Mitigation measure **MM-CUL-1** would be implemented, as applicable, for future site-specific projects under the proposed PMPU. If such projects are required to avoid the historical resource or to conform to the SOI Standards and involve the relocation, conversion, rehabilitation, or alteration of a historical resource, or alterations to the immediate surroundings of a historical resource, then any impact on historical resources would be mitigated to less than significant. With implementation of **MM-CUL-1**, in many cases, future projects under the proposed PMPU would not result in significant impacts on historical resources. For future projects that necessarily alter a historical resource directly or indirectly so as to impair its ability to convey historical significance, or for future projects that necessarily entail demolition of a historical resource, **MM-CUL-1** would not reduce impacts to a less-than-significant level. As such, the potential exists for future development to result in cumulatively considerable historical resource impacts, when added to significant cumulative impacts from other past, present, and probable future site-specific projects (**Impact-C-CUL-1**).

Archaeological Resources

As discussed in Threshold 2, potential impacts from future ground-disturbing activities associated with landward portions of future development would depend on whether such activities occur within artificial fill materials (low likelihood of impact) or intact soil deposits (higher likelihood of impact). If site-specific and future project-related construction or operation activities damaged or destroyed intact archaeological resources that may be eligible for the NRHP or CRHR, or resources meeting the definition of a unique archaeological resource under PRC 21083.2 and State CEQA Guidelines Sections 15064.5(c) and 15126.4(b)(3), this would result in significant impacts. Future, site-specific projects built or operated on artificial fill material on the landward and seaward portions of the proposed project site are less likely to impact a significant archaeological resource or unique archaeological resource because fill materials have little likelihood of containing intact archaeological deposits. Thus, construction and ground-disturbing operations associated with future development allowed under the proposed PMPU would have the potential to make a cumulatively considerable contribution to a significant cumulative impact on archaeological resources (**Impact-C-CUL-2**). Therefore, the proposed PMPU's contribution is considered cumulatively considerable/significant.

Because the proposed PMPU area has recorded archaeological sites that have not been assessed for CRHR eligibility, or for unique archaeological resource status, and the potential to contain unknown buried or otherwise obscured archaeological resources, mitigation is required for future site-specific construction and operation activities. Mitigation measure **MM-CUL-2** would be implemented for future projects developed under the proposed PMPU. Implementation of **MM-CUL-2** would help to avoid contributing to the loss or alteration of archaeological historical resources and unique archaeological resources. However, because the location, nature, scope, and effects of future development proposals are not known at this time, it is not possible to state with certainty that **MM-**

CUL-2 would avoid or reduce cumulative impacts to less than significant. As such, the potential exists for future development to result in cumulatively considerable impacts on archaeological historical resources and unique archaeological resources, when combined with significant cumulative impacts from other past, present, and probable future site-specific projects (**Impact-C-CUL-2**).

Human Remains, Including those Outside of Formal Cemeteries

As discussed under Threshold 3, there are many areas within San Diego County where prehistoric and historic period human remains have been uncovered during both archaeological investigations and construction-related ground-disturbing activities. However, as discussed above, for site-specific and future project-related construction or operation activities resulting in the discovery of human remains, construction activities would have to comply with existing laws. Health and Safety Code Section 7050.5 states that in the event of discovery of human remains during ground disturbances, no further disturbance shall occur until the San Diego County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. The San Diego County Coroner must be notified of the find immediately, and if the Coroner determines the remains are Native American, notification to the NAHC and coordination with the designated Most Likely Descendant shall occur. In addition, per State CEQA Guidelines Section 15064.5(e)(2), the landowner or landowner's authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance if the NAHC is unable to identify a MLD or if the MLD failed to make a recommendation within 24 hours after being notified by the NAHC; if the descendent identified fails to make a recommendation; or if the landowner or their authorized representative rejects the recommendation of the descendent and mediation by the NAHC fails to provide measures acceptable to the landowner. Compliance with these laws would avoid or reduce such impacts to a level below significance. Accordingly, impacts would not be cumulatively considerable and would be less than significant.

Tribal Cultural Resources

TCRs may be found throughout the San Diego region and it is difficult to document TCRs with precise locations. Construction activities associated with trenching and deeper excavations, as opposed to more surficial disturbances, have the potential to uncover or disturb TCRs. Development projects approved under the proposed PMPU would generally involve site disturbance, movement of construction equipment, construction staging areas, and import and export of materials, all of which could result in a substantial adverse change in the significance of a TCR. Therefore, when combined with significant cumulative impacts from other past, present, and probable future site-specific projects, construction and ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to make a cumulatively considerable contribution to a significant cumulative impact on TCRs (**Impact-C-CUL-3**). Although implementation of mitigation measures (**MM-CUL-2** and **MM-CUL-3**) would help reduce the impacts, because the location, nature, scope, and effects of future development proposals are not known at this time, it is not possible to state with certainty that **MM-CUL-2** and **MM-CUL-3** would avoid or reduce cumulative impacts to less than significant. Therefore, the proposed PMPU's contribution to cumulative TCR impacts would be cumulatively considerable and unavoidable after mitigation.

4.4.5.4 Cumulative Impact Determination and Mitigation

Cumulative impacts on historical built environment resources (**Impact-C-CUL-1**) may still remain significant and unavoidable after mitigation (**MM-CUL-1**). This potential loss or alteration of historical built environmental resources, in combination with the progressive cumulative loss or alteration of historical built environment resources associated with other past, present, and probable future projects, would mean the cumulatively considerable contribution of probable future development projects, consistent with the proposed PMPU, to the loss or alteration of historical built environment resources would be significant and unavoidable.

Cumulative impacts on archaeological resources and TCRs (**Impact-C-CUL-2** and **Impact-C-CUL-3**, respectively) may still remain significant and unavoidable after mitigation (**MM-CUL-2** and **MM-CUL-3**, respectively). This potential loss or alteration of archaeological resources and TCRs, in combination with the progressive cumulative loss or alteration of archaeological resources and TCRs associated with other past, present, and probable future projects, would mean the cumulatively considerable contribution of probable future development projects, consistent with the proposed PMPU, to the loss or alteration of archaeological resources and TCRs would be significant and unavoidable.

Adherence to the specific procedures described in State CEQA Guidelines Section 15064.5(e), of Health and Safety Code Section 7050.5 and PRC Section 5097.98 would ensure that future development allowed under the proposed PMPU would not result in a cumulatively considerable contribution to a significant cumulative impact on human remains, including those interred outside of formal cemeteries. No mitigation is required.

4.5.1 Overview

This section describes the existing conditions and laws and regulations for geology and soils, followed by an analysis related to the proposed Port Master Plan Update's (PMPU's) potential to: (1) expose people or structures to geologic hazards, (2) result in substantial soil erosion or loss of topsoil, (3) be located on unstable ground, (4) be located on expansive soil, and (5) destroy a unique paleontological resource or site or unique geologic feature. Other potential geology and soils issues, such as impacts related to landslides and soils incapable of supporting wastewater disposal systems, were analyzed in Section VI of the Initial Study/Environmental Checklist (see Appendix A) and determined to have no impact. The analysis and conclusions regarding these impacts are also summarized in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*.

Information in this section is based on the *EIR Level Geology and Soils Evaluation for the Integrated Planning Port Master Plan Update* prepared by Ninyo & Moore, dated June 2017 (Appendix F). Unless cited otherwise, all technical information in this section is based on Appendix F. For the paleontological resources analysis, the technical information is based on records searches conducted by the San Diego Natural History Museum on May 1, 2017 (San Diego Natural History Museum 2017) for the proposed PMPU area.

Table 4.5-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.5.4.3, *Project Impacts and Mitigation Measures*.

Table 4.5-1. Summary of Significant Geology and Soils Impacts and Mitigation Measures

Summary of Potentially Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-GEO-1: Future Construction Activities within PD1, PD3, PD8, PD9, and PD10 May Adversely Impact Unique Paleontological Resources	PD1, PD3, PD8, PD9, PD10	MM-GEO-1: Require Paleontological Sensitivity Screening and Monitoring in Areas of Sensitivity	Less than Significant	MM-GEO-1 would reduce the potential for future development in the proposed PMPU area to result in destruction of a paleontological resource.
Impact-C-GEO-1: Future Construction Activities Within PD1, PD3, PD8, PD9, and PD10, Combined with Probable Future Projects, May Cumulatively Impact Unique Paleontological Resources	PD1, PD3, PD8, PD9, PD10	MM-GEO-1 , as described above	Less than Cumulatively Considerable	MM-GEO-1 would reduce the potential for future development in the proposed PMPU area to result in destruction of a paleontological resource.

4.5.2 Existing Conditions

The following section describes the existing geologic conditions and related hazards within the proposed PMPU area. This section is introduced by first describing the proposed PMPU area geology followed by groundwater characteristics, faulting, and area seismicity.

4.5.2.1 Geologic Setting

Regional Geology

The PMPU area is situated in the coastal foothill section of the Peninsular Ranges Geomorphic Province. The province encompasses an area that extends approximately 900 miles from the Transverse Ranges and the Los Angeles Basin south to the southern tip of Baja California. The province varies in width from approximately 30 to 100 miles. In general, the province consists of rugged mountains underlain by Jurassic metavolcanic and metasedimentary rocks, and Cretaceous igneous rocks of the southern California batholith.

The Peninsular Ranges Province is traversed by a group of sub-parallel faults and fault zones trending roughly northwest. Several of these faults are considered active. The Rose Canyon, Elsinore, San Jacinto, and San Andreas faults are active fault systems located northeast of the proposed PMPU area; the Coronado Bank, San Diego Trough, and San Clemente faults are active faults located west of the proposed PMPU area. Major tectonic activity associated with these and other faults within the regional tectonic framework consists primarily of right-lateral, strike-slip movement. Specifics of faulting are discussed in further detail below.

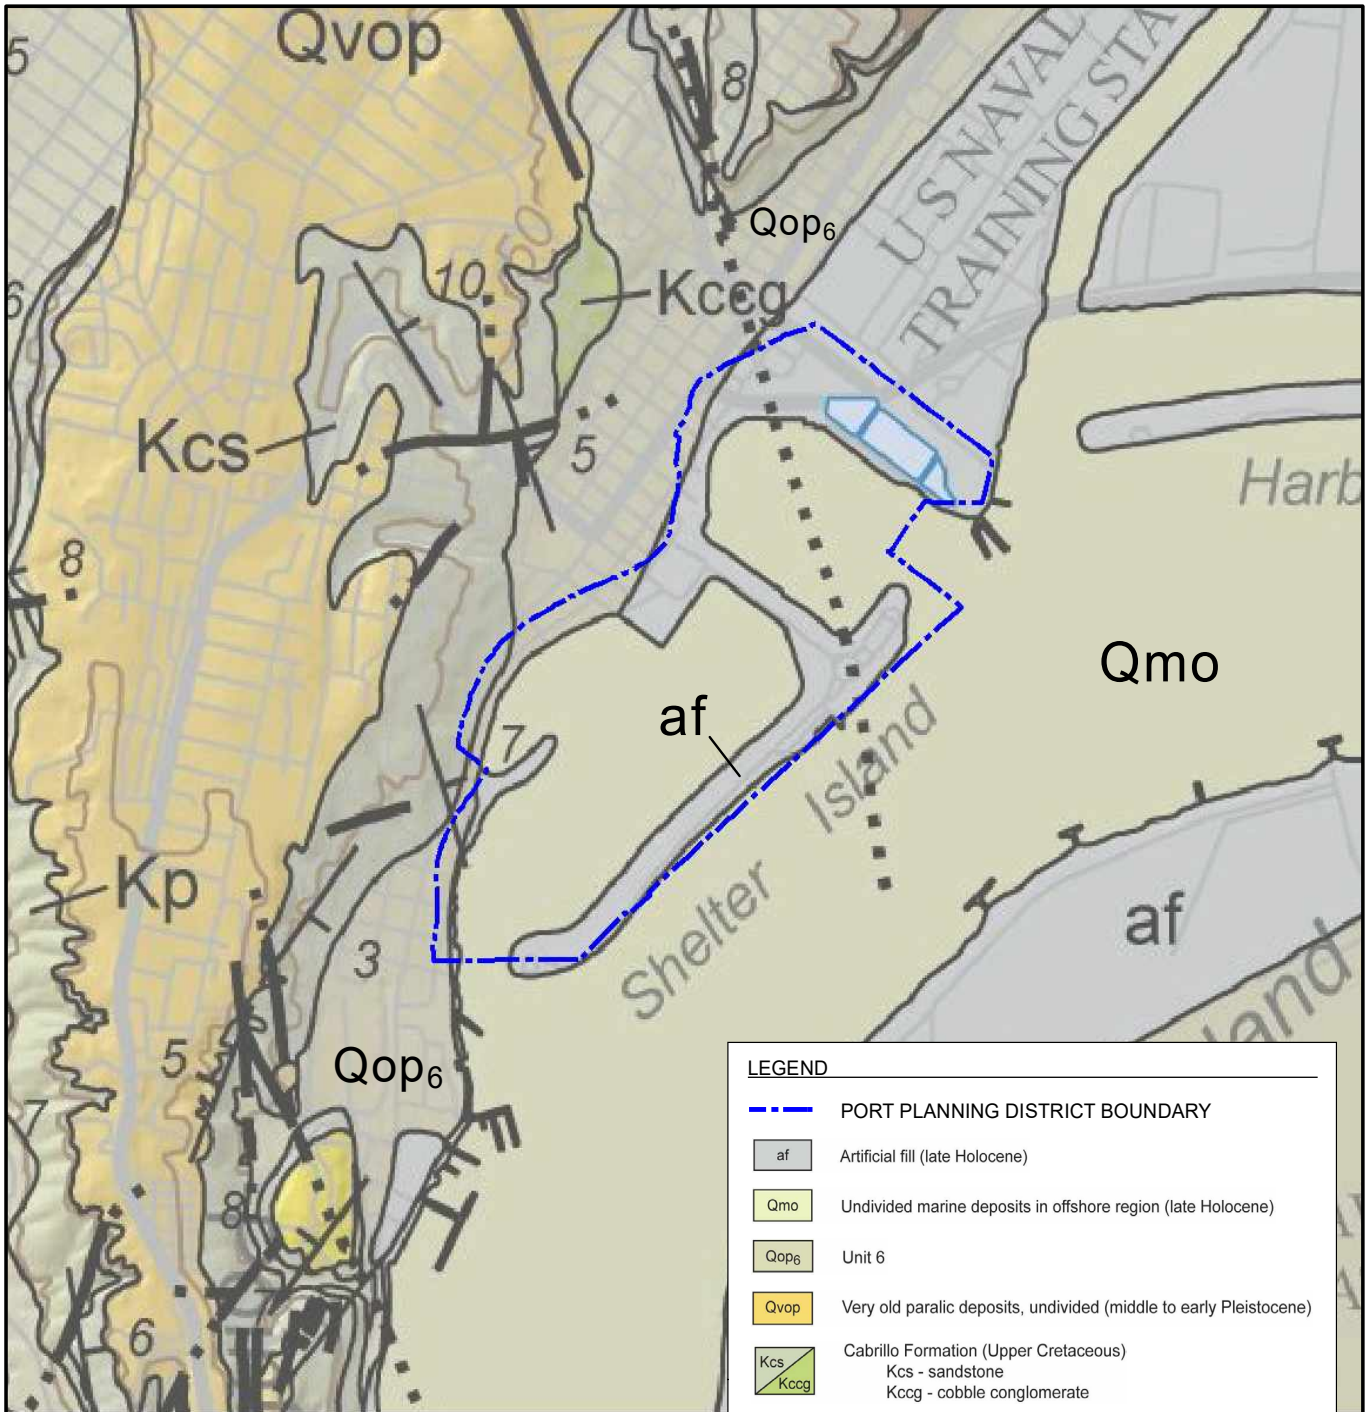

PMPU Area Geology

Recently published geologic maps for the proposed PMPU area include the San Diego 30' x 60' Quadrangle. As shown on Figures 4.5-1 through 4.5-8, near-surface geology in the proposed PMPU area includes artificial fill, marine beach deposits, undivided marine deposits in offshore region, young alluvial floodplain deposits, old paralic deposits, and materials of the Cabrillo Formation (Appendix F). Descriptions of each of these geologic units are presented below. Table 4.5-2 identifies the geologic units underlying each of the planning districts (PDs).

- Qaf: Artificial fill (late Holocene) may range in depth from a few feet to on the order of 20 feet in depth throughout the proposed PMPU area. Artificial fill generally consists of fill deposits from human construction, mining, or quarrying activities and includes compacted engineered and non-compacted non-engineered fill (CGS 2008). Fill soils within the proposed PMPU area are anticipated to have been derived from onsite materials and generally consist of silty sand, clayey sand, and sandy clay.
- Qmb: Marine beach deposits (late Holocene) are unconsolidated beach deposits (CGS 2008) that generally consist of loose to medium dense sand and silt.
- Qmo: Undivided marine deposits in offshore region (late Holocene) are unconsolidated, often ponded marine sediments (CGS 2008) that generally consist of loose to medium dense sand and silt deposited below the water table.

- Qya: Young alluvial floodplain deposits (Holocene and late Pleistocene) are poorly consolidated, poorly sorted, permeable floodplain deposits (CGS 2008) that generally consist of loose to medium dense, clay silt, sand and gravel.
- Qop: Old paralic deposits (late to middle Pleistocene) are poorly sorted, moderately permeable, interfingering strandline, beach, and estuarine colluvial deposits (CGS 2008) that generally consist of stiff to hard, silt and clay, and medium dense to very dense clay, silt, and sand.
- Kcs: Cabrillo Formation, sandstone member (Upper Cretaceous) generally consists of weakly to strongly cemented, interbedded sandstone, siltstone, and gravel and cobble conglomerate. The Cabrillo Formation conformably overlies massive sandstone and siltstone of the Point Loma Formation (CGS 2008).

Note: PD5, National City Bayfront, and PD6, Chula Vista Bayfront, are not part of the proposed PMPU.

4.5.2.2 Geologic Hazards

Faulting and Seismicity

The PMPU area contains several faults. The geologic hazards for each planning district, including the approximate locations of fault strands, are shown on Figures 4.5-9 through 4.5-15. The Rose Canyon Fault Zone is the closest major fault system to the proposed PMPU area and is the onshore portion of a more extensive fault zone that includes the Offshore Zone of Deformation and the Newport-Inglewood fault to the north, and several possible extensions southward, both onshore and offshore. Portions of this fault zone have been designated by the State of California as Earthquake Fault Zones pursuant to the Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo).

The Rose Canyon Fault Zone consists of predominantly right-lateral strike-slip faults that extend south-southeast through the San Diego metropolitan area. Various fault strands display strike-slip, normal, oblique, or reverse components of displacement. The fault zone extends offshore at La Jolla and continues north-northwest subparallel to the coastline. South of downtown San Diego, the fault zone splits into several splays that underlie San Diego Bay west of the proposed PMPU area, Coronado, and the ocean floor south of Coronado. According to the California Geological Survey Earthquake Fault Zone Map for the Point Loma Quadrangle (2003), active fault segments associated with the Rose Canyon Fault Zone are mapped within PDs2, PD4, and PD10.

As shown on Figure 4.5-11, a strand of the northwest to southeast-trending Point Loma Fault Zone has been mapped in the western portion of the proposed PMPU area and an unnamed segment intersects PD1. The Point Loma Fault Zone is mapped as being buried and is considered potentially active (i.e., a fault that exhibits evidence of ground displacement in the last 2,000,000 years).

In addition, the La Nacion Fault Zone has been mapped approximately 2 miles to the east of the proposed PMPU area, and consists of a series of parallel to subparallel, west dipping normal faults. As defined by the City of San Diego Seismic Safety Study (2008), the La Nacion Fault Zone is considered "Potentially active, Inactive, Presumed Inactive, or Activity Unknown." The PMPU area is located within an Alquist-Priolo Fault Zone and the Downtown Special Fault Zone. Furthermore, a fault was recently discovered within PD3 that transects the existing Seaport Village during a geotechnical investigation completed for a proposed redevelopment of the site.

As such, there is potential for ground rupture due to faulting in the proposed PMPU area. Other hazards associated with seismic activity include strong ground motion, liquefaction, lateral spreading, and seismically induced settlement. These hazards are discussed in more detail, below.

Seismically Induced Ground Motion

Seismically induced ground motion is the ground shaking that occurs during an earthquake. Because the proposed PMPU area is located in a seismically active region, the entire PMPU area is susceptible to strong ground motion. A detailed discussion of the peak ground acceleration analysis completed for each of the planning districts is included in Appendix F.

Liquefaction and Seismically Induced Settlement

Seismically induced soil liquefaction can be described as a significant loss of strength and stiffness due to cyclic pore water pressure generation from seismic shaking or other large cyclic loading. Liquefaction typically occurs when (1) a site is located in a zone with seismic activity, (2) onsite soils

are cohesionless, (3) groundwater is encountered within 50 feet of the surface, and (4) soils' relative densities are less than about 70 percent. If these four criteria are met, a seismic event could result in a rapid pore-water pressure increase from the earthquake-generated ground accelerations. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to rapid rise in pore water pressure, and it eventually causes the soil to behave as a fluid for a short period of time. Liquefaction is known generally to occur in saturated or near-saturated cohesionless soils at depths shallower than 50 feet below grade. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking. Adverse impacts associated with liquefaction include lateral spreading, ground rupture and/or sand boils, and settlement of the liquefiable layers. Seismically induced settlement is settlement that may occur whether or not the potential for liquefaction exists.

Based on the granular nature of the subsurface materials, the shallow depth to groundwater, and proximity to San Diego Bay and the Pacific Ocean, the entire PMPU area has a high potential for liquefaction and seismically induced settlement (Appendix F).

Lateral Spreading

Lateral spread of the ground surface during an earthquake usually takes place along weak shear zones that have formed within a liquefiable soil layer. Lateral spread has generally been observed to take place in the direction of a free-face (i.e., retaining wall, slope, channel, etc.) but has also been observed to a lesser extent on ground surfaces with very gentle slopes. For sites located in proximity to a free-face, the amount of lateral ground displacement is correlated with the distance of the site from the free-face. Other factors such as earthquake magnitude, distance from the causative fault, thickness of the liquefiable layers, and the fine content and particle sizes of the liquefiable layers also influence the amount of lateral ground displacement. Because lateral spreading is a secondary seismic effect of liquefaction, and the proposed PMPU area has a high potential for liquefaction, there is a potential for lateral spreading to occur in the proposed PMPU area next to a free-face feature such as, but not limited to, a retaining wall or channel (Appendix F).

Landslides

Based on a review of referenced geologic maps, literature, topographic maps, and stereoscopic aerial photographs, no landslides or indications of deep-seated landsliding were noted underlying the proposed PMPU area. According to the Landslide Hazards maps for the Point Loma, National City, and Imperial Beach Quadrangles (1995), the proposed PMPU area is mapped as being "least susceptible" to landslides (with "most susceptible" being the greatest landslide risk). Additionally, landslides are not anticipated to be a concern based on the relatively flat topography of the proposed PMPU area (Appendix F).

4.5.2.3 Planning District–Specific Geologic Hazards

The City of San Diego Seismic Safety Study (2008) is a series of maps that identify the anticipated geologic hazards throughout the city. In addition to the general discussion of faulting and seismic-related hazards above, the following describes the specific geologic hazards for each of the planning districts. Where applicable, the City of San Diego Seismic Safety Study was used. According to the Seismic Safety Study, PD1, PD2, PD3, PD4 and PD7 are mapped within geologic hazard categories 11, 12, 13, 31, 52, and 53 (Figures 4.5-9 through 4.5-16). Definitions of each geologic hazard category

and descriptions of the mapped hazard categories for each of the planning districts are provided below.

- Hazard category 11 is defined as an active, Alquist-Priolo Fault Zone.
- Hazard category 12 is defined as a potentially active, inactive, presumed inactive, or activity unknown fault zone.
- Hazard category 13 is defined as the Downtown Special Fault Zone.
- Hazard category 31 is defined as having a high potential for liquefaction, with shallow groundwater, major drainages, and hydraulic fills.
- Hazard category 52 is defined as other level areas, gently sloping to steep terrain with favorable geologic structure, low risk.
- Hazard category 53 is defined as level or sloping terrain, unfavorable geologic structure, low to moderate risk.

Planning Districts 8–10 are not within the City of San Diego and are not included in the hazards mapping. However, a discussion of the anticipated geologic hazards for each of these planning districts is also provided based on other available resources, including general plans and liquefaction maps for San Diego County.

Planning District 1: Shelter Island

As shown on Figure 4.5-9, PD1 is mapped within hazard categories 12 (unknown fault), 31 (liquefaction), 52 (favorable geologic structure), and 53 (unfavorable geologic structure). Hazard category 12 is mapped in the southwest portion of Shelter Island and the northern portion of the planning district near Harbor Drive. Most of the planning district is mapped within hazard category 31. Hazard category 52 is mapped near its northwestern boundary near Scott Street, and hazard category 53 is mapped near its southwestern boundary near Bessemer Path.

Planning District 2: Harbor Island

As shown on Figure 4.5-10, PD2 is mapped within hazard categories 11 (active Alquist-Priolo Fault Zone), 12 (unknown fault), and 31 (liquefaction). Hazard category 11 is mapped in the eastern portion of Harbor Island and extends north to Harbor Drive. Hazard category 12 is mapped in the eastern portion of Harbor Island. The entirety of PD2 is mapped as hazard category 31.

Planning District 3: Embarcadero

As shown on Figure 4.5-11, PD3 is mapped within hazard categories 12 (unknown fault), 13 (Downtown Special Fault Zone), and 31 (liquefaction). Hazard category 12 is mapped in the southern portion of the planning district and extends towards Embarcadero Marina Park North. Hazard Category 13 is mapped in the eastern and northern portions of the planning district that abut Pacific Highway and Harbor Drive. Most of PD3 is mapped as hazard category 31.

Planning District 4: Working Waterfront

As shown on Figure 4.5-12, PD4 is mapped within hazard categories 11 (active Alquist-Priolo Fault Zone), 13 (Downtown Special Fault Zone), and 31 (liquefaction). Hazard category 11 is mapped in the eastern portion of the Tenth Avenue Marine Terminal and extends nearly to the Coronado

Bridge. Hazard category 13 is mapped in the northern portions of the planning district that abut Harbor Drive. Most of PD4 is mapped as hazard category 31.

Planning District 7: South Bay

As shown on Figure 4.5-13, PD7 is mapped within hazard categories 31 (liquefaction) and 52 (favorable geologic structure). Much of the planning district is mapped as hazard category 31, while hazard category 52 is mapped near the southeastern boundary.

Planning District 8: Imperial Beach Oceanfront

Planning District 8 can be expected to have a high potential for liquefaction, as shown on Figure 4.5-14. According to the City of Imperial Beach General Plan/Local Coastal Plan (2019), areas expected to have a high potential for liquefaction in the event of strong ground shaking include those areas underlain by loose, unconsolidated sediments and shallow groundwater. The La Nacion Fault is located approximately 2 miles east of Imperial Beach. Landslides are not anticipated throughout the flat portions of Imperial Beach that are within PD8.

Planning District 9: Silver Strand

Planning District 9 can be expected to have a high potential for liquefaction, as shown on Figure 4.5-15. According to the Draft Liquefaction map for the County of San Diego, the Silver Strand is located within an area mapped as having a liquefaction risk. The Silver Strand sections of the Rose Canyon Fault are located less than 1 mile west and east of PD9. Landslides are not anticipated throughout the relatively flat planning district.

Planning District 10: Coronado Bayfront

Planning District 10 can be expected to have a high potential for liquefaction. According to the Draft Liquefaction map for the County of San Diego, the Coronado Bayfront is located within an area mapped as having a liquefaction risk. According to the Coronado General Plan, areas underlain by hydraulic fill along the margins of San Diego Bay can be expected to be susceptible to earthquake-triggered differential settlement or lateral spreading caused by liquefaction. Additionally, active Silver Strand segments associated with the Rose Canyon Fault Zone are mapped within the planning district, as shown on Figure 4.5-16.

4.5.2.4 Groundwater

Generally, groundwater depth can be expected to increase with increases in both ground surface elevation and lateral distance from bodies of water. Fluctuations in the groundwater level and perched conditions may occur due to variations in ground surface topography, sub-surface geologic conditions and structure, rainfall, irrigation, tidal fluctuations, and other factors.

Based on its coastal location, the proposed PMPU area has typical ground surface elevations between approximately 15 and 25 feet above mean sea level (MSL), and proximity to San Diego Bay and the Pacific Ocean. Average depths to groundwater are between 5 and 30 feet below ground surface for the planning districts, and should be anticipated at shallower depths as ground surface elevation decreases.

According to the Water Quality Control Plan for the San Diego Basin (Basin Plan), the proposed PMPU area is located within the Pueblo San Diego (908.00), Sweetwater (909.00), Otay (910.00), and Tijuana River (911.00) hydrologic units (HUs). Existing and potential beneficial uses of groundwater within these HUs may include municipal and domestic supply (MUN), agricultural supply (AGR), and industrial service supply (IND). Figure 4.5-17 shows the locations of the various HUs within the proposed PMPU area.

4.5.2.5 Soil Conditions

Expansive Soils

Expansive soils generally result from specific clay minerals that have the capacity to shrink or swell in response to changes in moisture content. Shrinking or swelling of foundation soils can lead to damage to foundations and engineered structures, including tilting and cracking. Clayey fill soils, alluvium, marine deposits, or old paralic deposits may also be moderately expansive. It is anticipated that expansive soils are present throughout the proposed PMPU area based on laboratory testing performed on soil samples obtained during previous projects within the San Diego Unified Port District's (District's) jurisdiction (Appendix F). The possibility for expansive soils to cause damage to foundations and other structures is still present despite the presence of shallow groundwater in the proposed PMPU area.

Erodible Soils

The soil types mapped within the proposed PMPU area were identified using the U.S. Department of Agriculture (USDA) Soil Survey. A summary of the mapped soil types and their erosion potential is presented in Table 4.5-3 for each planning district.

Table 4.5-3. Soil Series Characteristics

Soil Series and Map Symbol	Erosion Potential
PD1: Shelter Island	
Made land (Md)	Low to moderate
Marina loamy coarse sand (MIC)	Moderate
Reiff fine sandy loam, 0 to 2% slopes (RkA)	Moderate
Reiff fine sandy loam, 2 to 5% slopes (RkB)	Moderate
Urban land (Ur)	Low to moderate
PD2: Harbor Island	
Made land (Md)	Low to moderate
Urban land (Ur)	Low to moderate
PD3: Embarcadero	
Urban land (Ur)	Low to moderate
PD4: Working Waterfront	
Urban land (Ur)	Low to moderate
PD7: South Bay	
Grangeville fine sandy loam (GoA)	Moderate
Lagoon Water (LG-W)	Moderate to high
Huerhuero loam, 2 to 9% slopes (HrC)	Moderate
Huerhuero-Urban land complex, 2 to 9% slopes (HuC)	Moderate
PD8: Imperial Beach Oceanfront	
Coastal beaches (Cr)	Moderate to high
Marina loamy coarse sand (MIC)	Moderate to high
Tidal flats (Tf)	Moderate to high
PD9: Silver Strand	
Carlsbad gravelly loamy sand (CbB)	Moderate
Coastal beaches (Cr)	Moderate to high
Marina loamy coarse sand (MIC)	Moderate
Tidal flats (Tf)	Moderate to high
PD10: Coronado Bayfront	
Coastal beaches (Cr)	Moderate to high
Made land (Md)	Low to moderate
Marina loamy coarse sand (MIC)	Moderate

Note: PD5, National City Bayfront, and PD6, Chula Vista Bayfront, are not part of the proposed PMPU.

4.5.2.6 Unique Paleontological Resources and Geologic Features

Paleontological resources (fossils) are the remains and/or traces of prehistoric life and represent an important and nonrenewable natural resource. Fossil remains are found in the geologic units (i.e., formations) within which they were originally buried. Fossils or fossil deposits are generally regarded as older than 11,700 years, the generally accepted temporal boundary marking the end of the last late-Pleistocene glacial event and the beginning of the current period of climatic

amelioration of the Holocene. For planning purposes, paleontological resources can be thought of as including not only actual fossil remains and traces, but also the localities where those fossils are collected and the geologic units containing the localities. A fossil collection locality is the combined geographic and stratigraphic context of fossils—the place on the Earth and stratum (deposited during a particular time in Earth’s history) from which the fossils were collected. Localities themselves may persist for decades, in the case of a fossil-bearing outcrop that is protected from natural or human impacts, or may be temporarily exposed and ultimately destroyed, as is the case for fossil-bearing strata uncovered by erosion or construction.

A unique paleontological resource is any fossil or assemblage of fossils, or paleontological resource site or formation that meets any one of the following criteria (County of San Diego 2009):

- The best example of its kind locally or regionally.
- Illustrates a paleontological or evolutionary principle (e.g., faunal succession; plant or animal relationships).
- Provides a critical piece of paleobiological data (illustrates a portion of geologic history or provides evolutionary, paleoclimatic, paleoecological, paleoenvironmental, or biochronological data).
- Encompasses any part of a “type locality” of a fossil or formation.
- Contains a unique or particularly unusual assemblage of fossils.
- Occupies a unique position stratigraphically within a formation.
- Occupies a unique position, proximally, distally or laterally within a formation’s extent or distribution.

A paleontological record search was conducted by the San Diego Natural History Museum on May 1, 2017 (San Diego Natural History Museum 2017) to determine the geologic units underlying each planning district and to identify any recorded fossil collection localities at or in the vicinity of each planning district. Four geologic units underlay the planning districts: artificial fill, Holocene marine deposits, Holocene alluvial floodplain deposits, and Bay Point Formation (old paralic deposits, unit 6).

Artificial fill deposits result from human construction, mining, or quarrying activities and include compacted engineered and non-engineered fill. Holocene marine deposits (mapped as Qmb and Qmo by Kennedy and Tan 2008) occur along modern shorelines and offshore, and consist of mostly fine- to medium-grained sand and silt. Holocene alluvial floodplain deposits (mapped as Qya by Kennedy and Tan 2008) occur in modern canyons and floodplains. Holocene alluvial deposits are usually less than 10,000 years old and consist of poorly consolidated, poorly sorted, permeable floodplain deposits of sandy, silty or clay-bearing alluvium. Bay Point Formation is a geological stratum consisting of nearshore marine and lagoonal deposits of the Pleistocene age (approximately 85,000 to 500,000 years old). Specifically, the deposits of the Bay Point Formation are situated atop the Nestor terrace (approximately 120,000 years old) with the exception of the Sweetwater District where the deposits are undivided (San Diego Natural History Museum 2017). The Bay Point Formation is mapped as Unit 6, old paralic deposits (Qop₆) by Kennedy and Tan (2008).

A search of the documented fossil collection localities within the planning districts and a 0.25-mile buffer indicated that a total of 112 fossil collection localities are present. These localities produced trace fossils (e.g., sponge borings in shell, worm borings in shell and matrix, and worm tubes), and fossilized impressions of plants (e.g., calcareous algae and vascular plants), marine invertebrates

(e.g., foraminifers, bryozoans, corals, chitons, snails, clams, mussels, oysters, scallops, tusk shells, ostracods, crabs, shrimp, barnacles, sea urchins, and sand dollars), marine vertebrates (e.g., sharks, skates, rays, bony fish, and whales), and terrestrial vertebrates (e.g., frogs, snakes, birds, rodents, horses and mammoths) (San Diego Natural Museum 2017). Six fossil localities were found within the boundaries of two of the planning districts, one within PD and five within PD10. Based on City of San Diego's California Environmental Quality Act (CEQA) Significance Determination Thresholds (2016),¹ artificial fill is assigned no paleontological sensitivity, Holocene marine deposits are assigned low paleontological sensitivity, Holocene alluvial floodplain deposits are assigned low paleontological sensitivity, and Bay Point Formation is assigned a high paleontological sensitivity. Table 4.5-4 summarizes the paleontological sensitivity by planning district based on the geologic units present. Figures 4.5-1 through 4.5-8 show the geologic units that underlay each of the planning districts.

Table 4.5-4. Geologic Formations and Paleontological Sensitivity by Planning District

Planning District	District Name	Geologic Unit Present	Paleontological Sensitivity
PD1	Shelter Island	Artificial Fill	None
		Holocene Marine Deposits	Low
		Bay Point Formation	High
PD2	Harbor Island	Artificial Fill	None
		Holocene Marine Deposits	Low
PD3	Embarcadero	Artificial Fill	None
		Holocene Marine Deposits	Low
		Bay Point Formation	High
PD4	Working Waterfront	Artificial Fill	None
		Holocene Marine Deposits	Low
PD7	South Bay	Artificial Fill	None
		Holocene Marine Deposits	Low
		Holocene Alluvial Flood Plain Deposits	Low
		Bay Point Formation	High
PD8	Imperial Beach Oceanfront	Holocene Marine Deposits	Low
		Holocene Alluvial Flood Plain Deposits	Low
		Bay Point Formation	High
PD9	Silver Strand	Artificial Fill	None
		Holocene Marine Deposits	Low
		Bay Point Formation	High
PD10	Coronado Bayfront	Artificial Fill	None
		Holocene Marine Deposits	Low
		Bay Point Formation	High

In addition, San Diego County defines a unique geologic feature as “a site that exhibits distinctive characteristics, is exclusive to the region, or provides a key piece of geologic information important in the study of geology or geologic history” (County of San Diego 2011). Examples may include unique rock outcrops (e.g., natural bridge), type localities of named geologic formations (e.g., type

¹ The City of San Diego's paleontology thresholds were developed in consultation with the San Diego Natural History Museum based on expert opinion of qualified paleontologists and, therefore, are appropriate for general use.

locality of Scripps Formation in the sea cliffs north of Scripps Institute of Oceanography), information-rich geologic exposures (e.g., cliff face exposing faulted sedimentary layers), or unique landform (e.g., Round Mountain in Jacumba Valley, which represents a volcanic plug) (County of San Diego 2011). Per the general and community plans for the adjacent cities, no unique geologic features have been identified as occurring within or adjacent to the proposed PMPU area. Moreover, the proposed PMPU does not contain any of the features described above.

4.5.3 Laws, Regulations, Plans, and Policies

4.5.3.1 Federal

Occupational Safety and Health Act of 1970

The Occupational Safety and Health Act establishes the framework for safe and healthful working conditions for working men and women by authorizing enforcement of the standards developed under the act. The act assigns the Occupational Safety and Health Administration (OSHA) two regulatory functions: setting standards and conducting inspections to ensure that employers are providing safe and healthful workplaces. OSHA standards may require that employers adopt certain practices, means, methods, or processes reasonably necessary and appropriate to protect workers on the job. Employers must become familiar with the standards applicable to their establishments and eliminate hazards.

Compliance with standards may include implementing engineering controls to limit exposures to physical hazards and toxic substances, implementing administrative controls, and ensuring that employees have been provided with, have been effectively trained on, and use personal protective equipment when required for safety and health, where the former controls cannot be feasibly implemented. Employees must comply with all rules and regulations that apply to their own actions and conduct. Even in areas where OSHA has not set forth a standard addressing a specific hazard, employers are responsible for complying with the act's "general duty" clause, which states that each employer "shall furnish...a place of employment which is free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees" (Section 5(a)(1)).

Regulations defining safe standards have been developed for general industry, construction, maritime, recordkeeping, and agriculture. OSHA standards specific to safety and health regulations pertaining to construction are listed in 29 Code of Federal Regulations (CFR) 1926, Subtitle B. Specifically, subpart C handles general safety and health provisions including safety training and education, first aid and medical attention, fire protection and prevention, and personal protective equipment. Subpart D is specific to occupational health and environmental controls such as radiation, gases/vapors/fumes/dust, lead, hazardous chemicals, and noise exposure. Subpart P handles excavation work and safety. Subparts Q and R handle concrete/masonry and steel structures, respectively. In addition, several more subparts provide additional requirements.

4.5.3.2 State

Alquist-Priolo Earthquake Fault Zoning Act

California's Alquist-Priolo Act (Public Resources Code [PRC] 2621 et seq.) was enacted by the State of California in 1972.² The act's primary purpose is to prohibit the construction of structures intended for human occupancy across the traces of active faults and strictly regulates construction in the corridors along active faults. It also defines criteria for identifying active faults, giving legal weight to terms such as "active," and establishes a process for reviewing building proposals in and adjacent to active faults. In addition, the Alquist-Priolo Act requires the State Geologist to establish regulatory zones, known as "earthquake fault zones," around the surface traces of active faults and to issue appropriate maps to assist cities and counties in planning, zoning, and building regulation functions. Maps are distributed to all affected cities and counties for the controlling of new or renewed construction and are required to sufficiently define potential surface rupture or fault creep. The State Geologist is charged with continually reviewing new geologic and seismic data and revising existing zones and delineating additional earthquake fault zones when warranted by new information. According to the Alquist-Priolo Act, before a project can be permitted, cities and counties shall require a geologic investigation, prepared by a licensed geologist, to demonstrate that buildings will not be constructed across active faults. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back. Although setback distances may vary, a minimum 50-foot setback is required.

Under the Alquist-Priolo Act, faults are zoned, and construction along or across them is strictly regulated if the faults are considered "sufficiently active" and "well-defined." A fault is considered sufficiently active if one or more of its segments or strands shows evidence of surface displacement during Holocene time (defined for the purposes of the act as within the last 11,000 years). A fault is considered well-defined if its trace can be clearly identified by a trained geologist at the ground surface or in the shallow subsurface, using standard professional techniques, criteria, and judgment.

International Building Codes

Development and building design standards, implemented through the California Building Code (CBC), require the proposed project to comply with appropriate seismic design criteria in the International Building Code, adequate drainage facility design, and preconstruction soils and grading studies. Seismic design standards have been established to reduce many of the structural problems occurring because of major earthquakes. In 1998, the code was revised as follows.

- Upgrade the level of ground motion used in the seismic design of buildings.
- Add site amplification factors based on local soils conditions.
- Improve the way ground motion is applied in detailed design.

California Building Code

The California Code of Regulations, Title 24 (California Building Code or CBC) applies to all applications for building permits. The CBC (also called the California Building Standards Code) has incorporated the International Building Code, which was first enacted by the International

² The act was originally titled the Alquist-Priolo Geologic Hazards Zone Act.

Conference of Building Officials in 1927 and has been updated approximately every 3 years since that time. The current version of the CBC (2019) became effective on January 1, 2020. Building codes provide minimum standards regulating a number of aspects of construction that are relevant to geology and geologic hazards. Title 24, Part 2 of the CBC provides building codes and standards for the design and construction of structures in California. The CBC requires, among other things, seismically resistant construction and foundation and soil investigations prior to construction. The CBC also establishes grading requirements that apply to excavation and fill activities, and requires the implementation of erosion control measures.

The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress, and general stability by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all building and structures within its jurisdiction. In addition, the CBC contains necessary California amendments, which are based on the American Society of Civil Engineers (ASCE) Minimum Design Standards 7-05. ASCE 7-05 provides requirements for general structural design and includes means for determining earthquake loads as well as other loads (flood, wind, etc.) for inclusion into building codes. The provisions of the CBC apply to the construction, alteration, movement, replacement, and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures throughout California.

The earthquake design requirements of the CBC take into account the occupancy category of the structure, site class, soil classifications, and various seismic coefficients, which are used to determine a Seismic Design Category (SDC) for a project. The SDC is a classification system that combines the occupancy categories with the level of expected ground motions at the site and ranges from SDC A (very small seismic vulnerability) to SDC E/F (very high seismic vulnerability and near a major fault). Design specifications are then determined according to the SDC. Future development allowed under the proposed PMPU would be required to comply with the CBC, including Part 2, Volume 2, Chapter 18, Soils and Foundations, which outlines the minimum standards for structural design and construction. This includes the preparation of geotechnical evaluations, which, among other requirements, include a record of the soil profile, regulation of active faults in the area, recommendations for foundation type and design criteria that address issues, as applicable, such as (but not limited to) bearing capacity of soils, provisions to mitigate the effects of expansive soils, liquefaction, settlement, and varying soil strength. Section 1803.1.1.3 of Chapter 18 states that if a building department, or other appropriate enforcement agency, determines that recommended action(s) presented in the geotechnical evaluations are likely to prevent structural damage, the approved recommended action(s) must be made a condition to the building permit (Section 1803.1.1.3 of Chapter 18).

The CBC also provides standards for various aspects of construction, including but not limited to excavation, grading, and earthwork construction; preparation of the site prior to fill placement, specification on fill materials and fill compaction and field testing; retaining wall design and construction, foundation design and construction; and seismic requirements. It includes provisions to address issues such as (but not limited to) construction on expansive soils, liquefaction potential, and soil strength loss. The CBC sets seismic design requirements based on seismic risk categories, which are associated with a structure's occupancy category (i.e., structures that represent low hazard to human life, structures that represent substantial hazard to human life, structures designated as essential facilities based on the proposed use), and a structure's seismic risk category (i.e., the severity of the design earthquake ground motion and specific soil properties at the site). In accordance with California law, project design and construction would be required to comply with

provisions of the CBC. Local agencies must ensure that development in their jurisdictions complies with guidelines contained in the CBC. Cities and counties can, however, adopt building standards beyond those provided in the code.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (PRC Sections 2690–2699.6) is intended to reduce damage resulting from earthquakes. While the Alquist-Priolo Act addresses surface fault rupture, the Seismic Hazards Mapping Act addresses other earthquake-related hazards, including strong ground shaking, liquefaction, and seismically induced landslides. Its provisions are similar in concept to those of the Alquist-Priolo Act: the State is charged with identifying and mapping areas at risk of strong ground shaking, liquefaction, landslides, and other corollary hazards; and cities and counties are required to regulate development within mapped seismic hazard zones.

Under the Seismic Hazards Mapping Act, permit review is the primary mechanism for local regulation of development. Under PRC Section 2697, cities and counties must require, prior to the approval of a project located in a seismic must zone, a geotechnical report defining and delineating any seismic hazard. Each city or county shall submit one copy of each geotechnical report, including mitigation measures, to the State Geologist within 30 days of its approval.

Construction General Permit (Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-006-DWQ)

Construction activities that disturb 1 acre or more of land must obtain coverage under the State Water Resources Control Board (SWRCB) Construction General Permit (Order 2009-0009-DWQ as amended by Order 2010-0014-DWQ and Order 2012-006-DWQ).³ Under the terms of the permit, applicants must file complete and accurate Notice of Intent and Permit Registration Documents with the State Water Resources Control Board. Applicants must also demonstrate conformance with applicable construction best management practices (BMPs) and prepare a construction Storm Water Pollution Prevention Plan (SWPPP) containing a site map that shows the construction site perimeter, existing and proposed buildings, lots, roadways, stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the proposed PMPU area. BMPs include but are not limited to silt fences, straw wattles, sediment traps, gravel sandbag barriers. The Construction General Permit requires dischargers to consider good housekeeping measures for construction materials, waste management, vehicle storage & maintenance, landscaping materials, and potential pollutant sources.⁴ Dischargers are also required to consider measures to reduce erosion such as but not limited to, covering disturbed areas with mulch, temporary seeding, soil stabilizers, binders, fiber rolls or blankets, temporary vegetation, and permanent seeding. Sediment control BMPs must be considered by dischargers as secondary means of preventing storm water contamination. Sediment control BMPs could include but are not limited to silt fences or straw wattles. Lastly, the discharger is required by the Construction General Permit to manage run-on and runoff from a project site using measures such as but not limited to installing berms or other temporary diversions.

³ For additional details, please see the SWRCB Orders which are available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

⁴ See pp. 32-33 of the Construction General Permit pdf at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/wqo_2009_0009_complete.pdf.

Industrial General Permit (Order No. 2014-0057 DWQ)

Industrial facilities with specific standard industrial codes (SIC) that discharge stormwater to waters of the United States must obtain coverage and comply with the requirements of the General Permit for Stormwater Discharges Associated with Industrial Activities (Industrial General Permit), Order No. 2014-0057-DWQ (National Pollutant Discharge Elimination System [NPDES] No. CAS000001), issued by the SWRCB. Under the Industrial General Permit, dischargers must demonstrate conformance with applicable industrial BMPs and prepare an industrial SWPPP, containing a site map that shows the site perimeter, areas where industrial activities occur, stormwater collection and discharge points, and drainage patterns across the site. The Industrial General Permit includes the required minimum BMP categories that must be implemented and maintained at industrial facilities to prevent pollutants from entering stormwater discharges or reduce their levels. The associated SWPPP includes a Site Monitoring Implementation Plan, as required by the Industrial General Permit, that describes (1) the monthly dry-weather visual observation, (2) the stormwater visual observation, and (3) the facility-specific stormwater sampling program at the facility, which includes sample collection locations (discharge points), contaminants for analysis, and potential pollution sources.

The design standard for structural treatment controls required by the Industrial General Permit, includes a volume-based treatment design that would treat the volume of runoff produced from an 85th-percentile, 24-hour storm event, as determined from local historical rainfall records. This design standard is consistent with the treatment control requirements necessary to meet the redevelopment project BMP requirements of the Municipal Stormwater Permit and District *BMP Design Manual*, as discussed under Section 4.5.3.3, *Local*, below.

California Public Resources Code

Section 5097.5 of PRC addresses paleontological resources and states that “no person shall knowingly and willfully excavate, upon, or remove, destroy, injure, or deface” any “vertebrate paleontological site, including fossilized footprints, or any other paleontological feature situated” on public lands without the “express permission of the public agency having jurisdiction over the lands.” Violation of this section is a misdemeanor.

As used in PRC Section 5097.5, “public lands” means lands owned by or under the jurisdiction of the State or any city, county, district, authority, or public corporation, or any agency thereof. Consequently, public agencies are required to comply with PRC Section 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others.

4.5.3.3 Local

Future projects allowed under the proposed PMPU would be required to obtain grading and construction permits from the jurisdictions in which they are located, including the cities of Coronado, Imperial Beach, and San Diego. Therefore, the following city ordinances would apply to future projects within the proposed PMPU area.

City of San Diego Municipal Code

Chapter 14, Article 2, Division 1: Grading Regulations

Earthwork activities, including grading, are regulated by the City of San Diego Municipal Code, Chapter 14, Article 2, Division 1, which provides standards for slope stability, protection of property, erosion control, water quality, and landform preservation and to protect the public health, safety, and welfare of persons, property, and the environment. The following sections are related to geology and soils and apply to future development allowed under the proposed PMPU within PD1, PD2, PD3, and PD4.

Section 142.0130: Development Standards for Grading

All *grading* shall be designed and performed in conformance with applicable City Council policies and the standards established in the Land Development Manual.

Section 142.0131: Geotechnical Report Requirements

All *grading* shall be designed to incorporate the recommendations of any required *geotechnical reports*.

All *geotechnical reports* shall be prepared in accordance with the standards established in the Lands Development Manual and the City of San Diego Technical Guidelines for Geotechnical Reports.

Section 142.0135: Grading Within the *Special Flood Hazard Area*

Grading within the *Special Flood Hazard Area* shall comply with Chapter 14, Article 2, Division 2 (Drainage Regulations) and Chapter 14, Article 3, Division 1 (Environmentally Sensitive Lands Regulations).

Section 142.0146: Erosion, Sedimentation, and Water Pollution Control

All *grading* work shall incorporate erosion and siltation control measures in accordance with Chapter 14, Article 2, Division 4 (Landscape Regulations) and the standards established in the Land Development Manual.

All *development* shall be conducted to prevent erosion and stop sediment and pollutants from leaving the work site. The property owner is responsible to implement and maintain temporary and permanent erosion, sedimentation, and water pollution control measures to the satisfaction of the City Manager, whether or not such measures are a part of approved plans. The property owner shall install, monitor, maintain, and revise these measures, as appropriate, to ensure their effectiveness. Controls shall include measures outlined in Chapter 14, Article 2, Division 2 (Storm Water Runoff Control and Drainage Regulations) that address the *development's* potential erosion and sedimentation impacts.

Section 142.0148: Protection of Adjacent Properties and Public Rights-of-Way

During *grading*, the property owner shall take all necessary measures to protect adjacent property and public rights-of-way from damage that may result from the work. The property owner shall provide *fences* or barricades needed to eliminate any hazard to the public in their normal use of the property or *public right-of-way* as follows:

Where a temporary excavation is adjacent to an existing developed public right-of-way or other public property and the slope gradient is 50 percent (2 horizontal feet to 1 vertical foot) or steeper or the height of the *excavation* is more than 6 feet, temporary *fences* or barricades shall be provided adjacent to the *excavation* satisfactory to the City Engineer. The *fences* or barricades shall be constructed and maintained as long as the hazard resulting from the *excavation* exists.

Where a permanent *excavation* is adjacent to an existing developed *public right-of-way* or other public property and the slope gradient is 50 percent (2 horizontal feet to 1 vertical foot) or steeper, the height of the *excavation* is more than 6 feet, and the top of the slope is within 10 feet of the *public right-of-way*, the property owner shall construct a permanent, 4-foot-high *fence* adjacent to the *public right-of-way*, satisfactory to the City Engineer.

The City Engineer may modify the requirements of this section where it is evident that the *grading* work will present no hazard to the adjacent property or *public rights-of-way*.

Section 142.0151: Paleontological Resources Requirements for Grading Activities

Paleontological resources monitoring shall be required in accordance with the General Grading Guidelines for Paleontological Resources in the Land Development Manual for any of the following:

1. *Grading* that involves 1,000 cubic yards or greater, and 10 feet or greater in depth, in a High Resource Potential Geologic Deposit/Formation/Rock Unit; or
2. *Grading* that involves 2,000 cubic yards or greater, and 10 feet or greater in depth, in Moderate Resource Potential Geologic Deposit/Formation/Rock Unit; or
3. *Grading* on a fossil recovery site or within 100 feet of the mapped location of a fossil recovery site.

If paleontological resources, as defined in the General Grading Guidelines for Paleontological Resources, are discovered during *grading*, notwithstanding Section 142.0151(a), all *grading* in the area of discovery shall cease until a qualified paleontological monitor has observed the discovery, and the discovery has been recovered in accordance with the General Grading Guidelines for Paleontological Resources.

Chapter 14, Article 5, Division 18: Additions and Modifications to Chapter 18 of the California Building Code

(a) Chapter 18 of the California Building Code is adopted by reference with modifications and additions pursuant to Sections 145.0105 and 145.0106 of the Land Development Code.

(b) Section 1803 is adopted by reference with modifications and additions pursuant to Sections 145.0105 and 145.0106 of the Land Development Code.

(c) Section 1801, Section 1802, and Sections 1804 through 1810 are adopted by reference without change pursuant to Section 145.0103 of the Land Development Code.

Chapter 12, Article 9, Division 2: Building Permit Procedures

Section 129.0201: Purpose of Building Permit Procedures

The purpose of these procedures is to establish the process for review of Building Permit applications for compliance with the minimum standards necessary to safeguard life or limb, public

health, property, and welfare. The intent of these procedures is to review the proposed design, construction methods, and type and quality of materials used for new construction or for construction involving existing structures.

Section 129.0202: When a Building Permit Is Required

(a) No structure regulated by the Land Development Code shall be erected, constructed, enlarged, altered, repaired, improved, converted, permanently relocated or partially demolished unless a Building Permit has first been obtained from the Building Official, except as exempted in Sections 129.0202(b) and 129.0203.

Section 129.0206: Who May Prepare Plans for Building Permits

If plans or other material submitted are not prepared by an architect or engineer licensed by the State of California, the Building Official may require the applicant to demonstrate that State law does not require the material to be prepared by a licensed architect or engineer. The Building Official may require plans, computations, and specifications to be prepared by an architect or engineer licensed by the State of California, in circumstances where preparation by a licensed professional is not required by State law.

Section 129.0210: Plan Review Procedures

The application, plans, specifications, and other data filed by an applicant for a Building Permit shall be reviewed by the Building Official. The plans may be reviewed by other departments of the City to verify compliance with any other applicable provisions of the Municipal Code.

City of Coronado Municipal Code

Title 70, Chapter 70.20: California Building Code

The City of Coronado has adopted the California Building Code, 2019 Edition, California Code of Regulations, Title 24, Part 2, Volumes 1 and 2 as published by the California Building Standards Commission based on the International Building Code, as the City Building Code for the purpose of prescribing regulations in the City of Coronado for the erection, construction, enlargement, alteration, repair, moving, removal, conversion, demolition, occupancy, equipment, use, height, area, and maintenance of building and structures or any appurtenances connected or attached to such buildings or structures within this jurisdiction.

70.20.020 Appendices

The City of Coronado has adopted the California Building Code Appendix J: Grading.

City of Imperial Beach Municipal Code

Title 15, Chapter 15.06: Building Code

Except as provided in Chapter 15.02 (Administrative Code) and Chapter 15.06, the City of Imperial Beach has adopted the 2019 California Building Code (Part 2 of Title 24 of the California Code of Regulations) as the Building Code of the City of Imperial Beach.

Title 15, Chapter 15.54: Grading Permits and Plans

This chapter provides grading requirements to address slope stability, protection of property, erosion control, and water quality and to protect the public health, safety, and welfare of persons, property, and the environment.

Section 15.54.030: Grading Permit

No grading, including clearing of vegetative matter, shall be done until all necessary environmental clearances are secured and reviewed by the city for the work listed in this section. The following work shall require a grading permit:

- A. Any grading within open space easements or city-owned open space;
- B. Any grading required for the restoration of unauthorized grading;
- C. Any grading within the one hundred-year floodplain;
- D. Any grading as a condition of approval of a discretionary permit, including subdivision maps, parcel maps, conditional use permits or other discretionary approvals;
- E. Any grading that includes any of the following:
 - 1. Excavation or fill that results in a slope with a gradient of twenty-five percent or greater (four horizontal feet to one vertical foot) and for which the depth or height at any point is more than three feet measured vertically at the face of the slope from the top of the slope to the bottom of the slope;
 - 2. Excavation or fill for which the depth or height at any point from the lowest grade to the highest grade at any time during the proposed grading is more than eighteen inches measured vertically;
 - 3. Excavation or fill greater than fifty cubic yards;
 - 4. Grading for which the graded area is more than one acre.

Section 15.54.110: Lot Grading – Safety Precautions

- A. If, at any stage of work for which an approved grading plan, or a grading permit, is required, the city engineer determines that authorized grading is likely to endanger any public or private property or result in the deposition of debris on any public way or interfere with any existing drainage course, the city engineer may specify and require reasonable safety precautions to avoid the danger. The permittee may be responsible for removing excess soil and debris deposited upon adjacent and downstream public or private property resulting from his/her grading operations. Soil and debris shall be removed and damage to adjacent and downstream property repaired, as directed by the city engineer. Erosion and siltation control shall require temporary or permanent siltation basins, energy dissipaters, or other measures as field conditions warrant, whether or not such measures are a part of approved plans. Cost associated with any work outlined in this section shall be incurred by the permittee.
- B. No off-site work will be required when, in the opinion of the city engineer, the permittee has properly implemented and maintained erosion control measures and the deposition of soil and

debris or erosion on adjacent properties is the direct or indirect result of actions of the downstream property owner.

Municipal Stormwater Permit (Order No. R9-2013-0001 as amended by Order Nos. R9-2015-001 and R9-2015-0100)

The Municipal Stormwater Permit (Order No. R9-2013-0001, as amended by Order Nos. R9-2015-001 and R9-2015-0100) is an NPDES permit that requires the owners and operators of MS4s within the San Diego region to implement management programs that limit discharges of pollutants and non-stormwater discharges to and from their MS4. The Municipal Stormwater Permit requires the District and other “co-permittees” to develop watershed-based Water Quality Improvement Plans (WQIPs) and Jurisdictional Runoff Management Plans (JRMPs). The Municipal Stormwater Permit emphasizes watershed program planning and program outcomes. The intent of the permit is to enable each jurisdiction to focus its resources and efforts to:

- Reduce pollutants in stormwater discharges from its MS4,
- Effectively prohibit non-stormwater discharges to its MS4, and
- Achieve the interim and final WQIP numeric goals.

San Diego Bay Watershed Water Quality Improvement Plan

The Municipal Stormwater Permit requires development of the San Diego Bay WQIP. The purpose of the WQIP is to guide municipal stormwater permit co-permittees, including the District, via its JRMP, toward improving water quality in MS4 discharges and receiving waters. In the WQIP, priorities and goals are established, and each jurisdiction identifies strategies to assist in attaining the goals. This approach establishes the foundation that the District uses to develop and implement its JRMP. The District implements the WQIP in collaboration with other local agencies that have jurisdiction within the San Diego Bay Watershed Management Area, which comprises three HUs: Pueblo San Diego, Sweetwater, and Otay. Note that the Sweetwater HU is located outside of the proposed PMPU area.

San Diego Unified Port District Jurisdictional Runoff Management Program

Under the Municipal Stormwater Permit, each jurisdiction is required to have a JRMP. In addition, each co-permittee prepares and submits an annual report that describes program implementation and strategies to reduce the discharge of pollutants of concern to the MS4 and receiving waters to the maximum extent practicable.

The District’s JRMP has been developed to meet the conditions of the Municipal Stormwater Permit and to assist the District in achieving the goals identified in the WQIP. District-specific WQIP-based strategies have been incorporated into the JRMP. The JRMP’s focus is on controlling stormwater discharges to the MS4, with the overall goal of achieving improvements in receiving water quality. The District has developed a list of BMPs that are applicable to all persons, activities, and operations occurring on District Tidelands, and the JRMP utilizes District-specific jurisdictional activities and watershed-based strategies. Enforcement of the JRMP helps to prevent stormwater pollutants from entering local storm drains and, ultimately, San Diego Bay.

As part of the District’s JRMP, a *BMP Design Manual* was developed to provide guidelines for incorporating permanent post-construction BMPs into new and redevelopment projects. The *BMP Design Manual* identifies the required source-control and site-design BMPs to eliminate or reduce

pollutants in stormwater runoff for all projects. For Priority Development Projects (PDPs), the *BMP Design Manual* also describes pollutant-control BMPs that must be incorporated into the site design and, where applicable, addresses potential hydromodification impacts from changes in flow and sediment supply. The *BMP Design Manual* is applicable for both tenant- and District-sponsored major maintenance or capital improvement projects, as required by the Municipal Stormwater Permit.

Moreover, the Municipal Stormwater Permit (Provision E.4) requires the District to implement a Construction Management program in accordance with the strategies in the San Diego Bay Watershed WQIP in addition to core permit requirements. The core permit requirements include a project approval process that ensures appropriate BMPs are attached to conditions of approval for construction projects as well as ongoing construction site inventory updates and tracking and inspection. In addition, the District is required to establish minimum BMPs that include the following categories: Project Planning, Non-Stormwater Management, Good Housekeeping/Waste Management, Erosion Control, Sediment Control, and Run-on and Run-off Control.

If a project is not subject to the Construction General Permit (Order 2009-0009-DWQ, as amended by Order 2010-0014-DWQ and Order 2012-006-DWQ), a Construction BMP Plan is required pursuant to the JRMP. The Construction BMP Plan includes many of the same elements as a standard SWPPP except for most post-construction BMPs and a monitoring plan. The Construction BMP Plan applies to construction projects with less than 1 acre, but greater than 100 square feet of land disturbance, as well as construction projects that occur over water. District approval is required on all SWPPPs and Construction BMP Plans prior to any work beginning on a project.

San Diego Unified Port District Code, Article 10

District Code, Article 10—the San Diego Unified Port District Stormwater Management and Discharge Control Ordinance—prohibits the deposit or discharge of any chemicals or waste into the Tidelands or San Diego Bay, and makes it unlawful to discharge pollutants directly into the non-stormwater, or indirectly into the stormwater, conveyance system. Article 10 also requires the implementation of BMPs, stormwater plans, and other measures, as appropriate to control the discharge of pollution to Tideland or receiving waters. Where enforcement is required to maintain compliance, the District will use its enforcement authority established by Article 10. Article 10 of the code enables the District, including District inspectors, to prohibit discharges and require BMPs, so that discharges on Tidelands do not cause or contribute to water quality problems. Article 10 establishes enforcement procedures to ensure that responsible dischargers are held accountable.

4.5.4 Project Impact Analysis

4.5.4.1 Methodology

The following impact analysis evaluates the potential effects on geology and soils that could occur from future development under the proposed PMPU. The methodology considers the existing geologic and soil conditions established in Section 4.5.2, *Existing Conditions*, and the applicable laws and regulations pertaining to geologic hazards and soils described in Section 4.5.3, *Laws, Regulations, Plans, and Policies*, in order to determine the proposed PMPU's potential to directly or indirectly cause substantial adverse effects related to a hazardous geologic condition or event.

Information in this analysis is based on Ninyo & Moore's *EIR Level Geology and Soils Evaluation for the Integrated Planning Port Master Plan Update* dated June 2017 (Appendix F).

Except for a few situations identified in the State CEQA Guidelines, CEQA documents are not required to analyze the potential impact of the environment on a proposed project, including any residents or users that a project may introduce to an existing environmental condition, unless a proposed project, by developing in an area with a known hazardous environmental condition, may directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death, by exacerbating the existing environmental condition. An example of a project directly or indirectly causing adverse effects by exacerbating existing geologic hazards and soil conditions would be one that includes grading into a hillside that is prone to land or mudslides. In this example, because the project would directly influence the likelihood of such an action occurring, the conclusion is that the project would cause potential substantial adverse effects. On the other hand, if the project would build near the hillside, but would not actually cause a modification to it such that the potential to experience a hazardous event is not increased, then the project would not be found to cause substantial adverse effects, even when considering that by bringing new residents or users to the area, it may place more people and structures in harm's way. Therefore, the analysis below applies this same approach.

