species managed under two Fishery Management Plans (FMPs) (the Coastal Pelagic Species FMP and Pacific Coast Groundfish FMP) that may occur within the project impact zone, CLT, and marine mammals. The Existing Conditions section presents the species regional presence, population status, and natural history. The technical study presented here supplements the existing biological conditions review performed by Merkel & Associates (M&A).

2.1 Eastern Pacific Green Sea Turtle

Until recently, individual GST had been observed in San Diego Bay in the cooling channel of the former San Diego Gas and Electric (SDG&E) South Bay Power Plant in Chula Vista, where waters were artificially heated (to temperatures of >15 degrees Celsius [°C]) as a result of plant activities. The population of GST in the Bay historically used this warm water outflow for thermo-regulation, particularly during winter months when Bay-wide temperatures were below optimal temperatures (<15°C) for GSTs (Dutton and McDonald 1990; McDonald et al. 1994; Moon et al. 1997; Seminoff 2000; Benson and Dutton 2012; Eguchi et al. 2012). However, the South Bay Power Plant has been demolished, and thus the artificially heated water has stopped.

The possible response of GSTs to the changing thermal environment in the Bay may include: (1) inactivity during winter months when water temperatures drop to <15°C; (2) higher concentrations of GSTs in the warmest areas of the Bay (southern extreme) during late autumn, winter, and early spring; or (3) decrease in somatic (body) growth rates (Eguchi et al. 2012). Previous satellite and hydrophone tracking of GSTs in the Bay have reported that GSTs are most commonly observed in the south and south central Bay. Eelgrass communities, which are the primary foraging areas for GSTs, are similarly most abundant in the south and south central Bay and generally occur in waters less than 6 meters (m) (20 ft) MLLW.

2.2 Fish

Fish habitat in the Bay are managed under the Magnuson-Stevens Fisheries Management Act by the National Oceanic and Atmospheric Administration (NOAA)/National Marine Fisheries Service (NMFS). The Magnuson-Stevens Fisheries Management Act provides for conservation and management of commercially harvested species and protection of Essential Fish Habitat (EFH). There are several species of concern that may occur within the Bay that are managed under two FMPs: the Coastal Pelagic Species FMP and Pacific Coast Groundfish FMP. The species include the northern anchovy (*Engraulis mordax*), Pacific sardine (*Sardinops sagax*), English sole (*Parophrys vetulus*), Pacific mackerel (*Scomber japonicas*), jack mackerel (*Trachurus*

63732 PAGE 743

symmetricus), California scorpion fish (*Scorpaena guttata*), leopard shark (*Triakis semifasciata*), soupfin shark (*Galeorhinus galeus*), spiny dogfish (*Squalus acanthias*), cabezon (*Scorpaenichthys marmoratus*), and grass rockfish (*Sebastes rastrelliger*).

All eleven of the described fish species managed under the Coastal Pelagic Species FMP and Pacific Coast Groundfish FMP have populations that vary seasonally in the Bay. Bay-wide surveys performed in April and July of 2008 and 2012 for the Port of San Diego found that all eleven species were rare or absent in central San Diego Bay (Vantuna Research Group [VRG] 2009, 2012). This is consistent with results from previous fish surveys performed from 1999 to 2006 (Allen 1999; Allen et al. 2002; Pondella et al. 2006), which suggested similarly low abundances of these managed species. Based on previous presence data, there is a low probability of the species of concern occurring within the project area during the proposed in-water construction activities.

2.2.1 Northern Anchovy (*Engraulis mordax*)

San Diego Bay serves as a nursery for northern anchovy. Spawning occurs outside the Bay, and pelagic eggs and larvae enter the Bay during tidal exchange with nearshore ocean waters. Northern anchovy young-of-year recruit to the mid-water column in nearshore habitats, with numbers peaking in late spring and early summer (Allen et al. 2002; Allen 1999). During this time, northern anchovy abundance fluctuates and is one of the dominant fish species in the north Bay. High abundances of northern anchovy are nearly exclusively confined to summer months, based on five years of quarterly surveys conducted throughout the Bay from 1994 to 1999 (Allen et al. 2002). In 2012, 2,528 metric tons of northern anchovies were landed in California with only 196.5 metric tons landed in southern California during the summer months (California Department of Fish and Wildlife [CDFW] 2013). While the species is seasonally abundant in southern California waters, recent Bay-wide surveys (VRG 2009, 2012) found that northern anchovy accounted for less than 0.06% of the total abundance of fish collected during the VRG 2008 surveys and none during the 2012 surveys. A total of ten individuals were collected during two seasonal survey efforts with all ten individuals collected in the intertidal zone in 2008 (VRG 2009), suggesting population abundance may vary significantly over time.

2.2.2 Pacific Sardine (*Sardinops sagax*)

In southern California, Pacific sardines have a seasonal component with abundances highest during the summer and early fall, and can be near absent during the winter. Of the nearly 14,853 Pacific sardines collected during quarterly surveys conducted in the Bay from 1994 to 1999, 14,535 (98%) were collected during the July and October survey efforts. The species is seasonally abundant in southern California waters, and recent Bay-wide surveys (VRG 2009, 2012) found that Pacific sardines accounted for less than 0.01% of the total abundance of fish collected during the VRG 2008 and 2012 summer surveys. A total of two individuals were collected during two seasonal survey events in 2008 and 2012 (VRG 2009, 2012). Pacific sardines accounted for less than 3.0% of the total fish abundance in the Bay, based on five years of quarterly surveys conducted throughout the Bay from 1994 to 1999 (Allen et al. 2002).

63732 PAGE 744

2.2.3 Pacific Mackerel (*Scomber japonicas*)

Similar to other coastal pelagic species, Pacific mackerel display a seasonal component with abundances greatest during the summer and early fall and near absent during the winter. A total of 128 Pacific mackerel were collected during five years of quarterly surveys from 1994 to 1998, during only summer and fall survey months, and no individuals were collected during either of the 2008 survey events (Allen et al. 2002; VRG 2009). Pacific mackerel accounted for less than 0.01% of the total abundance of fish collected during the VRG 2012 surveys. Only one individual was collected during two seasonal survey events in 2012 (VRG 2012). Pacific mackerel accounted for less than 0.03 of total fish abundance in the Bay, based on five years of quarterly surveys conducted throughout the Bay from 1994 to 1999 (Allen et al. 2002).

2.2.4 Jack Mackerel (*Trachurus symmetricus*)

No jack mackerel were collected in any of the Bay-wide fish surveys conducted in 1994, 1999, 2003, 2008, or 2012 (Allen 1999; Allen et al. 2002; Pondella et al. 2006; VRG 2009, 2012).

2.2.5 California Scorpion Fish (*Scorpaena guttata*)

California scorpion fish accounted for less than 0.01% of the total abundance of fish collected during the VRG 2012 survey. A total of eight individuals were collected during two seasonal survey events in 2012 (VRG 2012). Previously, only three California scorpion fish were collected in the Bay-wide fish surveys conducted in 1994, 1999, 2003, or 2008 (Allen 1999; Allen et al. 2002; Pondella et al. 2006; VRG 2009).

2.2.6 English Sole (*Parophrys vetulus*)

No English sole were collected in the Bay-wide fish surveys conducted in 1994, 1999, 2003, 2008, or 2012 (Allen 1999; Allen et al. 2002; Pondella et al. 2006; VRG 2009, 2012).

2.2.7 Leopard Shark *(Triakis semifasciata)*

Leopard sharks are most commonly found in shallow California bays and estuaries and along southern California beaches rocks near rocky reefs and kelp beds. Leopard sharks will spawn and pup in the shallow waters of bay, estuaries, or mudflats (MCS 2013). A large grouping of this species is known to occur during summer months at La Jolla Shores Beach, north of San Diego Bay. Leopard sharks are possibly more common in San Diego Bay waters than capture data would suggest, and aggregations of adult leopard sharks have been in the Bay (Merkel, pers. obs.).

2.2.8 Soupfin Shark (*Galeorhinus galeus*)

Soupfin sharks are one of five species of houndsharks found in California waters. Generally, the soupfin can be found in shallow bays and near the bottom, but soupfin have been seen in waters as deep as 1,500 ft. South of Point Conception is important nursery ground, where females are located inshore, in waters less than 45 ft, while males are offshore in waters greater than 65 ft deep. Soupfin sharks may congregate by size and sex, and can migrate long distances (CDFG 2001).

2.2.9 Spiny Dogfish (*Squalus acanthias*)

Spiny dogfish occur in a variety of temperate and subarctic waters in both the Atlantic and Pacific Oceans. In the Pacific Ocean they are found from central Baja California to Alaska. This species is common in nearshore waters along most of the California coast. The spiny dogfish feeds upon smaller fishes, such as sardines, anchovies, smelts, and even small spiny dogfish. Adults range from 2 to 4 ft long, and generally, females are larger than males (CDFW 2013). Other common names include dog shark, grayfish, Pacific grayfish, spinarola, and California dogfish.

2.2.10 Cabezon (*Scorpaenichthys marmoratus*)

Cabezon occur from Baja California to Alaska. Cabezon are generally found on the bottom, around rocky outcrops, reefs, and kelp beds in water less than 120 ft deep (CDFW 2013). Male Cabezon mature first; however, females grow faster and attain larger sizes than do males. Adults tend to congregate at nesting sites, spawning from November through March, peaking in January. Young cabezon enter the tide pools and inshore areas during the spring when they are about 1.5 inches long when they lose their silvery color and take on the pattern characteristic of adults.

2.2.11 Grass Rockfish (*Sebastes rastrelliger*)

Grass rockfish occur from Oregon to central Baja California, although they are most common from northern California south. Grass rockfish are a shallow water species, found from the intertidal to 20 ft, but they have also been found to depths of 150 ft (M&A 2014). As juveniles they are pelagic, but as they mature and become adults, they associate with kelp beds and reefs.

2.3 California Least Tern

CLT existing conditions are described in detail in the biological resources report prepared by M&A, and provides sufficient background data to support the inclusion of CLT as a potential receiver of sound, including impact and mitigation analysis, when augmented with habitat and Existing Conditions for fish species. CLT nesting grounds are known to occur within 1.8 miles of the Proposed Project area, but not within the Proposed Project area. Therefore, analysis for impacts to CLTs are included for indirect effects analysis only during the ramp wharf and mooring dolphin construction (Phase V) activities. Given the absence of CLT nesting grounds within the Proposed Project area, the primary concern for indirect impacts to CLTs during construction is the relocation of available resources (i.e., small fish) during pile driving activities. During the nesting season, CLTs can feed almost exclusively on small marine fish (e.g., smelt and anchovies) in the surface waters of the Bay, river mouths, and nearshore ocean waters adjacent to Silver Strand (U.S. Department of the Navy [DoN] and Port 2013).

2.4 Marine Mammals

There are four marine mammal species with the potential to occur in San Diego Bay. Year-round species include the California sea lion (*Zalophus californianus*), Pacific harbor seal (*Phoca vitulina richardii*), and California coastal bottlenose dolphin (*Tursiops truncatus*) (U.S. Pacific Fleet 2009-2012; DoN 2012, 2013a, 2013b). The only migratory species with the potential to occur in San Diego

Bay is the eastern North Pacific gray whale (*Eschrichtius robustus*) (DoN 2012, 2013a, 2013b). All four species are protected under the Marine Mammal Protection Act (MMPA); however, none are listed under the Endangered Species Act. From February 2012 to March 2013, TDI conducted 26 marine mammal surveys in north San Diego Bay for the Navy (DoN 2012, 2013a, 2013b). Although the surveys were not designed to specifically document the presence of marine mammals in the Proposed Project area, surveyed areas covered the entire north Bay and portions of the outer and central Bay to document spatial distributions. Results showed that marine mammals are not randomly distributed and are concentrated in the north Bay, most likely entering the Bay to take advantage of feeding opportunities and, in the case of pinnipeds, utilizing easily accessible haul out sites (DoN 2012, 2013a, 2013b).

2.4.1 California Sea Lion (*Zalophus californianus*)

California sea lions breed from May through July on islands from the Gulf of California in Mexico to the Channel Islands in southern California (Bonnell and Dailey 1993). Most of the United States' stock (more than 95%) breed and give birth in the Channel Islands on San Miguel, San Nicolas, and Santa Barbara Islands (Lowry et al. 1991). A small number of pups (between 12 and 92 pups; Lowry and Maravilla-Chavez 2005) are born at the Coronado Islands annually, which is the closest rookery to San Diego Bay and is located 15 miles south in Mexican waters.

After the breeding season, the United States' stock of California sea lions migrate northward from the Channel Islands to forage during the winter along the coast of central and northern California, Oregon, Washington, and British Columbia. During this time, other animals, predominately adult males, from Mexican rookeries migrate into the Southern California Bight (Bonnell et al. 1981, 1983), and males from western Baja California rookeries may spend most of the year in the United States (Carretta et al. 2003).

California sea lion abundance in San Diego Bay peaks during the late summer and fall and decreases to its lowest numbers during the winter (DoN 2013b). The California sea lion is the most commonly sighted marine mammal in San Diego Bay (DoN 2013b). Ninety-four percent of all marine mammal sightings during bimonthly surveys conducted from February 2012 to March 2013 were of California sea lions (DoN 2012, 2013a, 2013b). Individuals are regularly observed hauled out on piers and buoys in groups ranging from a single individual to over 100 animals. Additionally, 95% of all California sea lion sightings from surveys were associated with the Everingham Brothers bait barges, which is near the mouth of the Bay (DoN 2013b).

2.4.2 Pacific Harbor Seal (*Phoca vitulina*)

The nearest harbor seal rookery to San Diego Bay is La Jolla, California, where females give birth from January through April and nurse into May. An estimated 40 pups are born to the La Jolla population annually (Hanan & Associates 2011). Pacific harbor seal abundance at the main rookery in La Jolla peaks during the breeding season and decreases to its lowest numbers from October to November, when adults are foraging away from haul out sites (Yochem and Stewart 1998; Hanan & Associates 2004). In San Diego Bay, Pacific harbor seals haul out year-round in

63732 PAGE 747

small groups along the shore to the east of Ballast Point, immediately outside of the Bay. Harbor seals are likely using this haul out area to rest between foraging trips in the kelp forest off Point Loma. Harbor seals are reluctant to haul out in the presence of humans and are rarely seen inside the Bay (DoN 2012, 2013a, 2013b). The Pacific harbor seal made up three percent of all sightings from surveys conducted in the northern portions of the Bay from February 2012 to March 2013. During the 2012 to 2013 survey time period Pacific harbor seal sightings were exclusively sighted outside of the Bay on the shore to the east of Ballast Point (DoN 2013b).

2.4.3 California Coastal Bottlenose Dolphin (*Tursiops truncatus*)

California coastal bottlenose dolphins (bottlenose dolphins) move along the California coast within about 1 kilometer of shore (Hansen 1990; Carretta et al. 1998; Defran and Weller 1999). In southern California, animals are found within 500 m of the shoreline 99% of the time (Hanson and Defran 1993). Bottlenose dolphins exhibit low site-fidelity (Defran et al. 1999; Feinholz 1996) and display movements in search of preferred, although patchy concentrations of, nearshore prey (Defran et al. 1999; Bearzi et al. 2009). Individuals that enter San Diego Bay are most likely in search of their preferred prey species, surfperch (Family Embiotocidae) and croaker (Family Sciaenidae), which are non-migratory year-round coastal species (Defran et al. 1999; Allen et al. 2006).

Bottlenose dolphins are present in the Southern California Bight year-round (Bonnell and Dailey 1993) with overall densities low during January and high in May. They are found in the Bay year-round, although the species' abundance is relatively low year-round (DoN 2012, 2013a, 2013b), when compared to the overall population in southern California waters. The bottlenose dolphin made up 3% of all sightings from surveys conducted in the northern portions of the Bay from February 2012 to March 2013. During the 2012 to 2013 survey time period, 97% of bottlenose dolphin sightings were north of Harbor Island (DoN 2013a).

2.4.4 Eastern North Pacific Gray Whale

The eastern North Pacific gray whale (gray whale) migrates south along the coast of North America from December through February. The northbound migration generally begins in mid-February and continues through May with a peak in March (Leatherwood 1974; Bonnell and Dailey 1993). Cows and newborn calves migrate northward primarily between March and June (Herzing and Mate 1984; Poole 1984). Gray whales are generally absent from southern California waters from August through November. While gray whales may occasionally be found within 1 kilometer of shore during migration, they are generally found farther offshore. Therefore, the gray whale is considered extremely rare to San Diego Bay.

3.0 IMPACT ASSESSMENT

The Proposed Project would include construction activities (e.g., pile driving) that would generate airborne and underwater sound levels potentially harmful to biological resources. Hydroacoustic impact analysis aims to identify portions of the Proposed Project that could have substantially adverse effects, direct or indirect, on marine species identified as candidates, sensitive, or actively maintain protected species-status by the NMFS and CDFW. Thresholds for significant effects are described as Level A and Level B Harassment. Amendments to the MMPA in 1994 define Level A Harassment as any act of pursuit, torment, or annoyance, which has the potential to injure a marine mammal or marine mammal stock in the wild. Level B Harassment is defined as having the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering but which does not have the potential to injure a marine mammal or marine mammal stock in the wild (NOAA 2006).

The technical guidance for hydroacoustic impact analysis presented here was prepared in accordance with the California Department of Transportation (Caltrans) *Technical Guidance for Assessment and Mitigation of Hydroacoustic Effects of Pile Driving on Fish* published in 2009 and updated in 2012 (Caltrans 2012), and coupled with NOAA/NMFS hydroacoustic Level A and Level B Harassment criteria for marine mammals, fish, and GSTs. This approach uses a transmission loss equation to calculate sound attenuation from source (i.e., pile driving) to Bay wide ambient levels. Zones of Influence (ZOI) can then be calculated based on NMFS criteria for harassment, sound transmission loss, and receiver distance from source.

3.1 Underwater Sound Levels and Propagation

Sound is defined as small disturbances in a medium through which energy is transferred away from a source by progressive fluctuations of pressure (or sound waves) (Caltrans 2012). SPLs are most often expressed in decibels (dB) relative to 1 micro Pascal (1 µPa). Underwater sound levels received at a given distance from an acoustic source, such as pile driving, are a function of source level and transmission loss (TL). Underwater TL is the decrease in acoustic intensity as an acoustic pressure wave propagates out from a source. The TL may vary with frequency, temperature, bottom composition, and various other confounding factors.

The general formula for TL is:

$$TL=B^* \log 10 (R) + C^*R$$

Where:

B = logarithmic loss predominantly by spreading;

C = linear loss through scattering and absorption;

R = ratio of the receiver distance (R_1) to source reference distance (R_2).

This equation assumes spherical spreading from a source in a non-confined environment. NOAA/NMFS applies this equation using some general assumptions where the linear loss (C) is assumed equal to zero, and 'effective spreading ' or 'practical spreading' is assumed (B= 15). This results in a simplified equation for TL of:

$$TL = 15 * \log 10 (R)$$

The attenuation of noise through water is used to predict the area that will be exposed to direct and indirect effects, referred to as the Project Action Area. Additional sound metrics commonly used in evaluating hydroacoustic impacts to fish and wildlife include:

- Peak sound pressure (L_{peak})
- Root mean square (rms)
- Sound exposure level (SEL)

Peak sound pressure (L_{peak}), rms, and SEL are generally accepted metrics used to measure the effective ZOI of a specific sound energy pulse or series of pulses. L_{peak} is the single strike maximum SPL, and is used to assess the potential for physical injury to receptor species from single strike events. SEL is most commonly defined as the sound exposure level, or the constant sound level in one second, which has the same amount of acoustic energy as the original time-varying sound (i.e., the total energy of an event). SEL is calculated by summing the cumulative pressure of a strike squared over the time of the event (Caltrans 2012), and is used as an energy metric, for calculating $SEL_{cumulative}$ which estimates total exposure from repeated events. RMS is the square root of the sum of the squares of the pressure contained within a defined period of time, which contains 90 percent of the sound energy.

3.2 Ambient Sound

To begin the assessment of impacts from impact pile driving, the ambient sound levels in the Bay need to be defined. To apply a representative ambient surrogate for the Proposed Project, ambient levels within a similar embayment was used. There are few embayments in the World with as diverse usage types as San Diego Bay, the combination of military presence, commercial and recreational users, goods and materials shipping, and cruise ships. From a hydroacoustic perspective, each one of the usage types (e.g., commercial, military, or recreational) contributes to ambient sound levels in the Bay. Recent unpublished data collected by the Navy indicates ambient sound levels in the Bay can vary significantly depending on vessel traffic and monitoring location in the Bay, with general rms values have been recorded between 120 and 130 dB rms. Caltrans has provided data for San Francisco Bay and Outer Oakland Harbor, indicating ambient values between 120 and 155 dB $_{peak}$, and 133 dB rms (Strategic Environmental Consulting, Inc. 2004, as cited by Caltrans 2012) For the purposes of this assessment, the generally accepted ambient sound level published by Caltrans (133 dB rms) will be used.

3.3 Pile Driving Sound Profiles

As described previously, the constructing of two new mooring dolphins will require driving forty-six 24-inch diagonal piles for mooring and deck support. The three ramp wharfs will require a total of eighty-four 24-inch octagonal concrete vertical and batter pile supports. Piles will be driven using a diesel impact hammer and driven unattended (i.e., absent of sound attenuation devices). Piles will be driven to -90 ft MLLW for the integrated (east) dolphin, -93 ft MLLW for the west dolphin, and the ramp wharfs between -40 and -80 ft MLLW. The amount of piles that can be driven in a day is subject several limiting factors, including water depth, substrate type, equipment, and environmental conditions encountered when driving piles. Due to these confounding factors, piles driven per day can range from one to ten. For the purposes of this assessment, the Caltrans provided estimate of five piles driven per day will be used for impact assessment purposes (Caltrans 2012). At an estimate of five piles per day, there would be a total of 26 pile driving days necessary to support ramp wharf and new mooring dolphin construction.

In order to perform representative impact analysis, the mooring dolphin located closest to the Bay navigational channel was selected as the point source for sound. Simply, models and assumptions for practical spreading and transmission loss of sounds in water are based on assumptions that include equal spreading (i.e., lack of sound blockage, refraction, or reflection from fixed structures). The western mooring dolphin is the most unobstructed location for pile driving, and therefore would be most representative and appropriate given the accepted assumptions made for this impact analysis of this type. Representative Peak pressures, SEL, and rms values were selected from a 24-inch octagonal concrete pile driving programs compiled in Appendix I of the Caltrans Technical guidance for the development of impact areas. Of the programs using 24-inch concrete octagonal piles and driven using a diesel impact hammer, Berth 22 in Oakland harbor had the highest reported sound levels, and therefore these biologically conservative levels (i.e., highest sound levels) were used for assessment purposes. The representative project Peak values used for analysis were 188 dB re:1Pa, and rms and SEL values of 176 dB and 166 dB re:1Pa^{2}sec respectively.

Peak, rms, and SEL representative values, ambient and the TL equation were used to develop and define the ZOI for GSTs, fish, and marine mammals. For estimating cumulative impacts from prolonged exposure to biological resources, $SEL_{cumulative}$ was estimated to be the single strike SEL logarithmically increasing the $SEL_{cumulative}$ by the number of strikes per day. The resultant $SEL_{cumulative}$ value is largely dependent on the number of strikes per day. The logarithmic nature of accumulated exposure results is only a marginal increase to the whole from an additional strike after the initial strike. For example, one pile driven with 580 strikes in one day is equivalent to a 193 dB $SEL_{cumulative}$ at 10 m. Five piles in a day results in a $SEL_{cumulative}$ value of 200 dB, despite having almost 2,000 more strikes overall. For the purposes of this estimation, five piles was selected to represent the total number of piles in a day, and therefore total number of strikes over the same time period used to estimate accumulated sound exposure ($SEL_{cumulative}$) was 2,900 strikes per day. This number is biologically conservative, and represents a maximum number of strikes and piles that could be driven in a day. For species of concern within the Proposed Project area, variables used for first-order estimation of impacts are presented in Table 1.

Table 1. Acoustic Inputs used for ZOI distance calculations.

Parameter	Acoustic Metric			
	Peak	SEL	RMS	Ambient Noise Level
Representative single strike level (dB)	188	166	176	133
Distance (m)	10	10	10	
Estimated number of strike per pile	580	Estimated Piles driven in a day		1-5
Total Pile Strikes per day	2900	Cumulative SEL ($SEL_{cumulative}$) at 10 m		200

After applying the surrogate source levels, estimating the pile strikes per day, and calculating $SEL_{Cumulative}$, TL was calculated, and the distances to underwater sound criteria thresholds for GSTs, fish, and marine mammals for the Proposed Project were developed (Table 2). Physical injury and Level B disturbance (behavioral) were examined for each species group, given an equal number of pile strikes in a day, and assuming that each strike has a constant sound level. Using the distances for the calculated sound criteria thresholds, a ZOI for each of the sound criteria was determined for a biological resource. Figure 2 presents ZOIs for fish species assuming Peak injury and Cumulative measures as prescribed by NOAA/NMFS. Figure 3 presents marine mammal ZOIs using the currently accepted behavioral disturbance thresholds using surrogate rms values and estimates of TL. Injury thresholds for marine mammals are not expected as a result of driving 24-in concrete piles, and are therefore omitted.

Table 2. Calculations of the distance of R1 for specific underwater sound disturbance criteria (sound levels) of sensitive marine resources from source (10 m).

Sound Level Criteria	Type of Impact	Sensitive Resource	Distance of Sound Level Criteria (m) [1]
RMS (dB re:1µPa)			
190	Injury	Cetacean Marine Mammals and GSTs	-*
180	Injury	Pinniped Marine Mammals	-*
160	Behavioral	Marine Mammals and GST	116
150	Behavioral	All Fish Sizes	541
Peak (dB re:1µPa^2*sec)			
206	Injury	All Fish Sizes	-*
Cumulative SEL (dB re:1µPa^2*sec)			
187	Injury	Fish ≥ 2 grams	81
183	Injury	Fish ≤ 2-grams	117

[1] estimating 176 dB rms source level, 166 dB SEL, and 188 dB peak. Distance Calculated assuming F=15 and equal spreading/loss. Calculation does not take into account obstructions, changes in substrate type and/or water depth.

*Note: rms, peak, or SEL SPLs at 10 m (33 ft) lower than injury threshold

4.0 THRESHOLDS OF SIGNIFICANCE

The following significance criteria are based on Appendix G of the California Environmental Quality Act Guidelines (14 California Code of Regulations 15000 et seq.), and will be used to determine the significance of potential biological resources impacts. Impacts to biological resources would be significant if the Proposed Project would:

BIO-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW, NMFS, or U.S. Fish and Wildlife Service;

BIO-2: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW, NMFS, or U.S. Fish and Wildlife Service;

BIO-3: Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

BIO-4: Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites;

BIO-5: Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

BIO-6: Conflict with the provisions of an adopted Habitat Conservation Plan; Natural Community Conservation Plan; or other approved local, regional, or state habitat conservation plan.

Impact assessments are categorically defined as a **Potentially Significant Impact**, where there is substantial evidence that an effect may be significant. **Less than Significant with Mitigation Incorporated** is where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." In these situations, mitigation measures will be discussed in section 5.0 of this document. **Less Than Significant Impact** is where the project creates no significant impacts, only less than significant impacts, and **No Impact**, is where the proposed project does not create an impact.

4.1 Marine Mammals

California sea lions and California coastal bottlenose dolphins are the only marine mammals species reasonably expected to occur within the Proposed Project area. California sea lions and Pacific harbor seals are most commonly seen hauled out near the mouth of the Bay and/or on buoys around the Bay. California coastal bottlenose dolphins occur throughout the Bay and move opportunistically to forage for preferred prey. Level A Harassment (physical injury) is not expected to occur based on the projected SPLs from pile driving activities, however single strike Peak SPLs generated from pile driving immediately adjacent to the point of impact would have the potential to approach or exceed the Level A (180 dB rms) injury threshold. Level B Harassment (behavioral) could occur if marine mammals move inside the 160 dB rms isopleths, which are 116 m from the source and encompass an area approximately 43,000 square meters (m^2). The variability in SPLs generated from pile driving activities and the potential impacts to marine mammals from physical contact with construction activities (pile driving equipment, barge movements, etc.), though unlikely, are possible, and therefore poses a **Less than Significant Impacts with Mitigation Incorporated** to marine mammals as defined by BIO-1.

4.2 Eastern Pacific Green Sea Turtle

Although there is no empirical data on the effects of pile driving on GSTs, NMFS has identified impact pile driving underwater sound criteria for GSTs as 190 dB rms for physiological effects (Level A Harassment) and 160 dB rms for behavioral disturbance (Level B Harassment).

In consideration of the documented distribution, foraging, and seasonal movement patterns of GSTs in San Diego Bay, no Level A Harassment (physical) is anticipated based on the projected SPLs from pile driving activities, estimated to be 176 dB rms. Potential Level A harassment to GSTs from physical contact with construction activities (pile driving equipment, barge movements, etc.) is possible, although the shipyards are not recognized as high quality habitat for these species. Level B Harassment (behavioral) has the potential to occur if GSTs enter the 160 dB rms isopleths (sound contours) during proposed pile driving activities (see Figure 2). The 160 dB isopleths are 117 m from source and encompass an area of approximately 43,000 m^2 of the Bay. The spring and summer months would be when there is the highest potential for impact, given warmer Bay waters and the potential for GST movement within the Bay. For this project, there are no pile driving activities scheduled during the spring and summer months, greatly reducing the potential for Level A and Level B impacts to GST. The absence of GSTs within the Project Area and the project schedule greatly reduce the potential for Level A (physical) and Level B Harassment (behavioral), but does not remove the potential for impacts to occur. Therefore, it can be concluded that there are **Less than Significant Impacts with Mitigation Incorporated** to GSTs as defined by BIO-1.