The impact analysis is organized first by identifying any proposed policies or standards that would assist with avoiding, eliminating, or reducing any impact associated with geology and soils. The analysis then considers the potential geology and soils impacts from the planned improvements and future allowable development consistent with the water and land use designations under the PMPU. Finally, the analysis considers any policies or standards that may cause or contribute to any related geology and soils impact.

To avoid redundancy in the analysis and present a concise discussion, the analysis discusses the planning districts collectively, as appropriate. In the case that a planning district has unique or special existing conditions and/or may result in one or more unique significant impacts with mitigation specific to that planning district, the analysis presents a separate discussion of that planning district.

4.5.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of geology and soils impacts from the implementation of the proposed PMPU. The determination of whether a geology and soils impact would be significant is based on the thresholds described below and the professional judgment of the District as Lead Agency, based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following.

1. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault (refer to Division of Mines and Geology Special Publication 42); (ii) strong seismic ground shaking; (iii) seismic-related ground failure, including liquefaction; (iv) landslides.
2. Substantial soil erosion or the loss of topsoil.

3. A geologic unit or soil becoming unstable and exacerbate the potential of onsite or offsite lateral spreading, subsidence, or collapse.
4. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.
5. Soils that would be incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems in areas where sewers are not available for the disposal of wastewater such that the potential for a hazardous condition would be exacerbated.
6. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

As discussed in the Initial Study/Environmental Checklist (Appendix A), thresholds 1 (iv) and 5 are not included in the analysis below, as the proposed PMPU would not result in significant impacts related to landslides and alternative wastewater disposal systems. Those conclusions are summarized in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*. Therefore, only thresholds 1 (i through iii), 2, 3, 4, and 6 are discussed in the impact analysis below.

Supplemental Thresholds for Paleontological Resources

To assist in determining the significance of paleontological resources impacts, this Program Environmental Impact Report (PEIR) relies on the City of San Diego's CEQA Significance Determination Thresholds for paleontological resources. An answer in the affirmative to either of these questions would indicate a significant paleontological resources impact would occur and mitigation would be required.

Would the project:

1. Require over 1,000 cubic yards of excavation and over 10 feet deep in an area considered to have high paleontological sensitivity?
2. Require over 2,000 cubic yards of excavation and over 10 feet deep in an area considered to have moderate paleontological sensitivity?

The City of San Diego's Thresholds were developed based on consultation with experts from the San Diego Natural History Museum who have detailed knowledge of the location of paleontological resources within the San Diego County region. These thresholds provide quantitative metrics for distinguishing between paleontological resources impacts that are significant (i.e., impact exceeds the quantitative threshold of significance) and those that are typically less than significant. If an impact exceeds the quantitative threshold of significance, mitigation measures are required. No construction monitoring for paleontological resources is required in areas with no or low paleontological sensitivity.

4.5.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policy would have the potential to avoid or reduce impacts associated with geology and soils and is considered in the impact analysis that follows.

SR Policy 1.1.6. Permittees of development that lies within, or partially within, a designated Earthquake Fault Zone shall:

- a. Comply with the seismic safety standards of all applicable seismic provisions and criteria in the most recent version of California State and applicable municipal codes; and
- b. Incorporate siting and design techniques to address any such geologic hazards.

4.5.4.4 Project Impacts and Mitigation Measures

Threshold 1: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault (refer to Division of Mines and Geology Special Publication 42)

ii. strong seismic ground shaking; or

iii. seismic-related ground failure, including liquefaction?

Impact Analysis

Construction

The PMPU serves as a long-term planning blueprint for future development on District Tidelands. Although the proposed PMPU would not directly result in construction, it would provide planned improvements, allowable water and land uses, and guidance for future development through its proposed planning policies and standards. The primary water and land uses proposed for the PMPU area would not result directly in construction; however, they would allow for, with issuance of a Coastal Development Permit of California Coastal Act exclusion and other real estate documents, where applicable, the future construction of development that would be compatible with the proposed designations and abide by the goals, objectives, policies, and development standards set forth in the proposed PMPU.

As described in Section 4.5.2.2, *Geologic Hazards*, under *Faulting and Seismicity*, the proposed PMPU area contains several faults, including the Rose Canyon Fault, Point Loma Fault Zone, and the La Nacion Fault Zone, which have been mapped approximately 2 miles to the east. Furthermore, a fault was recently discovered within PD3 that transects the existing Seaport Village development. The PMPU area is within an Alquist-Priolo Fault Zone and the Downtown Special Fault Zone, and there is potential for ground rupture due to faulting. Other hazards related to seismic activity associated with nearby faults are strong ground motion, liquefaction, lateral spreading, and seismically induced settlement. Based on the granular nature of the subsurface materials, the shallow depth to groundwater, and proximity to the Bay and Pacific Ocean, the entire PMPU area has a high potential for liquefaction and seismically induced settlement (Appendix F).

Under CEQA, if a project would directly or indirectly cause potential substantial adverse effects, the project would potentially result in a significant impact. All future development under the proposed PMPU would be required to comply with all applicable laws and regulations, including the building

codes identified in Section 4.5.3 above. Chapter 3, *Project Description*, provides a complete list of the allowable primary and secondary uses within PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10. The tables provided in Chapter 3 also identify future development that could occur in these planning districts by 2050, the planning horizon for the proposed PMPU. The following sections analyze the potential impacts by planning district.

Planning District 1: Shelter Island

Planning District 1 is mapped within hazard categories 12, 31, 52, and 53, as shown on Figure 4.5-9. Hazard category 12, a *potentially active, inactive, presumed inactive, or activity unknown* fault zone is mapped in the southwest portion of PD1. Most of the planning district is mapped within hazard category 31, which is defined as having a high potential for liquefaction. Hazard category 52, defined as *other level areas, gently sloping to steep terrain with favorable geologic structure, low risk*, is mapped within PD1 near Scott Street. Hazard category 53, defined as *level or sloping terrain, unfavorable geologic structure, low to moderate risk*, is mapped near Bessemer Path. Additionally, a strand of the northwest-to-southeast trending Point Loma Fault Zone, considered to be potentially active, has been mapped in the western portion of the planning district, and an unnamed segment intersects PD1. As such, construction of any potential primary and secondary uses in PD1, as listed in Table 3-4 in Chapter 3, would have a high potential to occur within areas mapped with geologic hazards.

Planning District 2: Harbor Island

Planning District 2 is mapped within hazard categories 11, 12, and 31, as shown on Figure 4.5-10. Hazard category 11, which is defined as an active, Alquist-Priolo Fault Zone, is mapped in the eastern portion of Harbor Island and extends north to Harbor Drive. Hazard category 12, which is defined as a *potentially active, inactive, presumed inactive, or activity unknown* fault zone, is mapped in the eastern portion of Harbor Island and the eastern portion of the San Diego International Airport. According to the California Geological Survey Earthquake Fault Zone Map for the Point Loma Quadrangle, active fault segments associated with the Rose Canyon Fault Zone are mapped within PD2. The entirety of the planning district is mapped as hazard category 31, defined as having a high potential for liquefaction, with shallow groundwater, major drainages, and hydraulic fills. As such, construction of any potential primary and secondary uses in PD2, as listed in Table 3-5 in Chapter 3, would have a high potential to occur within areas mapped with geologic hazards.

Planning District 3: Embarcadero

Planning District 3 is mapped within hazard categories 12, 13, and 31, as shown on Figure 4.5-11. Hazard category 12 is mapped in the southern portion of the planning district and extends towards Embarcadero Marina Park North. Hazard category 13, *Downtown Special Fault Zone*, is mapped in the eastern and northern portions of the planning district that abut Pacific Highway and Harbor Drive. The majority of the planning district is mapped as hazard category 31. As such, construction of many of the potential primary and secondary uses in PD3, as listed in Table 3-6 in Chapter 3, would have a high potential to occur within areas mapped with geologic hazards.

Planning District 4: Working Waterfront

Planning District 4 is mapped within hazard categories 11, 13, and 31, as shown on Figure 4.5-12. Hazard category 11 is mapped in the eastern portion of the Tenth Avenue Marine Terminal and extends nearly to the Coronado Bridge. Hazard category 13 is mapped in the northern portions of

the planning district that about Harbor Drive. The majority of PD4 is mapped as hazard category 31. According to the California Geological Survey Earthquake Fault Zone Map for the Point Loma Quadrangle, active fault segments associated with the Rose Canyon Fault Zone are mapped within PD4. As such, construction of any potential primary and secondary uses in PD4, as listed in Table 3-8 in Chapter 3, would have a high potential to occur within areas mapped with geologic hazards.

Planning District 7: South Bay

Planning District 7 is mapped within hazard categories 31 and 52, as shown on Figure 4.5-12. The majority of PD7 is mapped as hazard category 31, while hazard category 52 is mapped near the southeastern boundary. However, future development in PD7 would be minimal and would be primarily related to restoration, mitigation banking, aquaculture, and marine technology, as indicated in Table 3-9 in Chapter 3. If construction of physical structures or infrastructure improvements occur, development in PD7 would potentially occur within an area mapped with geologic hazards.

Planning District 8: Imperial Beach Oceanfront

According to the Fault Activity Map of California and the City of Imperial Beach General Plan/ Local Coastal Plan, PD8 is susceptible to strong ground motion and can be expected to have a high potential for liquefaction (Appendix F). As such, construction of any potential primary and secondary uses in PD8, as listed in Table 3-10 in Chapter 3, would have a high potential to occur within areas with known and anticipated geologic hazards.

Planning District 9: Silver Strand

According to the Fault Activity Map of California, PD9 is susceptible to strong ground motion and can be expected to have a high potential for liquefaction (Appendix F). As such, construction of any potential primary and secondary uses in PD9, as listed in Table 3-11 in Chapter 3, would have a high potential to occur within areas with known and anticipated geologic hazards.

Planning District 10: Coronado Bayfront

According to the Fault Activity Map of California and the City of Coronado General Plan, active fault segments associated with the Rose Canyon Fault Zone are mapped within PD10. Planning District 10 is susceptible to strong ground motion and can be expected to have a high potential for liquefaction (Appendix F). As such, construction of any potential primary and secondary uses in PD10, as listed in Table 3-12 in Chapter 3, would have a high potential to occur within areas with known and anticipated geologic hazards.

Construction-Related Impacts

The primary water and land uses proposed for the PMPU area would not result in construction directly; however, the water and land designations would allow for future development of uses that are compatible with the proposed designations and abide by the policies and standards set forth in the proposed PMPU. The allowable secondary water and land uses would generally be compatible with the primary uses and could result in construction involving soil-disturbing activities.

Future development of the primary or secondary water and land uses allowed within any of the planning districts would not directly or indirectly cause potential substantial adverse effects to an active fault because none of the allowable uses would permit activities that could potentially cause a

fault to rupture or slip. As stated above, future development allowed under the proposed PMPU would be required to comply with all applicable laws and regulations, including the building codes identified in Section 4.5.3, and would restrict development within Alquist-Priolo Zones or other areas where active faults are known. All future development would be sited at least 50 feet away from an active fault, in accordance with the Alquist-Priolo Act. Moreover, the proposed PMPU includes SR Policy 1.1.6, which requires compliance with the seismic safety standards of all applicable seismic provisions and criteria in the most recent version of California State and applicable municipal codes and the incorporation of siting and design techniques to address any such geologic hazards. Compliance with these regulations as well as PMPU SR Policy 1.1.6 would preclude construction of future development projects within the proposed PMPU area from occurring within an active fault and cause a fault to rupture or slip. As such, while future development and future users may experience strong seismic ground shaking, either as a result of a fault rupture or simply as a result of being within a seismically active region, mandatory compliance with applicable laws and regulations would ensure that any construction that occurs under the proposed PMPU would not exacerbate existing conditions involving earthquake or strong seismic ground shaking and directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death.

Future construction within the proposed PMPU area would not directly or indirectly cause substantial effects associated with liquefiable soils that are present due to compliance with mandatory regulations described in Section 4.5.3. Construction of future development within the proposed PMPU area would be required to comply with the current seismic design provisions of the CBC. The CBC incorporates the latest seismic design standards for structural loads and materials, as well as provisions from the National Earthquake Hazards Reduction Program, to mitigate losses from an earthquake and provide for the latest in earthquake safety. Additionally, Chapter 18, Soils and Foundations, of the CBC requires the preparation of geotechnical evaluations that include, among other requirements, a record of the soil profile, evaluation of active faults in the area, and recommendations for foundation type and design criteria that address issues, as applicable, such as (but not limited to) bearing capacity of soils and provisions to mitigate the effects of expansive soils, liquefaction, settlement, and varying soil strength. Section 1803.1.1.3 of Chapter 18 states that if a building department, or other appropriate enforcement agency, determines that recommended action(s) presented in the geotechnical evaluations are likely to prevent structural damage, the approved recommended action(s) must be made a condition to the building permit (Section 1803.1.1.3 of Chapter 18). Moreover, construction of future development allowed under the proposed PMPU would be required to adhere to the seismic safety requirements contained in the applicable city municipal code, which are updated periodically to incorporate the current version of the CBC. As such, liquefiable soil conditions would be adequately addressed and mitigated through compliance with the CBC (Chapter 18) and local municipal codes. Impacts associated with the rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and

certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would not directly or indirectly cause potential substantial adverse effects by exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, resulting in a less-than-significant impact.

Construction of a Waterfront Destination Park under Option 1 would involve landside ground-disturbing activities. However, construction activities for this option would be required to comply with all applicable laws and regulations, including the building and municipal codes identified in Section 4.3.5 above, to adequately address geologic hazards during construction of Option 1. As such, compliance with existing regulations would ensure that impacts associated with the rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) would be less than significant. Therefore, construction under Option 1 would not result in any additional or more severe impacts associated with exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would not directly or indirectly cause potential substantial adverse effects by exacerbating existing

conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, resulting in a less-than-significant impact.

Construction of additional park space under Option 2 would involve landside ground-disturbing activities, generally the same as those described above. However, construction activities for this option would be required to comply with all applicable laws and regulations, including the building and municipal codes identified in Section 4.3.5 above, to adequately address geologic hazards during construction of Option 2. As such, compliance with existing regulations would ensure that impacts associated with the rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) would be less than significant. Therefore, construction under Option 2 would not result in any additional or more severe impacts associated with exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3, *Project Description*.

As discussed above, implementation of the proposed PMPU, including within PD3, would not directly or indirectly cause potential substantial adverse effects by exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, resulting in a less-than-significant impact.

Ground-disturbing construction activities would be required for the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, as well as any new park space. However, construction activities for this option would be required to comply with all applicable laws and regulations, including the building and municipal codes identified in Section 4.3.5 above, to adequately address geologic hazards during construction of Option 3. As such, compliance with existing regulations would ensure that impacts associated with the rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) would be less than significant. Therefore, construction under Option 3 would not result in any additional or more severe impacts associated with exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction than buildout of the proposed PMPU without Option 3.

Operation

As described in Chapter 3, implementation of the proposed PMPU would result in an increase of Commercial Recreation facilities within PD2, PD3, and PD8, including, but not limited to, hotels, retail, and other commercial and visitor-serving development. Planning District 4 would primarily comprise marine terminal and marine industrial operations as well as ship building. Planning District 7 is predominately natural habitat, and operations within PD7 would consist of restoration, aquaculture, and habitat mitigation banking. The PMPU could also result in large-scale alterations to the circulation system in order to improve efficiency and reduce traffic (vehicle miles traveled) along the roadways, to provide infrastructure for transit opportunities, provide pedestrians and bicyclists with improved travel routes, and establish mobility hubs to meet the needs of the visitors to the proposed PMPU area. Implementation of the proposed PMPU would also allow for in-water development, including dock maintenance, vessel slip reconfiguration in the water basin, modification of marina capacity, enhancement or modifications to the existing anchorage area supporting transient vessel berthing, and the addition of aquaculture within the proposed PMPU area. Water use designations would include anchorage, commercial fishing berthing, conservation/inter-tidal, industrial and deep-water berthing, marine services berthing, navigation corridor, open bay/water, recreational berthing, and sportfishing berthing. Land use designations would include commercial fishing, commercial recreation, conservation open space, institutional/roadway, marine sales and services, maritime services and industrial, marine terminal, recreation open space, and sportfishing.

The PMPU area is in a region that is susceptible to ground rupture, liquefaction, and strong ground shaking due to seismic activity. All future development would be sited at least 50 feet away from an active fault, in accordance with the Alquist-Priolo Act. As discussed in Section 4.5.3.3, local jurisdictions have adopted the CBC, which requires geotechnical evaluations prior to development (Chapter 18 of the CBC). The geotechnical reports must contain an evaluation of active faults in the area, and recommendations for foundation type and design criteria that address issues as applicable, including seismic shaking and liquefaction. Moreover, none of the potential operational activities of future development associated with the proposed PMPU would have the potential to result in direct or indirect effects by exacerbating existing conditions related to a fault condition leading to a rupture or strong seismic ground shaking. Impacts would be less than significant.

Because future projects developed under the proposed PMPU would be engineered properly in compliance with applicable laws and regulations as required by the CBC, the operation of any development would not have a significant adverse effect on liquefaction. Therefore, impacts from operations related to liquefiable soil conditions would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 are the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including PD3, would not directly or indirectly cause potential substantial adverse effects by exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, resulting in a less-than-significant impact.

Operation of Option 1 would consist of routine maintenance and upkeep of the Waterfront Destination Park, similar to other existing parks on District Tidelands, and therefore would not include any activities that would have the potential to directly or indirectly cause substantial adverse effects associated with rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction). In addition, future development under this option would be engineered properly in compliance with applicable laws and regulations as required by the CBC and City of San Diego Municipal Code. Therefore, operation of Option 1 would result in less than significant impacts and would not result in any additional or more severe impacts related to exacerbating existing conditions involving known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would not directly or indirectly cause potential substantial adverse effects by exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, resulting in a less-than-significant impact.

Operation of Option 2 would consist of routine maintenance and upkeep of the expanded Lane Field Setback Park, similar to other existing parks on District Tidelands, and therefore would not

include any activities that would have the potential to directly or indirectly cause substantial adverse effects associated with rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction). In addition, future development under this option would be engineered properly in compliance with applicable laws and regulations as required by the CBC and City of San Diego Municipal Code. Therefore, operation of Option 2 would result in less-than-significant impacts and would not result in any additional or more severe impacts by exacerbating existing conditions related to known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) than the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would not directly or indirectly cause potential substantial adverse effects by exacerbating existing conditions related to the potential rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction, resulting in a less-than-significant impact.

Operation of Option 3 would consist of routine maintenance and upkeep of the additional park space added under this option, similar to other existing parks on District Tidelands, and therefore would not include any activities that would have the potential to directly or indirectly cause substantial adverse effects associated with rupture of a known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction). In addition, future development under this option would be engineered properly in compliance with applicable laws and regulations as required by the CBC and City of San Diego Municipal Code. Therefore, operation of Option 3 would result in less-than-significant impacts and would not result in any additional or more severe impacts by exacerbating existing conditions related to known earthquake fault, strong seismic ground shaking, or seismic-related ground failure (e.g., liquefaction) than the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

The proposed PMPU does not include any policies that would directly or indirectly cause substantial adverse effects from the rupture of a known earthquake fault; strong seismic ground shaking; or seismic-related ground failure, including liquefaction. Therefore, no significant impacts would occur.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not directly or indirectly cause potential substantial adverse effects by exacerbating existing conditions related to the potential rupture of a known

earthquake fault, strong seismic ground shaking, or seismic-related ground failure, including liquefaction. Impacts would be less than significant, and no mitigation is required.

Threshold 2: Result in substantial soil erosion or the loss of topsoil?

Impact Analysis

Construction

The water and land use designations proposed by the PMPU would allow for the future construction of a variety of uses, including, but not limited to, commercial and retail shops, recreational facilities, maritime industrial and cruise improvements, marine terminal support infrastructure, in-water piers and docks, hotels, and other visitor-serving development. Although the proposed PMPU area is primarily developed, soil-disturbing activities associated with future development, such as grading and excavation, could result in soil erosion.

As discussed in Section 4.5.2.5, *Soil Conditions*, the soil types mapped within the proposed PMPU area were identified using the USDA Soil Survey. A summary of the mapped soil types within each planning district and their erosion potential is provided in Table 4.5-3.

Given the onsite soil conditions (i.e., potential for erosion in areas) and future development through 2050, the potential exists for substantial soil erosion or loss of topsoil from the construction and grading activities of future projects. However, compliance with the existing regulatory framework for the prevention of soil erosion and sedimentation from exposed soils would reduce any potentially significant impact related to erosion.

As discussed under Section 4.5.3 and detailed further in Section 4.8, *Hydrology and Water Quality*, construction activities associated with future development that would disturb 1 acre or more of land would be required to comply with the NPDES Construction General Permit adopted by the SWRCB. Compliance with the Construction General Permit requires each qualifying development project to file a Notice of Intent with the SWRCB. Permit conditions require the preparation and implementation of a SWPPP, which must describe the site, the facility, erosion and sediment controls, runoff water quality monitoring, means of waste disposal, implementation of approved local plans, control of construction sediment and erosion control measures, maintenance responsibilities, and non-stormwater management controls. Inspection of construction sites before and after storms is also required to identify stormwater discharge from the construction activity and to identify and implement erosion controls, where necessary. Additionally, future projects that would disturb less than 1 acre are required to prepare and implement a Water Pollution Control Plan. These plans would identify BMPs to address erosion and sedimentation at the project site during construction activities. Additionally, as discussed in Section 4.8, construction activities associated with future development would be required to comply with District Code, Article 10—the San Diego Unified Port District Stormwater Management and Discharge Control Ordinance. Temporary BMPs, such as silt fences, straw waddles, sediment traps, gravel sandbag barriers, or other effective BMPs, would be required to control runoff and erosion during construction activities.

Implementation of erosion and sediment control BMPs would prevent substantial soil erosion and sedimentation from exposed soils. As discussed in Section 4.8, future development allowed under the proposed PMPU would be required to comply with the District's Stormwater Management and Discharge Control Ordinance and the JRMP, which include specific requirements for all development

and redevelopment activities. Pursuant to the District's JRMP, post-construction BMPs are required for all projects falling under the State's Construction General Permit. Post-construction measures, such as surface drainage design provisions that would recapture and filter runoff prior to irrigation with proper maintenance practices, would reduce potential soil erosion during operations of the proposed reuse along the project sites.

Furthermore, future development within PD1, PD2, PD3, PD4, and PD7 would be subject to San Diego Municipal Code Section 142.0146: *Erosion, Sedimentation, and Water Pollution Control* (described in detail in Section 4.5.3.3 above), which requires that all development implement and maintain both temporary and permanent erosion, sedimentation, and water pollution control measures. Additionally, as discussed in Section 4.8, District Code, Article 10 requires the implementation and maintenance of BMPs, stormwater plans, and other measures, as appropriate to control the discharge of pollution to Tideland or receiving waters.

Future development within PD8 would be subject to the Imperial Beach Municipal Code Section 15.54.110: *Lot Grading – Safety Precautions* (described in detail in Section 4.5.3.3), which states that erosion and siltation control shall require temporary or permanent siltation basins, energy dissipaters, or other measures as field conditions warrant, whether or not such measures are a part of approved plans. Future development within PD9 and PD10 would be subject to the City of Coronado Municipal Code, Title 61: *Stormwater and Urban Runoff Management and Discharge Control*. Title 61 mandates the use of BMPs for all dischargers within the City of Coronado to prevent erosion and sediment discharges.

As such, there are existing laws and regulations that help to ensure there would be no substantial loss of topsoil or erosion. Adherence to the applicable laws and regulations is mandatory and would ensure that impacts are less than significant and no mitigation would be required.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and

Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with existing laws and regulations that would ensure a less-than-significant impact related to substantial loss of topsoil or erosion.

Option 1 would involve ground-disturbance during construction of a new Waterfront Destination Park. Due to the presence of soil types with the potential for erosion, it is possible construction under Option 1 could result in soil erosion or loss of topsoil; however, compliance with the existing regulatory framework, including NPDES Construction General Permit, Article 10, the District's JRMP, and City of San Diego Municipal Code Section 142.0146, would ensure that impacts related to soil erosion would be less than significant by requiring implementation of erosion and sediment control BMPs during construction. Therefore, construction activities under Option 1 would not result in any additional or more severe impacts related to substantial loss of topsoil or erosion than the buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with existing laws and regulations that would ensure a less-than-significant impact related to substantial loss of topsoil or erosion.

Option 2 would involve ground-disturbing activities during construction of the expanded Lane Field Setback Park that could result in erosion or loss of topsoil; however, all future development would comply with the existing regulatory framework established to prevent erosion, including NPDES Construction General Permit, Article 10, the District's JRMP, and City of San Diego Municipal Code Section 142.0146. Adherence to the applicable laws and regulations is mandatory and would ensure that impacts are less than significant by requiring implementation of erosion and sediment control BMPs during construction, and no mitigation would be required. Therefore, construction activities under Option 2 would not result in any additional or more severe impacts related to substantial loss of topsoil or erosion than the buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of

North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with existing laws and regulations that would ensure a less-than-significant impact related to substantial loss of topsoil or erosion.

Option 3 would involve ground-disturbing activities during construction that could result in erosion or loss of topsoil; however, all future development would comply with the existing regulatory framework established to prevent erosion, including NPDES Construction General Permit, Article 10, the District's JRMP, and City of San Diego Municipal Code Section 142.0146. Adherence to the applicable laws and regulations is mandatory and would ensure that impacts are less than significant by requiring implementation of erosion and sediment control BMPs during construction, and no mitigation would be required. Therefore, construction activities under Option 3 would not result in any additional or more severe impacts related to substantial loss of topsoil or erosion than the buildout of the proposed PMPU without Option 3.

Operation

The operation of proposed planned improvements and allowable development consistent with the water and land use designations under the PMPU, would be similar to operation of water and land uses that currently exist throughout the District as it relates to geology and soils. Soil erosion and loss of topsoil associated with future development allowed under the proposed PMPU would generally occur during construction rather than operation of site-specific projects given the ground-disturbing activities typically associated with construction. Once operational, a project site would generally have been developed with impervious surfaces and/or landscaping, and would have little or no impact on soil erosion and the loss of topsoil. Therefore, operation of such future development would not result in substantial soil erosion or the loss of topsoil, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, operation of the proposed PMPU, including within PD3, would not involve ground-disturbing activities and would result in a less-than-significant impact related to substantial loss of topsoil or erosion.

Operations under Option 1 would not result in soil erosion or loss of topsoil because ground-disturbing activities would generally occur during construction, and the new Waterfront Destination Park would generally be built out with impervious surfaces and/or landscaping during operation with little to no activities that would disturb topsoil. Therefore, impacts associated with operation of Option 1 would be less than significant and would not result in any additional or more severe impacts related to substantial loss of topsoil or erosion than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, operation of the proposed PMPU, including within PD3, would not involve ground-disturbing activities and would result in a less-than-significant impact related to substantial loss of topsoil or erosion.

Operations under Option 2 would not involve any activities that would result in the potential for erosion or loss of topsoil because ground-disturbing activities would generally occur during construction, and the expanded Lane Field Setback Park would generally be built out during operation with impervious surfaces and/or landscaping, with little to no activities that would disturb topsoil. Therefore, impacts associated with operation of Option 2 would be less than significant and would not result in any additional or more severe impacts related to substantial loss of topsoil or erosion than the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, operation of the proposed PMPU, including within PD3, would not involve ground-disturbing activities and would result in a less-than-significant impact related to substantial loss of topsoil or erosion.

Operations under Option 3 would not involve any activities that would result in the potential for erosion or loss of topsoil because ground-disturbing activities would generally occur during construction and the new park space that could be developed under Option 3 would generally be built out during operation with little to no activities that would disturb topsoil. Therefore, impacts associated with operation of Option 3 would be less than significant and would not result in any additional or more severe impacts related to substantial loss of topsoil or erosion than the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

The proposed PMPU does not include any policies that would result in substantial soil erosion or the loss of topsoil. Therefore, impacts would be less than significant.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in substantial soil erosion or the loss of topsoil. Impacts would be less than significant and no mitigation is required.

Threshold 3: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Impact Analysis**Construction**

Marine beach deposits and artificial fill layers underlying much of the proposed PMPU area are considered unstable due to their liquefaction potential. Because the potential for liquefaction exists in all of the planning districts, there is also potential for lateral spreading (liquefaction is discussed in detail under *Threshold 1*). Lateral spreading is a secondary seismic effect of liquefaction. Lateral spreading occurs when there is liquefiable soil in the immediate vicinity of a free face, such as a slope. Factors controlling lateral displacement include earthquake magnitude, distance from the

earthquake epicenter, thickness of liquefiable soil layer, grain size characteristics, fine contents of the soil, and density of granular deposits, such as sands and gravel.

As discussed under Threshold 1, construction activities associated with future development allowed under the proposed PMPU would not exacerbate the potential for liquefaction due to compliance with mandatory regulations such as Chapter 18 of the CBC and applicable city municipal codes. Consequently, future development projects would also not exacerbate conditions that would promote on- or offsite lateral spreading because they would comply with mandatory regulations that address liquefaction and lateral spreading as a secondary effect of liquefaction. Impacts would be less than significant.

Ground subsidence results from fluid (water or petroleum) extraction from underlying formations, which causes the collapse of pore spaces previously occupied by the removed fluid. The collapse of these pore spaces compacts these underlying formations, leading to a gradual drop in ground surface elevation. Ground subsidence is most often found in areas where large volumetric withdrawals of fluids from underground reservoirs have occurred or are ongoing. Ground shaking from tectonic activity can exacerbate the vertical sinking of land in an area over the withdrawal site. Underlying geologic formations within San Diego County have a low potential of subsidence, and there are no historical records of subsidence events in San Diego County (County of San Diego 2017, USGS 2019).

Future development associated with the proposed PMPU would potentially require dewatering during construction activities involving ground disturbances that extend into groundwater. Materials excavated from below the groundwater table would need to be moisture-conditioned and/or mixed before being reused for structural backfill, consistent with existing regulations pertaining to water quality and grading/foundation support. Dewatering would be temporary, would require appropriate permits, and would not result in the substantial drawdown of groundwater. Future development projects requiring dewatering during construction would be required to comply with the dewatering requirements imposed by the San Diego Regional Water Quality Control Board (RWQCB) general waste discharge requirements for discharges from temporary groundwater extraction and similar waste discharges to San Diego Bay (Order No. R9-2015-0013). To obtain coverage under this order, a discharger must submit a complete Notice of Intent application package to the San Diego RWQCB office at least 60 days before proposed commencement of the discharge. The discharger would be required to maintain compliance with the effluent limitations applicable to the receiving water, as specified in Order No. R9-2015-0013 (refer to Table 8 of the order) (see Section 4.8 for additional details on dewatering). As such, temporary dewatering would not permanently affect groundwater levels, and the proposed PMPU would not exacerbate conditions related to on- or offsite subsidence.

Collapsible soils are subject to changes in volume and settlement due to the introduction of water, which can break down soil grain bonds in dry, low-density, unconsolidated soils, resulting in collapse of the soil. Other mechanisms for soil collapse include the sudden closure of voids in a soil, whereby the sudden decrease in volume results in loss of the soil's internal structure, causing the soil to collapse. The artificial fill material and marine deposits that underlie all of the planning districts, as identified in Table 4.5-2, may be loosely or inadequately compacted, may contain oversize materials unsuitable for reuse in engineered fills, and may contain unsuitable organic or expansive materials and debris that may preclude their use in engineered fills. Future development allowed under the proposed PMPU would be required to be constructed in compliance with mandatory CBC regulations related to unstable soils, which include requirements for specific

materials to be used for fill, compaction specifications, dewatering requirements, removal of unsuitable material prior to placing fill, and other soil enhancements for surficial stability. Specifically, Chapter 18, Soils and Foundations, of the CBC requires the preparation of geotechnical evaluations that include, among other requirements, a record of the soil profile and recommendations for foundation type and design criteria that address issues, as applicable, such as (but not limited to) bearing capacity of soils, and provisions to mitigate the effects of expansive soils, liquefaction, settlement, and varying soil strength. Additionally, Chapter 18 of the CBC includes specific requirements for excavation, grading, and fill. Chapter 18 of the CBC requires these to be addressed prior to project construction and are enforced by the local municipality issuing the building permit for the project. Therefore, with mandatory compliance with applicable regulations, future development projects would not directly or indirectly cause conditions that would result in collapsible or unstable soils on- or offsite. Impacts related to collapsible soils would be less than significant.

Lastly, as described in Section 4.5.2.2, no landslides or indications of deep-seated landsliding were noted underlying the proposed PMPU area. According to the Landslide Hazards maps for the Point Loma, National City, and Imperial Beach Quadrangles (1995), the proposed PMPU area is mapped as being “least susceptible” to landslides (with “most susceptible” being the greatest landslide risk). Additionally, landslides are not anticipated to be a concern based on the relatively flat topography of the proposed PMPU area (Appendix F). As such, construction activities for future development allowed under the proposed PMPU would not have the potential to result in on- or offsite landslides, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts related to landslide, subsidence, liquefaction, or lateral spreading.

Implementation of Option 1 would occur in areas with the potential for liquefaction or lateral spreading. However, construction activities would comply with mandatory regulations that would prevent future development of Option 1 from exacerbating conditions resulting in liquefaction or lateral spreading. In addition, construction activities under Option 1 could involve dewatering. However, the area has a low potential for subsidence, and all dewatering activities would be done in compliance with State and local regulations that would reduce the potential for subsidence. Future development proposed as part of Option 1 would also be required to be constructed in compliance with mandatory CBC regulations related to unstable soils, which would reduce the potential of future development to indirectly or directly cause conditions that would result in collapse of unstable soils. Lastly, the potential for landslides is low in PD3, where Option 1 would be implemented, and, as such, construction activities would not have the potential to result in on- or offsite landslides. Therefore, construction associated with Option 1 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to landslide, subsidence, liquefaction, or lateral spreading than the buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts related to landslide, subsidence, liquefaction, or lateral spreading.

Implementation of Option 2 would occur in areas with the potential for liquefaction or lateral spreading. However, construction activities would comply with mandatory regulations that would prevent future development of Option 2 from exacerbating conditions resulting in liquefaction or lateral spreading. In addition, construction activities under Option 2 could involve dewatering. However, the area has a low potential for subsidence, and all dewatering activities would be done in compliance with State and local regulations that would reduce the potential for subsidence. Construction activities associated with the implementation of Option 2 would comply with mandatory CBC regulations that would reduce the potential for liquefaction and lateral spread, subsidence, and collapse. Option 2 would also not be located in an area that has a high potential for landslides, and therefore would not result in direct or indirect effects that could result in on- or offsite landslides. Therefore, construction associated with Option 2 would result in a less-than-significant impact and would not result in any additional or more

severe impacts related to landslide, subsidence, liquefaction, or lateral spreading than the buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts related to landslide, subsidence, liquefaction, or lateral spreading.

Implementation of Option 3 would occur in areas with the potential for liquefaction or lateral spreading. However, construction activities would comply with mandatory regulations that would prevent future development of Option 3 from exacerbating conditions resulting in liquefaction or lateral spreading. In addition, construction activities under Option 3 could involve dewatering. However, the area has a low potential for subsidence, and all dewatering activities would be done in compliance with State and local regulations that would reduce the potential for subsidence. Construction activities associated with the implementation of Option 3 would comply with mandatory CBC regulations that would reduce the potential for liquefaction and lateral spread, subsidence, and collapse. Option 3 would also not be located in an area that has a high potential for landslides, and therefore would not result in direct or indirect effects that could result in on- or offsite landslides. Therefore, construction associated with Option 3 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to landslide, subsidence, liquefaction, or lateral spreading than the buildout of the proposed PMPU without Option 3.

Operation

The operation of proposed planned improvements and allowable development consistent with the water and land use designations under the PMPU, would be similar to operations of existing water and land uses that operate throughout the District as it relates to geology and soils. Operational activities associated with future development would not have the potential to directly or indirectly cause on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse. Future development would be required to perform site-specific geologic studies in accordance with Chapter 18 of the CBC and local municipal codes, and would be sited on engineered soils that would be required by applicable regulations to be stable and satisfactory for structural foundations. As such, these geologic hazards would be addressed during the design phase of future development projects. Thus, future operations would not involve soil-disturbing activities on unstable soils, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts related to landslide, subsidence, liquefaction, or lateral spreading.

Operations under Option 1 would be similar to current operations in PD3 as it relates to geology and soils. Geologic hazards would be addressed during the design phase of future development projects, and construction would occur in compliance with applicable regulation. Operational activities would not have the potential to indirectly or directly cause on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse. Therefore, operational impacts under Option 1 would be less than significant and would not result in any additional or more severe impacts related to landslide, subsidence, liquefaction, or lateral spreading than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts related to landslide, subsidence, liquefaction, or lateral spreading.

Operations under Option 2 would be similar to current operations in PD3 as it relates to geology and soils. Geologic hazards would be addressed during the design phase of future development projects, and construction would occur in compliance with applicable regulation. Operational activities would not have the potential to indirectly or directly cause on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse. Therefore, operational impacts under Option 2 would be less than significant and would not result in any additional or more severe impacts related to landslide, subsidence, liquefaction, or lateral spreading than PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts related to landslide, subsidence, liquefaction, or lateral spreading.

Operations under Option 3 would be similar to current operations in PD3 as it relates to geology and soils. Geologic hazards would be addressed during the design phase of future development projects, and construction would occur in compliance with applicable regulation. Operational activities would not have the potential to indirectly or directly cause on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse. Therefore, operational impacts under Option 3 would be less than significant and would not result in any additional or more severe impacts related to landslide, subsidence, liquefaction, or lateral spreading than PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

The proposed PMPU does not include any policies that would result in potential substantial adverse effects, including on- or offsite landslide, lateral spreading, subsidence, liquefaction or collapse, from being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project. Therefore, impacts would be less than significant.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse from being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project. Therefore, impacts would be less than significant, and no mitigation is required.

Threshold 4: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Impact Analysis

Construction

The water and land use designations proposed by the PMPU would allow for the construction of commercial and retail shops, recreational facilities, marine terminal support infrastructure, in-water piers and docks, hotels, and other visitor-serving development. Although the proposed PMPU area is primarily developed, soil-disturbing activities, such as grading and excavation, could occur on expansive soils.

Expansive soils are fine-grained soils (generally high-plasticity clays) that can undergo a significant increase in volume with an increase in water content, as well as a significant decrease in volume with a decrease in water content. Changes in the water content of highly expansive soils can result in severe distress for structures constructed on or against the soils. Table 18-1-B of the Uniform Building Code illustrates a classification for expansive soils utilizing an expansion index and the associated potential for expansion. For example, an expansion index of 0–20 has a very low potential for expansion, while an expansion index of 91–130 has a high potential for expansion. As discussed in Section 4.5.2.5, *Soil Conditions*, clayey fill soils, alluvium, marine deposits, or old paralic deposits may be moderately expansive. It is anticipated that expansive soils are present throughout the proposed PMPU area.

As shown in Table 4.5-3, soils in PD1, PD2, PD3, PD4, and PD10 have variable potential for expansion. Soils in PD7 have both low and high expansion potential. Planning District 8 includes Coastal beaches and Marina loamy coarse sand, which have low expansion potential. Tidal flats are also identified within PD8, which have high expansion potential. Soils in PD9 consist of Tidal flats, which have high expansion potential, and Carlsbad gravelly loamy sand, Coastal beaches, and Marina loamy coarse sand, each of which have low expansion potential. Finally, soils in PD10 include Coastal beaches and Marina loamy coarse sand (low expansion potential) and made land (variable expansion potential).

The PMPU would not result directly in construction. However, the water and land use designations; listing of appealable projects; and the goals, objectives, and policies of the proposed PMPU would allow for future development of uses that are compatible with the proposed designations and abide by the goals, objectives, policies, and development standards set forth in the proposed PMPU. Construction of future development could occur on soils with the potential to expand. As with any new development within the state, building design and construction of future development within the planning districts would be required to comply with the current structural design provisions of Part 2, Volume 2, Chapter 18, Soils and Foundations, of the CBC, which are enforced by the local municipalities during the building permit process. Building codes provide minimum standards regulating a number of aspects of construction that are relevant to geology and geologic hazards. These include excavation, grading, and fill placement; foundations; and mitigation of soil conditions such as expansive soils. Additionally, construction would be required to adhere to the applicable city's municipal code, which would identify earthwork activity restrictions. As discussed in detail in Section 4.5.3.3, Chapter 14, Article 2, Division 1 of the San Diego Municipal Code; Chapter 14, Article

2, Division 1 of the City of Coronado Municipal Code; and Title 15, Chapter 15.54 of the City of Imperial Beach Municipal Code contain specific grading requirements for construction projects. Moreover, geotechnical studies are required by and, per the above-referenced local municipal codes building permit applicants are required to demonstrate compliance with, Chapter 18 of the CBC and local municipal codes to ensure soils are properly engineered and building foundations are properly designed. Therefore, because building design and construction of future development would be required to comply with the applicable regulations, the proposed project would not cause a potential direct or indirect risk to life or property from being located on expansive soil. Therefore, impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As described above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts associated with potential direct or indirect risk to life or property from being located on expansive soil.

Expansive soils may be present in PD3 and implementation of Option 1 could result in construction of the proposed Waterfront Destination Park on soils with the potential to expand. Option 1 construction activities would be required to comply with the CBC and Chapter 14, Article 2, Division 1 of the San Diego Municipal Code as they apply to excavation, grading, fill placement, foundations, and mitigation of soil conditions such as expansive soils. Additionally, geotechnical studies are required per the City of San Diego Municipal Code to ensure proper engineering of soils and building foundations are properly designed. Construction of the Waterfront Destination Park under Option 1 would be required to comply with applicable regulations, and would not result in a potential direct or indirect risk to life or property from being located on expansive soils, and impacts would be less than significant. Therefore, Option 1

would not result in any additional or more severe impacts related to expansive soils than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As described above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts associated with potential direct or indirect risk to life or property from being located on expansive soil.

Expansive soils may be present in PD3 and construction of the expanded Lane Field Setback Park under Option 2 could result in construction on soils with the potential to expand. Future development would be required to comply with the CBC and Chapter 14, Article 2, Division 1 of the San Diego Municipal Code as they apply to excavation, grading, fill placement, foundations, and mitigation of soil conditions such as expansive soils. Additionally, geotechnical studies are required per the City of San Diego Municipal Code to ensure proper engineering of soils and building foundations are properly designed. Construction associated with Option 2 would be required to comply with applicable regulations, and would not result in a potential direct or indirect risk to life or property from being located on expansive soils, and impacts would be less than significant. Therefore, Option 2 would not result in any additional or more severe impacts related to expansive soils than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As described above, implementation of the proposed PMPU, including within PD3, would occur in compliance with applicable regulations that would ensure less-than-significant impacts associated with potential direct or indirect risk to life or property from being located on expansive soil.

Expansive soils may be present in PD3 and construction of the new park space that could be developed under Option 3 could result in construction on soils with the potential to expand. Construction activities would be performed in compliance with the CBC and Chapter 14, Article 2, Division 1 of the San Diego Municipal Code as they apply to excavation, grading, fill placement, foundations, and mitigation of soil conditions such as expansive soils. Additionally, geotechnical studies are required per the City of San Diego Municipal Code to ensure proper engineering of soils and building foundations are properly designed. Construction associated with Option 3 would be required to comply with applicable regulations, and would not result in a potential direct or indirect risk to life or property from being located on expansive soils, and impacts would be less than significant. Therefore, Option 3 would not result in any additional or more severe impacts related to expansive soils than buildout of the proposed PMPU without Option 3.

Operation

The operation of proposed planned improvements and allowable development consistent with the water and land use designations under the PMPU, would be similar to operation of existing water and land uses that operate throughout the District as it relates to geology and soils impacts. Operational activities associated with future development consistent with the proposed primary and secondary water and land uses would not have the potential to cause conditions that would potentially result in hazards from expansive soils. Typically, the type of activities that have the potential to impact expansive soils are those that occur during construction. As such, while this development would potentially bring additional people to District Tidelands, mandatory compliance with existing regulatory requirements such as the CBC and applicable city municipal codes would ensure that operation of future development would not create substantial direct or indirect risks to life or property, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would comply with applicable regulations during project design and construction and would not involve ground-disturbing activities during operation. Thus, implementation of the proposed PMPU would result in less-than-significant impacts related to direct or indirect risk to life or property due to being located on expansive soils.

Operation of the new Waterfront Destination Park under Option 1 would not involve ground-disturbing activities that typically have the potential to impact expansive soils. Therefore, operation of Option 1 would result in less-than-significant impacts and would not result in any

additional or more severe impacts associated with being located on expansive soils than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would comply with applicable regulations during project design and construction and would not involve ground-disturbing activities during operation. Thus, implementation of the proposed PMPU would result in less-than-significant impacts related to direct or indirect risk to life or property due to being located on expansive soils.

Operation of the expanded Lane Field Setback Park under Option 2 would not include any ground-disturbing activities that would typically result in an impact on expansive soils. Typically, the type of activities that have the potential to impact expansive soils are those that occur during construction. Therefore, operation of Option 2 would result in less-than-significant impacts and would not result in any additional or more severe impacts associated with being located on expansive soils than the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would comply with applicable regulations during project design and construction and would not involve ground-disturbing activities during operation. Thus, implementation of the proposed PMPU would result in less-than-significant impacts related to direct or indirect risk to life or property due to being located on expansive soils.

Operation of the new park space that could be developed under Option 3 would not include any ground-disturbing activities that would typically result in an impact on expansive soils. Typically, the type of activities that have the potential to impact expansive soils are those that occur during construction. Therefore, operation of Option 3 would result in less-than-significant impacts and would not result in any additional or more severe impacts associated with being located on expansive soils than the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

The proposed PMPU does not include any policies that would result in potential impacts associated with expansive soil. Therefore, impacts would be less than significant.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result substantial adverse effects from being located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property. Therefore, impacts would be less than significant.

Threshold 6: Directly or indirectly destroy a unique paleontological resource or site or a unique geological feature?

Impact Analysis

Construction

Chapter 3 provides a complete list of the allowable primary and secondary uses and identifies future development that could occur in PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10 by 2050.

The primary type of activities that may directly destroy a unique paleontological resource or site are ground-disturbing activities. As presented above in Table 4.5-4 of Section 4.5.2.6, *Unique Paleontological Resources and Geologic Features*, each planning district contains several geologic units, which have differing levels of sensitivity. All planning districts contain at least one geologic formation with low or no paleontological sensitivity, and none of the planning districts contains geologic formations with moderate paleontological sensitivity. However, PD1, PD3, PD8, PD9, and PD10 contain Bay Point Formation, a geologic formation that has high paleontological sensitivity. Additionally, six fossil localities have been identified within two planning districts: one in PD4 and five in PD10. As such, per the City of San Diego's CEQA Significance Determination Thresholds, which were developed based on consultation with experts from the San Diego Natural History Museum, construction activities in areas underlain by Bay Point Formation have the potential to cause significant direct impacts on paleontological resources or sites when they require over 1,000 cubic yards of excavation and depth of excavation exceeding 10 feet, or require any amount of grading on a fossil recovery site or within 100 feet of a mapped fossil recovery site.

Construction activities for future PMPU-related development have the potential to require 1,000 cubic yards or more of excavation exceeding depths of 10 feet in areas of PD1, PD3, PD8, PD9, and PD10, which are underlain by Bay Point Formation. Construction in PD4 and PD10 could entail grading on a fossil recovery site or within 100 feet of a mapped fossil recovery site. Therefore, the proposed PMPU has the potential to result in future construction activities in PD1, PD3, PD8, PD9, and PD10 that could directly cause significant impacts on unique paleontological resources or sites, and impacts are considered significant (**Impact-GEO-1**). Activities that indirectly destroy unique paleontological resources or sites or unique geologic features typically include creating access to a previously undeveloped area that increases visitation, potentially allowing for rock or fossil hunting, which would not occur during construction activities.

In addition, as noted under Section 4.5.6.2, there are no unique geologic features within the proposed PMPU area and, thus, implementation of the proposed PMPU would not result in any direct or indirect impacts on these resources. Therefore, construction activities would not have the potential to result in indirect impacts on unique geologic features.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 6.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and

certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in a significant impact related to direct significant impacts on unique paleontological resources or sites (**Impact-GEO-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside the option boundary within PD3.

Option 1 would include the construction of the Waterfront Destination Park within PD3, which contains Bay Point Formation, a geologic formation that has high paleontological sensitivity, and construction activities for a new Waterfront Destination Park may require 1,000 cubic yards or more of excavation exceeding depths of 10 feet. Thus, construction of Option 1 would result in a significant impact on unique paleontological resources or sites (**Impact-GEO-1**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in a significant impact related to direct significant impacts on unique paleontological resources or sites (**Impact-GEO-1**). This significant impact would still occur within PD3 under Option 2 due to future development that could still occur outside the option boundary within PD3.

Construction of the expanded Lane Field Setback Park under Option 2 would be located in PD3, which contains Bay Point Formation, a geologic formation that has high paleontological sensitivity, and construction activities of the new park may require 1,000 cubic yards or more of excavation exceeding depths of 10 feet. Therefore, ground-disturbing construction activities associated with Option 2 would result in a significant impact on unique paleontological resources or sites (**Impact-GEO-1**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in a significant impact related to direct significant impacts on unique paleontological resources or sites (**Impact-GEO-1**). This significant impact would still occur within PD3 under Option 3 due to future development that could still occur outside the option boundary within PD3.

Construction of a new park space that could be developed under Option 3 would be located in PD3, which contains Bay Point Formation, a geologic formation that has high paleontological sensitivity, and construction activities may require 1,000 cubic yards or more of excavation exceeding depths of 10 feet. Ground-disturbing construction activities for this option would be required for the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, as well as any new park space. Therefore, construction of Option 3 would result in a significant impact on unique paleontological

resources or sites (**Impact-GEO-1**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Operation

Activities with ground disturbance (i.e., construction activities) have the potential to result in direct impacts on unique paleontological resources or sites and unique geologic features. Future operations associated with allowable primary and secondary water and land uses would not include ground disturbance, and therefore do not have the potential to directly result in the destruction of unique paleontological resources or unique geological features. In general, activities that indirectly destroy paleontological resources or unique geologic features typically include creating access to a previously undeveloped area that increases visitation, potentially allowing for rock or fossil hunting. Future development under the proposed PMPU would primarily be infill development and would occur in urban areas that do not provide opportunities for rock or fossil hunting. Therefore, no direct or indirect operational impacts on paleontological resources or unique geologic features would occur, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 6.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, operation of the proposed PMPU, including within PD3, would not include ground disturbance and would not create access to previously undeveloped areas that could provide opportunities for rock or fossil hunting, and, thus, would not result in direct or indirect operational impacts on paleontological resources or unique geologic features.

Operation of Option 1 would not include ground-disturbing activities; thus, operation of Option 1 would not have the potential to directly result in the destruction of unique paleontological resources. Development of the Waterfront Destination Park under Option 1 would be infill development and would not provide access to unique geologic features; thus, the park would also not result in indirect impacts on unique geologic features. Therefore, operation of Option 1 would result in less-than-significant impacts and would not result in any additional or more severe impacts associated with impacts on paleontological or geologic resources than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, operation of the proposed PMPU, including within PD3, would not include ground disturbance and would not create access to previously undeveloped areas that could

provide opportunities for rock or fossil hunting. Thus, the proposed PMPU would not result in direct or indirect operational impacts on paleontological resources or unique geologic features.

Operation of Option 2 would not include ground-disturbing activities; thus, operation of Option 2 would not have the potential to directly result in the destruction of unique paleontological resources. The expanded Lane Field Setback Park under Option 2 would be infill development and would not provide access to unique geologic features; thus, the park would not result in indirect impacts on unique geologic features. Therefore, operation of Option 2 would result in less-than-significant impacts and would not result in any additional or more severe impacts associated with paleontological or geologic resources than the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, operation of the proposed PMPU, including within PD3, would not include ground disturbance and would not create access to previously undeveloped areas that could provide opportunities for rock or fossil hunting; thus, the proposed PMPU would not result in direct or indirect operational impacts on paleontological resources or unique geologic features.

Operation of Option 3 would not include ground-disturbing activities; thus, operation of Option 3 would not have the potential to directly result in the destruction of unique paleontological resources. The new park space that could be developed under Option 3 would be infill development and would not provide access to unique geologic features; thus, the park would not result in indirect impacts on unique geologic features. Therefore, operation of Option 3 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to paleontological or geologic resources than the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

The proposed PMPU does not include any policies that would result in potential impacts on a unique paleontological resource or site or a unique geological feature. Therefore, impacts would be less than significant.

Impact Determination and Mitigation

Construction activities associated with future development allowed under the proposed PMPU may result in the destruction of a unique paleontological resource or site or unique geologic feature.

Significant Impacts

Impact-GEO-1: Future Construction Activities Within PD1, PD3, PD8, PD9, and PD10 May Adversely Impact Unique Paleontological Resources. Planning Districts 1, 3, 8, 9 and 10 contain areas with the Bay Point Formation, which is known to contain sensitive paleontological resources and is assigned a high paleontological sensitivity. Ground disturbance of more than 1,000 cubic yards at a depth of 10 feet or greater within these locations from future construction activities allowed under the proposed PMPU would have the potential to result in a significant impact on unique paleontological resources or sites.

Mitigation Measures

For Impact-GEO-1

MM-GEO-1: Require Paleontological Sensitivity Screening and Monitoring in Areas of Sensitivity. ~~Future development allowed under the proposed PMPU~~ Prior to approval of a future project, shall be subject to a paleontological and geologic resource sensitivity screening as part of the application process for District approval analysis shall be performed. The paleontological resource sensitivity screening shall examine whether the proposed development would include ground disturbance with the potential to encounter undisturbed soils and whether the development is located on a site (or sites) underlain by Bay Point Formation, and meets one or more of the following conditions: (1) construction would involve ground disturbance of a fossil recovery site or within 100 feet of a mapped fossil recovery site, or (2) construction would require over 1,000 cubic yards of excavation and depth of excavation exceeding 10 feet. The Paleontological Sensitivity Screening analysis will be subject to the District's review and approval and no development shall proceed until the Paleontological Sensitivity Screening analysis is deemed acceptable to the District.

If the proposed development meets either or both of the above-stated criteria, the project proponent shall retain a Qualified Paleontologist, approved by the District, who shall conduct paleontological monitoring during all ground-disturbing activities. The paleontological monitoring required by this mitigation measure shall include the following measures:

- The project proponent shall retain a Qualified Paleontologist, approved by the District. A "Qualified Paleontologist" shall be defined as an individual (i) who has a M.S. or Ph.D. in paleontology, or geology, (ii) who also has demonstrated familiarity with paleontological procedures and techniques, (iii) who is knowledgeable in the geology and paleontology of San Diego County, and (iv) who has worked as a paleontological ~~mitigation project supervisor~~ monitor within the County of San Diego County for at least 1 year.
- The Qualified Paleontologist shall attend the preconstruction meeting(s) to consult with the grading and excavation contractors or subcontractors concerning excavation schedules, paleontological field techniques, and safety issues.
- The Qualified Paleontologist or Paleontological Monitor shall be on site, on a full-time basis, during ground-disturbing activities that occur 10 feet or more below ground surface, to inspect exposures for contained fossils. The Paleontological Monitor shall work under the direction of the project's Qualified Paleontologist. A "Paleontological Monitor" shall be defined as an individual selected by the Qualified Paleontologist who has experience in monitoring excavation and the collection and salvage of fossil materials.
- If fossils are discovered on a development site, the Qualified Paleontologist shall recover them and temporarily direct, divert, or halt grading to allow recovery of fossil remains.
- The Qualified Paleontologist shall be responsible for the cleaning, repairing, sorting, and cataloguing of fossil remains collected during the monitoring and salvage portion of the mitigation.
- The Qualified Paleontologist shall deposit and donate prepared fossils, along with copies of all pertinent field notes, photos, and maps, in a scientific institution with permanent paleontological collections, such as the San Diego Natural History Museum, approved by the District. Curation costs of the fossils shall be paid for by the project proponent.

- Within 30 days after the completion of excavation and pile-driving activities, a final data recovery report shall be completed by the Qualified Paleontologist and submitted to the District for review and approval. The final report shall document the results of the mitigation and shall include discussions of the methods used, stratigraphic section(s) exposed, fossils collected, and significance of recovered fossils.

Level of Significance After Mitigation

With implementation of **MM-GEO-1**, impacts on unique paleontological resources (**Impact-GEO-1**) would be reduced to a less-than-significant level because future site-specific projects would be required to screen for excavation quantities and paleontological sensitivity. The required monitoring of any ground-disturbing activities and the related paleontological resource recovery procedures would minimize the potential to affect a unique paleontological resource or site.

4.5.5 Cumulative Impact Analysis

A significant cumulative impact on geology and soils would result if the proposed PMPU would contribute to cumulative impacts related to exacerbating the potential for fault rupture, strong seismic ground shaking, ground failure, erosion, unstable soils, lateral spreading, subsidence, liquefaction, collapse, or expansive soils; or to the direct or indirect destruction of a unique paleontological resource or site or a unique geologic feature.

4.5.5.1 Geographic Scope

The geographic scope for cumulative impacts varies for geological resources and depends on the geologic issue. The geographic scope with respect to seismicity includes the proposed PMPU area and extends to adjacent areas, including three adjacent cities: Coronado, Imperial Beach, and San Diego. An earthquake within the cumulative geographic scope could cause substantial damage or injury throughout this area of bay and marine deposits and undocumented fill, which are prone to seismic-related geologic hazards. However, CEQA is concerned with a project's potential to exacerbate an existing environmental condition and, with a few exceptions, does not consider the existing condition's effects on the project to fall within its scope.

Projects that involve ground disturbance in intact, natural landforms have the potential to contribute to cumulative impacts on paleontological resources. The geographic scope with respect to paleontological resources includes the proposed PMPU area and the adjacent area, including the three member cities.

There is no potential for landslides, mudflows, and modification of topography or the direct or indirect destruction of unique geologic features because the proposed PMPU area is not subject to slope instability and contains no unique geologic features.

4.5.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Table 2-2 in Chapter 2, *Environmental Setting*, includes past, present, and probable future plans and programs in the vicinity of the proposed PMPU area. Future development under each of these plans and programs would potentially remove onsite soils unsuitable for development and replace them

with soils that are suitable, as required by applicable engineering regulations (i.e., city grading requirements) and best practices (i.e., recommendations from geotechnical investigations).

Past and present development has increased, and future development will increase, the infrastructure, structural improvements, and number of people working and/or living in the proposed PMPU area and adjacent cities, which has placed, and will continue to place, commercial, industrial, and residential structures, their occupants, and associated infrastructure in areas that are susceptible to seismic events. All the present and probable future projects listed in Table 2-2 would also result in increased infrastructure, structures, and number of people working and/or living in the cumulative geographic scope. However, none of these projects would be capable of exacerbating the potential for a geologic hazard given their limited impact on the area's geologic setting and the requirement to grade and compact soils in accordance with local and State laws, regulations, and standards designed to prevent soil-related geologic hazards from occurring. Consequently, the impacts of past, present, and probable future projects as they relate to exacerbating fault rupture, seismic ground shaking, and liquefaction would be less than cumulatively significant.

Present and probable future projects within the cumulative study area could damage or destroy paleontological resources during construction activities. For paleontological resources, previous historical urban development within the cumulative study area without proper professional assessment and systematic collection of data has resulted in the loss of potentially significant scientific data. More recent development has been carried out under Federal, State, and local regulations, with mitigation of significant impacts on such resources. However, because paleontological resources are non-renewable resources, the direct and indirect impacts of past, present, and probable future projects are cumulatively significant.

While there are no unique geologic features identified in the proposed PMPU area, present and probable future projects could damage or destroy unique geologic features in adjacent areas, which would be considered part of the cumulative study area. Damage could be direct due to construction activity or project design, or could be indirect, related to the creating access to a previously undeveloped area that increases visitation, potentially allowing for rock hunting. Because direct or indirect impacts could occur as a result of implementation of past, present or probable future projects, the impacts would be cumulatively significant.

4.5.5.3 Project Contribution

Geology and Soils

All future development associated with the proposed PMPU would be required to comply with the CBC and the applicable city's municipal code, which requires geotechnical evaluations prior to development (Chapter 18 of the CBC) that must contain an evaluation of active faults in the area, and recommendations for foundation type and design criteria that address issues as applicable, including seismic shaking, settlement, and liquefaction. Section 1803.1.1.3 of Chapter 18 of the CBC states that if a building department, or other appropriate enforcement agency, determines that recommended action(s) presented in the geotechnical evaluations are likely to prevent structural damage, the approved recommended action(s) must be made a condition to the building permit (Section 1803.1.1.3 of Chapter 18). Moreover, construction of future development allowed under the proposed PMPU would be required to adhere to the seismic safety requirements contained in the applicable city municipal code, which are updated periodically to incorporate the current version of the CBC. Compliance with these regulations would ensure that impacts associated with future

development allowed under the proposed PMPU that may directly or indirectly cause adverse effects from geologic hazards would be less than significant. When combined with the cumulative projects listed in Table 2-2, which would also be required to comply with the CBC and the applicable city's municipal code, the proposed project's contribution to a cumulative geology and soils impacts would not be cumulatively considerable. For the same reasons Options 1–3 would not be cumulatively considerable.

Unique Paleontological Resources or Sites and Unique Geologic Features

As discussed in Section 4.5.2.6, 112 fossil collection localities are present within a 0.25-mile radius of the proposed PMPU area; six of these are within the proposed PMPU area. Five of the eight planning districts contain geologic units that possess high paleontological sensitivity, and two of the eight are located within 100 feet of a documented fossil locality. Other unknown and unrecorded unique paleontological resources could be located within and adjacent to the proposed PMPU area. Therefore, any ground-disturbing construction activities could impact previously unidentified paleontological resources, resulting in the potential for permanent loss of a paleontological resource of regional or statewide significance. Grading and excavation associated with future construction activities would potentially expose subsurface paleontological resources. Any vertebrate fossils exposed by grading without appropriate professional, systematic recovery would be destroyed, and their ability to be preserved for future study would be lost. Therefore, without mitigation, the project's contribution to cumulative impacts on unique paleontological resources is considered cumulatively considerable for the proposed PMPU and Options 1–3 (**Impact-C-GEO-1**). However, with implementation of **MM-GEO-1**, construction-related impacts on unique paleontological resources would be reduced to a less-than-significant level because future site-specific projects would be required to screen for excavation quantities and paleontological sensitivity. As such, construction of future, site-specific developments allowed under the proposed PMPU would not result in a cumulatively considerable contribution to a significant cumulative impact on paleontological resources with mitigation. In addition, operation of those future projects would not result significant impacts on paleontological resources because operations would not involve ground-disturbing activities. Therefore, the proposed PMPU's contribution to cumulative paleontological resources impacts would not be cumulatively considerable with mitigation.

In addition, as noted under Section 4.5.6.2, there are no unique geologic features within the proposed PMPU area and, therefore, implementation of the proposed PMPU would not result in any direct or indirect impacts on these resources, and the proposed PMPU's contribution would not be cumulatively considerable.

4.5.5.4 Cumulative Impact Determination and Mitigation

Compliance with existing regulations and the implementation of **MM-GEO-1** by future development projects allowed under the proposed PMPU and Options 1–3 for unique paleontological resources or sites would reduce cumulative impacts (**Impact-C-GEO-1**) to a less-than-significant level. Because **MM-GEO-1** would avoid or reduce the loss of unique paleontological resources or sites and unique geologic features, the proposed PMPU's contribution to cumulative impacts would not be cumulatively considerable after mitigation.

Section 4.6

Greenhouse Gas Emissions and Energy

4.6.1 Overview

This section describes the existing conditions and regulatory setting for greenhouse gas (GHG) emissions and analyzes the proposed Port Master Plan Update's (PMPU's) consistency with (1) the San Diego Unified Port District's (District's) Climate Action Plan (CAP) reduction targets and regulatory programs outlined in the California Climate Change Scoping Plan and adopted by the California Air Resources Board (CARB) or other California agencies to reduce GHG emissions in 2030; and (2) the reduction targets set forth through California Executive Order (EO) S-03-05 and EO B-55-18 and plans, policies, promulgated to reduce GHG emissions post-2030. Additionally, this section describes the existing conditions and regulatory setting for energy systems that serve the proposed PMPU area and analyzes whether implementation of the proposed PMPU would (1) result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; and (2) conflict with or obstruct a state or local plan for renewable energy or energy efficiency. The supporting calculations and modeling of GHG emissions and energy consumption are provided in Appendix C.

Table 4.6-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.6.4.4, *Project Impacts and Mitigation Measures*.

Table 4.6-1. Summary of Significant Greenhouse Gas Emission Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-GHG-1: Inconsistency with the Statewide Reduction Target for 2030 (Project-Adjusted) and Goal for 2050	All	Implement MM-AQ-2 and MM-AQ-3 , and MM-AQ-6 through MM-AQ-12 . Implement MM-TRA-1 through MM-TRA-3 . MM-GHG-1: Secure All Electricity from Renewable Sources. MM-GHG-2: <u>Replace Fossil-Fueled Vehicles and Equipment with Zero Emission Purchase Alternative Fuel, Electric, or Hybrid Vehicles and Equipment</u>	Significant and Unavoidable	Mitigation would reduce PMPU-related GHG emissions and would achieve the efficiency metric; however, because it cannot be stated with certainty that the project would result in emissions that would represent a fair share of the requisite reductions towards the statewide carbon neutrality goal, impacts would remain significant and unavoidable.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-GHG-2: Conflict with Plans, Policies, and Regulations Adopted to Reduce GHG Emissions	All	Implement MM-AQ-2 and MM-AQ-3, and MM-AQ-6 through MM-AQ-12 . Implement MM-TRA-1 through MM-TRA-3 . Implement MM-GHG-1 and MM-GHG-2 .	Less than Significant	Mitigation would ensure consistency with plans, policies, and regulatory programs.
Impact-EN-1: Potential Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources	All	Implement MM-AQ-2, MM-AQ-3, MM-AQ-6, and MM-AQ-9 through MM-AQ-12 . Implement MM-GHG-1 and MM-GHG-2 .	Less than Significant	Mitigation would reduce construction and operational energy use, and therefore would reduce impacts to less than significant.
Impact-EN-2: Potential Inconsistency with Applicable Energy Use Reduction Plans	All	Implement MM-AQ-9, MM-AQ-10, MM-AQ-11, MM-AQ-12, and MM-GHG-2 .	Less than Significant	Mitigation measures would ensure compliance with renewable energy or energy efficiency plans, and therefore would reduce impacts to less than significant.
Impact-C-GHG-1: Inconsistency with the Statewide Reduction Targets for 2030 and 2050	All	Implement MM-AQ-2 and MM-AQ-3, and MM-AQ-6 through MM-AQ-12 . Implement MM-GHG-1 and MM-GHG-2 .	Less than Cumulatively Considerable	Mitigation would reduce PMPU-related GHG emissions and would achieve the reduction efficiency metric; however, because it cannot be stated with certainty that the project would result in emissions that would represent a fair share of the requisite reductions towards the statewide carbon neutrality goal, impacts would remain cumulatively considerable and unavoidable
Impact-C-GHG-2: Conflict with	All	Implement MM-AQ-2, MM-AQ-3, and MM-AQ-6 through MM-AQ-12 .	Less than Cumulatively Considerable	Mitigation would ensure consistency with plans, policies,

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Plans, Policies, and Regulations		Implement MM-GHG-1 and MM-GHG-2 .		and regulatory programs.
Impact-C-EN-1: Potential Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources	All	Implement MM-AQ-2, MM-AQ-3, MM-AQ-6, MM-AQ-9, MM-AQ-10, and MM-AQ-12. Implement MM-GHG-1 and MM-GHG-2 .	Less than Cumulatively Considerable	Mitigation would reduce construction and operational energy use, and therefore would reduce impacts to less than cumulatively considerable.
Impact-C-EN-2: Potential Inconsistency with Applicable Energy Use Reduction Plans	All	Implement MM-AQ-9 through MM-AQ-12. Implement MM-GHG-2 .	Less than Cumulatively Considerable	Mitigation measures would ensure compliance with renewable energy or energy efficiency plans, and therefore would reduce impacts to less than cumulatively considerable.

4.6.2 Existing Conditions

This section provides a discussion of the existing understanding of global climate change and discusses GHG emissions and sources within the proposed PMPU area. A discussion of the State's energy resource portfolio and the energy utility provider serving the proposed PMPU area is also provided. Section 4.6.2.1 summarizes the effects of climate change globally and within the proposed PMPU area. Section 4.6.2.2 describes principal GHG pollutants of concern. Section 4.6.2.3 summarizes relevant GHG inventories, including the District's. Section 4.6.2.4 summarizes the GHG emissions setting by Planning District. Section 4.6.2.5 describes the State's energy resources and annual consumption by resource sector along with the annual electricity and natural gas supplied by the energy utility provider serving the proposed PMPU area.

4.6.2.1 Climate Change

The process known as the *greenhouse effect* keeps the atmosphere near the Earth's surface warm enough for the successful habitation of humans and other life forms. GHGs include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), perfluorinated carbons (PFCs), sulfur hexafluoride (SF₆), and hydrofluorocarbons (HFCs), in addition to water vapor. These six gases are also identified as GHGs in Section 15364.5 of the California Environmental Quality Act (CEQA) Guidelines.

Sunlight in the form of infrared, visible, and ultraviolet light passes through the atmosphere. Some of the sunlight striking the Earth is absorbed and converted to heat, which warms the surface. The

surface emits infrared radiation to the atmosphere, where some of it is absorbed by GHGs and re-emitted toward the surface. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and amplifying the warming of the Earth (Center for Climate and Energy Solutions 2011).

Increases in fossil fuel combustion and deforestation have exponentially increased concentrations of GHGs in the atmosphere since the Industrial Revolution. Rising atmospheric concentrations of GHGs in excess of natural levels enhance the greenhouse effect, which contributes to global warming of the Earth's lower atmosphere. This warming induces large-scale changes in ocean circulation patterns, precipitation patterns, global ice cover, biological distributions, and other changes to the Earth system that are collectively referred to as *climate change*. Impacts of climate change are felt on a global scale and are expected to manifest in different ways in different locations depending on local and regional factors, such as topography, regional climate, ocean circulation, and land uses. In California, climate change is forecasted to result in the following effects: reduction in water supply and significant loss of snow pack; sea level rise resulting in coastal erosion and seawater intrusion; increased average temperatures including more extreme heat days per year; exacerbation of air quality problems including more high ozone days; increased vulnerability of forests due to pest infestation and higher temperatures; more large forest fires; more drought years; increased challenges for the State's important agricultural industry due to water shortages, increasing temperatures, and saltwater intrusion; increased electricity demand, particularly in the hot summer months; damage to marine ecosystems and the natural environment including acidification of the oceans due to increased CO₂ levels (including coral bleaching); and increased incidences of infectious diseases, asthma, and other human health related problems.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs). Criteria air pollutants and TACs occur locally or regionally, and local concentrations respond to locally implemented control measures. However, the long atmospheric lifetimes of GHGs allow them to be transported great distances from sources and become well mixed, unlike criteria air pollutants, which typically exhibit strong concentration gradients away from point sources. GHGs and global climate change represent cumulative impacts; that is, GHG emissions contribute, on a cumulative basis, to the significant adverse environmental impacts of global climate change.

4.6.2.2 Principal Greenhouse Gases

The GHGs listed by the Intergovernmental Panel on Climate Change (IPCC) (CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆) (IPCC 2014) are discussed in this section in order of abundance in the atmosphere, and the principal characteristics surrounding these pollutants are discussed below. California law and the State CEQA Guidelines contain a similar definition of GHGs (Health and Safety Code Section 38505(g); 14 California Code of Regulations Section 15364.5). Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic (human-made) sources. Consequently, the primary GHGs of concern associated with the proposed PMPU are CO₂, CH₄, and N₂O. Note that HFCs, and SF₆, and PFCs are not discussed because those gases are primarily generated by manufacturing processes, which are not anticipated as part of the proposed PMPU.

- **Carbon Dioxide (CO₂)** enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, respiration, and also as a result of other

chemical reactions (e.g., manufacture of cement). CO₂ is also removed from the atmosphere (or “sequestered”) when it is absorbed by plants as part of the biological carbon cycle.

- **Methane (CH₄)** is emitted during the production and transport of coal, natural gas, and oil. CH₄ also results from livestock and other agricultural practices and by the decay of organic waste in municipal solid waste landfills.
- **Nitrous Oxide (N₂O)** is emitted during agricultural and industrial activities, as well as during combustion of fossil fuels and solid waste.

Methods have been set forth to describe emissions of GHGs in terms of a single gas to simplify reporting and analysis. The most commonly accepted method to compare GHG emissions is the GWP methodology defined in the IPCC reference documents. IPCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of carbon dioxide equivalent (CO₂e), which compares the gas in question to that of the same mass of CO₂ (which has a GWP of 1 by definition). The GWP values used in this report are based on the IPCC Fourth Assessment Report (AR4) and United Nations Framework Convention on Climate Change reporting guidelines and are defined in Table 4.6-2 (IPCC 2007). The AR4 GWP values are used in CARB’s 2018 California GHG inventory and CARB’s 2017 Scoping Plan Update, as well as in the District’s GHG emissions inventory (CARB 2021a, 2017a; District 2018a). Table 4.6-2 lists the GWP of CO₂, CH₄, and N₂O.

Table 4.6-2. Global Warming Potentials of Key GHGs

Gas	GWP (100 years)
CO ₂	1
CH ₄	25
N ₂ O	298

Sources: CARB 2020b.

GWP = global warming potential; CO₂ = carbon dioxide; CH₄ = methane; N₂O = nitrous oxide.

All GWPs used for CARB’s GHG inventory and to assess attainment of the State’s reduction targets are considered over a 100-year timeframe (as shown in Table 4.6-2). However, CARB recognizes the importance of short-lived climate pollutants and reducing these emissions to achieve the State’s overall climate change goals. Short-lived climate pollutants have atmospheric lifetimes on the order of a few days to a few decades, and their relative climate forcing impacts, when measured in terms of how they heat the atmosphere, can be tens, hundreds, or even thousands of times greater than that of CO₂ (CARB 2017a).

Recognizing their short-term lifespan and warming impact, short-lived climate pollutants are measured in terms of CO₂e using a 20-year time period. The use of GWPs with a time horizon of 20 years better captures the importance of the short-lived climate pollutants and gives a better perspective on the speed at which emission controls will impact the atmosphere relative to CO₂ emission controls. The *Short-Lived climate Pollutant Reduction Strategy*, which is discussed in Section 4.6.3, *Laws, Regulations, Plans, and Policies*, addresses methane, hydrofluorocarbon gases, and anthropogenic black carbon. Methane has a lifetime of 12 years and a 20-year GWP of 72. Hydrofluorocarbon gases have lifetimes of 1.4 to 52 years and a 20-year GWP of 437 to 6,350. Anthropogenic black carbon has a lifetime of a few days to weeks and a 20-year GWP of 3,200 (CARB 2017a).

4.6.2.3 Greenhouse Gas Inventories

International, National, Statewide, and Regional GHG Emissions

A GHG inventory is a quantification of all GHG emissions and sinks¹ within a selected physical and/or economic boundary. GHG inventories can be performed on a large scale (e.g., for global and national entities) or on a small scale (e.g., for a particular building or person). Although many processes are difficult to evaluate, several agencies have developed tools to quantify emissions from certain sources.

Table 4.6-3 outlines the most recent global, national, statewide, and regional GHG inventories to help contextualize the magnitude of potential PMPU-related emissions. GHG inventories from member cities are included.

Table 4.6-3. Global, National, State, and Regional GHG Emissions Inventories

Emissions Inventory	CO₂e (metric tons)
2010 IPCC Global GHG Emissions Inventory	52,000,000,000
2019 EPA National GHG Emissions Inventory	6,558,300,000
2019 CARB State GHG Emissions Inventory	418,200,000
2012 SANDAG Regional GHG Emissions Inventory	34,670,000
2016 SANDAG Regional GHG Emissions Inventory (Draft)	26,000,000
2019 City of San Diego GHG Emissions Inventory	9,600,000
2014 City of Chula Vista GHG Emissions Inventory	1,249,503
2012 City of Imperial Beach GHG Emissions Inventory	96,400
2005 City of National City GHG Emissions Inventory	550,714
2016 City of Coronado GHG Emissions Inventory	112,801
2016 District GHG Emissions Inventory	504,554

Sources: IPCC 2014; EPA 2021; CARB 2021a; SANDAG 2015, 2021; City of San Diego 2020; City of Chula Vista 2018; City of Imperial Beach 2019; City of National City 2011; City of Coronado 2021; District 2018b.

CO₂e = carbon dioxide equivalent; IPCC = Intergovernmental Panel on Climate Change; EPA = United States Environmental Protection Agency; CARB = California Air Resources Board; SANDAG = San Diego Association of Governments.

Like the Federal and State governments, the District conducts periodic GHG inventories to assess its progress in reducing emissions and meeting its climate change goals. Sources throughout the proposed PMPU area that generate GHG emissions include tenant facilities (e.g., hotels, marinas, boatyards), maritime activity (e.g., the movement of goods and people associated with marine terminal operations), and Port operations (e.g., District-owned building energy consumption and fleet activity).

The District adopted a CAP in 2013 that established a plan and framework for achieving a 10 percent decrease in GHG emissions from a 2006 baseline, by 2020. The CAP also established a longer-term GHG reduction goal to reduce GHG emissions by 25 percent from a 2006 baseline, by 2035. The CAP contains a suite of GHG reduction strategies to meet the 2020 target and demonstrate progress toward the 2035 goal.

¹A GHG sink is a process, activity, or mechanism that removes a GHG from the atmosphere.

The District recently completed an emissions inventory for 2016 calendar year conditions. In addition, since the adoption of the CAP, more refined data and updated methodologies have become available to estimate GHG emissions. CARB guidance states that it is good practice to recalculate historic emissions when methods are changed or refined (CARB 2017a). Given this, a recalibration of the 2006 baseline was deemed vital to track progress toward 2020 goals. This 2006 recalibration was included in the District's 2016 updated inventory, which was based on more locally specific and comprehensive datasets.

Table 4.6-4 provides a comparison of the recalibrated 2006 baseline and emissions generated during 2016. As shown, GHG emissions in 2016 are lower than the revised 2006 baseline. This decrease in emissions is due to several factors, including reduced Ocean-Going Vessel (OGV) calls and berthing duration, increased on-road vehicle fuel economy, decreased natural gas consumption, and a decrease in the SDG&E electricity emission factor due to the increase in renewable generations under the State Renewable Portfolio Standard.

Note that Table 4.6-4 includes adjustments to capture changes since the 2016 CAP Progress Report was released. Specifically, in the 2016 CAP Progress Report, GHG emissions associated with natural gas consumption from sources regulated by CARB, under the Cap-and-Trade program, was assumed to be 114,847 MTCO₂e. However, that reporting was based on 2015, since 2016 was not available at the time. Further, the 2015 reporting included a permitted facility that was not regulated by CARB, under Cap-and-Trade. The revised estimates provided in Table 4.6-4 include actual 2016 reporting for the CARB Regulated Source (CP Kelco) and adds the natural gas-related emissions that were erroneously assigned to CARB Regulated Sources back to tenant uses. Goal setting is based on the 2006 and 2016 emission estimates, without the CARB Regulated Sources. As shown in Table 4.6-4 below, GHG emissions were reduced by approximately 18 percent from 2006 to 2016.

Note that apportioning emissions into planning districts, based on the activities within each planning district, may be misleading because some of the larger emission categories, such as on-road (passenger vehicles), tenant electricity, tenant natural gas, and water and solid waste, do not occur solely within specific areas of the Port (e.g., vehicles travel between and through planning districts).

4.6.2.4 Planning District Setting

Activity throughout the proposed PMPU area generates GHG emissions. Each of the planning districts has a combination of unique emission sources, resulting in varying emission levels throughout the PMPU area. The proposed PMPU area comprises approximately 3,535 acres of water and 2,403 acres of land in and around the San Diego Bay and along the Imperial Beach oceanfront. For example, emission sources within the proposed PD4 include OGVs, locomotives, automotive repair and transport activities, and painting operations, whereas emission sources within the PD8 are limited to recreational-based activities (e.g., public parks, beach access parking lots). Water and land uses with key emission sources by planning district are shown in Table 4.6-5. Each planning district results in mobile source and electricity emissions and, as such, each involves the primary GHGs of concern, including CO₂, CH₄, and N₂O.

Table 4.6-5. Water and Land Uses and Emission Sources by Planning District

Planning District	Water and Land Uses	Emission Sources and Emission Types
PD1: Shelter Island	Hotels, restaurants, yacht- or marine-related businesses, fishing piers, boat launches	Motor vehicles Building utilities Recreational and fishing vessels
PD2: Harbor Island	Hotels, restaurants, yacht- or marine-related businesses, airport parking, auto repair facilities, rental car facilities, Harbor Police, District headquarters	Motor vehicles Building utilities Recreational and fishing vessels District-owned equipment and vessels
PD3: Embarcadero	Hotels, restaurants, retail, museum, marine-related businesses, fishing piers, Convention Center, public	Motor vehicles Building utilities Recreational and fishing vessels

Planning District	Water and Land Uses	Emission Sources and Emission Types
	parks, cruise ship terminal, manufacturing	Maritime (vessels, equipment, and shore power) Manufacturing
PD4: Working Waterfront	Industrial warehouses and open storage, cold storage facilities, rail, marine shipping, fishing piers, public parks, ship building and repair	Shipyards electricity and equipment Maritime (vessels, equipment, and shore power) Rail Motor vehicles and terminal trucks
PD7: South Bay	Open space wetland and natural vegetation, marshy habitat conservation area, salt evaporation ponds	No emissions Net benefit of carbon sequestration
PD8: Imperial Beach Oceanfront	Beach, public parks, open water	Motor vehicles
PD9: Silver Strand	Beach, public parks, open water, hotel, restaurants, yacht- or marine-related businesses	Motor vehicles Building utilities Recreational and fishing vessels
PD10: Coronado Bayfront	Hotels, restaurants, retail, public parks, ferry landing, golf course, yacht- or marine-related businesses	Motor vehicles Building utilities Recreational and fishing vessels

4.6.2.5 Energy

California has a diverse portfolio of energy resources that produced 2,449.4 trillion British thermal units² (BTUs) in 2019 (U.S. Energy Information Administration 2019).³ Excluding offshore areas, the state ranked third in the nation in crude oil production in 2019, producing the equivalent of 920.1 trillion BTUs of energy. The state also ranked first in the nation for energy production from renewable resources (U.S. Energy Information Administration 2021a). Other energy sources in the state include natural gas (220.8 trillion BTUs), nuclear (168.8 trillion BTUs), wood and waste (139.3 trillion BTUs), and biofuels (31.4 trillion BTUs) (U.S. Energy Information Administration 2019).⁴

According to the U.S. Energy Information Administration, California consumed approximately 7,802 trillion BTUs of energy in 2019. Per capita energy consumption (i.e., total energy consumption divided by the population) in California is the lowest in the country, with 198 million BTU in 2019, which ranked 50th among all states. Natural gas accounted for the majority of energy consumption (28.3%), followed by motor gasoline (21.6%), renewable energy, including nuclear electric power, hydroelectric power, biomass, and other renewables (18.5%); distillate and jet fuel (14.9%), interstate electricity (8.8%), with the remaining 7.9 percent coming from a variety of other sources (U.S. Energy Information Administration 2021b). The transportation sector consumed the highest

² One BTU is the amount of energy required to heat 1 pound of water by 1°F at sea level. BTU is a standard unit of energy that is used in the United States and is on the English system of units (foot-pound-second system).

³ Note that 2018 data are the most recent available.

⁴ No coal production occurs in California; however, imported coal made up approximately 3% of California's energy mix as of 2019. SDG&E, the energy provider for the San Diego region, does not have any coal in its energy mix as of 2019 (CEC 2019a).

quantity of energy (39.4%), followed by the industrial (23.1%), commercial (18.8%), and residential (18.7%) sectors (U.S. Energy Information Administration 2021b).

Per capita energy consumption, in general, is declining due to improvements in energy efficiency and design. However, despite this reduction in per capita energy use, the state's total overall energy consumption (i.e., non-per capita energy consumption) is expected to increase over the next several decades due to overall growth in population, jobs, and vehicle travel. For example, annual electricity demand is anticipated to grow by about 1.59 percent from the year 2016 to 2030 (CEC 2018).

San Diego County is served by San Diego Gas and Electric (SDG&E), which provides energy service to over 3.6 million customers (i.e., 1.4 million accounts) in the county and portions of southern Orange County (SDG&E n.d.). The utility has a diverse power production portfolio, composed of a variety of renewable and non-renewable sources. Energy production typically varies by season and by year. Regional electricity loads also tend to be higher in the summer because the higher summer temperatures drive increased demand for air-conditioning. In contrast, natural gas loads are higher in the winter because the colder temperatures drive increased demand for natural gas heating.

Table 4.6-6 outlines the SDG&E power mix in 2020 compared to the power mix for the state). In 2019, the most recent year of data, SDG&E customers used 20,481 gigawatt hours of electricity and 534 million therms of natural gas (CEC 2019b). Customers used 21,157 gigawatt hours of electricity and 482 million therms of natural gas (CEC 2019b). Table 4.6-7 outlines the breakdown of electricity and natural gas usage by sector in the SDG&E service area. Residential and commercial uses account for 89 percent of electricity use and 94 percent of natural gas use within the SDG&E service area (CEC 2021).

Table 4.6-6. SDG&E and the State of California Power Mix in 2020 (percent)

Energy Resources	SDG&E Power Mix	California-Wide Power Mix
Eligible Renewables	31.0	33.1
<i>Biomass and Waste</i>	<i>2.1</i>	<i>2.5</i>
<i>Geothermal</i>	<i>0</i>	<i>4.9</i>
<i>Small hydroelectric</i>	<i>0</i>	<i>1.4</i>
<i>Solar</i>	<i>17.9</i>	<i>13.2</i>
<i>Wind</i>	<i>11.0</i>	<i>11.1</i>
Coal	0	2.7
Large Hydroelectric	1.7	12.2
Natural Gas	26.2	37.1
Nuclear	0.2	9.3
Other	0	0.2
Unspecified Sources of Power ¹	40.9	5.4
Total	100	100

GWh = gigawatt hours

4.6.3 Laws, Regulations, Plans, and Policies

The State of California has adopted various pieces of legislation addressing various aspects of climate change, GHG mitigation, energy efficiency, and climate change. Much of this establishes a broad framework for the State's long-term GHG and energy reduction goals and climate change adaptation program. The former and current governors of California have also issued several EOs related to the State's evolving climate change policy. Moreover, court rulings have helped define acceptable practices for adequate analysis of GHG emissions under CEQA, including setting thresholds, properly defining a level of significance, and identifying mitigation measures. The key regulations, laws, and policies that are relevant to the proposed PMPU are summarized below. Additional information pertaining to GHG emission reduction, fuel economy, and energy efficiency is included in Section 4.2, *Air Quality and Health Risk*.

4.6.3.1 International

International Maritime Organization International Convention for the Prevention of Pollution from Ships Annex VI and Initial IMO Strategy for GHG Reductions

The International Maritime Organization (IMO) amended Annex VI in 2011 to include fuel economy and GHG requirements. The new Chapter 4 of Annex VI includes requirements for energy efficiency for ships and makes mandatory the Energy Efficiency Design Index for new ships, and the Ship Energy Efficiency Management Plan for all ships. The regulations apply to all ships of 400 gross tonnage and became effective January 1, 2013, with certain exceptions. These regulations are in effect today. In April 2018, IMO adopted an Initial IMO Strategy on reduction of GHG emissions from ships. The Initial IMO Strategy aims to reduce the total annual GHG emissions from international shipping by at least 50 percent by 2050 compared to 2008 while pursuing efforts towards phasing GHGs out entirely. The Initial IMO Strategy lays out a list of short-, mid-, and long-term candidate measures to achieve these GHG reduction goals.

4.6.3.2 Federal

There is currently no overarching Federal law specifically related to climate change or the reduction of GHG emissions. During the Obama administration, the U.S. Environmental Protection Agency (EPA) began developing GHG regulations under the Federal Clean Air Act (CAA). The Biden administration has restarted some of these efforts, including rejoining the Paris agreement, formally establishing a goal of achieving net-zero emissions, economy-wide, by no later than 2050, and establishing the Office of Climate Change and Health Equity (OCCHE); however, no Federal law is in effect at this time. At the state level, California has adopted broad statewide legislation to address various aspects of climate change and GHG emissions.

The EPA has issued an endangerment finding and cause or contribute finding for six key well-mixed GHGs—CO₂, CH₄, N₂O, HFC, PFC, and SF₆. The EPA has also issued the Greenhouse Gas Reporting Rule, which sets CO₂-based permitting criteria for certain industrial facilities. The Obama administration developed the Clean Power Plan in August 2015 to reduce CO₂ emission from electric power generation by 32 percent within 25 years, relative to 2005 levels. However, on February 9, 2016, the Supreme Court stayed implementation of the Clean Power Plan pending judicial review, which is still ongoing as of this analysis. As discussed in Section 4.2, the National Highway Traffic Safety Administration (NHTSA) and EPA have also proposed limits on future light-duty vehicle emission standards via the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule. However, repeal of the SAFE Rule is currently underway.

Energy Policy Act of 2005

The Energy Policy Act of 2005 was intended to establish a comprehensive, long-term energy policy and is implemented by the U.S. Department of Energy. The Energy Policy Act addresses energy production in the U.S., including oil, gas, coal, and alternative forms of energy, and energy efficiency and tax incentives. Energy efficiency and tax incentive programs include credits for the construction of new energy-efficient homes, production or purchase of energy-efficient appliances, and loan guarantees for entities that develop or use innovative technologies that avoid the production of GHGs.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act, enacted by Congress in 2007, is designed to improve vehicle fuel economy and help reduce the United States dependence on foreign oil. It expands the production of renewable fuels, reducing dependence on oil, and confronting climate change. Specifically, it does the following:

- Increases the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard, requiring fuel producers to use at least 36 billion gallons of biofuel in 2022, which represents a nearly five-fold increase over current levels.
- Reduces United States demand for oil by setting a national fuel economy standard of 35 miles per gallon (mpg) by 2020 – an increase in fuel economy standards of 40 percent.

The Energy Independence and Security Act of 2007 also set energy efficiency standards for lighting (specifically light bulbs) and appliances. Development would also be required to install photosensors and energy-efficient lighting fixtures consistent with the requirements of 42 United States Code (USC) Section 17001 et seq.

4.6.3.3 State

California has established various regulations, laws, and policies to address GHG emissions, which also indirectly result in a reduction of energy. The most relevant of these regulations are described below.

Executive Orders

There are three primary EOs issued by the Executive Branch of the State of California related to the State's GHG reduction goals. EOs apply to State government operations but are not law and do not apply to non-government entities and facilities.

EO S-03-05

This EO established GHG-reduction targets for 2010 (2000 emission levels), 2020 (1990 emission levels), and 2050 (80 percent below 1990 levels).

EO S-30-15

This EO established a GHG reduction target for 2030 (40 percent below 1990 levels).

EO B-55-18

This EO established a new statewide goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." While this EO has not been codified in law, the EO directs CARB to ensure future Climate Change Scoping Plans (discussed below) identify and recommend measures to achieve the carbon neutrality goal.

Legislative Reduction Targets

In an effort to implement the EOs through State law, the State has passed legislation that establishes a broad framework for the long-term GHG reduction and climate change adaptation program at the State level. The two primary bills related to GHG reduction targets are as follows:

Assembly Bill 32

Assembly Bill (AB) 32 codified the 2020 reduction target of EO S-03-05 (i.e., by 2020, reach the GHG emissions levels of 1990). AB 32 also gave CARB authority to develop a plan that describes the approach California will take to achieve GHG reduction targets. CARB's plan to achieve the 2020 reduction target is referred to as the Scoping Plan. In 2016, the State of California achieved its 2020 GHG emission reduction targets as emissions fell below 431 million metric tons (MMT) of CO₂e. The annual 2030 statewide target emissions level is 260 MMT of CO₂e.

Senate Bill 32

Senate Bill (SB) 32 codified the 2030 reduction target of EO B-30-15 (i.e., by 2030, reach statewide GHG emission levels of 40 percent below 1990 levels). As part of SB 32, CARB updated the Scoping Plan to achieve the 2030 reduction target in 2017. With implementation of the 2017 Scoping Plan, regulated GHG emissions are projected to decline to 260 MMT of CO₂e per year by 2030.

Statewide Reduction Plans

CARB has various air quality and climate goals and various plans for achieving these goals, including attaining and maintaining air quality standards, achieving GHG reductions, reducing petroleum use, reducing community health risks from exposure to air pollution, and increasing renewable energy and energy efficiency.

AB 32 Scoping Plan

The AB 32 Scoping Plan identifies specific measures to reduce GHG emissions to 1990 levels by 2020 and requires CARB and other State agencies to develop and enforce regulations and other initiatives to reduce GHG emissions. The AB 32 Scoping Plan, first adopted in 2008, comprises the State's roadmap for meeting AB 32's reduction target. Specifically, the scoping plan articulates a key role for local governments by recommending that they establish GHG emissions-reduction goals for both their municipal operations and the community that are consistent with those of the State (i.e., approximately 15 percent below current levels) (CARB 2008). The AB 32 Scoping Plan was updated in 2014 to reflect the economic downturn (CARB 2014).

2017 Scoping Plan Update

The 2017 Scoping Plan Update represents the State's roadmap to achieving long-term GHG reduction targets of SB 32. The Scoping Plan itself integrates various CARB regulations and strategies, including Cap-and-Trade, Low Carbon Fuel Standard (LCFS), SB 350, Sustainable Freight Action Plan, Mobile Source Strategy, and the Short-Lived Climate Pollutant (SLCP) Strategy. The Scoping Plan Update proposes meeting the 2030 goal by accelerating the focus on zero and near-zero technologies for moving freight, continued investment in renewables, greater use of low-carbon fuels including electricity and hydrogen, stronger efforts to reduce emissions of short-lived climate pollutants (CH₄, black carbon, and fluorinated gases), further efforts to create walkable communities with expanded mass transit and other alternatives to traveling by car, continuing the cap-and-trade program, and ensuring that natural lands become carbon sinks to provide additional emissions reductions and flexibility in meeting the target. The Scoping Plan Update also recommends that local governments aim to achieve community-wide efficiency of 6 metric tons (MT) CO₂e per capita by 2030 and 2 MTCO₂e per capita by 2050 in local climate action planning (CARB 2017a).

Reduction measures in the Scoping Plan are grouped into the following end-use sectors: Agriculture, Commercial and Residential, Electric Power, High GWP, Industrial, Recycling and Waste, and Transportation.

2022 Scoping Plan

On September 16, 2022, the state legislature passed AB 1279, which codified this carbon neutrality goal for the state of achieving carbon neutrality and an 85 percent reduction in 1990 emissions level by 2045. On December 16, 2022, CARB adopted the *Final 2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan), which assesses progress towards achieving the SB 32 2030 target and lays out a path to achieve carbon neutrality no later than 2045 as called for in AB 1279. The actions and outcomes in the 2022 Scoping Plan aim to achieve significant reductions in fossil fuel combustion by deploying clean technologies and fuels, further reductions in short-lived climate pollutants, support for sustainable development, increased action on natural and working lands to reduce emissions and sequester carbon, and the capture and storage of carbon. Moreover, Appendix

D of the 2022 Scoping Plan includes recommended actions for local governments to implement through the CEQA and climate action planning process to ensure local actions align with the State's climate goals (CARB 2022a and CARB 2022b).

California Sustainable Freight Action Plan

The Sustainable Freight Action Plan provides an integrated action plan that establishes clear targets to improve freight efficiency, transition to zero-emission technologies, and increase the competitiveness of California's freight system. The Sustainable Freight Action Plan was developed by several State agencies and is a recommendation document that integrates investments, policies, and programs across several State agencies to help realize a singular vision for California's freight transport system. The Sustainable Freight Action Plan provides a recommendation on a high-level vision and broad direction to the Governor to consider for State agencies to utilize when developing specific investments, policies, and programs related to the freight transport system that serves California's transportation, environmental, and economic interest. The Scoping Plan incorporates potential actions from the Sustainable Freight Action Plan that provide GHG emissions reduction benefits,

Mobile Source Strategy

CARB developed the Mobile Source Strategy to provide an integrated action plan that establishes an integrated planning perspective and common vision for transforming the mobile sector. The Mobile Source Strategy supports multiple planning efforts, including the State Implementation Plans, the Scoping Plan, the Short-Lived Climate Pollutant Reduction Strategy (discussed below), and the Sustainable Freight Action Plan (discussed above). The Mobile Source Strategy outlines CARB's approach to reducing emissions from mobile sources. The Strategy includes actions to modernize and upgrade transportation infrastructure, enhance system-wide efficiency and mobility options, and promote clean economic growth. The Mobile Source Strategy is updated every 5 years. The latest update is the 2020 Draft Mobile Source Strategy, which was released for public review in November 2020 and revised based on public comments received in May 2021. CARB is anticipated to approve and adopt the revised 2020 Draft Mobile Source Strategy during a public meeting on October 29, 2021. (CARB 2021b).

While the concepts in the Draft Mobile Source Strategy will continue to be developed and translated into CARB planning documents over the coming years, CARB has emphasized that they aim to maximize the use of zero-emission technology to achieve emission reductions of GHGs along with criteria pollutants and air toxics. In 2020 Draft Mobile Source Strategy, various concepts for all mobile source categories are assumed. The concepts that are applicable to the proposed PMPU are summarized in Table 4.6-8. CARB notes that even with extremely aggressive electrification and accelerated turnover, coupled with aggressive vehicle miles traveled (VMT) reductions and fuel decarbonization, the mobile source sector alone cannot become carbon neutral by 2045.

Tale 4.6-8. Applicable Mobile Source Strategy Concepts

Category	Source	Scenario Assumptions
On-road	Light Duty Vehicles	70% ZEV + PHEV sales in 2030. 100% ZEV + PHEV sales in 2035. 7.9 M ZEV by 2030. 27.9 M ZEV+PHEV by 2045.
	VMT	15% reduction in statewide per capita GHG by 2050 compared to BAU.
	On Road Motorcycles	Alignment with EU5 standard for model year Y2024+ motorcycles. 100% ZEM sales in 2035 and onward.
	Medium-Duty Vehicles	100% ZEV sales starting 2035.
	Heavy Duty Vehicles	Reflect heavy duty Omnibus, Advanced Clean Trucks, and Heavy-Duty Inspection and Maintenance Program starting in 2024, and Federal 0.02 g/bhp-hr starting in 2027. 100% of model year 2035 and newer vehicles registered in California will be ZEV. Accelerated turnover of older trucks.
Off-Road	Off-Road Efficiency Improvement	Zero emissions and hybridization where feasible with the goal of 12% reduction in GHG by 2030 and 30% by 2040.
	Off-Road Tier V Standard	Tier 5 being introduced starting in 2028–2030. 50–90% NOx reduction from current Tier 4 Final standard, and approximately 25% reduction in fuel consumption.
	Rail	100% of replaced locomotives will be Tier 4. Remanufacturing limit. Tier 5 being introduced in 2028.
	Ocean-Going Vessels	100% of Tier 0/1/2 visits are phased out by 2031. Tier 3 visits begin in 2025 (begin replacing all Tier 0–2). Tier 4 visits begin in 2028 (no additional Tier 3 visits).
	Construction	Full turnover of Tier 0/1/2 to Tier 4f by 2033.
	Small Off-Road Engines	100% of new sales will be zero-emission equipment (ZEE) by 2024 (2028 for generators).
	Transport Refrigeration Units	Accelerated penetration of electric TRU (from 10% in 2024 to 100% in 2034).
	Commercial Harbor Craft	All vessels (including commercial fishing) being Tier 4/5 by 2031. Introduction of plug-in hybrid for excursions and diesel-electric for tugs by 2030.
	Cargo Handling Equipment	Begin transition to full electric operation beginning in 2026 (accelerated turnover).
	Forklifts	Transition to zero-emission technology starting in 2025 with fully electric fleet by 2034.
	Recreational Watercraft	New THC + NOx standards of 40 and 70% below current levels. Electrification of small outboard and personal watercraft engines.

Source: CARB 2021c.

Note: Table does not include non-applicable categories, such as aircraft, airport ground support equipment, and agriculture equipment.

BAU = business as usual; ZEV = zero-emission vehicles; PHEV = plug-in hybrid electric vehicles; GHG = greenhouse gases; bhp-hr = brake horsepower hour; ZEM = zero-emission motorcycles; NOx = nitrogen oxides; THC = total hydrocarbons; TRU = transport refrigeration units; EU5 = Euro 5 emissions standards.

Short-Lived Climate Pollutant Reduction Strategy

SB 605 directed CARB, in coordination with other State agencies and local air districts, to develop a comprehensive Short-Lived Climate Pollutant (SLCP) Reduction Strategy. SB 1383, adopted in 2013, requires CARB to develop and implement a SLCP Reduction Strategy with the following 2030 goals: 40 percent reduction in methane, 40 percent reduction in hydrofluorocarbon gases, and 50 percent reduction in anthropogenic black carbon. The bill also establishes the following targets for reducing organic waste in landfills and CH₄ emissions from dairy and livestock operations: 50 percent reduction in organic waste disposal from the 2014 level by 2020, 75 percent reduction in organic waste disposal from the 2014 level by 2025, and 40 percent reduction in CH₄ emissions from livestock manure management operations and dairy manure management operations below the dairy sector's and livestock sector's 2013 levels by 2030.

Per its directive, CARB adopted the SLCP Strategy in March 2017, establishing a path to decrease SLCPs from various sectors of the economy. Strategies span from wastewater and landfill practices and methane recovery to reducing natural gas leaks and consumption. The SLCP strategy also identifies measures that can reduce HFC emissions through incentive programs and limitations on the use of high-GWP refrigerants in new refrigeration and air-conditioning equipment (CARB 2017b).

Draft 2030 Natural and Working Lands Implementation Plan

In a joint, interagency effort, the California Environmental Protection Agency (CalEPA), California Department of Food and Agriculture (CDFA), California Natural Resources Agency (CNRA), CARB, and California Strategic Growth Council released the *Draft California 2030 Natural and Working Lands Climate Change Implementation Plan* (Draft Plan), in January 2019 (CARB 2019a). The Draft Plan is specific to the natural and working lands sector, which includes farmland, rangeland, forests, grasslands, wetlands, riparian areas, seagrass, and urban green space. The Draft Plan addresses the carbon flux from this sector, including the ever-dynamic changes in both GHG emissions and carbon sequestration associated with the management of these lands, and includes reduction of GHGs and black carbon from forest fires and fire management. The Draft Plan serves as a multidisciplinary approach to conserve and maintain a resilient natural and working lands sector that will gradually shift the natural and working lands sector from being a net carbon emitter to being a net carbon sink, while also improving air quality, water quality, wildlife habitat, and recreation, and providing other benefits.

The Draft Plan sets goals for, at a minimum, increasing the rate of State-funded soil conservation practices fivefold, doubling the rate of State-funded forest management and restoration efforts, tripling the rate of State-funded oak woodland and riparian reforestation, and doubling the rate of State-funded wetland and seagrass restoration. The measures included in the Draft Plan are projected to result in cumulative emissions reductions of -36.6 to -11.7 million MTCO_{2e} by 2045 (CalEPA et al. 2019).

Regional Land Use and Transportation Planning to Reduce Vehicle Miles Traveled

Senate Bill 375, Sustainable Communities Strategy

SB 375 (2015) provides for a new planning process that coordinates land use planning, regional transportation plans, and funding priorities, originally in order to help California meet the GHG reduction goals established in AB 32. SB 375 requires regional transportation plans (RTPs) to incorporate a “sustainable communities strategy” (SCS). The goal of the SCS is to reduce regional VMT through land use planning and consequent transportation patterns. SCS measures include transportation demand management, transportation system management, and pricing. SB 375 also includes provisions for streamlined CEQA review for some infill projects such as transit-oriented development. CARB revised the San Diego Association of Governments’ (SANDAG’s) GHG target in 2018 to 15 percent reduction in emissions per capita by 2020 and 19 percent by 2035 based on a 2005 baseline.

Senate Bill 743

SB 743 (passed in 2013) requires revisions to the State CEQA Guidelines that establish new impact analysis criteria for the assessment of a project’s transportation impacts. The intent behind SB 743 and revising the State CEQA Guidelines was to integrate and better balance the needs of congestion management, infill development, active transportation, and GHG emissions reduction. The Governor’s Office of Planning and Research (OPR) recommended that VMT serve as the primary analysis metric, replacing the existing criteria of delay and level of service. In 2018, OPR adopted amendments to the State CEQA Guidelines and released a technical advisory outlining potential VMT significance thresholds for different project types. As of July 1, 2020, State CEQA Guidelines Section 15064.3 requires the use of VMT as the metric for analyzing potential impacts on transportation.

Vehicle Fuel Economy Standards

Fuel economy standards are discussed in Section 4.2. In summary, strengthening of the Pavley I standards (referred to as the *Advanced Clean Cars* measure) is expected to increase average fuel economy to roughly 54.5 miles per gallon in 2025.

As of the time of this writing, the Federal SAFE Vehicles Rule Part 2 had been posted in the *Federal Register* (FR) but was intended to take effect on June 29, 2020. This new rule rolls back California fuel efficiency standards for on-road passenger vehicles. California is currently challenging this new rule in the court system, and it is reasonably foreseeable that the State will be successful in its legal challenges, for the reasons outlined in the State’s lawsuit⁵ and on the CARB website.⁶ Furthermore, in February 2021 the Biden administration Department of Justice asked courts to put the litigation on hold while the administration “reconsidered the policy decisions of a prior administration.” Most Recently, on April 22, 2021, the Biden Administration formally proposed to roll back portions of the SAFE Rule thereby restoring California’s right to enforce more stringent fuel efficiency standards,

⁵ *State of California et al. v. Chao et al.* (Case 1:19-cv-02826) available at: https://oag.ca.gov/system/files/attachments/press_releases/California%20v.%20Chao%20complaint%20%280000002%29.pdf.

⁶ <https://ww2.arb.ca.gov/resources/documents/carb-waiver-timeline>.

and in May 2021, NHTSA published the proposed rulemaking in the *Federal Register*, proposing to repeal key portions of the SAFE Vehicles Rule Part I.

The adjustment factors provided by CARB were applied to the estimates of passenger car and light truck emissions used in this analysis, which, in turn, were used to estimate fuel consumption. These factors are conservative as they assume the less efficient SAFE Rule standards.

Truck Fuel Economy Standards

Truck fuel economy standards are discussed in Section 4.2. In summary, both EPA and CARB have adopted the Phase 1 and 2 truck standards at the Federal level, and the Tractor-Trailer Greenhouse Gas Regulation at the State level. These regulations improve fuel economy and reduce GHG emissions by requiring the use of aerodynamic tractors and trailers that are also equipped with low rolling resistance tires.

The Advanced Clean Truck Regulation, adopted in 2020, accelerates the transition of zero-emission medium- and heavy-duty vehicles. The regulation requires the sale of zero-emission medium- and heavy-duty vehicles to increase over time. By 2035, zero-emission truck/chassis sales would need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales. Zero-emission vehicles have no tailpipe emissions and are two to five times more energy efficient than traditional diesel vehicles.

Low Carbon Fuel Standard

The LCFS mandates a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In September 2018, the LCFS regulation was amended to increase the statewide goal to a 20 percent reduction in carbon intensity of California's transportation fuels by at least by 2030. Note that while the LCFS regulation was amended and extended to ensure compliance with the 2030 Scoping Plan, CARB ultimately adopted a more stringent target (20 percent reduction in carbon intensity by 2030) than assumed in the 2030 Scoping Plan (18 percent reduction in carbon intensity by 2030). Therefore, future updates to the Scoping Plan are likely to include the more stringent version of the LCFS that was adopted by CARB. Note that the majority of the emissions benefits due to the LCFS come from the production cycle (upstream emissions) of the fuel rather than the combustion cycle (tailpipe).

Rail/Locomotive Regulations

On April 27, 2023, the California Air Resources Board (CARB) approved Resolution 23-12, which includes the In-Use Locomotive Regulation (13 Cal. Code Regs. §§ 2478 et seq.). Under this new regulation, starting in 2024, locomotive operators would be required to fund their own trust account based on the emissions created by their locomotive operations in California. The dirtier the locomotive, the more funds must be set aside. Spending Account funds would be used in the following manner: (A) Until 2030, to purchase, lease, or rent Tier 4 or cleaner locomotives, or for the remanufacture or repower to Tier 4 or cleaner locomotive(s). (B) At any time, to purchase, lease, or rent ZE locomotive(s), Zero Emission (ZE) capable locomotive(s), ZE rail equipment, or to repower to ZE locomotive(s) or ZE capable locomotive(s). (C) At any time, for ZE infrastructure associated with ZE locomotive(s), ZE capable locomotive(s), ZE rail equipment. (D) At any time, to pilot or demonstrate ZE locomotives or ZE rail equipment technologies.

Starting in 2030 the regulation's operational requirements allow: (1) only locomotives less than 23 years would be able to be used in California, (2) Switchers operated by Class I, Class III, industrial and passenger locomotive operators with an original engine build date of 2030 and beyond would be required to operate in a Zero Emission (ZE) configuration to operate in California, (3) Passenger locomotives with an original engine build date of 2030 and beyond would be required to operate in a ZE configuration to operate in California, (4) Class I line haul locomotives with an original engine build date of 2035 and beyond would be required to operate in a ZE configuration to operate in California. While CARB recently pulled submittal of the regulations to the Office of Administrative Law on July 21, 2023, CARB has indicated that it will be resubmitting the regulations at a subsequent date. (CARB 2023).

Renewable Energy

Renewables Portfolio Standard

SB 1078 (2002), SB 107 (2006), SB 2 (2011), and SB100 (2015) govern California's Renewables Portfolio Standard (RPS) under which investor-owned utilities, energy service providers, and Community Choice Aggregators must procure additional retail sales per year from eligible renewable sources. As of 2019, SDG&E eligible renewable procurement was approximately 31.0 percent (CPUC 2020).

Senate Bill 100

SB 100 (De León, also known as the "California Renewables Portfolio Standard Program: emissions of greenhouse gases") was approved by the California legislature and signed by Governor Brown in September 2018. The bill establishes a new RPS target of 50 percent by 2026, increases the RPS target in 2030 from 50 to 60 percent, and establishes a goal of 100 percent zero-carbon energy sources by 2045.

California Energy Code (Solar and Energy Storage)

Starting in 2020, the California Energy Code was revised to require solar, and the 2022 Code now requires "All single-family residential buildings shall have a newly installed photovoltaic (PV) system or newly installed PV modules meeting the minimum qualification requirements specified in Joint Appendix JA11." (Cal. Code Regs., tit. 24, Part 6, § 150.1(c)(14).) The California Energy Code was further updated in 2022 to require solar for multifamily buildings, and energy storage for structures greater than three habitable stories. (Cal. Code Regs., tit. 24, Part 6, § 170.2(f), (g), (h).) Similarly, solar photovoltaics and energy storage are now required for grocery stores, offices, financial institutions, unleased tenant space, retail, schools, warehouses, auditoriums, convention centers, hotels/motels, libraries, medical office buildings/clinics, restaurants, theaters, and mixed-use buildings where one or more of these building types constitute at least 80 percent of the floor area. (Cal. Code Regs., tit. 24, Part 6, § 140.10(a).)

Maritime

Regulations that affect maritime activity are discussed in Section 4.2. As detailed in that section, there are several regulations that address emissions from maritime activities. The majority of rules and regulations adopted to reduce emissions from goods movement have been focused on reducing the direct human health effects or to attain air quality standards (e.g., to meet ozone standards).

However, many of these rules and regulations also reduce GHG emissions. For example, while the shore power rule is an air toxic control measure aimed at reducing air toxic emissions from vessels at berth, vessels that utilize shoreside electrical supply at berth experience increasing GHG benefits over time as the electric grid becomes increasingly renewable (see *Renewable Energy* above). This example results in a reduction of GHG emissions per unit of electricity consumed over time.

Moreover, as discussed in *Truck Fuel Economy Standards* above, all trucks, including those associated with cargo movements at the Port, will see GHG benefits over time, as regulations drive the zero-emission medium- and heavy-duty vehicles market. Again, as the electric grid becomes increasingly renewable, GHG emissions per unit of electricity will decrease over time.

Building Efficiency

Updated every 3 years through a rigorous stakeholder process, Title 24 of the California Code of Regulations requires California homes and businesses to meet strong energy efficiency measures, thereby lowering their energy use. Title 24 contains numerous subparts, including Part 1 (Administrative Code), Part 2 (Building Code), Part 3 (Electrical Code), Part 4 (Mechanical Code), Part 5 (Plumbing Code), Part 6 (Energy Code), Part 8 (Historical Building Code), Part 9 (Fire Code), Part 10 (Existing Building Code), Part 11 (Green Building Standards Code), and Part 12 (Referenced Standards Code).

California Code of Regulations Title 24, Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings, was adopted in 1978 in response to a legislative mandate to reduce California's energy consumption, which in turn reduces fossil fuel consumption and associated GHG emissions. California has also adopted Green Building Standards Code (CALGreen), which sets aggressive energy efficiency standards for new residential and non-residential buildings that are updated every few years. The update process reviews the standards with the legislative directive of "[r]educing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy." (Public Resources Code [PRC] Section 25402.)

The most recent update was the 2019 Building Energy Efficiency Standards, which were adopted in May 2018 and took effect on January 1, 2020. For projects implemented after January 1, 2020, the California Energy Commission (CEC) estimates the 2019 standards will reduce consumption by 7 percent for single-family residential buildings and 30 percent for non-residential commercial buildings, relative to the 2016 standards. Overall, the 2019 standards are anticipated to use about 53 percent less energy than structures developed under the 2016 standards, which in turn were 28 percent more efficient than the 2013 standards (CEC 2020). The State is already in the process of preparing 2022 building standards and energy efficiency requirements (CEC 2021b). SB 350, which was signed by Governor Brown in October 2015, also requires a doubling of energy efficiency (electrical and natural gas) by 2030, including improvements to the efficiency of existing buildings. Additional information on these building standards is provided in the regulatory setting discussion in Section 4.15, *Utilities and Service Systems*.

Cap-and-Trade

CARB adopted the Cap-and-Trade program in October 2011. The program is a market-based system with an overall emissions limit for affected emission sources. Affected sources include in-state electricity generators, hydrogen production, petroleum refining, and other large-scale manufacturers and fuel suppliers and distributors. The original Cap-and-Trade program set a

compliance schedule through 2020. AB 398 extends the program through 2030 and requires CARB to make refinements, including establishing a price ceiling. Revenue generated from the Cap-and-Trade program is used to fund various programs. AB 398 established post-2020 funding priorities, to include (1) Air Toxics and Criteria Pollutants, (2) Low and Zero Carbon Transportation, (3) Sustainable Agricultural Practices, (4) Healthy Forests and Urban Greening, (5) Short-lived Climate Pollutants, (6) Climate Adaptation and Resiliency, and (7) Climate and Clean Energy Research. This includes regulated activities at CP Kelco in the District's Tidelands.

Energy

Various regulations adopted pursuant to air quality and GHG emission reductions goals also provide benefits to energy conservation and consumption. In addition, the below pieces of legislation directly affect energy.

Senate Bill 350 (2015)

SB 350 (De Leon, also known as the "Clean Energy and Pollution Reduction Act of 2015") was approved by the California legislature in September 2015 and signed by Governor Brown in October 2015. Its key provisions are to require the following by 2030: (1) an RPS of 50 percent and (2) a doubling of efficiency for existing buildings.

State Energy Plan

The CEC is responsible for preparing the State Energy Plan (SEP), which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The SEP calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the fewest environmental and energy costs. To further this policy, the SEP identifies a number of strategies, including providing assistance to public agencies and fleet operators.

California Energy Commission Requirements

The CEC is tasked with conducting assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. The CEC uses these assessments and forecasts to develop energy policies that conserve resources, protect the environment, ensure energy reliability, enhance the state's economy, and protect public health and safety (PRC Section 25301(a)).

As the State's primary energy policy and planning agency, the CEC collaborates with State and Federal agencies, utilities, and other stakeholders to develop and implement State energy policies. Since 1975, the CEC has been responsible for reducing the State's electricity and natural gas demand, primarily by adopting new Building and Appliance Energy Efficiency Standards that have contributed to keeping California's per capita electricity consumption relatively low. The CEC is also responsible for the certification, and environmental review of thermal power plants 50 megawatts and larger, including all project-related facilities in California (CEC 2019c). The California Public Utilities Commission (CPUC) regulates investor-owned electric and natural gas utilities operating in California. The energy work responsibilities of the CPUC are derived from the California State Constitution, specifically Article XII, Section 3 and other sections more generally, numerous State legislative enactments, and various Federal statutory and administrative requirements. The CPUC

regulates natural gas utility service for approximately 3.4 million customers that receive natural gas from SDG&E and other natural gas utilities across California (CPUC 2019).

State CEQA Guidelines, Appendix F

Appendix F of the State CEQA Guidelines contains energy conservation measures that promote the efficient use of energy for projects. In order to ensure that energy impacts are considered in project decisions, CEQA requires that Environmental Impact Reports (EIRs) include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

The goal outlined in Appendix F of the State CEQA Guidelines is to conserve energy through the wise and efficient use of energy. The means of achieving this goal include the following.

- Decreasing the overall per capita energy consumption.
- Decreasing reliance on natural gas and oil.
- Increasing reliance on renewable energy sources.

4.6.3.4 Regional

San Diego Air Pollution Control District

The AB 32 Scoping Plan does not provide an explicit role for local air districts in implementing AB 32, but it does state that CARB will work actively with air districts in coordinating emissions reporting, encouraging and coordinating GHG reductions, and providing technical assistance in quantifying reductions. The ability of air districts to control emissions (both criteria pollutants and GHGs) is provided primarily through permitting, as well as through their role as a CEQA lead or responsible agency, the establishment of CEQA thresholds, and the development of analytical requirements for CEQA documents. As discussed in Section 4.2, the San Diego Air Pollution Control District (SDAPCD) is responsible for air quality planning in San Diego County. To date, SDAPCD has not developed specific thresholds of significance with regard to the GHG emissions in CEQA documents.

Community Emissions Reduction Plan

The Community Emissions Reduction Plan (CERP) contains detailed information and strategies that are intended to reduce both air pollution emissions and community exposure to air pollution in the Community of Portside Environmental Justice Neighborhoods (Portside Community).

The goals in the CERP are aspirational and are intended to guide the community members, businesses, organizations, and government agencies partnering in the implementation of the CERP to support health and environmental justice in the Portside Community. While there might not be a clear path to reach some of these goals, the goals identify the direction in which the community wants to go to achieve emission reductions beyond regulatory requirements. As technology evolves and data continues to be collected, the goals in the CERP may be adjusted (SDAPCD 2021).

The CERP was presented in two phases. Phase I includes actions that have been fully developed and supported by all jurisdictions or organizations that have an implementation role. The Phase I Draft CERP was released in September 2020. The Phase II CERP was finalized by SDAPCD in July 2021 and

includes 11 goals and 39 actions to achieve these emission reductions. Goals include reducing TAC emissions in the community, supporting electric freight truck infrastructure and upgrades, quantifying health risk from port and non-port activities, establishing health risk reduction goals, and implementing actions to achieve those goals (SDAPCD 2021). The Portside Community's CERP was approved by CARB's governing board in October 2021 (CARB 2021d).

San Diego Association of Governments

San Diego Forward: The Regional Plan

SANDAG's San Diego Forward: The Regional Plan, which incorporates the 2050 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS), was adopted in 2015 and provides a planned vision for the region's transportation system through 2050. The plan also incorporates a sustainable communities strategy as required by SB 375, which includes implementation of a Transportation Demand Management (TDM) strategy to help local governments reduce energy consumption. The update to the Regional Plan was released for public review in May 2021, the Draft EIR for the 2021 Regional Plan was released in summer 2021, and the EIR is expected to be adopted in December 2021.

SANDAG Energy Programs

SANDAG's Energy and Climate Change program supports local efforts to reduce GHG emissions in alignment with statewide goals to prepare for the impacts of climate change. Projects include climate action planning and energy engineering services for local jurisdictions, electric vehicle charging, and climate adaptation (SANDAG 2019).

Through its Energy Roadmap Program, SANDAG provides energy efficiency and engineering support to qualifying local jurisdictions (i.e., cities), which includes free energy assessments and energy management plans, or "Energy Roadmaps," to SANDAG member agencies that do not have Local Government Partnerships with SDG&E.

In July 2015, SANDAG launched Plug-in San Diego through a 2-year CEC grant. The program implemented recommendations from SANDAG's Electric Vehicle (EV) Readiness Plan through a combination of resource development, training, technical assistance through an EV Expert, and outreach. SANDAG has provided various reports and documents to assist property owners in acquiring EV charging infrastructure and better understanding the technologies, incentives, and installation options available.

SANDAG Regional Energy Strategy

The Regional Energy Strategy (RES) serves as the energy policy blueprint for the region through 2050. The RES establishes long term goals in eleven topic areas including energy efficiency, renewable energy, distributed generation, transportation fuels, land use and transportation planning, border energy issues, and the green economy. Priority Early Actions of the Regional Energy Strategy include the following:

1. Pursue a comprehensive building retrofit program to improve efficiency and install renewable energy systems.
2. Create financing programs to pay for projects and improvements that save energy.

3. Utilize the SANDAG-SDG&E Local Government Partnership to help local governments identify opportunities and implement energy savings at government facilities and throughout their communities.
4. Support land use and transportation planning strategies that reduce energy use and GHG emissions.
5. Support planning of electric charging and alternative fueling infrastructure.
6. Support use of existing unused reclaimed water to decrease the amount of energy needed to meet the water needs of the San Diego region.

In the RES, SANDAG acknowledges that the State’s “preferred loading order” to meet goals for satisfying the State’s growing electricity demand. The preferred loading order is as follows:

1. Increase energy efficiency.
2. Increase demand response – temporary reduction or shift in energy use during peak hours.
3. Meet generation needs with renewable and distributed generation resources.
4. Meet new generation needs with clean fossil-fueled generation and infrastructure improvements.

The RES contains a suite of goals and measures to achieve those goals. For example, the RES includes an energy efficiency and conservation goal of reducing per capita electricity consumption 20 percent by 2030 in order to compensate for population growth. Other regional goals include recommended actions and goals for renewable energy, distributed generation, reducing water consumption and diversifying water sources, reducing peak demand, smart energy, replacing inefficient power plants, supporting alternative fuel transportation, appropriate land use planning, among others. To accomplish these goals, SANDAG recommends various measures that local jurisdictions can implement to achieve the goals of the RES, including pursuing a comprehensive building retrofit program and identifying, securing, or developing funding mechanisms to pay for energy-related projects and programs. The RES will be updated periodically to reflect progress toward RES goals, account for changes in energy and climate change policy, and make recommendations for continued progress.

4.6.3.5 Local

District Plans and Programs

The District developed the Green Port Program to support the goals of the Green Port Policy, which was adopted in 2008. The Green Port Program supports resource conservation, waste reduction, and pollution prevention. The Clean Air Program is one key area of the Green Port Program, with the primary goal of reducing GHG emissions and other air emissions from Port operations at its three marine terminals. The Clean Air Program seeks to voluntarily reduce emissions through the identification and evaluation of feasible and effective control measures. Through this program, the District has identified control measures to achieve a reduction of pollutants from the largest sources. The Clean Air Program will continue to be refined and adapted to future changes in District operations. Recent updates to the Clean Air Program include the Maritime Clean Air Strategy (MCAS), which is a strategic planning document, identifying goals and objectives that are consistent with the District Board of Port Commissioners’ (Board) vision of health equity and a clean,

sustainable, and modern seaport. The MCAS is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. A detailed description of the MCAS is provided under the *Local Regulations* in Section 4.2 and is summarized in the context of GHG emissions below.

The District and SDG&E have also established a partnership to increase energy efficiency and reduce overall energy consumption. SDG&E currently allocates a portion of funds collected from utility customers to energy efficiency programs with local governments. The District uses some of those funds to develop energy efficiency education programs, track energy consumption, perform energy audits, and implement energy retrofits. The District's energy efficiency programs benefit employees, tenants, and the general public.

Climate Action Plan

As noted above under *State Reduction Plans*, CARB encourages local governments to adopt a reduction goal for municipal operations emissions and move toward establishing similar goals for community emissions that parallel the State's commitment to reducing GHG emissions (CARB 2008). The District adopted a CAP in December 2013. The CAP includes an inventory of existing (2006) and projected emissions in 2020, 2035, and 2050 and identifies the District's GHG reduction goals and measures to be implemented to support meeting the statewide reduction goals set forth in AB 32 (1990 levels by 2020). Port-wide 1990 emissions were not quantified given activity data gaps; instead, a base year of 2006 was used to calculate reductions needed at the Port to reach 1990 levels by 2020. Consistent with AB 32 targets, a 10 percent reduction target (471.3 million MTCO₂e in 2006 and estimated 426.6 million MTCO₂e in 1990 statewide) was used as the Port-wide reduction target for 2020. As shown in Table 4.6-4 above, the District's GHG emissions were reduced by 17.7 percent from 2006 to 2016.

Green Port Program and Green Port Policy (BPC Policy No. 736)

The District's Board adopted the Green Port Policy in 2007. This policy establishes guiding principles to achieve long-term environmental, societal, and economic benefits through resource conservation, waste reduction, and pollution prevention. The policy provides the overall framework for the Green Port Program. The Green Port Program is an umbrella program designed to achieve the District's environmental sustainability goals in six key areas: water, energy, air, waste management, sustainable development, and sustainable business practices. It was established in early 2008 to achieve the objectives outlined in the District's Green Port Policy. Policy objectives include the following.

- Minimize, to the extent practicable, environmental impacts directly attributable to operations on San Diego Bay and the tidelands.
- Strengthen the District's financial position by maximizing the long-term benefits of energy and resource conservation.
- Prevent pollution and improve personal, community, and environmental health.
- When possible, exceed applicable environmental laws, regulations, and other industry standards.
- Ensure a balance of environmental, social, and economic concerns are considered during planning, development, and operational decisions.

- Define and establish performance-driven environmental sustainability objectives, targets, and programs.
- Monitor key environmental indicators and consistently improve performance.
- Foster socially and environmentally responsible behavior through communications with employees, tenants, stakeholders, and the community.
- Collaborate with tenants to develop an integrated, measurable, Bay-wide environmental sustainability effort.

At present, the Green Port Program primarily focuses on things the District can do to be more environmentally sustainable, such as using less water and being more energy efficient in its own operations. In the future, the District will work with its tenants (businesses that lease bayfront land from the District), local environmental groups, and others around San Diego Bay to identify ways they can support the Green Port Program.

Maritime Clean Air Strategy

As mentioned above, and as discussed in detail in Section 4.2, the MCAS is a strategic planning document that is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. While the vision of the MCAS is *Health Equity for All*, with a primary focus on air pollutants that contribute to negative health outcomes (criteria pollutants and toxic air contaminants), most of the measures in the MCAS achieve GHG reductions as a co-benefit as well. For example, MCAS Truck Goal 1 aims to improve air quality in the Portside Community by accelerating the implementation of zero-emission/near-zero-emission trucks. Electrifying trucks is an air quality- and health-driven goal, designed to reduce diesel emissions from trucks traveling through the neighboring communities. However, this effort would achieve GHG reductions as a co-benefit due to the fact that the electrical grid emits fewer GHG emissions than diesel combustion. Moreover, as the electrical grid gets cleaner (lower emitting) over time due to RPS and overall net zero generation goals, GHG emissions from trucks, and all other equipment that transitions from combustion to electric, will trend down even more over time.

The MCAS includes two short-term goals for 2030 and complementary long-term goals. Short-term goals for 2030 include the following:

- **Long-Term Goal for Trucks:** In advance of the State's goals identified in Executive Order No. N-79-20, attain 100 percent zero-emission truck trips by 2030 for all trucks that call at the Port's two marine cargo terminals.
- **Long-Term Goal for Cargo Handling Equipment:** In advance of the State's goals identified in Executive Order No. N-79-20, the transition of diesel cargo handling equipment to 100 percent zero-emission equipment by 2030.

Long-term goals include the following:

- **Long-term Goal for Harbor Craft:** Tugboat-related Diesel Particulate Matter (DPM) emissions identified in the District's Emissions Inventory (2019) will be reduced by half by transitioning to zero-emission/near-zero-emission technologies and/or other lower-emitting engines or alternative fuels.

- **Long-term Goal for Port Fleet:** Transition Port-owned fleet of vehicles and equipment to ZE/NZE emission technologies in manner that meets operational needs and reduces emissions, as outlined below:
 - Beginning in 2022, transition light-, medium-, and heavy-duty vehicles to zero-emission vehicles.
 - Transition emergency vehicles to alternative fuels, including hybrid, electric, and/or low carbon fuels.
 - Convert equipment, such as forklifts and lawn maintenance equipment, to zero-emission equipment.
 - Seek opportunities to advance lower emitting solutions for marine vessels.
- **Long-term Goal for Ocean-going Vessels:** Equip marine terminals with shore power and/or an alternative technology to reduce ocean-going vessel emissions for ships that call to the Port.

The MCAS is intended to keep the District in front of and go beyond State regulations. The MCAS will serve as a living document, and the District will regularly report to the Board, including comprehensive updates every two years. The measures in the MCAS may change over time, based on Board direction or as technology improvements occur.

The draft revised MCAS was released for public review in August 2021, and it was adopted by the District Board in October 2021. The goals and strategies will guide the District's investments in zero emissions technology and electrification and will allow the District to help tenants and terminal operators prioritize replacements over time. As noted in the MCAS document, the MCAS is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. The MCAS focuses on maritime and shipyard activities. Measures from both the MCAS and potentially the CERP will be applicable to new projects as they arise.