4.3 Fish

Coastal Pelagic Species FMP and Pacific Coast Groundfish FMP managed fish species are not documented to occur directly within the Proposed Project area, but may be present adjacent to the BAE Systems facility and proximally in the Bay. Data from 24-inch concrete pile strike does not exceed 206 dB re:1 μPa^2*sec, the criteria for direct injury to fish from pile driving. The criteria for cumulative effects to fish from repeated exposure to pile strikes is based on the size of the fish. 187 dB $SEL_{cumulative}$ is used for fish greater than 2 grams body weight, and 183 dB $SEL_{cumulative}$ for fish under 2 grams. For fish larger than 2 grams, the ZOI for repeated exposure extends 81 m from source and for those species less than 2 grams, 117 meters from source. The areas of impact and resultant ZOI areas are not high quality habitat for fish, minimizing cumulative exposure risk, but it does not negate the potential for managed fish species in these areas. The 150 dB rms behavioral affects criteria is reached approximately 541 m away from source, assuming equal spreading, and spreading over an area that is similarly considered low quality fish habitat. A low potential for cumulative exposure and hydroacoustic impacts across low quality habitat suggest there are less than significant impacts; however, cumulative impacts to fish as a result of repeated exposure to sound pressure levels within a 117-m ZOI are possible. Therefore, impacts to fish from pile driving can be characterized as **Less than Significant Impacts with Mitigation Incorporated** due to the potential for cumulative exposure effects to fish less than 2 grams.

4.4 California Least Tern

The California Least Tern does not occur within the Project Area, however, there are several CLT colonies on beaches in the Bay, two that are within 5 miles of the Proposed Project site. The lack of CLT presence within the Project Area significantly reduces the potential for direct impacts to CLTs from pile driving. CLT absence through the Project Area similarly minimizes the potential for indirect impacts to CLTs through the cumulative exposure to pile driving strikes. The highest potential for impact are indirect cumulative effect on fish prey species, which may experience behavioral changes from repeated exposure to sound pressure levels (see Section 4.3 for further information on cumulative effects on fish). The greatest potential for impact would be during the nesting season (spring and summer), when CLTs are foraging throughout the Bay, however, the project schedule does not include pile driving during the spring and summer months, greatly limiting the potential for indirect impacts to CLT. While it may be necessary for some in-water construction activity, including dredging, to take place during the CLT nesting season, construction would not impact any nesting areas, as there are no CLT nesting grounds located within the Project Area. Additional information on impacts to CLT species from other project construction activities (including dredging) can be found in the Marine Biological Assessment (M&A 2014) and water quality technical study (AMEC 2014). Project timelines and the proximity of sensitive species to the project area suggest a limited potential for direct and indirect impacts to CLT from the Proposed Project, therefore impacts are determined to be **Less than Significant.**

Table 3 provides a summary of significance for managed marine species that may be directly or indirectly impacted by pile driving activities.

5.0 MITIGATION MEASURES

To mitigate **potentially significant** impacts to GST and marine mammals to **less than significant,** proposed mitigation measures include implementation of the following:

1) BAE Systems shall maintain an on-site biological observer during pile driving activities with the authority to stop construction if a GST or marine mammal approaches or enters the shutdown zone. The shutdown zone is the area within 10 m of construction activities or inside the 190 dB rms isopleths for GST and marine mammal cetaceans or 180 dB rms for marine mammal pinnipeds. Prior to the start of pile-driving activities, the biological observer shall monitor the shutdown zone for 15 minutes to ensure that GSTs and marine mammals are not present. If a GST or marine mammal approaches or enters the shutdown zone during the pile-driving activities, the biological observer shall notify the construction contractor to stop the activity. The pile-driving activities shall be stopped and delayed until the biological observer visually confirms either that the animal has voluntarily left the shutdown zone and is beyond the shutdown zone, or 15 minutes have passed without re-detection of the animal. If the on-site biological observer determines that weather conditions prevent the visual detection of GSTs or marine mammals in the shutdown zone, such as heavy fog, in-water construction activities with the potential to result in Level A Harassment (injury) shall not be conducted until conditions change.

2) Biological monitoring would be conducted by qualified observers. The observer would be placed in the best vantage point practicable to monitor, and when applicable, shall communicate directly with the construction superintendent and/or hammer operator.

3) Prior to the start of any pile driving activities the construction contractor shall implement a soft-start procedure to provide additional protection to GSTs, fish, and marine mammals by providing a warning and/or giving individuals a chance to leave the area prior to the hammer operating at full power. The soft-start procedure would require contractors to initiate noise from the impact hammer with an initial set of one strike at 40% or less energy followed by a 30-second waiting period. If at any point pile driving stops for greater than 30 minutes then the soft start procedure must be conducted prior to the starting of further pile driving activities.

4) During all observation periods, observers shall use binoculars and the naked eye to scan continuously for GSTs and marine mammals. As part of the monitoring process the observer shall collect sighting data and behavioral responses to construction from GSTs and marine mammals observed in the Proposed Project area of activity during the period of construction. The observer shall record any marine mammal, GST, or CLT sightings, and submit the sighting records to the District within 60 days of the completion of the mitigation monitoring with a summary of observations.

6.0 CONCLUSION

As described in Section 4.4, project timelines and the proximity of sensitive species to the Project Area suggest the potential for direct impacts and indirect impacts to the CLT from the Proposed Project will be less than significant. With implementation of mitigation measure described herein, the impacts of the Proposed Project pile driving on GSTs, fish, and marine mammals would be less than significant.

Subject: Phase I Environmental Site Assessment
BAE Pier 1 North Drydock Project
400 East Belt Street
San Diego, California

Dear Mr. Czechowski:

In accordance with our subcontractor agreement dated June 23, 2014, Ninyo & Moore has performed a Phase I Environmental Site Assessment of the above-referenced site. The attached report presents our methodology, findings, opinions, and conclusions regarding the environmental conditions at the site.

We appreciate the opportunity to be of service to you on this project.

Respectfully submitted,
NINYO & MOORE

Adrian Olivares
Senior Project Environmental Scientist

Stephan A. Beck, PG 4375
Manager, Environmental Sciences Division

1. INTRODUCTION

Ninyo & Moore was retained by LSA Associates, Inc. (LSA) on behalf of the San Diego Unified Port District (District) (herein referred to as the client) and BAE Systems, Inc. San Diego Ship Repair (BAE Systems) (project applicant) to perform a Phase I Environmental Site Assessment (ESA) of the property located at 400 East Belt Street in San Diego, California (hereinafter referred to as the site or subject site). The following sections discuss the purpose, the involved parties, the scope of services, and the limitations and exceptions associated with the Phase I ESA.

1.1. Purpose

In accordance with the ASTM International (ASTM) Standard Practice for Environmental Site Assessments on Commercial Real Estate E1527-13, the objective of the Phase I ESA is to identify recognized environmental conditions (RECs). The term recognized environmental conditions means "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions."

Identification of RECs will fall into three categories: existing RECs (as defined above); Historical RECs (HRECs); or Controlled RECs (CRECs). HRECs and CRECs are defined below.

HREC – An HREC is "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations [AULs], institutional controls, or engineering controls)."

CREC – A CREC is a "recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority),

with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, AULs, institutional controls, or engineering controls)."

1.2. Scope of Services

Ninyo & Moore's scope of services for this Phase I ESA included the following:

- Reviewed physical setting and available background information (e.g., topographic maps, geologic maps).
- Performed a site reconnaissance to document potential hazardous materials handling, storage, and disposal practices, areas of possibly contaminated surficial soil or surface water, possible sources of polychlorinated biphenyls (PCBs), underground and aboveground storage tanks (USTs and ASTs, respectively), and possible sources of contamination from activities at the site and adjacent properties.
- Reviewed federal, state, tribal, and local regulatory agency databases for the site and for properties located within a specified radius of the site. The databases documented locations of known hazardous waste sites, landfills, leaking underground storage tanks, permitted facilities that utilize USTs, and permitted facilities that use, store, or dispose of hazardous materials and wastes.
- Reviewed reasonably ascertainable local regulatory agency files for the site.
- Reviewed historical information for the site, such as historical aerial photographs, historical topographic maps, reverse street directories, and Sanborn® fire insurance maps.
- Reviewed user-provided information, as available.
- Interviewed the property occupant regarding the environmental status of the site.
- Performed a preliminary vapor encroachment screening assessment on the site and adjoining properties.
- Prepared this Phase I ESA report, summarizing findings and providing opinions and conclusions regarding RECs at the site. Findings were evaluated with respect to Questions A, B, and D of Section 8, Hazards and Hazardous Materials within Appendix G of the California Environmental Quality Act (CEQA).

1.3. Significant Assumptions

Significant assumptions were not made during the preparation of this report.

1.4. Limitations and Exceptions

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard of care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information or has questions regarding the content, interpretations presented, or completeness of this document.

The findings, opinions, and conclusions are based on an analysis of the observed site conditions and the referenced literature. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control. Ninyo & Moore cannot warrant or guarantee that not finding indicators of any particular hazardous material means that this particular hazardous material or any other hazardous materials do not exist on the site. Additional research, including invasive testing, can reduce the uncertainty, but no techniques now commonly employed can eliminate the uncertainty altogether.

1.5. Special Terms and Conditions

This study did not include an evaluation of geotechnical conditions or potential geologic hazards. In addition, unless otherwise indicated in this report, this Phase I ESA does not include analysis of the following, which is not intended to be all-inclusive: asbestos-containing materials (ACM), methane gas, radon, lead-based paint (LBP), lead-containing

surfaces, lead in drinking water, underground pipelines, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, mold, or high voltage power lines.

1.6. User Reliance

This report may be relied upon by, and is intended exclusively for, the client and its assigns. Any use or reuse of the findings, opinions, and/or conclusions of this report by parties other than the above-referenced client is undertaken at said parties' sole risk.

1.7. Involved Parties

Mr. Adrian Olivares, Senior Project Environmental Scientist, conducted interviews on September 16, 2014, the site reconnaissance on October 20, 2014, and performed regulatory and historical research. Mr. Stephan Beck, Environmental Manager, performed project oversight and quality review.

2. PROJECT DESCRIPTION

The Phase I ESA was requested as part of the preparation of an Environmental Impact Report study for the Pier 1 North Drydock Project, which includes a proposed drydock (dry berth) on the north side of BAE Systems' Pier 1, located within the San Diego Bay, adjacent to the southwest of the site. The proposed drydock would support the current and planned future homeporting of U.S. Naval assets (ships) in San Diego and allow greater flexibility in the utilization of dry-docking facilities. As part of the project, BAE Systems proposes to enter into a long-term real estate agreement with the District on the two-acre land parcel (the site) and four-acre water area, which are currently leased by San Diego Gas & Electric (SDG&E) under a Tidelands Use and Occupancy Permit (TUOP). The site, also referred to as the TUOP parcel, is improved with two underground intake/discharge tunnels, which could be removed during or at a later phase of the proposed project. An evaluation of hazards and hazardous materials associated with the water area portion of the project will be completed under separate cover by AMEC.

The following sections provide a general description of the subject site and adjacent properties. Photographs taken during the site reconnaissance are provided in Appendix A.

2.1. Site Location

The site consists of a single, two acre parcel, located approximately 250 feet southwest of the East Belt Street and Sampson Street intersection, in San Diego, California (Figure 1). The site is identified by the District as 021-028, Parcel No. 2.

2.2. Site Vicinity General Characteristics

The site is located in an area generally developed with maritime-related industrial properties. The site and surrounding properties are identified in Figure 2.

2.3. Current Site Occupants and Property Use

The site is occupied by BAE Systems. The northwest portion of the site is utilized as an off-site parking lot for the BAE Systems facility (2205 East Belt Street), located adjacent to the south-east. The southwest and eastern portions of the site are located within the BAE Systems facility. Access to these areas is through the main facility entrance at 2205 East Belt Street. The subject site is utilized by BAE Systems for parking and material storage.

2.4. Site Improvements

The following sections provide a description of structures, roads, and other site improvements.

2.4.1. Structures

A pre-fabricated metal maintenance building, identified as Building 01, is present on the central-eastern portion of the site within the BAE Systems facility. Temporary trailers are also present on the southern portion of the site. Structures are not present on the northwestern parking lot portion of the site.

2.4.2. Roads

Roads are not present on the site. Site access is provided via East Belt Street.

2.4.3. Heating and Cooling Systems

Heating and cooling systems were not observed. Electricity and natural gas are provided to the site vicinity by SDG&E.

2.4.4. Sewage Disposal

Sewage disposal is provided by City of San Diego.

2.4.5. Potable Water

Potable water is provided by City of San Diego.

2.5. Adjacent Properties

Adjacent properties were observed by Ninyo & Moore personnel on October 20, 2014. The properties adjacent to the site are as follows and as depicted on Figure 2:

- **Northeast:** East Belt Street followed by Burlington Northern Santa Fe (BNSF) railroad tracks and an SDG&E substation.
- **Southeast**: BAE Systems shipyard facility (2205 East Belt Street) followed by similar use maritime-related industrial properties.
- **Southwest**: San Diego Bay.
- **Northwest:** R.E. Staite Engineering, Inc. (2145 East Belt Street) and CP Kelco (2031 East Belt Street) followed by similar use maritime businesses.

3. USER PROVIDED INFORMATION

The following sections summarize information provided by the user to assist the environmental professional in identifying the possibility of RECs in connection with the site and to fulfill the user's responsibilities in accordance with Section 6 of ASTM E1527-13. Mr. Paul Brown, Program Manager, Environmental Land Use Management, with the District was interviewed on November 4, 2014.

3.1. Title Records

A title report was not provided by the client.

3.2. Environmental Liens or Activity and Use Limitations

As the user of this Phase I ESA, Mr. Brown stated he did not search recorded land title records and does not know whether environmental liens are recorded against the site. AULs for the site are related to lease limitations for the lessee.

3.3. Specialized Knowledge

Mr. Brown stated that he has been involved with site investigations at the property.

3.4. Commonly Known or Reasonably Ascertainable Information

Mr. Brown stated the site was previously used by SDG&E's Silver Gate Power Plant for cooling water tunnels and then subleased to BAE Systems. A report prepared by Ninyo & Moore in 2011 identified petroleum and PCB impacts at the property. The report is summarized in Section 3.8.

3.5. Valuation Reduction for Environmental Issues

A property purchase was not involved; therefore, a value reduction is not applicable.

3.6. Owner, Property Manager, and Occupant Information

The site is currently owned by the District and is occupied by BAE Systems.

3.7. Reason for Performing Phase I ESA

The purpose of the Phase I ESA is to conduct environmental due diligence as part of a CEQA review of a proposed project.

3.8. Other User-Provided Information

The client provided Ninyo & Moore with two site assessment reports prepared in July 2004 by ENV America Incorporated (ENV America) and a Subsurface Investigation Report prepared by Ninyo & Moore in May 2011. The reports are included in Appendix B and are summarized below.

Technical and Site Assessment Reports (ENV America, 2004a & 2004b)

According to the report, the site was historically used by SDG&E for the storage of plant waste from the Silver Gate Power Plant, located adjacent to the northwest of the site. Two circulating water tunnels, which extend from the power house (off-site) to the bay, traverse the site. Bay water was used as once-through, non-contact cooling water in the power plant and was transmitted via two intake and two discharge tunnels. Each of the four tunnels are approximately 8 feet by 8 feet.

ENV America performed a historical review, which included review of photographs from the San Diego Historic Society, the County of San Diego Department of Planning and Land Use, and SDG&E files. In the 1930s, the land southwest of Belt Street was created by placement of fill dredged from the bay. In the late 1940s, the site was used for outdoor storage and parking. In 1952, "Pond A" was observed at the site and in 1955 an oil/water separator was present ("Structure C"). In May 1959, another oil/water separator was present ("Structure D"). From 1966 to 1973, a second pond ("Pond B") was present. Reportedly, basement bilge water was piped into the discharge cooling water tunnels to an oil-water separating pond, identified as Noble Lake, which was used for evaporation and settling. In 1974, SDG&E ceased using the pond.

According to the report, since the mid-1960s the site has been subleased to Southwest Marine and ISP Alginates and their predecessor companies. At the time of the preparation of the report, the site was subleased to Southwest Marine for shipyard operations and parking, and ISP Alginates for maintenance activities and parking (ENV America, 2004b).

ENV America performed an investigation focusing on potential impacts from the two former wastewater ponds located on the site (Figure 3). Seven borings were advanced in the vicinity of Ponds A and B, and soil and groundwater samples were collected. The investigation identified the presence of total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), most of which appeared to be chlorinated solvents, polycyclic aromatic hydrocarbons (PAHs), trace metals, and polychlorinated biphenyls (PCBs) in subsurface soil and groundwater (ENV America, 2004a).

Subsurface Investigation (Ninyo & Moore, 2011)

In December 2010, Ninyo & Moore performed a subsurface investigation including advancing 38 cone penetration testing (CPT) / Ultraviolet Optical Screening Tool (UVOST) locations to depths from 40 to 48 feet below ground surface (bgs), advanced 28 soil borings, and installed 15 temporary wells to collect groundwater samples, and collected sediment samples from the cooling tunnels. Based on visual observation of the sediment extracted from the two cooling water tunnels, the sediment generally consisted of silty sands to sandy silts. Sediment samples from the discharge and intake tunnels had a slight hydrocarbon odor, and the samples were generally gray to black in color. The study found TPH, VOCs, PAHs, PCBs, and metals above the laboratory detection limits in soil, groundwater, and the cooling tunnel sediment samples.

4. RECORDS REVIEW

The following sections summarize records reviewed for the site.

4.1. Standard Environmental Record Source - Environmental Database Search

A computerized, environmental information database search was performed by Environmental Data Resources, Inc. (EDR) on September 18, 2014. The search included federal, state, tribal, and local databases. A summary of the environmental databases searched, their corresponding search radii, and number of noted properties of potential environmental concern, is presented in the EDR report provided in Appendix C. The review was conducted to evaluate whether the

site or properties within the site vicinity have been documented as having experienced significant unauthorized releases of hazardous substances or other events with potentially adverse environmental effects.

4.1.1. Geocoded (Mapped) Listings

The site was not listed in the environmental databases reviewed. Off-site properties within 1 mile of the site appeared on various regulatory agency databases. The following table lists databases that were searched and the number of listings (excluding non-geocoded [unmapped] sites). See Appendix C for full descriptions of the searched databases.

Table 1 – ASTM Standard Environmental Databases

Database Name	Search Radius (mile)	Number of Listings
FEDERAL DATABASES		
NPL (National Priority List)	1	0
Proposed NPL	1	0
NPL LIENS (Federal Superfund Liens)	site	0
Delisted NPL	1	0
CERCLIS (Comprehensive Environmental Response Compensation and Liability Information System)	0.5	1
FEDERAL FACILITY (Federal Facility Site Information listing)	0.5	0
CERC-NFRAP (Former CERCLIS sites where no further remedial action is planned under CERCLA)	0.5	10
CORRACTS (facilities subject to Corrective action under RCRA)	1	2
RCRA-TSDF (hazardous waste treatment, storage, or disposal facilities)	0.5	1
RCRA-LQG (large quantity generator)	0.25	18
RCRA-SQG (small quantity generator)	0.25	6
RCRA-CESQG (conditionally exempt SQG)	0.25	1
US ENGINEERING CONTROL (EC)	0.5	0
US INSTITUTIONAL CONTROL (IC)	0.5	0
ERNS (Emergency Notification System)	site	0
STATE/TRIBAL DATABASES		
RESPONSE (State Response Sites, State- and Tribal- equivalent NPL)	1	0
ENVIROSTOR (The DTSC's Site Mitigation and Brownfields Reuse Program; CERCLIS-equivalent)	1	16
SWF/LF (Solid Waste Information System)	0.5	1
LUST (Geotracker's Leaking Underground Fuel Tank Report)	0.5	44
SLIC (Spills, Leaks, Investigation and Cleanup database by the California Regional Water Quality Control Board)	0.5	29
San Diego County Site Assessment and Mitigation (SAM)	0.5	41
UST (registered USTs)	0.25	3
AST (registered ASTs)	0.25	3
FEMA UST (Underground Storage Tank Listing)	0.25	0
VCP (Voluntary Cleanup Program Properties)	0.5	0
Note: LUST = Leaking Underground Storage Tank		

Off-site properties/facilities listed in the database report were evaluated as to their potential to impact soil and/or groundwater at the site. To supplement the information in the EDR report, the State Water Resources Control Board (SWRCB) GeoTracker database was reviewed and/or files were requested from the County of San Diego, Department of Environmental Health (DEH). Information from both sources is included in the facilities of potential concern summaries below. Supporting documentation is provided in Appendix D. The following properties/facilities were interpreted to represent a potential environmental concern to the site, based on their proximity to the site, the nature of the database on which they are listed, and/or the assumed direction of groundwater flow in the site vicinity (southwest):

Table 2 – Facilities of Potential Concern

Facility Name/Address	Distance/ Direction from Site	Database	Summary
BAE Systems (Southwest Marine) 2205 East Belt Street	Adjacent to East	CERC-NFRAP LUST RCRA-LQG SLIC	The facility has two closed unauthorized release cases (H09689-001 and -002) and one open case. The first case was opened as part of the voluntary assistance program (VAP) case for dredged bay sediment that was stockpiled to dry and then disposed of offsite. The second case (-002) was opened when soil sampling as part of an in-place tank closure found petroleum hydrocarbon-impacted soil in the vicinity of a former dispenser. It was estimated that less than 10 cubic yards of impacted soil is present between 5 and 13 feet bgs. The case was closed in May 1998. The third case (2090005) is related to bay sediments and surface water associated with ship repair services performed at the facility. The Regional Water Quality Control Board (RWQCB) is the lead oversight agency. Contaminants of concern include PCBs, metals, petroleum hydrocarbons, and PAHs. In 2012, the RWQCB issued a Cleanup and Abatement Order (CAO) for the shipyard sediment cleanup.

Table 2 – Facilities of Potential Concern

Facility Name/Address	Distance/ Direction from Site	Database	Summary
ISP Alginates (Kelco Division of Merk & Co) 2145 East Belt Street	Adjacent to West	CERC-NFRAP Enviros-tor LUST RCRA-LQG SLIC	The property has 10 unauthorized release cases (H02377-001 through -010), of which, 9 are closed. According to the most recent closure letter for case -009, dated March 15, 2014, 30 areas were identified as potential environmental concerns in Phase I and II ESAs, and by the DEH. Contaminants of concern include TPH, PAHs, PCBs, formaldehyde, calcium chloride, acids, and VOCs. Of the 30 areas of concern, four were recommended for the investigation to be deferred until current operations and infrastructure changes. For the remaining areas, no further action was recommended. The DEH concurred with the consultant and closed the case with residual contamination in soil and groundwater remaining in place. The open case -010 is under the DEH VAP and no information was found at the DEH regarding the specifics of the case.
Continental of San Diego, Inc. (South-west Marine) 1995 Bay Front	149 feet / North	CERC-NFRAP Enviros-tor LUST RCRA-LQG SLIC	The facility has three closed unauthorized release cases (H00120-001 through -003). After reviewing case files from the DEH, it was found that the property was incorrectly plotted by EDR and the property is located approximately 1,000 feet northwest of the site, adjacent to the Coronado Bridge. Based on the distance from the site, this facility is not considered a concern to the subject site at this time.
Silvergate Power Plant (SDG&E Environmental Dept) 1348 Sampson Street	423 feet / ENE	Cortese HMMD LUST SAM SLIC	The former power plant has two unauthorized release cases (H13942-001 and -002). The first case was opened as a result of a fuel oil line leak to soil. Approximately 210 cubic yards of soil were disposed of offsite and the case was closed with residual contamination in soil. A second case (-002) was opened in July 2006 when three 222,000-gallon USTs were closed-in-place. Petroleum hydrocarbon impacts to soil and groundwater were found during the tank closures. Additionally, TCE was found in groundwater, which the consultant attributed to an off-site, upgradient source. The DEH issued a notice to comply letter in May 2012 for past due reports and in December 2013, the case was transferred to the RWQCB.
Chevron Pipeline Rupture Belt Street	793 feet / ESE	SLIC	During drilling of a soil boring in February 2001, an 8-inch unleaded gasoline underground pipe was ruptured. It was estimated approximately 3,000 gallons of gasoline was released to soil and groundwater The case was closed in August 2003.
CP Kelco 2025 East Harbor Drive	893 feet / North	Enviros-tor FINDS RCRA-LQG	The facility has three closed unauthorized release cases (H38979-001 through -003). The facility had three 275,000-gallon diesel and one 275,000-gallon isopropyl alcohol AST that were removed from the property. Site assessment investigations found impacts were limited to the upper 5 feet of soil and groundwater was not impacted.

Notes:
- Distances provided by EDR
- A complete description of each database is provided in the EDR Report (Appendix C).

Based on our review of the database report and previous project experience, numerous off-site facilities of potential environmental concern are present within the site vicinity (within the ASTM-specified search distances). The fact that 73 LUST and SLIC listings

are reported within one-half mile of the site, the site's location in an area with a long history of industrial usage, and on-going sediment remediation project indicates a higher likelihood of off-site releases from hazardous materials and/or petroleum products potentially impacting groundwater at the site. See Appendix C for more detailed regulatory information provided in the database report for the properties in the site vicinity.

4.1.2. Non-Geocoded (Unmapped) Listings

This portion of the regulatory database report includes properties for which regulatory agencies did not report sufficient address information to be plotted by EDR. The listings were reviewed to evaluate their potential impact to the site, based on their interpreted distance/direction from the site, and/or the nature of the database in which they were listed. One facility, Southwest Marine, Inc., located adjacent to the east of the site was listed in the DEH's Site Assessment and Mitigation (SAM) Program database. According to the database, the facility has two closed unauthorized release cases (H09689-001 and -002), which were summarized in Section 4.1.1. It is our opinion that there is a low likelihood that the remaining non-geocoded listings represent an environmental concern to the site at the current time, based on the nature of the listings and/or the interpreted distances of the properties associated with the listings.

4.2. Additional Environmental Record Sources

According to the ASTM Standard, "if the property or any of the adjoining properties is identified on one or more of the standard environmental record sources, pertinent regulatory files and/or records associated with the listing should be reviewed." The purpose of a file review is to "obtain sufficient information" to assist the environmental professional in determining if an REC, HREC, CREC or *de minimis* condition exists at the site in connection with the listing of standard environmental record sources (see Table 1). Because a portion of the site is within the BAE Systems facility, addresses for the site and BAE Systems facility were requested and reviewed. Off-site records were summarized in Section 4.1.1, Table 2. Regulatory records for the site and adjoining properties are provided in Appendix D.

4.2.1. County of San Diego Department of Environmental Health

According to a DEH representative on August 14, 2014, no records were found for the site address (400 East Belt Street). Although a portion of the site is within the shipyard (2205 East Belt Street), the site is primarily used for material storage and parking. DEH records related to the BAE Systems facility were discussed in Section 4.1.1.

4.2.2. San Diego County Air Pollution Control District

According to a representative of the San Diego County Air Pollution Control District (APCD) on July 22, 2014, records were not found for the site address or 2205 East Belt Street. However, APCD records were provided from the RWQCB. APCD permits to operate (PTOs) were issued to BAE Systems for the following:

- Adhesive material application operation
- Solvent recovery process
- Fiberglass reinforced plastic machining booths (Booths A and B)
- Marine coating and adhesive application operations (fixed and portable)
- Marine/metal parts coating operation
- Fiberglass/polyester/epoxy resin operation
- Abrasive blast room with recycling equipment
- Remote reservoir solvent cleaner
- Cold solvent cleaner
- Portable diesel engine to operate a winch
- Diesel engines for:
    - Crane on the Pride of San Diego Dry Dock
    - Dredging crane
    - Floating dry dock

The PTOs pertain to BAE Systems shipyard operations. The permitted equipment was not observed during the site reconnaissance and is not associated with the subject site.

4.2.3. City of San Diego Fire Department

According to a representative of the City of San Diego Fire Department (SDFD) on July 28, 2014, records were not on file for the 400 East Belt Street address. Records were found for 2205 East Belt Street and were reviewed to evaluate whether the listings were

located within the site boundary. According to a hazardous material permit, one 400-gallon propane AST, 20 5- to 7-gallon propane cylinders, and five 25-gallon propane cylinders were approved in July 2009. A second application was on file for the installation of three diesel ASTs of 100-gallon (2) and 210-gallon (1) capacities. The ASTs and cylinders correspond to those observed during Ninyo & Moore's site reconnaissance and are depicted on Figure 3. Other records on file were for additional tanks and UST removal located east of the site.

4.2.4. Regional Water Quality Control Board, San Diego Region

According to a representative of the RWQCB on July 22, 2014, records were not on file for the 400 East Belt Street address. Documents were available for the 2205 East Belt Street address, and pertained to Clean Water Act Section 401 Water Quality Certification documentation for dredging near the Pride of San Diego Dry Dock and Pier 4 Replacement Project. These projects are located outside of the site boundaries and are considered offsite. In 2012, the RWQCB issued a CAO for the shipyard sediment cleanup project. The case was previously summarized in Section 4.1.1.

4.2.5. Industrial Wastewater Control Program

According to a representative of the Industrial Wastewater Control Program (IWCP) on July 29, 2014, records were not on file for the 400 East Belt Street address. The following three records were on file for the 2205 East Belt Street address:

- Permit for vehicle steam cleaning issued to BAE Systems and Southwest Marine. Violations were issued for late/incomplete self-monitoring reports in 2004, 2005, 2009, and 2014, and for an exceedance in zinc levels in 1996.
- An incomplete permit application filed for the San Diego Bay Environmental Restoration Fund, which was filed in June 2014. No permit was issued at the time the IWCP's response.
- A permit for construction dewatering with possible pollutants was issued to BAE Systems in August 2013 and inactivated in October 2013. No violations were issued.