4.6.4 Project Impact Analysis

4.6.4.1 Methodology

GHG Emissions

GHG impacts associated with construction and operation of the proposed PMPU were assessed and quantified (where applicable) using industry standard and accepted software tools, techniques, and emission factors. A summary of the methodology is provided below. A full list of assumptions and emission calculations can be found in Appendix C. The methodology used to estimate GHG emissions discussed below is the same that was used to estimate air quality emissions, as described in Section 4.2.

Construction

Land uses that could be developed under the proposed PMPU would generate construction-related GHG emissions from mobile and stationary construction equipment exhaust, and employee and haul truck vehicle exhaust. However, the specific design, size, location, and construction techniques and

scheduling that would be utilized for each individual development project occurring from implementation of the proposed PMPU are not currently known. With an anticipated buildout year of 2050, development of the various land uses associated with the proposed PMPU would occur over an extended period and would depend on factors such as local economic conditions, market demand, and other financing considerations.

Although the proposed PMPU would not directly result in construction activities, future development projects that are proposed, consistent with the proposed PMPU policies and land/water designations, would include construction activities. Therefore, construction activities are a reasonably foreseeable indirect consequence of the proposed PMPU's implementation. In order to evaluate future construction activities, it is assumed that construction activities are likely to occur periodically over the 30-year planning horizon, through 2050. Moreover, construction activities could be more concentrated in certain years and timeframes.

The GHG analysis evaluates the total GHG emissions associated with all baywide development at full buildout of the proposed PMPU, as shown in Table 4.2-12 in Section 4.2. Construction emissions (i.e., CO₂, CH₄, and N₂O) were calculated using the California Emissions Estimator Model (CalEEMod) Version 2020.4.0 based on proposed land use types using CalEEMod default values for construction schedule, phasing, equipment, and vehicle trips.

Consistent with established protocols and published guidance from other lead agencies and air districts, construction emissions are amortized over the expected operational life of the PMPU (2050) and added to annual operational emissions.

Operation

GHG emission sources at the Port include tenant facilities (e.g., hotels, marinas, boatyards), maritime activity (e.g., the movement of goods and people associated with marine terminal operations), and District operations (e.g., District-owned building and outdoor energy consumption and fleet activity). Emission sources include on-road activity related to passenger car and freight vehicle exhaust; off-road activity related to freight movement and industrial activities (e.g., boatyards, shipyards); off-road boating emissions related to recreational boating, commercial fishing, sport/charter fishing, excursions, and ferries; electricity and natural gas consumption associated with building energy and to power maritime shore power; and other utility uses, such as water consumption and waste and wastewater generation associated with land uses (e.g., hotels).

Under the PMPU, new proposed policies that affect all water and land uses baywide would be implemented through proposed elements, and allowable water and land uses would be modified. Buildout of the proposed PMPU is likely to change and in some cases increase activity associated with these emission sources.

Analysis Years

The proposed PMPU is designed to guide the use and development of District Tidelands through the horizon year of 2050. Development of the various land uses associated with the proposed PMPU would occur over an extended period and would depend on factors such as local economic conditions, market demand, and other financing considerations, with an assumed buildout of all land use changes by 2050. Additionally, the analysis here considers the year 2030, which is the next statewide GHG milestone target after the project's opening day (certification of this Program EIR [PEIR]). To provide an analysis of conditions in 2030, this analysis considers activity and emission

profiles (e.g., regulatory standards at a specific analysis year, discussed in more detail below) that could be in place by both 2030 and 2050. In most cases, this 2030 activity estimate is based on the assumption that land uses, development, and associated activity change linearly over time between existing and buildout conditions. This is the case for all development and acreage changes. For the Tenth Avenue Marine Terminal (TAMT), the methods employed for estimating activity in 2030 is as follows.

Activity assumptions for TAMT are based on the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR (TAMT EIR, December 2016), which assumes full buildout in 2035. For purposes of this analysis, the throughput at full buildout assumed for 2035 is the same throughput assumed for buildout by 2030. More information on TAMT is provided below.

New land use development (e.g., hotel rooms, retail and restaurant square footage) assumed in 2030 and at full buildout of the proposed PMPU relative to existing conditions is summarized in Table 4.2-12 of Section 4.2. Descriptions of method for each source type (e.g., motor vehicles, electricity) are provided below.

As noted, the net change in vehicle activity, utility and energy consumption, and boating activity for 2030 is 41 percent of the net change by 2050, based on the number of years between baseline (2016) and full buildout (34 years), and the number of years between baseline (2016) and 2030 (14 years) (i.e., $14/34 \approx 41$ percent).

Motor Vehicles

GHG emissions from motor vehicles associated with the proposed PMPU were evaluated using the EMFAC2021 emissions model (version 1.02) and traffic data provided by the traffic engineers, as summarized in detail in Section 4.14, *Transportation, Circulation, and Mobility*. Daily VMT were provided for new development under full buildout of the proposed PMPU. To estimate emissions in 2030, daily VMT under 2030 conditions were interpolated between 2016 and 2050 conditions. The mobile source emission factors (grams per mile) were averaged in EMFAC2021 based on all vehicle and fuel types at aggregated speeds for the vehicle fleet operating within the San Diego Air Basin (SDAB) for each analysis year. GHG emissions from vehicle movement were calculated by multiplying the VMT estimates by the appropriate emission factors provided by EMFAC2021, and emissions from vehicle movement were added to process emissions (i.e., emission from vehicle starts, running losses, etc.), which were calculated by multiplying the daily trips by the appropriate emission factors provided by EMFAC2021. Project-specific vehicle trip information used to generate mobile source emission estimates given in Section 4.14 is summarized in Table 4.2-13 of Section 4.2, *Air Quality and Health Risk*. The analysis also includes CARB's criteria pollutant adjustment factors to account for the SAFE Vehicle Rule Part One and the Final SAFE Rule, which are embedded in the EMFAC2021 model.⁷

⁷ On September 27, 2019, the EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program" (84 FR 51,310 [September 27, 2019]). The Part One Rule revokes California's authority to set its own greenhouse gas emissions standards and set zero-emission vehicle mandates in California. To accurately estimate future transportation emissions, CARB has prepared off-model adjustment factors for EMFAC2017. These adjustments are provided in the form of multipliers that can be applied to the emissions outputs from the EMFAC model and account for the impact of the SAFE Vehicle Rule Part One.

Land Use Development Area and Energy Sources

Operational area, energy, water, solid waste, and wastewater emissions were estimated under 2030 and 2050 development conditions using CalEEMod, version 2020.4.0. Energy sources include the combustion of natural gas as well as the use and generation of electricity. Water consumption results in indirect GHG emissions from the conveyance and treatment of water. Solid waste and wastewater generation results in fugitive CH₄ and N₂O emissions from the decomposition of organic matter.

The changes in area, energy, water, solid waste, and wastewater emissions from implementation of the proposed PMPU were quantified based on the change in land uses associated with buildout of the PMPU, which are provided in Table 4.2-12 of Section 4.2.

The electricity emissions were estimated based on projected SDG&E's energy intensity factors for 2030 and 2050 (370 pounds per pounds of CO₂e per megawatt-hour [MWh]) in 2030, and carbon free in 2050) from SANDAG's 2016 regional inventory (SANDAG 2021), which account for RPS targets of 60 percent RPS by 2030 and 100 percent carbon-free electricity by 2045 under SB 100.

Emissions from natural gas, water, wastewater, and solid waste generation were estimated based on default consumption data for the various land uses within CalEEMod (i.e., therms, gallons, tons) and default emission estimation from the project proponent and CalEEMod's default method for estimating natural gas, water, wastewater, and solid waste emissions in San Diego County.

Recreational Boating, Commercial Fishing, and Sport/Charter Fishing

Emissions associated with boating and fishing activity would change over time if additional slips and berthing areas are added. Each of these activity types is summarized below.

- Recreational boating includes non-commercial boats and harbor craft that are used solely for personal enjoyment, and includes a variety of gasoline- and diesel-powered vessels. San Diego Bay has numerous marinas and yacht clubs as well as four public boat launch ramps. Recreational boating occurs at various planning districts, including PD1, PD2, PD3, PD9, and PD10.
- Commercial fishing includes those vessels that carry crew to fishing areas both within and outside 24 nautical miles of the Port. Commercial fishing vessels are harbored at commercial fishing areas at Shelter Island (PD1) and Tuna Harbor (PD3).

A summary of fishing and recreational boating emissions estimates from the 2016 maritime air emissions inventory is provided in Table 4.6-4. Note that the emissions shown in Table 4.6-4 are for all planning districts, even those excluded from the proposed PMPU analysis herein.

Emission estimates for all baywide activities were assigned to each planning district based on the number of current slips within each planning district. Existing slips counts by slip type are as follows, including areas excluded from this PMPU analysis:

- Recreational boating: 6,780 total slips, based on 2,420 within PD1, 2,228 within PD2, 418 within PD3, 250 within PD5, 926 within PD6, 167 within PD9, and 364 within PD10.
- Commercial fishing: 228 slips, based on 123 slips within PD1 and 105 slips within PD2.

Table 4.2-15 of Section 4.2 summarizes the change in boating and fishing slips associated with PMPU buildout and in 2030. Additional new slips by 2030 are assumed to be 41 percent of the net change

by 2050. As shown, there would be an increase in both commercial fishing and recreational boating slips as part of the proposed PMPU.

Tenth Avenue Marine Terminal

The TAMT EIR evaluated potential GHG emissions impacts from buildout of the TAMT Redevelopment Plan through 2035. The analysis of the proposed PMPU evaluates activities baywide through 2050. While this PEIR does not re-analyze buildout of the TAMT Redevelopment Plan, it does include GHG emissions from TAMT between 2035 and 2050. The proposed PMPU would not result in any changes in land use or cargo throughput at TAMT.

Energy

Public Resources Code Section 21100(b)(3) states that an EIR must include “mitigation measures proposed to minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy.” State CEQA Guidelines Section 15126.2(b) further states that an EIR’s analysis of energy impacts must include a project’s energy use during all phases and components, including transportation, construction-, and operations-related energy use.

Energy impacts would occur if the proposed PMPU would result in the wasteful, inefficient, or unnecessary use of energy or if the proposed PMPU would conflict with a state or local plan for renewable energy or energy efficiency. ~~Energy impacts would also occur if the proposed PMPU would require or result in the construction of new energy system infrastructure or the expansion of existing infrastructure, the construction of which could cause significant environmental effects.~~ The energy analysis for the proposed PMPU evaluates the following sources of energy consumption associated with existing conditions and future development under the proposed PMPU.

Energy Use During Construction

Implementation of the proposed PMPU would result in energy use from construction of waterside and landside development. Energy use associated with construction activities includes the consumption of transportation fuels (i.e., gasoline and diesel) for equipment use and employee, delivery, and haul truck vehicle travel along with electricity consumption by temporary buildings used during construction. Diesel fuel would be required for operation of heavy-duty off-road construction equipment (e.g., cranes, forklifts, loaders) that would be used for a variety of activities, including demolition of structures, walkways, and asphalt; construction of buildings and infrastructure; and grading and laying foundations. It was assumed that all off-road equipment would be diesel-powered. Both diesel and gasoline fuel would also be required for the operation of on-road vehicles (e.g., pickup trucks, flatbed trucks, passenger cars) which would be used for material and equipment hauling, crew and material movement, employee commuting, and material disposal.

Energy use during construction was estimated using a combination of methods and energy factors from published best available documentation. Fuel consumption was estimated using the CO₂ emission outputs from the GHG construction estimates, as discussed above. Energy usage associated with fuel consumption was calculated by converting CO₂ emissions estimated from the construction analysis using the rate of CO₂ emissions per gallon of combusted gasoline (8.78 kilograms/gallon) and diesel (10.21 kilograms/gallon) (Climate Registry 2020). The estimated fuel consumption was

converted to BTUs, assuming an energy intensity of 113,927 BTUs per gallon of gasoline and 129,488 per gallon of diesel, and electricity was converted to BTUs assuming an energy intensity of 3,416 BTUs per kilowatt hour (kWh) (Argonne National Laboratory 2015). A full list of assumptions and emission and energy calculations for construction can be found in Appendix C.

Energy Use During Operation

Operation of the proposed PMPU would require energy associated with tenant facilities (e.g., hotels, marinas, boatyards), maritime activity (e.g., the movement of goods and people associated with marine terminal operations), and District operations (e.g., District-owned building and outdoor energy consumption and fleet activity). These uses would require natural gas for space and water heating, electricity for building operations and maritime shore power, and diesel and gasoline for boating and visitor travel to and from future project sites.

Operational energy use was estimated using the same methods and energy factors described for short-term construction energy use, above. Fuel consumption during operation was calculated by converting GHG emissions estimated for the GHG operational analysis using the rate of CO₂ emissions per gallon of combusted gasoline and diesel. Fuel consumption was then converted to energy using industry standard emission factors for BTUs per gallon of gasoline and diesel. Energy use associated with area sources, such as natural gas consumption (for space and water heating), water consumption, electricity, wastewater, and solid waste removal was estimated based on CalEEMod default energy consumption factors (kWh of electricity and therms of natural gas) for the proposed land use (see Table 4.6-9). These assumptions were also used in both the air quality and GHG analyses. The assumptions and emission and energy calculations for project operations can be found in Appendix C.

Table 4.6-9. Annual Energy Generation Rates

Use	Electricity (kWh) ²	Natural Gas (therm)	Unit
Hotel	18,063	841	Per room
Restaurant	37,820	1,741	Per tsf
Convention and Meeting Space	15,150	321	Per tsf

Source: Appendix C.

kWh = kilowatt-hour; tsf = thousand square-feet. Generation rates are based on CalEEMod defaults for hotel, restaurant, and office uses.

Transportation-Related Energy Use

Energy usage associated with fuel consumption was calculated by converting CO₂ emissions estimated from the construction analysis using the rate of CO₂ emissions per gallon of combusted gasoline (8.78 kilograms/gallon) and diesel (10.21 kilograms/gallon) (Climate Registry 2018). The estimated fuel consumption was converted to BTUs, assuming an energy intensity of 113,927 BTUs per gallon of gasoline and 129,488 per gallon of diesel, and electricity was converted to BTUs assuming an energy intensity of 3,416 BTUs per kWh (Argonne National Laboratory 2015).

4.6.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining significance of impacts associated with GHG emissions and energy use resulting from the proposed PMPU. The determination of whether a GHG emissions and energy use impact would be significant is based on the thresholds described below, and the professional judgment of the District as Lead Agency based upon substantial evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following.

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.
3. Result in wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
4. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

The State CEQA Guidelines do not indicate what amount of GHG emissions would constitute a significant impact on the environment. Instead, they authorize the lead agency to consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence (State CEQA Guidelines Sections 15064.4(a) and 15064.7(c)). The State CEQA Guidelines provide the lead agency discretion whether to quantify GHG emissions resulting from a project and/or rely on a qualitative analysis or performance-based standards, focusing specifically on the following factors (State CEQA Guidelines Sections 15064.4(b):

- The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting.
- Whether the project GHG emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. The lead agency must include substantial evidence linking statewide goals, strategies, and plans to the project's findings.

Several agencies throughout the state, including multiple air districts, have drafted and/or adopted varying threshold approaches and guidelines for analyzing GHG emissions and climate change in CEQA documents. Although these threshold approaches and guidelines are binding only within the jurisdiction of the adopting agencies, they may be considered for application by other agencies pursuant to State CEQA Guidelines Section 15064.7(c).

GHG Threshold Approach

Overview

There are multiple potential thresholds and methodologies for evaluating project-level GHG emissions consistent with CEQA, depending on the circumstances of a given project. Although efforts at framing GHG significance issues have not yet coalesced into any widely accepted set of numerical significance thresholds across the state and within the region, a range of possible approaches do exist. Common threshold approaches include (1) compliance with a qualified GHG reduction strategy, (2) performance-based reductions, (3) numeric “bright-line” thresholds, (4) efficiency-based thresholds, and (5) compliance with regulatory programs.

The proposed PMPU includes a variety of project components and a mixture of land uses, including commercial recreation, commercial, recreational boating, parks, streets, and bikeways. Recent case law directs GHG analyses to tailor threshold concepts to the specifics of a project and that project’s uses. While no numeric or efficiency threshold has been formally adopted for use in the region, numerical targets can be derived from published documentation, such as a CAP, for uses where a defensible numeric CEQA threshold can be developed. An efficiency metric is most appropriate for projects that include some form of occupancy by which to benchmark emissions. For example, the District’s CAP includes an inventory of baseline and future year emissions, square footage, number of rooms, and emissions associated with “lodging” uses under 2006 and 2020 conditions. In this case, it would be appropriate to benchmark emissions with the number of rooms for years that data is available (in this case, 2006 and 2020), and are based on the level of emissions (MTCO_{2e}) emitted per unit of activity or development (e.g., in this case, the number of hotel rooms). Another example would be the recommended efficiency goals stated in CARB’s 2017 Scoping Plan of no more than 6 MTCO_{2e} per capita by 2030 and no more than 2 MTCO_{2e} per capita by 2050 for projects or plans with residential uses. The benefit of efficiency metrics is that they allow for a quantitative demonstration that a project would be in line with and support the State’s overall reduction trajectory towards long-term reduction targets. For these project types, where numeric thresholds have not been established and there is no feasible way to develop efficiency thresholds, the best approach is to rely on regulatory consistency to demonstrate if a project is consistent with those statewide GHG emission reduction targets, and the programs to achieve the reduction target have been adopted by CARB or other State agencies. A lead agency can rely on regulatory consistency to show a less-than-significant GHG impact if a project is consistent with statewide GHG emission reduction targets and those programs adopted to achieve them by CARB or other State agencies. However, such analysis is only applicable within the area governed by the regulations. For example, consistency with regulations addressing building efficiency would not suffice to determine that the project would not have significant GHG emissions from transportation.

The OPR’s guidance (2018) specifies that a “land use development project that produces low VMT, achieves applicable building energy efficiency standards, uses no natural gas or other fossil fuels, and includes Energy Star appliances where available, may be able to demonstrate a less-than-significant greenhouse gas impact associated with project operation.” To the extent the District CAP and PMP policies applicable to GHGs comply with or exceed the statewide GHG emission reduction targets and the regulations outlined in the 2017 Scoping Plan and adopted by the District, CARB, or other agencies, the project could appropriately rely on consistency with these documents to demonstrate consistency with statewide plans, policies, and regulations aimed at reducing GHG

emissions. The proposed PMPU's consistency with regulatory programs is used to evaluate the significance of the proposed PMPU.

While the regulatory framework to achieve long-term (post-2030) emissions reductions is in its infancy, many of the programs outlined in the District's CAP and the 2017 Scoping Plan are likely to be carried forward or have already been adopted with post-2030 requirements (e.g., RPS).

Accordingly, evaluating PMPU consistency with these programs and relevant guidance published by OPR and CARB for the reduction of long-term emissions is also considered in the analysis of full buildout (2050) emissions.

GHG Approach Used in This PEIR

The State has formally adopted reduction targets for years 2020 (AB 32) and 2030 (SB 32), and EOs exist for years 2045 (EO B-55-18) and 2050 (EO S-03-05). The proposed PMPU is expected to guide development within the District's jurisdiction through 2050. The next statewide milestone year after plan adoption is 2030, and, as discussed above, the State has developed a Scoping Plan to meet the 2030 reduction goal. At this time, the 2045 and 2050 targets have not been codified into law, and the State does not have a plan to meet these targets. However, buildout of the proposed PMPU will occur through the 2050 timeframe. Thus, the impact analysis considers buildout of the proposed PMPU based on two separate benchmark timeframes. The first timeframe considers implementation of the proposed PMPU through 2030, whereas the second considers implementation beyond 2030 through the year 2050.

Based on the questions posed in Appendix G of the State CEQA Guidelines, this PEIR analyzes the significance of potential impacts associated with GHG emissions under two thresholds: (1) whether future development under the proposed PMPU would generate GHG emissions, either directly or indirectly, that would have a significant impact on the environment; and (2) whether the proposed PMPU would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions.

The analysis of potential impacts under these thresholds for the 2030 and post-2030 periods are both quantitative and qualitative in nature. Under Threshold 1, the quantitative portion of the analysis includes quantification of emissions from new development under the proposed PMPU consistent with long-term local and statewide reduction targets. Under Threshold 2, the qualitative portion of the analysis assesses policy inconsistencies between the proposed PMPU and plans, policies, measures, and regulatory programs outlined, adopted, or proposed by all relevant agencies, including the District, CARB, and other California agencies. These two approaches are discussed in further detail below.

Generate a Significant Amount of GHG Emissions

The quantitative threshold approach used to determine whether the proposed PMPU would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment is two-pronged for both the 2030 and 2050 analysis years.

For threshold 1, impacts from the buildout of the proposed PMPU would be considered significant if the proposed PMPU would:

- A. Result in an increase in GHG emissions relative to baseline (2016) GHG emissions under both 2030 and 2050 conditions, or

- B. Be inconsistent with the State’s overall reduction target for 2030 (SB 32) or inconsistent with the State’s ability to achieve its overall reduction target for 2050 (EO S-03-05).

The analysis for both of these methods is quantitative. The first method quantitatively considers whether buildout of the proposed PMPU would result in a net increase in GHG emissions relative to baseline (2016) GHG emissions under both 2030 and 2050 conditions. Under the second method, the analysis for 2030 is quantitative with respect to SB 32 consistency. The quantitative analysis for 2030 is based on a quantitative 2030 emissions target that aligns with the State target.

The quantitative analysis also uses a post-2030 emissions reduction goal that aligns with the State’s trajectory and scientific consensus. A discussion of these 2030 and post-2030 numerical reduction targets is provided below.

GHG Reduction Targets Used in This PEIR

The first method considers whether buildout of the proposed PMPU would result in a net increase in GHG emissions relative to baseline conditions. The second method considers numerical targets to determine whether new development under the proposed PMPU would generate emissions in line with the 2030 reduction target (SB 32) and post-2030 (EO B-55-18 and EO S-03-05) reduction goals.

Consistent with OPR (2018), an efficiency metric (e.g., emissions per capita, emissions per service population) allows agencies to compare projects of various types, sizes, and locations equally, and determine whether a project is consistent with the State’s reduction. Normalizing by the number of hotel rooms serves the same purpose, in that it allows the District to compare projects of various sizes equally.

Consistent with OPR and case law, the numerical efficiency targets used herein are based local emission reductions goals and development projections for 2020 from the District’s CAP, which are equal to 1990 levels, continued growth in development, and emission reductions required to meet the statewide reduction targets for 2030 and post-2030.

The numerical efficiency targets were estimated using the emission and development projections for the lodging sector within the District’s CAP for 2020. The 2030 and 2050 efficiency targets are based on the level of reductions and overall efficiency required to meet the 2030 reduction target (SB 32) and post-2030 (EO B-55-18 and EO S-03-05) reduction goals based on the lodging emissions goal for 2020 and the development projections for 2020 within the District’s CAP. Consistency with these numerical efficiency targets is used to determine impacts for new development under the proposed PMPU. Note that the new development under the proposed PMPU includes not only lodging, but also commercial uses—such as retail, restaurants, and meeting space—that support lodging (hotel) uses. Use of a lodging-specific target allows for all emissions to be captured in a single analysis.

The efficiency metric is based on the amount of emissions divided by the number of rooms, resulting in a metric on an emissions-per-room basis. The equation is shown below.

$$\text{Efficiency Metric (GHG per room)} = \frac{\text{Emissions}}{\text{Number of Hotel Rooms}}$$

For each analysis year, the level of emissions to achieve the fair share toward the statewide targets (numerator) and the number of hotel rooms (denominator) need to be estimated.

The District's CAP includes an inventory of baseline and future year emissions, square footage, occupied rooms, and lodging emissions for baseline (2006) and 2020 business-as-usual (BAU) conditions. The CAP also identifies the 2020 GHG reduction target (1990 levels, or 10 percent below 2006 levels).

The number of hotel rooms from the CAP for 2006 and 2020 serve as the basis for calculating the efficiency target for 2030, while the 2050 target is based on the State's carbon neutrality goal.

The calculation methods for emissions and hotel rooms and overall metric calculation is provided below.

Emission Targets

The CAP assumes 137,429 MTCO₂e from lodging based on 4,793 hotel rooms in 2006. The CAP assumes 249,852 MTCO₂e from lodging based on 8,927 hotel rooms in 2020. Based on these numbers, the following emission targets were calculated based on the statewide 2030 target and post-2030 goals:

- The 2020 reduction target for lodging uses is estimated to be 124,004 MTCO₂e, based on a 10-percent reduction in emissions from 2006 levels (137,429 MTCO₂e * (1-10 percent)). The 2020 reduction target represents the District's 1990 estimate, consistent with CARB's calculation approach for its 2020 target per AB 32.
- The 2030 reduction target for lodging uses is estimated to be 74,402 MTCO₂e, based on a 40-percent reduction in emissions from 1990 levels (124,004 MTCO₂e * (1-40 percent)), consistent with CARB's calculation approach for its 2030 target per SB 32.
- The 2050 reduction target for lodging uses is assumed to be 0 MTCO₂e, based on the statewide carbon neutrality goal for 2045.

Hotel Rooms

The CAP is based on 4,793 hotel rooms in 2006 and 8,927 hotel rooms in 2020. This rate of growth equates to 295 new rooms per year, and it was assumed that growth in hotel rooms over the life of the PMPU will be consistent with historical rate of growth. Based on this same rate of growth, the following room estimates were calculated:

- The 2030 estimate for hotel rooms is 11,880 hotel rooms, based on growth trends in the CAP.
- The 2050 estimate for hotel rooms is 17,786 hotel rooms, based on growth trends in the CAP.

Hotel Room Metric Calculation

As shown above, the efficiency metric is based on the level of emissions by the level of hotel rooms for each year, as follows:

- The 2030 efficiency metric target 74,402 MTCO₂e divided by the 11,880 hotel rooms, which equates to 6.3 MTCO₂e per room.
- The 2050 efficiency metric target 0 MTCO₂e divided by the 17,786 hotel rooms, which equates to 0.0 MTCO₂e per room.

The efficiency of emissions associated with the proposed PMPU are calculated in the same manner as the efficiency metrics. For each year, the level of emissions is divided by the number of hotel rooms assumed to be developed by 2030 and 2050, respectively.

Conflict with Plans, Policies, or Regulations for Reducing GHG

The threshold approach used to determine whether the proposed PMPU would conflict with plans, policies, or regulations for reducing GHG emissions is two-pronged for both the 2030 and 2050 analysis years. For threshold 2, impacts from the buildout of the proposed PMPU would be considered significant if the proposed PMPU would:

1. Conflict with regulatory programs outlined in the 2017 Scoping Plan and adopted by CARB or other California agencies for 2030.
2. Conflict with regulatory programs outlined in the 2017 Scoping Plan and adopted by CARB or other California agencies for post-2030.

The analysis for both 2030 and 2050 discusses whether or not the proposed PMPU would conflict with the regulatory programs outlined in existing CARB documentation for achieving reductions by 2030, as well as those that will continue to reduce emissions through 2050, including the District's CAP, the Scoping Plan, the Mobile Source Strategy, and other documents adopted or discussed by CARB or other California agencies. The proposed PMPU is considered consistent with these plans if the PMPU meets the general intent of these plans and does not obstruct attainment of the other plan's goals and policies. As discussed in Section 4.9, *Land Use and Planning*, the proposed PMPU is considered consistent with the provisions of the identified regional and local plans if it meets the general intent of the applicable plans. Additionally, in reaching such consistency conclusions, the District may also consider the consequences of denial of a project, which can also result in other policy inconsistencies. The analysis below provides a brief overview of the most relevant planning documents and their primary goals. However, the District's consistency conclusions are based upon the planning documents as a whole.

4.6.4.3 Proposed PMPU Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to reduce or avoid impacts associated with consistency with GHG reduction targets and goals and are considered in the impact analysis that follows.

Mobility Policy 1.1.8. The District shall coordinate with agencies that have transportation authority, and with adjacent jurisdictions and permittees, to plan shared mobility infrastructure in support of the safe movement of people and/or goods. Specific transit improvements included in this Plan are outlined in *Chapter 5, Planning Districts*, including any planned improvements within the applicable planning district or subdistrict.

Mobility Policy 1.1.9. The District shall coordinate with agencies that have transportation authority to explore opportunities to expand accessible transit service to Tidelands. Specific transit improvements included in this Plan are outlined in *Chapter 5, Planning Districts*, including any planned improvements within the applicable planning district or subdistrict.

Mobility Policy 1.1.11. The District shall require certain development, as applicable, to develop and comply with project-specific Transportation Demand Management (TDM) guidelines ~~and require development to comply with such guidelines~~, with the intent to reduce dependence on single-occupancy vehicles and reduce miles traveled to, ~~and from, and within Tidelands the proposed development site. All proposed development shall also be required to provide a project-specific TDM program in accordance with the District's guidelines.~~

Mobility Policy 1.1.16. Through CDPs issued by the District, permittees shall advance as part of development the implementation of zero-emission mobility options, when feasible, and near-zero-emission passenger-related mobility options and supportive infrastructure improvements for the movement of people in alignment with District sustainability and maritime clean air strategies.

Mobility Policy 1.1.19. The District shall prepare a curbside management program that will provide strategies and guidelines for the use of curb space along corridors fronted by predominantly commercial uses.

Mobility Policy 1.1.20. Development shall implement curbside management strategies in accordance with the District's curbside management program, once established.

Mobility Policy 2.2.3. The District shall engage with stakeholders, such as railway companies, trucking companies, cargo and freight shipping lines, and service providers to identify and implement feasible sustainable freight strategies in accordance with District's environmental and operational strategies, plans, and regulations, as well as the State's sustainability objectives.

Mobility Policy 2.2.4. The District shall engage with railroad operators and agencies that have transportation authority to maintain, enhance, and expand access between the cargo terminals and the regional freight infrastructure.

Mobility Policy 2.2.5. The District, in coordination with permittees of development, tenants, and adjacent jurisdictions, and regional transportation agencies, shall maintain and develop improvements to linkages between the marine terminals and landside networks, including but not limited to, roadways, rail, and pipelines, to enable efficient movement of goods along those networks and to support the working waterfront.

Mobility Policy 2.2.6. The District and permittees shall optimize off-terminal land-based freight networks to maintain, enhance, and expand the vitality of the working waterfront.

Mobility Policy 2.2.7. In coordination with operators and stakeholders, the District shall plan for improvements to railroad corridors, such as spurs, rail storage facilities, switching facilities, and suitable rail trackage within the working waterfront, both on dock and near dock, to better interface the movement of cargo between ship and land carriers.

Ecology Policy 3.1.1. Permittees shall implement programs and activities that reduce exposure to toxic air contaminants and criteria air pollutants in and adjacent to Tidelands.

Ecology Policy 3.1.2. The District shall encourage development to implement clean air action measures such as:

- Efficient buildings design features
- Alternative powered vehicles, vessels and advanced technologies
- Parking management programs

- Alternative transportation programs
- Energy efficient lighting
- Native tree planting and landscaping

Ecology Policy 3.1.3. In cooperation with regional, state, and federal agencies, the District shall advance maritime clean air strategies to help improve local air quality.

Ecology Policy 4.2.1. The District shall establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources, and how to protect them.

SR Policy 3.1.1. The District shall periodically update its climate action goals and targets to ensure alignment with this Plan and with the District and State goals and targets for greenhouse gas emissions and shall start to update these goals and targets no later than two years of the effectiveness of the certification of this Plan, and may periodically update them thereafter.

SR Policy 3.1.2. The District shall encourage, support, and plan to deploy net zero carbon emission projects and technologies on Tidelands.

SR Policy 3.1.4. The District shall explore innovative carbon sequestration potential with partner agencies within the region to offset GHG emissions.

EJ Policy 3.2.2. Maritime development shall transition to clean, modern, and operationally efficient marine terminal facilities and working waterfront businesses based on feasibility and best available science.

The following proposed PMPU policies would have the potential to avoid or reduce impacts associated with energy and are considered in the impact analysis that follows.

SR Policy 3.1.3. Permittees of development shall deploy renewable energy technology to improve energy reliability and economic resilience, where feasible.

SR Policy 3.1.5. The District shall continue to coordinate with Tidelands' tenants and adjacent local businesses to reduce resource consumption and promote sustainable operations.

SR Policy 3.1.6. The District shall promote the innovative use of "green" design for new or retrofitted Tidelands' buildings, structures, and facilities.

SR Policy 3.1.7. Development shall include water conservation strategies to save water and energy on-site, where feasible.

ECON Policy 1.2.4. The District shall explore the creation of, and allow for the use of, different financing mechanisms to help fund the building of new infrastructure or improvement to existing infrastructure, including multimodal transportation facilities, water and stormwater systems, information and communication systems, and public space.

ECON Policy 2.3.2. The District and permittees shall coordinate the investment in improvements to marine terminal and maritime industrial operations that improve functionality and efficiency through modernization of terminal infrastructure and equipment, including electrification that supports optimization of cargo movement and reduces emissions.

4.6.4.4 Project Impacts and Mitigation Measures

Threshold 1: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Impact Analysis

Impacts of Water and Land Uses

Construction and operation of the proposed PMPU would have the potential to create significant impacts associated with the emission of GHGs. A discussion of project-related impacts is presented below.

Construction

The proposed PMPU serves as a long-term planning blueprint for future development within several planning districts. Approval of the PMPU would not include approval of any specific development project, including the construction of any buildings or infrastructure. It is reasonably foreseeable, however, that future construction activities would result from future development projects that meet the water and land use designation requirements and abide by the policies and standards set forth by the proposed PMPU. Specifically, buildout of the proposed PMPU would include the construction of new hotels and lower cost accommodations, restaurants, park space and promenades, retail, convention and meeting space, and other uses that either are water dependent or help to enhance the waterfront experience. In-water uses would include additional vessel activity associated with more slips and docks with waterside uses that include anchorage, commercial fishing berthing, industrial and deep-water berthing, marine services berthing, navigation corridors, recreational berthing, and sportfishing berthing facilities. Although implementation of the proposed PMPU would increase the construction activity in the proposed PMPU area, buildout of the proposed PMPU would take place over a long-range timeframe, and construction activities would occur periodically throughout that timeframe.

Table 4.6-10 presents the estimated construction emissions from implementation of the proposed PMPU assuming construction of all proposed development shown in Table 4.2-12 and 4.2-15 of Section 4.2. Emissions are amortized over the 30-year life of the proposed PMPU and added to the operational emissions below.

Table 4.6-10. Construction GHG Emission Estimates Associated with All Development– Unmitigated (total metric tons for all construction)

Phase	MTCO₂e
Demolition	1,285
Site Preparation	209
Grading	872
Building Construction	55,746
Paving	274
Architectural Coating	327
Waterside Construction	4,267
Total Emissions	62,981
<i>Amortized (Annual) Emissions</i>	<i>2,099</i>

Source: Appendix C.

Note: Emissions may not add exactly due to rounding. Assumes all development amortized equally over 30-year period.

MTCO₂e = metric tons of carbon dioxide equivalent.

As shown in Table 4.6-10, the majority of GHG emissions during construction would result from equipment vehicles associated with building construction as well as equipment associated with waterside construction, which is assumed to involve numerous in-water and landside construction pieces, such as tugboats, pushboats, small support boats, and cranes. Each slip project is assumed to take 3 months, and it is assumed that only one such project would occur at a time.

Note that construction emissions would primarily occur in PD2 and PD3, as they would see the most development under the proposed PMPU.

The quantitative modeling above represents potential scenarios for how construction may occur. However, the proposed PMPU is a long-range plan that does not propose any specific development projects and, therefore, does not include a specific buildout schedule. Instead, the exact timing and sizes of future development under the proposed PMPU would be driven by market conditions, and construction of future land use developments would occur intermittently throughout the course of the buildout period. Construction of landside uses would result in emissions due to construction equipment exhaust, haul and delivery trucks, and worker vehicles. Construction of waterside uses may be passive and not include much activity, while some, such as activities to construct additional slips, would include use of in-water equipment such as tugboats, survey vessels, skiffs, and other types of equipment to remove, move, and install waterside features. Construction emissions for individual projects would be temporary, and the total duration would vary from project to project. As the timing and intensity of future development projects is as yet unknown, the precise effects of construction activities associated with buildout of the proposed PMPU cannot be determined at this time. Potential impacts associated with the GHG emissions from the construction of individual future projects would be analyzed on a case-by-case basis as part of future CEQA analyses of individual future projects pursuant to State CEQA Guidelines Section 15168.

Given the current lack of information regarding the timing and design of future construction projects, it is uncertain whether construction activities from individual components would result in emissions that would be consistent with State reduction targets. Given the cumulative nature of GHG emission and climate change, effects of construction-related GHG emissions are not analyzed in

isolation, but are instead amortized over the 30-year life of the proposed PMPU and combined with the effects of long-term operations below.

Operation

Table 4.6-11 summarizes emissions by source compared against the numerical targets associated with new development under the proposed PMPU assuming construction of all proposed development shown in Tables 4.2-12 and 4.2-15 of Section 4.2. As shown, new development would exceed the numerical efficiency targets in both 2030 and 2050. This is considered a significant impact prior to mitigation (**Impact-GHG-1**).

Table 4.6-11. Unmitigated Operational Emissions Associated with New Development under the PMPU Buildout (MTCO₂e per year)

Sector	Source	2030 Unmitigated	2050 Unmitigated
Land Use Development	Mobile	3,143	6,620
	Electricity	6,103	0
	Natural Gas	8,781	21,406
	Water	425	358
	Waste	1,340	3,268
Boating	Recreational Boating	266	743
	Commercial Fishing	48	119
<i>Amortized Construction</i>		<i>2,099</i>	<i>2,099</i>
Total Annual for All Development		22,205	34,614
Number of Occupied Rooms		1,604	3,910
Emissions Per Room (MT/Room)		13.8	8.9
Threshold (MT/Room)		6.3	0.0
Target Met?		No	No

The proposed PMPU would achieve additional GHG reductions through policies that encourage alternative transportation, efficient building design, sustainable freight, and other GHG-reducing measures. However, GHG emissions reductions of these strategies were not quantified because the exact number of installed systems, affected structures, and affected visitor trips is currently unknown.

New development would primarily occur in PD2 and PD3. As shown in Table 4.6-11, emissions from new development would increase in both 2030 and 2050. Moreover, the increase in GHG emissions would exceed the efficiency target for both 2030 and 2050, which would be considered a significant impact prior to mitigation for both 2030 and 2050 (**Impact-GHG-1**).

Land use development would increase over time, resulting in an increase in emissions in PD1, PD2, PD3, PD4, PD8, PD9, and PD10. While emissions on a per unit or activity basis (e.g., per vehicle mile traveled) decrease over time as vehicles and vessels become more efficient, emissions would still increase because the increase in activity would outweigh the decrease in emissions on a per-activity basis.

The increase in emissions would be associated with new motor vehicle trips, energy use, waste disposal and water consumption, recreational boating, and commercial fishing.

Emissions from land use development are tied to the increase in vehicle trips and utility consumption associated with new hotel uses, restaurant uses, and meeting space. Emissions per unit of activity from these sources would decrease over time due to implementation of regulations to improve fuel economy and increase renewables in the electrical grid, but the increase in activity associated with buildout under the proposed PMPU still results in an increase in GHG emissions. Emissions from land use development would primarily occur in PD2 and PD3, with minor amounts in PD8.

The increase in emissions from recreational boating is due entirely to the increase in the number of slips to be added in PD1, PD2, PD3, PD9, and PD10. There are currently no regulations in place to reduce GHG emissions from recreational boating. As discussed in Section 4.2, CARB is working on a recreational marine vessel regulation to limit emissions from marine engines that contribute to air quality violations, but it is unclear at this point if this regulation would reduce fuel consumption or GHG emissions. Rulemaking for this is expected to take a few years (CARB 2021a).

The change in fishing would increase emissions over time in PD1, due to the increase in slips. The change in recreational boating would increase emissions over time in PD1, PD2, PD3, PD9, and PD10 due to the increase in slips. For both fishing and recreational boating, the increase in emissions is due solely to the increase in activity. There are currently no regulations in place to reduce emissions from commercial fishing or sport fishing. As of 2021, the existing CARB Commercial Harbor Craft rule (CARB 2008) exempts various harbor craft from the rule, including, but not limited to, commercial fishing, sport fishing (called *commercial passenger fishing* in all of CARB's rulemaking), work boats, and pilot vessels. CARB's most recent Proposed Concepts for Commercial Harbor Craft proposed extending the rule to sport fishing, commercial fishing, work boats, and pilot vessels (CARB 2021c). This rule would require all in-use sport fishing vessels to be equipped with Tier 4 engines by 2030 at the latest, all commercial fishing vessels to be equipped with Tier 2 engines between 2030 and 2032, and all harbor craft to use renewable diesel. This rule ~~is expected to be considered~~ was adopted by the CARB board in early March 2022, and ~~take took~~ took effect in January 1, 2023. Because this rule ~~is currently was~~ is currently in draft form at the time of the Draft EIR, the associated emissions reductions are not quantified.

The increase in operational GHG emissions associated with PMPU buildout would not occur immediately and all at once, but would instead occur incrementally over time as statewide emissions decline and regulations to reduce emissions from Port-related sources take effect.

As noted, **Impact-GHG-1** would be significant. **MM-AQ-2**, **MM-AQ-3**, and **MM-AQ-6** through **MM-AQ-12**, which are proposed to mitigate air quality and health risk impacts (Section 4.2), also would reduce GHG emissions associated with buildout of the proposed PMPU. A discussion of operational mitigation measures and their effect on GHG emissions is presented below.

- **MM-AQ-2** requires construction best practices, including maintaining construction equipment in proper working condition, minimizing idling time, and promoting measures to reduce construction worker commute trips. While these measures could reduce GHG emissions by ensuring equipment is operating as efficiently as possible, the extent of emission reductions due to **MM-AQ-2** cannot be quantified and is likely to be small in scale.
- **MM-AQ-3** requires all off-road equipment to use renewable diesel fuel and meet Tier 4 emissions standards, depending on when construction occurs. These measures could marginally reduce GHG emissions and improve fuel economy because modern equipment incorporates efficient design that reduces fuel consumption. There are no quantifiable GHG reductions

associated with higher tiered engines but there are marginal fuel economy benefits due to their efficient design. Furthermore, this measure requires the use of zero or near-zero emission construction equipment as it becomes commercially available over the life of the proposed PMPU.

- **MM-AQ-6** requires all harbor craft or dredgers used to construct new slips to use renewable diesel fuel and meet Tier 3 or 4 emissions standards, or use zero emission pieces, depending on when construction occurs and the availability of pieces. These measures would reduce GHG emissions if zero emission fully electric pieces are used. As fully electric harbor craft become more prevalent, their usage during construction activities will increase. GHG reductions cannot be quantified given that specific construction timing and fleet mix are unknown at this time.
- **MM-AQ-7** is related to **MM-AQ-6** in that this measure obligates the District to track the rollout of zero or near-zero (i.e., hybrid) harbor craft pieces both within San Diego Bay and within nearby ports. Zero or near-zero (i.e., hybrid) harbor craft pieces substantially reduce (or eliminate) all GHG emissions. Their usage over time will increase as new pieces become available within the Bay and nearby. GHG reductions are potentially substantial, but cannot be quantified given that specific construction timing and fleet mix are unknown at this time.
- **MM-AQ-8** requires future project proponents to document and track activities and emissions to ensure that projects do not exceed daily thresholds individually or in combination with other projects being implemented as part of the proposed PMPU. These measures require reporting to the District and changes to the overall construction schedule if emissions would exceed thresholds.
- **MM-AQ-9** requires all tenants to implement sustainability measures in building design ~~through 2030~~, **MM-AQ-10a** requires all new hotels constructed prior to 2030 to use electric energy only, and **MM-AQ-10b** requires all development to be carbon neutral after 2030. Both measures will reduce emissions from new development by reducing energy and water consumption and waste generation. The push for carbon neutral design will increase over time and become more standard practice during the life of the proposed PMPU. This measure has been quantified and assumes that, in 2030, new hotel uses only consume natural gas associated with cooking, which reduces natural gas consumption from new hotels 90 percent, or reduces emissions equivalent to this reduction through implementation of other strategies. Beyond 2030, it is assumed that all new development will be carbon neutral and will not increase natural gas consumption beyond that assumed in 2030.
- **MM-AQ-11** requires the District to develop and implement an EV charging program, and to require future development to incorporate EV charging into project design. Installing EV chargers is a supplemental measure in that it does not directly reduce emissions itself, but instead supports local, regional, and statewide efforts to increase usage of zero emission electric vehicles. While the emission reductions associated with this measure have not been quantified in the mitigated emissions analysis because details regarding this measure (e.g., location, usage per day) have not yet been developed, a preliminary estimate is that ~~the achieving a possible addition of up to 421 publicly accessible chargers in-by~~ 2030 could reduce new GHGs by 2.3 percent, and ~~the achieving a possible addition of up to 507 publicly accessible chargers in-by~~ 2050 could reduce new GHGs by 1.4 percent assuming all new vehicle trips have access to these chargers (i.e., they are in high-traffic areas) and assuming four vehicles access each charger on a daily basis (CARB 2019b, NREL 2014). While these emission reductions are shown here, the emission reductions have not been applied to mitigated emissions analysis.

- **MM-AQ-12** requires marina operators to install dockside electrical infrastructure for boats to plug into when docked. CARB notes that there are opportunities to electrify many recreation boats, specifically small outboard engines (less than 19 kW). Many of these options are drop-in ready. The marina operators shall install dockside electrical infrastructure and will promote public awareness. This measure will reduce all emission types. This measure has not been quantified because the specifics regarding this measure have not yet been developed.

A large portion of baywide electricity is purchased through Direct Access, which refers to electricity purchased directly from an electric service provider instead of a regulated electric utility, like SDG&E. In many cases, if the sources of energy from the electric service provider are unknown, a default emission rate from CPUC is assumed. This default emission rate is much higher than SDG&E's emission rate.

- **MM-GHG-1** requires all future tenants to ensure that all electricity obtained is completely provided by renewable sources (i.e., carbon free) by 2030. This will ensure that electricity-related emissions trend down over time and faster than the SDG&E grid, which has a 2045 timeline for net-zero grid generation.
- **MM-GHG-2** requires the District to replace its fleet with zero emissions vehicles by 2030, or when commercially available for specialized fleet vehicles, as fleet vehicles are retired. Over time this will lead to a decrease in GHGs eventually down to zero overall emissions once the fleet is fully replaced. This measure has not been quantified because specifics regarding which existing vehicles are replaced, and when specialized fleet vehicles will be available, is not yet known.

Other efforts are underway that will help to reduce emissions from the proposed PMPU, as described below.

The MCAS is discussed in detail in Section 4.2, and includes various air quality and GHG emission reduction goals, with strategies to achieve those goals. Most of the measures in the MCAS go beyond regulatory requirements, and will achieve emission reductions at the District's two cargo terminals; the Cruise Ship Terminal (CST); along the entire Working Waterfront; and with the District's fleet of vehicles, equipment, and marine vessels. The Draft Revised MCAS was released for public review in August 2021, and was adopted by the District Board in October 2021. The goals and strategies will guide the District's investments in zero emissions technology and electrification and will allow the District to help tenants and terminal operators prioritize replacements over time. As noted in the MCAS document, the MCAS is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. The MCAS focuses on maritime and shipyard activities. Measures from both the MCAS and potentially the CERP will be applicable to new projects as they arise.

Numerous PMPU policies and objectives will support GHG reduction efforts. Specifically, SR Objective 3.1 states that the District will aim to reduce GHG emissions and support pathways toward carbon neutrality. SR Policy 3.1.1 states that the District shall periodically update ~~the District's CAP~~ its climate action goals and targets to ensure alignment with this Plan and with the District and State goals and targets for GHG emissions, shall start ~~the CAP's to update these goals and targets~~ no later than within 2 years of the effectiveness of the certification of this Plan, and may periodically update the District's CAP them thereafter.

While the MCAS [a non-binding strategic plan], future updates to the District's climate action goals and targets, and other District efforts are likely to result in emission reductions over the life of the proposed PMPU, the effects of the GHG emission reductions that may result from these efforts cannot be quantified at this time because the timing and other specific details about the implementation of these efforts are not known at this time. Additionally, the MCAS implementation is based on certain assumptions including, but not limited to, technology capability, deployment of zero emission infrastructure, commercial availability of zero emissions equipment and vehicles, and financial assistance with capital expenditures to offset cost of zero emission vehicles and equipment.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact associated with the generation of GHG emissions that would exceed the reduction targets for both 2030 and 2050 (**Impact-GHG-1**). This significant impact would still occur within PD3 under Option 1, as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 analyzed above, and operations that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1 would not include new uses that generate substantial emissions, and would not change the construction and operational assumptions. GHG emissions associated with reconfiguring and closing of North Harbor Drive, construction of a Waterfront Destination Park, and other improvements to open space would be similar to the analysis above. Option 1 could result in construction and operational emissions that are similar to those identified for the proposed project and, therefore, could generate GHG emissions that would exceed the reduction targets for both 2030 and 2050, which would be considered a significant impact (**Impact-GHG-1**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact associated with the generation of GHG emissions that would exceed the reduction targets for both 2030 and 2050 (**Impact-GHG-1**). This significant impact would still occur within PD3 under Option 2, as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 analyzed above, and operations that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include new uses that generate substantial emissions and would not change the construction and operational assumptions. Operation of additional Recreation Open Space and the expansion of the Lane Field Setback Park would be similar to the analysis above. Option 2 could result in construction and operational emissions that are similar to those identified above and, therefore, could generate GHG emissions that would exceed the reduction target for both 2030 and 2050, which would be considered a significant impact (**Impact-GHG-1**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact associated with the generation of GHG emissions that would exceed the reduction targets for both 2030 and 2050 (**Impact-GHG-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 analyzed above, and operations that would occur for Option 3 would fall within the range of scenarios analyzed above. Option 3 would not include new uses that generate substantial emissions and would not change the construction and operational assumptions. GHG emissions associated with realignment of North Harbor Drive and the additional Recreational Open Space would be similar to the analysis above. Option 3 could result in construction and operational emissions that are similar to those identified above and, therefore, could generate GHG emissions that would exceed the reduction target for both 2030 and 2050, which would be considered a significant impact prior to mitigation (**Impact-GHG-1**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Tenth Avenue Marine Terminal

Since the TAMT EIR was certified in December 2016, several regulations have been adopted that will affect long-term GHG emissions at TAMT. Note that the proposed PMPU would not result in any changes in land use or cargo throughput at TAMT. Existing maritime activities would be unaffected, and any future improvements at TAMT would be subject to mitigation measures in the TAMT PEIR.

In June 2020, CARB adopted the Advanced Clean Truck Regulation, which promotes zero-emission technology penetration with sales requirements for medium- and heavy-duty truck manufacturers. In August 2020, CARB expanded the At Berth Regulation to other vessels, although the impact on TAMT may be small given that container ships were already covered and TAMT rarely if ever sees the type of vessels that were added (roll-on/roll-off, auto carries, tankers). In September 2020, Governor Newsom signed EO N-79-20, which established various zero-emission goals, including a goal that 100 percent of new passenger car and trucks sales be zero-emission by 2035, all drayage trucks be zero-emission by 2035, all off-road equipment be zero-emission where feasible by 2035, and the remainder of medium- and heavy-duty vehicles be zero-emission where feasible by 2045. Under the EO, CARB is tasked to work with other State agencies to develop regulations to achieve these goals while accounting for technological feasibility and cost effectiveness. While the goals

under this EO are not law, it is likely that CARB will adopt rules per this EO in the coming years (CARB 2017a). These regulations are discussed in Section 4.2 as well.

Additionally, CARB adopted or proposed other measures or orders aimed specifically at reducing GHG emissions and moving towards decarbonization of the economy. In 2018, the Governor adopted EO B-55-18, which established a new statewide goal of achieving carbon neutrality no later than 2045. Also adopted in 2018, SB 100 establishes a goal of 100 percent zero-carbon energy sources by 2045.

These regulations will affect emissions from TAMT in several ways. In particular, the emission estimates associated with buildout of the TAMT Redevelopment Plan in 2035 are likely overstated in that regulations to reduce emissions from vessels, trucks, and electricity from both shore power and other uses do not incorporate the newly adopted rules that will require substantially reduced emissions. Over the long-term, emissions from some sources, such as trucks and shore power, may effectively be zero, which was not assumed in the TAMT EIR.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not generate GHG emissions that would have a significant impact on the environment or conflict with the State's emission reduction target for 2030 (project-adjusted to 33 percent), the State's 80 percent emission reduction goal for 2050, or the State's carbon neutrality goal for 2045. Rather, the proposed PMPU policies listed in Section 4.6.4.3, *Proposed PMPU Policies that May Avoid or Reduce Impacts*, would reduce potential impacts related to GHG emissions by:

- Committing the District to require project proponents of certain future development to develop and comply with project-specific developing TDM guidelines and requiring development to comply with such guidelines, with the intent to reduce dependence on single-occupancy vehicles and reduce VMT to, and from, and within Tidelands the proposed development site (Mobility Policy 1.1.11).
- Engaging with stakeholders—such as railway companies, trucking companies, cargo and freight shipping lines, and service providers—to identify and implement feasible sustainable freight strategies in accordance with the District's environmental and operational strategies, plans, and regulations, as well as the State's sustainability objectives (Mobility Policy 2.2.3).
- Maintaining and developing improvements to linkages between the marine terminals and landside networks—including but not limited to roadways, rail, and pipelines—to enable efficient movement of goods along those networks and to support the working waterfront (Mobility Policy 2.2.5).
- In coordination with operators and stakeholders, planning for improvements to railroad corridors—including but not limited to spurs, rail storage facilities, switching facilities, and suitable rail trackage within the working waterfront, both on dock and near dock—to better interface the movement of cargo between ship and land carriers (Mobility Policy 2.2.7).
- Requiring, where feasible, efficient and sustainable dockside operations for ocean-going vessels and freight-related harbor craft (Mobility Policy 2.1.4).
- Encouraging development to implement clean air action measures such as efficient building design features; alternative-powered vehicles, vessels, and advanced technologies; parking

management programs; alternative transportation programs; energy-efficient lighting; and native tree planting and landscaping (Ecology Policy 3.1.2).

- Reducing GHG emissions and supporting pathways toward carbon neutrality throughout Tidelands by powering future development with renewable energy, reducing energy consumption, and exploring carbon sequestration potentials (SR Policies 3.1.1 to 3.1.5).

Impact Determination and Mitigation

Implementation of the proposed PMPU would result in significant impacts associated with GHG emissions.

Significant Impacts

Impact-GHG-1: Inconsistency with the Statewide Reduction Target for 2030 (Project-Adjusted) and Goal for 2050. Proposed PMPU buildout emissions would be inconsistent with the statewide reduction 2030 target and 2050 goal. Therefore, the contribution of PMPU-related GHG emissions is considered significant.

Mitigation Measures

For **Impact-GHG-1**:

Implement **MM-AQ-2**, **MM-AQ-3**, and **MM-AQ-6** through **MM-AQ-12**, as described under Threshold 2 in Section 4.2, *Air Quality and Health Risk*.

Implement **MM-TRA-1** through **MM-TRA-3**, as described under Threshold 2 in Section 4.14, *Transportation, Circulation, and Mobility*.

MM-GHG-1: Secure All Electricity from Renewable Sources. Prior to the District's approval operation of any future development Commercial Recreation land use designation projects under the proposed PMPU, the project proponent shall ensure that all non-emergency electricity used by the project obtained is provided by renewable sources by 2030. Emergency conditions in this case are defined as loss of power to the tenant or District facilities, under which circumstances generators may be used for a short duration until normal functions return. Renewable energy is defined as energy from a source that is not permanently depleted when used, such as solar power. Tenants shall submit evidence of compliance with this requirement annually to the District's ~~Development Services Department~~. This can be met by purchasing and installing renewable energy systems, entering into power purchase agreements with renewable energy providers, or by opting into carbon-free electricity through an offsite provider, ~~such as Direct Access.~~

MM-GHG-2: Replace Fossil-Fueled Vehicles and Equipment with Zero Emission Purchase Alternative Fuel, Electric, or Hybrid Vehicles and Equipment. As vehicles are retired, Tthe District shall replace all fossil-fueled on-road vehicles in its fleet with zero-emission vehicles ~~by 2030.~~ For fossil-fueled on-road vehicles still operating past 2030, the District shall deprioritize their operation in favor of ZE vehicles until all fossil-fueled on-road vehicles have been replaced with ZE vehicles. For specialized equipment where zero-emission vehicles are not commercially available, the District shall replace such specialized all on-road vehicles in its fleet as they are retired, with the lowest emitting option commercially available.

Level of Significance After Mitigation

As shown in Table 4.6-12, after implementation of **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, and **MM-GHG-1** and **MM-GHG-2**, the proposed project would result in emissions below the numerical target in 2030 but above the carbon-neutrality goal in 2050. However, because CARB has not formally adopted a plan to achieve the carbon neutrality goal set by EO B-55-18, it cannot be stated with certainty that the project would result in emissions that would represent a fair share of the requisite reductions toward the statewide carbon neutrality goal. Therefore, **Impact-GHG-1** would be considered significant and unavoidable after mitigation.

Table 4.6-12. Mitigated Operational Emissions Associated with New Development Under the PMPU Buildout (MTCO_{2e} per year)

Sector	Source	2030 Mitigated	2050 Mitigated
Land Use Development	Mobile	2,610	5,548
	Electricity	0	0
	Natural Gas	2,058	2,058
	Water	340	286
	Waste	1,340	3,268
Boating	Recreational Boating	266	743
	Commercial Fishing	48	119
<i>Amortized Construction</i>		<i>2,099</i>	<i>2,099</i>
Total Annual for All Development		8,761	14,122
Number of Occupied Rooms		1,604	3,910
Emissions Per Room (MT/Room)		5.5	3.6
Threshold (MT/Room)		6.3	0.0
Target Met?		Yes	No

Source: Appendix C.

Threshold 2: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact Analysis

Impacts of Water and Land Uses

Implementation of the proposed PMPU would have the potential to conflict with relevant plans, policies, and regulatory programs that aim to reduce GHG emissions. This analysis qualitatively discusses the proposed PMPU's consistency with relevant plans, including the District's CAP; the CARB 2017 Scoping Plan; and other plans, policies, and regulatory programs adopted, drafted, or recommended by CARB and other agencies.

District CAP

The District's CAP includes numerous measures to reduce GHG emissions from District operations, including both maritime and landside sources. The CAP also considers growth in District-wide activities from all sectors (e.g., maritime, lodging). As discussed above under Threshold 1, the

proposed PMPU is expected to result in an increase in activities due to changes in water and land uses within the District. Emissions associated with these changes in activity would result from electricity and natural gas consumption, passenger vehicle travel, water consumption, waste and wastewater generation, recreational boating, and commercial fishing.

The District's CAP includes reduction quantification to meet the 2020 statewide GHG reduction target from AB 32. Many of the measures in the existing CAP will continue to be implemented and result in emission benefits well beyond the 2020 timeframe, and many of the current measures will serve as a starting point in the development of post-2020 reduction measures.

Project consistency with relevant CAP measures is compared in Table 4.6-13. It is not the purpose of the PMPU to "implement all the reduction measures" in the CAP. Instead, the Threshold cited on Draft EIR page 4.6-50 asks whether the project would "Conflict with an applicable plan." As shown in Table 4.6-13, and as discussed on Draft EIR page 4.6-38, "[t]he proposed PMPU is considered consistent with these plans if the PMPU meets the general intent of these plans and does not obstruct attainment of the other plan's goals and policies." (See also *City of Long Beach v. City of Los Angeles* (2018) 19 Cal.App.5th 465, 491-494 [Port rail project which increased emissions levels, was consistent with state GHG goals.] The PMPU would not obstruct the Climate Action Plan and impacts would be less than significant. ~~Future development that could occur under the proposed PMPU would not be consistent with the CAP because it would not implement all of the reduction measures, which is considered a significant impact (Impact-GHG-2). Future development under the proposed PMPU would be required to implement mitigation measures to ensure consistency with the District's CAP. These measures include relevant emission-reducing measures from the District CAP that reduce emissions through the incorporation of green building practices (MM-AQ-9, and MM-AQ-10), and that require the facilitation (MM-AQ-12) and purchase of zero-emission vehicles (MM-GHG-2).~~ Moreover, future development that could occur under the proposed PMPU would be subject to all applicable mitigation measures identified herein, and design features that reduce GHG emissions will be required as conditions of approval in the Coastal Development Permits issued for such future projects.

Implementation of mitigation would ensure that future development allowed under the proposed PMPU is consistent with the applicable GHG reduction measures in the District's CAP.