4.2.6. Online Regulatory Databases

Online regulatory databases were reviewed by Ninyo & Moore to supplement the environmental database search conducted by EDR. The following is a summary of pertinent information.

Table 3 – Online Regulatory Databases

Online Database/Website	Findings
Department of Toxic Substances Control (DTSC) Hazardous Waste Tracking System	The site address was not listed.
DTSC EnviroStor	The site was not listed. One adjacent property, Nutrasweet Kelco Co (2145 East Belt Street) was listed as an inactive tiered permit facility. No other information was provided.
DTSC Cortese List	The site was not listed.
State Water Resources Control Board (SWRCB) GeoTracker	The site was not listed. Unauthorized release cases in the site vicinity were discussed in Section 4.1.1.
DTSC List of Facilities with Deed Restrictions	The site was not listed.
California Department of Resources Recycling and Recovery (CalRecycle) Solid Waste Information System	The Coronado Bridge Paint Limited Volume Transfer Operation (LVTO) is located at 1995 Newton Avenue, approximately 2,000 feet north-northwest of the site. Waste material is collected from state right-of-way (ROW), transported to the facility, and then transferred offsite for disposal. Based on the type of type of facility (transfer) and distance from the site, this facility is not an environmental concern to the subject site at this time.
California Department of Oil, Gas, and Geothermal Resources (DOGGR)	Wells were not depicted on the site.
United States Pipeline and Hazardous Materials Safety Administration, National Pipeline Mapping System Map Viewer	A hazardous materials transmission pipeline operated by Kinder Morgan is depicted along the railroad ROW adjacent to the northeast of the site.
Army Corps of Civil Engineers Formerly Used Defense Sites (FUDS) Database	No FUDS properties were depicted within 0.5 mile of the site.

4.3. Physical Setting

The following sections include discussions of topographic, geologic, and hydrogeologic conditions in the vicinity of the site, based upon the referenced document review and/or our visual reconnaissance of the site.

4.3.1. Topography

Based on a review of the United States Geological Survey (USGS), Point Loma, California, 7.5-minute quadrangle map, the site is situated at an elevation of approximately 20 feet

above mean sea level. The topography at the site and vicinity slopes to the southwest toward the San Diego Bay, located adjacent to the southwest of the site (USGS, 2012).

4.3.2. Site Geology

Based on a review of the USGS Geologic Map of the San Diego 30' x 60' Quadrangle, the site is underlain by artificial fill, which is described as deposits of fill resulting from human construction, mining, or quarrying activities. The fill includes compacted engineered and non-compacted, non-engineered fill (Kennedy and Tan, 2008).

During Ninyo & Moore's December 2010 field investigation, 38 CPT / UVOST borings were advanced using a 30-ton truck-mounted CPT rig. Borings were advanced to a maximum depth of 48 feet bgs. UVOST data was simultaneously collected while advancing the CPT borings. According to the UVOST logs, soil was predominately described as sand, sandy silt, silty sand from the surface to approximately 30 feet bgs. From approximately 30 feet to 48 feet, alternating layers of clays, silts, and sands were logged (Ninyo & Moore, 2011).

4.3.3. Surface Water

Natural surface water bodies, including ponds, streams, or other bodies of water, were not observed on the site during the time of the site reconnaissance. The San Diego Bay is located adjacent to the southwest of the site (USGS, 2012).

4.3.4. Groundwater

According to the RWQCB Water Quality Control Plan for the San Diego Basin, the project area is situated within the Chollas Hydrologic Subarea of the San Diego Mesa Hydrologic Area (HA) and Pueblo San Diego Hydrological Unit. Groundwater within the San Diego Mesa HA is exempt from municipal beneficial use (RWQCB, 2007).

During Ninyo & Moore's December 2010 field investigation, temporary groundwater monitoring wells were installed in 15 soil borings. Groundwater depth, as measured from the temporary wells, ranged from 8.4 to 10.1 feet bgs (Ninyo & Moore, 2011).

Groundwater is expected to follow the topography and flow to the southwest. The groundwater flow direction may vary due to hydrogeologic properties such as soil porosity and permeability, tidal influence, groundwater extraction, recharge by irrigation and rainfall, and other factors.

4.4. Site Historical Use Information

Ninyo & Moore conducted a historical record search for the site. This included a review of city directories, historical fire insurance maps, historical aerial photographs, topographic maps, and building department records. The following sections summarize information obtained from the historical sources utilized for this assessment.

4.4.1. City Directories

Available historical reverse street directories from 1927 through 2013 were obtained from EDR and reviewed to evaluate facilities of potential concern, which may have been historically located at or near the site. A summary of notable city directory listings is presented in the table below, and the EDR city directory abstract is provided in Appendix E.

Table 4 – Summary of City Directory Listings

Year	Listings in Address Range of Site and Surrounding Area
1927	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): None in vicinity
1933	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): None in vicinity
1938	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): None in vicinity
1943	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – Kelco Chemicals
1945	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – Kelco Co Plant
1948	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2031 – Shepard Diesel Marine; 2145 – Kelco Co Plant
1952	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2031 – Shepard Diesel Marine; 2095 – Golden MH Constn; 2145 – Kelco Co; 2295 – ETS-Hokin & Galvan (Sampson Ave): 1348 – San Diego Gas & Electric (Silver Gate Station); 1401 – Carter-Delig Oil Co
1955	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2031 – Shepherd Marine; 2095 – Warehouse Water Front; 2145 – Kelco Co Genl Ofc

Table 4 – Summary of City Directory Listings

Year	Listings in Address Range of Site and Surrounding Area
1960/61	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2025 – National Marine Terminal, Inc; 2031 – Shepard Diesel Marine, Johnson Western Constructors; 2095 and 2145 – Kelco Plant; 2295 – ETS-Hokin & Galavan (Sampson Ave): 1401 – Carter-Delig Oil Co, San Diego Maritime Construction
1966	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2095 and 2145 – Kelco Co (Plant); 2293 – Harco Engineering; 2295 – ETS-Hokin & Galvan Elec Contrs (Sampson Ave): 1347 – International Forwarding Co, Universal Carloading and Distributing Co, Western Parcel Service; 1348 – San Diego Gas & Electric (Silver Gate Station); 1401 – National Petroleum Co
1975	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – Kelco Co (Plant) (Sampson Ave): 1335 – San Diego Marine Construction Corp; 1347 –Santa Fe Railway; 1348 – San Diego Gas & Electric (Silver Gate Station); 1401 – National Petroleum Co
1980	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – Kelco Co (Plant) (Sampson Ave): 1335 – SDG&E (Transformers); 1347 – Atchison Topeka & Santa Fe Railway, Ace High Transportation, G&H Transportation Inc; 1348 – San Diego Gas & Electric (Silver Gate Station)
1984	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – Kelco Co (Plant) (Sampson Ave): 1335 – SDG&E (Transformers); 1348 – San Diego Gas & Electric (Silver Gate Station)
1990	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2205 – Southwest Marine
2000	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2205 – Southwest Marine
2006	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2205 – Southwest Marine
2008	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – ISP Alginates Inc
2013	***Site Address:*** Not Listed ***Surrounding Area Addresses*** (E. Belt St): 2145 – RE Staite Engineering

The site address was not listed in the city directory review. Properties in the surrounding area were primarily maritime-related industrial facilities from 1943 to the present.

4.4.2. Sanborn® Fire Insurance Maps

Sanborn® fire insurance map coverage was available for the subject site for selected years from 1921 to 1970. The Sanborn maps are summarized in the table below and provided in Appendix E.

Table 5 – Sanborn Fire Insurance Rate Map Summary

Year	Description
1921	The site and adjacent property to the northwest is submerged tidelands. The Atchison Topeka & Santa Fe railroad is depicted to the north of the site followed by the McCormick Lumber facility. San Diego Marine Construction Co is depicted on a pier/wharf adjacent to the east of the site.
1950 1956 1959 1960 1962 1965 1970 1971	The tidelands at the site and adjacent properties to the northwest and southeast are filled. Structures are not depicted at the site. The Kelco Co, Alginating Plant is depicted adjacent to the northwest. Multiple processing tanks and ASTs containing calcium chloride, formaldehyde, oil, and acids are depicted at the facility. San Diego Marine Construction Co. is depicted adjacent to the southeast of the site. The lumber facility to the north of the site has been replaced by the SDG&E Silvergate Power Plant. Approximately 300 feet to the northeast, on the northeast corner of Sampson Street and Belt Street, an oil and grease warehouse is depicted along with six oil ASTs.

4.4.3. Historical Aerial Photographs

A comprehensive historical aerial photograph review was performed by ENV America in their Technical Report dated July 2004, which included review of the San Diego Historic Society photographs, the County of San Diego Department of Planning and Land Use aerial photographs, and SDG&E files. Excerpts from ENV America's review are included in the table below, along with Ninyo & Moore's historical review for select years from 1953 through 2013. A listing of the photographs reviewed and summary of notable observations from the photograph review is provided in the table below.

Table 6 – Aerial Photographs Summary

Date	Source	Summary
1930	A	The site and adjacent properties to the northwest and southeast are beach and submerged tidelands.
1938	A	The site is vacant, recently filled tidelands.
1941	A	Construction debris is visible on southern portion of the site. The Silver Gate Power Plant is under construction to the north-northeast of the site.
1949-52	A	The site is used for outdoor storage and parking. "Pond A" is present on the south-central portion of the site (1952 photograph).
1953	B	The site appears vacant and Pond A is no longer visible. A dark feature, likely a pond or soil disturbance, is present on the northeastern portion of the site. The adjacent properties to the northwest and southeast are developed with industrial buildings, and the Silver Gate Power Plant is present adjacent to the north-northeast. East Belt Street and railroad tracks are visible adjacent to the north-northeast of the site.
1955	A	An oil/water separator identified as Structure C is on the northeastern portion of the site, north of Pond B.
1959	A	A second oil/water separator, "Structure D" is present adjacent to the south of Structure C.
1963	B	A dark feature resembling a pond is present in the vicinity of Pond B, on the eastern-central portion of the site. Increased industrial development is apparent in the surrounding area.

Table 6 – Aerial Photographs Summary

Date	Source	Summary
1966-73	A	Pond B is present.
1975	B	Automobiles are visible on the northern and central portions of the site. The southern portion of the site appears vacant. The surrounding area is developed with industrial buildings.
1983	B	The eastern and western portions of the site are divided by a fence. A structure in the vicinity of the present-day maintenance building is visible. The surrounding area appears similar to the previous photograph.
1989	B	A portion of the present-day maintenance building is visible.
1994	B	An unknown structure is present north of the maintenance building.
2005	B	An unknown rectangular structure is present on the northeastern portion of the site, along East Belt Street.
2009 2010 2012 2013	B, C	The site and vicinity are in their current configuration. The Silver Gate Power Plant has been replaced by the present-day electric substation.
Sources: A = Technical Report for RWQCB Investigation Order No. R9-2004-0026 (ENV, 2004) B = EDR C = Google Earth Pro		

4.4.4. Building Department Records

Due to the absence of structures at the site, building permits were not reviewed.

4.4.5. Historical Topographic Maps

Historical topographic maps were provided by EDR for the years 1904, 1930, 1942, 1953, 1967, 1975, 1991, 1994 and 1996. In the 1904 and 1930 topographic maps, the site and adjacent property to the northwest and southeast appeared as submerged tidelands. A rail-road track was depicted to the north of the site. In the 1942 through 1996 topographic maps, tidelands at the site and vicinity have been filled; no structures are depicted. In the 1996 map, the site is depicted within a built-up area. Environmental concerns were not noted during the historical topographic map review.

4.5. Adjacent Property History

Facilities of potential concern identified in the surrounding area include the following adja-cent industrial use properties with multiple unauthorized release cases:

- BAE Systems (Southwest Marine) - 2205 East Belt Street
- ISP Alginates (Kelco Division of Merk & Co.) - 2145 East Belt Street
- Silvergate Power Plant (SDG&E Environmental Dept) - 1348 Sampson Street

5. SITE RECONNAISSANCE

The objective of the site reconnaissance was to obtain information indicating the likelihood of RECs in connection with the site. The reconnaissance was conducted on October 20, 2014 by Mr. Adrian Olivares. A site plan is provided as Figure 3 and photographic documentation is provided in Appendix A.

5.1. Methodology and Limiting Conditions

The site reconnaissance consisted of walking on the site and along public sidewalks (for viewing of adjacent/nearby properties). The hazardous materials storage containers were inaccessible at the time of the site reconnaissance, which is considered a limiting condition. Due to security issues within the BAE Systems facility, photographs in certain areas were limited.

5.2. General Site Setting

At the time of the site reconnaissance, the site was developed with a parking lot on the northwestern portion, which is utilized as off-site parking for the adjacent BAE Systems facility. The southern and eastern portions of the site are within the BAE Systems facility. A pre-fabricated metal maintenance building, identified as Building 01, is present on the central-eastern portion of the site. Temporary trailers are also present on the southern portion of the site. The southwestern portion was under construction and is to be used as a truck loading area for the San Diego Bay Cleanup Project. A truck loading ramp was partially dug adjacent to the bay and a truck wash area was under construction. Surface drainage at the site was directed toward storm drains at the BAE shipyard or to the bay.

5.3. Adjacent Property Observations

Adjacent properties were observed from the site and from publicly accessible vantage points (e.g., streets, sidewalks) during the site reconnaissance. Similar use industrial properties were present in the site vicinity. Adjacent properties are depicted on Figure 2 and discussed in Section 2.5

5.4. Site Observations

Ninyo & Moore evaluated the site for evidence of the following potential environmental concerns:

Table 7 – On-Site Observations

Conditions	Observed or Noted	Comments
Hazardous Substances/Petroleum Products	X	Diesel fuel, propane, and four hazardous materials storage lockers were observed within the BAE Systems facility portion of the site.
Waste Generation/Storage/Disposal	X	Dredged solid waste was observed within the remediation area (southwestern) of the site. The debris was being demolished for disposal at an off-site location. A hazardous waste storage area is located adjacent to the northwest of the hazardous materials storage lockers. Drums containing hazardous waste were stored on wood pallets. Additional hazardous waste drums were observed on a pallet with secondary containment in the maintenance building.
ASTs	X	Two 100-gallon diesel ASTs and one 210-gallon diesel AST equipped with electric pumps were observed adjacent to the southwest of the maintenance building. A 400-gallon propane AST and several 5-gallon cylinders were present adjacent to the diesel ASTs.
Potential Evidence of USTs		Not observed
Potential PCB-Containing Equipment		Not observed
Chemical/Petroleum Odors		Not observed
Concrete Patches/Pads	X	Concrete patches were throughout the site and correspond to boring locations from a prior Phase II ESA. Other patches were related to subsurface utilities.
Pools of Liquid		Not observed
Sewage Discharge Pipes		Not observed
Floor Drains/Sumps	X	A sump was under construction at the truck loading ramp area on the southwestern portion of the site. Storm drains were located on the shipyard portion of the site.
Elevator		Not observed
Wells		Not observed

Table 7 – On-Site Observations

Conditions	Observed or Noted	Comments
Drums	X	Approximately 20 empty drums and drums containing hazardous waste were stored on wooden pallets along the southwestern property boundary in the vicinity of the hazardous materials/waste storage area. Approximately twelve drums containing new fuel/oil and hazardous waste were stored on pallets equipped with secondary containment in the maintenance building.
Unidentified Substance Containers		Not observed
Stained Soil or Pavement	X	Stained asphalt and concrete were generally observed throughout the site. Areas of heavy staining were observed on asphalt and concrete floors inside the maintenance building and adjacent to the hazardous materials storage area.
Stressed Vegetation		Not observed
Pits, Ponds, or Lagoons		Not observed
Wastewater Discharges Disposal Systems		Not observed
Septic Systems/Cesspools		Not observed
Municipal Solid Waste Disposal Areas		Not observed

6. PRELIMINARY VAPOR ENCROACHMENT SCREEN

The purpose of the preliminary vapor encroachment screen is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of potential contaminants of concern (COC) vapors in subsurface soils at the site caused by the release of vapors from contaminated soil or groundwater either on or near the site. The potential for VECs beneath the site was evaluated using a Vapor Encroachment Screening Matrix (VESM). The vapor encroachment screening was based on the guidelines presented in the ASTM E2600-10 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions. The VESM included performing a Search Distance Test to identify if there are any known or suspect contaminated properties surrounding or upgradient of the site within specific search radii, a COC Test (for those known or suspect contaminated sites identified within the Search Distance Test) to evaluate whether or not COCs are likely to be present, and a Critical Distance Test to evaluate whether or not COCs in a contaminated plume may be within the critical distance of the site (100 feet for non-petroleum hydrocarbon contaminants and 30 feet for petroleum hydrocarbon contaminants).

Based on the completion of the VESM, it is likely a VEC exists from on- and off-site historical uses. A copy of the VESM is included in Appendix F.

7. INTERVIEWS

Interviews were conducted by Ninyo & Moore with the objective of obtaining information regarding potential RECs in connection with the site. Interviews with present owners, operators, and/or occupants of the site, as well as other knowledgeable parties as appropriate, is mandated by ASTM E1527-13.

7.1. Property Owner Representative

Mr. Paul Brown, Program Manager, Environmental Land Use Management, with the District was interviewed on November 4, 2014. According to Mr. Brown, the site is used for parking and construction equipment lay down by BAE Systems. Mr. Brown is aware of environmental issues associated with historical uses from the site from a 2011 report prepared by Ninyo & Moore (Ninyo & Moore, 2011). Historical uses include cooling water tunnels and surface impoundments. The site and surrounding area was constructed from dredged bay sediment. He does not know whether there has been storage of hazardous materials or wastes on the property and recommended we contact BAE Systems. Mr. Brown stated there is an ongoing bay sediment cleanup related to a CAO issued for the site and surrounding area.

7.2. Property Manager

A property manager was not identified for interview.

7.3. Occupants

Mr. Shaun Halvax completed the Property Background Questionnaire on September 22, 2014. According to the questionnaire, the site has been used for maritime industrial purposes, including ship/boat building and repair since approximately 1915. BAE Systems is not aware of any previous structures at the site. Four USTs were formerly located at the shipyard (all of which are located outside of the site boundaries of this study). Fill soils have

been brought to the site and hazardous materials/waste have been stored at the site. Chemicals have been stored at the site in quantities greater than 5-gallons. There are subsurface wastewater features, including sumps, clarifiers, and discharge systems. Mr. Halvax noted that there are issues related to spills/contamination with properties in the immediate site vicinity. There is also an environmental cleanup lien / AUL filed for the site and pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property.

7.4. Past Owners

Past ownership entities were not made available to Ninyo & Moore during the preparation of this ESA. Therefore, interviews with past site owners were not conducted.

8. FINDINGS

Based upon the results of this Phase I ESA, the following findings are provided.

- The site consists of a single, two acre parcel, located approximately 250 feet southwest of the East Belt Street and Sampson Street intersection. Two underground intake/discharge tunnels traverse the site.

- At the time of the site reconnaissance, the site was developed with a parking lot on the northwestern portion, which is utilized as off-site parking for the adjacent BAE Systems facility. The southern and eastern portions of the site are within the BAE Systems facility. A pre-fabricated metal maintenance building, identified as Building 01, is present on the central-eastern portion of the site. The southwestern portion was under construction and is to be used as a truck loading area for the San Diego Bay Cleanup Project.

- During the site reconnaissance, the following hazardous materials/wastes were observed:

    - Two 100-gallon diesel ASTs and one 210-gallon diesel AST equipped with electric pumps were observed adjacent to the southwest of the maintenance building.

    - A 400-gallon propane AST and several 5-gallon cylinders were present adjacent to the diesel ASTs.

    - Dredged solid waste was observed within the remediation area (southwestern) of the site. The debris was being demolished for disposal at an off-site location.

- A hazardous waste storage area is located adjacent to the northwest of the hazardous materials storage lockers.
- Approximately 20 empty drums and drums containing hazardous waste were stored on wooden pallets along the southwestern property boundary in the vicinity of the hazardous materials/waste storage area. Approximately twelve drums containing new fuel/oil and hazardous waste were stored on pallets equipped with secondary containment in the maintenance building.

- Based on a review of historical records and prior reports, in the 1930s, the land southwest of Belt Street was created by placement of fill dredged from the bay. In the late 1940s, the site was used for outdoor storage and parking. In 1952, "Pond A" was observed at the site and in 1955 an oil/water separator was present ("Structure C"). In May 1959, another oil/water separator was present ("Structure D"). From 1966 to 1973, a second pond ("Pond B") was present. Reportedly, basement bilge water was piped into the discharge cooling water tunnels to an oil-water separating pond, identified as Noble Lake, which was used for evaporation and settling. In 1974, SDG&E ceased using the pond.

- The following environmental assessments identified contamination in soil, groundwater, and sediment at the site as a result of historical uses at the site and potential impacts from off-site sources:
  - ENV America performed an investigation focusing on potential impacts from the two former wastewater ponds located on the site. The investigation identified the presence of TPH, VOCs, PAHs, trace metals, and PCBs in subsurface soil and groundwater.
  - In December 2010, Ninyo & Moore performed a subsurface investigation including advancing 38 CPT / UVOST locations to a maximum depth of 48 feet bgs, advanced 28 soil borings, and installed 15 temporary wells to collect groundwater samples, and colleted sediment samples from the cooling tunnels. The study found TPH, VOCs, PAHs, PCBs, and metals above the laboratory detection limits in soil, groundwater, and sediment samples.

- DEH and APCD records were not found for the site address. Records were available for the adjacent BAE Systems facility, which the eastern and southern portions of the site are located within; however, the available records pertained to other areas outside of the site boundaries.

- SDFD records were not on file for the 400 East Belt Street address. Records were found for the BAE Systems facility and were reviewed to evaluate whether the listings were located within the site boundary. According to a hazardous material permit, one 400-gallon propane AST, 20 5- to 7-gallon propane cylinders, and five 25-gallon propane cylinders were approved in July 2009. A second application was on file for the installation of three diesel ASTs of 100-gallon (2) and 210-gallon (1) capacities. The ASTs and cylinders correspond to those observed during Ninyo & Moore's site reconnaissance and are depicted on Figure 3.

- RWQCB records were not on file for the 400 East Belt Street address. Documents were available for the 2205 East Belt Street address, and pertained to Clean Water Act Section 401 Water Quality Certification documentation for dredging near the Pride of San Diego Dry Dock and the Pier 4 Replacement Project. These projects are located outside of the site boundaries and are considered offsite. In 2012, the RWQCB issued a CAO for the shipyard sediment cleanup project.

- IWCP records were not on file for the 400 East Belt Street address. Three records were found for the BAE Systems facility and were related to violations for late/incomplete self-monitoring reports, exeedance in zinc levels, an incomplete permit application, and permit for construction dewatering with possible pollutants.

- Numerous off-site facilities of potential environmental concern are present within the site vicinity (within the ASTM-specified search distances). The fact that 73 LUST and SLIC listings are reported within one-half mile of the site, and the site's location in an area with a long history of industrial usage, indicates a higher likelihood of offsite releases from hazardous materials and/or petroleum products potentially impacting groundwater at the site. Facilities of potential concern identified in the surrounding area include the following adjacent industrial properties with multiple unauthorized release cases:

  - BAE Systems (Southwest Marine) - 2205 East Belt Street
  - ISP Alginates (Kelco Division of Merk & Co.) - 2145 East Belt Street
  - Silvergate Power Plant (SDG&E Environmental Dept) - 1348 Sampson Street

- Based on the completion of the VESM, it is likely a VEC exists from on- and off-site historical uses.

8.1. Known or Suspect Recognized Environmental Conditions

This assessment has indicated the following evidence of known or suspected RECs and/or HRECs and CRECs in connection with the site:

- From the 1950s to 1974, the former Silver Gate Power Plant utilized the site for settlement ponds (Ponds A and B), oil/water separators (Structures C and D), and Noble Lake, which was used for evaporation and settling of basement bilge water. Two circulating water tunnels, which extend from the power house (off-site) to the bay, traverse the site. Bay water was used as once-through, non-contact cooling water in the power plant and was transmitted via two intake and two discharge tunnels. Site assessments at the site have found TPH, VOCs, PAHs, PCBs, and metals in soil, groundwater, and cooling tunnel sediment samples.

- The site's location in an area with a long history of industrial usage, indicates a higher likelihood of off-site releases from hazardous materials and/or petroleum products potentially impacting groundwater at the site. Facilities of potential concern identified in the surrounding area include the following adjacent industrial use properties with multiple unauthorized release cases:
    - BAE Systems (Southwest Marine) - 2205 East Belt Street
    - ISP Alginates (Kelco Division of Merk & Co.) - 2145 East Belt Street
    - Silvergate Power Plant (SDG&E Environmental Dept) - 1348 Sampson Street
- A portion of the site is utilized as part of the BAE Systems shipyard. Hazardous materials and wastes are stored at the site, and the southern portion of the site is to be used as a truck loading area for the San Diego Bay Cleanup Project.
- Based on the completion of the VESM, it is likely a VEC exists from on- and off-site historical uses.

9. OPINIONS

It is our opinion that this assessment has identified conditions indicative of releases or threatened releases of hazardous substances, pollutants, contaminants, and/or petroleum/petroleum products at the site.

9.1. Evaluation of Recognized Environmental Conditions

The rationale for concluding whether the conditions listed in Section 8, above, represent RECs, HRECs, or CRECs (i.e., the presence or likely presence of hazardous substances or petroleum products on a property due to any release to the environment, under conditions indicative of a release, or a material threat of a future release of hazardous substances, pollutants, contaminants, and/or petroleum/petroleum products at the site) is provided below.

- It is our opinon that the former use of the site by SDG&E for settling ponds, oil/water seperators, and cooling tunnels is considered a REC based on the documented presence of contaminants in soil, groundwater, and the cooling tunnel sediment.
- It is our opinion that the presence of numerous properties in the immediate site vicinity with unuathorized release cases is collectively considered a REC based on the potential to impact groundwater and sediment at the site.

- It is our opinion that the portion of the site currently used for storage of hazardous materials/wastes and as a truck loading area is considered a *de minimis* condition based on the absence of reported releases at the site, that the ship repair operations are not performed at the site, and that the BAE Systems facility is under regulatory oversight.

- It is our opinion that the VEC condition is considered a *de minimis* condition, based on the absence of permanent structures, vapor intrusion into the site building is unlikely.

9.2. Data Gaps

Significant data gaps that would affect the ability of the environmental professional to identify conditions indicative of releases or threatened releases were not encountered during this Phase I ESA.

9.3. Additional Appropriate Investigation

Our findings did not reveal evidence of conditions at the site posing an immediate threat to human health or the environment, or a reportable release, threatened release, or on-going release of a regulated substance at the site.

10. CONCLUSIONS

We have performed a Phase I ESA, in conformance with the scope and limitations of the ASTM Practice E1527-13, of the property located at 400 East Belt Street, San Diego, California. Any exceptions to, or deletions from this practice are described in Section 1.4 and in the body of this report. This assessment has revealed no evidence of RECs in connection with the property except for the following:

- From the 1950s to 1974, the former Silver Gate Power Plant utilized the site for settlement ponds (Ponds A and B), oil/water separators (Structures C and D), and Noble Lake, which was used for evaporation and settling of basement bilge water. Two circulating water tunnels, which extend from the power house (off-site) to the bay, traverse the site. Bay water was used as once-through, non-contact cooling water in the power plant and was transmitted via two intake and two discharge tunnels. Site assessments at the site have found TPH, VOCs, PAHs, PCBs, and metals in soil, groundwater, and sediment samples.

- The site's location in an area with a long history of industrial usage, indicates a higher likelihood of off-site releases from hazardous materials and/or petroleum products potentially impacting groundwater at the site. Facilities of potential concern identified in the surrounding area include the following adjacent industrial use properties with multiple unauthorized release cases:

    - BAE Systems (Southwest Marine) - 2205 East Belt Street
    - ISP Alginates (Kelco Division of Merk & Co.) - 2145 East Belt Street
    - Silvergate Power Plant (SDG&E Environmental Dept) - 1348 Sampson Street

11. NON-SCOPE SERVICES

The following services were performed at the request of the client, which are outside the scope of the Phase I ESA Standard Practice.

11.1. CEQA SIGNIFICANCE OF IMPACTS

The findings of this study and the proposed Pier 1 North Drydock Project were evaluated with respect to Questions A, B, and D of Section 8, "Hazards and Hazardous Materials" within Appendix G of the CEQA Guidelines for the proposed.

A. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

The Pier 1 North Drydock Project is anticipated to increase the quantity of spend abrasive, paint, rust, petroleum products, marine growth, and general refuse through an increase of maintenance and repair activity. However, all the wastes generated are contained and then transported to shore facilities for disposal. Environmental protections related to drydock operations include complete encapsulation of the vessel to prevent fugitive particle emissions, stormwater collection, and zero discharge of industrial wastewater.

The proposed drydock would extend onto the neighboring TUOP parcel. Based on the findings of this Phase I ESA, there is a moderate to high probability that hazardous materials or wastes are present at the site. Any soil or groundwater generated may result in a short-term increase of hazardous waste disposal. If hazardous materials or wastes are encountered during construction activities (e.g., contaminated soil and groundwater), there is low likelihood that the disturbance would create a significant hazard to the public or the environment, with the implementation of mitigation measures (Section 11.2).

B. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Based on the fact that hazardous materials or wastes are anticipated to be associated with the proposed project, there is a moderate likelihood that upset and accident conditions related to hazardous materials or wastes would be associated with implementation of the proposed project. However, implementation of mitigation measures (Section 11.2) would reduce the likelihood of a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

D. Would the project be located on a site, which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

Government Code Section 65962.5 requires that Department of Toxic Substances Control (DTSC) compile a list of facilities/properties in the categories discussed below.

- *Hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code* - The DTSC has designated two facilities in the state of California that fall under this category. These two facilities are located outside of San Diego County.

- *Land designated as "hazardous waste property" or "border zone property"* - The DTSC has not designated any hazardous waste property or border zone properties pursuant to the provisions cited in the Health and Safety Code.

- *Properties with hazardous waste disposals on public land* - The DTSC does not maintain separate records of reports that relate to public lands/properties.

- *Hazardous substance release sites selected for (and subject to) a response action* - The sites that meet this criteria are listed on the "Cortese List" in the DTSC EnviroStor database, which graphically depicts facilities associated with cases with the DTSC and SWRCB. Ninyo & Moore's review of the databases identified the adjacent properties to the northwest, southeast, and north-northeast as substance release properties.

- *Sites included in the Abandoned Site Assessment Program* - The Abandoned Site Assessment Program was intended to include properties in "rural unsurveyed counties." The program concluded in the early 1990s, and properties in the program were transferred to the Cal-Sites database, which has been incorporated into the DTSC's current EnviroStor database. However, the EnviroStor database does not indicate whether a specific site was at one time included in the Abandoned Site Assessment Program and does not have a separate category for abandoned sites. Ninyo & Moore's review of the EnviroStor database, which graphically

depicts facilities associated with cases with the DTSC and SWRCB, did not indicate hazardous substance release properties within or adjacent to the site.

- *Sites with public drinking water wells that contain detectable levels of organic contaminants and that are subject to water analysis pursuant to Section 116395 of the Health and Safety Code* - Based on laws, regulations, and security policies adopted after September 11, 2001, the Department of Health Services no longer makes publicly available the locations of public drinking water wells due to concerns about illegal actions that could endanger public health and safety. In addition, there are currently no wells subject to water analysis pursuant to Section 116395 of the Health and Safety Code, because the analysis required by that Section was to be completed by 1988.

- *Sites with USTs for which an unauthorized release report is filed* - The SWRCB provides this information in its GeoTracker online database. Ninyo & Moore's review of the GeoTracker database identified the adjacent properties to the northwest, southeast, and north-northeast as properties with USTs for which an unauthorized release report was filed.

- *Solid waste disposal facilities from which there is a migration of hazardous waste* - The SWRCB maintains a list of facilities with waste constituents above hazardous levels outside the waste management unit. No such facilities were identified within San Diego County.

- *Sites with cease and desist orders and/or cleanup and abatement orders that concern the discharge of wastes that are hazardous materials* - Ninyo & Moore's review of the SWRCB list of properties with active cease and desist orders or cleanup and abatement orders identified the adjacent property to the southeast with a cleanup and abatement order for the San Diego Bay Cleanup Project.

Based on the information provided above, the site is located adjacent to three properties on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5

11.2. Mitigation Framework

The following mitigation framework measures relating to hazardous materials/wastes are provided.

- Subsurface disturbance activities should include implementation of a soil and groundwater management plan to address the possibility of encountering areas of potential environmental concern. The plan should be prepared by a qualified environmental consultant and should be implemented during subsurface disturbance activities by the contractor under the oversight of an environmental professional on behalf of the project proponent. The plan should address soil and groundwater monitoring, handling, stockpiling, characterization, reuse, export, and disposal protocols. The objective of the plan is to assist the contractor in the excavation, notification, monitoring, segregation, charac-

terization, handling, and reuse and/or disposal (as appropriate) of waste that may be encountered during earthwork activities.

- For areas with documented or suspected impacts to soil and/or groundwater, appropriate worker and community health and safety measures (e.g., dust control, air monitoring, stockpile management) should be implemented by the contractor during soil disturbance activities.

- Based on the potential impacts to soil from potential historical site uses, soil generated during construction activities may be considered a waste, and may require characterization (e.g., analytical testing) prior to reuse, export, or disposal.

- If contamination is discovered, notification to regulatory agencies and proper soil management may be required, particularly if there is the potential to affect public health, safety, and/or the environment.

13. PROFESSIONAL STATEMENT

As required by 40 CFR §312.21(d) and Section 12.13 of ASTM 1527-13, the following statement is included:

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined by §312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Stephan A. Beck, PG 4375
Manager, Environmental Sciences Division

14. QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL

Resumes, which document the professional qualifications, pursuant to 40 CFR §312.10(b)(2), of the persons that prepared and reviewed this report are provided as Appendix G.

USER- AND CLIENT-PROVIDED INFORMATION

INTERVIEWS

PROPERTY BACKGROUND INFORMATION QUESTIONNAIRE

Site Name / Address	**BAE Systems Pier 1N Dry Dock & ~~Cooling Tunnel Removal Project~~ 400 East Belt Street San Diego, California**	**Project No.**	**107764001**

***Please answer *in good faith and to the best of your ability* and elaborate as much as possible on any question answered "yes."**

THE INFORMATION PROVIDED BELOW IS NOT RELATED TO THE COOLING WATER REMOVAL PROJECT

General Environmental

1) Describe the current uses of the site. How long has the site been used for these purposes?

This information has already been provided or is otherwise available in the CAO EIR and Pier 4 replacement project EIR.

2) Describe the structures previously present at the site and their usage/occupants and age.

BAE Systems is not familiar with any "previous" structures.

3) When were the structures constructed, if known?

4) What is the historical land use of the site? Describe the past uses, owners, and operators of the site. (Be as detailed as possible and note approximate time periods, if known.)

Maritime industrial, including ship/boat building and repair going back to approximately 1915.

5) Are there currently, or were there previously any underground storage tanks (USTs) at the site? If so, please describe their capacities and contents.

1. At the foot of the former Pier 4 location, there was a 1,000 gallon UST that was converted into a sewage lift station in about 1987, when then SWM took over that portion of the site from the former tenant, National Pump and Injector. This UST/sewer lift station was removed in 2013 as part of the Pier 4 modernization project.
2. In about 1997, at the foot of the Pier 3 Gantry Tracks, a 10,000 gallon diesel UST was closed in place.
3. In about 1987, a 12,000 gallon gasoline UST was installed on the north end of the site. This UST was removed in 2012.
4. In about 1997, a 12,000 gallon diesel UST was installed on the north end of the site, adjacent to the gasoline UST. This tank was removed at the same time the gasoline UST was removed (2012).

6) Have all USTs been removed from the site? If so, when?

Except for the UST closed in place (No 2 above), no known UST exist at the site.

Site Name / Address	**BAE Systems Pier 1N Dry Dock & ~~Cooling Tunnel Removal Project~~ 400 East Belt Street San Diego, California**	Project No.	**107764001**

7) Was associated underground piping associated with the USTs removed?

   Yes, except for the piping associate with item 2 above. This piping (2") was slurry filled with the tank and closed in place. The line ran from the UST to the head of Pier 3 on the south side.

8) Was soil and/or groundwater sampling conducted at the time of UST removal? If so, please describe.

   Yes. Under the oversight of the DEH and documented accordingly.

9) Are you aware of any environmental issues associated with the site or of potential soil and/or groundwater contamination?

   [XXX] Yes [ ] No

During certain excavation activities associated with the Pier 4 Replacement Project, petroleum and lead contaminated soil was encountered. The Port of San Diego was notified of such events. (See reports)

PROPERTY BACKGROUND INFORMATION QUESTIONNAIRE

Site Name / Address	BAE Systems Pier 1N Dry Dock & ~~Cooling Tunnel Removal Project~~ 400 East Belt Street San Diego, California	Project No.	107764001

10) Have fill soils been brought to the property?

[X] Yes [ ] No [ ] Unknown

11) Has there been storage of hazardous materials or wastes on the property?

[X] Yes [ ] No [ ] Unknown

12) Have any of the following items been stored on the site in containers greater than 5 gallons?

Paint [ ] Yes [X] No [ ] Unknown
Chemicals [X] Yes [ ] No [ ] Unknown
Pesticides/Herbicides [ ] Yes [X] No [ ] Unknown
Automotive-Related Oils/Fuels [X] Yes [ ] No [ ] Unknown

13) Have there been any spills or releases of chemicals, hazardous substances, or wastes on the property?

[X] Yes [ ] No [ ] Unknown

14) Have any hazardous substances, petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or other waste materials been dumped aboveground, buried, or burned on the site?

[ ] Yes [X] No [ ] Unknown

15) Is the site hooked up to a municipal sanitary sewer system or is there a septic tank/system?

[X] Sanitary Sewer [ ] Septic

16) Are/were there any subsurface wastewater features, such as sumps, clarifiers, discharge systems, at the site?

[X] Yes [ ] No [ ] Unknown

17) Does the site discharge wastewater, other than domestic wastewater or storm water, into the sewer or onto another property?

[X] Yes [ ] No [ ] Unknown

18) Other than permission for domestic hookup, have any city, county, or other permits for wastewater discharge been issued to the site?

[X] Yes [ ] No [ ] Unknown

PROPERTY BACKGROUND INFORMATION QUESTIONNAIRE

Site Name / Address	**BAE Systems Pier 1N Dry Dock & ~~Cooling Tunnel Removal Project~~ 400 East Belt Street San Diego, California**	Project No.	**107764001**

19) Is there a transformer, capacitor, or other equipment that may contain PCBs on the site?

[ ] Yes [X] No [ ] Unknown

20) Other than small quantities of legal pesticides used for landscape maintenance (e.g., Roundup), have pesticides, herbicides, or insecticides been applied on the site?

[ ] Yes [X] No [ ] Unknown

21) Are/were there any wells on the site (e.g., water supply wells, groundwater monitoring wells, etc.)

[X] Yes [ ] No [ ] Unknown

22) Are there currently, or were there previously, any pits, ponds, or lagoons on the site?

[ ] Yes [X] No [ ] Unknown

23) Are there currently, or were there previously, areas on the site with stained soil?

[ ] Yes [X] No [ ] Unknown

24) To your knowledge, have adjoining properties been used for industrial activities, such the following? (Please note that an adjoining property is a property that is contiguous with, or directly across the street from the site.)

Gasoline Station [ ] Yes [X] No [ ] Unknown
Printing Facility [ ] Yes [X] No [ ] Unknown
Metal Plating/Manufacturing [X] Yes [ ] No [ ] Unknown
Landfill [ ] Yes [X] No [ ] Unknown
Auto Repair Facility [ ] Yes [X] No [ ] Unknown
Dry Cleaners [ ] Yes [X] No [ ] Unknown
Junkyard [ ] Yes [X] No [ ] Unknown
Waste or Wastewater Treatment [ ] Yes [X] No [ ] Unknown
Storage, Disposal, or Recycling Facility [ ] Yes [X] No [ ] Unknown

25) Are there any known issues related to spills/contamination with adjoining or nearby properties?

[X] Yes [ ] No [ ] Unknown

26) Are you aware of any previously prepared documentation for the site, such as:

- environmental sampling, compliance audit, or assessment reports
- environmental permits
- registrations for aboveground or underground storage tanks
- material safety data sheets (MSDS)
- community right-to-know plans
- safety plans; preparedness and prevention plans; spill prevention, countermeasure, and control plans
- geotechnical or hydrogeologic reports

PROPERTY BACKGROUND INFORMATION QUESTIONNAIRE

Hi Adrian,

Shaun forwarded over some answers to the questionnaire – although he did mention that much of the information could be found in past studies conducted. Would you be able to pull any of the info you seek from the past reports done for the property? All the reports we have are posted on the Sharepoint site in the Cooling Tunnels Reference folder.

I will also check with Larry to see if there is anything else he can provide. Thanks!

Best Regards,

Hi Larry and Shaun,

Please find attached the Phase 1 ESA Questionnaire that Ninyo & Moore has sent over. We will need these questionnaires filled out as part of the Phase 1 ESA being done for the TUOP parcel as noted in Adrian's email below. Please let us know if you have any questions or comments. Thank you!

Hi Kelly,

As requested, please see the attached Phase I ESA questionnaires. The user questionnaire should be completed by the party requesting the Phase I ESA and the property background questionnaire should be completed by the property owner and tenant.

Thanks,

DISCLAIMER

This Site Assessment Report of the Tidelands Lease Area at Silver Gate power Plant (Report) was prepared for the sole use and benefit of the San Diego Gas and Electric Company (Client) and for the specific Site known as Silver Gate Power Plant Landside Tidelands Lease Area, located at the foot of Sampson Street, San Diego, California 92113. Neither this Report, nor any of the information contained herein, shall be used or relied upon for any purpose by any person or entity other than the Client and for the Site.

ENV America makes no warranty as to the accuracy of statements made by others which are contained in this Report, nor are any other warranties or guarantees, express or implied, included or intended in this Report with respect to information supplied by outside sources or conclusions or recommendations substantially based on information supplied by outside sources. This Report has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing the same or similar services.

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature, but shall be a representation of findings of fact from records examined.

1.0 INTRODUCTION

1.1 General Project Description

This Site Assessment Report (Report) was prepared by ENV America Incorporated (ENV America), on behalf of the San Diego Gas and Electric Company (SDG&E), to investigate possible soil and groundwater impacts related to past use of wastewater ponds located southwest of the Silver Gate Power Plant in San Diego, California (Figures 1 and 2).

This Report summarizes the results of an investigation conducted in accordance with the *Workplan for Site Assessment, Former Wastewater Ponds, Silver Gate Power Plant* (Workplan) (ENV America, 2002). This investigation was conducted to determine if adverse residual chemical impacts exist below two former ponds. The investigation scope of work included the collection and analysis of soil and water samples from seven hydraulic–push borings. Eight borings were originally proposed; however, only seven were drilled due to access restrictions. Field activities were conducted in August 2003.

1.2 Site Location and Description

The area of interest (the Site) is located between Belt Street and San Diego Bay, at the foot of Sampson Street, southwest of the Silver Gate Power Plant in the City of San Diego (City), California (Figures 1 and 2). The property has Assessors Parcel Number 760-022-06.

SDG&E leases the land from the Port of San Diego (Port). Exhibit A includes a copy of SDG&E's Use and Occupancy Agreement, which describes the legal boundaries of the land that SDG&E leases from the Port. The current occupants of the Site are Southwest Marine and ISP Alginates. Southwest Marine and ISP Alginates occupy the Site via sublease agreements.

1.3 Objectives

The primary objective of this investigation was to characterize the potential residual contamination that may be present on the Site due to former wastewater pond operations. In the next few years, SDG&E plans to disassemble and remove the power

839
63732 PAGE 839
SAR193335

plant, and SDG&E plans to terminate the associated leases of adjacent properties, including the Site. As part of terminating these leases, SDG&E intends to restore the properties to a condition that is mutually agreeable to SDG&E and the property owners. SDG&E requested that ENV America conduct this site assessment to determine Site conditions, to aid in determining if Site conditions warrant restoration activities.

2.0 BACKGROUND INFORMATION

This investigation focused on potential impacts from the two former wastewater ponds located on the Site. The ponds were identified in historical documents and are referred to here and in the site investigation workplan (ENV America 2002) as Pond A and Pond B.

After the site investigation field work was completed, a number of additional historical photographs were obtained, which indicated that there were two additional wastewater structures on the Site. The additional wastewater structures apparently were oil/water separators. We have named these features Structure C and Structure D.

The following section provides a brief history of the Silver Gate Power Plant operations relating to the Site.

2.1 Plant Operations and History

The Silver Gate Power Plant includes four electric generating units contained within a powerhouse. The power house contains six boilers which supplied steam to four steam turbine generating units, known as Units 1 through 4. The Silver Gate Power Plant was built between 1943 and 1952, and operated until the mid-1980s. All of the power plant's operating permits and licenses have expired.

The plant operated almost continuously from 1943 to 1974. The power plant was used intermittently after 1974 to meet peak demands, but generally ran at minimal capacity. The boilers initially burned fuel oil, and in later years were converted to burn both natural gas and fuel oil.

Water from the bay was used as once-through, non-contact cooling water in the power plant. The cooling water was transmitted via four tunnels (two intake tunnels and two discharge tunnels) constructed upon land that SDG&E leased from the Port and the Atchison, Topeka and Santa Fe (AT&SF) Railway. Each of the four tunnels had cross-sectional dimensions of approximately 8 feet wide by 8 feet tall. The non-contact cooling water was passed through tube-type condensers to condense the steam.

841

63732 PAGE 841

SAR193337

The power plant and associated switchyard and substations are located on property owned by SDG&E. The circulating water tunnels (CW tunnels) are located on leased land (Figure 2).

The leased land comprises the following parcels.

AT&SF Railway Land

- Land that is currently occupied by parking lots and railroad tracks

Port Land

- Parcel 1, land that is currently occupied by Belt Street
- Parcel 2, land that is currently occupied by ISP Alginates, Inc., a chemical manufacturer, and Southwest Marine, a shipyard
- Parcel 3, a wharf lease (submerged tidelands).

2.2 History of Wastewater Operations on Parcel 2

This Section describes the wastewater operations on Parcel 2.

Historical photographs were obtained from SDG&E, the San Diego Historical Society and the County of San Diego Department of Planning and Land Use Cartography Department. Copies of the historical photographs are included in Exhibit A. The photographs indicate that there were two wastewater ponds and two subgrade oil/water separators on Port Parcel 2.

- Wastewater settling/evaporation ponds
  - Pond visible in photographs from 1952 (herein named Pond "A")
  - Pond visible in photographs from 1966 to 1973 (Pond "B")
- Oil/water separator structures
  - Structure visible in photographs from 1950 to 1952 (herein named Structure "C")
  - Structure visible in photographs from 1959 (Structure "D")

The photographs allowed us to plot the locations these four structures on a scaled site map (see Figure 2). The photographs from 1952 also indicate a surface spill occurred in 1952 when a plug in piping led to overflow of liquid onto adjacent ground.

An illustration prepared by Southwest Marine Construction Company in 1970 (see Exhibit A) showed a proposed ship haul-out that was to be constructed over Pond B. Aerial photographs indicate that the planned structure was not built.

An internal SDG&E memorandum from 1974 described Pond B as an oil-water settling pond, and included a drawing that illustrated how the pond received wastewater from the bilge trenches of the power house. The memo stated that the pond had reached its capacity; therefore, the memo concluded that it could not be relied upon for future use and proposed alternatives. In 1977, SDG&E completed construction of a wastewater treatment plant. Many plant documents indicate that this plant was used to treat bilge wastewater from the power plant. The records indicate that use of Pond B ceased circa 1974.

Today there is no visible surface evidence of the former ponds and structures.

2.3 Geology and Hydrogeology

The following description of geology and hydrogeology is in part based on a recent geotechnical investigation of Belt Street (Allied Geotechnical Engineers, 2000).

Belt Street follows the former Bay shoreline. In the 1930s the land southwest of Belt Street was created by placement of fill dredged from the Bay (see historical photographs in Exhibit A). Consequently, the shallow geology northeast of Belt Street is different from the shallow geology southwest of Belt Street.

Northeast of Belt Street, there are three shallow stratigraphic units:

- Variable thickness of fill soil
- Five to 10 feet of alluvium/colluvium
- Pleistocene terrace deposits (also known as the Bay Point Formation).

The alluvium and colluvium are generally described as tan to gray, dense silty sand. The Pleistocene terrace deposits are described as brown to gray brown, poorly cemented, dense to very dense silty sand.

The fill deposits south of Belt Street are reportedly hydraulically dredged Bay material. Allied Geotechnical Engineers (2000) described the Bay deposits below Belt Street as medium to dark gray, loose to dense silty sand with occasional layers of organic–rich material, lean sandy clay, and shell fragments.

843

63732 PAGE 843
SAR193339

The property and surrounding area are located within the Chollas Hydrologic Sub Area (HSA 8.22), which is designated as a non-beneficial groundwater use area by the San Diego Regional Water Quality Control Board (RWQCB).

Field observations of Parcel 2 indicate that the surface soil is a silty fine sand with shell fragments. Underlying fill soil, as recorded on boring logs in Exhibit A, is generally poorly graded sand with shell fragments. The depth to groundwater in Parcel 2 was approximately 10 feet below ground surface (bgs) in August 2003.

2.4 Site Conceptual Model

Based on the six borings advanced through the locations of the former ponds and one boring advanced adjacent to the former Pond B, each pond generally has the following stratigraphy:

- 0 to 6 inches bgs: Pavement
- 6 inches to 3 feet bgs: Fill soil
- 3 to 5 feet: minor staining of fill soil possibly from pond operations (Pond B only)
- 5 to 20 feet bgs: Fill soil
- >20 feet bgs: Beach and near-shore sediments (not confirmed during drilling)

Cross-sections A-A' and B-B' depict the subsurface beneath the former wastewater Ponds A and B. Cross-section locations are shown on Figure 3 and cross-sections A-A' and B-B' are on Figure 4.

The potential receptors of concern are industrial workers or construction workers, who could be exposed to soil by subsurface excavation activities; and the Bay, which could be impacted by potential lateral migration of groundwater.

3.0 SUMMARY OF SITE INVESTIGATION ACTIVITIES

3.1 Overview

The Site investigation was conducted in accordance with a Workplan prepared by ENV America (2002). Of the eight proposed boring locations, only seven were advanced due to access restrictions. Fieldwork was conducted on August 7, 2003.

3.2 Preliminary Activities

A Site visit was performed prior to the initiation of drilling to reconnoiter the proposed work area. To minimize the potential for damage to underground utilities, Underground Service Alert (commonly referred to as "USA" or "Dig Alert") was notified so that local utilities could mark underground lines in the Site vicinity. A geophysical survey was conducted to identify any obstructions or utilities in the area of the borings.

Permits were secured from the County of San Diego Department of Environmental Health and the Port of San Diego. Copies of the permits are included in Exhibit C.

3.3 Sampling Methodology

Seven of the eight proposed boreholes were advanced directly below or adjacent to the footprint of the two former ponds for the purposes of soil sample collection and groundwater investigation (Figures 2 and 3). Access restrictions prevented drilling at one of the proposed locations. The borings were advanced using a direct-push drill rig. Gregg Drilling and Testing, Inc., of Signal Hill, California, provided a Marl 5T, rubber track-mounted drill rig and support vehicles.

A garage-type building is located within the footprint of Pond B; therefore, one boring was advanced immediately northwest of the footprint of Pond B. Each boring was cored continuously for lithologic logging purposes. The borings were advanced to approximately 5 feet below the water table (a total depth of approximately 16 feet bgs). A California Registered Geologist (RG) logged soils in general accordance with American Society of Testing and Materials (ASTM) Method Number D2488-90, Description and Identification of Soils (*Visual-Manual Procedure*). The soil samples were used for subsequent analytical testing, as well as for lithologic interpretations. The

845
63732 PAGE ONE
SAR193341

lithologic conditions encountered during drilling are described in the boring logs in Exhibit B.

Soil headspace samples were collected in resealable plastic bags at 1 to 5 foot intervals and screened with a photo ionization detector (PID) to assist in selection of soil samples for laboratory submittal. Based on the results of the headspace readings and visual observations, three soil samples were retained from each boring (one sample from the shallow fill above the former pond bottom, one sample from the approximate depth of pond sediments, and one sample from the soil underlying the pond sediments) and submitted to a fixed-base analytical laboratory to determine the concentration of constituents of concern. Sample selection was biased to include any stained or odorous soils.

Each sample submitted to the laboratory was identified with a two-unit designation such as B2-2.0. The first unit indicates the borehole number (B2) and the second unit indicates the sample depth (e.g., 2.0 feet below ground surface [bgs]). Soil samples were collected in acetate sleeves and capped with Teflon®-lined caps, labeled, entered into chain-of-custody, and stored on ice in a cooler.

One groundwater sample was collected from each boring in laboratory-supplied, pre-cleaned, pre-preserved containers. Samples were collected using a peristaltic pump and disposable tubing within new PVC pipe and screen. Samples for metals analysis were field filtered using a 45-micron filter. Each sample submitted to the laboratory was identified with a two-unit designation such as B2-080703. The first unit indicates the borehole number (B2) and the second unit indicates the sample date. Sample bottles were labeled, entered into chain-of-custody, and stored on ice in a cooler.

Each boring was backfilled with medium bentonite chips, hydrated with potable water; and the pavement was patched using cold-patch asphalt, to match existing conditions.

3.4 Quality Control Samples

Quality control (QC) samples included one groundwater duplicate (duplicate of sample B2-080703 was labeled B9-080703) and one trip blank (TB-080703). In addition, sufficient volume was collected for laboratory QC samples.

Because disposable sampling equipment was used, no equipment blank samples were collected.

3.5 Equipment Decontamination

To prevent cross-contamination between samples and borings, routine precautions were implemented. These precautionary measures included decontaminating sampling equipment, and using a three-bucket wash between each sample drive. All drilling equipment (e.g., continuous core samplers, drilling rods) was decontaminated by washing with a non-phosphate detergent, rinsing with potable water, and rinsing with deionized water.

Disposable equipment such as nitrile gloves and bailers were discarded between samples. In most cases, pre-cleaned disposable samplers were used (e.g., acetate sleeves and tubing).

3.6 Investigation-derived Waste

Since the drilling method was direct push, no soil cuttings were generated. Investigation derived waste (IDW) consisted of one 5-gallon bucket of water generated during decontamination of equipment. The water was taken by the drillers back to their shop to be combined with other wastewater, batched, sampled, and disposed of properly.

3.7 Worker Health and Safety

Worker health and safety was addressed in a Site-specific Health and Safety Plan [ENV America 2003]. All Site work was conducted in accordance with the Site-specific Health and Safety Plan.

847
63732 PAGE SAR193343

4.0 ANALYTICAL TESTING

4.1 Analytical Program

All samples collected from the Site were submitted under chain of custody (COC) to American Environmental Testing Laboratory, Inc. (AETL), of Burbank, California. AETL is certified by the State of California, Department of Health Services' Environmental Laboratory Accreditation Program (ELAP).

Soil and groundwater samples collected from the borings were analyzed for one or more of the following: total petroleum hydrocarbons within the gasoline, diesel, and heavy hydrocarbon ranges (TPH-g, TPH-d, and TPH-h, respectively) by USEPA Method 8015 (modified); polychlorinated biphenyls (PCBs) using USEPA Method 8082; volatile organic compounds (VOCs) by USEPA Method 8260; semi volatile organic compounds (SVOCs) by USEPA Method 8270; and, Title 22 metals by USEPA Method series 200.7/6010/7000. The chemical analyses were consistent with those proposed in the Workplan. The laboratory reports and COC records are presented in Exhibit D. Soil and groundwater analytical results are summarized in Tables 1 and 2, respectively.

4.2 Soil Sample Analytical Results

All 21 soil samples were initially analyzed for TPH-d and TPH-h. Additional analyses (TPH-g, VOCs, SVOCs, PCBs, and metals) were then requested for the sample from each boring with the highest preliminary TPH-d and TPH-h results. Since preliminary results showed that Boring B8 had no detectable concentrations for TPH, no additional analyses were requested. However, Sample B8-10 was analyzed for VOCs due to laboratory error in reading the COC instructions. Soil analytical results are summarized in Table 1, and laboratory reports are included as Exhibit D.

TPH Results

Total petroleum hydrocarbon soil results for gasoline, diesel, and heavy hydrocarbons ranged from non-detectable to 46.5, 1960, and 5360 milligrams per kilogram (mg/kg), respectively. The highest soil TPH results for all three ranges were found in Boring B2 at 2.0 feet bgs. Analytical results for TPH-g, TPH-d, and TPH-h are summarized in Figure 5.

848
63732 PASAR193344

VOC Results

Seven soil samples, one from each boring, were analyzed for VOCs. Only soil one sample, B2-2.0, had VOC concentrations which exceeded the practical quantitation limit (PQL) for the method.

SVOC Results

Six soil samples were analyzed for SVOCs. Concentrations above the method detection limit (MDL) were not detected for samples B3-4.0 and B7-2.0. Of the remaining soil samples, the highest concentrations were found in Samples B2-2.0 and B6-2.0.

PCB Results

Six soil samples were analyzed for PCBs. Four of the six soil samples analyzed did not report PCB concentrations above the MDL. Only two of the Aroclors were detected above the MDL. Aroclor-1254 was reported at concentrations ranging from non-detectable to 2,800 micrograms per kilogram (ug/kg). Aroclor-1260 concentrations ranged from non-detectable to 1,600 ug/kg.

Metals Results

Six soil samples were analyzed for Title 22 metals. The metals antimony, arsenic, beryllium, cadmium, mercury, selenium, silver, and thallium were not detected in any sample. Chromium was reported at concentrations ranging from 5.5 mg/kg in Boring B3 at 4.0 feet bgs to 4,220 mg/kg in Boring B2 at 2.0 feet bgs. Lead concentrations ranged from non-detectable to 520 mg/kg in Boring B4 at 3.0 feet bgs.

4.3 Groundwater Sample Analytical Results

All eight groundwater samples (including one duplicate) submitted to the laboratory were analyzed for TPH-g, TPH-d, TPH-h, VOCs, SVOCs, PCBs, and metals. SVOCs and PCBs were not detected in any of the groundwater samples. Concentrations of TPH, VOCs, and metals are discussed below. Groundwater analytical results are summarized in Table 2, and laboratory reports are included as Exhibit D.

TPH Results

TPH-g concentrations ranged from non-detectable (6 samples) to 45.9 micrograms per liter (ug/L) in Boring B5. TPH-d and TPH-h concentrations were not detected above the PQL in any of the samples analyzed. Analytical results for TPH-g, TPH-d, and TPH-h are on Figure 6.

VOC Results

VOC concentrations for groundwater samples from Borings B2, B3, B4, and B8 did not exceed the PQL. Samples from Borings B5, B6, and B7 contained several detectable compounds, most of which were chlorinated hydrocarbons.