Table 4.6-13. Project Consistency with Relevant District CAP Measures

No.	District CAP Measure Description	Project Consistency Analysis
Transportation and Land Use		
TA1	Support and promote the use of alternate fuel, electric, or hybrid District-owned vehicles and vessels (also includes cargo handling equipment, terminal and stationary equipment).	Consistent Before Mitigation. <u>The PMPU would not obstruct CAP measure TA1. The District has electrified various pieces of equipment at each of its marine terminals. Both the MCAS and CERP will further electrification and emission reduction efforts. Moreover, various proposed PMPU policies support renewable and zero-emission goals, such as SR Policy 3.1.2, which obligates the District to encourage, support, and plan to deploy net zero carbon emission projects and technologies on Tidelands. Additionally, MM-GHG-2 requires the District to <u>replace fossil-fueled vehicles and equipment with zero emission vehicles and equipment</u> purchase alternate fuel, electric, or hybrid</u>

No.	District CAP Measure Description	Project Consistency Analysis
		passenger vehicles. MM-AQ-11 requires the District to install electric vehicle charging stations. MM-TRA-3 requires new development to implement TDM measures.
TA2	Support and promote non-District-owned vehicles and vessels to achieve the lowest emissions possible, using a mix of alternative fuel, electric, or hybrid technology.	<p>Consistent Before Mitigation.</p> <p>See TA1.</p> <p>In addition, MM-AQ-6 requires the District to work with tenants to monitor and track alternate fuel or zero-emission harbor craft, dredgers, and other equipment. MM-AQ-7 requires the District to perform annual technological reviews to track roll-out and availability of zero-emission construction equipment.</p>
TA3	Implement emissions reduction strategies at loading docks through electrification of docks or idling-reduction systems for use while at loading docks.	<p>Consistent After Mitigation.</p> <p><u>Implementation of the PMPU would not obstruct TA3. Additionally, MM-AQ-2</u> requires all construction vehicles, including delivery trucks, to limit idling times to 3 minutes, which is beyond that required by State law.</p>
TA4	Electrification of marinas.	<p>Consistent After Mitigation.</p> <p><u>Implementation of the PMPU would not obstruct TA4. Additionally, MM-AQ-123</u> ensures that any marina or yacht club expansion will include infrastructure to ensure large yachts can utilize shore power while at berth.</p>
TR1	Implement traffic and roadway management strategies to improve mobility and efficiency, and reduce associated emissions on general roadways within District Tidelands.	<p>Consistent Before Mitigation.</p> <p><u>The PMPU would not obstruct CAP measure TR1. Mobility 1.1.11</u> requires the District to develop TDM guidelines and require development to comply with such guidelines.</p> <p>In addition, MM-TRA-1 requires the District to develop an impact fee and implement a VMT infrastructure mitigation program, consistent with ECON Policy 1.2.6, to fund <u>multi-modal</u> transportation infrastructure improvements that would reduce VMT <u>within the District</u>. MM-TRA-2 requires project proponents to <u>complete project-level VMT analysis and identify associated mitigation measures for VMT impacts. This could include participation in the District's VMT Infrastructure Mitigation Program (MM-TRA-1) or by implementation of VMT-reducing infrastructure that fully mitigates the project's VMT-related impacts make a fair share contribution to the District-implemented impact fee program to develop and expand VMT reducing infrastructure, including mobility hubs.</u> MM-TRA-3 requires future project proponents to implement a TDM Plan. These measures would improve mobility and efficiency by reducing vehicle trips and promoting alternative forms of transportation.</p> <p>In addition, EJ Policy 3.2.32 requires permittees, through CDPs issued by the District, to pursue electrification of marine terminal and working</p>

No.	District CAP Measure Description	Project Consistency Analysis
		waterfront operations, including drayage trucks, prioritizing the facilities adjacent to Portside Communities-disadvantaged communities.
TR3	Vehicle Idling: Enforce State idling laws for commercial vehicles, including delivery and construction vehicles.	Consistent Before Mitigation. See TA3.
TL1	Promote greater linkage between land uses and transit, as well as other modes of transportation.	Consistent Before Mitigation. See TR1.
TL2	Increase bicycling and walking opportunities (safe infrastructure to priority destinations) as an alternative to driving.	Consistent Before Mitigation. See TR1.
TT1	Encourage expansion of the transit network; both passenger transit and rail freight transportation.	Consistent Before Mitigation. See TR1.
TT2	Encourage increased transit performance (e.g., frequency and speed).	Consistent Before Mitigation. See TR1.
TT3	Encourage implementation of transit access improvements.	Consistent Before Mitigation. See TR1.
TV1	Implement trip reduction programs, such as: ride sharing, telecommuting and alternative work schedules; commute trip reduction marketing; and employer-sponsored vanpool/shuttle.	Consistent Before Mitigation. See TR1.
Energy Conservation and Efficiency		
EB1	Establish green building standards and/or policy for new construction.	Consistent After Mitigation. <u>Implementation of the PMPU would not obstruct EB1. Additionally,</u> Ecology Policy 3.1.2 requires the District to encourage development to implement clean air action measures, such as efficiency building and energy efficient design. SR Policy 3.1.6 requires the District to promote the innovative use of “green” design for new or retrofitted Tidelands’ buildings, structures, and facilities. MM-AQ-9 requires future projects to incorporate energy efficiency design features striving to exceed the current year required Title 24 California Building Energy Efficiency Standards. Measures that may be implemented include: high-performance glazing; increased insulation; cool roof; high-efficiency heating, ventilating, and air condition systems and controls; programmable thermostats; variable frequency drives; and a high-efficiency lighting and control system. in addition, the project would be required to achieve Leadership in Energy and Environmental Design (LEED) Silver certification. MM-AQ-10a requires all new hotels prior to 2030 to reduce natural gas consumption (or

No.	District CAP Measure Description	Project Consistency Analysis
		achieve equivalent reductions elsewhere in design) and MM-AQ-10b requires all development to be carbon neutral after 2030.
EB2	Establish green building standards and/or policy for existing buildings.	Consistent After Mitigation. See EB1.
EB3	Develop energy efficiency performance standards that achieve a greater reduction in energy use than otherwise required by State law.	Consistent After Mitigation. See EB1.
EB6	Replace light fixtures in non-Port facilities with lower energy bulbs such as fluorescent, LEDs, or CFLs.	Consistent After Mitigation. See EB1.
EH1	Implement the Adopt a Heat Island Reduction Plan that uses cool roofs, cool pavements, and strategically placed shade trees, and actively inspect and enforce State requirements for cool roofs on non-residential re-roofing projects.	Consistent After Mitigation. Implementation of the PMPU would not obstruct EH1. Additionally, in MM-AQ-9 , future buildings project proponents will install a high-performance glazing with a low solar heat gain coefficient value that reduces the amount of solar heat allowed into the building and install sun shading devices in parking lots and asphalted common areas.
EH2	Urban Forestry Management: Develop an Urban Forestry Program to consolidate policies and ordinances regarding tree planting, maintenance, and removal.	Consistent After Mitigation. Implementation of the PMPU would not obstruct EH2. Additionally, MM-AQ-9 requires each project proponent to incorporate various measures into project design, including tree planting and maintenance.
EH3	Evaluate existing landscaping and options to convert reflective and impervious surfaces to landscaping, and install or replace vegetation with drought-tolerant, low-maintenance native species that can also provide shade and reduce heat island effects.	Consistent After Mitigation. Implementation of the PMPU would not obstruct EH3. Additionally, in accordance with MM-AQ-9 , future project proponents will install low-water plantings and drip irrigation to minimize water demand for landscaping.
EL1	Develop and implement performance standards for exterior lighting of commercial and industrial buildings and parking lots, which include minimum and maximum lighting levels while providing a safe environment.	Consistent After Mitigation. Implementation of the PMPU would not obstruct EL1. Additionally, in accordance with MM-AQ-9 , future project proponents will use high-efficiency outdoor lighting and control systems. Additionally, all outdoor lighting will be equipped with light-emitting diode (LED) fixtures.
Water Conservation and Recycling		
WR 1	Recycled Water Use: Establish programs and policies to increase the capture and use of recycled water.	Consistent After Mitigation. Implementation of the PMPU would not obstruct WR1. Additionally, in accordance with MM-AQ-9 , future project proponents will maximize use of recycled water for irrigation in future project design.
WC1	Implement the Adopt a Water Conservation Strategy.	Consistent After Mitigation. Implementation of the PMPU would not obstruct WC1. Additionally, MM-AQ-9 requires future project

No.	District CAP Measure Description	Project Consistency Analysis
		proponents to incorporate indoor water reduction measures, including high-efficiency toilets, high-efficiency urinals, low-flow faucets, and low-flow showers (as applicable) into design.
Alternative Energy Generation		
EA2	Implement an onsite renewable energy generation policy for 2035 (solar power, wind power, methane recovery, wave power, etc.).	<p>Consistent Before Mitigation.</p> <p><u>The PMPU would not obstruct CAP measure EA2.</u> SR Policy 3.1.3 requires future development to deploy renewable energy to improve energy reliability and economic resilience, where feasible. In addition, MM-AQ-9 requires future development to implement onsite renewable energy systems (e.g., a photovoltaic system with battery storage) on new buildings given the appropriate structural and operational conditions, and MM-GHG-1 requires all new development to procure carbon free energy for non-emergency electricity.</p>
EA3	Implement an onsite renewable energy generation policy by 2050 (solar power, wind power, methane recovery, wave power etc.).	<p>Consistent After Mitigation.</p> <p><u>Implementation of the PMPU would not obstruct EA3.</u> See EA2.</p>
EA1 1	Implement a program to install technologies for generating energy from renewable sources such as solar power, wind power, and/or wave power on District Tidelands. Establish progressively more ambitious production goals for the years 2020, 2035, and 2050.	<p>Consistent Before Mitigation.</p> <p><u>The PMPU would not obstruct CAP measure EA11.</u> A solar-powered microgrid is currently under construction at TAMT. Solar photovoltaic panels will be installed on Warehouse C and will power the microgrid's battery storage. The microgrid will provide back-up power to Port-operated facilities, including security infrastructure, lights, offices, and the existing jet fuel storage system. Additionally, the District has installed four photovoltaic systems on District-owned facilities.</p>
Waste Reduction and Recycling		
SW1	Increase the diversion of solid waste from landfill disposal.	<p>Consistent After Mitigation.</p> <p><u>Implementation of the PMPU would not obstruct SW1.</u> Additionally, MM-AQ-9 specifies waste reduction as part of sustainable building.</p>
SW2	Adopt a Construction and Demolition Recycling Ordinance.	<p>Consistent After Mitigation.</p> <p><u>Implementation of the PMPU would not obstruct SW2.</u> Additionally, MM-AQ-9 requires future project proponents to divert construction and demolition debris from disposal in landfills and incineration facilities by 65%.</p>
SW3	Develop a policy to reduce the generation of solid waste.	<p>Consistent After Mitigation.</p> <p><u>Implementation of the PMPU would not obstruct SW3.</u> Additionally, MM-AQ-9 specifies compliance with AB 939³⁴¹ and the City of San Diego's Recycling Ordinance relevant city's recycling ordinances, which and requires 50% of solid waste to be recycled. In addition, MM-AQ-9 requires mandatory compliance with the City of San Diego's Construction and Demolition Debris Deposit</p>

No.	District CAP Measure Description	Project Consistency Analysis
		Ordinance-relevant jurisdictions' construction and demolition waste requirements and would also require 65% of all construction and demolition debris to be recycled. This measure would also encourage use of recycled, regional, and rapidly renewable materials where appropriate during construction.
Miscellaneous		
MP1	Increase public awareness of climate change and climate protection challenges, and support community reductions of GHG emissions through coordinated, creative public education and outreach, and recognition of achievements.	Consistent Before Mitigation. <u>The PMPU would not obstruct CAP measure MP1.</u> The proposed PMPU includes various policies aimed at educating the public on environmental awareness. For example, ECO Policy 4.2.1 requires the District to continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources.
MP3	Ensure the District's GHG reduction efforts and Port Master Plan are aligned with, support, and enhance any regional plans that have been developed consistent with State guidance to achieve reductions in GHG emissions.	Consistent Before Mitigation. <u>The PMPU would not obstruct CAP measure MP3.</u> The proposed PMPU includes various policies aimed at engaging and coordinating ing with regional agencies. For example, Mobility Policy 2.2.4 requires the District to engage with railroad operators and agencies that have transportation authority to maintain, enhance, and expand the access between the cargo terminals and the regional freight infrastructure. SR Policy 3.1.1 requires the District to periodically update the District's CAP <u>climate action goals and targets</u> to ensure alignment with this Plan and with the District and State goals and targets for GHG emissions, start to the CAP's <u>these goals and targets</u> no later than within two years of the effectiveness of the certification of this Plan, and may periodically update them District's CAP thereafter.
MP4	Require District, and encourage District tenants, to purchase goods and services that embody or create fewer GHG emissions.	Consistent Before Mitigation. See TA1, TR1, and EA2.

2017 Scoping Plan Update

The Scoping Plan, most recently updated in 2017 and again in 2022, is the State's roadmap to achieving long-term GHG reduction targets. The 2017 Climate Change Scoping Plan integrates various CARB regulations and strategies, including Cap-and-Trade, LCFS, SB 350, Sustainable Freight Action Plan, Mobile Source Strategy, and the SLCP Strategy. The 2017 Climate Change Scoping Plan proposes meeting the 2030 goal by accelerating the focus on zero and near-zero technologies for moving freight, continued investment in renewables, greater use of low-carbon fuels including electricity and hydrogen, stronger efforts to reduce emissions of short-lived climate pollutants (CH₄, black carbon, and fluorinated gases), further efforts to create walkable communities with expanded mass transit and other alternatives to traveling by car, continuing the Cap-and-Trade program, and ensuring that natural lands become carbon sinks to provide additional emissions reductions and flexibility in meeting the target (CARB 2017a).

The Scoping Plan also recognizes the key role local governments and new development have in helping the State meet its 2030 GHG reduction target. Guidance has also been published by CARB (2019), OPR (2018), and other agencies that identify goals and sustainability features that are needed of new development in order for the State to achieve its 2030 reduction target and demonstrate progress in attaining its 2045 and 2050 goals established under EO B-55-18 and S-3-05, respectively.

As mentioned, while the Scoping Plan is the State's roadmap to achieving long-term GHG reductions, CARB has developed various other plans, policies, regulations, and programs aimed at reducing GHG emissions. Table 4.6-14 summarizes the consistency of the proposed PMPU with selected Scoping Plan policies. Details regarding consistency with all statewide plans on an emissions sector-by-sector basis follows the table.

Note that after the release of the Draft PEIR, in December 2022, CARB adopted the 2022 Scoping Plan in December 2022. The 2022 Scoping Plan is an update to the 2017 Scoping Plan in that it assesses progress towards achieving the 2030 goal discussed in the 2017 Scoping Plan, while laying out a path to the 2045 carbon neutrality target. The 2022 Scoping Plan builds on existing programs for the deployment of clean fuels and technologies, and for the first time brings California's forests, wetlands, and agricultural lands into the process with the potential to leverage sustainable management to use these landscapes for carbon storage. The 2022 Scoping Plan reflects the need for additional methods of capturing carbon dioxide that include pulling it from the smokestacks of facilities, or drawing it out of the atmosphere, and then safely and permanently storing it (CARB 2022c). Because the 2022 Scoping Plan was adopted after the release of the Draft PEIR, consistency of the proposed PMPU with 2022 Scoping Plan policies is not included in this analysis.

Table 4.6-14. PMPU Consistency with Selected 2017 Scoping Plan Policies

Policy	Scoping Plan Primary Objective	Consistency Analysis
SB 350 (superseded by SB 100)	Reduce GHG emissions in the electricity sector through the implementation of the 50% RPS, doubling of energy savings, and other actions as appropriate to achieve GHG emissions reductions planning targets in the Integrated Resource Plan process.	This is a State program that requires no action at the local or project level. Benefits to project-related electricity, shore power, and water consumption will be realized. The project will be subject to any regulations or actions developed to implement the goals of SB 350. Proposed PMPU mitigation will require various strategies to reduce energy demands, including exceeding current building standards, water and lighting efficiency, installation of renewable energy, water conservation, and increased use of shore power. Mitigation promotes the development of all-electric buildings and requires applicants to implement zero net energy construction if such regulations are adopted.
Low Carbon Fuel Standard	Transition to cleaner/less-polluting fuels that have a lower carbon footprint.	This is a State program that requires no action at the local or project level. Nonetheless, development of new land uses under the proposed PMPU would support reducing the carbon footprint associated with vehicle travel. PMPU policies would promote a pedestrian-friendly and walkable waterfront. PMPU policies and PEIR mitigation would require development projects to implement measures to reduce VMT, including providing bicycle parking, dedicated

Policy	Scoping Plan Primary Objective	Consistency Analysis
		EV parking and charging, and telecommuting. Moreover, the MCAS supports the transition to cleaner/less-polluting fuels through ambitious goals for trucks, equipment, and all sectors of freight movement.
Mobile Source Strategy (Cleaner Technology and Fuels [CTF] Scenario)	Reduce GHGs and other pollutants from the transportation sector through transition to zero-emission and low-emission vehicles, cleaner transit systems and reduction of VMT.	This is a State program that requires no action at the local or project level. Benefits to District-wide vehicle travel and goods movement will be realized independently. Nonetheless, new land uses will be situated near existing transit and expand bikeways, and will reduce VMT, and mitigation will promote EV charging. Moreover, the MCAS supports the Mobile Source Strategy through the implementation of ambitious goals for mobile sources that reduce emissions to support attainment of State and Federal ozone standards, while improving community health and supporting statewide and local GHG reduction efforts.
SB 1383	Approve and implement Short-Lived Climate Pollutant strategy to reduce highly potent GHGs.	This is a State program that requires no action at the local or project level. Mitigation requires future project applicants to implement programs to promote waste reduction, recycling, or composting, and for commercial, retail, and restaurant uses to abide by organic waste collection, hauling, and composting standards.
California Sustainable Freight Action Plan	Improve freight efficiency, transition to zero-emission technologies, and increase competitiveness of California's freight system.	This is a State program that requires no action at the local or project level. This program aims to improve freight efficiency by 25%, deploy more than 100,000 zero-emission freight vehicles, and increase competitiveness of California's freight system. This program is only applicable to freight terminals (TAMT and National City Marine Terminal). The PMPU does not propose any changes to cargo throughput. Regardless, the MCAS supports the California Sustainable Freight Action Plan through the transition to zero-emission truck, harbor craft, and equipment technologies, while ensuring the freight terminals remain competitive.
Post-2020 Cap-and-Trade Program	Reduce GHGs across the largest GHG emissions sources.	This a State program that requires no action at the local or project level. This program is only applicable to the one source at the Port that is regulated under the Cap-and-Trade program. Emission reductions from that source are regulated by CARB and are outside of the control of the District until the next lease agreement.

Appendix B of the Scoping Plan includes a list of local actions that local agencies can implement to support the Scoping Plan and other climate goals. These are organized into municipal changes (such as municipal and zoning codes) and CEQA mitigation measures. While CARB acknowledges that the local action list is neither exhaustive nor required, the list of local actions can be viewed as a general reference document. The list of actions mostly includes measures that are similar to those applied herein. For example, the general intent is to reduce resource consumption from major sources of emissions by improving energy efficiency, reducing VMT, promoting zero-emission vehicles, and

promoting renewable energy. There are mitigation measures in both Section 4.2 and in this section, as well as various proposed PMPU policies, that address each of these sources.

As noted above, the proposed PMPU is considered consistent with the provisions of the identified plans if it meets the general intent of the applicable plans. A given project need not be in perfect conformity with every policy nor does State law require precise conformity of a proposed project with every policy or land use designation. Similarly, consistency with the Scoping Plan is based on the general intent of the plan (statewide emission reductions to achieve 40 percent below 1990 levels by 2030) and the measures to meet that goal (e.g., SB 350, Mobile Source Strategy), and not each local action called out in Appendix B of the Scoping Plan.

Passenger Vehicles

GHG emissions associated with on-road mobile sources would be generated from worker and visitor motor vehicles as well as delivery vehicles associated with the additional hotel rooms, increased restaurant and retail land uses, increased meeting and convention center space, additional slips for recreational boating and commercial fishing. As shown in Table 4.6-4, passenger vehicles were the largest emission source District-wide in 2016. As shown in Table 11, in 2030 and 2050, emissions from mobile sources represent the third largest source of GHG emissions among the proposed new uses in 2030 and second largest source of GHG emissions among the proposed new uses in 2050.

Federal, State, and local regulatory efforts target three elements of emissions reduction from mobile sources: vehicle fuel efficiency, the carbon content of fuels, and VMT. Most adopted programs and regulations focus on fuel efficiency (e.g., CAFÉ standards, Pavley standard) and reducing the carbon intensity of transportation fuels (e.g., LCFS). Vehicle electrification is also rapidly becoming part of the State's approach to reducing mobile source emissions (e.g., Title 24). California adopted SB 375 to integrate transportation planning, regional housing allocation, and GHG reduction through reductions in VMT. The GHG reduction targets adopted by CARB and incorporated by Metropolitan Planning Organizations in their RTP/SCS are expected to achieve much of the required VMT reduction needed for the State to meet their long-term GHG reduction targets. However, a recent CARB assessment makes clear that the State "is not on track to meet greenhouse gas reductions expected under SB 375" (CARB 2018). Accordingly, additional GHG reduction, specifically through further reductions in VMT, is needed to meet the State's climate change objectives (CARB 2020).

SB 743 is intended to close the VMT and emissions reduction gap. There is a nexus between SB 743 and the State's goals to reduce mobile source GHG emissions; one of the criteria under SB 743 for determining the significance of the transportation impacts of a project is a reduction in GHG emissions. In response to SB 743, OPR released its revised *Technical Advisory on Evaluating Transportation Impacts in CEQA* in December 2018. The advisory indicates that "achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals" (OPR 2018). This OPR reduction goal is consistent with recent CARB (2020b) analysis, which demonstrates that a 14.3 percent reduction of VMT per capita by 2050 (compared to a 2015–2018 average) would be needed statewide to meet their GHG planning goals through 2050.

The proposed PMPU does not include any features that would conflict with these programs. In fact, the PMPU includes various policies to reduce the dependence on passenger vehicles by promoting

alternative forms of transit. M Goal 1 provides for an integrated, accessible, inclusive, and diverse network that facilitates the movement of people. Various policies support this goal. For instance:

- Mobility Policy 1.2.1 requires the District plan, design, and implement a network of mobility hubs (Regional, Local Gateway, and Connector) that provides the opportunity for users to change from one mode of travel to another.
- Mobility Policy 1.1.10 requires the District to provide areas for transit stops and transit lanes for expanded transit opportunities on Tidelands and explore a means for financing expanded transit opportunities with agencies that have transportation authority.
- Mobility Policy 1.1.11 requires the District to develop TDM guidelines and require development to comply with such guidelines, with the intent to reduce dependence on single-occupancy vehicles and reduce VMT to, from, and within Tidelands.

~~Furthermore, implementation of P~~proposed PMPU mitigation ~~measures~~ would ~~align ensure~~ compliance with the CARB-related strategies to reduce emission from passenger vehicles. ~~For example, MM-TRA-2 requires project proponents to complete project-level VMT analysis and identify associated mitigation measures for VMT impacts, including through participation in the District's VMT Infrastructure Mitigation Program (MM-TRA-1) or by implementation of VMT-reducing infrastructure that fully mitigates the project's VMT-related impacts, make a fair share contribution to the District-implemented impact fee program to develop and expand VMT reducing infrastructure, including mobility hubs, and MM-TRA-3 requires future project proponents to implement a TDM Plan. Moreover, MM-GHG-2 requires the District to replace fossil-fueled on-road vehicles in its fleet with zero emission purchase alternative fuel, electric, or hybrid District vehicles and equipment. These mitigation measures would act to reduce VMT. However, while Therefore,~~ PMPU policies coupled with mitigation measures would reduce VMT and passenger vehicle emissions, ~~impacts related to transportation (passenger vehicle) emissions are considered significant because it is uncertain if measures would reduce transportation emissions in line with CARB concepts (Impact-GHG-2), and the proposed PMPU would not be consistent with Scoping Plan mobile source policies. Please also see the VMT discussion in Section 4.14.~~

Boating and Fishing

GHG emissions associated with boating and fishing would be generated from recreational and fishing boats visiting waterside features. As shown in Tables 4.6-11 and 4.6-12, emissions from these boating activities in both 2030 and full buildout 2050 represent a small share (1–6 percent) of PMPU emissions.

Recreational boating includes personal watercraft (jet skis), sailboats, jet boats, and yachts. Smaller watercraft are typically gasoline powered, and larger yachts are typically diesel powered. Commercial fishing includes vessels that carry staff to fishing areas outside of the Bay. CARB has proposed and adopted regulations for certain marine vessels, and regulations have been proposed for other spark-ignition engines used in boats for propulsion to reduce ozone precursor emissions. Spark-ignition auxiliary marine engines (power generators, winches, or auxiliary propulsion engines for sail boats) are defined as small off-road spark-ignition engines (below 25 horsepower [hp]) or large off-road spark-ignition engines (25 hp and greater) depending on their size. Compression-ignition auxiliary and propulsion marine engines under 50 hp are defined as off-road diesel

(compression-ignition) engines. Large yachts generally include engines that are regulated under CARB's harbor craft rules (District 2018b).⁸

The 2017 Climate Change Scoping Plan does not specifically plan for or identify emissions reductions from smaller watercraft that are used for personal recreational boating, or commercial and sport fishing uses. However, the modeling to support the 2017 Scoping Plan Update does include an assumption that a certain percentage of diesel harbor craft will convert to electricity. Starting in 2020, that modeling assumes 6 percent of harbor craft energy demand will be fully electric by 2050 and 71 percent of will be diesel hybrid by 2050, and proposes requiring all harbor craft vessels to use renewable diesel starting in 2023. While not directly applicable to recreational boating and boating related to commercial and sport fishing, these technologies may make their way into the recreational boating market, particularly for large diesel yachts. Additionally, the 2020 Mobile Source Strategy includes concepts to adopt new emission standards for smog forming pollutants as well as to incorporate electrification of small outboard and personal watercraft engines, and CARB has initiated rulemaking to adopt emission standards for recreational boats. The District has no authority to regulate which personal watercraft use its slips and boat ramps, but the District can require tenants to install electrical infrastructure to support CARB efforts to electrify a portion of the personal watercraft fleet.

The proposed PMPU does not include any policies specifically aimed at reducing emissions from boating and fishing-related activities. However, **MM-AQ-12** requires the District to ensure that all future projects that propose to install new slips, install and maintain shore power capabilities where suitable upgrades are feasible to ensure that larger watercraft (such as large yachts) can plug into shore-side power while docked in the marina (instead of running auxiliary engines to maintain the ship's power needs). This measure is consistent with District CAP measure TA4, which promotes electrification of marinas.

CARB has initiated rulemaking to amend the harbor craft rule. However, to date, because of the unique offshore operations and economic considerations, requirements for the commercial fishing fleet include upgrading fleet to Tier 2 or newer engines between 2030 and 2032. No additional requirements to electrify certain routes or pieces are being proposed. The District will track regulations through MCAS implementation and will be consistent with this regulation. Based on the above analysis, the District is consistent with CARB's intent regarding recreational boating and commercial fishing ~~based on implementation of MM-AQ-12 and by tracking regulations through the MCAS. Thus, after mitigation,~~ boating-related emissions would not conflict with the State's long-term emission reduction trajectory.

Energy Sources

GHGs are emitted directly from typical development through the combustion of fuel (e.g., natural gas for space and water heating) and indirectly from the generation of electricity. As shown in Table 4.6-11 and Table 4.6-12, in 2030 and 2050, emissions from energy consumption represent the largest source of PMPU emissions under unmitigated conditions and second to third largest under mitigated conditions.

⁸ Harbor craft include a variety of vessel and boat types that serve many functions within and near San Diego Bay, including crew and supply boats, charter fishing vessels, commercial fishing vessels, ferry and excursion vessels, pilot vessels, towboats or push boats, tug boats, and work boats

The 2017 Climate Change Scoping Plan outlines strategies to reduce energy demand and fossil fuel use, while increasing energy efficiency and renewable energy generation. These strategies include transitioning to cleaner fuels, increasing efficiency in existing buildings, and electrifying end uses. Several of these strategies are reflected in State laws and regulatory programs. For example, SB 100 requires a doubling of energy efficiency by 2030 and 60 percent renewable energy supply by 2030. SB 100 also sets a target of 100 percent carbon-free electricity by 2045. The 2019 Title 24 standards mandate higher efficiency levels and rooftop solar photovoltaic systems for all new residential buildings constructed in 2020 and beyond. Future standards are expected to result in zero net energy for newly constructed commercial buildings. The CEC also enforces the Appliance Efficiency Regulations contained in Title 20 of the California Code of Regulations. The regulations establish water and energy efficiency standards for both Federally regulated and non-Federally regulated appliances.

The District's Green Port Policy (BPC Policy No. 736) includes various policy objectives, some of which cover energy uses. For example, one policy objective requires the District to strive to strengthen the District's financial position by maximizing the long-term benefits of energy and resource conservation. The District has implemented various projects to reduce energy consumption, including retrofitting existing lighting to more efficient LED technology, providing educational programs for employees, conducting energy audits on Port facilities to identify future initiatives, and installing solar photovoltaic systems at four facilities owned by the District. In addition, the District is working on installation of a solar-powered microgrid at TAMT, and the District's CAP includes numerous goals for efficient consumption of energy (e.g., energy retrofits, efficient lighting) and renewable energy production.

The above energy efficiency and renewable energy policies are consistent with the 2017 Scoping Plan's overall goal of reducing building energy emissions to meet the State's 2030 GHG reduction target. The proposed PMPU does not include any features that would conflict with these programs. Ecology Policy 3.1.2 requires the District to encourage development to implement clean air measures, including but not limited to efficient buildings design features and energy efficient lighting.

While new development would be required to comply with the Title 24 Standards applicable at the time of construction, the proposed PMPU does not explicitly require new development to use high-efficiency or Energy Star appliances, which are recognized by OPR (2018) as critical design features for new development. Accordingly, the proposed PMPU may conflict with the 2017 Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation **(Impact-GHG-2). MM-AQ-9** would require all future development projects to use Energy Star appliances. The 2017 Scoping Plan calls for doubling of energy savings. Moreover, in order to meet the State's expressed interest in pursuing carbon neutrality (EO B-55-18), OPR (2018) recommends that all new buildings be all electric. Because SB 100 obligates utilities to supply 100 percent carbon-free electricity by 2045, all-electric buildings that do not include any onsite fuel combustion (such as natural gas) would not generate any emissions. **MM-GHG-1** requires all future tenants to ensure that all new non-emergency electricity obtained is provided by renewable sources.

After mitigation, energy-related emissions would not conflict with the State's long-term emission reduction trajectory.

Solid Waste

Solid waste emissions result from CH₄ associated with the decomposition of the waste and CO₂ emissions associated with the combustion or flaring of CH₄. Solid waste may be disposed of in landfills or diverted for recycling, composting, reuse, or other means to avoid landfilling. As shown in Table 4.6-11, emissions from solid waste represent a small share (6–9 percent) of unmitigated PMPU emissions.

The 2017 Scoping Plan aims to reduce waste emissions by diverting waste away from landfills through waste reduction, re-use, composting, and material recovery. It does not set quantitative targets for reducing waste emissions but does aim to reduce the amount of waste that enters landfills, with a goal of reducing solid waste-related GHG emissions due to organic diversion (i.e., composting) by 14 percent. AB 341 requires mandatory recycling for certain commercial businesses. AB 341 also established a statewide recycling goal of 75 percent by the year 2020. Implementation measures include source reduction, recycling, or composting. Forthcoming regulations pursuant to SB 1383 will establish minimum standards for organic waste collection, hauling, and composting. The final regulations will take effect on or after January 1, 2022.

The proposed PMPU does not include any features that would conflict with these programs. **MM-AQ-9** includes measures related to solid waste, consistent with the CAP, including staying in line with recycling ordinances; ensuring all commercial, restaurant, and retail uses implement recycling, composting of food waste and other organics, and the use of reusable products; and promoting the uses of recycled, regional, and rapidly renewable materials where appropriate. The emphasis on composting and provision of composting services is consistent with the 2017 Scoping Plan, and would support AB 341 and SB 1383's overall goals of reducing landfilled waste.

Water and Wastewater

Indirect GHG emissions result from the production of electricity used to convey, treat, and distribute water and wastewater. The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of water. Additional wastewater emissions include CH₄ and N₂O, although these are generated by wastewater treatment at individual wastewater treatment plants. The proposed PMPU does not include any new wastewater treatment plants. As shown in Table 4.6-11, emissions from water and wastewater represent a small share (less than 2 percent) of PMPU emissions under unmitigated conditions.

The 2017 Scoping Plan outlines objectives and goals to reduce GHGs in the water sector, including using and reusing water more efficiently through greater water conservation, drought-tolerant landscaping, stormwater capture, and water recycling. Regulations have further targeted water supply and water conservation through building and landscaping efficiency (e.g., Title 24). The Water Conservation Act of 2009 sets an overall goal of reducing per-capita urban water use by 20 percent by December 31, 2020.

MM-AQ-9 includes indoor and outdoor water efficiency measures, including a 20 percent target reduction for indoor water use and installation of low-water plantings and drip irrigation for District uses. These measures are consistent with the 2017 Scoping Plan's water measures and the State's regulatory programs within the water sector.

Area Sources

Area sources emitting GHGs typically include hearth usage (including wood-burning fireplaces) and landscaping equipment. As the proposed PMPU does not propose any residential development, GHG emissions from area sources would be limited to use of landscaping equipment. As shown in Table 4.6-11, emissions from area sources represent the smallest share (no greater than 1 percent) of PMPU emissions.

CARB has not developed any relevant measures in the Scoping Plan or other regulations related to area source emissions. CARB adopted emissions standards for small off-road engines (i.e., landscape equipment) in 1990. More recently, CARB stated in their 2020 Mobile Source Strategy their intent to consider new standards for small engines in 2020, including regulatory and incentive approaches and a major shift to zero-emission equipment (CARB n.d.). However, to date, adopted CARB emission standards are aimed at reducing smog-forming pollutants. No standards have been adopted that are aimed at reducing GHG emissions from small off-road engines. There are also no specific provisions for exterior electric outlets, which would support the 2017 Climate Change Scoping Plan's goal for decarbonizing off-road equipment. Accordingly, the proposed PMPU may conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation **(Impact-GHG-2)**.

Achieving the State's long-term climate change goals under S-3-05, B-55-18, and SB 100 will inevitably require the transition away from fossil-fuel power energy sources, including but not limited to landscaping equipment. Recognizing this, OPR (2018) guidance recommends that land use development projects strive to avoid fossil fuels. **MM-AQ-9** requires developments with landscaping to install electric outlets in the exterior to facilitate that use of electric landscaping equipment.

High GWP Emissions (HFCs)

HFCs are synthetic gases that may be used in residential refrigeration and air conditioning units, as well as in motor vehicle air conditioning units. Emissions of HFCs occur as a result of wear, faulty maintenance, and leakage at the end of a product's lifetime.

The 2017 Scoping Plan assumes implementation of the SLCP Reduction Strategy and attainment of the State's SLCP reduction targets for HFCs. The SLCP Reduction Strategy identifies four State strategies that will develop grants and incentives for alternatives to HFCs, as well as evaluate the feasibility of a new ban on HFCs in new non-residential refrigeration units, air conditioning (non-residential and residential) units, and residential refrigerators and freezers. Regulations stemming from these strategies have not yet been developed. Both existing and new development, including commercial, retail, and restaurant development associated with the proposed PMPU, would be required to comply with State regulations for minimizing HFCs that are in place at the time of construction.

Other State Programs

As discussed above, systemic changes will be required at the State level to achieve the statewide future GHG reduction goals. Regulations—such as the SB 100-mandated 100 percent carbon-free RPS by 2045; implementation of the State's SLCP Reduction Strategy, including forthcoming regulations for composting and organics diversion; and future updates to the State's Title 24 standards (including requirements for net zero energy buildings)—will be necessary to attain the magnitude of reductions required for the State's goals. The District will be required to comply with

these regulations in new construction (in the case of updated Title 24 standards), or would be directly affected by the outcomes (e.g., energy consumption would be less carbon intensive due to the increasingly stringent RPS). Unlike CARB's Scoping Plans, which explicitly call for additional emissions reductions from local governments and new projects, none of these State regulations identify specific requirements or commitments for new development beyond what is already required by existing regulations, or will be required in forthcoming regulation. Thus, for the foreseeable future, the District would not conflict with any other State-level regulations pertaining to GHGs in the post-2020 era, and this impact would be less than significant.

Conclusion for Consistency with State Plans, Programs, and Policies

Overall, the proposed PMPU ~~is generally consistent~~ would not conflict with or otherwise obstruct the goals and strategies employed by CARB through the Scoping Plan, the Sustainable Freight Action Plan, and the Mobile Source Strategy. The District is consistent with the accelerating focus on zero and near-zero technologies for moving freight, continued investment in renewables, greater use of low-carbon fuels including electricity, and further efforts to improve mobility and reduce VMT. However, prior to mitigation, future projects proposed consistent with the PMPU would not be required to use high-efficiency or Energy Star appliances, which are recognized by OPR (2018) as critical design features for new development, or include exterior electric outlets, which would potentially lead to a conflict with the Scoping Plan. Therefore, future projects may have the potential to conflict with the Scoping Plan and the attainment of the State's 2030 reduction target prior to mitigation (Impact-GHG-2). MM-AQ-9 requires use of high-efficiency appliances and installation of exterior outlets for electric equipment. After MM-AQ-9, the PMPU would not conflict with provisions of the Scoping Plan and Impact-GHG-2 would be less than significant. Overall, the proposed PMPU would be partially consistent with the Scoping Plan and related strategies.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to a potential conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation ~~conflicts with the District's CAP, which is a plan adopted to reduce GHG emissions (Impact-GHG-2).~~ This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1

would not include new uses that generate substantial emissions, and would not change construction or operational assumptions. GHG emissions associated with reconfiguring and closing of North Harbor Drive, construction of a Waterfront Destination Park, and other improvements to open space would be similar to the analysis above. Option 1 could result in operational emissions that are similar to those identified above, and therefore could result in the generation of GHG emissions that, before mitigation, would be a potential conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation inconsistent with the District's CAP, which was adopted to reduce GHG emissions (Impact-GHG-2). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to a potential conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation~~conflicts with the District's CAP, which is a plan adopted to reduce GHG emissions (Impact-GHG-2)~~. This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include new uses that generate substantial emissions, and would not change construction or operational assumptions. GHG emissions associated with operation of additional Recreation Open Space and the expansion of the Lane Field Setback Park would be similar to the analysis above. Option 2 could result in operational emissions that are similar to those identified above, and therefore could result in the generation of GHG emissions that, before mitigation, would be a potential conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation inconsistent with plans, policies, and regulations adopted to reduce GHG emissions (Impact-GHG-2). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to a potential conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030 reduction target prior to mitigation~~conflicts with the District's CAP, which is a plan adopted to reduce GHG emissions (Impact-GHG-2)~~. This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 3 would fall within the range of scenarios analyzed above. Option 3 would not include new uses that generate substantial emissions, and would not change construction or operational assumptions. GHG emissions associated with realignment of North Harbor Drive and the additional Recreational Open Space would be similar to the analysis above. Option 3 could result in operational emissions that are similar to those identified above, and therefore could result in the generation of GHG emissions that, before mitigation, would be a potential conflict with the 2017 Climate Change Scoping Plan and attainment of the State's 2030

~~reduction target prior to mitigation inconsistent with the District's CAP, which was adopted to reduce GHG emissions (Impact-GHG-2).~~ However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to consistency with plans, policies, and regulatory programs adopted for the purposes of reducing the emissions of GHGs for 2030 and post-2030. Rather, the proposed PMPU policies listed in Section 4.6.4.3 would reduce potential impacts related to consistency with GHG reduction programs by:

- Committing the District to coordinating with agencies that have transportation authority to explore opportunities to expand accessible transit service to Tidelands (Mobility Policy 1.1.9).
- ~~Developing~~ Requiring project proponents of certain future development to develop and comply with project-specific TDM guidelines, and requiring development to comply with such guidelines, with the intent to reduce dependence on single-occupancy vehicles and reduce VMT to, and from, and within Tidelands the proposed development site (Mobility Policy 1.1.11).
- Engaging with stakeholders—such as railway companies, trucking companies, cargo and freight shipping lines, and service providers—to identify and implement feasible sustainable freight strategies in accordance with the District's environmental and operational strategies, plans, and regulations, as well as the State's sustainability objectives (Mobility Policy 2.2.3).
- Maintaining and developing improvements to linkages between the marine terminals and landside networks—including but not limited to, roadways, rail, and pipelines—to enable efficient movements of goods along those networks and to support the working waterfront (Mobility Policy 2.2.5).
- In coordination with operators and stakeholders, planning for improvements to railroad corridors—including, but not limited to, spurs, rail storage facilities, switching facilities, and suitable rail trackage within the working waterfront, both on dock and near dock—to better interface the movement of cargo between ship and land carriers (Mobility Policy 2.2.7).
- Encouraging development to implement clean air action measures such as efficient building design features; alternative-powered vehicles, vessels, and advanced technologies; parking management programs; alternative transportation programs; energy efficient lighting; and native tree planting and landscaping (Ecology Policy 3.1.2).

Impact Determination and Mitigation

Implementation of the proposed PMPU would result in inconsistency with plans, policies, and regulations adopted to reduce GHG emissions, ~~including the District's CAP, CARB 2017 (i.e., CARB's Scoping Plan), and the CARB Mobile Source Strategy.~~

Significant Impacts

Impact-GHG-2: Conflict with Plans, Policies, and Regulations Adopted to Reduce GHG Emissions. Project emissions, before mitigation, would be inconsistent with plans, policies, and regulations adopted to reduce GHG emissions.

Mitigation Measures

For **Impact-GHG-2**:

Implement **MM-AQ-2** and **MM-AQ-3**, and **MM-AQ-6** through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-TRA-1** through **MM-TRA-3**, as described in Section 4.14.

Implement **MM-GHG-1** and **MM-GHG-2**, as described in Threshold 1 above.

Level of Significance After Mitigation

Impact-GHG-2 would be reduced to less than significant after implementation of **MM-AQ-2** and **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, **MM-TRA-1** and **MM-TRA-3**, **MM-GHG-1**, and **MM-GHG-2** because they would ensure that the proposed PMPU does not conflict with or obstruct ~~would be consistent with~~ the relevant plans, policies, and regulatory programs, including the Scoping Plan and Sustainable Freight Action Plan, by ensuring the District and PMPU are implementing all relevant measures in the stated plans. Therefore, these impacts would be less than significant.

Threshold 3: Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Impact Analysis

Construction

Construction activities for future development associated with the proposed PMPU would require use of heavy off-road equipment such as dump trucks, cranes, excavators, tractors, and graders. Construction would require electricity for use in mobile offices and water delivered to construction sites, gasoline and diesel fuel for transportation of construction workers and haul trucks to and from future development sites, and diesel fuel for operation of off-road equipment as well as marine vessels for in-water construction activities. Energy consumption would vary substantially depending on the level of activity, length of construction period, specific construction activities, types of equipment, and number of personnel. The majority of energy use during construction would be attributed to use of diesel-powered construction equipment, followed by the use of diesel-powered trucks for material hauling and vendor trips. Construction contractors would be required to comply with the provisions of 13 California Code of Regulations Sections 2449 and 2485, which prohibit diesel-fueled commercial motor vehicles and off-road diesel vehicles from idling for more than 5 minutes, which would minimize unnecessary fuel consumption. While the timing, intensity, and details of future project construction are not known at this time, modeling was performed to approximate the energy impacts that could arise from future construction activities. Table 4.6-15 summarizes the construction energy use by source associated with implementation of the proposed PMPU and all related uses.

Buildout under the proposed PMPU would also use building materials that would require energy use during the manufacturing and/or procurement of that material; however, as noted in the California Natural Resources Agency's Final Statement of Reasons, "a full 'lifecycle' analysis that would account

for energy used in building materials and consumer products will generally not be required” (California Natural Resources Agency 2018). It is reasonable to assume that manufacturers of building materials such as concrete, steel, lumber, or other building materials would employ energy conservation practices in the interest of minimizing the cost of doing business. It also is reasonable to assume that non-custom building materials, such as drywall and standard-shaped structural elements, would have been manufactured regardless of the proposed PMPU and, if not used for future development under the proposed PMPU, would be used in a different project. Therefore, the consumption of energy required for the manufacturing of building and construction material is not part of the quantitative analysis.

Table 4.6-15. Estimated Construction Energy Consumption by Source

Source	Energy Consumption (million BTUs/total)
Diesel	
Trucks	424,376
Equipment	75,492
<i>Total Diesel</i>	499,869
Gasoline	
Workers	314,273
<i>Total Gasoline</i>	314,273
Total	814,142

Source: Appendix C.

It is anticipated that, for any given future development, total energy consumed during the construction period would represent a small demand on local and regional fuel supplies. However, depending on the size and scale of an individual project, along with its construction schedule and other parameters, there may also be instances where the construction-related energy use generated by a single project could be substantial. While many future developments may not require a significant amount of energy during construction relative to regional demand, it is possible that such projects could still result in the wasteful, inefficient, or unnecessary consumption of energy resources during project construction if measures are not taken to ensure energy is used efficiently. Therefore, potential impacts for wasteful, inefficient, or unnecessary construction of future development associated with the proposed PMPU would be significant (**Impact-EN-1**).

To reduce the potential for future development under the proposed PMPU to result in wasteful, inefficient, or unnecessary consumption of energy resources during project construction, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-GHG-2** would be implemented. **MM-AQ-2** requires the implementation of diesel emission-reduction measures including limits to all equipment and delivery truck idling times during construction and maintenance and proper tuning of all construction equipment. **MM-AQ-3** and **MM-AQ-6** require the use of modern and clean off-road equipment and harbor crafts or dredgers, respectively, during future construction projects, and require these projects to use renewable diesel-fuel. Moreover, **MM-GHG-2** requires that the District replace all fossil-fueled on-road vehicles in its fleet with zero-emission vehicles by 2030 as the existing vehicles are retired, consistent with the District’s CAP. The above measures would avoid or reduce the wasteful, inefficient, and unnecessary consumption of energy resources during construction of future projects under the proposed PMPU. Therefore, implementation of these

measures would reduce energy impacts associated with construction of future development under the proposed PMPU to less than significant.

Operation

Operation of future development allowed under the proposed PMPU would require energy associated with tenant facilities (e.g., hotels, marinas, boatyards), maritime activity (e.g., the movement of goods and people associated with marine terminal operations), and District operations (e.g., District-owned building and outdoor energy consumption and fleet activity). Operation of future development on the landside portion of the proposed PMPU area that would involve the use of energy resources include employee and visitor vehicle trips (e.g., diesel and gasoline for visitor travel to and from future project sites), and utility-related consumption (e.g., electricity and natural gas in buildings, water consumption, wastewater and solid waste generation). Waterside energy consumption during operation of future development would be related to the use of recreational boats and marine terminal operations, which would primarily include electricity for maritime shore power and diesel and gasoline for boating. Once operational, these future development projects would result in greater energy consumption compared to existing conditions. Similar to what was described under *Construction* above, because the details of future projects are not known at this time, the specific effects on energy from operation of individual future projects cannot be accurately quantified. However, the overall operational energy consumption from buildout of the proposed PMPU is presented in Table 4.6-16. As shown in Table 4.6-16, operation of new development is estimated to consume approximately 330,000 million BTUs of energy by 2030 and 790,000 million BTUs of energy by 2050, under unmitigated conditions.

Table 4.6-16. Estimated Energy Consumption During Operations Prior to Mitigation (million BTUs/year)

Source	Unmitigated		Mitigated	
	2030	2050	2030	2050
Natural Gas	163,574	398,768	38,336	38,336
Electricity	124,216	302,818	114,203	278,408
Gasoline	38,861	81,899	32,272	68,639
Diesel	1,877	3,908	1,558	3,275
Total	328,528	787,393	186,369	388,658
Change from Unmitigated	-	-	-43%	-51%

Source: Appendix C.

Notes:

Energy is provided in million BTUs for comparison purposes.

Totals may not sum due to rounding.

BTUs can be converted to gallons of gasoline and diesel using the following constants: 113,927 BTU/1 gallon of gasoline; 129,488 BTU/1 gallon of diesel. BTUs can be converted to kWh/year using the 3,416 BTUs per kWh constant.

Energy consumption is deemed wasteful, inefficient, or unnecessary if it increases per capita consumption, increases reliance on fossil fuels, and decreases reliance on renewable energy sources. The proposed PMPU includes policies that increase energy efficiency, promote or require the reduction of fossil fuel consumption (i.e., by replacing diesel equipment with electric equipment), and increase reliance on renewable energy sources (occurring per State law, and occurring sooner per MM-GHG-2). However, future development allowed under the PMPU will result in an increase in

energy consumption relative to existing conditions, and would increase with increased development through 2050. Because per capita energy consumption cannot be quantified in this situation, the increase in energy consumption during operations may result in a potentially significant impact due to wasteful, inefficient, and unnecessary consumption of energy resources during operations. **(Impact-EN-1).**

To reduce the potential for future development under the proposed PMPU to result in wasteful, inefficient, or unnecessary consumption of energy resources associated with new development, **MM-AQ-2, MM-AQ-3, MM-AQ-6, and MM-AQ-9 through MM-AQ-12** as well as **MM-GHG-1 and MM-GHG-2** would be implemented.

MM-AQ-2, MM-AQ-3, MM-AQ-6, and MM-AQ-9 through MM-AQ-12 as well as **MM-GHG-1 and MM-GHG-2** include various mitigation strategies to increase energy efficiency, reduce fossil fuel energy consumption, promote renewable energy sources, and ensure future development projects are constructed in line with sustainability and resource conservation goals established by the State and by the District. These measures will promote energy conservation and reduce energy consumption from all relevant sources. For example, **MM-GHG-1** will ensure non-emergency electricity for all tenants is completely provided by renewable sources by 2030, which will ensure that electricity-related emissions trend down over time. **MM-GHG-2** will require the replacement of the District's existing fossil-fueled on-road vehicles with ~~alternative fuel, electric, or hybrid~~ zero emission vehicles.

Additionally, implementation of **MM-AQ-11** and **MM-AQ-12** would also reduce fuel consumption by requiring the District to develop and implement an EV charging program and requiring marina operators to install dockside electrical infrastructure for boats to plug into when docked, respectively. Marina operators would provide charging infrastructure at marinas and promote public awareness. Other measures, including ~~MM-AQ-9 and MM-AQ-10a, and MM-AQ-10b~~, would require new developments to implement sustainability measures in building design that would result in the reduction of energy and water consumption and waste generation. Specially, **MM-AQ-10a and MM-AQ-10b** would reduce natural gas energy consumption 73 percent.

Implementation of **MM-AQ-9 through MM-AQ-12, and MM-GHG-1 and MM-GHG-2** would reduce the energy demand and fossil fuel use of future development to ensure the proposed PMPU does not result in potential wasteful, inefficient, or unnecessary consumption of energy resources. With mitigation, future development under the proposed PMPU would assist with energy conservation goals because it would promote energy efficiency and sustainability measures to reduce energy consumption, and promote installation of renewable energy. With this mitigation, the proposed PMPU's energy consumption would be reduced to 43 percent in 2030 and 51 percent in 2050 relative to unmitigated conditions. Thus, the mitigated operational energy demand would not cause a wasteful, inefficient, or unnecessary consumption of energy sources by implementing energy efficiency and sustainability measures that would reduce total energy consumption compared to the unmitigated buildout projections, and impacts would be less than significant.

Transportation-Related Energy Demand

Construction

As discussed above, the construction of future development under the proposed PMPU would involve transportation-related energy demand (i.e., diesel and gasoline fuel). During construction

activities, contractors would be required to comply with the provisions of 13 California Code of Regulations Sections 2449 and 2485, which prohibit diesel-fueled commercial motor vehicles and off-road diesel vehicles from idling for more than five minutes, which would minimize unnecessary fuel consumption. It is anticipated that, for any given future development, transportation-related energy consumed during the construction period would represent a small demand on local and regional fuel supplies. However, it is possible that the proposed project could still result in the wasteful, inefficient, or unnecessary consumption of transportation-related energy if measures are not taken to ensure energy is used efficiently. Thus, while not quantifiable, future development under the proposed PMPU would implement mitigation measures **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-GHG-2** to reduce transportation related energy demand. The implementation of these measures would implement feasible strategies to help avoid or reduce the wasteful, inefficient, and unnecessary consumption of transportation-related energy resources during construction of future projects under the proposed PMPU. Therefore, implementation of the recommended measures would reduce transportation-related energy impacts associated with construction of future development under the proposed PMPU to less than significant (**Impact-EN-1**).

Operations

Operations of the future development allowed under the proposed PMPU would include transportation-related energy demand. Specifically, this demand would be associated with diesel and gasoline usage from maritime activity, district operations, as well as employee and visitor trips. As shown in Table 4.6-16, gasoline and diesel fuel consumption would increase due to the implementation of the proposed PMPU. However, the PMPU would incorporate **MM-AQ-10a**, **MM-AQ-10b**, **MM-AQ-11**, and **MM-AQ-12** as well as **MM-GHG-2** to help reduce any wasteful, inefficient, or unnecessary consumption of transportation-related energy resources during project operation. Implementation of **MM-AQ-10a** through **MM-AQ-12**, and **MM-GHG-2** would reduce the transportation-related fossil fuel use of future development to ensure the proposed PMPU does not result in potential wasteful, inefficient, or unnecessary consumption of energy resources (**Impact-EN-1**).

Appendix F Discussion

Table 4.6-17 evaluates the potential impacts of the proposed PMPU on energy using the criteria provided in Appendix F of the State CEQA Guidelines. Overall, the proposed PMPU would assist with energy conservation goals because it would promote energy efficiency and sustainability measures to reduce energy consumption. However, because of the increase in energy consumption relative to existing conditions, this impact is potentially significant, and mitigation is required to ensure energy efficiency and sustainability measures beyond existing regulations are incorporated into future project designs (**Impact-EN-1**).

Table 4.6-17. Proposed Project Comparison to State CEQA Guidelines Appendix F

Project Impact Considerations from Appendix F	Project Applicability and Analysis
Energy requirements and energy use efficiencies by amount and fuel type for each stage of the project.	Applic. See Tables 4.6-15 and 4.6-16, which break down construction and operational energy use. As indicated, future development with the proposed PMPU would increase the use of electricity and the need for fossil fuels such as diesel fuel, gasoline, and natural gas.

Project Impact Considerations from Appendix F	Project Applicability and Analysis
Effects on local and regional energy supplies and the need for additional capacity	<p>Applies. Operation of future landside and waterside development associated with the proposed PMPU would potentially require upgrades to existing energy infrastructure to accommodate the increased energy demand of the proposed PMPU. Please see Section 4.15, <i>Utilities and Service Systems</i>, for an analysis of the potential environmental impacts associated with new or expanded energy infrastructure (i.e., electricity and natural gas facilities) resulting from implementation of the proposed PMPU. Implementation of various mitigation measures, most notably MM-AQ-9, would require the implementation of various sustainability and energy-saving features in compliance with the District's CAP which would reduce the overall energy demand of the proposed project, such as indoor water reduction measures, high-efficiency lighting systems, and "Cool Roofs." Other measures, such as those to replace District fleet vehicles with zero-emission vehicles and to use clean or electric harbor craft during construction (MM-GHG-2 and MM-AQ-6), would reduce fossil fuel consumption over the life of the proposed PMPU. As such, adverse effects on local or regional energy supplies as a result of the proposed PMPU would be less than significant.</p>
Effects of the project on peak and base period demands for electricity and other forms of energy	<p>Applies. Energy load would vary over time, and it is anticipated that current energy supply and infrastructure would be able to accommodate the additional demand without interruption or issues to existing customers and without the need for new infrastructure. However, because the proposed PMPU is a long-range plan extending to 2050 and the specific location, timing, design specifications of future development is unknown, there is a potential that new or upgraded infrastructure may be required. Please see Section 4.15 for an analysis of the potential environmental impacts associated with new or expanded energy infrastructure (i.e., electricity and natural gas facilities) resulting from implementation of the proposed PMPU. As discussed above, implementation of MM-AQ-6, MM-AQ-9, and MM-GHG-2 would be required, which would ensure the project does not result in the efficient or wasteful use of energy. With implementation of these mitigation measures, the PMPU does not propose demand that is expected to affect peak and base-period demand.</p>
Degree to which the project complies with existing energy standards	<p>Applies. The proposed PMPU would be fully compliant with all existing energy standards, including the Clean Energy and Pollution Reduction Act of 2015, Energy Building Regulations and Energy Conservation Standards, and California Energy Code (Title 24). Additionally, implementation of MM-AQ-9 would require all tenants to implement sustainability measures in building design, and MM-AQ-10a would require all hotels to reduce fuel combustion prior to 2030 and MM-AQ-10b requires all development to be carbon neutral starting in 2030 (or earlier if required per law); both measures would reduce energy consumption.</p>
Effects of the project on energy resources	<p>Applies. The proposed PMPU would not result in an adverse impact on energy resources such as electricity, natural gas, and solar. There are sufficient energy resources to accommodate the</p>

Project Impact Considerations from Appendix F	Project Applicability and Analysis
Projected transportation energy use requirements and overall use of efficient transportation alternatives	<p>additional project energy demand, and implementation, and MM-AQ-9, MM-AQ-10a, MM-AQ-10b, and MM-GHG-2 would require the implementation of various sustainability and energy-saving features, including those prescribed in the District's CAP.</p> <p>Applies. The proposed PMPU would increase the need for fossil fuels compared to baseline conditions because it would introduce new uses to the proposed PMPU area that would increase transportation energy use. The construction of hotels, marina, restaurant(s), retail, and other general tourist/visitor-serving commercial uses would result in new motor vehicle trips, while future in-water development such as new boat slips would increase the number of recreational boats operating, which would result in use of both gasoline and diesel fuel. However, MM-AQ-9, MM-AQ-10a, and MM-AQ-10b would require the incorporation of sustainability measures for future development to reduce impacts on energy resource. MM-AQ-11 requires the District to develop and implement an EV charging program, and MM-AQ-12 requires dockside electrical infrastructure to be installed to serve docked boats. MM-TRA-3 requires future project proponents to implement TDM measures, by reducing vehicle trips and promoting alternative forms of transportation, which will reduce transportation energy use during construction and operation. Overall, implementation of these measures would decrease the proposed PMPU's need for fossil fuels compared to unmitigated conditions.</p>

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources. The proposed PMPU includes several policies that would promote energy efficiency and conservation, including SR Policy 3.1.3 (deployment of renewable energy technology to improve energy reliability), SR Policy 3.1.5 (coordination with Tidelands' tenants and adjacent local businesses to reduce resource consumption and promote sustainable operations.), SR Policy 3.1.6 (promotion of the innovative use of "green" design), and SR Policy 3.1.7 (water conservation strategies).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact due to wasteful, inefficient, or unnecessary consumption of energy resources (**Impact-EN-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction and operational activities associated with Option 1 would be similar to those analyzed above because they would be associated with the same water and land uses and infrastructure improvements. While development associated with Option 1 would require energy during construction and operation, it is not anticipated that a Waterfront Destination Park would require a significant amount of energy during construction or operation relative to regional demand such that it would result in the wasteful, inefficient, or unnecessary consumption of energy resources. Therefore, potential impacts for wasteful, inefficient, or unnecessary consumption of energy resources associated with Option 1 would be less than significant. Moreover, compliance with PMPU policies SR Policy 3.1.3, SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 would further reduce energy usage associated with Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact due to wasteful, inefficient, or unnecessary consumption of energy resources (**Impact-EN-1**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses analyzed above that could increase energy use during construction and operation. While future development under Option 2 would require energy during construction or operation, it is not anticipated that new park space would require a significant amount of energy during construction and operation relative to regional demand such that it would result in the wasteful, inefficient, or unnecessary consumption of energy resources. Therefore, potential impacts for wasteful, inefficient, or unnecessary consumption of energy resources would be less than significant. Moreover, compliance with PMPU policies SR Policy 3.1.3, SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 would further reduce energy usage associated with Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact due to wasteful, inefficient, or unnecessary consumption of energy resources (**Impact-EN-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses analyzed above that could increase energy use during construction and operation. While future development under Option 3 it is not anticipated that new park space would require a significant amount of energy during construction or operation relative to regional demand such that it would result in the wasteful, inefficient, or unnecessary consumption of energy resources. Therefore, potential impacts for

wasteful, inefficient, or unnecessary consumption of energy resources would be less than significant. Moreover, compliance with PMPU policies SR Policy 3.1.3, SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 would further reduce energy usage associated with Option 3.

Impact Determination and Mitigation

Implementation of the proposed PMPU would result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during construction and operation of the proposed PMPU.

Significant Impacts

Impact-EN-1: Potential Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources. Implementation of the proposed PMPU would have the potential to result in the wasteful, inefficient, or unnecessary consumption of energy resources during construction and operation.

Mitigation Measures

For **Impact-EN-1**:

Implement **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-AQ-9** through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-GHG-1** and **MM-GHG-2**, as described under Threshold 1 above.

Implement **MM-TRA-3**, as described in Section 4.14.

Level of Significance After Mitigation

As shown in Tables 4.6-17 and 4.6-18, with implementation of **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-AQ-9** through **MM-AQ-12**, as well as **MM-GHG-1**, and **MM-GHG-2**, construction and operational energy use (**Impact-EN-1**) would be reduced. Therefore, the proposed PMPU would not result in the wasteful, inefficient, or unnecessary use of energy, and impacts would be less than significant after mitigation.

Threshold 4: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Impact Analysis

State and local renewable energy and energy efficiency plans that are applicable to the proposed PMPU are discussed above in Section 4.6.3. State plans, California Title 24 energy efficiency standards, SB 350, and SB 100 contain required standards related to energy efficiency and renewable energy development. The proposed PMPU is required to comply with the State and local plans and regulations, all of which are aimed at increasing energy efficiency and renewable energy development. Some plans and regulations are statewide and do not require local or project action to implement. Table 4.6-18 provides a consistency analysis with State and local energy plans and regulations.

Table 4.6-18. Proposed Project Consistency with State and Local Energy Plans and Regulations

Regulation, Plan, or Policy	Project Applicability and Consistency
Clean Energy and Pollution Reduction Act of 2015 (SB 350)	Consistent without Mitigation. The Clean Energy and Pollution Reduction Act of 2015 requires the following by 2030: (1) an RPS of 50% and (2) a doubling of efficiency for existing buildings. The RPS is dependent on the utility provider and the project does not impede reaching a goal of 50%.
Energy Building Regulations and Energy Conservation Standards (Title 20, Energy Building Regulations; Title 24, Energy Conservation Standards)	Consistent without Mitigation. Implementation of the proposed PMPU would result in the construction of energy efficient buildings that would comply with existing building codes and may replace older less efficient structures. At a minimum, new construction occurring under the proposed PMPU would be required to comply with the current Title 24 building standards, which include a broad set of requirements for energy conservation and green design. Moreover, the project would incorporate MM-AQ-9 , which would require all tenants to implement sustainability measures in building design, and MM-AQ-10b , which would require all development to be carbon neutral starting in 2030 (or earlier if required per law). While these mitigation measures are not necessary for consistency with the Energy Building Regulations and Energy Conservation Standards, MM-AQ-9 and MM-AQ-10b would help reduce energy consumption.
The 100 Percent Clean Energy Act of 2018	Consistent without Mitigation. SB 100 increases the RPS target set in SB 350 to 60% by 2030. It also requires all retail sales of electricity to California end-users and electricity procured to serve State agencies to be provided by zero-carbon resources by 2045. Building energy efficiency is expected to increase, as a result of compliance with Title 24 building codes, which are expected to move toward zero net energy for newly constructed buildings. The proposed PMPU would not hinder implementation of SB100 since it is not an energy infrastructure project that would have retail sales of electricity.
San Diego Unified Port District Climate Action Plan (CAP)	Consistent with Mitigation. As detailed in Table 4.6-13, the proposed PMPU would be inconsistent with the District's CAP without implementation of mitigation. The CAP includes an inventory of existing and projected emissions in 2020, 2035, and 2050 and identifies the District's GHG reduction goals and measures to be implemented to support meeting the statewide reduction goals set forth in AB 32. As discussed in Threshold 2, future development under the proposed PMPU would comply with the District's CAP with promotion of zero net energy buildings through MM-AQ-9 , MM-AQ-10a , and MM-AQ-10b , creation of a fleet using alternative fuel, electric, or hybrid vehicles through MM-GHG-2 , and use of shore power for marinas under MM-AQ-12 . Thus, with implementation of MM-AQ-9 , MM-AQ-10a , MM-AQ-10b , MM-GHG-2 , and MM-AQ-12 , the proposed PMPU would be consistent with the energy goals of the CAP.
Green Port Policy (BPC 736) and Program	Consistent without Mitigation. The Green Port Policy was designed to achieve the District's environmental sustainability goals in six key areas: water, energy, air, waste management, sustainable development, and sustainable business practices. The policy establishes guiding principles to achieve long-term environmental, societal, and economic benefits through resource conservation, waste

Regulation, Plan, or Policy	Project Applicability and Consistency
SB 375 and SANDAG's San Diego Forward: The Regional Plan	<p>reduction, and pollution prevention. As detailed in Chapter 3, the proposed PMPU would adhere and further implement the sustainability goals identified in the District's Green Port Policy.</p> <p>Consistent without Mitigation. SANDAG's Regional Plan established a long-range blueprint for the San Diego region's growth and development through the year 2050. Because the proposed PMPU would not include any components that would result in substantial unplanned population growth it would be consistent with the Regional Plan. In addition, the proposed PMPU would also result in large-scale alterations to the circulation system in order to improve efficiency and reduce traffic (VMT) along the roadways, to provide infrastructure for transit opportunities, and pedestrians and bicyclists with improved travel routes, and to establish mobility hubs to meet the needs of the visitors to the proposed PMPU area, which would be consistent with the goals of SB 375 and SANDAG's Regional Plan.</p>
SANDAG Regional Energy Strategy	<p>Consistent without Mitigation. SANDAG's RES established long-term goals related to energy efficiency, renewable energy, distributed generation, and transportation fuel, among others. The strategies and goals found in the RES were used as guidance for development of the energy components of the 2050 RTP/SCS.</p> <p>Proposed PMPU ECON Policy 2.3.2 requires coordination for the investment in improvements to marine terminal and maritime industrial operations that improve functionality and efficiency through modernization of terminal infrastructure and equipment, including electrification that supports optimization of cargo movement and reduces emissions. This policy supports land use and transportation planning strategies that reduce energy use and GHG emissions.</p>

As shown in Table 4.6-18, future development under the proposed PMPU would be consistent with statewide renewable energy or energy efficiency plans and regulations, but would not be consistent with local plans, such as the District's CAP, prior to mitigation. Because the proposed PMPU may result in an inconsistency with the adopted CAP, impacts would be significant prior to mitigation (**Impact-EN-2**).

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Rather, the proposed PMPU includes several policies that would promote energy efficiency and conservation, including SR Policy 3.1.3 (deployment of renewable energy technology to improve energy reliability), SR Policy 3.1.5 (coordination with Tidelands' tenants and adjacent local businesses to reduce resource consumption and promote sustainable operations.), SR Policy 3.1.6 (promotion of the innovative use of "green" design), and SR Policy 3.1.7 (water conservation strategies).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to conflicting with or obstructing a State or local plan for renewable energy or energy efficiency (**Impact-EN-2**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction and operational activities associated with Option 1 would be similar to those associated with the proposed PMPU because they would be associated with the same water and land uses and infrastructure improvements. Construction and operation of Option 1 would be required to comply with the State and local plans and regulations, all of which are aimed at increasing energy efficiency and renewable energy development. However, because implementation of Option 1 may result in an inconsistency with the adopted CAP, impacts would be significant prior to mitigation (**Impact-EN-2**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to conflicting with or obstructing a State or local plan for renewable energy or energy efficiency (**Impact-EN-2**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses analyzed above. Construction and operation of Option 2 would be required to comply with the State and local plans and regulations, all of which are aimed at increasing energy efficiency and renewable energy development. However, because implementation of Option 2 may result in an inconsistency with the adopted CAP, impacts would be significant prior to mitigation (**Impact-EN-2**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to conflicting with or obstructing a State or local plan for renewable energy or energy efficiency (**Impact-EN-2**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses analyzed above. Construction and operation of Option 3 would be required to comply with the State and local plans and regulations, all of which are aimed at increasing energy efficiency and renewable energy development. However, because implementation of Option 3 may result in an inconsistency with the adopted CAP, impacts would be significant prior to mitigation (**Impact-EN-2**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Impact Determination and Mitigation

Implementation of the proposed PMPU would conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

Significant Impacts

Impact- EN-2: Potential Inconsistency with Applicable Energy Use Reduction Plans. The proposed PMPU would be consistent with statewide renewable energy or energy efficiency plans and regulations, but would not be consistent with local plans, such as the District's CAP, prior to mitigation. This would be considered a significant impact prior to mitigation.

Mitigation Measures

For **Impact-EN-2**:

Implement **MM-AQ-9**, **MM-AQ-10a**, **MM-AQ-10b**, **MM-AQ-11**, and **MM-AQ-12**, as described in Section 4.2.

Implement **MM-GHG-2**, as described in Threshold 1.

Level of Significance After Mitigation

Implementation of **MM-AQ-9**, **MM-AQ-10a**, **MM-AQ-10b**, **MM-AQ-11**, **MM-AQ-12**, and **MM-GHG-2** would ensure compliance with the District's CAP. These measures include relevant emission-reducing measures from the District CAP through; promotion of zero net energy buildings through **MM-AQ-11**, creation of a fleet using alternative fuel, electric or hybrid vehicles through **MM-GHG-2**, and use of shore power for marinas under **MM-AQ-12**. As such, any potential inconsistency would be avoided and **Impact-EN-2** would be reduced to less than significant after mitigation.