Metals Results

The metals antimony, arsenic, beryllium, cadmium, lead, mercury, selenium, silver, and thallium were not detected in any sample. With the exception of barium and nickel, metals were not detected at concentrations exceeding the PQL.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The objective of this investigation was to evaluate potential environmental impacts from former wastewater ponds associated with the Silver Gate Power Plant. The approximate locations of the former ponds were identified using historical aerial photos and maps. Data generated from borings located within and around the former waste ponds indicated that Pond A soil contained low concentrations of organic compounds, including TPH in the diesel and heavy oil range, and SVOCs. However, none of the soil samples from Pond A contained detectable VOCs, PCBs, or appreciable metals. Soil data from Pond B showed the presence of organic and metal analytes. The occurrence of shallow soil contaminants was generally coincident with what was visually identified to be the base of the former ponds. Hydrocarbon soil concentrations typically decreased rapidly with depth, indicating limited vertical migration. Maximum TPH concentrations were below the "Petroleum Residual NAPL Saturation" concentrations referenced in the County of San Diego SAMD manual. Chromium and benzo(a)anthracene were detected in one sample from Pond B soil at concentrations above US EPA industrial Preliminary Remediation Goals (PRGs).

Groundwater beneath the site was sampled through temporary PVC screens that were placed in the borings. Low hydrocarbon concentrations were detected in both Pond A and B areas. No SVOCs or PCBs were detected in groundwater. Volatile compounds including chlorinated solvents were detected in groundwater; however, there are no local numerical standards for non-beneficial use areas. All solvent compound concentrations were well below the applicable US EPA National Recommended Ambient Water Quality Criteria for Saltwater Aquatic Life Protection numerical standards. Based on these criteria, groundwater quality beneath the former Ponds meets regulatory criteria.

INTERNAL CORRESPONDENCE

FORM 118-61439

FROM A. W. Hovland DATE September 10, 1974

TO M. J. Horna FILE NUMBER EPE 000

SUBJECT Proposed Bilge System Revision for Oil Spill Prevention at Silver Gate

1.0 INTRODUCTION

Recent State Regulations and also physical changes to the bilge system at Silver Gate have created the need to review alternatives to our existing Bilge System. Specifically, these changes are as follows:

1. The oil-water settling pond known as "Nobles Lake" is presently filled to an overflowing condition, thus the discharge from Silver Gate will eventually find a path to the San Diego Bay.
2. A report by Russell Associates advises a total reconstruction of the pond.

The nature of this memo is to review both of the above comments and to recommend a possible alternate solution. These suggestions are intended to be preliminary and not too detailed. The Mechanical Engineering Section of SDG&E along with Fluor-Pioneer are planning additional studies and engineering on this particular subject.

2.0 SUMMARY

The present system utilizes a common header that ties in 8-turbine room sump pumps and 8-boiler room sump pumps. Their

RECEIVED
San Diego Gas & Electric Company

MECH. ENG. DEPT.

Extension 1483

898
63732 SAR193394

total capacity is 800 gal/min, although they are seldom if ever used at full rated capacity. The common header is routed via underground 8" pipe on Sampson Street, then to Nobles Lake. See attached Figures 1 for existing Bilge System, and Figure 2 for Nobles Lake location.

Nobles Lake is filled to the brim and is at least 11 feet deep with a mixture of oil and earth. It is no longer an acceptable settling pond. It is not desirable to pump any additional bilge water to it.

The alternative to discharging the bilge to Nobles Lake is as follows. We have three possible storage locations at the Silver Gate plant proper so why not pump the bilge system into either one or more of the holding tanks? These tanks are located in the C.W. Deck void spaces that hold approximately 90,000 gallons, 190,000 gallons and 190,000 gallons. A common header system could be built to tie in both the turbine room sump pumps (presently draining to the C.W. discharge) and the boiler room sump pumps that would pump the bilges directly to any one of the void spaces. These void spaces will act as holding tanks that are periodically pumped out into an oil-water separator. See Figure 3 for proposed configuration.

The Argo International Corporation is marketing a Separation Recovery-System (SRS) that will separate water and oil at

the rate of 10 parts per million oil in water. This system or equivalent could be piped to the Circulating Water System Discharge if at least one CW pump is on (to dilute the concentration to less than 0.1 parts per million) or to the City Sewer System. The latter may require permission from the City of San Diego.

This type of oil separation is used extensively by the Navy to purify bilge water before pumping overboard. It will work for minor oil spills in an oil-water mixture. However, for Major Diesel oil or fuel oil spills, it would quickly clog up and be in-operative. In this event, an overflow indicator on the oil-water separator would shut off the void suction pump, such that oil would be totally contained within the void space. This "secondary" containment of a fuel oil spill would hold the spill until removed by other means (i.e. trucks from Pepper sufficiently equipped to pickup oil spills).

One void that could retain the proposed Bilge System discharge presently contains air-preheater wash which has a relatively high pH that must be neutralized before pumping it to the city sewer system. If this were to be pumped to the proposed oil water separator prior to treatment, it could destroy the filtering elements of the separator. This could be resolved by using the other smaller void space for preheater wash and utilizing the larger void space for the Bilge System.

900
63732 SAR193396

Engineering calculations should be made with regard to capacities and flow rates for both effluents.

3.0 CONCLUSIONS

As mentioned above this work is preliminary and requires additional detailed studies by the Mechanical Engineering Section of SDG&E and by Fluor-Pioneer. However, this proposed Bilge System Revision has been discussed and the highlights are as follows:

1. To permanently delete "Nobles Lake" as a settling pond.
2. Re-pipe both boiler and turbine Bilge Systems to the void space on the CW deck.
3. Install an oil-water separator to purify the bilge water before removal from the plant.

For a quick look at the minimum cost of such a proposition, I have renewed a 1972 estimate on labor, man-hours and material costs and have applied appropriate budgetary correction factors. The estimated total estimated cost (in 1975 dollars) of the project is $75,000 including filling in of "Nobles Lake". In view of the high cost, it will probably be postponed beyond the 1975 construction budget. Nevertheless, additional design studies should be made to determine compliance to the law on oil-spill counter-measures.

TIDELAND USE AND OCCUPANCY PERMIT

THIS PERMIT, granted this 20th day of March, 2000, by the SAN DIEGO UNIFIED PORT DISTRICT, a public corporation, hereinafter called "District," to SAN DIEGO GAS & ELECTRIC COMPANY, hereinafter called "Tenant," WITNESSETH:

District for the considerations hereinafter set forth, hereby grants to Tenant upon the terms and conditions and for the purposes and uses hereinafter set forth, the right to use and occupy a portion of those lands conveyed to the San Diego Unified Port District by that certain Act of the Legislature of the State of California, entitled "San Diego Unified Port District Act," Stats. 1962, 1st Ex. Sess., c. 67, as amended, which lands are more particularly described as follows:

> Approximately 261,591 square feet of tideland area and 6,630 square feet of subsurface tideland area located on the south side of Belt Street west of the foot of Sampson Street in the City of San Diego, California, more particularly delineated on Drawing No. 021-028 dated July 22, 1994, attached hereto as Exhibit "A" and by this reference made a part hereof.

This Permit is granted upon the following terms and conditions:

1. TERM: The term of this Permit shall be for five (5) years, commencing on the 1st day of November, 1999, and ending on the 31st day of October, 2004, unless sooner terminated as herein provided.

2. RENTAL: As and for the rental, Tenant agrees to pay to District the sum of Eleven Thousand Eight Hundred Forty-Five Dollars ($11,845) per month, payable in advance on or before the first (1st) day of each and every month during the term of this Permit.

DUPLICATE - ORIGINAL

905

63732 SAR193401

All payments shall be delivered to the Treasurer of the District. Checks shall be made payable to the Treasurer and mailed to the Office of the Treasurer, San Diego Unified Port District, Post Office Box 120488, San Diego, California 92112-0488, or delivered to the Office of the Treasurer, 3165 Pacific Highway, San Diego, California. The designated place of payment and filing may be changed at any time by District upon ten (10) days' written notice to Tenant. Tenant assumes all risk of loss and responsibilities for late charges, as herein described, if payments are made by mail.

Tenant hereby acknowledges that late payment by Tenant to District of rent and other sums due hereunder will cause District to incur costs not contemplated by this Permit. Accordingly, in the event Tenant is delinquent in remitting the rent due in accordance with the rent provisions of this Permit, Tenant shall pay, in addition to the unpaid rent, five percent (5%) of the delinquent rent. If rent is still unpaid at the end of fifteen (15) days, Tenant shall pay an additional five percent (5%) [being a total of ten percent (10%)]. The parties hereby agree that said late charges are appropriate to compensate District for loss resulting from rent delinquency including, without limitation, lost interest, opportunities, legal costs, and the cost of servicing the delinquent account. Acceptance of such late charges and any portion of the late payment by District shall in no event constitute a waiver of Tenant's default with respect to such overdue amount, nor prevent District from exercising any of its other rights and remedies. The Executive Director of District shall have the right to waive for good cause any late charges upon written application of Tenant for any such delinquency period.

All payments by Tenant to District shall be by a good and sufficient check. No payment made by Tenant or receipt or acceptance by District of a lesser amount than the correct amount of rent due under this Permit shall be deemed to be other than a payment on account of the earliest rent due hereunder, nor shall any endorsement or statement on any check or any letter accompanying any check or payment be deemed an accord and satisfaction, and District may accept such check or payment without prejudice to District's right to recover the balance or pursue any other available remedy.

3. USE: The above-described premises shall be used only and exclusively for the following purposes and for no other purposes whatsoever without the prior written consent of the Executive Director of District in each instance.

(a) As to the area delineated as Parcel No. 1 on Exhibit "A":

Tenant agrees that the premises shall be used only and exclusively for the operation and maintenance of underground circulating water tunnels, pipelines and conduits for any and all public utility purposes.

(b) As to the area delineated as Parcel No. 2 on Exhibit "A":

Tenant agrees that the premises shall be used only and exclusively for automobile parking, and operation of underground circulating water tunnels, pipelines and conduits, and necessary aboveground appurtenances and facilities as approved in writing by District.

(c) As to the area delineated as Parcel No. 3 on Exhibit "A":

Tenant agrees that the premises shall be used only and exclusively for the intake and discharge of cooling water associated with the operation of Tenant's adjacent underground improvements, and operation and maintenance of related improvements.

4. **ASSIGNMENT-SUBLEASE-ENCUMBRANCE:** Tenant shall not encumber this Permit, the premises thereof and the improvements thereon by a deed of trust, mortgage, or any other security instrument without the express written consent of the District, evidenced by resolution first had and obtained in each instance. Furthermore, neither the whole nor any part of the rented premises nor any of the rights or privileges granted by this Permit shall be assignable or transferable in any way without such consent. Nor shall Tenant grant any permission to any other person to occupy any portion of the rented premises without such consent. Any such purported assignment, transfer, sublease, encumbrance, or permission given without such consent shall be void as to District.

5. **CHANGES OR ALTERATIONS:** Tenant shall make no changes or alterations in the above-described premises, nor make, erect, or install any buildings, structures, signs, machines, or other improvements on the premises without the consent in writing of the Executive Director of District. Tenant further agrees to provide the proper containers for trash and to keep the premises free and clear of rubbish, debris, and litter at all times.

6. **MAINTENANCE:** Tenant hereby agrees that the premises are in a good and tenantable condition, that Tenant will take good care of the premises and appurtenances, including any personal property belonging to District; and that Tenant, as a part of the consideration for rental stated above, will at Tenant's sole cost and expense keep and maintain said premises, appurtenances, and personal property in good and sanitary condition and repair during the term of this Permit, subject to normal and ordinary wear and tear resulting from the use of the above-described premises as herein provided. District shall at no time during the term of this Permit be required to make any improvements or repairs to the above-described premises.

7. TITLE TO IMPROVEMENTS: For the purposes of this paragraph, "improvements" shall include, but are not limited to, subsurface improvements. On the commencement date of the term of this Permit, all existing structures, buildings, installations, and improvements of any kind located on the above-described premises are owned by and title thereto is vested in Tenant. All said existing structures, buildings, installations, and improvements as well as all structures, buildings, installations, and improvements placed on the above-described premises by Tenant subsequent to the commencement date of the term of this Permit shall at the option of District be removed by Tenant at Tenant's expense within thirty (30) days after the expiration of the term of this Permit or sooner termination thereof. District may exercise said option as to any or all of the structures, buildings, installations, and improvements, either before or after the expiration or sooner termination of this Permit. If District exercises such option and Tenant fails to remove such structures, buildings, installations, and improvements within said thirty (30) days, the District shall have the right to have such structures, buildings, installations, and improvements removed at the expense of Tenant. As to any or all structures, buildings, installations, and improvements owned by Tenant for which District does not exercise said option for removal, title thereto shall vest in District, without cost to District and without payment to Tenant.

Machines, appliances, equipment, and trade fixtures of any kind placed on the above-described premises by Tenant are owned by and title thereto is vested in Tenant and shall be removed by Tenant within thirty (30) days after the expiration of the term of this Permit or sooner termination thereof; provided, however, Tenant agrees to repair any and all damage occasioned by the removal thereof. If any such machines, appliances, equipment, and trade fixtures are not removed within thirty (30) days after the termination of this Permit, the same may be considered abandoned and shall thereupon become the property of District without cost to the District and without payment to Tenant, except that District shall have the right to have the same removed at the expense of Tenant.

During any period of time employed by Tenant under this paragraph to remove structures, buildings, installations, improvements, machines, appliances, equipment and trade fixtures, Tenant shall continue to pay the full rental to District in accordance with this Permit which said rental shall be prorated daily.

8. REMOVAL OF MATERIALS: Tenant hereby agrees that upon the expiration of this Permit or the sooner termination as herein provided, it will remove within thirty (30) days all ships, vessels, barges, hulls, debris, surplus, and salvage materials from the land area and water area forming a part of or adjacent to the above-described

premises, so as to leave the same in as good condition as when first occupied by Tenant, subject to reasonable wear and tear; provided, however, that if any said ships, vessels, barges, hulls, debris, surplus, and salvage materials shall not be so removed within thirty (30) days by Tenant, District may remove, sell, or destroy the same at the expense of Tenant; and Tenant hereby agrees to pay District the cost of such removal, sale, or destruction; or at the option of District, the title to said ships, vessels, barges, hulls, debris, surplus, and salvage materials not removed shall become the property of District.

During any period of time employed by Tenant under this paragraph to remove ships, vessels, barges, hulls, debris, surplus and salvage materials, or test for and/or remediate Contaminants as required in this Permit, Tenant shall continue to pay the full rental to District in accordance with this Permit which said rental shall be prorated daily.

9. TERMINATION: This Permit may be terminated by Executive Director of District or his duly authorized representative or Tenant as a matter of right and without cause at any time upon the giving of one hundred eighty (180) days' notice in writing to the other party of such termination.

10. HOLD HARMLESS: Tenant shall, to the fullest extent permitted by law, defend, indemnify and hold harmless District and its officers, employees, and agents for any and all liability, claims, judgments, or demands arising directly or indirectly out of the obligations undertaken in connection with this Permit, except claims or litigation arising through the sole active negligence or willful misconduct of District. It is the intent of this Paragraph that Tenant indemnify and hold harmless District for any actions of Tenant or District except, for those arising out of the sole active negligence or willful misconduct of District, including but not limited to claims based upon District's alleged breach of any statutory duty or obligation, or Tenant's duty under contracts with third parties. This indemnity obligation shall apply for the entire time that any third party can make a claim against or sue District for liabilities arising out of Tenant's use, occupancy, or operation of the above-described premises, or arising from any defect in any part of said premises.

11. INSURANCE: Tenant shall maintain "OCCURRENCE" form Commercial General Liability Insurance covering premises and operations in the amount of not less than Two Million Dollars ($2,000,000) combined single limit per occurrence for bodily injury, personal injury and property damage suffered or alleged to be suffered by any person or persons whatsoever resulting directly or indirectly from any act or activities of Tenant, of any person acting for it or under its control or direction, or any person authorized by it to use the rented premises. Either the general aggregate limit shall

apply separately to this location or the general aggregate limit shall be twice the required occurrence limit.

All required insurance shall be in force the first day of the term of this Permit. All insurance companies must be satisfactory to District, and the cost of all required insurance shall be borne by Tenant. Certificates in a form acceptable to District evidencing the existence of the necessary insurance policies, and original endorsements effecting coverage required by this clause, shall be kept on file with District during the entire term of this Permit. Certificates for each insurance policy are to be signed by a person authorized by that insurer to issue evidence of coverage on its behalf. Endorsements for each insurance policy are to be signed by a person authorized by that insurer to bind coverage on its behalf. The District reserves the right to require complete, certified copies of all required policies at any time.

All liability insurance policies will name, or be endorsed to name, District, its officers, officials and employees as additional insureds and protect District, its officers, officials and employees against any legal costs in defending claims. All insurance policies will be endorsed to state that coverage will not be suspended, voided, canceled, reduced in coverage or in limits except after thirty (30) days' prior written notice by certified mail, return receipt requested has been given to the District. And, all insurance policies will be endorsed to state that Tenant's insurance is primary and not excess or contributing to any insurance issued in the name of District.

Any deductibles or self-insured retentions must be declared and acceptable to the District. At the option of the District, either: the insurer shall reduce or eliminate such deductibles or self-insured retentions as respects the District, its officers, officials, and employees; or, the Tenant shall procure a bond guaranteeing payment of losses and related investigations, claim administration and defense expenses.

District shall retain the right at any time to review the coverage, form, and amount of the insurance required hereby. If, in the opinion of District, the insurance provisions in this Permit do not provide adequate protection for District and/or for members of the public, District may require Tenant to obtain insurance sufficient in coverage, form and amount to provide adequate protection. District's requirements shall be reasonable but shall be designed to assure protection from and against the kind and extent of risk which exist at the time a change in insurance is required.

District shall notify Tenant in writing of changes in the insurance requirements and, if Tenant does not deposit certificates evidencing acceptable insurance policies with District incorporating such changes within sixty (60) days of receipt of such notice,

this Permit shall be in default without further notice to Tenant, and District shall be entitled to all legal remedies.

The procuring of such required policies of insurance shall not be construed to limit Tenant's liability hereunder, nor to fulfill the indemnification provisions and requirements of this Permit. Notwithstanding said policies of insurance, Tenant shall be obligated for the full and total amount of any damage, injury, or loss caused by negligence or neglect connected with this Permit or with the use or occupancy of the rented premises.

12. TAXES AND UTILITIES: This Permit may result in a taxable possessory interest and be subject to the payment of property taxes. Tenant agrees to and shall pay before delinquency all taxes and assessments of any kind assessed or levied upon Tenant or the above-described premises by reason of this Permit or of any buildings, machines, or other improvements of any nature whatsoever erected, installed, or maintained by Tenant or by reason of the business or other activities of Tenant upon or in connection with the above-described premises. Tenant shall also pay any fees imposed by law for licenses or permits for any business or activities of Tenant upon the above-described premises or under this Permit, and shall pay before delinquency any and all charges for utilities at or on the above-described premises.

13. CONFORMANCE WITH RULES AND REGULATIONS: In all activities on or in connection with the premises and in all uses thereof, including activities and uses relating to aviation, Tenant shall abide by and conform to all provisions of the San Diego Unified Port District Act; any ordinances of the city in which the above-described premises are located, including the Building Code thereof; any ordinances, rules, and regulations of District; and any applicable laws of the State of California or Federal Government; as any of the same now exist or may hereafter be adopted or amended.

District shall not be liable to Tenant for any diminution or deprivation of its rights hereunder on account of any such laws, ordinances, statutes, rules, regulations, orders, limitations, restrictions, or prohibitions. In the event, however, that any such laws, ordinances, statutes, rules, regulations, orders, limitations, restrictions, or prohibitions shall so interfere with the conduct of Tenant's activities and business operations under this Permit by operation of law in accordance with the laws of the State of California, Tenant shall have the right to terminate this Permit by giving thirty (30) days' notice in writing of such termination. Such termination, however, shall not relieve the Tenant of any of its obligations and duties arising out of this Permit during Tenant's use and occupancy of the premises, including without limitation its responsibility and liability regarding hazardous substances and wastes, and its

obligation to defend, indemnify and hold the District harmless as provided in this Permit.

14. POLICY OF DISTRICT: It is the policy of District that prevailing wage rates shall be paid all persons who are employed by Tenant on the property of District.

15. DEFAULT: If any default be made in the payment of the rental herein provided or in the fulfillment of any terms, covenants, or conditions hereof, and said default is not cured within ten (10) days after written notice thereof, this Permit shall immediately terminate and Tenant shall have no further rights hereunder and shall immediately remove from said premises; and District shall immediately thereupon, without recourse to the courts, have the right to reenter and take possession of said premises. District shall further have all other rights and remedies as provided by law, including without limitation the right to recover damages from Tenant in the amount necessary to compensate District for all the detriment proximately caused by Tenant's failure to perform its obligations under this Permit or which in the ordinary course of things would be likely to result therefrom.

16. LIENS: Tenant agrees that it will at all times save District free and harmless and defend and indemnify it against all claims and liens for labor, services or materials in connection with improvements, repairs, or alterations on the premises caused to be performed by Tenant, and the costs of defending against such claims, including reasonable attorney's fees.

17. BANKRUPTCY: In the event Tenant commences a proceeding under Chapter XI of the Federal Bankruptcy Act, or is adjudicated bankrupt or insolvent, or a judicial sale is made of Tenant's interest under this Permit, this Permit shall at the option of District immediately terminate and all rights of Tenant hereunder shall immediately cease and terminate.

18. EASEMENTS: This Permit and all rights given hereunder shall be subject to all easements and rights-of-way now existing or heretofore granted or reserved by District in, to, or over the premises for any purpose whatsoever, and shall be subject to such rights-of-way for reasonable access, sewers, pipelines, conduits, and such telephone, telegraph, light, heat, or power lines as may from time to time be determined by District to be in the best interests of the development of the tidelands.

District agrees that such easements and rights-of-way shall be so located and installed as to produce a minimum amount of interference to the business of Tenant.

19. TITLE OF DISTRICT: District's title is derived from the provisions of the San Diego Unified Port District Act, Appendix 1, Harbors & Navigation Code, and is subject to the provisions of said Act. This Permit is granted subject to the terms and conditions of said Act.

20. JOINT AND SEVERAL LIABILITY: If Tenant, as a party to this Permit, is a partnership or joint venture, or is comprised of more than one party or entity or a combination thereof, the obligations imposed on Tenant under this Permit shall be joint and several, and each general partner, joint venturer, party, or entity of Tenant shall be jointly and severally liable for said obligations. Furthermore, nothing contained herein shall be deemed or construed as creating a partnership or joint venture between District and Tenant or between District and any other entity or party, or cause District to be responsible in any way for the debts or obligations of Tenant, or any other party or entity.

21. NONDISCRIMINATION: Tenant agrees at all times to fully comply with all laws prohibiting discrimination against any person or class of persons by reason of sex, color, race, religion, handicap or national origin. If the use provided for in this Permit allows the Tenant to offer accommodations or services to the public, such accommodations or services shall be offered by the Tenant to the public on fair and reasonable terms. In complying with all such laws, including, without limitation, the Americans With Disabilities Act of 1990, Tenant shall be solely responsible for such compliance and required programs and there shall be no allocation of any such responsibility between District and Tenant.

22. ENTIRE UNDERSTANDING: This Permit contains the entire understanding of the parties, and Tenant, by accepting the same, acknowledges that there is no other written or oral understanding between the parties in respect to the above-described premises. No modification, amendment, or alteration of this Permit shall be valid unless it is in writing and signed by the parties hereto.

23. PEACEABLE SURRENDER: Upon the termination of this Permit by the expiration thereof or the earlier termination as by the terms of this Permit provided, Tenant will peaceably surrender said above-described premises in as good condition, subject to normal and ordinary wear and tear resulting from the use of such premises as herein provided, as the same may be at the time Tenant takes possession thereof, and to allow District to take peaceable possession thereof.

24. HOLDOVER: This Permit shall terminate without further notice at expiration of the term. Any holding over by Tenant after either expiration or termination shall not constitute a renewal or extension or give Tenant any rights in or to the premises. If

Tenant, with District's consent, remains in possession of the premises after expiration or termination of the term or after the date in any notice given by District to Tenant terminating this Permit, such possession by Tenant shall be deemed to be a month-to-month tenancy terminable on thirty (30) days' notice given at any time by either party. During any such month-to-month tenancy, Tenant shall pay all rent required by this Permit; and if percentage rent is required by the Permit, it shall be paid monthly on or before the tenth (10th) day of each month.

All provisions of this Permit, except those pertaining to term, shall apply to the month-to-month tenancy.

25. ACCEPTANCE OF PREMISES: BY SIGNING THIS PERMIT, TENANT REPRESENTS AND WARRANTS THAT IT HAS INDEPENDENTLY INSPECTED THE PREMISES AND MADE ALL TESTS, INVESTIGATIONS AND OBSERVATIONS NECESSARY TO SATISFY ITSELF OF THE CONDITION OF THE PREMISES. TENANT AGREES IT IS RELYING SOLELY ON SUCH INDEPENDENT INSPECTION, TESTS, INVESTIGATIONS AND OBSERVATIONS IN MAKING THIS PERMIT. TENANT ALSO ACKNOWLEDGES THAT THE PREMISES ARE IN THE CONDITION CALLED FOR BY THIS PERMIT, THAT DISTRICT HAS PERFORMED ALL WORK WITH RESPECT TO PREMISES AND THAT TENANT DOES NOT HOLD DISTRICT RESPONSIBLE FOR ANY DEFECTS IN THE PREMISES. TENANT FURTHERMORE ACCEPTS AND SHALL BE RESPONSIBLE FOR ANY RISK OF HARM TO ANY PERSON AND PROPERTY, INCLUDING WITHOUT LIMITATION EMPLOYEES OF TENANT, FROM ANY LATENT DEFECTS IN THE PREMISES. Initial: District Tenant

26. WARRANTIES-GUARANTEES: District makes no warranty, guarantee, covenant, including but not limited to covenants of title and quiet enjoyment, or averment of any nature whatsoever concerning the condition of the above-described premises, including the physical condition thereof, or any condition which may affect the above-described premises; and it is agreed that District will not be responsible for any loss or damage or costs which may be incurred by Tenant by reason of any such condition or conditions.

27. ATTORNEY'S FEES: In the event any suit is commenced to enforce, protect or establish any right or remedy of any of the terms and conditions hereof, including without limitation a summary action commenced by District under the laws of the State of California relating to the unlawful detention of property, the prevailing party shall be entitled to have and recover from the losing party reasonable attorney's fees and costs of suit.

28. TERMINATION OF PRIOR AGREEMENT: It is mutually agreed that, on the effective date of this Permit, that certain Tideland Use and Occupancy Permit made and entered into on the 22nd day of November, 1994, and filed in the Office of the District Clerk as Document No. 32139, between District and Tenant is hereby terminated. Any rights, duties and obligations of the parties, if any, pursuant to the terms, covenants and conditions in such hereby terminated permit shall remain enforceable and subject to all defenses, including without limitation any applicable stature of limitations, which said statute shall not be waived or extended because of this Permit. Nothing herein is intended nor shall be construed as a waiver of any such rights, or as a release of any such duties or obligations, whether known or unknown at this time, or upon the effective date of this Permit.

29. HAZARDOUS MATERIALS: Tenant shall comply with all laws regarding hazardous substances, materials or wastes, or petroleum products or fraction thereof (herein collectively referred to as "Contaminants") relative to occupancy and use of the premises. Tenant shall be liable and responsible for any Contaminants arising out of the occupancy or use of the premises by Tenant. Such liability and responsibility shall include, but not be limited to, (i) removal from the premises any such Contaminants; (ii) removal from any area outside the premises, including but not limited to surface and groundwater, any such Contaminants generated as part of the operations on the premises; (iii) damages to persons, property and the premises; (iv) all claims resulting from those damages; (v) fines imposed by any governmental agency, and (vi) any other liability as provided by law. Tenant shall defend, indemnify and hold harmless the District, its officials, officers, agents, and employees from any and all such responsibilities, damages, claims, fines, liabilities, including without limitation any costs, expenses and attorney's fees therefor. District shall have a direct right of action against Tenant even if no third party has asserted a claim. Furthermore, District shall have the right to assign said indemnity.

If Tenant has in the past or continues to use, dispose, generate, or store Contaminants on the premises, District, or its designated representatives, at District's sole discretion, may at any time during the term of this Permit, enter upon the premises and make any inspections, tests or measurements District deems necessary in order to determine if a release of Contaminants has occurred. District shall give Tenant a minimum of twenty-four (24) hours' notice in writing prior to conducting any inspections or tests, unless, in District's sole judgment, circumstances require otherwise, and such tests shall be conducted in a manner so as to attempt to minimize any inconvenience and disruption to Tenant's operations. If such tests indicate a release of Contaminants, then District, at District's sole discretion, may require Tenant, at Tenant's sole expense, and at any time during the term of this Permit, to have tests for such Contaminants conducted by a qualified party or parties on the premises. If District has reason to believe that any

Contaminants that originated from a release on the premises have contaminated any area outside the premises, including but not limited to surface and groundwater, then District, at District's sole discretion, may require Tenant, at Tenant's sole expense, and at any time during the term of this Permit, to have tests for such Contaminants conducted by a qualified party or parties on said area outside the premises.

The tests conducted by Tenant's qualified party shall include, but not be limited to, applicable comprehensive soil, emission, or groundwater sampling test or other procedures to determine any actual or possible contamination. Tenant shall expeditiously, but no longer than thirty (30) days after District's request for such tests, furnish to District the results of said tests, sampling plans, and analysis thereof identifying any Contaminants which exceed then applicable levels permitted by federal, state, or local laws. Tenant shall report such contamination to the District within seventy-two (72) hours and shall diligently proceed to identify the extent of contamination, how it will be remediated, when it will be remediated, by whom, and the cost of such remediation.

30. UNDERGROUND STORAGE TANKS: In the event any underground storage tanks are located on the premises or hereinafter placed on the premises by any party during the term or extension of this Permit, Tenant shall be responsible for tank monitoring of all such underground storage tanks as required by the County of San Diego Hazardous Material Management Division (HMMD) or any other responsible agency. Tenant further agrees to take responsibility for reporting unauthorized releases to HMMD and the District within twenty-four (24) hours of such unauthorized release. Tenant will be responsible for all fees and costs related to the unauthorized release of Contaminants including but not limited to investigative, surface and groundwater cleanup, and expert and agency fees. Tenant shall maintain evidence of financial responsibility for taking corrective action and for compensating third parties for bodily injury and property damage caused by a release from the underground tank system. Tenant further agrees to be responsible for maintenance and repair of the storage tanks, obtaining tank permits, filing a business plan with HMMD or other responsible agency and for paying underground storage tank fees, permit fees, and other regulatory agency fees relating to underground storage tanks.

Tenant agrees to keep complete and accurate records on the premises for a period of not less than thirty-six (36) months from the applicable events, including, but not limited to permit applications, monitoring, testing, equipment installation, repairing and closure of the underground storage tanks, and any unauthorized releases of Contaminants and make such records available for District or responsible agency inspection. Tenant further agrees to include a copy of Health and Safety Code,

916

Chapter 6.7, Section 25299, as part of any agreement between Tenant and any Operator of such underground storage tanks.

Furthermore, Tenant shall be responsible for compliance with all other laws and regulations presently existing or hereinafter enacted applicable to underground storage tanks, including without limitation any such laws and regulations which alter any of the above requirements.

31. ABOVEGROUND STORAGE TANKS: Tenant shall be responsible for any aboveground storage tanks on the premises. Tenant shall, in accordance with this Permit and applicable laws and regulations, secure and pay for all necessary permits and approvals, prepare a spill prevention control counter measure plan and conduct periodic inspections to ensure compliance therewith, including conformance with the latest version of said laws and regulations. In addition, Tenant shall maintain and repair said tanks and conform and comply with all other applicable laws and regulations for aboveground storage tanks, including without limitation all of the requirements of Health & Safety Code, Sections 25270 through 25170.13 as presently existing or as hereinafter amended, including without limitation conducting daily visual inspection of said tanks, allowing the San Diego Regional Water Quality Control Board, District, or responsible agency, to conduct periodic inspections and complying with valid orders of said Board, filing the required storage tank statement and payment of the fee therefor, establishing and maintaining the required monitoring program and systems, reporting spills as required, and payment of lawfully imposed penalties as provided therein and as otherwise provided by law. Tenant shall be responsible for all costs associated with an unauthorized release from such tanks, including but not limited to, investigative, surface and groundwater cleanup, expert and agency fees.

32. NOTICES: Any notice or notices provided for by this Permit or by law to be given or served upon Tenant may be given or served by certified or registered letter addressed to Tenant at Post Office Box 1831, San Diego, California 92112 and deposited in the United States mail, or may be served personally upon said Tenant or any person hereafter authorized by it in writing to receive such notice; and that any notice or notices provided for by this Permit or by law to be served upon District may be given or served by certified or registered letter addressed to Executive Director of District at the Administrative Offices of the San Diego Unified Port District, Post Office Box 120488, San Diego, California 92112-0488 and deposited in the United States mail, or may be served personally upon said Executive Director or his duly authorized representative; and that any notice or notices given or served as provided herein shall be effectual and binding for all purposes upon the parties so served.

917

33. **SECTION HEADINGS:** The section headings contained herein are for convenience in reference and are not intended to define or limit the scope of any provision hereof.

34. **SIGNATURE OF PARTIES:** It is an express condition of this Permit that said Permit shall not be complete nor effective until signed by either the Executive Director or his authorized designee on behalf of District and by other party.

DISCLAIMER

This Report was prepared for the sole use and benefit of the San Diego Gas and Electric Company (Client) and for the specific Site known as Silver Gate Power Plant Site, located at 1348 Sampson Street, San Diego, California 92113. Neither this Report, nor any of the information contained herein, shall be used or relied upon for any purpose by any person or entity other than the Client and for the Site.

ENV America makes no warranty as to the accuracy of statements made by others which are contained in this Report, nor are any other warranties or guarantees, express or implied, included or intended in this Report with respect to information supplied by outside sources or conclusions or recommendations substantially based on information supplied by outside sources. This Report has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing the same or similar services.

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature, but shall be a representation of findings of fact from records examined.

1.0 INTRODUCTION

This Technical Report was prepared by ENV America for San Diego Gas and Electric Company (SDG&E) in response to San Diego Regional Water Quality Control Board (Board) Investigation Order No. R9-2004-0026 (the IO). This report summarizes historical operations associated with the former Silver Gate Power Plant (Plant), located at 1348 Sampson Street, San Diego, California (Site) (Figures 1 and 2).

1.1 Purpose of Work

San Diego Bay (Bay) sediments in the Southwest Marine and SDG&E leaseholds contain organic and metal contaminants that may have been deposited from multiple sources. The objective of this report is to document potential releases from former SDG&E activities in and around the power plant that may have contributed to sediment contamination. The scope of this report is focused on wastes that are consistent with those cited in the IO.

1.2 Scope of Services

This report summarizes SDG&E operations at the former Plant and surrounding area. The scope of work included researching historical data including internal SDG&E records, aerial photos (collections at County of San Diego Department of Planning and Land Use and San Diego Historical Society), property records, and recent investigation activities at SDG&E and neighboring properties. Public records at the Board, Port of San Diego (Port), and County of San Diego Department of Environmental Health (DEH) were reviewed and evaluated to determine if there was evidence of contaminant discharges that could have impacted Bay sediments.

1.3 Report Structure

This report addresses information required under the IO. Following this introduction are sections describing the Site conditions, SDG&E land leases, power plant history, chemical use and storage, waste handling, and discharges and monitoring. The report also includes sections that describe the potential for SDG&E and surrounding business operations to impact the Bay. Specific releases attributed to SDG&E in the IO are also discussed. The conclusions describe the distribution and likely sources of sediment contamination.

2.0 SITE DESCRIPTION

This section describes the physical attributes of the power plant and surrounding area, including surface and subsurface conditions, and historical lease boundaries.

2.1 Silver Gate Power Plant

The former Plant is approximately 750 feet from the Bay, on the northeast side of Southwest Marine (SWM) shipyard (Figure 1). The Plant consisted of three main areas, the power house (building containing the boilers, turbine generation equipment, and administrative area), the switchyard and substation (which distributed power from the plant, and today is an active substation), and the circulating water (CW) tunnels (tunnels extending from power house to Bay). The power house and switchyard are on land that SDG&E owns. The CW tunnels are on land that SDG&E leases. The Plant configuration is shown in Figure 2, and Figure 3 is a site vicinity map that shows the neighboring properties.

2.2 Geology and Hydrogeology

Belt Street is approximately coincident with the former shoreline of San Diego Bay. In the 1930s the land southwest of Belt Street was created by placement of fill dredged from the Bay. Consequently, the shallow geology northeast of Belt Street is different from the shallow geology southwest of Belt Street.

Northeast of Belt Street, there are three shallow stratigraphic units:

- Variable thickness of fill soil
- Five to 10 feet of alluvium/colluvium
- Pleistocene terrace deposits (also known as Bay Point Formation).

The alluvium and colluvium are generally described as tan to gray, dense silty sand. The Pleistocene terrace deposits are described as brown to gray brown, poorly cemented, dense to very dense silty sand.

The fill deposits south of Belt Street are reportedly material that was hydraulically dredged from the San Diego Bay. Field observations of Parcel 2 indicate that the

surface soil, and presumably the underlying fill, is a poorly graded silty fine sand with shell fragments.

The property and surrounding area are located within the Chollas Hydrologic Sub Area (HSA 8.22), which is designated as a non-beneficial groundwater use area by the Board.

The depth to groundwater in around the power house is approximately 15 feet below ground surface (bgs). The gradient is assumed to be westward, toward the Bay.

2.3 Surface Water Hydrology

Because the area around the Plant is primarily paved, rainfall generally results in run-off to municipal or Port storm drains, which discharge into the Bay. Some individual properties, such as NASSCO, SWM and SDG&E substations, currently have storm water capture capabilities; but historically storm water runoff was directed to the bay. According to the City of San Diego storm water conveyance system drawings, surface water run-off from the power plant and surrounding businesses is conveyed through a 30-inch pipe that runs along Sampson Street and discharges into the Bay. Exhibit A contains drawings prepared by the City and Port that show the storm water conveyances for the surrounding area.

A notice of intent (NOI) for the Plant was submitted on March 27, 1992, to the Board under the Statewide General Industrial Activities Storm Water Discharge Permit per NPDES No. CAS000001, Order 91-13-DWQ. In response to this NOI, the Board issued the Plant Waste Discharge ID (WDID) 9 37S05565. Under this permit, the Plant operated in accordance with a site specific Storm Water Pollution Control Plan (SWPCP). A facility drainage plan depicting the location of roof drains and drain inlets from this plan is included in Exhibit A. On October 2, 1995, SDG&E submitted a notice of termination (NOT) application to the Board as a result of the inactive status of the Plant. This NOT was approved by the Board on July 23, 1997.

SDG&E maintained facility spill prevention and control plans. These plans described equipment processes and associated containment incorporated into the plant design to prevent non-permitted releases from the facility. A Spill Prevention Control and Countermeasure (SPCC) plan dated in 1981 was located and reviewed. This SPCC plan described site grading, storage, and secondary containment incorporated into the Site design to control material releases if any were to occur from daily operations. This

938
63732 SAR193280

plan described the general direction of surface water drainage across the Site to be to the east towards Sampson Street and then south towards the Bay. Descriptions of secondary containment for all oil storage units were provided and consisted of:

- Transformers contained within concrete sumps;
- Eastward grading above the underground storage tanks (UST) away from the Bay;
- Six-inch high curb across the UST area that contained potential transformer spills or potential minor fuel oil tank overflows;
- A ten-inch high ramp across the driveway into the UST/transformer switchyard area that bounded the tank area between the ramp, the power plant building and a two foot high retaining wall;
- A sealed drain valve within the ramp capable of holding up to 25,000 gallons in the contained enclosure;
- Four-inch high curbs along the power house building to contain four small transformers that served generating Unit 2;
- A 12-inch high concrete wall and a 4-inch high doorway around the transformers that serve generating Unit 1;
- Drainage of turbines directed into a sump pump that discharged to wastewater Void 2 via level-actuated automatic pumps;
- High level alarms on wastewater Voids 1 and 2 to prevent overflow; and
- Manual release of water required for the secondary containment areas to ensure only clean water was released.

The SPCC plan stated that there were no reportable spills in the prior eight years, indicating that no spills occurred over the period 1973 to 1981.

The NPDES storm water permit for Southwest Marine (NPDES Permit No. CA0109151) as well as figures provided in the Sediment Characterization study (Exponent, 2003) indicated that Southwest Marine storm water was historically discharged to the Bay through eight outfalls located within the Southwest Marine leasehold. Since 1998, only one of the eight Southwest Marine outfalls has been in use.

The storm water conveyance system drawings obtained from the City of San Diego are dated 1994. Storm drain drawings prepared by the Port for the Jurisdictional Urban Runoff Management Plan in 2003 depict a 60-inch diameter pipe that discharges to the Bay from the Southwest Marine leasehold. This plan also depicts an abandoned 42-

939

63732 SAR193281

inch storm pipe that historically collected surface water from Sampson Street and the surrounding area and discharged to the Bay. This outfall was located within the Southwest Marine leasehold near Pier 3.

Chollas Creek also discharges to the Bay (Figure 1). The terminal area of the creek has deposits of contaminants that have been flushed from upstream domestic and industrial operations, which contain various organic compounds, including polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and metals.

2.4 Land Leases

The Plant and associated switchyard and substations are located on property owned by SDG&E. The circulating water (CW) tunnels are located on land within the Burlington Northern Santa Fe (BNSF) Railroad (formerly the Atchison, Topeka and Santa Fe [AT&SF] Railroad) right of way and on State land managed by the Port, formerly managed by the City of San Diego from 1941 to 1960 at which time the Port was formed to manage all tidelands adjacent to the Bay. Historically, there have been several subleases of SDG&E leased land.

Figure 4 illustrates the various lease boundaries for the three parcels that SDG&E has leased from the Port. The leased land has been referred to as Parcels 1, 2 and 3.

In the next few years, SDG&E plans to disassemble and remove the Plant. SDG&E also plans to cancel the associated leases of adjacent properties. As part of canceling these leases, SDG&E will restore the leased properties to a condition mutually agreeable to SDG&E and the property owners. This restoration may involve abandonment of the CW tunnels and associated structures.

- Port tidelands

  Land leased from the Port, 2.14 acres. This landside area contains an approximately 525 foot length of tunnels beneath land occupied by Belt Street, Southwest Marine and ISP Alginates. This is publicly owned land that is managed by the Port. The visible surface features of the SDG&E CW tunnels are (a) manhole entryways within the yard of Southwest Marine, and (b) inlet and outlet structures located on the waterfront. The Port lease documents recognize this landside area as two parcels.

"Parcel 1" is a 0.15 acre parcel that is occupied by Belt Street. On this parcel, the tunnels are overlain by a heavily traveled road and multiple buried utilities that run beneath Belt Street, including natural gas, storm sewer, sanitary sewer, and electric service.

"Parcel 2" is a 1.99 acre parcel that is subleased to Southwest Marine and ISP Alginates. ISP Alginates uses their space for maintenance activities and parking. Southwest Marine uses their space for shipyard operations and parking.

Based on aerial photographs (see Section 3.1), SDG&E's Parcel 2 has been subleased to Southwest Marine and ISP Alginates and their predecessor companies since the mid-1960s.

3.0 SITE OPERATIONAL HISTORY

This section describes the Plant property and operational history.

3.1 History of Property and Vicinity

The following is a tabular summary of the history of operations on the Plant Site and the adjoining leased land of Port Parcel 2, with a focus on information relevant to environmental concerns. The best information of historical land uses was obtained from reviewing historical photographs, copies of which are included in Exhibit B. The history was developed by reviewing a number of records, including:

- Photograph collections at the San Diego Historical Society (SDHS);
- Aerial photograph collections at the County of San Diego Department of Planning and Land Use (DPLU) Cartography Department; and
- SDG&E internal files.

Historical Summary	
Plant Land Area	**Port Parcel 2**
March 1930: land area used for lumber storage March 1937: land area was vacant	March 1930: parcel was beach and submerged tidelands (SDHS Photo 89-17537-46) March 1937: parcel was vacant, undeveloped, recently-filled tidelands (SDHS Photo 79-741-226)
1941: construction of generating Unit 1 began January 1943: generating Unit 1 began operating	March 1941: south side of parcel had piles of construction debris (SDHS Photo 79-741-672) 1949 - 1952: parcel used for outdoor storage and parking, apparently SDG&E storage (DPLU Photo 1949AXN_1F_154, SDHS Photo 82-13673-721)
1952: generating Unit 4 construction completed	1952: parcel contained a pond, here named "Pond A," with above-grade berms (SDHS Photo 82-13673-718) 1953 – 1959: parcel was primarily vacant (DPLU Photo 1953AXN-3m-197, SDG&E photo from 5/59) June 1955: six SDG&E photographs illustrate location of an oil/water separator, here named "Structure C," and a minor overflow/spill to surface soil May 1959: one SDG&E photograph illustrates that Structure C was not extant, and another oil/water separator was present, here named "Structure D"

Historical Summary	
Plant Land Area	**Port Parcel 2**
	1966-1973: parcel contained a pond, here named "Pond B" (DPLU Photo 1966-GSVB01-1-112, DPLU Photo 1973-SDPD-26-5) 1966 – present: parcel used for parking, and used for industrial operations of SWM and ISP Alginates and their predecessor companies
1978: wastewater treatment plant brought online	1974: use of Pond B discontinued
mid-1980s: electric generating activities ceased mid-1980s – present: powerhouse and CW deck unused, substation continuing in use	

3.2 Power Plant Operational History

The power house contains six boilers which supplied steam to four steam turbine generating units, known as Units 1 through 4. The construction of the power plant began in the early 1940s, with Unit 1. Construction of Units 2, 3 and 4 proceeded sequentially until Unit 4 was finished in the early 1950s. The only major addition after 1952 was the addition of a waste water treatment plant, which was constructed on the CW Deck in 1978.

The plant operated almost continuously from 1943 to 1974. The power plant was used intermittently after 1974 to meet peak demands, but generally ran at reduced capacity. Units 1 and 2 were taken off-line in 1983. Units 3 and 4 were taken off-line in 1984. The boilers burned natural gas or fuel oil (dual fuel boilers).

After the mid-1980s, the power plant equipment was mothballed and maintained for a period. The mothball maintenance activities likely included dehumidified air storage of the turbines and boilers, degassing and dry storage of the generators, and rinsing and dry storage of the condensers. The mothball maintenance was discontinued a number of years ago.

In recent years, maintenance was performed to maintain necessary items such as the basement sump pumps, wastewater voids, wastewater void ventilation, plant lighting, elevator certifications and security. Various parties have occasionally salvaged parts and tools from the plant, but the majority of the power plant equipment is still onsite.

SDG&E plans to begin disassembly and removal of the boilers and turbine generating units in late 2004.

Fuel oil used to fire the boilers was stored in three 220,000-gallon underground storage tanks (USTs) that were located below the switchyard and substation. These tanks consisted of 12 inch thick concrete lined with a ½-inch thick steel plate. These tanks were "temporarily closed in place," and are not accessible until a future time when the substation equipment is removed. Construction of the USTs was likely concurrent with power plant construction, and there was no documentation found that described changes to the tank configuration.

San Diego Bay was used for non-contact, once-through cooling water in the power plant. The cooling water was transmitted via four tunnels (two intake tunnels and two discharge tunnels), each of which had cross-sectional dimensions of approximately 8 feet wide by 8 feet tall. The non-contact cooling water was passed through tube-type condensers to cool the steam. The tunnels apparently were constructed concurrent with construction of Unit 1 and remain in place today.

3.3 Chemicals Stored and Used Onsite

Table 1 shows a summary of the major chemicals that were used in Plant systems. The table indicates the time period of usage and the storage location. Nearly all chemicals were stored within the plant interior, with the exception of sodium hydroxide and sulfuric acid, which were stored in tanks on the CW deck; and chlorine, which was stored adjacent to the control house. Included in Exhibit C are copies of the chemical usage/purchase records provided by SDG&E to the Board per NPDES Permit No. CA0001376.

A lube oil system distributed oil to the turbines. Other chemicals were used in small quantities, such as cleaners and lubricating oils for ongoing plant repairs.

3.4 Wastes Generated and Stored or Discharged From the Site

The Plant generated several waste streams, including water from cooling and wash/cleaning processes, solids from plant repairs and modifications, air stack emissions, and equipment lubricants. This report focuses on the waste streams that may have resulted in discharges to the bay, which are primarily limited to waste water streams. The following sub-sections describe the sources of waste water, which are summarized on Table 2. Additionally, selected relevant process descriptions obtained

during this investigation are included in Exhibit C. We have also included a brief description of non-water liquid wastes that would have been generated at the plant.

Waste streams underwent various methods of treatment and discharge over the life of the plant. In September 1978 a waste water treatment plant was completed on the CW deck and subsequently certain aqueous waste streams underwent onsite treatment. Waste water characteristics and operational information was obtained from SDG&E internal documents, NPDES permits, and Army Corp of Engineers (ACE) permits. The primary waste streams that were contained in discharges included the following:

- Non-contact cooling seawater;
- Domestic wastewater, which was discharged to the sanitary sewer system;
- Air-preheater wash water;
- Boiler wash water;
- Chemical boiler tube cleaning water;
- Boiler and evaporator blowdown water;
- Bilge water collected from the basement floor trench system; and
- Service system cooling water; this waste was a small contributor as it was circulated in a contained closed loop system that was used to cool generation equipment such as bearings, jackets and compressors.

3.4.1 Non-Contact Cooling Water

The non-contact cooling water was used to cool and condense steam in the condensers. Sea water was circulated from the Bay through the tunnels at flow rates that typically ranged from 120 to 180 million gallons per day (MGD), with maximum flows of about 220 MGD during peak generation periods when all boilers were in use. Figure 5 shows the basic flow-path of the circulating water through the plant. The only chemical added to the circulating water was chlorine, which was used to reduce bio-fouling. The circulating water discharges to the Bay were regulated under various permits as described in Section 4.0.

945
63732
SAR193287

3.4.2 Air Pre-Heater and Boiler Fireside Wash Water

Air pre-heaters were typically washed once a year when fired by gas and twice a year when using fuel oil. Similarly, the outside (fireside) of the boiler tubes were washed to remove soot and accumulated combustion by-products (scale) from metal surfaces in order to maintain efficient heat transfer of the tubing. High pressure water was used to clean the surfaces. Boilers washing averaged two per year. Individual pre-heater washes generated about 90,000 gallons of water (SDG&E, date unknown). The annual waste stream from the boiler washings was approximately 140,000 gallons per year (SDG&E, 1972). The wash water was captured in the wastewater voids, where suspended solids were settled. The water was then pumped into the sanitary sewer and the solids were disposed of offsite (SDG&E, 1972). Upon completion of the waste water treatment plant, the wash water was treated onsite and then discharged to the Bay under NPDES Permit No. CA0001376.

3.4.3 Chemical Boiler Tube Cleaning Water

The inside of the water/steam tubing in each of the six boilers was cleaned at least every four years to remove scale. A chemical solution was used to clean the equipment, which was followed by various rinses, including alkaline solutions. The cleaning water was captured in the waste voids, where it was neutralized and then disposed of into the sanitary sewer. Boiler cleaning chemicals were discharged into a void and subsequently hauled to a disposal site approved by the Board. Neutralized chemicals were discharged to the City sewer (SDG&E, 1972). Upon completion of the waste water treatment plant in 1978 (on the circulating water deck), the cleaning water was treated onsite and then discharged to the Bay under NPDES Permit No. CA0001376. Water that was untreated, if any, was held in one of the wastewater voids on the CW deck until it was disposed of offsite.

3.4.4 Boiler Blowdown Water

Boiler blowdown refers to the release of relatively clean water from the steam system. Water was purged from a low point in the system to release settled and precipitated solids. Boiler blowdown was conducted on a daily basis and generated approximately 5.9 million gallons of water per year (SDG&E, 1972). It appears that prior to 1978 the boiler blowdown was routed directly to the CW discharge tunnels (SDG&E, 1972). After the water treatment plant was constructed, blowdown water went to the wastewater voids, where it was tested for iron and copper and then either treated and discharged or directly discharged to the Bay, if no treatment was needed. Boiler blowdown reportedly

averaged approximately 75,000 gallons per month (SDG&E, date unknown). Once operations ceased at the plant, boiler blowdown discharges also ceased.

3.4.5 Basement Bilge Water

Basement bilge water consisted of liquids that accumulated in trenches in the plant basement. The WWTP manual (SDG&E, 1978) lists the following waste sources: "turbine drains, boiler drains, condenser drain pump drains, cooling water supply drains, water box drains, service air compressor drains, fire pump drains, relief valve drains, condensate storage and overflow and condensate makeup pump drains." The basement bilge system was divided into two areas, the turbine side and the boiler side. Diagrams from 1965 show that bilge water from the turbine side was piped into the discharge cooling water tunnels, andthe bilge water from the boiler side was pumped, via an 8 inch diameter pipeline, to an "oil-water separating pond" located on Parcel 2, referred to as "Nobles Lake", which was used for evaporation and settling. However, it is noted that an ACE application (SDG&E, 1972) stated that only blowdown and cooling water were discharged to the CW tunnels, whereas other wastes were disposed of by evaporation, discharge to sewer or offsite disposal. Some water from the pond was discharged to the Bay. A more detailed description of the settling pond is contained in the *Site Assessment Report, Tideland Lease Area, Silver Gate Power Plant,* (ENV America, 2004).

In late 1974, SDG&E ceased using the pond due to changing environmental practices and regulations. From 1974 to 1977, all bilge wastewater was accumulated in three wastewater voids in the CW deck area of the power plant (total capacity of the voids was 270,000 gallons), from which it was either treated onsite or discharged in batches to the City sanitary sewer. In 1978, SDG&E completed construction of a wastewater treatment plant, after which bilge water was treated onsite prior to discharge into the Bay.

Today, discharge of the facility's minimal wastewater is conducted on a batch basis. All facility wastewater is collected in the equipment sumps and the plant bilge trench system. The wastewater is accumulated in Void No. 2, tested and discharged under permit to the City sanitary sewer system. The wastewater consists of mostly rainwater and possibly in-seepage of groundwater. Recent batch discharges include 105,500 gallons in 1998; 29,500 gallons in October 1999; and 49,500 in April 2001.

3.4.6 Service System Cooling Water

The service system cooling water was in a fully contained network of pipes and heat exchangers which should not have resulted in discharges. The water was treated with sodium dichromate as a corrosion inhibitor. Although no documentation was found describing draining and replacement of coolant, chemical usage logs described annual purchases of additional sodium chromate. One instance of a leak into the cooling water was documents in the compliance records.

3.4.7 Non-Water Liquid Wastes

Wastes that were generated separate from water streams included a lube oil system, which circulated oil from reservoirs through the generating turbines. The lube oil system included eight oil storage tanks, the largest of which was 3,000 gallons. The tanks drained to a 20,000-gallon sump. From at least 1980 onward the sump was equipped with level-actuated pumps that discharged to Void No. 2, where oil would be contained and appropriately disposed or treated (SDG&E, 1981).

4.0 FACILITY DISCHARGE MONITORING RECORDS

This section summarizes waste discharge records for the waste water streams described in Section 3.

Discharges from the former Plant began when Unit 1 started generating in approximately 1943. Little information is available to document facility discharges prior to 1969. Starting in 1969, discharges were regulated by the Board, ACE, and the United State Environmental Protection Agency (USEPA). Discharge permit applications, compliance records, and facility-agency correspondence documents were reviewed for the period 1969 through 1995. In April 1995, the Plant NPDES permit was rescinded.

4.1 DISCHARGE PERMIT HISTORY

The first RWQCB Order, Resolution 69-R32, was issued by the Board in 1969. This resolution governed discharges during the period 1969 to 1974. In 1974, a NPDES permit (CA0001376) was adopted (Order 74-90) succeeding Resolution 69-R32, which was applicable until 1976. The plant's NPDES permit was subsequently renewed in 1976 (Order 76-9) and in 1985 (Order 85-07). A description of each of these permits is provided below, and Table 3 summarizes the permit conditions and discharge limitations.

4.2 RESOLUTION 69-R32

In July 1969, at the Board's request, SDG&E submitted a Report of Waste Discharge (ROWD) for the plant (Exhibit C). This ROWD described the plant's management of waste streams and cooling water discharge. It also specifically stated that all boiler chemical cleaning wastes were hauled offsite. Resolution 69-R32 was adopted by the Board in November 1969 (Board, 1969). This resolution regulated facility chemical usage to those chemicals already in use. These chemicals were identified to be sodium phosphate, sodium chromate, and ferrous sulfate. SDG&E was required to submit chemical usage data on a monthly basis pursuant to this resolution. Discharge practices pursuant to this resolution were described as follows:

- All industrial wastes, other than cooling water and boiler blowdown, were to be excluded from the discharge to the San Diego Bay;

- Chemical cleaning of the boilers was conducted every other year. All wastes from this process were hauled offsite;
- All domestic waste was discharged to the San Diego Metropolitan Sewage System; and
- The amounts of boiler cleaning waste generated and the point of disposal for each boiling event was to be documented.

In June 1971, a permit application under the Refuse Act per 33 U.S.C. 407 was submitted to the ACE. It indicated that facility discharges consisted of "relatively" pure water from boiler blowdown. The ACE permit application also stated that "Other wastes are excluded from this discharge and are disposed of by evaporation and/or city sewer (where approved). In some cases, disposal is made by hauling to an approved land disposal facility" (USEPA, 1972).

Additional waste stream treatment details were required by the ACE in response to SDG&E application under the Refuse Act to discharge non-contact cooling water into the Bay. In this response, dated June 1972, SDG&E indicated that boiler blowdown was conducted daily and generated approximately 5.9 million gallons per year of wastewater. Boiler wash (boiler tube fireside wash) was conducted on two boilers per year and generated a volume of 140,000 gallons per year. The SDG&E response stated that wash water from this process "...is drained into a holding cistern and the suspended solids allowed to settle. The liquid portion is neutralized to a pH of 6-7 and pumped to the City sanitary sewer. The remaining solids are hauled to a disposal site approved by the California Regional Water Quality Control Board" (SDG&E, 1972). A boiler cleaning (boiler chemical cleaning) was performed on two boilers per year. "The boiler cleaning chemicals are discharged into a holding tank and hauled to a disposal site approved by the California Regional Water Quality Control Board" (SDG&E, 1972).

Constituents monitored pursuant to the requirements of this resolution included flow rate, temperature, total suspended solids (TSS), total phosphorous, dissolved oxygen (DO), oil and grease, and pH. Discharge limits were based on a comparison between parameter concentrations in the cooling water intake versus the cooling water outlet. Quarterly reports were submitted to the Board. These reports presented monitoring results for each month in the quarter. The effluent limits for temperature, TSS, and oil and grease were established based on a comparison with the intake cooling water levels. As a result, the maximum temperature increase could not exceed 22 degrees Fahrenheit or an average temperature increase of 15 degrees Fahrenheit, no

950
63732 SAR193292

measurable increase in TSS was allowed and no more than 0.01 mg/L of oil and grease could be added to the Bay. Monitoring records are described in Section 4.7.

4.3 ORDER 74-90

Order 74-90 was adopted in December 1974 and covered the period December 1974 to June 1976. It described one facility discharge referred to as "discharge 001, cooling water." It stated that this discharge averaged 165.6 MGD and contained an average daily TSS concentration of 5.7 mg/L and a total iron daily average concentration of 0.20 mg/L. This order did not allow the discharge of oil, as defined by 40 CFR 110, at any time. It further stated that screenings, sludges, and other solid waste must be disposed of in such a manner as they do not enter any navigable waterway or tributary and that storm water runoff shall be routed so that it does not come in contact with raw materials, chemicals, and contaminants.