4.6.5 Cumulative Impact Analysis

There would be the potential for a cumulatively considerable GHG-related impact if the proposed PMPU would be inconsistent with statewide reduction planning efforts or the District's CAP; in conflict with regulatory programs outlined in the Scoping Plan and adopted by CARB or other California agencies to reduce GHG emissions; inconsistent with the post-2020 reduction targets set forth through California EO S-03-05, B-55-18, and SB 32; or in conflict with plans, policies, and regulations promulgated to reduce GHG emissions beyond the 2020 timeframe.

A significant cumulative impact on energy would result if the proposed PMPU would contribute to a cumulatively considerable environmental impact due to wasteful, inefficient, or unnecessary

consumption of energy resources during project construction or operation, or conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

4.6.5.1 Geographic Scope

GHG Emissions

Climate change is a cumulative issue, and the geographic scope for cumulative GHG emission impacts is global. Because climate change is the result of cumulative global emissions, no single project, when taken in isolation, can cause climate change—a single project's emissions are insufficient to change the radiative balance of the atmosphere. Because climate change is the result of GHG emissions, and GHGs are emitted by innumerable sources worldwide, cumulative GHG emissions that contribute to global climate change will have a significant cumulative impact on the natural environment as well as on human development and activity. The global increase in GHG emissions that has occurred and will occur in the future is the result of the actions and choices of individuals, businesses, local governments, states, and nations. Furthermore, although climate change impacts will likely vary by geography and intensity, the impacts that will result from cumulative global emissions will be felt worldwide. The GHG analysis above is inherently a cumulative analysis.

Energy

The geographic scope for cumulative impacts for energy usage includes the SDG&E service area, which is the entire County.

4.6.5.2 Cumulative Effects from Past, Present, and Probable Future Projects

GHG Emissions

Past, present, and probable future projects include plans, and programs throughout the region, state, nation, and world, including growth assumed by SANDAG as well as those additional plans and programs shown in Table 2-2 of Chapter 2, *Project Description*. Each of these plans and programs would potentially contribute cumulative impacts related to global climate change. As with the proposed PMPU, all the projects, plans, and programs, along with all other projects within the county, state, and region, would be required to comply with all applicable Federal, State, and local policies and regulations regarding GHG emission reductions (e.g., SB 32, Pavley 1, Advanced Clean Cars, Renewables Portfolio Standard, SB 350, SB 100). However, GHG emissions from past, present, and probable future projects have contributed to, and will continue to contribute to, a cumulatively significant impact.

Energy

A cumulative energy consumption impact would occur if development associated with plans and programs identified in Table 2-2 or within the geographic scope of the cumulative impact analysis for energy use, combined with the proposed PMPU, resulted in wasteful, inefficient, or unnecessary consumption of energy resources throughout the region. The cumulative plans and programs listed in Table 2-2 would result in the redevelopment of urbanized areas that are currently served by SDG&E,

and the development of the cumulative projects would not result in an expansion of SDG&E's service area. However, the cumulative projects would result in increases in energy demand compared to existing conditions, especially for plans which would develop undeveloped sites that would result in new energy demand. As required by the CPUC, California utilities, including SDG&E, are required to file long-term energy resources plans with the CPUC. SDG&E's most recent long-term procurement plan was filed in October 2014 and includes plans and strategies to meet the future energy demands of its customers, including a plan addressing the closure of the San Onofre Nuclear Generating Station. SDG&E would continue to import electricity and natural gas to meet regional demand; however, an increase in imported energy to meet demand could result in high energy prices and unreliable supply. SANDAG adopted an RES in 2009, which was updated in 2014 to specifically address regional energy supply. The RES includes proposed Early Actions to promote long-term energy efficiency and availability in the region. If the cumulative projects would not support the implementation of applicable Early Actions from the RES, a cumulative impact could occur. The cumulative projects would be required to comply with the Title 24 energy efficiency standards, which promote energy efficiency and reduce inefficient, wasteful, and unnecessary consumption of energy. However, Title 24 does not require additional measures to support the other RES Early Actions, including supporting alternative transportation to reduce transportation energy use, reducing GHG emission from energy use, and limiting water use to reduce indirect energy use for water transport. As such, it is possible that present and probable future plans and programs would not comply with all programs and policies designed to reduce energy demand. Therefore, impacts from past, present, and probable future plans and programs may be cumulatively significant.

4.6.5.3 Project Contribution

GHG Emissions

As discussed under Threshold 1, the proposed PMPU would contribute GHG emissions to the cumulative condition. As shown in Table 4.6-10, buildout of the proposed PMPU would result in a net increase in GHG emissions over existing conditions, resulting in a cumulatively considerable impact prior to mitigation. This increase in emissions would exceed the applicable efficiency metric for both 2030 and 2050, which would conflict with statewide emission reduction planning efforts prior to mitigation (**Impact-C-GHG-1**). With implementation of **MM-AQ-2** and **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2**, emissions from the proposed PMPU would be reduced to below the efficiency metric in 2030, but remain in excess of the efficiency metric for 2050. However, because it cannot be stated with certainty that the project would result in emissions that would represent a fair share of the requisite reductions toward the statewide carbon neutrality goal, impacts would remain significant for both 2030 and 2050. Therefore, after mitigation, the proposed PMPU would result in a cumulatively considerable contribution to impacts related to 2030 and 2050 because it would impede achievement of the State reduction targets and goals, and **Impact-C-GHG-1** would be cumulatively considerable and unavoidable.

As discussed under Threshold 2, the proposed PMPU would be inconsistent with relevant GHG reduction plans, policies, and regulations (**Impact-C-GHG-2**), which is considered a cumulatively considerable contribution to significant cumulative GHG impacts. With implementation of **MM-AQ-2** and **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, **MM-TRA-1** through **MM-TRA-3**, **MM-GHG-1**, and **MM-GHG-2**, the proposed PMPU would be consistent not conflict with or obstruct the relevant plans, policies, and regulatory programs, including CAP, the Scoping Plan, and other statewide reduction policies and plans. Therefore, after mitigation, the proposed PMPU would result in a less than

cumulatively considerable contribution to cumulative impacts related to consistency with relevant plans, policies, and regulations adopted to reduce GHG emissions.

Energy

As discussed under Threshold 3, the proposed PMPU would result in a significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, which, when combined with the cumulative projects listed in Table 2-2, would be cumulatively considerable prior to mitigation (**Impact-C-EN-1**). However, mitigation that would promote energy efficiency and sustainability measures to reduce energy consumption and promote installation of renewable energy (**MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, **MM-AQ-9**, **MM-AQ-10a**, **MM-AQ-10b**, **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2**) would reduce energy demand and fossil fuel use of future development to ensure that future development projects under the proposed PMPU do not result in potential wasteful, inefficient, or unnecessary consumption of energy resources.

As discussed under Threshold 4, the proposed PMPU also would conflict with or obstruct a local plan for renewable energy or energy efficiency, as the proposed PMPU would not be consistent with the District CAP before mitigation because it does not include measures specific to the CAP (**Impact-C-EN-2**). Implementation of **MM-AQ-9** through **MM-AQ-12** and **MM-GHG-2** would ensure compliance with the District's CAP. Therefore, the proposed PMPU would not conflict with State and local renewable energy and energy efficiency plans after mitigation. When combined with the cumulative projects listed in Table 2-2, which would also be required to be designed in compliance with the building energy efficiency standards of Title 24 of the California Building Code and to comply with any applicable State plans for renewable energy or energy efficiency to the extent required by law, cumulative impacts would be less than significant, and the proposed PMPU's contribution to cumulative energy impacts would not be cumulatively considerable after mitigation.

4.6.5.4 Cumulative Impact Determination and Mitigation

GHG Emissions

The proposed PMPU's incremental contribution to cumulative GHG impacts would be cumulatively considerable prior to mitigation. The potential cumulatively considerable impacts are as follows.

Impact-C-GHG-1: Inconsistency with the Statewide Reduction Targets for 2030 and 2050

Impact-C-GHG-2: Conflict with Plans, Policies, and Regulations

Mitigation Measures

For Impact-C-GHG-1:

Implement **MM-AQ-2** and **MM-AQ-3**, and **MM-AQ-6** through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-GHG-1** and **MM-GHG-2**, as described in Threshold 1 above.

For Impact-C-GHG-2:

Implement **MM-AQ-2**, **MM-AQ-3**, and **MM-AQ-6** through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-GHG-1** and **MM-GHG-2**, as described in Threshold 1 above.

Level of Significance After Mitigation

Implementation of **MM-AQ-2** and **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, and **MM-GHG-1** and **MM-GHG-2** would reduce **Impact-C-GHG-1** ~~to the extent feasible to less than significant levels.~~ However, Therefore, Impact-C-GHG-1 would be less than remain cumulatively considerable ~~after and unavoidable mitigation.~~

Implementation of **MM-AQ-2** and **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, and **MM-GHG-1** and **MM-GHG-2** would reduce **Impact-C-GHG-2** ~~to less than significant levels to the extent feasible.~~ Therefore, However, Impact-C-GHG-2 would be less than remain cumulatively considerable ~~after mitigation and unavoidable.~~

Energy

The proposed PMPU's incremental contribution to cumulative energy impacts would be cumulatively considerable prior to mitigation. The potential cumulatively considerable impacts are as follows.

Impact-C-EN-1: Potential Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources

Impact-C-EN-2: Potential Inconsistency with Applicable Energy Use Reduction Plans

Mitigation Measures

For **Impact-C-EN-1**:

Implement **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, **MM-AQ-9**, **MM-AQ-10a**, **MM-AQ-10b**, and **MM-AQ-12**, as described in Section 4.2.

Implement **MM-GHG-1** and **MM-GHG-2**, as described in Threshold 1 above.

For **Impact-C-EN-2**:

Implement **MM-AQ-9** through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-GHG-2**, as described in Threshold 1 above.

Level of Significance After Mitigation

Implementation of **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, **MM-AQ-9**, **MM-AQ-10a**, **MM-AQ-10b**, **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2** would reduce **Impact-C-EN-1** to less-than-significant levels. Therefore, **Impact-C-EN-1** would be less than cumulatively considerable.

Implementation of **MM-AQ-9** through **MM-AQ-12** and **MM-GHG-2** would reduce **Impact-C-EN-2** to less-than-significant levels. Therefore, **Impact-C-EN-2** would be less than cumulatively considerable.

Section 4.7

Hazards and Hazardous Materials

4.7.1 Overview

This section describes the existing conditions and laws and regulations for hazards and hazardous materials, followed by an analysis of the proposed Port Master Plan Update's (PMPU's) potential to (1) create a significant hazard to the public or environment, (2) emit hazardous emissions or handle hazardous materials within 0.25 mile of a school, (3) be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, (4) be located within an airport land use plan and result in a safety hazard for people residing or working in the proposed PMPU area, and (5) impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. All other potential hazards and hazardous materials issues, including safety hazards associated with private airstrips and exposing people or structures to a significant risk involving wildland fires, were analyzed in Section VIII of the Initial Study/Environmental Checklist (see Appendix A) and determined to have no impact. The analysis and conclusions regarding these impacts are also summarized in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*. In certain cases, information about water quality and sediment contamination is discussed in this section; however, greater detail regarding the proposed PMPU's potential impacts on water quality are provided within Section 4.8, *Hydrology and Water Quality*.

Information on hazardous materials in this section is summarized from the *Hazardous Materials Technical Study, Integrated Planning Port Master Plan Update, San Diego Unified Port District, San Diego, California* prepared by Ninyo & Moore Geotechnical and Environmental Sciences Consultants (Ninyo & Moore) for the PMPU (2017), provided as Appendix G.

Table 4.7-1 summarizes the significant impacts and mitigation measures (MMs) in Section 4.7.4.4, *Project Impacts and Mitigation Measures*.

Table 4.7-1. Summary of Significant Hazards and Hazardous Materials Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-HAZ-1 and Impact C-HAZ-1: Possible Onsite Contamination	PD1, PD2, PD3, PD4	MM-HAZ-1: Conduct an Environmental Site Assessment, Prepare a Remediation Plan, and Remediate Accordingly	Less than Significant	MM-HAZ-1 would ensure that proper due diligence is conducted; and if contaminated material is encountered, ensure it would be handled safely and correctly through evaluation, characterization, and application of best practices by a qualified environmental professional.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-HAZ-2 and Impact-C-HAZ-2: Potential to Encounter Undocumented Contamination During Reasonably Foreseeable Construction Activities	All planning districts	MM-HAZ-1 , as described above MM-HAZ-2: Identify Unknown Hazardous Materials Encountered During Construction	Less than Significant	MM-HAZ-1 , would ensure a site that is potentially contaminated is identified and any contamination encountered is handled safely through evaluation, characterization, and application of best practices by a qualified environmental professional. MM-HAZ-2 would ensure previously unknown hazardous materials encountered during construction would be properly characterized and handled.
Impact-HAZ-3 and Impact-C-HAZ-3: Potential to Encounter Lead or Organochlorine Pesticides in Soil During Reasonably Foreseeable Construction Activities	All planning districts	MM-HAZ-1 and MM-HAZ-2 , as described above	Less than Significant	MM-HAZ-1 would ensure a site that is potentially contaminated is identified and any contamination encountered is handled safely through evaluation, characterization, and application of best practices by a qualified environmental professional. MM-HAZ-2 would ensure previously unknown hazardous materials encountered during construction would be properly characterized and handled.
Impact-HAZ-4 and Impact-C-HAZ-4: Potential to Encounter Contamination On Site Due to Listing on a Hazardous Materials Database	All planning districts	MM-HAZ-1 and MM-HAZ-2 , as described above	Less than Significant	MM-HAZ-1 would ensure a site that is potentially contaminated is identified and any contamination encountered is handled safely through evaluation, characterization, and application of best practices by a qualified environmental professional. MM-HAZ-2 would ensure previously unknown hazardous materials encountered during construction would be properly characterized and handled.

4.7.2 Existing Conditions

The following section describes the existing hazard and hazardous materials conditions within the proposed PMPU area. This section provides a general history of the proposed PMPU area followed by an overview of historical activities within each planning district (PD), a summary of known contamination and related regulatory actions, and a summary of the findings from hazardous materials databases for each planning district. Please note, the term *hazardous materials* refers to hazardous waste or other contaminants, for example petroleum products or lead-based paint, while the term *contaminated media* refers to the substance that has been affected by the release of a hazardous material, including soil, sediment, or groundwater.

4.7.2.1 PMPU Area Historical Overview

During the height of the land boom in San Diego in the 1880s, which was driven by railroad development in the region, San Diego Bay had six privately developed wharfs. The City of San Diego became involved in development in the Bay in the 1910s. In 1911, the State of California instituted a policy of handing over control of Tidelands to local governments that agreed to invest at least \$1,000,000 in Tidelands improvements. In May 1919, the City of San Diego's first mayor-appointed Harbor Commission and Port Director began managing the Tidelands within the city limits (ICF International 2016:16, Reupsch 1970a:2-3, District 1974:2-3.). The City of San Diego completed a municipal wharf, that is now known as Broadway Pier, in 1916, and a second municipal pier, now known as B Street Pier, was completed in 1926. (ICF International 2016:16-18.)

Federal military investment also shaped the development of the San Diego bayfront for the first half of the twentieth century. In the years 1916 and 1917 the West Coast Marine Corps Advance Base, the naval Hospital, and Rockwell Field were established in San Diego. By the mid-1920s, the Federal government had begun or completed the Destroyer Base (today's Naval Base San Diego), the Naval Training Station, the Eleventh Naval District Supply Center, the Marine Corps Recruit Base, the naval Radio Station, the Fleet Fuel Depot, the U.S. Coast Guard Base, and Fort Rosecrans. Economic and population growth driven largely by the military development resulted in industrial, commercial, and civic development along the bayfront. A commercial fishing industry developed during this time, accompanied by the supporting canneries and shipbuilding industries.

During the early 1900s the bayfront was often used as a location for waste disposal. Raw sewage was dumped into the Bay starting in the early 1900s, and several waste dumps were located along the shoreline, including two near Chollas Creek. Refuse burning on the Tidelands has been recorded as occurring at the 8th Avenue Tidelands Dump (in the vicinity of current-day Tenth Avenue Marine Terminal [TAMT]) and at the Newton Avenue Dump (in the vicinity of current-day PD4) (District 2016). The City of San Diego constructed a garbage incinerator along the bayfront in the vicinity of the dumping areas sometime between 1906 and 1921 on land formed from trash deposits and dredged fill material, which gradually expanded the shoreline (District 2012, Seymour 2013). Other uses along the Tidelands at this time were recreational, including the San Diego Rowing Club clubhouse constructed in 1900, and industrial, such as lumberyards that received lumber by water, shipyards building and repairing ships, fish canning and packing plants, and wharfs. Railyards and railroads were constructed along the Tidelands to support the industries along the Bayfront. Manufacturing also had a presence along the bayfront; the National Steel and Shipbuilding Company (NASSCO) was first formed as the California Iron Works in 1905 (later renamed as National Iron Works, then NASSCO) and operated as a steel foundry and steel plant until it shifted to building ships, machines, and tanks by the 1930s and 1940s. Shipbuilders in the early 1900s, including the San Diego Marine Construction Company (formerly located at the foot of Sampson Street) and Walter Benzanson's Robbins Machine Company (at the foot of Date Street) built commercial fishing vessels for the fishing industry.

During the Great Depression and World War II, Federal public works agencies such as the Civil Works Administration and Works Progress Administration (WPA) were responsible for projects in the Bay such as dredging, Tideland fill to expand the waterfront, and new wharfs and mole piers. The original San Diego Civic Center (now the San Diego County Administration Center) was a WPA-funded project completed in 1938. (City of San Diego 2007:29-30; Harbor Department 1948:26-28, 32-40, 70-78.)

In post-World War II San Diego (1945–1968), the City sought to grow the Bay into a more competitive commercial port. Also during this period, recreational uses and tourism became increasingly important elements of Bay planning and development. Shelter Island, built out of channel dredging material added to an existing shoal, was completed in 1950, and Harbor Island, constructed out of dredging to deepen the channel from the Bay entrance to North Island facilities, was completed in 1961. These islands were developed with hotels, restaurants, yacht clubs, and other recreational facilities, which became important elements in the growing tourism industry. City of San Diego leadership also sought to grow the shipping abilities of the Bay. Voter-approved bonds funded the development of the TAMT, which opened for business with two large transit sheds in 1958. The Twenty-Fourth Street Marine Terminal was constructed in 1968, and would later become the modern shipping facility now known as National City Marine Terminal. (Gross 1983:A-14; ICF International 2016:22–23, 24–25; District 1974:4, 6–7; Reusch 1970a: 8–9.)

The extensive industrial and military uses and waste disposal practices common during the first half of the twentieth century resulted in the polluted discharges into the Bay, the underlying sediment, and the Tidelands. Given the intensity of these uses, additional background and historic context is provided for PD1, PD2, PD3, and PD4. Planning District 7, PD8, PD9, and PD10 did not have the same intensity of historical uses leading to hazardous conditions, though there is limited information about their historical uses and any resulting contamination. Details of known contamination within all planning districts in the proposed PMPU area is provided in Section 4.7.2.2, *Known Contamination Within the Proposed PMPU Area*.

Planning District 1: Shelter Island

Shelter Island, built out of channel dredging material added to an existing shoal, was completed in 1950. Construction of Shelter Island created harbors to the east (America's Cup Harbor [formerly Commercial Basin]) and west (Shelter Island Yacht Basin). This planning district comprises two subdistricts: the East Shelter Island Subdistrict, which includes the adjacent lands surrounding America's Cup Harbor; and the West Shelter Island Subdistrict, which includes the adjacent lands surrounding the Shelter Island Yacht Basin. Since the early 1950s, the area has historically been developed for ship building, repair, fueling, and painting, as well as for marina and maritime-related activities (Kleinfelder 2019).

Planning District 2: Harbor Island

Harbor Island in its current configuration, was constructed between 1920 and 1961 using dredge material from the Bay main navigation channel (AMEC 2016). This planning district comprises the two basins created by the "T" shape Harbor Island (East Basin and West Basin) and the adjacent lands to the north of the basins along Harbor Drive and Convair Lagoon at the east end of the East Basin.

The Harbor Drive Test Facility (HDTF), located on the north shore of the East Basin, was owned and operated by Convair/General Dynamics, which developed the site to support aircraft, rocket engine, and military weapons testing and other testing and research activities. Development and operation of the site began in 1942 and continued through the 1960s. The HDTF supported a variety of government and commercial programs until approximately 1996. Site decommissioning began in the late 1990s, and the property was repurposed for use as rental car facilities.

The north-central portions of the HDTF were subleased to Gulf General Atomic Division in the late 1960s, and then to Universal Oil Products Inc. in the late 1970s (Groundwater Technology 1992).

The western portion of the site, known as Tow Basin, was subleased to Lockheed Ocean Labs in the late 1970s. The Tow Basin facility housed an open top concrete water tank used to test hull designs of boats. Lockheed purchased the Tow Basin and associated building and leased the surrounding property from the San Diego Unified Port District (District) in the late 1970s. In 1983, Rohr Marine Incorporated (RMI) purchased the Tow Basin and associated building and leased the surrounding property from the District. The District took ownership of the Tow Basin and associated building in 1986 (McLaren 1999).

The Lockheed Marine Terminal and Railway facility was first leased by Lockheed Aircraft Company in 1966. At the time the site included a recently constructed (1965–1966) building, a pier, and a railway that extended into the East Basin. Lockheed owned and operated Deep Submergence Vehicles (DSVs) out of the facility, and in the early 1970s, the U.S. Navy also operated DSV Programs and Deep Submergence Rescue Vehicles. Later uses of the facility included docking and off-loading of manganese nodules, prefabrication and testing of shipboard cables for power and data transfer, storage and staging of equipment and chemicals for array resurfacing, and prefabrication and testing of cathodic protection equipment for oil rigs (Tetra Tech 2012).

Storm water from the HDTF/Tow Basin and Marine Terminal and Railway facilities drained to a series catch basins or drainage channels with outfalls discharging to the Bay. Chemicals present or used at these facilities, included polychlorinated biphenyls (PCBs), organochlorine pesticides, volatile organic compounds (VOCs), petroleum hydrocarbons, mercury, copper and other metals, and these were transported to the Bay through stormwater and potentially other pathways.

The former Teledyne Ryan (TDY) facility was a 44-acre parcel located at the east end of the San Diego International Airport (SDIA) between Harbor Drive and the SDIA runway at 2701 North Harbor Drive. It should be noted that this facility is not within the planning district but has contributed to contamination in the proposed PMPU area. The facility operated primarily as a military aircraft manufacturing facility beginning in 1939 when it was leased to Ryan Aeronautical and later Teledyne Industries, Inc. (GeoSyntec 2005). TDY assets were sold to Northrup Grumman, and operations at the site ceased in 1999. The District terminated its lease with TDY in 2002. The facility was demolished around 2012 and is currently being used for SDIA parking and other airport-related operations.

During its operation, the TDY facility discharged wastes containing PCBs, metals, and VOCs through its stormwater collection system to the San Diego Bay and Convair Lagoon. Investigation and remediation of impacts on the Bay, as well as to the TDY leasehold began in 1988 and continued until 2015 when the San Diego Regional Water Quality Control Board (RWQCB) issued a No Further Action Letter, indicating no further remediation was recommended.

The former General Dynamics Lindberg Field Plant (GDLFP) facility occupied approximately 90 acres north of the SDIA, outside of the planning district. The site is currently leased to the San Diego County Regional Airport Authority (SDCRAA) by the District and has recently undergone redevelopment to include a new rental car, fixed based operator, and airport parking facilities.

The Convair Division of General Dynamics occupied the former GDLFP site from 1935 through approximately 1996. Operations conducted by Convair during these years included: military and commercial aircraft production; weapon assembly; rocket and weapons testing; aircraft parts manufacturing; spray painting; tooling and maintenance; radioactive chemical handling, photography, and reproduction; engineering; and research and support facilities including boilers, air compressors and electrical transformers (Brown and Caldwell 1994). Industrial waste generated

at the site included oil, fuels, acid and alkaline solutions, electroplating and anodizing solutions, solvents, paints and paint sludges, asbestos containing debris, and salvageable metals.

Stormwater from the northern and western portions of the GDLFP was collected in catch basins with an outfall in Convair Lagoon. Several phases of investigation and remediation were conducted in 1997 and 2004 to remove PCB-contaminated sediment from the GDLFP storm drain system and outfalls discharging to Convair Lagoon. Phase II site investigations conducted at the former GDLFP site in 2009 and 2010, prior to its redevelopment by the SDIA, found elevated concentrations of VOC in soil and groundwater and PCB in shallow soils at the site (Kleinfelder 2009). Remediation of the GDLFP site was completed as part of the North Side San Diego International Airport Redevelopment.

The SDIA has been operating at its current location since approximately 1928. It was owned and operated by the City of San Diego between 1928 and 1961, except for 1942 through 1945 when the U.S. Military and its contractors had control to support World War II operations. The District owned the SDIA from 1962 through 2002. In 2003, the San Diego County Regional Airport Authority took over operations and leased the property from the District. Wastes potentially generated by the SDIA include jet fuel, brake pad residuals, and various metals (see Section 4.9.2.2 for further information on historic contamination). Stormwater from the eastern portion of SDIA drained historically to the Laurel Hawthorn Central Embayment via the storm drain system (Brown and Caldwell 1997).

Stormwater runoff from the former TDY facility, the SDIA, and the former GDLFP discharged to Convair Lagoon through four outfalls. Sediment monitoring conducted within the Convair Lagoon by the RWQCB in 1983, 1984, and 1985 in the vicinity of these outfalls revealed elevated concentrations of PCBs in the sediments (CRWQCB 1986). Storm drain sampling conducted at the TDY facility, by the RWQCB in 1985, identified PCBs in the storm drain sumps at the site.

Planning District 3: Embarcadero

Laurel Hawthorn Embayment (LHE), located at the north end of the Embarcadero District, has been associated with industrial activities since the 1940s. The Solar Turbines (Solar) leasehold, located at 2200 Pacific Highway, is reclaimed Tidelands built up over the years with various types of rubble and fill material. The 27-acre parcel has been occupied by Solar since at least the mid-1940s. Prior to this, the buildings within the Solar complex were occupied by Solar, the Westgate Company, the Army Air Force, and others (Boyle 1968). Solar, currently a Caterpillar Company, owns and operates the facility, which manufactures industrial gas turbines. Up until approximately 1968, stormwater and industrial waste was discharged to the LHE through several outfalls owned by Solar and the City of San Diego. During repair activities conducted between 1998 and 2000 on one of the storm drains discharging to the LHE, PCB impacted sediment was found in the storm drain (ARCADIS 2000). A sediment investigation conducted within LHE in 2004 identified elevated concentration of PCBs in sediment samples collected off-shore of the Solar facility (UC Davis 2004).

Stormwater from the southern and eastern portions of the GDLFP site, SDIA, Pacific Highway, and potentially other upland locations was collected ~~through the by an on-site system of catch basins and underground laterals that drained to~~ stormwater control systems (SWCSs) with outfalls in the LHE. Portions of the SWCSs originate on City of San Diego property and are owned by the City of San Diego. Stormwater from the northern and western portions of the GDLFP was collected in catch basins and laterals that drain to a separate SWCS with an outfall in Convair Lagoon. For further details, see the discussion for PD2 above.

The property in the vicinity of Broadway Pier, B Street Pier, the former Lane Field, and the Naval Facilities Engineering Command was the site of numerous industrial activities dating back to the late 1800s (Ninyo and Moore 2006). Earliest uses included shipbuilding operations in the near terminus of Broadway dating back to 1887. The property was also the site of the Santa Fe freight house, the City Harbor Department Truck Facility and Equipment Yard, the Naval Broadway Complex, the Star & Crescent Boat Company, various warehouses, the San Diego Gas & Electric (SDG&E) Station B powerhouse and numerous other industrial facilities, military facilities, automobile service stations, and storage areas (Ninyo & Moore 2006). Many of these facilities used industrial chemicals that may have impacted soil and sediment in the adjacent San Diego Bay. The area between B Street and Broadway Piers was identified as impacted by polycyclic aromatic hydrocarbons (PAHs) by the RWQCB (Appendix G).

The south Embarcadero was the site of Campbell Machine Company and later the Campbell Shipyard. The former Campbell Shipyard was located at 501 East Harbor Drive. The site has been recently redeveloped to a hotel/marina and is currently bounded to the southeast by the TAMT; to the northwest by the South Embarcadero and the San Diego Convention Center; and to the northeast by Harbor Drive, the BNSF Railway, and the Metropolitan Transit System (MTS) Maintenance Yard.

Prior to 1926, the Campbell Shipyard site was Tidelands. The Bay shoreline was expanded bayward by several reclamation projects. Campbell Machine Company began an engine building and repair operation in the east parking lot of the site (foot of 8th Avenue) in 1908. The City of San Diego Refuse Incinerator and the Economy Waste Paper Company were also in operation at the foot of 8th Avenue at the time. Campbell Industries (Campbell), successor to Campbell Machine Company, began operations in 1926 primarily building commercial fishing vessels. In the early 1980s, its business shifted to Naval ship repair potentially due to the decline in the fishing industry. From approximately 1921 to the 1990s, the Campbell operations expanded into portions of adjacent properties occupied by Gould Hardware and Machinery, American Products Company, Arrow Transfer Company, and the San Diego Sports Arena. The site infrastructure included cranes, floating dry docks, marine railways, berth, piers and over water structures. Operation at the site included: formation and assembly of ship hulls; application of paints; installation and repair of mechanical, electrical and hydraulic systems; repair of damaged vessels; removal and replacement of expended/failed paint systems; and support systems for the ships and crew. Campbell also operated a fueling apron wharf, in conjunction with General Petroleum of California, which operated a fuel farm adjacent to and southeast of the Campbell site. Wastes generated by these operations included abrasive blast waste (i.e., spent grit, spent paint, marine organisms, rust), fresh paint, bilge waste/oil wastewater, hydro-blast waste water, oils, waste paints/sludges/solvents/thinners, construction and repair wastes, and other miscellaneous wastes typical of a ship building operation.

Planning District 4: Working Waterfront

The Working Waterfront (PD4) has been the location of concentrated industrial activity since the early 1900s. Significant early activities include the 8th Avenue Tidelands Dump and City refuse incinerator, working railyards and rail lines initially operated by the San Diego and Arizona Eastern Railway, the Atchison Topeka and Santa Fe Railroad, the Benson Lumber Company, the West Coast Crab & Lobster Company, Southern Reduction Company, fuel storage facilities and fueling docks, tuna docks and processing facilities kelp processing, and ship repair and construction activities. The leasehold currently occupied by Continental Maritime was a tuna processing facility until the 1980s. The leaseholds currently occupied by BAE Systems and General Dynamics/NASSCO have been active ship repair and construction facilities since at least the 1930s. CP Kelco has operated a Kelp

processing facility at its current leasehold since the late 1920s (Geosyntec and Integral 2018). The former SDG&E Silvergate Power Plant, located on Sampson and Belt Streets northeast of the current BAE Systems facility, operated from 1940s until 1984. Cooling water intake and discharge tunnels extend from this facility to the Bay within the current BAE Systems leasehold (Geosyntec and Integral 2018). SDG&E also operated a manufactured gas plant (Station A) dating back to the 1920s, which may have used tunnels or channels connected to the Bay (Kleinfelder 2018).

The existing TAMT facility was constructed on the Tidelands in the mid-1950s following placement of dredged fill and material from San Diego Bay, from approximately 8th Avenue to Crosby Road. Portions of the TAMT facility were constructed over garbage and burned rubbish associated with the 8th Avenue Tidelands Dump and City refuse incinerator and land previously occupied by the Benson Lumber Company, West Coast Crab & Lobster Company, and Southern Reduction Company. Historically, the TAMT facility was used for truck and tractor sales and service, vehicle maintenance, fish oil manufacturing, and stock holding; and for material storage including lumber, petroleum, scrap metal, molasses, acid, grain, and fish oil. More recently, TAMT is used for import, storage, and offsite shipping of materials by tenants including Cemex, Dole Fresh Fruit Company, The Jankovich Company, International Materials Inc., Searles Valley Minerals, and San Diego Refrigerated Services (Kleinfelder 2018).

Shipbuilding and other manufacturing and industrial uses within, adjacent to, and upstream of PD4 have resulted in the discharge of metals including copper and zinc, PCBs, PAHs, and petroleum hydrocarbons to the Bay through stormwater runoff or direct discharges as the result of spills, paint overspray, the release of sandblast grit for paint removal, and other activities.

Planning District 7: South Bay

Planning District 7 consists entirely of salt marshes and open water within the Bay. The adjacent salt ponds to the east and west of PD7 have been historically developed with salt extraction sites. The South Bay Salt Works harvested salt from the salt ponds in south San Diego Bay from as early as 1871. The processing plant is located on land to the east of the ponds. In the 1920s California Chemical Corporation also removed chemicals from the salt pond water. In 1999 the salt ponds were sold to the San Diego County Regional Airport Authority, transferring the salt ponds to the U.S. Fish and Wildlife Service, which leased them for salt extraction.

Planning District 8: Imperial Beach Oceanfront

Planning District 8 consists predominantly of the beach and open ocean along the Imperial Beach oceanfront, the Imperial Beach Pier, and Dunes Park. The Imperial Beach Pier was first built in 1963. A storm destroyed the pier and it was rebuilt in the 1980s. The Tijuana River runs through the City of Tijuana, Mexico, and drains into the Tijuana River Estuary in the U.S. and ultimately to the Pacific Ocean in the City of Imperial Beach, in PD8. Sewage infrastructure inadequacies in Tijuana over the last 30 years have degraded the water quality in the Tijuana River Valley, in the estuary, and the adjacent coastal waters and beachfronts, resulting in risk to public health and the environment (RWQCB 2021).

Planning District 9: Silver Strand

Planning District 9 consists of open water, bayfront shoreline, the land mass of Crown Isle, and the land mass east of Coronado Cays, which contains commercial recreation and Grand Caribe Shoreline

Park. The two land masses were built in the late 1960s to 1970s during the development of the Coronado Cays residential community. Shortly thereafter they were developed with marinas and visitor-serving commercial recreation uses. No historic uses that have led to hazardous conditions are known to be present in PD9.

Planning District 10: Coronado Bayfront

The original ferry landing ran from east Coronado bayfront to downtown San Diego from 1886 to 1969. The existing Ferry Landing Pier and the associated landside commercial recreation, retail, and restaurant development was built in 1988, and the pier just southeast of the Ferry Landing Pier was developed in 1987. The southern portion of the North Coronado Subdistrict was developed with hotel and park uses in 1987, prior to which the area was occupied by the Federal Housing Project and Glorietta School built in 1944 to house servicemen and their families. Glorietta Bay was first dredged to deepen the channel and build up the shoreline in 1888 to serve recreational boating purposes. The Coronado Municipal Golf Course was built in 1957 on previously developed shoreline along the Bay. No historic uses that have led to hazardous conditions are known present in PD10.

4.7.2.2 Known Contamination Within the Proposed PMPU Area

Several planning districts in the proposed PMPU area have contamination cases recorded within their boundaries. The specific sites with contamination are identified below based on the summary of findings from the hazardous materials technical study performed by Ninyo & Moore (2020) and other sources. The main contaminants of concern that have resulted from historic and current uses along the Bayfront include PCBs, PAHs, polychlorinated terphenyls (PCTs), metals (e.g., copper, lead, mercury, and zinc), and pesticides. Further background information on the sources of contaminants of concern, as well as human health and environmental effects of each contaminant is provided below.

Hazardous Substances and Related Health Effects

Chemicals

Polychlorinated Biphenyl (PCBs)

PCBs are organic chlorine compounds and represent a complex mixture of individual congeners that were produced in the U.S. between 1930 and 1977. Their production was banned in 1977 by the U.S. Environmental Protection Agency (EPA) because of their known environment persistence possible harmful effects (ATSDR 2000). PCBs were produced for applications in a myriad of uses including for the electric industry as dielectric fluids in capacitors and transformers, in paints, marine finishes, surface coatings, adhesives, resins, plasticizers, hydraulic fluids, asphalt products, cutting oils, and pesticide extenders. PCBs are persistent in the environment and exist in San Diego Bay sediments and surrounding areas at levels requiring regulatory action. Because of their stability and lipophilicity, PCBs bioaccumulate through the food chain, and are stored in fatty tissues. In San Diego Bay, the concentration of PCBs in fish tissue, particularly of high trophic level species, has resulted in the publishing of fish consumption advisories for recreational fish caught in San Diego Bay.

Data from human and laboratory mammal studies provide evidence of the toxic potential of exposure to PCBs (ATSDR 2000). Dietary consumption is the major source of PCB accumulation in humans and wildlife. Epidemiological and laboratory studies indicate an association between

dietary PCB exposures and both reproductive functions and developmental effects. PCBs also have the potential for toxicity from dermal and inhalation exposure. PCBs have been reported to elicit a broad range of toxic effects in laboratory mammals, including lethality, hepatotoxicity, porphyria, body weight loss, dermal toxicity, thymic atrophy, immunosuppressive effects, reproductive and developmental effects, carcinogenesis, and neurotoxicity (Safe 1991, 1992, 1994, 1984; Seegal 1996; Silberhorn et al. 1990; WHO 1993; Battershill 1994). Adverse effects on growth, reproduction, and behavior have also been observed in fish and birds exposed to PCBs (Bengtsson 1980, Fernie et al. 2001, Hansen et al. 1974, Haseltine and Prouty 1980, Hugla and Thome 1999, Peakall and Peakall 1973, Platonow and Reinhart 1973). Exposure to some PCB mixtures by workers through inhalation or dermal contact can result in respiratory tract symptoms; gastrointestinal effects; mild liver effects; and effects on the skin and eyes such as chloracne, skin rashes, and eye irritation (ATSDR 2000). EPA has classified PCBs as a Group B2, probable human carcinogen (EPA 2018).

Polycyclic Aromatic Hydrocarbons (PAHs)

PAHs are a class of hydrocarbon chemicals that have two or more fused benzene rings and occur in the environment as complex mixtures. There are more than 100 individual PAHs, which are generally grouped into two categories: low-molecular-weight PAHs (LPAHs) (compounds composed of fewer than four benzene rings) and high-molecular-weight PAHs (HPAHs) (compounds composed of four or more benzene rings). PAHs occur naturally in coal, crude oil, and refined products such as gasoline, motor oil, and lubricants. PAHs are also produced as a combustion byproduct of some materials, such as coal, oil, wood and garbage. In addition, some PAHs are manufactured; these are found in products such as plastics, creosote, and roofing tar (ATSDR 1995). PAHs are ubiquitous in the San Diego Bay environment resulting from multiple sources including fueling operations, presence of creosote-coated pilings, presence in stormwater runoff entering the Bay, and combustion of PAH-containing products in gasoline and diesel engines. In general, LPAHs have a greater tendency to volatilize and a lesser tendency to bind to organic carbon than do HPAHs, resulting in a lower persistence in the aquatic environment. HPAHs tend to be more persistent in the environment; however, bioaccumulation of PAHs by upper trophic level organisms, including fish, birds, and mammals, is limited because PAHs are metabolized and excreted by fish following uptake (Khairy et al. 2014).

PAHs are a human health and environmental concern. The focus on toxicity for PAHs is for 16 PAHs.¹ A number of studies show increased incidence of cancer (lung, skin, and urinary cancers) in humans exposed to PAH mixtures from inhalation or dermal exposure (ATSDR 1995). Many individual PAH compounds have been classified as probable or possible carcinogens by entities such as the National Toxicology Program and EPA (EPA 2018). Non-carcinogenic chronic effects of PAHs involve pulmonary, gastrointestinal, renal, and dermatologic systems in humans. The toxicity, carcinogenicity, and mutagenicity of PAHs vary with the molecular weight of the compound, the degree of alkylation, and the mode of accumulation (water, food, or sediment) by the organism (Neff 1979, Moore and Ramamoorthy 1984). LPAHs generally have significant acute toxicity, whereas HPAHs do not. However, several HPAHs are known to be carcinogenic and cause chronic toxicity. Dietary exposure of PAHs in animals has been linked to immunosuppression and reproductive effects. In fish, exposure to PAHs is known to cause narcosis (a generalized toxic effect) and

¹ The 16 PAHs that are the focus for evaluating PAH toxicity are: 7 LPAHs (i.e., acenaphthene, acenaphthylene, anthracene, fluoranthene, fluorene, naphthalene, and phenanthrene) and 9 HPAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b,j)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and pyrene).

developmental abnormalities in embryos (Schultz 1989). Fish exposed to PAH-contaminated sediments through direct contact have been shown to exhibit increased incidence of skin and liver lesions and other deformities (Myers et al. 1994,; Pinkney et al. 2000).

Polychlorinated terphenyls (PCTs)

PCTs are similar to high chlorinated PCBs in that they are stable and bioaccumulate through food webs and are ubiquitous in the environment, including soil, sediment, and biological tissues. Toxicity of PCTs is also similar to those of PCBs; however, PCT mixtures are not. Adverse effects associated with chronic exposure to PCTs include liver damage, incidence of tumors, endocrine disruption, immunosuppression, and other reproductive effects (Jensen and Jorgensen 1983). In laboratory studies, PCT exposure was associated with reduction in growth, liver toxicity, and developmental effects (WHO 1993).

Pesticides

Pesticides are a large and diverse group of substances used to prevent, destroy, or mitigate unwanted organisms. Most pesticides can be classified as organochlorine pesticides, organophosphate pesticides, herbicides, pyrethroid pesticides, and carbamate insecticides. Many pesticides have been banned from use (e.g., dichlorodiphenyltrichloroethane [DDT]) or have restrictions placed on the use (e.g., diazinon banned for residential use); however, many pesticides are persistent in the environment, and lipophilic pesticides accumulate in the food chain. Residential use and urban runoff are likely sources of pesticides to San Diego Bay. Pesticides are commonly required for investigation in investigative orders issued in San Diego Bay. In addition, a total maximum daily load (TMDL) for diazinon was adopted by the San Diego RWQCB on August 14, 2002, to meet the toxicity water quality objective in Chollas Creek, located in PD5, to ensure that water quality with respect to diazinon supports the aquatic life beneficial uses of the creek (see Section 4.8.2 for additional details).

Human health and environmental effects from pesticides are variable and dependent upon the pesticide and exposure. Pesticides can cause both acute and chronic adverse effects. Some pesticides, such as the organophosphates and carbamates, affect the nervous system. Others may irritate the skin or eyes, while some pesticides may be carcinogens and others may affect the hormone or endocrine system in the body. Pesticides such as DDT and dieldrin are documented to cause eggshell thinning and have reproductive effects in avian species.

Organochlorine pesticides are a certain type of pesticide used primarily between the 1940s and 1970s for pest control for agricultural crops and around buildings (termiticides). While the use of organochlorine pesticides has been banned, legacy organochlorine pesticides can be found in surface soils and aquatic sediments. Health effects from exposure to organochlorine pesticides include neurological effects, birth defects, and cancer (DTSC 2010).

Metals

Copper

Copper is a naturally occurring and ubiquitous metal found throughout the Earth's crust. Copper can enter the environment through human activities, including mining, smelting, and releases of wastewater, and through natural sources such as volcanoes or forest fires. Copper found in the environment is usually associated with organic material or other soil/sediment components such as

clay or sand. Once released into the environment, copper does not break down, meaning that once it enters the water, it builds up in the sediments of lakes and rivers; it can be found in high concentrations in animal species (ATSDR 2004). Copper is extensively mined in the United States to produce various products, including electrical wires, plumbing components, building materials (e.g., roof, gutters, and ornamental features), and alloys used in other products. Additionally, copper compounds are used in pesticides (e.g., algicides, fungicides, and bactericides), for water treatment, and as a preservative in products such as wood and fabrics (ATSDR 2004). Copper is used as an antifouling agent on a vessel's hull to prevent buildup of marine organisms but can leach into the water.

While low levels of copper are important for good health (copper is an essential element for plants and animals, including humans), high levels of copper can be harmful to health or the environment. In humans and mammals, copper is absorbed from the stomach and small intestine. In excess, copper exposure is associated with gastrointestinal distress, liver and kidney damage, anemia, and immunosuppression (ATSDR 2004). Effects of exposure to copper for laboratory mammals include decreased growth for mice and rats and reduced reproduction (reduced kit survival) for mink (NTP 1993, Aulerich et al. 1982, Dodds-Smith et al. 1992). Reduced growth and survival in fish and birds have also been reported from exposure to dietary copper (Jensen and Maurice 1978, Kang et al. 2005, Lanno et al. 1985, Mehring et al. 1960, Mount et al. 1994, Poupoulis and Jensen 1976, Smith 1969).

Mercury

Mercury is a naturally occurring metal that is present in various forms, including elemental mercury, inorganic mercury (primarily as mercuric salts), and organic mercury (primarily methylmercury). Elemental and inorganic mercury can enter the environment as byproducts of industrial and commercial operations (e.g., mining, emissions from coal-fired power plants, and incineration of waste containing mercury), as well as through natural processes (e.g., weathering of rocks that contain mercury). In addition, before the 1970s (i.e., when the health effects of methylmercury were unknown), methylmercury was used as a fungicide to protect seed grain (ATSDR 1999). Recycling of mercury in the environment often involves elemental mercury volatilizing from surface soils and waters, followed by atmospheric transport and deposition back to surface soils and waters. Mercury can also be associated with air particulates, but it is unlikely to be transported long distances (ATSDR 1999). Mercury can be transformed into methylmercury by microorganisms in soil, sediment, and water. Methylmercury is important with regard to human and ecological risks because it is soluble and mobile, and rapidly bioaccumulates in aquatic organisms and concentrates in the tissues of carnivorous fish and other organisms. It is also known to be more toxic and bioaccumulative than elemental and inorganic mercury (ATSDR 1999, EPA 2015). In San Diego Bay, the concentrations of mercury in fish, which that are is suspected to have been caused largely from historical sources, has-ve resulted in baywide fish consumption advisories.

Mercury exposure is associated with a number of toxic effects on humans and wildlife, including adverse effects on the kidneys and nervous system, growth, reproduction, blood and serum chemistry, motor coordination, vision, hearing, histology, metabolism, and survival, and can have teratogenic effects (Eisler 1987, ORNL 1998). EPA has identified mercury chloride and methylmercury as possible human carcinogens. Adverse effects on growth, reproduction, and survival have been observed in mink after dietary mercury exposure from fish consumption (Wobeser et al. 1976a, 1976b; Aulerich et al. 1974; Dansereau et al. 1999). Changes in behavior of fish and avian species (i.e., predator avoidance, motor coordination) have also been observed in laboratory studies following exposure to mercury (Bouton et al. 1999, Heinz 1975, Kania and O'Hara

1974, Kreitzer and Heinz 1974, Matta et al. 2001; Webber and Haines 2003); the significance of these behavior alternations on ecological populations in the wild are unknown.

Zinc

Zinc is a naturally occurring metal found in the Earth's crust. Zinc compounds are widely used in industry for uses such as white paints, ceramics, rubber production, wood preservative, and fabric dying and manufacturing, as well as for drug production (ATSDR 2005). Sources of zinc in the environment come from mining, ore purification, steel production, coal burning, and waste burning (ATSDR 2005). In addition, zinc has been used as an antifoulant and anticorrosive paint coating for boats, in the aerospace and automotive industries, and by the military. The use of San Diego Bay for recreational marinas and boating, shipyards, airplane manufacturing, and other defense-based support industries are likely sources of zinc in the Bay. Furthermore, tires and outdoor galvanized materials have been found as common sources of zinc in urban runoff in California (TDC Environmental 2015), including in the Chollas Creek Watershed (Weston Solutions 2011).

Zinc is an essential trace element; while low levels of zinc are important for good health, high levels can be harmful to health or the environment. Toxicity studies have shown adverse effects from ingestion of zinc by laboratory mammals including anemia, pancreatic and kidney impairment, and reproductive effects, including infertility (ATSDR 2005). Exposure to dietary zinc has been associated with adverse effects on growth in fish and wildlife, and reproductive parameters in mammals (Persia et al. 2004, Roberson and Schaible 1960, Schlicker and Cox 1968, Sutton and Nelson 1937, Straube et al. 1980, Takeda and Shimma 1977). Toxicity values are generally affected by the age and nutrient status of the organism, changes in the physicochemical regimen, and interactions with other chemicals, especially copper salts.

Lead

Lead is a naturally occurring metal found in the Earth's crust. Lead can be found throughout the environment, largely as a result of anthropogenic activities such as mining, burning of fossil fuels, and various manufacturing processes. Lead is currently mined in the United States for use in products such as pipes, batteries, and ammunition. The use of lead in other products (e.g., caulking materials and pigments for paints and ceramic glazes) has been greatly reduced due to health concerns associated with exposure to lead. Historically, lead has been used in pesticides in fruit orchards (starting in the early 1900s) and as an additive to gasoline (between 1950 and 2000) to increase engine efficiency; both of these uses occurred worldwide (ATSDR 2020). Once lead enters the environment, its particulates in the air are subject to atmospheric transport and deposition, allowing lead to enter sediment, soil, or surface water. Lead strongly sorbs to soil and sediment and generally will not leach into subsurface soil and groundwater. Lead in surface water exists primarily in an undissolved phase (i.e., as lead carbonate, lead oxide, and lead hydroxide) (ATSDR 2007).

Studies have shown adverse effects with lead exposure and neurological, renal, cardiovascular, hematological, immunological, reproductive, and developmental effects; there is a particular concern with lead exposure and the neurological effects in infants and children (ATSDR 2020). The exposure of mammals to high concentrations of lead in the diet has been reported to cause anemia, weight loss, muscle atrophy, paralysis, brain damage, mortality, and reproductive effects (Eisler 1988) and reductions in growth and survival for both fish and birds (Mount et al. 1994, Kendall and Scanlon 1982, Hoffman et al. 1985, Pattee 1984, Edens et al. 1976). Sublethal concentrations of lead can accumulate in blood and tissues, and higher-trophic-level organisms may experience adverse effects as a result of consuming prey with accumulated lead concentrations.

Hazardous Substance-Related Regulatory Actions

Planning District 1: Shelter Island

From 1979 to 1985, the RWQCB issued Waste Discharge Requirements (WDRs) to various ship repair facilities adjacent to America's Cup Harbor located in the East Shelter Island Subdistrict, prohibiting the discharge of waste to the Bay. Due to violations of the WDRs and the potential for runoff or direct discharges from the historic industrial use around America's Cup Harbor, the RWQCB issued Cleanup and Abatement Orders (CAOs) to investigate and remediate contaminated sediments within the harbor. In 1988 and 1989, the RWQCB issued CAOs 88-70, 88-78, 88-79, 88-86, 89-18, and 89-32 to seven boatyards related to contaminants of concern including copper, mercury, and tributyltin (TBT). Dredging was subsequently performed to remediate the impacted sediments (Kleinfelder 2019).

From 2008 to 2018, the Regional Harbor Monitoring Program (RHMP) and the Southern California Coastal Water Research Project (SCCWRP) found elevated levels of PCBs in America's Cup Harbor sediments and fish tissues (SCCWRP 2020).

Releases of petroleum products to land or directly to the Bay from underground storage tanks (USTs) and surface spills have been reported for various facilities adjacent to America's Cup Harbor. These reported releases include petroleum releases to land during UST removal in 1984 from Standard Oil Marina, in 1990 at Kettenburg Marine, in 1991 at Driscoll, Inc., and in 1994 at the Harbor Boat and Yacht Company fuel dock. Additionally, releases of petroleum products directly to the Bay were reported at Bay City Marine Inc. (approximately 50 to 100 gallons of diesel fuel and orange fluorescent material in 1994 and 1995), Sun Harbor Marina (gasoline and diesel fuel from various incidents from 2006 to 2017), and Eichenlaub Yacht & Marine (diesel fuel in 1999) (Kleinfelder 2019).

Comparatively, the West Shelter Island Subdistrict had fewer issues. Elevated levels of dissolved copper have been found within the Shelter Island Yacht Basin due to the use of anti-fouling paints containing copper on marine vessels. In February 2005, the RWQCB adopted a TMDL for dissolved copper within the Shelter Island Yacht Basin. On June 11, 2008, the San Diego RWQCB adopted a TMDL for indicator bacteria (fecal bacteria that serve as indicators of human pathogens) for the Shelter Island Shoreline Park. (See Section 4.8 for additional details on the existing TMDLs.)

Planning District 2: Harbor Island

The California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) issued an Imminent or Substantial Endangerment Determination and Remedial Action Order (IS&E Order) to the District, General Dynamics Corporation, and Lockheed Martin Corporation in 1998 related to PCBs in the Tow Basin. The District, General Dynamics Corporation, and Lockheed Martin Corporation were ordered to develop and implement a site remediation strategy, in conformance with the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) to address PCBs and other pollutants found at the Tow Basin Site. The site investigation and soil, groundwater, and hazardous materials remediation activities were completed and the site transferred to the RWQCB in 2009 to oversee the remaining sediment cleanup in the East Basin.

RWQCB Investigative Order R9-2011-0064, issued to the District in 2011, found that copper and zinc reported in sediment samples were the result of discharges from boats moored within the East Basin (Sunroad Resort Marina). At the same time RWQCB IO R9-2011-0026 was issued to Lockheed

for unauthorized discharge of mercury to the East Basin from the Marine Terminal and Railway facility. Investigation and remedial activities are ongoing.

In 1986, the RWQCB issued Cleanup and Abatement Order No. 86-92 at the Teledyne Ryan Aeronautical site near Lindbergh Field, San Diego County. This order found that, at a minimum, PCB-impacted sediment in SWCSs site has contributed to the elevated PCB concentrations found in Convair Lagoon sediment and would continue to be a discharge source during future rainfall events. The order directed: (1) the submittal of reports of historic storm drain cleaning activities, (2) removal of sediment and waste from sump and storm drain lines, and (3) implementation of best management practices to prevent future discharges to the SWCSs.

Pursuant to Order 86-92 and addenda, between 1986 and 1998, actions were taken to: (1) remove PCB-containing equipment from the site, (2) remove and clean PCB-impacted sediment from the onsite SWCSs, (3) replace portions of the SWCS system, and (4) install an engineered sand cap in Convair Lagoon to isolate the sediment-containing PCBs from the environment. In 1998, the RWQCB issued Order No. 98-21 containing the Waste Discharge Requirements (WDRs) and the Monitoring and Reporting Program for Closure and Post-Closure Maintenance of the Convair Lagoon sediment cap (CRWQCB 1998).

Sampling of the SWCS sediments performed between 1999 and 2003 found continued elevated concentrations of PCBs in the SWCS sediments (CRWQCB 2004). RWQCB Cleanup and Abatement Order No. R9-2004-0258 was issued to conduct additional site characterization activities to identify the sources of PCB and other chemicals of concern, implement interim remedial actions, conduct a remedial investigation/feasibility study, and implement remedial actions. PCB sources included building materials (i.e., paint, joint compound, concrete slabs, and foundations) and surrounding soils, SWCS sediment, localized areas of impacted soil, and groundwater.

SWCS sampling between 2007 and 2012, as part of the RWQCB Order 98-21 (Waste Discharger Requirements for Teledyne Ryan Aeronautical, Closure and Post Closure Maintenance of the Convair Lagoon Sand Cap, San Diego Bay), reported decreasing concentrations of PCBs in sediments at the outfalls (Geosyntec 2007). In 2015, the RWQCB issued Order R9-2015-0029 containing WDRs for the Convair Lagoon sand cap superseding Order 98-21. Order R9-2015-0029 reduced the monitoring requirements to visual inspections and sampling and analysis of the sand cap. Monitoring of sediments at the SWCS outfalls was eliminated.

Surface samples collected from the sand cap cores in 2013 and 2018 contained elevated concentrations of PCBs.

Planning District 3: Embarcadero

In 2014, the RWQCB issued Investigative Order No. R9-2014-0007 directing General Dynamics, the SDCRAA, and the District to submit technical reports pertaining to an investigation of sediment chemistry in the Laurel Hawthorn Central Embayment (LHCE) in San Diego Bay. Chemicals of concern included metals, PCBs, PAHs, and pesticides. A sediment investigation conducted within the LHCE during early 2015 found elevated concentrations of metals (copper, lead, mercury and zinc), chlorinated pesticides, and PCBs in the LHCE sediments.

In October 2019, the RWQCB issued Investigative Orders No. R9-2019-0039, R9-2019-0040, R9-2019-0041 to Solar Turbines, Inc. and Navistar, Inc., the City of San Diego, and General Dynamics, respectively. These orders directed Solar/Navistar, the City of San Diego and General Dynamics to

conduct sediment investigations within the LHCE to assess the nature and extent of sediment impacts resulting from discharges from their respective facilities. Target chemicals for these investigations include metals, semi-volatile organic compounds (SVOCs), PAHs, pesticides, and PCBs. These investigations are underway.

In 1985, the RWQCB issued Order No. 85-01, Waste Discharge Requirements for Campbell Industries, San Diego, California. This order, and associated addenda, required the collection and analysis of sediments from 11 stations along the Campbell shoreline, four stations at SWCS outfalls discharging to the Bay at the Campbell site, and three remote reference stations. The suite of required analyses included several chemicals of concern, such as metals, hydrocarbons, PCBs, and PCTs. Elevated concentrations of PCBs and PCTs were reported in the Bay sediments from these sampling events.

In 1995, the RWQCB issued Cleanup and Abatement Order No. 95-21 for Campbell Industries, Marine Construction and Design Company. This order concluded, among other things, that concentrations of PCBs in sediment along the Campbell shoreline were above the background levels and that the contaminated sediment had caused or threatened to cause a condition of pollution. Order 95-21 required best management practices to be implemented to the satisfaction of the RWQCB, the cleanup of sediment contaminated with PCBs and other chemicals, and the cleanup of upland soil and groundwater. The order was amended (Revised Amendment No. 3) and replaced the District as a responsible party.

In 2005, the RWQCB issued Order No. R9-2004-0295, Waste Discharge Requirements for the Port of San Diego Campbell Shipyard Bay Sediment Cap, Closure and Post Closure Maintenance, San Diego Bay and associated Monitoring and Reporting Program No. R9-2004-0295. This order included the requirements for dredging contaminated sediment from the Bay and placement of an engineered cap to isolate remaining contaminants. The Monitoring and Reporting Program established the requirement for monitoring and reporting during the implementation of the remedial action and the long-term monitoring requirement after completion (CRWQCB 2004).

The sediment dredging and engineered cap construction were completed in 2008. The cap included a 5-foot-thick isolation cap with a 1.6-acre habitat cap to support eelgrass. Pursuant to the requirements of the long-term monitoring program, samples of sediment accumulated on the engineer cap since its completion have been collected and were found to have elevated concentrations of metals, polynuclear PAHs, and PCBs.

Planning District 4: Working Waterfront

In March 2012, the RWQCB issued Cleanup and Abatement Order No. R9-2012-0024 (2012 Order) within PD4 for the Shipyard Sediment Site, encompassing NASSCO, the BAE Systems San Diego Ship Repair Facility (BAE Systems), the City of San Diego, San Diego Marine Construction Company, 1 Campbell Industries (Campbell), San Diego Gas and Electric (SDG&E), the United States Navy, and the District areas. The order required the following actions: (1) terminate illicit discharges, (2) prepare and implement a remedial action plan to remediate the contaminated marine sediment; (3) implement interim measures to correct and abate discharges from the contributing municipal separate storm sewer (MS4) systems, and (4) prepare and implement an investigation of the nearby MS4 and Mitigation Plan. The chemicals of concern included metals (copper, zinc, mercury, and others), PAHs, PCBs, and tributyltin. The remedial actions included dredging and capping completed in 2016 (Anchor QEA 2016), and the subject site is currently under post-remedial monitoring.

In August 2017, the RWQCB issued Investigative Order R9-2017-0081 that directed the performance of a sediment chemistry assessment in the Bay and upland areas around the Tenth Avenue Marine Terminal (TAMT IO). Chemicals of concern included PCBs, PAHs, PCTs metals and pesticides. Bay sediment and upland investigations were performed between 2017 and 2019, and the Sediment Chemistry Assessment Report was submitted in March 2020. Further actions are ongoing.

In August 2017, the RWQCB issued Investigative Order R9-2017-0082, requiring the performance of a sediment chemistry assessment in the Bay and upland areas around the Continental Maritime ship repair facility (Continental Maritime Shipyard IO). Chemicals of concern included PCBs, PAHs, PCTs, metals, and pesticides. Bay sediment and upland investigations were performed between 2017 and 2019, and an initial Sediment Chemistry Assessment Report was submitted in February 2020 (Wood 2020). Additional sediment investigation was performed as part of wharf maintenance activities in September 2020, and a supplemental investigation report was submitted in February 2021 (Anchor QEA 2021). Further actions are ongoing.

In August 2017, the RWQCB issued Investigative Order R9-2017-0083, directing a sediment chemistry assessment in the Bay and upland areas around the Continental Maritime ship repair facility (BAE-SDG&E IO). Chemicals of concern included PCBs, PAHs, PCTs, metals, and pesticides. An initial Sediment and Analysis Report was submitted in August 2019, with both report revisions and ongoing actions continuing.

Planning District 7: South Bay

There are no hazardous substance-related regulatory actions that have taken place within PD7.

Planning District 8: Imperial Beach Oceanfront

There are no hazardous substance-related regulatory actions that have taken place within PD8. For decades, the release of untreated or partially treated sewage and other hazardous substances from infrastructure inadequacies in the Tijuana River Watershed has created recurring sewage and other pollution problems on both sides of the California/Mexico border and specifically within PD8, which is located north of the estuary where the Tijuana River meets the Pacific Ocean. Recent events related to sewage releases in the Tijuana River Watershed are described below:

- In February 2017 untreated sewage was released into the Tijuana River Valley via the main channel of the river.
- On March 2, 2017, the San Diego Water Board's Executive Officer sent a letter to the U.S. and Mexican International Boundary and Water Commission (IBWC) in response to the large cross-border release of untreated sewage in February 2017. The letter included recommendations with respect to improved communication, infrastructure, and water quality monitoring.
- On April 3, 2017, the IBWC released an investigative report entitled *Report of Transboundary Bypass Flows into the Tijuana River*, which was produced in response to the February 2017 incident. It was determined that 28 million gallons of untreated sewage were discharged into the Tijuana River from February 6 through 23, 2017, while the Tijuana municipal utilities department (Comisión Estatal de Servicios Públicos de Tijuana, CESPT) made repairs to the sewage collection system in central Tijuana.

- On May 14, 2018, the San Diego RWQCB and the California Attorney General, on behalf of the people of California, filed a Notice of Intent to Sue the U.S. Section of the IBWC for violations of the Clean Water Act related to transboundary discharges of waste.
- On February 5, 2020, the San Diego RWQCB issued Investigative Order No. R9-2020-0030, which requires the U.S. Section of the IBWC to submit technical reports pertaining to the investigation of pollution, contamination, and nuisance from transboundary flows in the Tijuana River Valley.
- On May 12, 2021, the San Diego RWQCB adopted Tentative Order No. R9-2021-0001, reissuing Waste Discharge Requirements for the United States Section of the International Boundary and Water Commission, South Bay International Wastewater Treatment Plant, Discharge to the Pacific Ocean through the South Bay Ocean Outfall, San Diego County (NPDES No. CA0108928).
- On May 12, 2021, the San Diego RWQCB also adopted the revised Tentative Cease and Desist Order (CDO) for the United States Section of the International Boundary and Water Commission (USIBWC) South Bay International Wastewater Treatment Plant (SBIWTP) discharge to the Pacific Ocean through the South Bay Ocean Outfall (Tentative CDO No. R9-2021-0107). The Tentative CDO addresses discharges from the South Bay International Wastewater Treatment Plant that are taking place in violation of the requirements of Order No. R9-2014-0009 and threatening to take place in violation of the requirements of Tentative Order No. R9-2021-001.

Planning District 9: Silver Strand

No hazardous-substance-related regulatory actions have taken place within PD9. However, outside the proposed PMPU boundaries, Military cleanup sites are located north and south of PD9 along the Silver Strand.

Planning District 10: Coronado Bayfront

No hazardous-substance-related regulatory actions have taken place within PD10. However, Military cleanup sites are located to the southeast and west of PD10 in Coronado and along the Silver Strand due to the extensive use of the area for military purposes from as early as 1917. The Coronado Naval Amphibious Base is a Navy facility southwest of Glorietta Bay on the Silver Strand peninsula that has undergone and continues to undergo investigation and remediation for contaminants of concern including petroleum, metals, UXOs, PCBs, and VOCs. The Naval Air Station North Island is a Navy Facility northwest of PD7 occupying the northern half of the island of Coronado. The Naval Air Station North Island has 140 solid waste management units and 3 areas of concern under DTSC oversight for contaminants of concern including petroleum products, solvents, metals, PCBs, PAHs, chlorinated hydrocarbons.