Constituents monitored pursuant to the requirements of this order consisted of flow rate, temperature, TSS, DO, oil and grease, total residual chlorine, settleable solids, and pH. Similar to Resolution 69-R32, no measurable increase in TSS was allowed and the maximum temperature increase could not exceed 22 degrees Fahrenheit or an average temperature increase of 15 degrees Fahrenheit. In addition, the order stated the Bay water must not be reduced to less than 4.5 mg/L of dissolved oxygen. Oil and grease, total residual chlorine, and settleable solids had set concentration and daily loading requirements.

Quarterly reports were submitted to the Board. These reports presented monitoring results for each month in the quarter, which are described in greater detail in Section 4.7.

4.4 ORDER 76-9

This order was adopted in May 1976 and covered the period May 1976 through June 1985. This permit marks the first period when metals analyses for copper and iron in wastewater were required. In addition, during this period of operation and monitoring, SDG&E was required to meet the new EPA steam electric generating categorical effluent limits for low volume wastes, boiler blowdown and metal cleaning wastes. To accomplish this, SDG&E constructed a wastewater treatment plant for wastewater processing. This plant was brought on-line in September 1978 and was used to treat the metal cleaning waste and low volume waste prior to discharge from the facility.

Waste streams under this permit were divided into combined waste discharge (discharge 001), metal cleaning waste (discharge 001B), boiler blowdown (discharge 001C), and low volume waste (discharge 001D). The combined waste discharge consisted of non-contact cooling water used to cool the condensers and pumps and other waste discharges that entered the Bay. Metal cleaning wastes were associated with boiler wash and air pre-heater wash water (if chemicals were used) and all chemical cleaning wastes from boiler cleanings. Low volume wastes consisted of bilge water, drainage of the service water system spent circulation water, and any equipment drip water that entered into the power house basement bilge trenches.

Monitoring of the metal cleaning waste stream, the boiler blowdown waste stream, and the low volume waste stream was suspended under this order via Technical Order 77-29 and subsequent amendments thereto, issued by the Board from July 1976 through April 1978. This was done to allow SDG&E time to reconfigure equipment and piping and to construct the new wastewater treatment plant. As a result, copper and iron monitoring did not begin until June 1978.

Monitoring under Order 76-9 included monitoring of the cooling water intake for TSS, oil and grease, and total copper. Discharge 001 was monitored for temperature, TSS, oil and grease, free available chlorine, pH, and total copper. However, monitoring limits were only set for temperature and free available chlorine. There was no limit set for total copper in this discharge. The compliance records suggest that TSS, oil and grease, and total copper were compared with an influent sample collected from the cooling water intake at the same time as the effluent sample to ensure the discharge was not adversely impacting the Bay. Discharge 001B and discharge 001C were monitored for TSS, total copper, total iron, and oil and grease. Concentration limits consisting of an allowable 30-day average and daily maximum concentration limit were established. Additionally, a 30-day average mass loading requirement and a daily maximum mass loading were established for each of these parameters. Discharge 001D was limited to TSS and oil and grease with concentration and mass loading limits.

Monitoring reports were submitted on a monthly basis to the Board. In addition, a year-end annual report was submitted which presented the average monthly concentration measured for each waste stream in tabular form and on trend plots. Compliance records are described in Section 4.7.

4.5 ORDER 85-07

This order was adopted in January 1985 and covered the period January 1985 through April 1995 when SDG&E rescinded their NPDES permit. Similar to Order 76-9, this order permitted the discharge of combined waste, metal cleaning waste, and low volume waste. Order 85-07 permitted the discharge of once-through cooling water, circulating pump lubrication water, and evaporator boiler blowdown water to the Bay without treatment. Pursuant to Order 85-07, the combined discharge consisted of once-through non-contact cooling water, and treated waste streams including cooling water pump lubrication wastes, low volume wastes and metals cleaning wastes.

Metal cleaning wastes included waste water from periodic boiler tube chemical cleanings, air pre-heater wash water and boiler fireside wash water. Treatment per permit requirements consisted of neutralization, chemical precipitation and flocculation. At times, boiler chemical cleaning waste was collected and shipped offsite to an approved disposal facility. This was a common practice in later years when little metal cleaning wastewater was generated due to intermittent operation of the plant.

Low volume wastes included condenser cleaning wash water, bilge water, evaporator blowdown, boiler blowdown and water collected from floor and sample drains throughout the facility. This waste stream, except for boiler blowdown and evaporator blowdown, was collected prior to discharge, isolated, sampled, treated if necessary and subsequently released from the facility.

Monitoring results were submitted monthly, semi-annually, and annually to the Board. Monthly reports included temperature data for both the influent and effluent. The combined discharge waste stream was monitored for temperature, TSS, oil and grease, pH, and total residual chlorine. Limits existed for the instant and daily maximum concentration and daily mass loading were required for total residual chlorine. The metal cleaning waste stream was monitored for TSS, oil and grease, total iron and total copper. Limits existed for instant maximum allowable concentrations, daily maximum allowable concentrations, monthly average allowable concentrations, instant maximum allowable loadings, daily maximum allowable loading, and monthly average allowable loading for each parameter. The low volume waste stream was monitored for oil and grease and TSS with concentration and mass loading limits.

In the semi-annual monitoring reports required pursuant to Order 85-07, SDG&E was required to monitor the combined discharge for toxicity, metals consisting of arsenic,

cadmium, chromium, copper, lead mercury, nickel, silver and zinc, cyanide, ammonia, phenols, pesticides, and organics. Limits were set for the instant maximum concentration and the instant maximum loading for each of these parameters. A six month median toxicity maximum limit was set for the low volume waste in the semi-annual monitoring reports. However, there was no additional monitoring required for the metal cleaning waste.

The semi-annual report for Order 85-07 required monitoring of the in-plant waste stream. The in-plant waste stream represented a pre-discharge wastewater sample of all in-plant waste streams combined including the metal cleaning waste and low volume wastes such as boiler and evaporator blowdown. Limits for the in-plant waste were established by the Board for metals consisting of arsenic, cadmium, chromium, copper, lead mercury, nickel, silver and zinc, cyanide, ammonia, phenols, pesticides, and organics. Monitoring limits for these parameters were set for instant maximum concentration, instant maximum loading, daily maximum loading, and 6-month median maximum loading.

The monitoring limits for the combined discharge and in-plant waste were set by the Board using the California State Water Resources Control Board (SWRCB) Ocean Plan Water Quality Standards. This method was used to set effluent limits for mass loading requirements due to the absence of standards for bays and estuaries. These limits were set based on full-scale operation of the plant (all units running). However, since SDG&E did not operate at full capacity during the majority of the period covered under this permit, the Board required SDG&E to compute actual loading limits based on the actual flow rate on the day of sampling. Thus, the limits outlined in Table 3 were not the actual limits for the plant, unless the discharge flow rates were at full permitted flows. Instead, SDG&E was required to meet much lower, more stringent limits than those shown in the table due to actual discharge flows. Compliance records are described in greater detail in Section 4.7.

4.6 WASTE STREAM SAMPLING METHODS

There was little documentation available describing actual waste stream sampling locations. Information with regard to sampling locations for NPDES monitoring under Order 85-07 was available and is presented below for each waste stream. It has been assumed that similar sampling locations were utilized in previous years as facility operations remained constant, other then the construction of the wastewater treatment plant in 1978. The combined discharge was sampled from the CW deck within a void

954
63732 SAR193296

space or as the waste exited the facility at the CW outlet tunnel located on the south side of the CW deck adjacent to the inlet tunnels.

Combined Discharge

The combined discharge sampling was conducted at the location where the two 8 foot diameter tunnels exited the facility en route to the Bay.

Metal Cleaning Waste

The metal cleaning waste stream was sampled from various locations following treatment in the wastewater treatment plant. Composite samples collected for TSS, copper, and iron were collected from the multi-stage filter outlet of the wastewater treatment plant. Samples collected for oil and grease analysis were collected from Void 2 on the CW deck.

Low Volume Waste

The low volume waste streams were sampled prior to discharge to the combined discharge. Low volume waste streams such as bilge water were always directed to a void for settling and separation. Samples for TSS were collected as a composite sample from the multi-stage filter outlet on the wastewater treatment plant. Oil and grease grab samples were collected directly from the void. If a batch of low volume waste was not sent through the multi-stage filter on the wastewater treatment plant, it would be isolated in the void, sampled and then released to the Bay. Boiler blowdown and evaporator blowdown were sampled prior to the combined discharge from sample points located within the plant.

In-Plant Waste

The in-plant waste was also sampled pursuant to semi-annual monitoring requirements set by the Board. This waste stream was sampled prior to discharge into the non-contact cooling water in the CW tunnels. Typically, the in-plant waste sample was collected from the voids prior to being combined with the non-contact cooling water. In the event an exceedance occurred in the combined discharge sample, the in-plant data could be used to determine if the source was from the plant wastewater.

4.7 MONITORING RECORDS

Pursuant to Resolution 69-R32 and NPDES CA0001376 (Order 74-90, Odder 76-9 and Order 85-07), monitoring data were submitted to the Board. The compliance records

were reviewed to identify and evaluate instances when permit limits were exceeded. Table 4 summarizes available monitoring records and lists permit exceedances.

The following sections discuss the monitoring results for each compliance period where specific exceedances of chemicals of concern (COCs) relative to the current IO occurred. The COCs included in the IO and presented herein are cadmium, chromium, mercury, nickel and PCTs. Total suspended solids are also included in this discussion since they may have contained COCs.

4.7.1 Resolution 69-R32

The compliance records located for review at the Board and in SDG&E internal files were limited to the year 1974, although it is noted that this resolution covered the period December 1969 to December 1974. Under this resolution, quarterly reports were submitted to the Board.

During the year 1974, the compliance records reviewed indicated that TSS compliance limits were exceeded. TSS compliance limits were set based on the difference between influent and effluent concentrations of the circulating water from the Bay. The criteria set by the Board did not allow any increase in TSS concentrations. The compliance limits for TSS were exceeded seven times during 1974. However, the magnitude of the exceedances is not known as SDG&E reported only that the TSS concentration between the intake and discharge water exceeded 0 milligrams per liter (mg/L). TSS exceedances were described in an SDG&E June 1974 internal memorandum to have resulted from sample variation between the influent and discharge water. This is understandable given the very large volume of Bay cooling water being sampled, and the difficulty of ensuring that influent samples were collected from the same water as the effluent samples. This memorandum indicated that new sampling methods were being researched to ensure sampling data were representative of actual conditions.

4.7.2 Order 74-9

Compliance records for this order were reviewed for the period December 1974 through June 1976. TSS limits which were the same under this Order as for Resolution 69-R32, were exceeded on seven occasions during this period. TSS concentration exceedances ranged between 0.1 mg/L to 1.6 mg/L. These seven occasions indicate that exceedances of the compliance limit occurred only 1.4% of the time during this period. Similar explanations for the TSS exceedances were given during this period as were provided during the 1969 to 1974 period; namely sampling methods and

laboratory analytical precision. Again, compliance reports submitted to the Board indicated that a different method of sampling was being researched to ensure representative data were obtained.

4.7.3 Order 76-9

Compliance records for this order were reviewed for the period June 1976 through January 1985. Limits for TSS in the low volume waste stream were exceeded in one sample in May 1981. This sample exceeded the 30-day average concentration of 30 mg/L (measured TSS concentration of 66.9 mg/L); the daily maximum concentration of 100 mg/L (measured TSS concentration of 126 mg/L); and the 30-day average mass emission limit of 23.8 lb/day (computed TSS 30-day average mass emission limit of 34.2 lbs/day). There was no explanation provided as to the cause of these exceedances in the documents available for review.

4.7.4 Order 85-07

Compliance records for this order were reviewed for the period January 1985 through plant shutdown in April 1995. There were no exceedances of the monthly compliance limits during this period. However, semi-annual compliance limits were exceeded over three time periods for chemicals identified in the IO.

The first exceedance occurred for chromium during the first half of 1985 in the in-plant waste stream. The chromium six month median in-plant mass emission limit of 0.0011 lbs/day was exceeded. The plant computed a concentration of 0.0794 lbs/day chromium in June 1985 during a small plant discharge from void 1. An explanation for this exceedance was not provided. The plant was operating in stand-by mode and made infrequent discharges during the first half of 1985. According to the semi-annual compliance report, it appears that a combined waste discharge was made on June 3, 1985 and not on June 25, 1985, when the small waste volume (approximately 0.017 MGD) was discharged from void 1.

During the first half of 1988, chromium exceeded the compliance limits on two sampling events. On April 6, 1988, the in-plant waste stream chromium six month median mass emission limit of 0.1477 lbs/day was exceeded (computed six month median mass emission limit of 0.2983 lbs/day based on an in-plant flow rate of 0.07 MGD). On June 15, 1988 the chromium combined discharge instant maximum concentration limit of 78 micrograms per liter (ug/L) was exceeded (measured chromium concentration of 240 ug/l); the combined discharge chromium mass emission limit of 3.798 lbs/day was

exceeded (computed chromium mass emission limit of 11.69 lbs/day based on a flow rate of 5.84 MGD); and the chromium six month median in-plant waste mass emission limit of 0.3798 lbs/day was exceeded (computed chromium six month median mass emission limit of 0.908 lbs/day based on a flow rate of 0.038 MGD. It is important to note that the chromium concentration in the cooling water inlet was approximately 170 ug/L.

Due to the initial chromium exceedance that occurred in April 1988, SDG&E conducted an investigation of their facility and re-sampled in June 1988 during their next facility discharge. It was determined at this time that the chromium present in the in-plant waste stream and subsequently in the combined waste discharge leaving the facility resulted from a leak in the plant's service water system. This waste stream was immediately isolated to prevent further discharge. Remaining wastewater onsite was hauled offsite for final disposal.

The final chromium exceedance occurred during the second half of 1989. The chromium combined discharge instant maximum concentration of 78 ug/L was exceeded (measured concentration of 1,022 ug/L) during this period. The in-plant waste stream was sampled at the same time as the combined discharge, and it contained essentially no total chromium (concentration less than 4 ug/L). In response to the elevated concentration of chromium in the combined discharge, SDG&E performed a facility inspection to ensure no leaks or spills had occurred. It was concluded that all piping and valves were in good condition. Facility data were further evaluated to identify the cause and/or source of chromium. The flow rate for the cooling water was approximately 19,300 gallons per minute (gpm) and the in-plant waste stream had a flow rate of approximately 128 gpm. Thus, the combined discharge flow rate was approximately 19,428 gpm at the time the exceedance occurred. Using these flow rates and assuming a concentration of 0 ug/L chromium in the Bay, it was estimated that the in-plant waste total chromium concentration would have needed to be approximately 155,200 ug/L to result in the measured concentration of 1,022 ug/L present in the combined discharge. Since the in-plant waste stream was sampled and did not contain chromium, it was assumed that the Bay water was the source.

5.0 POTENTIAL FACILITY RELEASES OF METAL AND ORGANIC COMPOUNDS

The IO identified several metals and polychlorinated terphenyls that were detected at elevated concentrations in sediments at the north end of Southwest Marine's leasehold. This section describes potential COC releases to the bay through Plant facility operations. It also addresses three specific SDG&E historical releases described in the IO that were associated with the plant and nearby facilities.

5.1 POTENTIAL RELEASES FROM FACILITY OPERATIONS

The Plant generated several waste streams as described in the previous sections. Historical documentation shows that operational practices typically prevented facility generated contaminants from entering the Bay. In 1978 the WWTP became operational, and served to further reduce potential releases to the Bay. Prior to 1978 the containment voids located on the CW deck were used to capture various waste streams and allow off-site disposal.

5.1.1 Bilge and Blowdown Water

Two waste streams may have discharged metals and organics to the Bay during the early operation of the plant (prior to 1974). Accumulation of liquids in the turbine side bilge trenches appears to have been discharged to the circulating tunnels that went directly to the bay (based on a 1965 plant diagram). Bilge water contained various liquids as described in Section 3.4.5. Bilge water from the boiler side was pumped to an oil/water separator and/or a settling pond in lease Parcel 2, where oily material and solids were separated before discharge to the Bay.

Potential releases in the bilge water may have included oil and grease from equipment lubrication, total suspended solids from water system drains, and possible service system water leaks or spills that contained chromium VI.

The second direct Bay discharge was from boiler and evaporator blowdown water, which may have contained solids and low level metals. After the WWTP was constructed, blow-down water was captured in voids, tested, and treated if necessary prior to Bay discharge (SDG&E, date unknown). Although permits allowed direct

discharge of blowdown water, waste streams were sometimes combined such that they required testing and potential treatment prior to discharge.

Water discharge sampling and analyses from 1974 onward showed occasional permit exceedances of total suspended solids, oil and grease, iron, copper and chromium (Table 4).

5.1.2 Chromium Usage

The IO listed several specific chemicals of concern for the Plant, one of which was chromium. Chromium VI was used at the plant in the form of sodium dichromate as a corrosion inhibitor in the service water cooling system. Annual NPDES reports from 1976 through 1994 listed the amount of sodium dichromate used annually at the plant, which ranged from 0 to a maximum of about 1200 pounds (Exhibit C). This was the only source of chromium found in plant documentation.

The service water was a closed loop system that did not have direct discharges to the Bay. Operational data indicate only extraordinary events such as leaks and spills could have released chromium to the environment. Leaks in the system may have impacted CW tunnel discharges (as described in chrome exceedance in 1988, Table 4). Leaks or spills may have also drained to the bilge system, which would have been pumped to Parcel 2 settling ponds prior to 1974. No documents describing spills or unauthorized releases of sodium chromate were found.

5.1.3 Storm Water Runoff

Site surface waster hydrology is described in Section 2.3. On the north (substation) side of the plant the site surface slopes eastward to Sampson Street, where storm water runoff is channeled to storm drains that discharge to the Bay. Water on the substation side of the plant is contained by berms that have been in place since at least 1981 (SDG&E, 1981). In addition to secondary containment structures inside the substation, the ground surface of the substation is covered with gravel, which filters potentially eroded sediments. The CW deck, which is on the south side of the plant, is about 10 feet lower than the surrounding surface grade. Water from the roof and CW deck drains into the open CW tunnels. Parking areas on the south side of the plant drain directly to Sampson Street.

No documentation was found that described spills or leaks outside the plant that would have impacted storm water runoff. Chemicals were reportedly kept inside the plant, or

had secondary containments, which would have prevented releases to water runoff. Potential releases due to storm water runoff do not appear to be a concern.

5.2 SDG&E RELEASES NOTED IN INVESTIGATION ORDER

The IO identified three specific releases that may have impacted the Bay sediment. Each of these releases was researched to determine potential impacts to the bay.

5.2.1 Transformer Oil Spill, 2295 East Harbor Drive and Sampson Street

This release was documented in the Board files in the Historical Occupancy Search Report prepared by Woodward Clyde (1995) on behalf of Southwest Marine in May, 1995. The release was discovered through a federal database search completed by VISTA on behalf of Woodward Clyde. The release was reported in the Emergency Response and Notification System (ERNS) federal database maintained by the USEPA. Similar documentation of the release was recovered by BBL during a federal database search in October 2000 on behalf of ENV America. Information available in this USEPA database, which can be viewed on the internet, indicates that in April 1988 approximately 40 gallons of transformer oil containing 1,400 ppm PCBs was spilled onto asphalt and a small area of soil as a result of a leaking transformer. The database indicates that the spill was cleaned up and the area was re-sampled. No records exist at this address under the name SDG&E at either the Board or the DEH. Further, all records for this address maintained by the DEH show ARCO as the property owner. SDG&E reported that they had no information on this event.

5.2.2 Underground Storage Tank Releases, 2141 Main Street

Underground storage tank (UST) files for two tanks, #801 and #802, were reviewed at the DEH and the Board offices. These files indicated that a release corresponding to moist, stained soil was first documented in 1986 from tank #802. It was also noted that the tank was emptied and taken out of service in 1982. Tank #802 was first installed in 1970, had a capacity of 500 gallons, and was used to store diesel or gasoline fuel between 1970 and 1982. Corrosion holes were observed in the tank's steel frame in 1986 following discovery of the stained soil. In-situ bioremediation was implemented as the site remedial action for groundwater. Groundwater modeling was completed to determine if the release had the potential to impact the Bay at concentrations that would exceed the Bay standard of 21 ug/L. The modeling results showed that the benzene in groundwater (maximum concentration of 3.1 mg/L) would not reach the Bay, which was 1,800 feet away. A no further action decision was issued for the Site in 1994 by SD DEH in conjunction/agreement with the Board.

5.2.3 Wastewater Ponds, SDG&E Leased Land (Parcel 2)

San Diego Board files document the disposal of waste via evaporation ponds in an Army Corp of Engineer discharge permit dated 1971. These "ponds" were reportedly used to settle solids and separate oil and grease from bilge water as described in Section 3.4.5.

The history of the structures is described in detail in a separate report by ENV America (2004), which summarizes site investigation activities conducted in 2003. Aerial photos showed a total of four structures on Parcel 2 over the course of about 20 years. These structures consisted of what are interpreted to have been two oil/water separators and two settling/evaporation ponds. Only one release was documented in available records. One of the oil/water separators became plugged in 1955, spilling waste to the land surface.

A few of the soil samples collected from borings drilled as part of the 2003 site investigation contained hydrocarbons, polychlorinated biphenyls, and metals in soil (analytical results are in Exhibit D). The investigation results indicated there was localized residual waste in former "Pond B". Boring B2 penetrated a stained horizon at approximately 2 feet below grade, beneath which was clean soil. Groundwater samples from the borings indicated there was no appreciable impact to the underlying groundwater. Neighboring shipyard operations may have also contributed wastes to the structures, as aerial photos indicate that Pond B was within a fenced area of Southwest Marine's shipyard from 1966 onward.

Use of the ponds was terminated by 1974 with the adoption of the first NPDES permit (Order No. 74-90) issued by the SD Board to the Plant. Upon completion of the WWTP in 1978, treatment of waste streams was confined to the CW deck.

6.0 DISTRIBUTION AND SOURCES OF CHEMICALS IN SEDIMENT

Finding Number 10 of the IO inferred that elevated concentrations of cadmium, chromium, mercury, nickel and polychlorinated terphenyls (PCTs), documented by Exponent (2003) in sediments at the north end of SWM's leasehold, were due in whole or in part to discharges from SDG&E's operations. However, the inference is not supported by Exponent's (2003) data and the site history.

ENV America prepared new isoconcentration maps for the Exponent (2003) data, because the Exponent report presented isoconcentration contour maps of chemical results without including relevant data such as concentrations at individual sample stations, bathymetry or boundaries of prior dredging. Additionally, Exponent's isoconcentration contour maps did not account for the potential effects of the Silver Gate circulating water system upon local Bay circulation and sediment deposition in the vicinity of the circulating water intake and discharge. The following text describes our analysis of the distribution and sources of chemicals in sediment.

6.1 SOURCES OF CONTAMINANTS AND INFLUENCES ON CONTAMINANT DISTRIBUTION

The potential local sources of releases to the Bay include:

- Releases from the SWM shipyard, including:
  - Surface water runoff from the shipyard and piers;
  - Direct discharges to the Bay;
- Discharges from City and Port storm sewers;
- Potential release from the chemical plants located on the north side of SDG&E's leasehold; and
- SDG&E's discharges of circulating water.

The preceding sections of this report described SDG&E's known and potential releases to the Bay.

The shipyard had documented releases to the Bay. For instance, Woodward Clyde (1995) stated that the SWM shipyard property "dust suppression system for blasting house consisted of blowers directed at the bay with a water spray to cause dust to settle

963
63732
SAR193305

into the water" and "all waste generated on the dry dock including blast grit, paint, etc. were discharged into the bay."

Figure 6 illustrates the probable current flows that would have occurred during periods when the circulating water system was active at Silver Gate. The Silver Gate circulating water system had a maximum pumping capacity of 222 million gallons per day, or 154,000 gallons per minute (at peak operation). The circulating water intake and discharge streams at the shoreline were separated by sheet pile jetties. Several historical photos of the water front (e.g. Exhibit B, 1952 photograph, SDHS, 82-13673-718) illustrate that the discharge flowed into the Bay from the discharge outlet in a direction perpendicular to the shoreline. Such a flow directed into the Bay likely would have caused corresponding currents in the vicinity of Pier 3 as illustrated in Figure 6. We theorize that discharges of shipyard waste in the vicinity of the marine railways, which flanked Pier 1, would generally result in relatively rapid deposition of coarser particles near the release, and transport of suspended finer particles to eventual deposition sites at downstream locations. The sheet pile jetties were constructed of steel sheets that extended into the underlying sediment. The sheet pile jetties were solid barriers, which would have prevented migration of contaminants parallel to the shoreline across the jetties. In preparing the isoconcentration contour maps in Figures 7 to 13, the sheet pile jetties were treated as barriers that would have controlled the contaminant distribution.

The data for cadmium, chromium, mercury, nickel, PCTs and tributyltin were re-mapped and are presented in Figures 7 to 13. Tributyltin is also included here because tributyltin is a contaminant that is associated with shipyards and is generally not associated with fossil fuel power plants. Tributyltin is useful for comparison to other metals suspected to be from non-shipyard sources. Isoconcentration contours were drawn using the maximum value from the surface and the uppermost (0-2 foot) core samples.

Our records review indicates that the majority of chemical releases from the shipyard and other local industries to the Bay were prior to the introduction of stricter waste management practices in the 1970s and 1980s. In addition, the majority of releases may pre-date the latest maintenance dredging of berths on either side of SWM's Pier 1, which is estimated to have occurred within the last 20 years. SAIC (1992) includes drawings that indicate dredging was planned for the pier and sumps in the early 1990s. ENV America attempted to obtain dredge records, but was unable to obtain the records

in the short period allotted to prepare this report. The dredge records may provide information that would allow further understanding of the distribution of contaminants in sediment.

6.2 TRIBUTYLTIN

Tributyltin is an organotin compound used primarily as a biocide in antifouling paints and its presence in Bay sediment is most likely due to releases from shipyard and maritime operations. Figure 12 illustrates the distribution of tributyltin in sediments of SDG&E's leasehold and the northern portion of SWM's leasehold. In the Bay area covered by Figure 12, tributyltin was detected at the highest concentration at Exponent (2003) sampling station SW08, directly in front of the marine railways located between Piers 1 and 2. Figure 12 also illustrates that tributyltin was detected at relatively elevated concentrations throughout SDG&E's wharf lease and on ISP Alginate's leasehold. The presence of tributyltin, which is not related to power plant discharges, is a strong indicator that other detected contaminants on SDG&E's wharf leasehold come from the shipyard.

6.3 POLYCHLORINATED TERPHENYLS (PCTS)

PCTs are chlorinated aromatic hydrocarbons that were used in similar ways as PCBs. According to Kimbrough (1980), "in the U.S., PCTs were mainly used as plasticizers." According to Hale et al (1990), "suggested major uses of PCTs were as fire-retardants, as vapor suppressants to extend the kill-life of insecticides, as coatings to render fabric flame- and rot-proof and water-repellant, and in the manufacture of brake linings, abrasives for grinding wheels, lacquers, varnishes, and paints. In the electrical field, [PCT] Aroclors have been suggested for use in wire and cable coatings, as impregnants for braided cotton and asbestos insulation, and as dielectric sealants." And according to Jensen and Jorgensen (1983), an important use of PCTs was in waxes for investment casting. PCTs detected in sediment may have originated from a variety of industrial and domestic sources, including shipyards and municipal storm water runoff.

The available information does not strongly indicate that PCTs were discharged from SDG&E's operations. Figure 11 illustrates that the highest concentration of PCTs was detected in the surface and shallow sediment in the northern area of SWM's leasehold directly in front of the marine railways located between Piers 1 and 2 (sediment station SW08 core sample from 0 to 2 feet). Figure 11 also illustrates that PCTs were detected at elevated concentrations on SDG&E's wharf lease at sediment sampling stations SW01 and SW02. Exponent's (2003) Figure 4-19 illustrated that PCTs were detected at

relatively elevated concentrations at numerous locations along the length of the NASSCO and the SWM bulkhead. All of the detectable PCTs illustrated in Figure 11 were Aroclor 5460 (Aroclors 5432 and 5442 were not detected in any sample). Given the distribution pattern of PCTs, we conclude that the primary source of PCTs was the shipyard.

SDG&E's environmental staff reported to ENV America that SDG&E is not aware of using PCTs in SDG&E operations, nor has SDG&E detected PCTs on SDG&E facilities in the course of their routine in-house analytical work. SDG&E staff reportedly have no historical knowledge of purchasing or using PCTs at SDG&E facilities. SDG&E's Environmental Analysis Laboratory conducts PCB analyses to support SDG&E's environmental characterization and waste management operations. SDG&E's laboratory Team Leader stated that in his experience PCTs have not been detected in their routine PCB analyses (PCTs would be detected in routine PCB analyses if they were present).

6.4 METALS

The four metals, cadmium, chromium, nickel and mercury, had similar distribution patterns (Figures 7 to 10). The isoconcentration contours of the four metals do not conclusively indicate an SDG&E source for the four metals. The highest metal concentrations were detected at sediment sampling stations SW01, SW02, SW04 and SW08, which are directly in front of the marine railways (SW04 and SW08) and the CW discharge (SW01 SW02). The metal distribution patterns have strong similarities with the distribution patterns for tributyltin and PCTs, contaminants which appear to be present due only to shipyard operations.

Exponent (2003) presented a limited mineralogy study of copper and chromium speciation at four sediment stations, including stations SW02 and SW04. Exponent (2003) determined that at station SW04 the most frequently occurring form of mineral was slag, chromium occurred primarily as iron-chrome oxide and copper occurred primarily as chalcopyrite. Metal slag is a common blast grit, and it is likely that the slag at station SW04 is sand blasting waste. Exponent (2003) found that the analytical results from SW02 had analytical error rates that made the results for SW02 unreliable (the results indicated that chromium occurred primarily as an iron sulfate, and copper occurred primarily as native copper and chalcopyrite.).

We conclude that the four metals, cadmium, chromium, mercury and nickel, are present in sediments due to releases from the SWM leasehold, but the data are inconclusive in determining whether SDG&E's discharges contributed to the metals detected in sediment.

7.0 SUMMARY AND RECOMENDATIONS

The Silver Gate power plant operated from 1943 to the mid-1980s. During this period the Plant used circulating (CW) tunnels to transmit non-contact, once-through cooling water (up to 222 MGD), which was discharged to the Bay at a location which was immediately adjacent to the SWM shipyard. The shipyard operations have occurred over a long period, beginning in the 1930s, long before construction of the Silver Gate power plant (1943-1952). The Shipyard operations have continued to date, almost 20 years since the shutdown of the Silver Gate power plant.

The Plant CW discharge has a documented record from 1969 through plant shutdown in the mid-1980s and onward until the final NPDES permit was terminated in 1995. The primary waste stream that was known to have been discharged to the Bay was boiler blowdown. There is limited information indicating that bilge trench water or service water may have been discharged to the Bay at times; however, most information indicates that bilge trench water and service water were treated and disposed of by means that did not involve discharge to the Bay. Two additional sites mentioned in the IO, 2295 East Harbor Drive and 2141 Main Street, were reviewed and determined to have had minimal potential for releases to the Bay.

Finding Number 10 of the IO inferred that measurements of elevated concentrations of cadmium, chromium, mercury, nickel and polychlorinated terphenyls (PCTs), documented by Exponent (2003) in sediments at the north end of SWM's leasehold, were due in whole or in part to discharges from SDG&E's operations. Section 6 of this report presented an analysis of the distribution and sources of chemicals in sediment of the SDG&E wharf leasehold and the north portion of SWM's wharf leasehold. Section 6 presented revised isoconcentration maps, with additional details not shown in the maps prepared by Exponent (2003). Those additional details include relevant data such as concentrations at individual sample stations, bathymetry and locations of SDG&E's sheet pile jetties. The revised contour maps were prepared to account for the potential effects of the Silver Gate circulating water system upon local Bay circulation and sediment deposition in the vicinity of the circulating water intake and discharge.

Tributyltin was evaluated here because tributyltin is a contaminant that is associated with shipyards and is generally not associated with fossil fuel power plants. Tributyltin is

an organotin compound used primarily as a biocide in antifouling paints and its presence in Bay sediment is most likely due to releases from shipyard and maritime operations. The distribution of tributyltin impacts (illustrated in Figure 12), extends across the SDG&E wharf lease. Based on the distribution of tributyltin, it is apparent that shipyard contaminants may occur throughout the SDG&E wharf lease.

We analyzed the distribution pattern of PCTs and PCT usage and concluded that the primary source of PCTs was not SDG&E, and there was little data supporting a conclusion that SDG&E's discharges contributed to PCTs detected in sediment.

The analysis in Section 6 also demonstrated the four metals of concern identified in the IO, cadmium, chromium, nickel and mercury, are present in sediments due to releases from the SWM leasehold, but the data are inconclusive in determining whether SDG&E's discharges contributed to the metals detected in sediment.

The Exponent (2003) sediment sampling stations in the SDG&E wharf leasehold and the north portion of SWM's wharf leasehold were spaced over 100 feet apart, and there were only three sediment sampling stations in SDG&E's leasehold. The data indicate that SDG&E discharges were not a cause of sediment contamination. Additional data are recommended to conclude with certainty that SDG&E discharges were not a cause of sediment contamination.

Recommendation. We recommend that additional sediment data be collected to establish whether SDG&E was a contributor to the shipyard sediment contamination detected in the SDG&E wharf leasehold and the north portion of SWM's wharf leasehold. The additional sediment data should be collected to (1) increase the sample density to determine accurate concentrations trends across the leaseholds, and (2) collect forensic chemistry and mineralogy data that may be used to determine the source of sediment contaminants. Additionally, dredging and historical sediment sampling data, such as that presented in SAIC (1992), should be compiled and evaluated to better understand contaminant distribution in sediments

Process Name	Corresponding NPDES Permit Process Discharge Description [1]	Process Description	Waste Constituents	Quantity[1]	Discharge Practice	Reference
Non-Contact Cooling Water for Heat Exchange	Non-Contact Cooling Water (Discharge 001)	Once-through non-contact cooling water for condenser cooling and service cooling of bearings, oil, etc.	Chlorine (added to prevent fouling of heat exchangers)	• Average rate of 165 6 millions gallons per day (MGD) • Max rate of 223 MGD	• 1940s to Plant Shutdown: to CW tunnels to Bay	• RWQCB, 1969 • USEPA, 1972 • SDG&E, 1972 • SDG&E, 1978 • SDG&E, date unknown • SDG&E, 1980a • SDG&E,1980b • SDG&E,1988
Air Pre-heater Wash	Low Volume Waste (Discharge 001D) (Note, classified as Metal Cleaning Waste (Discharge 001B) if the addition of chemicals was required)	Water wash solution flush through air pipes to remove scale	Dissolved and suspended solids; metals	• Six washings per year (1 to 2 times per year per boiler) (Betz, 1978) • One wash per year per air heater when burn gas • Two washes per year per air heater when burn oil • 90,000 gallons per wash per air heater (Betz, 1978) • 90,000-120,000 gallons per wash per year per air heater (SDG&E, source unknown) • 179,500 gallons per month (SDG&E, March 1975) • 6,000 gallons per day (SDG&E, December 1975) • 158,000 gallons per day (SDG&E 1980a, 1980b, 1988 and RWQCB, 1985)	• 1940s to 1977: to CW voids then to sanitary sewer • 1978 to Plant Shutdown: to WWTP (clean effluent to Bay via CW tunnels)	• RWQCB, 1969 • SDG&E, 1972 • SDG&E, 1975 • SDG&E, 1978 • Betz, 1978 • SDG&E, date unknown • SDG&E, 1980a • SDG&E, 1985 • SDG&E, 1988 • RWQCB, 1985
Boiler Fireside Wash	Metal Cleaning Waste (Discharge 001B)	Washing/cleaning of external side of water tubes to remove soot and combustion by-products with high pressure water	Dissolved and suspended solids; metals	• Infrequent - typically occurred during unit shut-down • 1978 WWTP manual (Betz, 1978) indicated, " fireside washes not conducted currently." • 120,000 gallons per month (SDG&E, March 1975) • 140,000 gallons per year per boiler at 2 boiler washings per year (SDG&E, 1972) • 4,000 gallons per day (SDG&E, 1975)	• 1940s to 1977: to CW voids where water was neutralized and pumped into City Sewer. Solids were settled, removed and shipped to offsite facility • 1978 to Plant Shutdown: to WWTP, clean effluent to Bay • 1978: Boiler Fireside Washes not conducted (Betz, 1978) • All scale to offsite disposal facility	• RWQCB, 1969 • SDG&E, 1972 • SDG&E, 1975 • SDG&E, date unknown • SDG&E, 1978 • Betz, 1978 • SDG&E, 1980a • RWQCB, 1985 • SDG&E, 1988

Notes:
[1] The listed volume discrepancies may be attributed to:
- Varying documentation describing a range of operations that were conducted over the years
- Documented volume representing one versus all equipment pieces (i.e. one boiler versus six).
- Varying operating periods and equipment usage (all units on-line versus half versus none when the plant operated in stand-by mode in the later years).

San Diego, California

Dear Mr. Hays:

Ninyo & Moore is submitting this revised report to reflect amendments to the analytical laboratory results made by Calscience on May 18, 2011 upon a more detailed review and data validation process. During this process, the PCB Aroclor 1254 was identified in six soil samples and four cooling water tunnel sediment samples. A copy of the revised analytical reports is included Appendix D, and the revised results are indicated in blue on the associated tables.

We appreciate the opportunity to be of service to you on this project.

Sincerely,
NINYO & MOORE

1. INTRODUCTION

San Diego Unified Port District (SDUPD) retained Ninyo & Moore to conduct a subsurface investigation of the San Diego Gas and Electric (SDG&E) Tidelands Area located at Belt Street and San Diego Bay, San Diego, California (site) (Figure 1). The work was conducted in general accordance with the SDUPD Contract No. 50092, Request for Services No. 57 (and amendments), the work plan dated November 15, 2010, and the County of San Diego, Department of Environmental Health (DEH), Site Assessment and Mitigation Manual.

2. BACKGROUND

The site is located between Belt Street and the San Diego Bay, at the foot of Sampson Street, southwest of the former Silver Gate Power Plant in the City and County of San Diego, California (Figure 2). SDG&E is the current lease holder from SDUPD. The current tenant at the site is BAE Systems.

3. SCOPE OF SERVICES

Ninyo & Moore's scope of services generally included the following tasks:

- Provided project management and coordination.
- Obtain revised San Diego County, DEH, boring permits reflecting Ninyo & Moore as the subcontractor and Gregg Drilling as the driller.
- Prepared a site-specific health and safety plan.
- Marked the proposed boring locations and notified Underground Service Alert (USA) and DEH a minimum of 48 hours prior to starting the subsurface investigation.
- Conducted a geophysical survey of the boring locations and potential subsurface anomalies, which may have related to historical structures, settling ponds, or sea water cooling tunnels.
- Advanced 38 Cone Penetration Testing (CPT)/Ultra Violet Optical Screening Tool (UVOST) locations to depths of approximately 40 to 48 feet below ground surface (bgs).
- Reviewed the CPT/UVOST data and identified 28 locations and specific depths at each location to collect soil samples.

- Advanced 28 locations using a direct push drill rig and collected soil samples at depths associated with selected UVOST data and in areas where staining or hydrocarbon odors were noted. Temporary wells were set at 15 locations with total depths ranging from 15 to 32 feet bgs to collect groundwater samples.
- Conducted sediment sampling from the interior base of the sea water cooling tunnels located beneath the site.
- Collected soil, sediment, and groundwater samples and submitted them to a state-certified analytical laboratory for chemical analysis.
- Compiled and performed a quality control review of the analytical results.
- Prepared this report summarizing the subsurface investigation.

4. PREVIOUS SITE ASSESSMENT

The site has historically been used by SDG&E for the storage of plant waste from the Silver Gate Power Plant. ENV America Incorporated (ENV America) performed a site investigation on August 7, 2003, on behalf of SDG&E (ENV America, 2004). The ENV America investigation focused on potential impacts from two former wastewater ponds located on the site. That investigation identified the presence of total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), most of which appeared to be chlorinated solvents, polycyclic aromatic hydrocarbons (PAHs), trace metals, and polychlorinated biphenyls (PCBs) in subsurface soil and groundwater. The approximate locations of the ENV America samples are provided on Figure 2.

After ENV America completed the site investigation fieldwork, additional historical information was discovered and included photographs that indicated that there were two additional wastewater structures at the site. The additional structures were identified as oil/water separators (ENV America, 2004a).

Given the areal extent of the site and the associated historical site usage, the sampling conducted by ENV America was limited and did not characterize the site or delineate the contamination identified during their investigation.

PORT098013

63732 PAGE 994

5. SITE SPECIFIC HEALTH AND SAFETY PLAN

Ninyo & Moore prepared a site-specific health and safety plan (SHSP) that identified the potential chemical and physical hazards that may be encountered during the field activities. In addition, the plan provided guidelines for use of personal protective equipment based on site-specific conditions, location and directions to the nearest hospital, and contingency plans. Ninyo & Moore's field activities were performed in accordance with the SHSP, and field personnel signed copies of the employee acknowledgement prior to start of work. In addition, each morning a tail-gate safety meeting was held with all parties involved in conducting the scope of services outlined above.

6. FIELD ACTIVITIES

The following sections describe the field activities associated with the subsurface investigation conducted by Ninyo & Moore in December 2010.

6.1. Permits and Notifications

Ninyo & Moore revised the previously-approved boring permits for the advancement of 40 CPT/UVOST borings and 30 soil borings including installation of a temporary monitoring well at each location. The original application was submitted to the DEH and approved on August 30, 2010. A revised boring permit was approved, which included identification of the selected sub-consultant and the drilling contractor. USA and the DEH were notified a minimum of 48 hours prior to the start of advancement of the CPT/UVOST and soil borings. The tenant and the client were notified a minimum of 24 hours prior to drilling activities at the site. A copy of the approved DEH Soil Boring Permit is included in Appendix A.

6.2. Boring Locations

CPT/UVOST boring locations were selected based upon historical information provided by the client, a review of historical aerial photographs, and a site reconnaissance. Soil borings

and temporary groundwater well locations were selected based on the UVOST results. Each of the boring locations is depicted on Figure 3.

6.3. Geophysical Survey

On December 11, 2010, Southwest Geophysics, Inc. (Southwest) assessed the proposed boring locations at the site to mark potential buried utilities and locate other subsurface anomalies. A combination of electromagnetic induction, magnetometry, and ground penetrating radar was utilized. In addition, a grid survey was conducted in the general locations of the former ponds and the sea water cooling tunnels to help delineate these features. A copy of the geophysical survey report is included in Appendix B.

6.4. Cone Penetration Testing – Ultra Violet Optical Screening Tool

CPT/UVOST fieldwork was conducted between December 12 and December 15, 2010. CPT/UVOST borings were advanced using a 30-ton truck-mounted CPT rig operated by Gregg Drilling (Gregg), a bonded, C-57 licensed drilling contractor. Borings were advanced to a maximum total depth of 48 feet bgs. Refusal was encountered with the CPT/UVOST in borings CPT-23 and CPT-24 at 4.9 and 1.5 feet bgs, respectively and CPT-17 was terminated at approximately 16 feet bgs because it was located above the discharge cooling water tunnel. In addition, CPT data could not be collected at location CPT-34 through CPT-38 due to a malfunction in the cone. UVOST data was simultaneously collected while advancing the CPT borings including locations where CPT data was not available. Drilling and sampling activities were conducted under the supervision of a California Professional Geologist. Upon completion, each boring was backfilled with bentonite grout, and capped with either asphalt or concrete to match the pre-existing surface. Copies of the CPT and UVOST data are provided in Appendix C.

6.5. Soil Sampling

Based on the CPT/UVOST data, 28 soil borings were advanced between December 18 and December 21, 2010. Soil samples were collected using a 2-inch diameter continuous core

barrel lined with acetate sleeves: SB-39, SB-40, and SB-41, located inside a structure, were advanced using a hand auger. However, refusal was met in locations SB-39 and SB-41 at depths of one and 3 feet bgs, respectively. Table 1 indicates the sample depths at each of the boring locations.

Sample intervals were selected at each boring locations using the UVOST data and visual observation of the material in the field. The acetate sleeve was sliced in half to view the desired sample depth; three 5-gram samples were collected from the sample interval using a Terra Core Sampler® and were transferred to pre-preserved vials with stir bars for VOC analysis as described in United State Environmental Protection Agency (EPA) Prep Method 5035A. The selected interval was then placed into a stainless steal mixing bowl and composited. Once composited, the sample was placed in a new 8-ounce glass jar, securely closed, labeled with pertinent information and placed in a cooler with ice. Samples were transferred under chain-of-custody procedures to Calscience Environmental Laboratories (Calscience), of Garden Grove, California, a state-certified laboratory, for analytical testing. Upon completion, each soil boring was backfilled with bentonite grout, and capped with either asphalt or concrete to match the pre-existing surface. Excess sample material was placed in appropriately-labeled, DOT compliant 55-gallon drums and temporarily stored at the site, pending disposal.

6.6. Groundwater Sampling

Once the borings were advanced to their total depth, temporary groundwater wells were installed in 15 of the soil borings. Total depth of the temporary wells varied based on field conditions. Table 1 indicates the depth and screen intervals of each temporary well. Wells were constructed using 3/4-inch diameter flush-threaded schedule 40 polyvinyl chloride (PVC) with 5 feet of 0.010 slotted PVC screen at the base of each well. After installation, each temporary well was allowed to equilibrate for a minimum of 30 minutes prior to measuring the water level in each well to the nearest 0.1 foot using an electronic water level meter. Depth to groundwater ranged from 8.4 feet to 10.1 feet bgs as measured in the temporary wells (Table 1). Groundwater samples were then collected from each of the

temporary wells using a stainless steel bailer, which was decontaminated between each use. Groundwater samples were placed directly into laboratory supplied sampling containers, labeled with pertinent information and placed in a cooler with ice. Samples were transferred under chain-of-custody procedures to Calscience for analytical testing.

6.7. Cooling Water Tunnel Sediment Sampling

On December 29, 2010, samples were collected at each of the access points to the cooling water tunnels located beneath the site. Two samples were collected from the intake tunnel and two samples were collected from the discharge tunnel using a bottom dredge sampler. The dredge sampler was slowly lowered to the base of the tunnel; once impacting the bottom, the spring-loaded mechanism closed and was then raised to the surface. The material collected at each location was placed in a cleaned stainless steel mixing bowl. Larger material including rocks and trash was removed from the sampler prior to placing the sediment into the laboratory supplied containers. Three 5-gram samples were collected from the sample using a Terra Core Sampler® and transferred to pre-preserved vials with stir bars for VOC analysis as described in EPA Preparation Method 5035A. However, a VOC sample was not collected from the northern intake cooling water tunnel sample location because the material was saturated, and therefore, not suitable for this preparation method. The remainder of the sample was placed in a new 8-ounce glass jar, securely closed, labeled with pertinent information and placed in a cooler with ice. Samples were transferred under chain-of-custody procedures to Calscience for analytical testing.

6.8. Decontamination Procedures

Non-dedicated monitoring and sampling equipment was decontaminated after each use. Decontamination procedures included a non-phosphate detergent and potable water wash, followed by potable and distilled water rinses. Decontamination fluids were placed in appropriately-labeled, DOT compliant 55-gallon drums and temporarily stored at the site, pending disposal.

7. ANALYTICAL TESTING

Soil, groundwater, and cooling water tunnel sediment samples were analyzed for TPH extended range organics (TPH-ero) for carbon ranges C_6-C_{44} by EPA Method 8015M with silica gel cleanup, VOCs by EPA Method 8260B (prep by EPA Method 5035A for soil and sediment samples), polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C, polychlorinated biphenyls (PCBs) and polychlorinated terphenyls (PCTs) by EPA Method 8082 and 8082M, respectively, and Title 22 Metals by EPA Methods 6010B/7471A.

7.1.1. Field Quality Assurance and Quality Control Trip Blank

Trip blanks are carbon-free deionized water samples provided by the laboratory to accompany the samples during all stages of shipment, storage, and analysis. Trip blanks are used to evaluate the potential for the artificial introduction or cross-contamination of analytes into the investigative samples during the transportation and sample handling processes. One set of trip blanks accompanied each sample delivery group from the field to the laboratory and was analyzed for VOCs by EPA Method 8260B.

A trip blank accompanied each sample delivery group associated with the subsurface investigation. VOC compounds were not detected in the trip blanks.

7.1.2. Field Quality Assurance and Quality Control Equipment Blank

Quality control equipment blanks (QCEBs) are samples collected by pouring carbon-free deionized water over and/or through sample collection devices following the aforementioned decontamination procedures. QCEBs are used to evaluate the effectiveness of the decontamination procedures and determine if sample cross-contamination has occurred. One QCEB was collected at the end of each sampling day. The QCEBs were analyzed for TPH-ero by EPA Method 8015M (with silica gel cleanup), VOCs by EPA Method 8260B, PAHs by EPA Method 8270C, PCBs/PCTs by EPA Methods 8082 and 8082M respectively, and Title 22 Metals by EPA Methods 6010B/7471A.

An equipment blank accompanied each sample delivery group associated with the subsurface investigation. The QCEB sample collected December 18, 2010 had a concentration of zinc above the reporting limit and the QCEB sample collected December 19, 2010 had a concentration of naphthalene above the laboratory reporting limit. These detections do not exceed the detected concentrations of either zinc or naphthalene in samples collected on December 18 and December 19, 2010, respectively. Therefore, the data are acceptable for their intended purpose.

8. SUMMARY OF FINDINGS

This section summarizes the analytical results of the December 2010 subsurface investigation. Figure 3 indicates the sampling locations, Table 2 summarizes the analytes detected in soil, Table 3 summarizes the analytes detected in groundwater, and Table 4 summarizes the analytes detected in cooling water tunnel sediment.

8.1. Soil Sample Analytical Results

Based on visual observation, the soil generally consisted of silty sand to sandy silt and consisted primarily of hydraulically placed fill. Photoionization detector screening of the soil cuttings did not indicate the presence of VOCs, and neither staining nor unusual odors were noted from any of the borings. A copy of the laboratory analytical results is included in Appendix D. The following provides a summary of the soil sample analytical results:

- TPH was detected in 36 soil samples at or above the method detection limits. Table 5 provides a summary of all TPH soil sample analytical results.
- VOCs were detected in 16 soil samples at or above the method detection limit. Table 6 provides a summary of all VOC soil sample analytical results.
- PAHs were detected in 18 soil samples at or above the method detection limit. Table 7 provides a summary of all PAH soil sample analytical results.
- PCBs were detected above the method detection limit as Aroclor 1254 in six soil samples and as Aroclor 1260 in eight soil samples. PCTs, as Aroclor 5460, were detected in

eight soil samples at or above the method detection limit. Table 8 provides a summary of all the PCB/PCT soil sample analytical results.

- Metals were detected above the reporting limit in numerous samples. Metals analytical results in soil samples are summarized in Table 9.

8.2. Groundwater Sample Analytical Results

Neither odor nor visible free-product was observed in the groundwater samples at the time of collection. Groundwater sampling locations are depicted on Figure 3. A copy of the laboratory analytical results is included in Appendix D. The following provides a summary of the groundwater analytical results:

- TPH was detected in eight groundwater samples at or above the method detection limits. Table 10 provides a summary of all TPH groundwater sample analytical results.
- VOCs were detected in nine groundwater samples at or above the method detection limit. Table 11 provides a summary of all VOC groundwater sample analytical results.
- Fluoranthene was detected above the method detection limit in the groundwater sampled collected from SB10. Other PAHs were not detected in groundwater at or above the method detection limit. Table 12 provides a summary of all PAH groundwater sample analytical results.
- PCBs/PCTs were not detected at or above the method detection limit in the groundwater samples analyzed. Table 13 provides a summary of all PCB/PCT groundwater sample analytical results.
- Metals were detected above the reporting limit in numerous samples. Metals analytical results in groundwater samples are summarized in Table 14.

8.3. Cooling Water Tunnel Sediment Sample Analytical Results

Based on visual observation of the sediment extracted from the two cooling water tunnels, the sediment generally consisted of silty sands to sandy silts. Sediment samples from the discharge and intake tunnels had a slight hydrocarbon odor, and the samples were generally gray to black in color. A copy of the laboratory analytical results is included in Appendix D. The following provides a summary of the sediment sample analytical results.

- TPH was detected in four of the five cooling water tunnel sediment samples at or above the method detection limits. Table 15 provides a summary of all TPH cooling water tunnel sediment sample analytical results.

- Benzene was detected above the method detection limit in the cooling water tunnel sediment sample DT01. Other VOCs were not detected at or above the method detection limit in cooling water tunnel sediment samples. Table 16 provides a summary of all VOC cooling water tunnel sediment sample analytical results.

- PAHs were detected in four of the five cooling water tunnel sediment samples at or above the method detection limit. Table 17 provides a summary of all PAH cooling water tunnel sediment sample analytical results.

- PCBs, as Aroclors 1254 and 1260, and PCTs, as Aroclor 5460, were detected above the method detection limit in four of the five cooling water tunnel sediment samples. Table 18 provides a summary of all PCB/PCT cooling water tunnel sediment sample analytical results.

- Metals were detected above the reporting limit in numerous samples. Metals analytical results in cooling water tunnel sediment samples are summarized in Table 19.

9. LABORATORY DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

A quality assurance/quality control (QA/QC) review was performed on the analytical data from the subsurface investigation to assess the quality and usability of the laboratory data. The QA/QC review evaluated the holding times, trip and equipment blank samples, laboratory internal quality control, surrogate recovery, and data qualifiers.

Based upon the results of the laboratory QA/QC review, it is the opinion of Ninyo & Moore that these analytical data are acceptable for use as intended.

10. LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines, and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in site conditions may ex-

PORT098021

63732 PAGE 1002

activities. Please also note that this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

The environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analysis. Further assessment of potential adverse environmental impacts from past on-site and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated; however, conditions can vary significantly between sampling locations. Variations in soil and/or groundwater conditions will exist beyond the points explored in this evaluation.

The data contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

SOIL BORING CONSTRUCTION PERMIT

SITE NAME: SAN DIEGO PORT DISTRICT PROPERTY

SITE ADDRESS: FOOT OF SAMPSON ST, SOUTH OF BELT ST., SAN DIEGO, CA 92113

PERMIT FOR: **70 SOIL BORINGS**

PERMIT APPROVAL DATE: AUGUST 30, 2010

PERMIT EXPIRES ON: DECEMBER 28, 2010

RESPONSIBLE PARTY: SAN DIEGO UNIFIED PORT DISTRICT

PERMIT CONDITIONS:

1. All borings must be sealed from the bottom of the boring to the ground surface with an approved sealing material as specified in California Well Standards Bulletin 74-90, Part III, Section 19.D. **Drill cuttings are not an acceptable fill material.**

2. All borings must be properly destroyed within 24 hours of drilling.

3. Placement of any sealing material at a depth greater than 30 feet must be done using the tremie method.

4. All water and soil resulting from the activities covered by this permit must be managed, stored and disposed of as specified in the SAM Manual in Section 5, E- 4. (**http://www.sdcounty.ca.gov/deh/lwq/sam/manual_guidelines.html**). In addition, drill cuttings must be properly handled and disposed in compliance with the Stormwater Best Management Practices of the local jurisdiction.

5. Within 60 days of completing work, submit a well construction report, including all well and/or boring logs and laboratory data to the Well Permit Desk. This report must include all items required by the SAM Manual, Section 5, Pages 6 & 7.

6. This office must be given 48-hour notice of any drilling activity on this site and advanced notification of drilling cancellation. Please contact the Well Permit Desk at 619) 338-2339.

NOTE: **This permit does not constitute approval of a work plan as defined in Section 2722 of Article 11 of C.C.R., Title 23. Work plans are required for all unauthorized release investigations in San Diego County.**

APPENDIX B

GEOPHYSICAL SURVEY REPORT

SOUTHWEST
GEOPHYSICS, INC.
YOUR SUBSURFACE SOLUTION

January 14, 2011
Proposal No. 110336

Mr. Scott Lutz
Ninyo & Moore
5710 Ruffin Road
San Diego, CA 92123

Subject: Geophysical Services
BAE Systems
San Diego, California

Dear Mr. Lutz:

In accordance with your authorization, we are pleased to submit this letter-report pertaining to our geophysical survey services at the BAE Systems property located in San Diego, California (Figure 1). Specifically, our services included delineating the presence of detectable underground utilities in the area of 43 proposed boreholes at the site. This report presents our survey methodology, equipment used, analysis, and findings from our study.

Our scope of services for the project included performance of a geophysical survey, analysis of the data collected, and preparation of this letter-report. The geophysical survey included the use of a GSSI SIR 3000 ground penetrating radar (GPR) with a 400 MHz transducer, Schonstedt GA-52 magnetic gradiometer, Geonics model EM61 time domain instrument, RD4000 line tracer, and M-Scope TW6 pipe and cable locator. Roughly a 10-foot by 10-foot area centered about the proposed borehole locations were surveyed, access permitting. In many cases surface objects (i.e., buildings, vehicles, storage containers, etc.) limited the survey area.

Interpretation of the collected data took place in real time as the survey progressed. The results of our survey were marked on the ground surface with paint and reported to your field representative at the time of our survey. Based on the results, a preferential boring location was marked on the ground surface with pink paint. It should be noted that the depth of radar penetration was on the order of 3 feet and that non metallic objects deeper than the penetration depth may not be detected.

The field evaluation and geophysical analyses presented in this report have been conducted in general accordance with current practice and the standard of care exercised by consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be present. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface surveying can be performed upon request.

Please note that our evaluation was limited to the assessment of the possible presence of detectable underground utilities, and that "USA" or "Dig Alert" should also be contacted prior to conducting subsurface exploration activities. In addition, we recommend that available utility plans/drawings for the project site be reviewed as appropriate.

Southwest Geophysics, Inc. should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document. This report is intended exclusively for use by the client. Any use or reuse of this report by parties other than the client is undertaken at said parties' sole risk.

We appreciate the opportunity to be of service on this project. Should you have any questions please contact the undersigned at your convenience.

Sincerely,
SOUTHWEST GEOPHYSICS, INC.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 10/25/2013 has revealed that there is 1 CERCLIS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
MASTER PLATING	***2109 NEWTON AVE***	***NNE 1/4 - 1/2 (0.275 mi.)***	***M87***	***493***

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there are

10 CERC-NFRAP sites within approximately 0.5 miles of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/11/2014 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or

dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/11/2014 has revealed that there are 18 RCRA-LQG sites within approximately 0.25 miles of the target property.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 06/05/2014 has revealed that there are 16 CA ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

CA SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the CA SWF/LF list, as provided by EDR, and dated 05/19/2014 has revealed that there is 1 CA SWF/LF site within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, and dated 07/30/2014 has revealed that there are 3 CA UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: The EPA's listing of Brownfields properties from the Cleanups in My Community program, which provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

A review of the US BROWNFIELDS list, as provided by EDR, and dated 07/01/2014 has revealed that there is 1 US BROWNFIELDS site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/11/2014 has revealed that there are 4 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 6 EDR US Hist Auto Stat sites within approximately 0.25 miles of the target property.