Hazardous Materials Database Search Results

The hazardous materials technical study (HMTS) prepared for the proposed PMPU provided a review of the environmental database search conducted by Environmental Database Resource, Inc. (EDR). The environmental database search provided by EDR included Federal, State, and local environmental databases that identify and track sites that contain, or have released, hazardous materials to the soil and/or groundwater. The HMTS also reviewed the State Water Resources Control Board (SWRCB) GeoTracker database and the California DTSC Envirostor database for supplemental information. The environmental database search encompassed a 1/16-mile radius

from each PMPU planning district boundary to identify unauthorized releases to soil, groundwater, and/or sediment on or in the immediate vicinity of each planning district. The 1/16-mile radius was selected for this program-level analysis to evaluate offsite properties with the greatest potential to adversely impact the planning districts. Industry standards recommend open cases or documented contamination plumes within 300 feet of a project site are the cases that have the greatest potential to adversely impact a site via groundwater. A large release could occur over 300 feet from the future development project site, but the documented contamination plume could migrate to within 300 feet of the site, and adversely impact groundwater at the site. Additionally, standard industry practice for cases involving soil vapor uses a vapor encroachment screening matrix search distance test that specifies a distance of 30 feet from the edge of a petroleum plume and 100 feet from the edge of a chlorinated hydrocarbon plume. Both of these release types would be covered using the 300-foot distance for open cases and 150-foot for closed cases.

The databases searched are listed in the HMTS (Appendix G). Cases of unauthorized release that have been “closed” by the responsible agency indicate that the contamination was remediated to a level at or below the applicable local, State, and Federal standards or has been safely and securely isolated and encapsulated. An “open” status indicates a release of a hazardous material occurred on site, is possibly undergoing remediation, and has not yet been closed by the responsible agency. In some instances, the EDR search results contain multiple listings on different databases for the same site. The results of the EDR database search are provided below for each planning district and depicted on Figure 4.7-1 with the corresponding Map ID number. The findings of the HMTS represent the most current database listings at the time of the report, but the databases are continuously updated. Thus, based on the planning horizon, the database searches may need to be updated for reasonably foreseeable future projects.

Planning District 1: Shelter Island

The environmental database search conducted for PD1 identified 15 sites, 2 of which had an “open” status, the rest of which are closed (see Figure 4.7-1). The open cases are described below.

- The site with the Map ID 113a has one opened leaking underground storage tank (LUST) case. The site is reportedly undergoing investigation and quarterly groundwater monitoring.
- Map ID 128 is an open case listed on the EnviroStor database. It is in the eastern portion of PD1, offshore of the Shelter Island peninsula. This facility is a Formerly Used Defense Sites (FUDS) facility, and the case is listed as *inactive*²; however, the database indicates the site “needs evaluation.”

Planning District 2: Harbor Island

Based on the HMTS, PD2 has 42 unauthorized release sites on or adjacent to it, based on the environmental database review (see Figure 4.7-2). Fifteen of these sites have an open status and are described below.

- Map ID 7b is a FUDS facility listed as Consolidated Aircraft Main Plant and did not have an address. The case is listed as *inactive*. According to the database, evaluation is needed. No other information is available on the database.

² According to the DTSC Envirostor database, sites with an “inactive – needs evaluation” designation are non-active sites where the DTSC has determined a preliminary endangerment assessment (PEA) or other evaluation is required.

- Map ID 12a is located at Northside San Diego International Airport Redevelopment, 3302 Pacific Highway. The case is under the oversight of the RWQCB and was opened in September 2010. The case is listed on the Spills, Leaks, Investigation and Cleanup (SLIC) database and is related to a release of PCBs and chromium affecting soil, indoor air, soil vapor, groundwater, and surface water. The property is under ongoing investigation as part of redevelopment efforts by the San Diego County Regional Airport Authority.
- Map ID 23f is located at Ryan Aircraft facility, which did not list an address. The case is listed on the EnviroStor database as a FUDS facility. The case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed (see description for the sites listed in PD1). No other information related to the site was provided in the database results.
- Map ID 25a is located at the Camp Consair facility and has no address. The facility is listed as a FUDS facility on the EnviroStor database. The case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the site was provided in the database results.
- Map ID 25b is located at the San Diego International Airport and has no address. It should be noted that the database results list the site as San Diego Municipal Airport. The facility is listed as a FUDS facility on the EnviroStor database. The case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the site was provided in the database results.
- Map ID 31 is located at the non-addressed Searchlight Battery #35 property. The facility is listed as a FUDS facility on the EnviroStor database. The case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the site was provided in the database results.
- Map ID 35b is identified as Lindbergh Field Shell underground storage tank (UST), located at 2400 Stillwater Road. The facility is listed on the SLIC database for a release of aviation fuel and gasoline that affected soil and groundwater. The cases were closed between 1987 and 2002. The facility is an active, class C, industrial waste site.
- Map ID 38 is identified as San Diego City Sewer Pump Station, located at 4077 North Harbor Drive. The facility is listed on the EnviroStor database, and is listed as a tiered permit and as of September 2000 was applying to the Certified Unified Program Agency (CUPA) for a permit to treat corrosive wastewaters. The facility is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information is provided in the database results.
- Map ID 42a is Avis Rent-a-Car, located at 3875 North Harbor Drive. There are three closed unauthorized release cases related to gasoline releases affecting soil and groundwater. Residual petroleum-related contamination remains in soil and groundwater. One open case is for a release of petroleum hydrocarbons that impacted soil and groundwater. Impacted soil and groundwater remain at the facility.
- Map IDs 47 and 64 are both associated with the former Tow Basin Facility located adjacently north of the East Basin. The site is listed on both the SLIC and EnviroStor databases. Multiple SLIC cases were closed between 1999 and 2005. All landside assessment and remediation activities are complete. One case remains open and is associated with a release of contaminants into sediments and surface water. Due to ongoing remediation in the East Basin associated with

other historical uses (Map ID 66 Lockheed Martin Systems), the sediment remediation related to Tow Basin has been incorporated into the Cleanup and Abatement Order for East Basin that was issued to Lockheed Martin in 2017 (CAO R9-2017-0021). All further documentation of the Tow Basin Facility is associated with the Lockheed Marine Railway (GeoTracker case Tow Basin - East Harbor Basin Sediment Assessment; see following bullet for additional details). Lockheed Martin's feasibility study was approved by the San Diego RWQCB in September 2020.

- Map ID 66 is the Lockheed Martin Systems (East Harbor Basin Sediment Assessment/Cleanup), located at 1160 Harbor Island Drive. The site is listed on the SLIC database, and is related to the presence of mercury and other contaminants in Bay sediments. An Investigative Order was issued in June 2011. A Cleanup and Abatement Order for divalent metals, mercury, and PCBs was issued to Lockheed Martin in 2017 for Tow Basin and the Former Marine Terminal and Railway Facilities [rescinded and reissued as Cleanup and Abatement Order No. R9-2022-0007]. ~~Lockheed Martin's feasibility study was approved by the San Diego RWQCB in September 2020.~~
- Map ID 54 is the UOP Inc. – Fluid Division facility, located at 2980 North Harbor Drive. The site is listed on the EnviroStor database. The case is under corrective action with a status of *inactive*; according to the database *evaluation is needed*, as of December 2010, indicating further actions must be taken before the listing can be closed. A preliminary assessment was conducted in September 1991.
- Map ID 62 is the TDY Convair Lagoon, located west of the U.S. Coast Guard Station. The site is listed on the Land Disposal Sites (LDS) database. In 1986 an investigation of PCBs was performed in the Convair Lagoon portion of San Diego Bay. Several Cleanup and Abatement Orders were issued for bay sediments. The case status is *open – closed with monitoring*. The site was capped in 1998, and the cap is currently maintained and monitored in compliance with waste discharge requirements.
- Map ID 73 is at the U.S. Coast Guard Base and has no address. The facility is listed on the EnviroStor database as a FUDS facility. The FUDS case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the suspected contaminant or release is provided in the database results.
- Map ID 74 is the Harbor Island – East Basin Sediment Assessment (Sunroad Resort Marina), located at 955 Harbor Island Drive. The case is listed on the SLIC database and is related to a copper and zinc discharge to bay sediments. A Sediment Investigation Report was submitted to the San Diego RWQCB in 2012.

Planning District 3: Embarcadero

Planning District 3 has 44 unauthorized release sites on or adjacent to it, based on the environmental database review (see Figure 4.7-3). Thirteen of these sites have an open status and are described below.

- Map ID 58a is the Solar Turbines facility located at 2200 Pacific Highway. The site is listed on the LUST, aboveground storage tank (AST), EnviroStor, and SLIC databases. The cases were opened in September 1986 and June 1998. Contaminants of concern include metals, VOCs, PCBs, PAHs, and total petroleum hydrocarbons (TPH), which have impacted soil, soil vapor, groundwater, and bay sediments. The facility is currently undergoing remediation and further evaluation.

- Map ID 59 is the non-addressed Solar Aircraft Group facility. The facility is listed on the EnviroStor database as a FUDS facility and the case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the suspected contaminant or release is provided in the database results.
- Map ID 70 is the Laurel to Hawthorne Street Bay Sediment (Laurel Hawthorne Embayment [LHE]) site and is currently the focus of three separate IOs for sediments within the embayment. Sediments are being analyzed for a wide class of contaminants, including SVOCs, PCBs, metals, PAHs, and pesticides. Along with sediment chemistry, sediment quality will be evaluated for the protection of beneficial uses, including potential impacts on the aquatic food chain (benthic community) and potential contributions to fish consumption advisories. The case is listed on the SLIC database and is related to a release of PCBs, metals, waste oil, and PAHs affecting sediments and surface water. The case was opened in January 2012. An investigation is ongoing.
- Map ID 77 is the San Diego Barracks site and has no address. The facility is listed on the EnviroStor database as a FUDS facility. The site is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the suspected contaminant or release is provided in the database results.
- Map ID 81f is the Wood Atla Pacific LLC, located at 1919 Pacific Highway. The site is listed on the SLIC database. The case was opened in September 2016 for regulatory oversight during redevelopment activities at the facility.
- Map ID 110c is the AST Flooring Company, located at 808 West Cedar Street. The site is listed on the SLIC and Superfund Enterprise Management System (SEMS)-Archive databases; however, details were not available for the facility in the database results.
- Map ID 110d is the Cedar-Cal facility located at 1560 California Street. The site is listed on the SLIC database, and the case has been open since August 2014 for regulatory oversight during redevelopment activities at the facility. Although the case is listed as *open*, there has been no activity since 2014.
- Map ID 134a is the Point Loma Naval Complex/Manchester North Gateway Project, located at 937 North Harbor Drive. The site is listed on the EnviroStor and SLIC databases. The facility is an open military base. Potential contaminants of concern include metals, waste oil, solvents, and hydrocarbons. This Voluntary Assistance Program (VAP) case was opened in January 2016 and is under investigation.
- Map ID 134b is the 11th Naval District Headquarters, which is listed on the EnviroStor database and has no address. The facility is a FUDS facility and the case is listed as *inactive*. According to the database, *evaluation is needed*, indicating further actions must be taken before the listing can be closed. No other information related to the suspected contaminant or release is provided in the database results.
- Map ID 134c is the site of the North Embarcadero Visionary Plan project, located at North Harbor Drive. The site is listed on the SLIC database. This VAP case was opened in September 2011 for regulatory oversight during redevelopment. No other information related to the suspected contaminant or release is provided in the database results.

- Map ID 167b is the San Diego Convention Center (Tidelands Dump), located at 100 Harbor Drive. The site is listed on the SLIC database. The case has been open since June 2000 and is related to a release of metals, dioxins, and PAHs that impacted soil and groundwater.
- Map ID 171 is the San Diego Marriott Hotel and Marina facility, located at 333 West Harbor Drive. The site is listed on the LUST and SLIC databases. The LUST case was opened in 1997 after damage to a UST resulted in a release of TPH-gasoline and TPH-diesel that impacted soil only and was closed in October 1999. The *open unauthorized* case was opened in May 2016 and is related to a release of metals that impacted sediments and surface water. The facility is under investigation.
- Map ID 193 is located at the Campbell Shipyard Bay Sediment San Diego Bay and has no address. The site is listed on the LDS database. The LDS case was opened in November 2006 and the status is *open – closed with monitoring* and is related to a release of solvents, PCBs, and metals that impacted sediments and surface water. The in-water remedy included a combination of removal of contaminated sediment through dredging and placement of an engineered cap.

Planning District 4: Working Waterfront

PD4 has 26 unauthorized release sites on or adjacent to it, based on the environmental database review (see Figure 4.7-4). Eight of these sites have an open status.

- Map ID 192 is located at the Mouth of Switzer Creek, along Water Street. The site is listed on the SLIC database, and the SLIC case was opened in May 2016 for a release of PCBs, metals, and PAHs that impacted sediments and surface water. The site is under investigation.
- Map IDs 203b and 204 are located at the Santa Fe Railway (Burlington Northern Santa Fe Rail), located at 1342 Crosby Street. The site is listed on the LUST database. A release of gasoline-impacted soil and groundwater was reported at the facility. The cases were closed in June 2008 and January 2015, respectively.
- Map ID 203d is the Port of San Diego facility (Cesar Chavez Park) located at 1875 Water Street. The site is listed on the LUST and SLIC databases. The LUST case was opened in January 1994 for a diesel release that impacted soil and groundwater and was closed in December 1996. The SLIC case was opened in July 2015 and is related to a release of gasoline and oil that impacted soil. The facility is under investigation.
- Map ID 204b is the Pacific Maritime Fright Inc. and Tenth Avenue Marine Terminal facility. The site is listed on the SLIC database. The SLIC case is related to a release of PCBs and metals that impacted soil and surface water. The case was opened in May 2016 and is under investigation.
- Map ID 212a is the Continental Maritime San Diego City of San Diego Pipeline, located at 1995 Bayfront Street. The site is listed on the LUST, SEMS-Archive, SLIC, and EnviroStor databases. The LUST cases are related to releases of diesel and gasoline that impacted soil and groundwater. The cases were closed between 1989 and 2013. The SLIC case was opened in January 1995 and is related to oil and metals releases that impacted soil only. The facility is currently under further evaluation.
- Map ID 212b is the CP Kelco (Harbor Boat and Tug) site, located at 2145 Belt Street. The site is listed on the LUST, SLIC, and EnviroStor databases. The LUST cases are related to releases of alcohol, diesel, hydraulic fluid, and oil that impacted soil only. The cases were closed between 1988 and 2004. The SLIC case was opened in March 2004 and is related to a diesel release that impacted soil only. The facility is under investigation.

- Map IDs 213a and 223 are located at the Shipyard Sediment Site, North Shipyard, BAE Systems, at 2205 East Belt Street. The site is listed on the LUST and SLIC databases. The closed LUST case was opened in 1997 and is related to a diesel release that impacted soil only. The case was closed in July 1998. The SLIC cases were opened in 1995 and 2009 and are related to releases of PCBs, metals, and PAHs that impacted soil and groundwater. The facility is under a Cleanup and Abatement Order (CAO). The remedy defined under the CAO was constructed in 2016, and the site is currently under a long-term monitoring program.
- Map IDs 213b and 215 are located at the Chevron USA Inc. facility, located at 2351 East Harbor Drive. The site is listed on the LUST database. The offsite LUST cases were opened in 1987 during a UST removal and are related to releases of petroleum that impacted soil and groundwater. The case is still open and was transferred to the RWQCB in 2019.

Planning District 7: South Bay

Based on the environmental database review, two unauthorized release sites are located approximately 1 mile from the boundaries of PD7 near Pond 20, which is not included in the proposed PMPU. Neither of the two sites have an open status (see Figure 4.7-5).

Planning District 8: Imperial Beach Oceanfront

Planning District 8 did not have any unauthorized release sites on or adjacent to it, based on the environmental database review (see Figure 4.7-6).

Planning District 9: Silver Strand

Planning District 9 has two unauthorized release sites on or adjacent to it, based on the environmental database review. Neither of these two sites have an open status (see Figure 4.7-7).

Planning District 10: Coronado Bayfront

Planning District 10 has six unauthorized release sites on or adjacent to it, based on the environmental database review. None of these sites have an open status (see Figure 4.7-8).

Existing Schools Within 0.25 Mile of the Proposed PMPU Area

There are no schools located within the proposed PMPU boundaries; however, there are four within 0.25 mile of the proposed PMPU area. Table 4.7-2 lists the school districts and schools within 0.25 mile of the planning districts.

Table 4.7-2. Schools in the Vicinity of the Planning Districts

School District	Schools	Distance to Planning District(s)
San Diego Unified School District	Cabrillo Elementary School	0.14 mile northwest of PD1
	Perkins Elementary School	0.22 mile northeast PD4
San Diego County Office of Education	Monarch School (Special Education)	0.07 mile east of PD4

4.7.2.3 Existing Airports and Airstrips Within 2 Miles of the Proposed PMPU Area

All of the planning districts lie either entirely or partially within the Airport Influence Area (AIA) of a public airport or military airport (see Figure 4.7-9). An AIA is established by the Airport Land Use Compatibility Plan (ALUCP) for each airport and represents the boundary where the policies of the ALUCP apply. An ALUCP governs the suitable land uses that may locate within a specified boundary of a public or military airport, to protect the public (SDIA ALUC 2019). The AIA represents that specified area surrounding an airport where current and projected airport-related noise, safety, airspace protection, and overflight factors may influence land uses (ALUC 2014).

Table 4.7-3 provides an overview of the planning districts that would be within the various airport overlay zones associated with SDIA and NOLF Imperial Beach. The SDIA is within the boundaries of PD2 but is not governed by the proposed PMPU; however, the AIA for the SDIA encompasses PD2 and several other planning districts, as shown in Table 4.7-3. Planning District 8 is approximately 0.5 mile west of the Naval Outlying Landing Field (NOLF) Imperial Beach. The AIA for the NOLF Imperial Beach encompasses not only PD8, but also PD7 and PD9.

Naval Air Station (NAS) North Island is located on the western portion of the City of Coronado and is within the vicinity of PD1, PD2, and PD10. The San Diego County Airport Land Use Commission approved the ALUCP for NAS North Island in October 2020. The Draft ALUCP indicates all of the planning districts except for PD8 would be within the AIA for NAS North Island. The information in Table 4.7-3 is based on the ALUCP document (SDC ALUC 2020).

Table 4.7-3. Airport Land Use Plan Overlay Zones

Airport Overlay Zone	Planning District
San Diego International Airport	
Airport Influence Area	PD1, PD2, PD3, PD4, PD10
Review Area 1	PD2, PD3
Review Area 2	PD1, PD2, PD3, PD4, PD10
Noise	PD2, PD3
Overflight	PD1, PD2, PD3
Safety	PD2
Threshold Siting Surfaces	PD2
Naval Overlying Landing Field – Imperial Beach	
Airport Influence Area	PD7, PD8, PD9
Review Area 2	PD7
Airspace Protection	PD7, PD8, PD9
NAS North Island	
Airport Influence Area	PD1, PD2, PD3, PD4, PD7, PD9, PD10
Noise	PD1
Overflight	PD1, PD9, PD10
Safety	N/A

4.7.3 Laws, Regulations, Plans, and Policies

4.7.3.1 Federal

Federal Toxic Substances Control Act/Resource Conservation and Recovery Act/Hazardous and Solid Waste Act

The Federal Toxic Substances Control Act (1976, 15 U.S. Code [USC] 2601 et seq.) and the Resource Conservation and Recovery Act of 1976 (RCRA, 42 USC 6901 et seq.) established a program, which is administered by the EPA, to regulate the generation, transport, treatment, storage, and disposal of hazardous waste. Under RCRA regulations (40 Code of Federal Regulations [CFR] Parts 260–299), hazardous wastes must be tracked from the time of generation to the point of disposal. The RCRA program also establishes standards for hazardous waste treatment, storage, and disposal units, which are intended to have hazardous waste managed in a manner that minimizes present and future threats to the environment and human health. At a minimum, each generator of hazardous waste must register and obtain a hazardous waste activity identification number. If hazardous wastes are stored for more than 90 days or treated or disposed of at a facility, any treatment, storage, or disposal unit must be permitted under the RCRA. The RCRA was amended in 1984 by the Hazardous and Solid Waste Act, which affirmed and extended the “cradle to grave” system of regulating hazardous materials.

In 1979, the EPA banned the use of PCBs in most new electrical equipment and began a program to phase out certain existing PCB-containing equipment. The use and management of PCBs in electrical equipment is regulated pursuant to the Toxic Substances Control Act, 15 USC 2601 et seq. The Toxic Substances Control Act and its implementing regulations generally require labeling and periodic inspection of certain types of PCB equipment and set forth detailed safeguards to be followed for disposal of such items.

Department of Transportation Hazardous Materials Regulations (49 CFR 100–185)

U.S. Department of Transportation (DOT) Hazardous Materials Regulations (49 CFR Parts 100–185) cover all aspects of hazardous materials packaging, handling, and transportation. Parts 107 (Hazard Materials Program), 130 (Oil Spill Prevention and Response), 172 (Emergency Response), 173 (Packaging Requirements), 177 (Highway Transportation), 178 (Packaging Specifications), and 180 (Packaging Maintenance) would all apply to goods movement to and from the planning districts. These regulations require that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Vehicles transporting certain types or quantities of hazardous materials must display placards (warning) signs. Carriers are required to report accidental releases of hazardous materials to DOT and the earliest practical moment. Other incidents that must be reported include deaths, injuries requiring hospitalization, and property damage exceeding \$50,000.

Enforcement of these aforementioned DOT regulations is shared by each of the following administrations under delegations from the Secretary of the DOT.

- **Research and Special Programs Administration** is responsible for container manufacturers, re-conditioners, and re-testers and shares authority over shippers of hazardous materials.

- **Federal Highway Administration** enforces all regulations pertaining to motor carriers.
- **Federal Railroad Administration** enforces all regulations pertaining to rail carriers.
- **Federal Aviation Administration (FAA)** enforces all regulations pertaining to air carriers.
- **U.S. Coast Guard (USCG)** enforces all regulations pertaining to shipments by water.

Additionally, the California Highway Patrol (CHP) and the California Department of Transportation (Caltrans) are the State agencies with primary responsibility for enforcing Federal and State regulations related to transportation within California. These agencies respond to hazardous materials transportation emergencies. Together, these agencies determine container types to be used and grant licenses to hazardous waste haulers for hazardous waste transportation on public roads.

Comprehensive Environmental Response, Compensation, and Liability Act

The CERCLA, commonly known as Superfund, was enacted in 1980 to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA established prohibitions and requirements concerning closed and abandoned hazardous waste sites, provided for liability of persons responsible for releases of hazardous waste at these sites, and established a trust fund to provide for cleanup when no responsible party could be identified. The corresponding regulation in 42 CFR 103 provides the general framework for response actions and managing hazardous waste.

Spill Prevention Control and Countermeasure Plans (40 CFR 112.7)

Spill Prevention Control and Countermeasure (SPCC) plans are required for facilities in which construction and removal operations involve oil in the vicinity of navigable waters or shorelines. SPCC plans ensure that facilities implement containment and other countermeasures that would prevent oil spills from reaching navigable waters. SPCC plans are regulations administered by EPA. Preparation of an SPCC Plan is required for projects that meet three criteria: (1) the facility must be non-transportation-related, or, for construction, the construction operations involve storing, using, transferring, or otherwise handling oil; (2) the project must have an aggregate aboveground storage capacity greater than 1,320 gallons or completely buried storage capacity greater than 42,000 gallons; and (3) there must be a reasonable expectation of a discharge into or upon navigable waters of the United States or adjoining shorelines. For construction projects, for criterion (1), 40 CFR 112 describes the requirements for implementing SPCC plans. The following three areas should clearly be addressed in a SPCC plan.

- Operating procedures that prevent oil spills.
- Control measures installed to prevent a spill from reaching navigable waters.
- Countermeasures to contain, clean up, and mitigate the effects of an oil spill that reaches navigable waters.

United States Coast Guard 33 CFR and 46 CFR

The USCG, through Title 33 (Navigation and Navigable Waters) and Title 46 (Shipping) of the CFR, is the Federal agency responsible for vessel inspection, marine terminal operations safety, coordination of Federal responses to marine emergencies, enforcement of marine pollution statutes,

marine safety (such as navigation aids), and operation of the National Response Center for spill response, and is the lead agency for offshore spill response. The USCG implemented a revised vessel-boarding program in 1994 designed to identify and eliminate substandard ships from U.S. waters. The program pursues this goal by systematically targeting the relative risk of vessels and increasing the boarding frequency on high risk (potentially substandard) vessels. The relative risk of each vessel is determined through the use of a matrix that factors the flag of the vessel, owner, operator, classification society, vessel particulars, and violation history. Vessels are assigned a boarding priority from I to IV, with priority I vessels being the potentially highest risk and priority IV having relatively low risk.

Emergency Planning and Community Right-To-Know Act (42 U.S. Code 11001 et seq.)

The Emergency Planning and Community Right-to-Know Act (EPCRA) was enacted by Congress as the national legislation on community safety in 1986, as Title III of the Superfund Amendments and Reauthorization Act. This law was designated to help local communities protect public health, safety, and the environment from chemical hazards. To implement this act, Congress required each state to appoint a State Emergency Response Commission. The State Emergency Response Commissions are required to divide their states into Emergency Planning Districts and to name a Local Emergency Planning Committee for each district. The act provides requirements for emergency release notification, chemical inventory reporting, and toxic release inventories for facilities that handle chemicals.

Occupational Safety and Health Act of 1970

The Occupational Safety and Health Act (OSHA) establishes the framework for safe and healthful working conditions for working men and women by authorizing enforcement of the standards developed under the act. The act also provides for training, outreach, education, and assistance related to establishing a safe working environment. Regulations defining safe standards have been developed for general industry, construction, maritime, recordkeeping, and agriculture. A major component of the act is the requirement that employers implement the Occupational Safety and Health Act Hazard Communication Standard to provide information to employees about the existence and potential risks of exposures to hazardous substances in the workplace. As part of the Hazard Communication Standard, employers must:

- Obtain material safety data sheets from chemical manufacturers that identify the types and handling requirements of hazardous materials used in given areas;
- Make the material safety data sheets available to their employees;
- Label chemical containers in the workplace;
- Develop and maintain a written hazard communication program; and
- Develop and implement programs to train employees about hazardous materials.

Occupational Safety and Health Administration standards specific to hazardous materials are listed in 29 CFR 1910 Subpart H. Safety and health regulations pertaining to construction are listed in 29 CFR 1926 Subpart H.

California has implemented its OSHA regulations under Title 8 of the California Code of Regulations (CCR). Additional information is provided in the subsequent section on State regulations.

14 CFR Part 77 – Safe, Efficient Use, and Preservation of the Navigable Airspace

Code of Federal Regulations, Title 14, Part 77 establishes the requirements to provide notice to the FAA of certain proposed construction of structures or alteration of existing structures. Part 77 also establishes standards used to determine obstructions to air navigation and navigational and communication facilities, the process for aeronautical studies to determine potential effects on navigable space, and the process to petition the FAA for discretionary review of determinations related to construction or alternation.

The FAA Notification overlay outlines the area surrounding the airport required to comply with Federal law requiring notification to the FAA for the construction of new structures or objects in the airspace. Federal law 14 CFR Part 77 Notification Criteria requires project sponsors of structures or objects such as antennas, trees, or construction cranes, that exceed the Part 77 height criteria to submit to the FAA a Notice of Proposed Construction or Alternation (Form 7460-1). The Part 77 height criteria apply to any construction or alteration that is more than 200 feet above the ground anywhere in the United States; and any construction or alteration that exceeds an imaginary surface extending outward and upward at any of the following slopes:

1. 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport...with its longest runway more than 3,200 feet in actual length, excluding heliports.
2. 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport ... with its longest runway no more than 3,200 feet in actual length, excluding heliports.
3. 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport...

Additionally, the FAA may require notification for construction or alternation on applicable airports and heliports; and for structures that may cause signal reception interference with navigational aids (NAVAIDS).

Clean Water Act

The primary goals of the Clean Water Act (CWA) are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and make all surface waters fishable and swimmable. The EPA is the lead Federal agency responsible for water quality management. The CWA (33 USC 1251–1387) amended the Federal Water Pollution Control Act of 1972 and is the primary Federal law that governs and authorizes water quality control activities by EPA as well as the states. The Federal CWA of 1977 established the basic structure for regulating discharges of pollutants into the waters of the United States (not including groundwater). Under the CWA, it is unlawful for any person to discharge any pollutant from a point source into navigable waters, unless a National Pollutant Discharge Elimination System (NPDES) permit is obtained and implemented. In addition, the CWA requires the states to adopt water quality standards for receiving water bodies and have those standards approved by EPA. Water quality standards consist of designated beneficial uses for a particular receiving water body (e.g., wildlife habitat, agricultural supply, fishing), along with the water quality criteria necessary to support those uses. Following are descriptions of sections of the CWA applicable to the potential release of hazardous materials; for more discussion of the CWA, see Section 4.8.

CWA Section 303: Impaired Water Bodies (303(d) list) and Total Maximum Daily Loads

Under Section 303(d) of the CWA, the SWRCB is required to develop a list of impaired water bodies that do not meet water quality standards (promulgated under the National Toxics Rule or the California Toxics Rule) after the minimum technology-based effluent limitations have been implemented for point sources. Lists are to be priority ranked for development of a TMDL. A TMDL is a calculation of the total maximum amount of a pollutant that a water body can receive on a daily basis and still safely meet water quality standards. The California RWQCBs and EPA are responsible for establishing TMDL waste-load allocations and incorporating improved load allocations into water quality control plans, NPDES permits, and WDRs. Section 305(b) of the CWA requires states to assess the status of water quality conditions and submit a report every 2 years. Both CWA requirements are addressed through development of a 303(d)/305(b) Integrated Report, which will provide both an update to the 303(d) list and a 305(b) assessment of statewide water quality. The SWRCB developed a statewide 2014 and 2016 California Integrated Report that was based on the Integrated Reports from each of the nine RWQCBs. The 2014 and 2016 California Integrated Report was approved by the SWRCB on October 3, 2017, and EPA issued its final decision and approval of the California 303(d) list on April 6, 2018. For a full list of TMDLs issued for the Bay, see Section 4.8.

Section 404: Permits for Dredged or Fill Material

Under Section 404, the U.S. Army Corps of Engineers (USACE) and EPA regulate the discharge of dredged and fill materials into waters of the United States. These waters are defined primarily as navigable waterways or water features (including wetlands) that have a significant nexus to navigable waters. Project sponsors must obtain authorization from USACE for all discharges of dredged or fill materials into waters of the United States before proceeding with a proposed activity. Individual Section 404 permits may be issued only for a least environmentally damaging practicable alternative. Compliance with CWA Section 404 requires compliance with several other environmental laws and regulations. USACE cannot issue an individual permit or verify the use of a general permit until the requirements of the National Environmental Policy Act of 1969, Endangered Species Act, Coastal Zone Management Act, and National Historic Preservation Act have been met. In addition, no permit can be issued or verified until a water quality certification, or waiver of certification, has been issued pursuant to CWA Section 401.

Section 404 of the CWA provides for the issuance of dredge/fill permits by the USACE. Permits are typically conditioned to minimize impacts to water quality. Conditions typically include, but are not limited to:

- USACE review and approval of sediment quality analysis prior to dredging. Sediments are tested using approved EPA protocols;
- Detailed pre- and post-construction monitoring plan that includes disposal site monitoring;
- Timing and water quality restrictions on flow back of dredged water at the dredging site with flow-back water meeting RWQCB Waste Water Discharge and Receiving Water Monitoring Program requirements;
- Compensation for loss of waters of the United States, including wetlands.

As part of this regulatory/permitting process, monitoring requirements include measurements of water quality parameters such as dissolved oxygen, light transmittance (turbidity), pH, and

suspended solids at varying distances from the dredging operations. In the unlikely event that dredging activities exceed any of the monitoring levels, the dredging permit would include corrective actions such as use of silt curtains and requiring a slower dredge bucket speed, which would be implemented if the monitoring data indicate that water quality conditions outside of the mixing zone exceed the permit-specified limits.

4.7.3.2 State

Cortese List

California Government Code 65962.5 (commonly referred to as the *Cortese List*) includes hazardous waste facilities and sites listed by DTSC, Department of Health Services lists of contaminated drinking water wells, sites listed by the SWRCB as having underground storage tank leaks or a discharge of hazardous wastes or materials into the water or groundwater, and lists from local regulatory agencies of sites with a known migration of hazardous waste/material.

California Health and Safety Code (Hazardous Waste Control Act)

The California DTSC, a department of the California Environmental Protection Agency (Cal/EPA), is the primary agency in California for: regulating hazardous waste; cleaning up existing contamination; and finding ways to reduce the amount of hazardous waste produced in California. DTSC regulates hazardous waste primarily under the authority of the Federal RCRA and the California Health and Safety Code (primarily Division 20, Chapters 6.5 through 10.6, and Title 22, Division 4.5). Division 20, Chapter 6.5, of the California Health and Safety Code identifies hazardous waste control regulations pertaining to transportation, treatment, recycling, disposal, enforcement, and the permitting of hazardous waste. Division 20, Chapter 6.10, identifies regulations applicable to the cleanup of hazardous materials releases. Title 22, Division 4.5, contains environmental health standards for the management of hazardous waste, as well as standards for the identification of hazardous waste (Chapter 11), and standards that are applicable to transporters of hazardous waste (Chapter 13). The Hazardous Waste Control Act requires a hazardous waste generator that stores or accumulates hazardous waste for periods greater than 90 days at an onsite facility or for periods greater than 144 hours at an offsite or transfer facility, which treats or transports hazardous waste, to obtain a permit to conduct such activities. The law provides for the development of a State hazardous waste program that administers and implements the provisions of the Federal RCRA for a cradle-to-grave waste management system in California. It also provides for the designation of California-only hazardous waste and development of standards that are equal to or, in some cases, more stringent than Federal requirements, such as mandating source-reduction planning and regulating the number of types of waste and waste management activities that are not covered by Federal law with the RCRA.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (California Health and Safety Code, Chapter 6.11, Sections 25404–25404.9)

This program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of the environmental and emergency response programs and provides authority to the CUPA. The CUPA for San Diego County is the San Diego County Department of Environmental Health's (DEH's) Hazardous Materials Division (HMD), which

has the responsibility and authority for implementing and enforcing the requirements listed in Chapter 6.5 (commencing with Section 25100), Chapter 6.67 (commencing with Section 25270), Chapter 6.7 (commencing with Section 25280), Chapter 6.95 (commencing with Section 25500), and Sections 25404.1 and 25404.2, including the following.

- **Aboveground Petroleum Storage Act Requirements for SPCC Plans.** Facilities with a single tank or cumulative aboveground storage capacities of 1,320 gallons or greater of petroleum-based liquid product (e.g., gasoline, diesel, lubricants) must develop an SPCC plan. An SPCC plan must be prepared in accordance with the oil pollution prevention guidelines in 40 CFR 112. This plan must describe the procedures, methods, and equipment needed at the facility to prevent discharges of petroleum from reaching navigable waters. A registered professional engineer must certify the SPCC plan, and a complete copy of the plan must be maintained on site.
- **California Accidental Release Prevention Program.** This program requires any business that handles more than threshold quantities of an extremely hazardous substance to develop a Risk Management Plan. The Risk Management Plan is implemented by the business to prevent or mitigate releases of regulated substances that could have offsite consequences through hazard identification, planning, source reduction, maintenance, training, and engineering controls.
- **Hazardous Materials Business Plan/Hazardous Materials Inventory Statements.** Hazardous Materials Business Plans contain basic information regarding the location, type, quantity, and health risks of hazardous materials and/or waste. Each business must prepare a Hazardous Material Business Plan if that business uses, handles, or stores a hazardous material and/or waste or an extremely hazardous material in quantities greater than or equal to the following.
 - 55 gallons for a liquid
 - 500 pounds for a solid
 - 200 cubic feet for any compressed gas
 - Threshold planning quantities of an extremely hazardous substance
- **Hazardous Waste Generator Program.** This program regulates businesses that generate any amount of hazardous waste. Proper handling, recycling, treating, storing, and disposing of hazardous waste are key elements to this program.
- **Tiered Permitting Program.** This program regulates the onsite treatment of hazardous waste.
- **Underground Storage Tank Program.** This program regulates the construction, operation, repair, and removal of underground storage tanks that store hazardous materials and/or waste.

Environmental Health Standards for the Management of Hazardous Waste (California Code of Regulations, Title 22, Division 4.5, Section 66001 et seq.)

These standards establish requirements for the management and disposal of hazardous waste in accordance with the provisions of the State Hazardous Waste Control Act and Federal RCRA.

California Code of Regulations, Title 8—Industrial Relations

Title 8 of the CCR, Section 1532.1 (8 CCR 1532.1) is a rule developed by the Federal Occupational Safety and Health Administration in 1993 and adopted by the State of California. This rule is comparable to the Federal standards described above. Occupational safety standards exist in

Federal and State laws to minimize worker safety risks from both physical and chemical hazards in the workplace. The Federal Occupational Safety and Health Administration and the California Division of Occupational Safety and Health (Cal/OSHA) are responsible for ensuring worker safety in the workplace. Cal/OSHA assumes primary responsibility for developing and enforcing standards for safe workplaces and work practices. These standards would be applicable to both construction and operation of reasonably foreseeable future projects proposed under the proposed PMPU. Title 8 includes regulations pertaining to hazard control (including administrative and engineering controls), hazardous chemical labeling and training requirements, hazardous exposure prevention, hazardous material management, and hazardous waste operations. These regulations also include Compliance with Injury Illness Prevention Program (IIPP) requirements (8 CCR 3203), which would ensure that workers are properly trained to recognize workplace hazards and to take appropriate steps to reduce potential risks due to hazards. A site Health and Safety Plan must be prepared prior to commencing any work at a contaminated site or involving disturbance of building materials containing hazardous substances to protect workers from exposure to potential hazards.

Title 8 also specifies requirements for the removal and disposal of asbestos-containing materials (ACMs). In addition to providing information regarding how to remove ACMs, specific regulations limit the time of exposure, regulate access to work areas, require demarcation of work areas, prohibit certain activities in the presence of ACM removal activities, require the use of respirators, require monitoring of work conditions, require appropriate ventilation, and require qualified persons for ACM removal.

Title 8 also covers the removal of lead-based paint (LBP). Specific regulations cover the demolition of structures that contain LBP, the process associated with its removal or encapsulation, remediation of lead contamination, the transportation/disposal/storage/containment of lead or materials containing lead, and maintenance operations associated with construction activities involving lead, such as LBP. The construction safety orders establish an action level of 30 micrograms of lead per cubic meter ($\mu\text{g}/\text{cm}^3$) of air calculated over an 8-hour time-weighted average without regard for the use of a respirator, meaning this is the limit where safety protocols must be initiated, such as use of a respirator. Under no circumstance may a worker be exposed to 50 $\mu\text{g}/\text{cm}^3$ over an 8-hour weighted period. These regulations require implementation of engineering and work practice controls such as respiratory protection, protective clothing, housekeeping, hygiene practices, and signage requirements to meet worker exposure limits. Medical monitoring and training requirements are also identified.

California Labor Code (Division 5, Parts 1 and 7)

California Labor Code regulations ensure appropriate training regarding the use and handling of hazardous materials and the operation of equipment and machines that use, store, transport, or dispose of hazardous materials. Division 5, Part 1, Chapter 2.5, ensures that employees who handle hazardous materials are appropriately trained and informed about the materials. Division 5, Part 7, ensures that employees who work with volatile flammable liquids are outfitted with appropriate safety gear and clothing.

California Fire Code

The California Fire Code (24 CCR 9) regulates the types, configuration, and quantities of hazardous materials that can be stored within structures. The California Fire Code also regulates the storage of hazardous materials in outdoor areas. These regulations are implemented through regular

inspections of on-site operations and through issuance of notices of violation in cases where storage facilities do not meet code requirements.

Hazardous Waste Control Law

The Cal/EPA and DTSC regulate the generation, transportation, treatment, storage and disposal of hazardous waste. The Cal/EPA has authorized DTSC to enforce the Hazardous waste Control Law (California Health and Safety Code, Division 20, Chapter 6.5, Article 2), which implements the Federal RCRA cradle to grave waste management system in California. It establishes criteria for identifying, packaging, and labeling hazardous waste; prescribes management of hazardous waste establishes permit requirements for hazardous waste treatment, storage, disposal, and transportation and identifies hazardous waste that cannot be disposed of in landfills. California hazardous waste regulations can be found in Title 22, Division 4.5, "Environmental Health Standards for Management of Hazardous Wastes."

Hazardous Materials Release Response Plans and Inventory Law

Businesses in California that handle hazardous materials are required to comply with the Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act, also known as the Waters Bill) (Assembly Bill 2185; California Health and Safety Code, Chapter 6.6). Basic requirements of hazardous materials planning include the development of detailed hazardous materials inventories used and stored on-site, a program of employee training for hazardous materials release response, and the identification of emergency contacts and response procedures. The reporting thresholds for hazardous materials are 55 gallons of a liquid; 500 pounds of a solid; and 200 cubic feet of a compressed gas measured at standard temperature and pressure.

The law aims to ensure that the hazardous materials are properly handled, used, stored, and disposed of, and in the event that such materials are accidentally released, to prevent or reduce injury to health and the environment. This law is also designed to reduce the occurrence and severity of hazardous materials releases. However, an exemption exists for facilities (retail stores) handling hazardous materials contained solely in a consumer product and pre-packaged for direct distribution to, and use by, the general public.

4.7.3.3 Regional

San Diego County Code, Title 6, Division 8

San Diego County Code of Regulatory Ordinances under Title 6, Division 8, Chapters 8 through 11 establish the HMD as the local CUPA. The HMD is responsible for the protection of public health, safety, and the environment and inspects businesses or facilities that handle or store hazardous materials, generate hazardous waste, generate medical waste, and own or operate underground storage tanks. HMD also administers the California Accidental Release Prevention Program and the Aboveground Petroleum Storage Act Program, and provides specialized instruction to small businesses through its Pollution Prevention Specialist. HMD has the authority under State law to inspect facilities with hazardous materials or hazardous waste and, in cases where a facility is in non-compliance with the applicable State law or regulations, take enforcement action.

Projects are required to notify HMD regarding the use, handling, release (spills), storage, and/or disposal of hazardous materials and hazardous waste in accordance with existing State law and

County ordinance. The notification is the initial step in the HMD permitting process, which requires businesses that handle or store hazardous materials, are part of the California Accidental Release Prevention Program, generate or treat hazardous wastes, generate or treat medical waste, store at least 1,320 gallons of aboveground petroleum, or own and/or operate underground storage tanks to obtain and maintain a Unified Program Facility Permit. The online notification must be done using the State of California Environmental Reporting System by the applicant/permittee requesting a permit and submitted within 30 days.

If a building permit is required, Section 65850.2 of the California Government Code prohibits building departments from issuing a final Certificate of Occupancy to businesses or facilities that handle hazardous materials unless they have submitted and met the requirements of a Hazardous Materials Business Plan. The Hazardous Materials Business Plan contains detailed information on the storage of hazardous materials at regulated facilities and serves to prevent or minimize damage to public health, safety, and the environment from a release or threatened release of a hazardous material. The Hazardous Materials Business Plan also provides emergency response personnel with adequate information to help them better prepare and respond to chemical-related incidents at regulated facilities.

Operational Area Emergency Operations Plan

The San Diego County Operational Area was formed to help the County and its incorporated cities develop emergency plans, implement such plans, develop mutual aid capabilities between jurisdictions, and improve communications between jurisdictions and agencies. The San Diego County Operational Area consists of the County and all jurisdictions within the County. The Operational Area Emergency Operations Plan is for use by the County and all the cities within the County to respond to major emergencies and disasters. It defines roles and responsibilities of all County departments and many city departments.

Cities within the County are encouraged to adopt the Operational Area Emergency Operations Plan, with modifications that would be applicable to each city. The plan is updated once every 4 years by the Office of Emergency Services and the Unified Disaster Council of the Unified San Diego County Emergency Services Organization.

The District has developed a basic Emergency Operations Plan, as well as supplemental preparedness plans that cover topics such as hazard mitigation and continuity of operations in accordance with the Standardized Emergency Management System (SEMS) and National Incident Management System (NIMS). SEMS and NIMS are the established State and Federal emergency response standards, respectively. These standards ensure continuity in planning and response to critical incidents, disasters and planned events which impact communities. The District's emergency response plans are reviewed and updated regularly in accordance with the SEMS and NIMS standards. Integral in these emergency response plans is coordination between Local, State and Federal agencies, as well external communications with the community, businesses and other stakeholders.

4.7.3.4 Local

City of San Diego Solid Waste Local Enforcement Agency

The City's Solid Waste Local Enforcement Agency is responsible for enforcing Federal and State laws and regulations for the safe and proper handling of solid waste. State law (Public Resources Code) requires that every local jurisdiction designate a solid waste Local Enforcement Agency that is certified by the Department of Resources Recycling and Recovery to enforce Federal and State laws and regulations for the safe and proper handling of solid waste.

Any development plan proposing to handle, process, transport, store, or dispose of solid wastes including household trash and garbage, construction debris, commercial refuse, sludge, ash, discarded appliances and vehicles, manure, landscape clippings, and other discarded wastes shall contact the Local Enforcement Agency for determination of the need for a solid waste facility permit.

Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District

The District developed Best Management Practices (BMPs) and Environmental Standards (collectively, "Standards") for any and all routine repairs and maintenance activities conducted by the District that involve existing overwater structures, such as piers, docks, and wharves, in order to avoid or minimize the potential to increase water turbidity. The Standards address how to conduct and monitor in-water construction activities that have the potential to increase turbidity, including without limitation, pile removal and installation via jetting, impact hammer, and various vibratory methods. The Standards also outline the requirements for disposal of creosote treated piles at District facilities. The District's implementation of the Standards is intended to ensure water quality standards are not exceeded and to protect the environment, San Diego Bay, and the Pacific Ocean. The Standards apply to in-water repair and maintenance activities for existing facilities conducted by the District under its USACE Regional General Permit No. 72, but would not be applied to construction of new facilities. This includes limitations on pile jetting to minimize sediment displacement, use of silt curtains, and limitations on pile driving activity. A Summary of the District's Standards is available online at: <https://pantheonstorage.blob.core.windows.net/ceqa/2019-057-CatDet.pdf>. More detailed information is available in the District's June 18, 2019, Staff Report (Item 18) and attachments thereto, which are available online at: <https://portofsandiego.legistar.com/LegislationDetail.aspx?ID=3984328&GUID=FF187847-E9BC-4D2A-9C55-ACD0F0DE6812> [see Attachments A and C]).

Water Quality Regulations

In addition to the regulations discussed above, there are several water quality regulations and laws that pertain to reasonably foreseeable future development projects, which would have co-benefits related to the prevention of hazardous material spills. Because these regulations are specific to water quality, more detail is provided in Section 4.8. Other regulations include but are not limited to the requirements set forth by the SWRCB Construction General Permit, RWQCB Municipal Stormwater Permit, the District's Jurisdictional Runoff Management Program (JRMP) and *BMP Design Manual*, District Code Article 10, District Ordinance No. 2681 (In-Water Hull Cleaning

Regulations, and the Temporary Groundwater Extractions Permit), all of which are discussed in detail in Section 4.8.

4.7.4 Project Impact Analysis

4.7.4.1 Methodology

The following impact analysis evaluates the potential effects on hazards and hazardous materials that could occur from future development under the proposed PMPU. The methodology considers the existing hazardous conditions established above in order to determine the PMPU's potential to create or exacerbate a hazardous condition.

The impact analysis is organized first by identifying any policies or standards proposed in the PMPU that would assist with avoiding, eliminating, or reducing any impact associated with hazards and hazardous materials. The analysis then considers the potential hazards and hazardous materials impacts from the reasonably foreseeable future projects that could be constructed and operated consistent with the proposed PMPU's water and land uses. Finally, the analysis also considers any policies or standards that may cause or contribute to any related hazards and hazardous materials impact.

To avoid redundancy in the analysis and present a concise discussion, the analysis discusses the planning districts collectively, as appropriate. In the event that a planning district has unique or special existing conditions and/or may result in one or more unique significant impacts with mitigation specific to that planning district, the analysis presents a separate discussion of that planning district.

4.7.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines and provide the basis for determining significance of impacts associated with hazards and hazardous materials resulting from the implementation of the PMPU. The determination of whether a hazards and/or hazardous materials impact would be significant is based on the thresholds described below and the professional judgment of the District as Lead Agency, based on the evidence in the administrative record.

Impacts are considered significant if the project would result in any of the following.

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?
3. Emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?
4. Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

5. Be located within an airport land use plan area or, where such a plan has not been adopted, be within two miles of a public airport or public use airport, and result in a safety hazard or excessive noise for people residing or working in the project area?
6. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
7. Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including in areas where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

As discussed in Section VIII of the Initial Study prepared for the proposed PMPU (Appendix A), Threshold 7 is not included in the analysis below, as it was determined that the PMPU would not result in significant impacts related to increasing the risk of wildfires. The conclusion and the supporting rationale are summarized in Chapter 5, *Additional Consequences of PMPU Implementation*. Therefore, only Thresholds 1 through 6 are discussed in the following impact analysis.

4.7.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to reduce or avoid impacts associated with hazards and hazardous materials and are considered in the impact analysis that follows.

ECO Policy 2.2.1 The District shall prioritize and pursue opportunities for the protection and enhancement of sediment quality.

ECO Policy 2.2.2 Remediation and restoration efforts shall be implemented in a manner that maximizes ecological benefits, including water quality, ecosystems, and the public use of Tidelands consistent with the Port Act.

ECO Policy 2.2.3 Development shall not result in degradation beyond regulatory or legal limits for fill, soil, and sediment quality and shall minimize exposure of adjacent communities to fill, soil, and sediment-based environmental contamination. Also, refer to ECO Policy 2.3.3.

ECO Policy 2.3.3 ~~WhereIn the event proposed~~ development disrupts shoreline fill or Bay sediment, ~~itthe development project~~ shall remove ~~the~~ contaminated fill or appropriately contain and remediate the fill in a manner consistent with applicable requirements.

ECO Policy 2.3.4 Permittees shall implement measures to prevent pollution impacts and adverse impacts from runoff flows from all development and maintenance activities.

SR Policy 1.1.7 Development within an Airport Land Use Compatibility Plan (ALUCP) defined safety compatibility zone shall be sited and designed to minimize the risk of personal injury to people and damage to property in the air and on the ground, consistent with ALUCP requirements.

SR Policy 1.1.8 The District shall:

- a. Restrict development of any project that would cause hazards to air navigation located within airport approach and departure areas or known flight patterns within the applicable Airport Influence Area (AIA), and

- b. Restrict future uses that may impact airport operations or not meet State or federal aviation standards, including the introduction of new incompatible uses within Runway Protection Zones (RPZs).

SR Policy 1.1.9 Permittees shall coordinate as appropriate, with the Federal Aviation Administration on proposed developments (structures and temporary equipment) that meet the notification criteria as defined by Code of Federal Regulations Title 14, Part 77.

SR Policy 2.1.1 The District shall maintain and direct its permittees to maintain emergency disaster mitigation, preparation, response, and recovery capabilities.

SR Policy 2.1.2 The District shall maintain emergency response and recovery processes and plans and periodically update these processes and plans, as appropriate, in preparation for future hazard conditions.

SR Policy 2.1.3 The District shall coordinate with regional, State, and federal partners to create, maintain, and update the District's emergency operations plan, as needed.

SR Policy 2.1.4 The District shall maintain a hazard mitigation plan to help identify and respond to risks associated with natural and human-caused hazards. Such a plan may be a District-wide plan, a series of site-specific plans, or part of a regional plan.

SR Policy 2.1.5 The District shall periodically update the Tidelands' hazard mitigation plan with best available science-guided information.

SR Policy 2.1.6 The District shall engage with adjacent jurisdictions, regional, State, federal partners, and private businesses during emergencies and catastrophic events for effective response and recovery.

SR Policy 2.1.7 The District shall coordinate with federal agencies and marine terminal tenants and operators to establish readiness for terminal facility sharing to support strategic Department of Defense needs and requirements.

4.7.4.4 Project Impacts and Mitigation Measures

Threshold 1: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Impact Analysis

As described under Section 4.7.3, there are numerous Federal and State laws and regulations that govern the safe handling, storage, transport, and disposal of hazardous materials and waste, and several Federal, State, and local agencies that provide enforcement.

- The Federal Toxic Substances Control Act/Resource Conservation and Recovery Act/Hazardous and Solid Waste Act regulates the generation, transport, treatment, storage, and disposal of hazardous waste. These Federal acts are enforced by the EPA.
- The Department of Transportation Hazardous Materials Regulations (49 CFR 100–185) cover all aspects of hazardous materials packaging, handling, and transportation. Parts 107 (Hazard Materials Program), 130 (Oil Spill Prevention and Response), 172 (Emergency Response),

173 (Packaging Requirements), 177 (Highway Transportation), 178 (Packaging Specifications), and 180 (Packaging Maintenance) would all apply to goods movement to and from the planning areas. Provide required procedures for the transport of hazardous materials as well as policies for the reporting and response of emergency spills or releases.

- CERCLA establishes prohibitions and requirements concerning closed and abandoned hazardous waste sites. CERCLA provides the Federal set of regulations to respond to releases and threatened release of hazardous substances, and the long-term remediation of polluted properties, and is enforced by the EPA.
- The Spill Prevention Control and Countermeasure Plans (40 CFR 112.7) ensure that facilities implement containment and other countermeasures that would prevent oil spills from reaching navigable waters. Facilities that meet the following criteria would be required to prepare and implement a SPCC Plan:
 - Facilities that store, transfer, use or consume oil or oil products, such as diesel fuel, gasoline, lube oil, hydraulic oil, adjuvant oil, crop oil, vegetable oil or animal fat; and
 - Facilities that store more than 1,320 U.S. gallons in total of all aboveground containers (only count containers with 55 gallons or greater storage capacity) or more than 42,000 gallons in completely buried containers; and
 - Facilities that could reasonably be expected to discharge oil to navigable waters of the U.S. or adjoining shorelines, such as lakes, rivers and streams.
- Existing facilities in the proposed PMPU area and reasonably foreseeable future projects that would involve facilities that meet these criteria would be subject to the SPCC Plans, which minimize the risk of potential spills, as well as control a spill should one occur. The County DEH is responsible for enforcement of SPCCs. The U.S. Coast Guard 33 CFR and 46 CFR provides the USCG the authority to inspect vessels, ensure marine terminal operations safety, coordinate Federal responses to marine emergencies, enforce marine pollution statutes, ensure marine safety (such as navigation aids), and operate the National Response Center for spill response. Oil spills must be reported to the U.S. Coast Guard National Response Center and EPA pursuant to the CWA (40 CFR 110), and the U.S. Coast Guard enforces spill response procedures and standards.
- The Emergency Planning and Community Right-To-Know Act (42 USC 11001 et seq.), enforced by the EPA, establishes, among other things, requirements for emergency release notification, chemical inventory reporting, and toxic release inventories for facilities that handle chemicals.
- The OSHA of 1970 provides regulations that define safe standards have been developed for general industry, construction, maritime, recordkeeping, and agriculture to ensure the safe and healthful working conditions for working men and women. OSHA is enforced by the Occupational Safety and Health Administration, which is part of the United States Department of Labor.
- The Cortese List (California Government Code 65962.5) includes hazardous waste facilities and sites listed by DTSC, Department of Health Services lists of contaminated drinking water wells, sites listed by the SWRCB as having underground storage tank leaks or a discharge of hazardous wastes or materials into the water or groundwater, and lists from local regulatory agencies of sites with a known migration of hazardous waste/material.

- California Health and Safety Code (Hazardous Waste Control Act) provides for the development of a State hazardous waste program that administers and implements the provisions of the Federal RCRA for a cradle-to-grave waste management system in California. It also provides for the designation of California-only hazardous waste and development of standards that are equal to or, in some cases, more stringent than Federal requirements, such as mandating source-reduction planning and regulating the number of types of waste and waste management activities that are not covered by Federal law with the RCRA. The associated regulations and programs are enforced by the local CUPA (i.e., San Diego County DEH HMD).
- The Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (California Health and Safety Code, Chapter 6.11, Sections 25404–25404.9) serves to consolidate, coordinate, and make consistent the administrative requirements, permits, inspections, and enforcement activities of the environmental and emergency response programs and provides authority to the local CUPA (i.e., San Diego County DEH HMD). The DEH HMD is responsible for overseeing SPCC Plans, the California Accidental Release Prevention Program, Hazardous Materials Business Plans and Inventory Statements, Hazardous Waste Generator Program, Tiered Permitting Program, and the Underground Storage Tank Program. See *San Diego County Code, Title 6, Division 8*, as well.
- Environmental Health Standards for the Management of Hazardous Waste (California Code of Regulations, Title 22, Division 4.5, Section 66001 et seq.) establish requirements for the management and disposal of hazardous waste in accordance with the provisions of the State Hazardous Waste Control Act and Federal RCRA. These standards are enforced by the Local CUPA (i.e., San Diego County DEH HMD).
- California Code of Regulations, Title 8—Industrial Relations includes regulations pertaining to hazard control (including administrative and engineering controls), hazardous chemical labeling and training requirements, hazardous exposure prevention, hazardous material management, and hazardous waste operations. Moreover, this regulation provides requirements for the removal and disposal of ACMs and LBP to ensure their safe removal and disposal. The DTSC within the California Environmental Protection Agency is responsible for enforcement of regulations pertaining to hazard management and control.
- California Labor Code (Division 5, Parts 1 and 7) regulations ensure appropriate training regarding the use and handling of hazardous materials and the operation of equipment and machines that use, store, transport, or dispose of hazardous materials. Labor laws are enforced by Cal/OSHA.
- California Water Code (Division 7) authorizes the San Diego RWQCB to regulate the investigation and cleanup of polluted sites.
- Title 22, Division 4.5 of the CCR authorizes DTSC oversight of contaminated sites and hazardous materials facilities.

In addition, there are several water quality regulations and laws that pertain to reasonably foreseeable future development projects, which would have co-benefits related to the prevention of hazardous material spills. Because these regulations are specific to water quality, more detail is provided in Section 4.8. Other regulations include, but are not limited to, the requirements set forth by the SWRCB Construction General Permit, RWQCB Municipal Stormwater Permit, the District's JRMP and *BMP Design Manual*, District Code Article 10, and the Temporary Groundwater Extractions Permit.

Construction

The proposed PMPU serves as a long-term planning blueprint for future development within the proposed PMPU area. Future development currently anticipated in the planned improvements or each planning district's Vision, as well as development consistent with the water or land use designation for a proposed development site, as described in Table 3-2, may occur. Construction activities for future PMPU-related development would involve the temporary use of common hazardous materials such as petroleum-based substances (cleaners, solvents, fuels, lubricants, and oils), as well as metals and other construction materials. Generally, standard construction materials do not include acutely hazardous materials, and inadvertent releases of hazardous materials on construction sites are typically localized and would be cleaned up in a timely manner. The transport, use, and disposal of construction-related hazardous materials would be required to comply with applicable regulations, as described above, such as the RCRA (40 CFR 260-299), DOT Hazardous Materials Regulations (49 CFR 100-185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, the transport, use, and disposal of such materials would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH. Further, potential releases of hazardous substances during construction would be addressed through the EPCRA, which is administered in California by the State Emergency Response Commission (SERC), the Hazardous Material Release Response Plans and Inventory Law, and the California Hazardous Waste Control Law, which would govern proper containment, spill control, and disposal of hazardous waste generated during construction. Construction BMPs would be implemented as part of a Stormwater Pollution Prevention Plan (SWPPP) as required by the statewide NPDES General Permit for Construction Activities for sites disturbing 1 acre or more. Required construction BMPs are designed to reduce potential adverse effects on the general public and the environment. The SWPPP includes measures to eliminate or reduce pollutant discharges and describes the implementation of BMPs to control stormwater and other runoff during construction. BMPs include, but are not limited to:

- Control erosion and sedimentation associated with construction-related surface disturbance.
- Establish a dedicated area for fuel storage and refueling activities that includes secondary containment protection measures and spill control supplies.
- Follow manufacturer's recommendations on use, storage and disposal of chemical products used in construction.
- Avoid overtopping construction equipment fuel gas tanks.
- During routine maintenance of construction equipment, properly contain and remove grease and oils.
- Properly dispose of discarded containers of fuels and other chemicals.

Requirements of the General Permit for Construction Activities also include the preparation of a spill prevention and response plan which is incorporated into the SWPPP. The spill prevention and response plan includes BMPs to reduce chances of spills, and to catch spills as soon as they happen, and procedures to stop and clean-up spills correctly. BMPs could include, but are not limited to, use secondary containment for storage of liquid materials, use correct labels for all materials, use catch basin filtration, and/or stockpile spill cleanup materials near storage area for hazardous materials.

These regulations, and the oversight provided by the local CUPA (County DEH), the USCG, the San Diego RWQCB, DTSC, California Highway Patrol, and Caltrans, given authority under these

aforementioned regulations, would prevent or minimize potential impacts related to hazards to the public or the environment through the routine transport, use, storage, or disposal of hazardous materials. Therefore, impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board of Port Commissioners (Board) may choose one or more of the three options within PD3, the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this Program Environmental Impact Report (PEIR). A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the routine transport, use, or disposal of hazardous materials.

Construction activities associated with the new Waterfront Destination Park would involve the use of hazardous materials typically used for construction, including petroleum-based substances (cleaners, solvents, fuels, lubricants, and oils), as well as metals and other construction materials. However, the use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their use, transport, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during transport, use and disposal. Thus, construction under Option 1 would not result in any additional impacts related to the routine transport, use, or disposal of hazardous materials during construction than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the routine transport, use, or disposal of hazardous materials.

Construction activities associated with the expanded Lane Field Setback Park would involve the use of hazardous materials typically used for construction, including petroleum-based substances (cleaners, solvents, fuels, lubricants, and oils), as well as metals and other construction materials. However, the use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their use,

transport, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during transport, use and disposal. Thus, construction under Option 2 would not result in any additional impacts related to the routine transport, use, or disposal of hazardous materials during construction than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the routine transport, use, or disposal of hazardous materials.

Construction activities associated with the new park space that could be developed under Option 3 would involve the use of hazardous materials typically used for construction, including petroleum-based substances (cleaners, solvents, fuels, lubricants, and oils), as well as metals and other construction materials. However, the use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their use, transport, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during transport, use and disposal. Thus, construction under Option 3 would not result in any additional impacts related to the routine transport, use, or disposal of hazardous materials during construction than buildout of the proposed PMPU without Option 3.

Operation

The proposed PMPU serves as a long-term planning blueprint for future development within the proposed PMPU area. Future development currently anticipated in the planned improvements or each planning district's Vision, as well as development consistent with the water or land use designation for the proposed development site, as described in Table 3-2, may occur. The operation of future development consistent with these water and land uses would use common hazardous materials, such as petroleum-based substances for mechanical and motorized equipment, vessels, and vehicles; and solvents, lubricants, and cleaners for facility maintenance. The transport, storage, use, and disposal of these hazardous materials would be regulated by the applicable oversight agencies and regulations, including the local CUPA (County DEH), DOT Hazardous Materials Regulations, DTSC, USCG, San Diego RWQCB, California Highway Patrol, and Caltrans.

The PMPU area includes marinas, marine terminals, and other commercial and recreational uses that require the use of petroleum-based substances and other common hazardous materials. Based on the HMTS, there are 48 RCRA – Large Quantity Generators (LQGs), which generate, transport, store, treat, and/or dispose of over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month, located within the 1/16-mile radius from each PMPU planning district boundary; and 86 RCRA – Small Quantity Generators (SQGs), which generate between 100 kg and 1,000 kg of hazardous waste per month located within the 1/16-mile radius from each PMPU planning district boundary. ~~Additionally, PD4 is unique in that it is dominated by industrial uses, including ship building and repair, and a marine cargo terminal (i.e., TAMT). These land uses would~~

~~result in the use of common types of hazardous materials (e.g., fuel, cleaning products and solvents, paints, oils, fuel, and grease associated with equipment operation and maintenance). Based on the findings of the HMTS, there are 31 facilities in PD4 that are listed on the RCRA databases, which identify Large Quantity Generators, Small Quantity Generators, Conditionally Exempt Small Quantity Generators, and Non-Generators/No Longer Regulations facilities, as defined by 40 CFR 261. Hazardous waste types regulated by the RCRA that could be found at these facilities could include, but are not limited to, waste oil, paint, or PCB-contaminated materials. Proposed water and land uses for PD4 would allow for the continued operation of the existing marine terminal uses, which may result in the use and transport of hazardous materials, including but not limited to those listed above, and in the generation of hazardous waste.~~

Planning District 4 encompasses the TAMT, which handles a variety of cargo types such as dry bulk, liquid bulk, refrigerated containers, and multi-purpose general cargo, as well as maritime industrial businesses. Some types of cargo handled at and transported through, or materials used at, TAMT may be considered a hazardous material (such as petroleum-based fuels and lubricants, refrigerants, and other chemicals). As described further in Chapter 1, *Introduction*, of this PEIR, the District prepared the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR (UPD# EIR-2015-39; SCH# 2015-031046), which analyzed infrastructure improvements to accommodate an increase in the terminal's capabilities and throughput capacity through 2035. The Final EIR (FEIR) was certified by the Board of Port Commissioners in December 2016 and is incorporated by reference within this PEIR (District 2016).

Additionally, PD4 is unique in that it is dominated by industrial uses, including ship building and repair, and a marine cargo terminal (i.e., TAMT). These land uses would result in the use of common types of hazardous materials (e.g., fuel, cleaning products and solvents, paints, oils, fuel, and grease associated with equipment operation and maintenance). Based on the findings of the HMTS, there are 31 facilities in PD4 that are listed on the RCRA databases, which identify Large Quantity Generators, Small Quantity Generators, Conditionally Exempt Small Quantity Generators, and Non-Generators/No Longer Regulations facilities, as defined by 40 CFR 261. Hazardous waste types regulated by the RCRA that could be found at these facilities could include, but are not limited to, waste oil, paint, or PCB-contaminated materials. Proposed water and land uses for PD4 would allow for the continued operation of the existing marine terminal uses, which may result in the use and transport of hazardous materials, including but not limited to those listed above, and in the generation of hazardous waste.

The PMPU does not propose any changes to the maximum sustainable throughput capacity identified in the certified TAMT EIR, which totaled 4,675,567 metric tons of annual throughput at buildout of the TAMT Redevelopment Plan (i.e., 2035). While no operational changes are proposed at the terminal, the proposed PMPU would allow for operations to continue at TAMT through the PMPU planning horizon of 2050, effectively extending the life of the TAMT Redevelopment Plan an additional 15 years. Therefore, because PD4 is almost entirely built out or, in the case of TAMT, currently has a modernization plan to increase throughput to the maximum sustainable capacity and has established mitigation measures in the certified TAMT EIR, the PMPU proposed water and land use designations would not result in substantial development in this planning district. Potential development is primarily focused on improving the efficiency of operations at both TAMT (consistent with the TAMT Redevelopment Plan) and the shipyards by upgrading existing facilities and infrastructure.

Storage, use, transport, and disposal of hazardous materials would continue to be required to comply with Federal, State, and local regulations, as discussed in this section. Specific examples include regulations (e.g., 40 CFR 112.7) that require that the onsite facilities implement containment and other countermeasures that would prevent oil spills from reaching navigable waters as well as the creation and maintenance of Risk Management Plans and Hazardous Materials Business Plans (i.e., California Health and Safety Code Chapter 6.11, Sections 25404–25404.9). Compliance with these regulations and the others described in this impact analysis section (i.e., RCRA, DOT Hazardous Materials Regulations, CERCLA, CWA, DTSC regulations, and local CUPA regulations), both at the shipyards and TAMT, require hazardous materials to be stored properly and any accidental spills to be promptly cleaned up based on the mandatory hazardous plans.

In summary, the proposed water and land uses would allow future development that would, in many cases, involve the use of commonly used hazardous materials, such as cleaners, solvents, fuels, oils, or lubricants, for normal cleaning and maintenance activities of facilities, equipment, vessels, and vehicles. In addition, some of the primary and secondary uses, such as Marine Terminal and Maritime Services and Industrial would store, use, and/or transport hazardous materials regularly. As referenced in Section 4.7.3, the transport, storage, use, and disposal of hazardous materials and waste is regulated by the DOT, DTSC, USCG, and County DEH. Compliance with the existing laws and regulations would reduce potential hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials to a less-than-significant level. Compliance with regulations associated with the transport of hazardous materials including but not limited to DOT Hazardous Materials Regulations would reduce potential risks associated with the transport and delivery of hazardous materials during operation. Compliance with the SPCC Plans would minimize the risk potential oil spills reaching navigable waters at facilities such as shipyards and marinas. OSHA regulations (29 CFR 1910 Subpart H) would reduce the potential impacts on workers while handling hazardous materials by requiring training for workers, as well as protective measures that must be implemented at the workplace. California Health and Safety Code, Chapter 6.11, Sections 25404–25404.9 authorize the County DEH as the local CUPA, which enforces the Hazardous Waste Generator Program, Tiered Permitting Program, and the Underground Storage Tank Program for all qualified facilities. Compliance with Title 8 and Title 22 of the CCR would ensure the adherence to management requirements established for the proper management and disposal of hazardous materials. Because compliance with these existing regulations is mandatory and there are oversight steps in place provided by the appropriate regulatory agencies, including permitting and inspection by various hazardous materials regulatory agencies (i.e., DOT, DTSC, USCG, County DEH, San Diego RWQCB, California Highway Patrol, and Caltrans), impacts would be less than significant, and no mitigation is required.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the routine transport, use, or disposal of hazardous materials.

Operational activities associated with the new Waterfront Destination Park may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 1 would not include the storage of hazardous materials as it would be a recreational space. The use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; California Labor Code Division 5, Parts 1 and 7; and OSHA regulations (29 CFR 1910 Subpart H). Also, their use, transport, and disposal would be subject to regulatory agency oversight and inspection by County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during routine transport, use, and disposal. Thus, operation of Option 1 would not result in any additional impacts related to the routine transport, use, or disposal of hazardous materials than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the routine transport, use, or disposal of hazardous materials.

Operational activities associated with the expanded Lane Field Setback Park may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 2 would not include the storage of hazardous materials as it would be a recreational space. The use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; California Labor Code Division 5, Parts 1 and 7; and OSHA regulations (29 CFR 1910 Subpart H). Also, their use, transport, and disposal would be subject to regulatory agency oversight and inspection by County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during routine transport, use, and disposal. Thus, operation of Option 2 would not result in any additional impacts related to the routine transport, use, or disposal of hazardous materials than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the routine transport, use, or disposal of hazardous materials.

Operational activities associated with the new park space that could be developed under Option 3 may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 3 would not include the storage of hazardous materials as it would be a recreational space. The use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts

260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; California Labor Code Division 5, Parts 1 and 7; and OSHA regulations (29 CFR 1910 Subpart H). Also, their use, transport, and disposal would be subject to regulatory agency oversight and inspection by County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during routine transport, use, and disposal. Thus, operation of Option 3 would not result in any additional impacts related to the routine transport, use, or disposal of hazardous materials than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in significant impacts related to the potential release of hazardous materials during routine use, transport, and disposal. The proposed PMPU policies listed in Section 4.7.4.3. would reduce impacts on the environment or adjacent communities from potential degradation from pollution or environmental contamination related to development. The policies outline initiatives that would be implemented by the District to reduce the release of pollutants, as well as requirements for project proponents that would be implemented during development.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not create a significant hazard to the public or the environment through the routine transport, storage, use, or disposal of hazardous materials because future development would be required to comply with the mandatory existing laws and regulations that govern the transport, storage, use, and disposal of hazardous materials. Impacts would be less than significant.

Threshold 2: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Impact Analysis

As discussed under Threshold 1, there are numerous hazardous materials and hazardous waste laws and regulations that apply to development projects within the proposed PMPU area. Specifically, the DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107 (Hazard Materials Program), 130 (Oil Spill Prevention and Response), 172 (Emergency Response), 173 (Packaging Requirements), 177 (Highway Transportation), 178 (Packaging Specifications), and 180 (Packaging Maintenance) would reduce impacts associated with transportation of hazardous materials. The SPCC plan (40 CFR 112.7) enforced by County DEH would reduce impacts associated with spills of fuel or oil to navigable waters. OSHA would reduce impacts related to workers' exposure to hazardous materials at the workplace. Title 8 and Title 22 of the CCR would reduce potential impacts related to the handling of hazardous materials and management of hazardous materials facilities, as well as the testing, abatement, and disposal of ACMs and LBP. For detailed explanations of the applicable regulations, see Section 4.7.3 above.

Construction

The proposed PMPU serves as a long-term planning blueprint for future development within the proposed PMPU area. Future development currently anticipated in the planned improvements or each planning district's Vision, as well as development consistent with the water or land use designation for a proposed development site, as described in Table 3-2, may occur. The construction of future development, in the absence of regulatory oversight, has the potential to result in upset or accident conditions involving the release of hazardous materials during the use or transport of such materials (also analyzed in Threshold 1), or to encounter contaminated soil, groundwater, and/or sediment, and result in upset or accident conditions involving the release of these hazardous materials (also analyzed in Threshold 4 below). As such, an analysis of the potential construction impacts from future development and from the implementation of the proposed policies and planning district standards is provided below.

Encountering Existing Contaminated Material

The HMTS (Appendix G) prepared for the proposed PMPU provides a review of the environmental database search conducted by EDR, which included Federal, State, and local environmental databases that identify and provide status updates on sites that contain or have released contaminants into the soil, sediments, or groundwater. The environmental database search encompassed a 1/16-mile radius of the proposed PMPU area to identify unauthorized releases to soil, sediment, and/or groundwater on or adjacent to each planning district. The search radius was determined in order to identify the cases within the proposed PMPU area as well as offsite properties that would have the greatest potential impact on the planning districts at this programmatic level of analysis (i.e., within 1/16 mile or 330 feet of the boundary of the planning districts). This does not preclude the possibility for cases outside of the database search radius to potentially impact a future project within the proposed PMPU area. However, these additional sites would be evaluated during project-specific environmental review. As discussed in Section 4.7.2.2, *Known Contamination within the PMPU Planning Area*, PD1 through PD4 currently have open cases either undergoing investigation or requiring further evaluation (i.e., cases identified as "needs evaluation"). The presence of open cases in each of these planning districts indicates that hazardous materials may be on site, and it is possible future projects could encounter contaminated soil, groundwater, and/or sediment. Note that because there are no open cases present within PD7, PD8, PD9, or PD10, these planning districts are not specifically discussed further in the analysis of known existing contaminated materials for this threshold. Closed cases were also identified throughout the proposed PMPU area, which had been closed by the overseeing agencies when remediation was deemed complete. These closed cases are discussed under *Encountering Undocumented Contaminated Media* below. Further discussion regarding the potential to encounter previously unidentified contaminated media can be found in that subsection.

Future development consistent with the proposed water and land uses in PD1, PD2, PD3, and PD4 could result in soil, sediment, and/or ground and sediment disturbance that would have the potential to encounter the known contamination areas. Furthermore, future development may be planned adjacent or close to areas of known contamination and may be close enough to have the potential to encounter suspected soil, water, or sediment contamination. Proposed PMPU policies would prevent the degradation of sediment and minimize exposure of adjacent communities to fill, soil, and sediment-based environmental contamination, and would require development to abate contamination in the Bay and along the shoreline to prevent further degradation of habitat or water quality due to historic or current contamination. As such, these policies would avoid or reduce

impacts associated with the exposure or release of hazardous materials to the public or the environment by ensuring any contaminated sediment encountered during development would be remediated, removed, or otherwise stabilized under the oversight of RWQCB.

In addition to these proposed PMPU policies, the existing regulatory framework would provide requirements and measures to prevent accidental release of contaminated media, and protocols in the event of an accidental release. The DTSC, RWQCB, and County DEH are the regulatory agencies that oversee the management and cleanup of sites identified as containing hazardous materials that could impact environmental or public health should those materials be released through upset or accident conditions. The DTSC, under Cal/EPA, oversees the evaluation and abatement of contaminated properties, and regulates the activities of hazardous waste facilities. The San Diego RWQCB is authorized to operate the Site Cleanup Program (SCP) by Division 7 of the California Water Code. The San Diego RWQCB's SCP regulates investigation and cleanup of polluted sites where recent or historic releases of hazardous materials have occurred. The County DEH oversees UST facilities, including UST releases, as well as operates the VAP, which provides review and approval of projects on properties contaminated with hazardous substances. Additionally, the County DEH manages the Site Assessment and Mitigation (SAM) Program, which provides oversight of all assessment and cleanups in San Diego County in accordance with the California Health and Safety Code.

However, due to the programmatic nature of the proposed PMPU, site-specific conditions are not known at this time and historical contamination could have migrated or changed, or existing sites may require further evaluation once future projects are proposed. Generally, properties with open unauthorized release cases within 300 feet have the greatest potential to adversely impact a site via groundwater. Sites with soil vapor contamination due to a petroleum plume or chlorinated hydrocarbon plume would have the greatest potential to adversely impact a site within approximately 30 feet and 100 feet, respectively. In addition, there is the potential of accidental spill or release when handling of contaminated media during excavation, removal, or remediation. Therefore, future projects involving ground disturbance could encounter hazardous materials, the handling of which could result in an accidental release of contamination. Consequently, the disturbance of contaminated soils, groundwater, and/or sediment during the construction or operation of future development could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Thus, impacts are considered significant (**Impact-HAZ-1**), and mitigation is proposed to ensure that ground-disturbing activities for future development would not encounter contaminated media and potentially result in the release of hazardous materials.

It should be noted that all future development projects would be required to undergo project review for CEQA compliance prior to their approval and construction. As part of the project review, any future development projects that include ground-disturbing activities within 300 feet of a known open case or documented contamination plume, or 150 feet from a closed case listed above, included in the HMTS, or documented since on a hazardous materials database, would be required to implement **MM-HAZ-1**. Mitigation measure **MM-HAZ-1** would apply to open cases or documented contamination plumes within 300 feet because these are the cases that have the greatest potential to adversely impact a site via groundwater. A large release could occur over 300 feet from the future development project site, but the documented contamination plume could migrate to within 300 feet of the site, and adversely impact groundwater at the site. Additionally, standard industry practice for cases involving soil vapor uses a vapor encroachment screening

matrix search distance test that specifies a distance of 30 feet from the edge of a petroleum plume and 100 feet from the edge of a chlorinated hydrocarbon plume. Both of these release types would be covered using the 300-foot distance for open cases and 150-foot distance for closed cases. Mitigation measure **MM-HAZ-1** would require a future project proponent to conduct site-specific due diligence through the completion of a desktop investigation and/or the preparation of a Phase I Environmental Site Assessment (ESA), and if recommended by the Phase I ESA, a Phase II ESA. In addition, for future development projects on properties with documented or suspected (based on historic uses of the site) soil, groundwater, and/or sediment contamination that would involve soil excavation, grading, or other subsurface disturbance, preparation and implementation of a soil, groundwater, and/or sediment management plan would be required. If previous remediation activities have occurred on the site, this would be taken into consideration when preparing the soil, groundwater, and/or sediment management plan. Additionally, if excess soil is generated as a result of excavation or grading for future PMPU-related development, the soil would require chemical characterization to determine the presence and/or extent of contamination by a qualified environmental professional prior to reuse, export, or disposal. If excavated soil is determined to be appropriate for reuse, it may be reused onsite or transported to another site for reuse. If soils are identified for disposal, they must be disposed of at a landfill or facility permitted to accept hazardous waste or materials.

Moreover, future development at the TAMT within PD4 that is consistent with the TAMT Redevelopment Plan, the environmental effects of which were analyzed, and their significance determined, in the TAMT EIR would still be required to implement the Mitigation Monitoring and Reporting Program (MMRP) associated with the TAMT EIR.

With the implementation of mitigation, the potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment would be minimized, and the related impact would be reduced to a less-than-significant level.

Encountering Undocumented Hazardous Materials

Many future projects that may be constructed under the proposed PMPU would result in ground-disturbing construction activities. Given the potential contamination from historical uses, which include past industrial and commercial uses as well as dumping sites, these ground-disturbing activities could occur in areas where there are no known open cases but contaminated media may be present nonetheless. As such, undocumented contaminated media could be disturbed or brought to the surface and could create a significant hazard to the public or the environment through reasonably foreseeable upset and accidental conditions involving the release of potentially hazardous materials.

The DTSC, RWQCB, and County DEH must be consulted if previously unknown contaminants are encountered. The San Diego RWQCB's SCP regulates investigation and cleanup of polluted sites where recent or historic releases of hazardous materials have occurred. The County DEH oversees UST facilities, including UST releases, as well as operates the VAP, which provides review and approval of projects on properties contaminated with hazardous substances. The County DEH also manages the SAM Program, which provides oversight of all assessment and cleanups in San Diego County in accordance with the California Health and Safety Code. Additionally, all workers on site exposed to hazardous substances must be trained according to OSHA standards, specifically Standard 1910 Subpart H, 1910.120I(1).

Proposed PMPU ECO Policy 2.2.3 and ECO Policy 2.3.3 have the potential to reduce impacts related to contaminated media that create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions. However, due to the general nature of these policies, they do not ensure that a significant impact would be avoided.

Future development that would occur consistent with the proposed PMPU may encounter contaminated media during construction that is presently not documented on a database or record search, and therefore was not anticipated. Unknowingly disturbing the contaminated soil, groundwater, or sediment would potentially result in an upset and accident condition involving the release of hazardous materials into the environment. Therefore, impacts are considered significant (**Impact-HAZ-2**). As such, mitigation is proposed to ensure that any historic or previously undiscovered and/or unknown contamination encountered during reasonably foreseeable construction activities is identified so that it may be properly handled, managed, and disposed of in accordance with existing local, State, and Federal regulations and laws (**MM-HAZ-1** and **MM-HAZ-2**).

Encountering Asbestos-Containing Materials, Polychlorinated Biphenyls, Lead-Based Paint, and Organochlorine Pesticides

Future development associated with the proposed PMPU may require the demolition of structures or buildings built before 1980. Such buildings were often constructed with ACMs, asbestos-containing construction materials (ACCMs), and lead-containing surfaces (i.e., LBP). The demolition of such buildings could release these materials to the air or environment and result in adverse effects if proper measures are not implemented. However, demolition or grading activities would be required to comply with CCR Title 8, Industrial Relations, which provides specific requirements for removal and disposal of ACM, and lead-containing surfaces. These requirements include preconstruction surveys for the presence of ACMs and lead-containing surfaces that would need to be conducted by California Department of Public Health Certified Lead Inspector/Assessors and California Division of Occupational Safety and Health Certified Asbestos Consultants. As such, compliance would ensure that removal of any ACM and/or lead-containing surfaces would be conducted in a safe manner, including proper disposal in an approved facility. Therefore, impacts are considered less than significant related to ACM and lead-containing surfaces.

Fluorescent lighting ballasts manufactured prior to 1978, and electrical transformers, capacitors, and generators manufactured prior to 1977, may contain PCBs, which were also found in other products such as caulking, paint, and adhesives from approximately 1950 to 1979. They are human-made organic chemicals that have been demonstrated to cause a variety of adverse health effects. In accordance with the Toxic Substances Control Act (15 USC 2601 et seq.) and other Federal and State regulations, future project proponents would be required to properly handle and dispose of electrical equipment (electric transformers, capacitors, and generators), PCB-containing building materials such as paint and caulking, and lighting ballasts that contain PCBs, ensuring that impacts would be less than significant.

In addition to the presence of lead in the buildings themselves, lead can also be present in the soil surrounding the building. Concentrations of lead in the soil can be above acceptable levels at the dripline (the edge of the roof where rain water might drip off) of an older structure (pre-1980s) because lead used in building materials or paint may have leached from paint and other substances and contaminated the soil surrounding the structure. In addition, organochlorine pesticides, often used historically as termiticides for wooden structures, may be present in the soil surrounding existing or historic structures. Hazardous materials could be encountered in the soil during ground-

disturbing construction activities at the location of older structures currently or formerly present on the development site, and potentially released into the environment. Therefore, impacts are considered significant (**Impact-HAZ-3**). As such, mitigation is required to ensure that any lead- or pesticide-contaminated soils are not released into the environment during future PMPU-related construction activities (**MM-HAZ-1** and **MM-HAZ-2**). These mitigation measures apply to any soil disturbance within the immediate area of a building built prior to 1980.

Construction Impact Analysis Summary

Open cases currently undergoing investigation or requiring further evaluation are present in PD1, PD2, PD3, and PD4. These ongoing investigations are evaluating and remediating primarily historic and current contaminated sediments on the Bay floor, and impacted soils and groundwater due to releases of contaminants (primarily gasoline, diesel, other fuels, and heavy metals) to the ground surface landside. Future development consistent with the proposed PMPU, as described in Table 3-2, may occur. The presence of contaminated media in PD1, PD2, PD3, and PD4 in areas that may experience soil, sediment, or groundwater disturbance during reasonably foreseeable project construction could expose workers, the public, or the environment to unsafe levels of contaminants. (**Impact-HAZ-1**). The remaining planning districts do not have documented sites currently undergoing remediation or investigation and, therefore, would have a reduced risk of encountering contaminated material during construction (see **Impact-HAZ-2** below). Future development that would disturb known or suspected impacted soils, groundwater, or sediment would be required to conduct further evaluation to characterize the contaminants and their potential extent, and to develop management plans to appropriately handle and dispose of any contaminated media in accordance with local, State, and Federal regulations (**MM-HAZ-1**).

In addition, due to the historic uses of the Bay, it is possible previously undiscovered soil, groundwater, or sediment contamination could be encountered during future project construction throughout the proposed PMPU area and be released into the environment (**Impact-HAZ-2**). To address the potential of encountering previously undiscovered contamination, future development involving earthwork would be required to prepare an environmental site assessment (**MM-HAZ-1**). Additionally, if previously unknown hazardous materials are discovered during construction or ground-disturbing activities, **MM-HAZ-2** would be implemented, which would entail immediate stoppage of work and retaining an environmental professional to characterize the hazardous materials. If hazardous materials are identified, **MM-HAZ-1** would be implemented.

Ground-disturbing construction may also encounter soil contaminated with lead or organochlorine pesticides (**Impact-HAZ-3**). In order to reduce potential impacts related to the accidental release of lead-contaminated soil or organochlorine pesticide-contaminated soil to the environment, any future development involving soil disturbance within the immediate area of a building built prior to 1980 would be required to prepare an environmental site assessment to investigate potential contamination (**MM-HAZ-1**). If undocumented hazardous material associated with buildings built prior to 1980 is discovered during construction activities, **MM-HAZ-2** would be implemented to minimize potential risk to workers, the public, and the environment.

For the reasons discussed above, implementation of **MM-HAZ-1** and **MM-HAZ-2** would reduce potentially significant impacts related to creating a significant hazard to the public or environment due to accidental upset involving the release of hazardous materials to less-than-significant levels.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3 North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, could result in significant impacts related to the exposure of people or the environment to hazardous conditions due to the potential for ground-disturbing activities to release contaminated soil, groundwater, or sediment (**Impact-HAZ-1, Impact-HAZ-2, and Impact-HAZ-3**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new Waterfront Destination Park would involve ground-disturbing activities that could encounter contaminated soil or groundwater and could release hazardous materials. Therefore, it is concluded that significant impacts associated with the release of hazardous materials to the environment as a result of ground-disturbing construction activities could occur due to Option 1 (**Impact-HAZ-1, Impact-HAZ-2, and Impact-HAZ-3**). However, construction of Option 1 would not result in any additional or more severe impacts related to the release of hazardous materials into the environment than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, could result in significant impacts related to the exposure of people or the environment to hazardous conditions due to the potential for ground-disturbing activities to release contaminated soil, groundwater, or sediment (**Impact-HAZ-1, Impact-HAZ-2, and Impact-HAZ-3**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the expanded Lane Field Setback Park would involve ground-disturbing activities that could encounter contaminated soil or groundwater and could release hazardous materials. Therefore, it is concluded that significant impacts associated with the release of hazardous materials to the environment as a result of ground-disturbing construction activities could occur due to Option 2 (**Impact-HAZ-1, Impact-HAZ-2, and Impact-HAZ-3**). However, construction of Option 2 would not result in any additional or more severe impacts related to the release of hazardous materials into the environment than buildout without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, could result in significant impacts related to the exposure of people or the environment to hazardous conditions due to the potential for ground-disturbing activities to release contaminated soil, groundwater, or sediment (**Impact-HAZ-1, Impact-HAZ-2, and Impact-HAZ-3**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new park space that could be developed under Option 3 would involve ground-disturbing activities that could encounter contaminated soil or groundwater and could release hazardous materials. Therefore, it is concluded that significant impacts associated with the release of hazardous materials to the environment as a result of ground-disturbing construction activities could occur due to Option 3 (**Impact-HAZ-1, Impact-HAZ-2, and Impact-HAZ-3**). However, construction of Option 3 would not result in any additional or more severe impacts related to the release of hazardous materials into the environment.

Operation

Operation of future PMPU-related development is not expected to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Implementation of the proposed PMPU would increase operational activities in all planning districts in the PMPU area because the PMPU would allow for the expansion of existing uses, as well as the establishment of new commercial, maritime, and recreational water and land uses. The changes in water and land uses and associated development could result in an increased use of common hazardous materials, such as cleaners, solvents, fuels, oils, or lubricants, for normal cleaning and maintenance activities of facilities, equipment, vessels, and vehicles.

The continued operation of the marine terminal and other industrial facilities in PD4 would entail the use, storage, and transport of hazardous materials, including but not limited to oil, fuel, and other types of liquid bulk cargo. The storage of fuel, oil, and other hazardous materials would continue to comply with Federal, State, and local regulations, including the specific regulations that require onsite facilities to implement spill prevention measures, and prepare a Risk Management Plan and Hazardous Materials Business Plan (discussed in Threshold 1). Additionally, all hazardous materials would be required to be used in accordance with applicable regulations, such as the RCRA, DOT Hazardous Materials Regulations, CERCLA, CWA, DTSC regulations, and the local CUPA regulations, as summarized in Section 4.7.3 above. Hazardous waste would be disposed of in accordance with all applicable laws and regulations enforced by the local enforcement agency, and the potential to create a significant hazard to the public or environment through reasonably foreseeable upset and accident conditions from the release of hazardous materials into the environment would be minimized.

The proposed PMPU would allow for additional recreational boat berthing and commercial fishing berthing slips, as well as the redevelopment of existing marinas. The accidental release or spill of fuel could occur at marinas, especially during fueling of vessels. Marinas that meet the criteria must prepare a SPCC plan (40 CFR 112.7) to address oil spill prevention procedures including secondary containment of oil product vessels, and procedures to be taken in the event of an accidental spill. The EPA has established requirements to report oil spills or discharge in accordance with the CWA.

Oil spills that may violate applicable water quality standards, cause a film or sheen upon the surface of the water or shoreline, or cause a sludge or emulsion to deposit beneath the surface of the water or shoreline must be reported to the USCG National Response Center and EPA (40 CFR 110). The CWA (Section 312(a)-(m)) also regulates vessel sewage discharge. It is illegal to dump untreated sewage on inland waters and within 3 miles of shore, and within No Discharge Zones, established by the State (40 CFR 140). Accidental discharge of sewage must also be reported to the USCG National Response Center.

Therefore, compliance with existing laws and regulations would minimize the potential for operation of future PMPU-related development to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials to the environment. Impacts would be less than significant, and no mitigation is required.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with upset or accidental conditions related to the release of hazardous materials.

Operational activities associated with the new Waterfront Destination Park may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 1 would not include the storage of hazardous materials as it would be a recreational space. These materials are regulated by existing regulations including RCRA, DOT Hazardous Materials, CERCLA, CWA, DTSC, and local CUPA regulations. Compliance with these regulations would ensure the safe handling of hazardous materials during operational activities. Thus, operation of Option 1 would not result in any additional impacts related to upset or accidental conditions associated with the release of hazardous materials than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with upset or accidental conditions related to the release of hazardous materials.

Operational activities associated with the expanded Lane Field Setback Park may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as

cleaners, solvents, fuels, oils, or lubricants. Option 2 would not include the storage of hazardous materials as it would be a recreational space. These materials are regulated by existing regulations including RCRA, DOT Hazardous Materials, CERCLA, CWA, DTSC, and local CUPA regulations. Compliance with these regulations would ensure the safe handling of hazardous materials during operational activities. Thus, operation of Option 2 would not result in any additional impacts related to upset or accidental conditions associated with the release of hazardous materials than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with upset or accidental conditions related to the release of hazardous materials.

Operational activities associated with the new park space that may be developed under Option 3 may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 3 would not include the storage of hazardous materials as it would be a recreational space. These materials are regulated by existing regulations including RCRA, DOT Hazardous Materials, CERCLA, CWA, DTSC, and local CUPA regulations. Compliance with these regulations would ensure the safe handling of hazardous materials during operational activities. Thus, operation of Option 3 would not result in any additional impacts related to upset or accidental conditions associated with the release of hazardous materials than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

None of the proposed PMPU Element policies identified above in Section 4.7.4.3 would result in impacts related to the potential release of hazardous materials during routine use, transport, and disposal. Furthermore, proposed PMPU policies would include the implementation of District programs and measures to prevent pollution from construction and operations of projects in the proposed PMPU area, and minimize the exposure of the environment and the public to contamination.

Impact Determination and Mitigation

Implementation of the proposed PMPU would create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials to the environment.

Significant Impacts

Impact-HAZ-1: Possible Onsite Contamination. Environmental database searches indicate properties with historic and ongoing investigation and remediation of contaminated soil, groundwater, and/or sediment may be encountered during construction activities in certain areas of PD1, PD2, PD3, and PD4. Construction activities with soil, sediment, or groundwater disturbance within 300 feet of a known open case or documented contaminant plume, or 150 feet from a closed case, either listed in the HMTS or documented since on a hazardous materials database, would potentially result in the accidental upset or release of hazardous materials and create a potentially significant hazard to workers, the public, and the environment. Impacts are therefore considered significant.

Impact-HAZ-2: Potential to Encounter Undocumented Contamination During Reasonably Foreseeable Construction Activities. Due to the historic uses within and adjacent to the proposed PMPU area, it is possible previously undiscovered contaminated soil, groundwater, and/or sediment may be present. Ground-disturbing activities at these sites could result in the accidental exposure of hazardous materials to workers, or the accidental release or spill of hazardous materials to the environment. Therefore, disturbance of undocumented contamination would have the potential to result in reasonably foreseeable upset and accidental conditions involving the release of hazardous materials to the environment. Impacts are therefore considered significant.

Impact-HAZ-3: Potential to Encounter Lead or Organochlorine Pesticides in Soil During Reasonably Foreseeable Construction Activities. Concentrations of lead in the soil may be above acceptable levels at sites either containing or formerly containing structures built prior to 1980 as a result of lead used in building materials or paint that may have leached from the structure into the soils. In addition, organochlorine pesticides, often used historically as termiticides for wooden structures, may be present in the soil surrounding existing or former structures. Impacts are therefore considered significant.

Mitigation Measures

For **Impact-HAZ-1:**

MM-HAZ-1: Conduct an Environmental Site Assessment, Prepare a Remediation Plan, and Remediate Accordingly. This mitigation measure applies to future ~~development projects~~ that includes ground-disturbing activities ~~and is located~~ within 300 feet of a known open hazardous materials case or documented contaminant plume, or 150 feet from a closed case. ~~During the preparation of a site-specific environmental review and before the District approves the future development project. Prior to approval of a project,~~ the project proponent shall retain a licensed, qualified, and experienced Environmental Professional, approved by the District, who shall conduct or directly oversee the preparation and implementation of the site assessment and remediation plans specified below. The Environmental Professional shall be a California-licensed Professional Geologist or Professional Engineer with more than 3 years of experience conducting hazardous materials environmental assessments, consistent with the definition of an environmental professional according to ASTM E1527-13 (Standard Practice for ESAs: Phase I ESA Process). For A.1. below, qualified District staff, with at least 3 years of experience interpreting and conducting hazardous materials desktop investigations consisting of environmental database searches, historical site use archival research, and environmental review of available aerial and site photography, may conduct the Desktop Investigation. Environmental site assessments, including the preparation of testing and remediation plans, shall include one or more of the following steps. Every assessment type mentioned below may not be required for each future development project, depending on onsite conditions and proposed elements of the development projects. The District shall determine which of the following site assessment and/or plans will be required for a future development project.

A. Steps for Land Disturbance Activities

1. **Desktop Investigation.** The project proponent shall either submit to the District for review and approval, or the District shall prepare, a desktop-based investigation (e.g., hazardous materials technical study, hazardous materials database review, or review of other similar reference documents) to evaluate the likelihood of contaminated soils,

sediments, and/or groundwater to be present within or adjacent to the future project site, due to historic uses on or near the project site, or past or present investigations or remediations that have occurred on adjacent or nearby properties that have the potential to affect development on the project site. The desktop investigation shall be performed by an Environmental Professional and reviewed and approved by the District or may be performed by qualified District staff with at least 3 years of experience interpreting and conducting hazardous materials desktop investigations consisting of database searches, historical site use archival research, and review of available aerial and site photography. The investigation shall consider the potential presence of structures or former structures on the site built prior to 1980, and shall determine if a potential for lead and organochlorine pesticides may be present in the soil at the project site due to proximity to a structure built prior to 1980. The desktop investigation shall include, at a minimum, a summary of the history of the project site, the current conditions on the project site, and a review of available documentation regarding previous evaluation(s) of the site. The desktop review shall take into account the site conditions and features of the project, including the location, depth, and quantity of soil disturbance resulting from construction of the project, the historic uses and former or existing buildings on the project site, the presence of former or current monitoring or investigation on the project site, past abatement and/or remediation of contaminants at the project site, whether the site has been previously graded, and the condition of existing site facilities on the project site. If the results of the desktop investigation indicate the potential for contamination to exist on site or adjacent to the site, further investigation and site planning would be required, and the project proponent shall perform one or more of the following steps, as determined by the District.

2. **Prepare Phase I ESA.** The Environmental Professional, shall, at the project proponent's expense, prepare a Phase I ESA in accordance with the standard of care at that time (currently the ASTM Standard Practice E1527-13) and applicable regulations (currently the EPA's "Standards and Practices for All Appropriate Inquiries [40 CFR 312]") and submit the Phase I ESA to the District for its review and approval.
3. **Prepare Phase II ESA.** In the event the findings of the Phase I ESA recommend further evaluation through a Phase II ESA, the Environmental Professional, shall, at the project proponent's expense, prepare a Phase II ESA to adequately evaluate the project area for the presence of contaminants of potential concern (COPCs), as indicated by the Phase I ESA. Sites with cases under regulatory oversight shall coordinate with the appropriate oversight agency (e.g., SWRCB, DTSC, USACE, or other) and the District prior to commencement of the Phase II ESA. The Environmental Professional shall prepare a Phase II work plan, which shall describe sampling and testing methodology that shall be followed while conducting the Phase II ESA. The Phase II work plan shall be submitted to and reviewed and approved by the oversight agency and/or the District. The Phase II ESA shall also include a review of any available existing documentation of previous ESAs, UST removal sampling data, remediation, or other assessments of the project site. Results of previous assessments and results of onsite testing shall be reported in the Phase II ESA, which shall be submitted to the District and oversight agency (if applicable) for review and approval.

4. **Prepare Soil and/or Groundwater Management Plan.** The project proponent for future development of impacted or potentially impacted properties (as determined by the Phase I and II ESAs) involving ground-disturbing activities, such as, but not limited to, soil excavation, demolition, grading, or other subsurface disturbance, shall be required to prepare and implement a Soil and/or Groundwater Management Plan (Management Plan) that addresses soil and groundwater (as applicable). The plan shall be prepared by the Environmental Professional, and be implemented during ground-disturbing activities under the oversight of the Environmental Professional. The plan, at a minimum, shall address (1) monitoring of excavated soil or other ground-disturbing activities; (2) community and worker health and safety; (3) soil and groundwater handling, stockpiling, characterization, onsite reuse, export, and disposal protocols; (4) permitting; (5) notifications; (6) contingency plans for encountering unanticipated contamination; and (7) reporting. Appropriate references of the potential to encounter contaminated soils and/or groundwater shall be included in construction specifications and bid documents so various environmental factors (e.g., construction dewatering, soil disposal) and worker and community health and safety are appropriately and cost-effectively planned for and managed by the contractor. The Management Plan shall be submitted to the District for review and approval during the project's site-specific environmental review. After the District's review and approval, the project proponent shall implement the Management Plan as a condition of approval of the project.
 - a. **When Dewatering is Proposed/Required.** When dewatering is proposed/required during construction that may generate contaminated groundwater, the Management Plan shall include additional measures applicable to dewatering activities. If dewatering is expected during construction, the project proponent shall obtain a NPDES permit from the RWQCB, or *Discharge Permit* or a *Batch Discharge Authorization* from the Cities of Coronado, Imperial Beach, or San Diego prior to commencing construction activities. The project proponent shall comply with the requirements of the discharge permit; and if the discharge water is contaminated, these requirements may include characterization of the water to be discharged and pretreatment of groundwater prior to discharge. The project proponent shall coordinate with the RWQCB and any other agency providing oversight of wastewater discharge for the project site, to ensure consistency between all applicable requirements for discharge pertaining to the property (i.e., existing NPDES permit, etc.). All requirements and measures regarding the dewatering process shall be included in the Management Plan. The Management Plan shall be submitted for the District's review and approval. After the District has reviewed and approved the Management Plan, it shall be implemented by the project proponent as a condition of approval of the project.
 - b. **Prepare Site Health and Safety Plan.** The Management Plan shall include a Site Health and Safety Plan to reduce potential health and safety hazards to workers and the public. The Site Health and Safety Plan shall require compliance with 29 CFR Part 120, Hazardous Waste Operations and Emergency Response regulations for site workers at uncontrolled hazardous waste sites. The Site Health and Safety Plan shall be based on the due diligence completed for the site (Phase I ESA and Phase II ESA) and the planned site construction activity to ensure that site workers potentially exposed to site contamination in soil and groundwater have the proper training, equipment, and hazard monitoring action levels during site activity. The Site Health

and Safety Plan shall be submitted to the District for review and approval during the project's environmental review and implemented under the oversight of a Certified Industrial Hygienist, retained by the project proponent as a mitigation measure and/or condition of approval of the project. The project proponent along with its contractors shall implement the training, equipment, and monitoring activities outlined in the Health and Safety Plan to ensure that workers are not exposed to contaminants above permissible exposure limits established by Table Z, 29 CFR Part 1910.1000.

B. Steps for Bay Sediment Disturbance Due Diligence

- 1. Prepare Sediment Management Plan.** The project proponent for future development of impacted or potentially impacted properties (as determined by the Phase I and II ESAs) involving sediment-disturbing activities, such as, but not limited to, dredging, excavation, pile removal, pile installation, or other subsurface disturbance, shall be required to obtain and implement a management plan that addresses sediment ("Sediment Management Plan"). The Sediment Management Plan shall be prepared by a California-licensed Professional Geologist, Professional Engineering Geologist, or Professional Engineer, retained by the project proponent. The Sediment Management Plan, at a minimum, shall address (1) monitoring of dredging, excavation, or other sediment-disturbing activities; (2) community and worker health and safety; and (3) sediment handling, stockpiling, characterization, onsite reuse, export, and disposal protocols. The Sediment Management Plan shall describe in detail the methods to be employed to minimize disturbance of contaminated sediment during waterside construction activities and the monitoring that will occur during construction activities. Appropriate references to the potential to encounter contaminated sediment shall be included in construction specifications and bid documents so that the contractor can ensure various environmental factors (e.g., sediment disposal) are appropriately and cost-effectively managed by the contractor. The Sediment Management Plan shall be submitted to the District for review and approval. After the District's review and approval, the project proponent shall implement the Sediment Management Plan as a condition of approval of the project. This measure shall be consistent with and shall not conflict with MM-WQ-5.

For **Impact-HAZ-2**:

Implement **MM-HAZ-1**, as described above.

MM-HAZ-2: Identify Unknown Hazardous Materials Encountered During Construction. If, during ground-disturbing construction activities, the project proponent or its contractors encounter indications of potential contamination, including but not limited to discoloration of the soil, a sheen on the surface of groundwater, or an odor, the project proponent or contractor shall halt work in the vicinity of the potential contamination. Before the project proponent resumes work, the project proponent shall retain an Environmental Professional, approved by the District, to characterize the potential contamination. If the Environmental Professional determines that the potential contamination is a hazardous material, the Environmental Professional shall prepare a Management Plan and a Health and Safety Plan (as described in **MM-HAZ-1**) for the project site. The project proponent shall submit the Management Plan and the Health and Safety Plan to the District for review and approval. The project proponent shall

implement the approved Management Plan and Health and Safety Plan prior to and throughout the remainder of construction activities. Additionally, if the substance encountered is determined to be a hazardous material, the project proponent shall notify the County DEH, and shall comply with any additional requirements of the County DEH.

For **Impact-HAZ-3**:

Implement **MM-HAZ-1** and **MM-HAZ-2**, as described above.

Level of Significance After Mitigation

In order to address the presence of known or suspected onsite contamination (**Impact-HAZ-1**), an ESA shall be conducted for future projects with known or suspected onsite contamination to evaluate potential environmental concerns associated with hazardous materials (**MM-HAZ-1**). One or more steps of the ESA may be required by the District, including a desktop investigation, a Phase I ESA, and/or a Phase II ESA (the latter of which would be based on the recommendations of the Phase I ESA). The Phase II ESA may recommend remediation activities prior to construction of project construction, which shall be conducted by a qualified Environmental Professional. Based on the findings of the Phase II ESA, a future project located on a property with known or suspected contamination shall prepare and implement a Management Plan to ensure the proper handling of potentially contaminated media. The Management Plan shall include a Site Health and Safety Plan, which would ensure the safety of the workers and the public.

To address the potential of encountering previously undiscovered contamination (**Impact-HAZ-2**), an ESA shall be performed to evaluate the likelihood of contaminated soils, sediments, and/or groundwater to be present within or adjacent to the future project site, based on historic uses at or adjacent to the site (**MM-HAZ-1**). Furthermore, assessment by a qualified Environmental Professional is required if discolored soil or other potential environmental issues are encountered during ground-disturbing construction activities (**MM-HAZ-2**). If the Environmental Professional determines that the potential contamination is a hazardous material, **MM-HAZ-1** shall be implemented. The implementation of site-specific evaluation, and excavation and/or soil monitoring if determined to be necessary, as required by **MM-HAZ-1**, would reduce the potential impact resulting from the unexpected encounter of previously undocumented contamination.

In order to reduce potential impacts related to the accidental release of lead-contaminated soil or organochlorine pesticide-contaminated soil to the environment due to the presence of a structure built prior to 1980 (**Impact-HAZ-3**), any future project involving soil disturbance within the immediate area of a building built prior to 1980 will be required to prepare an ESA to investigate potential contamination (**MM-HAZ-1**).

With implementation of **MM-HAZ-1** and **MM-HAZ-2**, impacts related to the potential creation of a significant hazard to workers, the public, or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment (**Impact-HAZ-1** through **Impact-HAZ-3**) would be less than significant because safeguards would be taken to ensure upset and accident conditions do not occur. Operational impacts would be less than significant because of existing regulations and regulatory agency oversight.

Threshold 3: Emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Impact Analysis

Construction

As described in Section 4.7.2.3, *Existing Schools Within 0.25 Mile of the Proposed PMPU Area*, there are no schools within the PMPU area, but there are four within 0.25 mile of the proposed PMPU area. Table 4.7-2 identifies the school districts and schools within 0.25 mile of the proposed PMPU area, and presents the distance and direction to the specific planning districts within 0.25 mile.

Future development currently anticipated in the planned improvements or each planning district's Vision, as well as development consistent with the water or land use designation for the proposed development site, as described in Table 3-2, may occur. The construction of future development may require the temporary use of standard hazardous materials used for construction, including fuels, oils, solvents, paints, lubricants, and paving materials. As described under Threshold 1, these hazardous materials would be used in compliance with applicable Federal, State, and local regulations, which would ensure the safe handling of hazardous materials and reduce risks related to these hazardous materials. The transport, use, and disposal of construction-related hazardous materials would be required to comply with regulations, as described above, such as the RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100-185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH. Further, potential releases of hazardous substances during construction would be addressed through the EPCRA, which is administered in California by the SERC, the Hazardous Material Release Response Plans and Inventory Law, and the California Hazardous Waste Control Law, which would govern proper containment, spill control, and disposal of hazardous waste generated during construction. Construction BMPs would be implemented as part of a SWPPP as required by the statewide NPDES General Permit for Construction Activities. Required construction BMPs are designed to reduce pollutant discharges and control stormwater and other runoff during construction, and provide controls for the proper storage and disposal of hazardous materials. Due to compliance and enforcement of the applicable regulations, impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the emitting hazardous emissions or handling hazardous or acutely hazardous materials within 0.25 mile of a school.

Construction activities associated with the new Waterfront Destination Park would involve the use of hazardous materials typically used for construction, including fuels, oils, solvents, paints, lubricants, and paving materials. However, the use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH (CUPA). Further, potential releases of hazardous substances during construction would be addressed through the EPCRA, the Hazardous Material Release Response Plans and Inventory Law, and the California Hazardous Waste Control Law. Compliance with these regulations would ensure the safe handling of hazardous materials during construction. Thus, construction under Option 1 would not result in any additional impacts related to the use of hazardous materials within 0.25 mile of a school than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the emitting hazardous emissions or handling hazardous or acutely hazardous materials within 0.25 mile of a school.

Construction activities associated with the expanded Lane Field Setback Park would involve the use of hazardous materials typically used for construction, including fuels, oils, solvents, paints, lubricants, and paving materials. However, the use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH (CUPA). Further, potential releases of hazardous substances during construction would be addressed through the EPCRA, the Hazardous Material Release Response Plans and Inventory Law, and the California Hazardous Waste Control Law. Compliance with these regulations would ensure the safe handling of hazardous materials during construction. Thus, construction under Option 2 would not result in any additional impacts related to the use of hazardous materials within 0.25 mile of a school than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the emitting hazardous emissions or handling hazardous or acutely hazardous materials within 0.25 mile of a school.

Construction activities associated with the new park space that could be developed under Option 3 would involve the use of hazardous materials typically used for construction, including fuels, oils, solvents, paints, lubricants, and paving materials. However, the use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; and California Labor Code Division 5, Parts 1 and 7. Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection, including by the applicable fire departments (storage) and County DEH (CUPA). Further, potential releases of hazardous substances during construction would be addressed through the EPCRA, the Hazardous Material Release Response Plans and Inventory Law, and the California Hazardous Waste Control Law. Compliance with these regulations would ensure the safe handling of hazardous materials during construction. Thus, construction under Option 3 would not result in any additional impacts related to the use of hazardous materials within 0.25 mile of a school than buildout of the proposed PMPU without Option 3.

Operation

The proposed water and land uses for the proposed PMPU area would not include uses that would emit or involve the handling of hazardous materials within 0.25-quarter mile of a school, such as power plants, manufacturing facilities, and factories. The proposed water and land uses would allow for the continued operation of maritime uses within the proposed PMPU area. These uses include shipping operations and ship building and vessel repair. These uses would not be expanded with the proposed water and land use designations, and would continue typical operations, which do not involve hazardous emissions. As described under Threshold 1, operation of these water and land uses would require the routine use of standard hazardous materials often used during operation, such as cleaners, solvents, fuels and oils for maintenance of vehicles, vessels, and other equipment and facilities. Operation of these proposed water and land uses would not include the routine use of acutely hazardous materials.

Implementation of the proposed PMPU is not anticipated to result in an increase in quantity or intensity of use, or expand the existing shipyards in PD4, which are physically built out. The continued operation of the shipyards would involve the use of hazardous materials for ship building activities, such as fuels, adhesives, and oils. The storage of fuel, oil, and other hazardous materials would continue to comply with Federal, State, and local regulations, including the specific regulations that require onsite facilities to implement spill prevention measures, and prepare a Risk Management Plan and Hazardous Materials Business Plan (discussed in Threshold 1). Additionally, all hazardous materials would be used in accordance with applicable regulations, such as RCRA regulations, DOT Hazardous Materials Regulations, and local CUPA regulations, as summarized in Section 4.7.3 above, which regulate the transportation, storage, and use of hazardous materials. Lastly, the proposed secondary uses are compatible with the primary uses in each planning district and do not propose any uses that would utilize hazardous materials. Therefore, operation of future development would not involve hazardous emissions or involve the handling of hazardous or acutely hazardous materials within 0.25 mile of a school due to the existing framework of regulations that would be applicable to the use and transportation of hazardous materials, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the emitting hazardous emissions or handling hazardous or acutely hazardous materials within 0.25 mile of a school.

Operational activities associated with the new Waterfront Destination Park may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 1 would not include the storage of hazardous materials as it would be a recreational space. The use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; California Labor Code Division 5, Parts 1 and 7; and OSHA regulations (29 CFR 1910 Subpart H). Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection by County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during operation. Thus, operation of Option 1 would not result in any additional impacts related to the use of hazardous materials within 0.25 mile of a school than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the emitting hazardous emissions or handling hazardous or acutely hazardous materials within 0.25 mile of a school.

Operational activities associated with the expanded Lane Field Setback Park may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 2 would not include the storage of hazardous materials as it would be a recreational space. The use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; California Labor Code Division 5, Parts 1 and 7; and OSHA regulations (29 CFR 1910 Subpart H). Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection by County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during operation. Thus, operation of Option 2 would not result in any additional impacts related to the use of hazardous materials within 0.25 mile of a school than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the emitting hazardous emissions or handling hazardous or acutely hazardous materials within 0.25 mile of a school.

Operational activities associated with the new park space that could be developed under Option 3 may involve the periodic use of hazardous materials typically used for cleaning and maintenance, such as cleaners, solvents, fuels, oils, or lubricants. Option 3 would not include the storage of hazardous materials as it would be a recreational space. The use, transport, and disposal of these materials are regulated by existing regulations including RCRA (40 CFR Parts 260-299), DOT Hazardous Materials Regulations (49 CFR 100–185) Parts 107, 130, 172, 173, 177, 178, and 180; Title 8 and Title 22 of the CCR; California Labor Code Division 5, Parts 1 and 7; and OSHA regulations (29 CFR 1910 Subpart H). Also, their transport, use, and disposal would be subject to regulatory agency oversight and inspection by County DEH (CUPA). Compliance with these regulations would ensure the safe handling of hazardous materials during operation. Thus, operation of Option 3 would not result in any additional impacts related to the use of hazardous materials within 0.25 mile of a school than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

None of the proposed PMPU Element policies could result in impacts related to the potential release of hazardous materials during their routine use, transport, and disposal. Furthermore, proposed PMPU policies (noted in Section 4.7.4.3) would include the implementation of District programs and measures to prevent pollution from construction and operations of projects in the proposed PMPU area and minimize the exposure of the environment and the public to contamination.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in a significant impact with respect to hazardous emissions or the handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school. No mitigation is required.

Threshold 4: Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Impact Analysis**Construction**

As discussed in Section 4.7.2, *Existing Conditions*, the HMTS prepared for the proposed project identified several sites within the proposed PMPU area where previous releases of hazardous materials occurred, and, in most instances, the subsequent remediation that took place. The environmental databases reviewed for the HMTS included Federal, State, and local environmental databases that identify and track sites that contain, or have released, hazardous materials to the soil

or groundwater. The environmental databases reviewed included those compiled pursuant to California Government Code 65962.5 (commonly referred to as the Cortese List) that identify hazardous waste facilities and sites listed by the DTSC, County DEH, and SWRCB. The database search encompassed all sites within a 1/16-mile radius of the planning districts. The search radius was determined in order to identify the cases within the proposed PMPU area as well as offsite properties that would have the greatest potential impact on the planning districts at this programmatic level of analysis (i.e., within 1/16 mile or 330 feet of the boundary of the planning districts). This does preclude the possibility for cases outside of the database search radius to potentially impact a future project within the proposed PMPU area. As detailed under Threshold 2, PD1, PD2, PD3, and PD4 each contain open cases. These open cases are either currently undergoing investigation, remediation, and/or monitoring, or require further evaluation and therefore are under regulatory oversight by the appropriate agency. All of the planning districts except for PD8 have “closed sites” within their boundaries, which indicates that a previous hazardous site has been considered successfully remediated or the contaminated media successfully isolated and contained by the overseeing agency.

Proposed PMPU ECO Policy 2.2.3 would prevent the degradation of sediment and minimize exposure of adjacent communities to fill, soil, and sediment-based environmental contamination. Proposed PMPU ECO Policy 2.3.3 would require development that disrupts shoreline fill or Bay sediment to remove contaminated fill or appropriately contain and remediate fill. As such, these policies have the potential to avoid or reduce impacts associated with projects located on a site listed on an environmental database for hazardous materials associated with Bay fill or Bay sediment by ensuring any contaminated sediment encountered during development would be remediated, removed, or otherwise stabilized under the oversight of RWQCB.

Future development projects allowed under the proposed PMPU could result in the construction or redevelopment of landside and in-water projects and/or facilities within the various PMPU planning districts that would require waterside and landside ground- or sediment-disturbing construction activities, respectively, on a property with an active or closed case listed in an environmental database for hazardous materials. Ground- or sediment-disturbing activities such as grading, excavation, and/or dredging could encounter contaminated soils, groundwater, and/or sediment associated with a known case, or a site that had been remediated, capped, or closed in-place. If not properly handled, contaminated soils and sediments could be encountered by these ground- or sediment-disturbing construction activities, and could be released into the environment or could be exposed to workers. This potential release of contaminated media could result in a significant hazard to the public or environment, which is considered a significant impact (**Impact-HAZ-4**).

Compliance with applicable Federal, State, and local laws and regulations, including but not limited to RCRA, CWA, Division 7 of the California Water Code (which authorizes the San Diego RWQCB to regulate the investigation and cleanup of polluted sites), 22 CCR Division 4.5 (which authorizes DTSC oversight of contaminated sites and hazardous materials facilities), and the California Health and Safety Code, under which the County DEH operates the VAP and SAM Program, would ensure the proper handling and management of existing hazardous material sites. However, compliance with regulations alone would not reduce this potential impact to less than significant. Additionally, implementation of **MM-HAZ-1** would ensure that future development projects would follow the appropriate protocol to identify and mitigate potential impacts on site related to creating a significant hazard to the public or the environment due to being located on a site that is listed on an environmental database. In the event that unanticipated contamination is encountered, implementation of **MM-HAZ-2** would require an assessment by a qualified environmental

professional to determine whether the potential contamination is a hazardous material. If the environmental professional determines that the potential contamination is a hazardous material, the environmental professional shall prepare a Management Plan and a Health and Safety Plan (as described in **MM-HAZ-1**) for the project site. With the implementation of **MM-HAZ-1** and **MM-HAZ-2**, the impact would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, could result in a significant impact related to being located on a site that is included on a list of hazardous materials sites (**Impact-HAZ-4**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new Waterfront Destination Park would involve ground-disturbing activities on or near a hazardous materials sites listed on a hazardous materials database (see Section 4.7.2.2 above and Figure 4.7-3). Ground-disturbing activities could encounter contaminated soil or groundwater and could release hazardous materials (**Impact-HAZ-4**). However, construction of Option 1 would not result in any additional or more severe impacts related to being located on a list of hazardous materials sites than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, could result in a significant impact related to being located on a site that is included on a list of hazardous materials sites (**Impact-HAZ-4**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could occur outside of the option boundary within PD3.

Construction activities associated with the expanded Lane Field Setback Park would not involve ground-disturbing activities on or near a hazardous materials sites listed on a hazardous materials database (see Section 4.7.2.2 above and Figure 4.7-3). Therefore, impacts would be less than significant, and Option 2 would not result in any additional or more severe impacts related to being located on a site that is included on a list of hazardous materials sites than implementation of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, could result in a significant impact related to being located on a site that is included on a list of hazardous materials sites (**Impact-HAZ-4**). This significant impact would still occur within PD3 under Option 3 as a result of the future development that could occur outside of the option boundary within PD3.

Construction activities associated with the new park space that could be developed under Option 3 would involve ground-disturbing activities on or near a hazardous materials sites listed on a hazardous materials database (see Section 4.7.2.2 above and Figure 4.7-3). Ground-disturbing activities could encounter contaminated soil or groundwater and could release hazardous materials (**Impact-HAZ-4**). However, construction of Option 3 would not result in any additional or more severe impacts related to being located on a site that is included on a list of hazardous materials sites than buildout of the proposed PMPU without Option 3.

Operation

Based on the findings of the HMTS (Appendix G), all planning districts in the proposed PMPU area except for PD8 have sites previously listed on environmental databases included in the Cortese List (pursuant to Government Code 65962.5) that have been closed. PD8 does not have any known cases located within its boundaries. PD1, PD2, PD3, and PD4 have sites with an open status at the time of preparation of this PEIR. The proposed water and land uses would allow for the potential development of new visitor-serving commercial and recreational uses, as well as marine industrial uses that may be located on sites included on a database of hazardous materials sites. After construction of a future project is complete within these planning districts, the operation of these uses on a site that may be included on an environmental database of hazardous materials sites would not result in further impacts because the operation of these future developments would not require further earthwork activities, and thus would not disturb contaminated media and risk exposing the public or the environment.

Therefore, operational activities would not create a significant hazard to the public or the environment as a result of being located on a Government Code Section 65962.5 hazardous site, and, as a result, operational impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located on a site included in a list of hazardous materials sites.

Operational activities associated with the new Waterfront Destination Park may be located on a site that is included on a hazardous materials sites database; however, operations would not include ground-disturbing activities and thus would not disturb contaminated media and risk exposing the public or the environment. Therefore, operation of Option 1 would not result in any additional impacts related to being located on a site included on a list of hazardous materials sites than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located on a site included in a list of hazardous materials sites.

Operational activities associated with the expanded Lane Field Setback Park may be located on a site that is included on a hazardous materials sites database; however, operations would not include ground-disturbing activities and thus would not disturb contaminated media and risk exposing the public or the environment. Therefore, operation of Option 2 would not result in any additional impacts related to being located on a site included on a list of hazardous materials sites than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located on a site included in a list of hazardous materials sites.

Operational activities associated with the new park space that could be developed under Option 3 may be located on a site that is included on a hazardous materials sites database; however, operations would not include ground-disturbing activities and thus would not disturb contaminated media and risk exposing the public or the environment. Therefore, operation of Option 3 would not result in any additional impacts related to being located on a site included on a list of hazardous materials sites than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

None of the proposed PMPU Element policies would result in impacts related to the potential release of hazardous materials during routine use, transport, and disposal. Furthermore, proposed PMPU policies (noted in Section 4.7.4.3) would include implementation of District programs and measures to prevent pollution from construction and operations of projects in the proposed PMPU area and to minimize the exposure of the environment and the public to contamination.

Impact Determination and Mitigation

Future development would have the potential to be located on a site that is listed on a database pursuant to Government Code Section 65962.5. Construction activities associated with such projects

may disturb known or unknown contamination and, as a result, would potentially create a significant hazard to the public or the environment.

Once constructed, operation of future development on such sites would not have the potential to disturb known or unknown contamination and, therefore, the operation of reasonably foreseeable future projects would not create a significant hazard to the public or the environment.

Significant Impacts

Impact-HAZ-4: Potential to Encounter Contamination On Site Due to Listing on a Hazardous Materials Database. Future development allowed under the PMPU that includes ground- or sediment-disturbing activities could encounter contaminated soil, groundwater, and/or sediment related to sites listed on a hazardous materials site database pursuant to Government Code Section 65962.5. Impacts would be significant.

Mitigation Measures

For **Impact-HAZ-4**:

Implement **MM-HAZ-1** and **MM-HAZ-2**, as described under Threshold 2.

Level of Significance After Mitigation

In order to address the presence of known or suspected onsite contamination associated with a site listed on an environmental database for hazardous materials (**Impact-HAZ-4**), a desktop investigation and/or a Phase I ESA and, depending on the results of the Phase I ESA, a Phase II ESA would be conducted for future projects to evaluate the potential environmental concerns prior to project commencement of any ground- or sediment-disturbing activities (**MM-HAZ-1**). The Phase II ESA may recommend remediation activities prior to ground- and sediment-disturbing activities, which would be conducted by a qualified environmental professional. In the event that unanticipated contamination is encountered, implementation of **MM-HAZ-2** would require an assessment by a qualified environmental professional to determine whether the potential contamination is a hazardous material. If the environmental professional determines that the potential contamination is a hazardous material, the environmental professional will prepare a Management Plan and a Health and Safety Plan (as described in **MM-HAZ-1**) for the project site. With implementation of these mitigation measures, the potential for future development under the proposed PMPU to result in a significant hazard to the public or the environment as a result of being located on a list compiled pursuant to Government Code Section 65962.5 (**Impact-HAZ-4**) would be less than significant because safeguards would be taken to ensure ground- and sediment-disturbing construction activities would not result in the release of hazardous materials.

Operation of the proposed water and land uses would not require further earthwork activities that would disturb known or unknown contamination, and thus would not disturb contaminated media listed pursuant to Government Code Section 65962.5 and would not risk exposing the public or the environment. Therefore, operations of the proposed water and land uses would not create a significant hazard to the public or the environment, and impacts would be less than significant.

Threshold 5: Be located within an airport land use plan area or, where such a plan has not been adopted, be within two miles of a public airport or public use airport, and result in a safety hazard or excessive noise for people residing or working in the project area?

Impact Analysis

As described in Section 4.7.2.4, *Existing Airports and Airstrips Within 2 Miles of the Proposed PMPU*, the proposed PMPU area is within the ALUCP area for the SDIA, NOLF Imperial Beach, and NAS North Island. Planning District 1, PD2, PD3, PD4, and PD10 are located either entirely or partially within the AIA for SDIA. Planning District 7, PD8, and PD9 are either entirely or partially within the AIA for NOLF Imperial Beach. (San Diego County Regional Airport Authority 2019). All or portions of PD1, PD2, PD3, PD4, PD7, PD9, and PD10 are within the AIA of NAS North Island.

Construction

Federal law requires proposed structures that exceed Federal Aviation Regulations Part 77 height criteria to undergo an Obstruction Evaluation/Airport Airspace Analysis. As noted in the discussion of 14 CFR Part 77 in Section 4.7.3.1, *Federal*, Part 77 regulations apply to any construction or alteration that is more than 200 feet above the ground anywhere in the United States, and any construction or alteration that exceeds an imaginary surface extending outward and upward at any of the following slopes:

1. 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport...with its longest runway more than 3,200 feet in actual length, excluding heliports.
2. 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport...with its longest runway no more than 3,200 feet in actual length, excluding heliports.
3. 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport...

Private developers and public agencies proposing the development of these structures must submit a Notice of Proposed Construction or Alteration to the FAA under Federal Aviation Regulations Part 77 (ALUC 2014). A Notice of Proposed Construction or Alteration is also required for structures or objects that may interfere with navigational aid and any project that would exceed 200 feet above ground level. Future development or redevelopment in all planning districts may involve the use of construction equipment and/or result in the development of structures that would exceed height limits and therefore would be required to comply with all FAA regulations and notification requirements. In addition, the Airport Land Use Commission (ALUC) is responsible for reviewing all land use plans, regulations, and projects within Review Area 1 of an airport's AIA. Within Review Area 2 of an airport's AIA, the ALUC is only responsible for reviewing land use plans and regulations proposing increases in height limits and for land use projects that:

- Have received from the FAA a Notice of Presumed Hazard, a Determination of Hazard, or a Determination of No Hazard subject to conditions, limitations, or marking and lighting requirements; and/or

- Would create hazards including glare; lighting; electromagnetic interference; dust, water vapor, or smoke; thermal plumes; and bird attractants.

As depicted on Figure 4.7-9, PD2 and PD3 are partially within Review Area 1 for SDIA, and PD1, PD2, PD3, PD4, and PD10 are within Review Area 2 of the SDIA AIA. A small portion of PD7 is within Review Area 2 for NOLF Imperial Beach. Planning District 1, PD2, PD3, PD4, PD7, PD9, and PD10 are entirely or partially within the AIA for NAS North Island. Future development that would exceed the height criteria in Federal Aviation Regulations Part 77 would be required to consult with the FAA and, under certain circumstances, the ALUC, if the development would be located within Review Area 1 or meet the review requirements for Review Area 2 described above. Compliance with these regulatory requirements would reduce potential conflicts with navigable airspace and alleviate the possibility of exacerbating an existing airport safety hazard for people working within the proposed PMPU area. Additionally, implementation of SR Policy 1.1.7, SR Policy 1.1.8, and SR Policy 1.1.9 of the proposed PMPU would also require coordination with the FAA for proposed development that meets the notification criteria under 14 CFR Part 77, and would also ensure development would be designed to minimize risk of injury to people and damage to property within the airport influence areas or interference with airport operations.

In addition to potential safety hazards, portions of the proposed PMPU area are within designated noise contours for SDIA as identified in the SDIA ALUCP. The proposed PMPU area is affected by notable noise contours (60 community noise equivalent level decibels or higher) from both the SDIA and NAS North Island. Noise contour maps for each of these are shown on Figures 4.10-2 and 4.10-3 in Section 4.10, *Noise and Vibration*. Elevated noise levels from operation of these airports is an existing condition within the noise contours. Development of future projects in portions of the proposed PMPU area that are within these noise contours could bring additional workers to the area during construction and expose them to noise from the airports, potentially exacerbating the existing condition by exposing additional people to excessive noise. However, these would be temporary construction-related jobs that would not result in the permanent exposure of people to excessive noise. In addition, OSHA has established noise and hearing conservation standards and regulations for construction (29 CFR 1926). OSHA established permissible noise exposure limits, and, when these limits are exceeded, requires that administrative or engineered controls be implemented to reduce noise levels (29 CFR 1926.52). If it is not possible to reduce noise levels, personal protective equipment must be used. Construction of future development would comply with OSHA regulations. Thus, the potential exposure of construction workers to airport-related noise would not be exacerbated, and would result in a significant impact due to the proposed project.

In accordance with the approved ALUCPs, proposed adoption of or amendment to a General Plan or Community/Specific/Precise Plan/Master Plan are subject to ALUC Review. As described in Section 6.2.3 of the proposed PMPU, the District would be responsible for the consistency review of discretionary and ministerial projects located within the AIAs of SDIA, NAS North Island, and NOLF Imperial Beach. The District would coordinate with the ALUC to ensure consistency with the ALUCPs for the preparation of future amendments or updates to the ALUCPs as well as future Port Master Plan Amendments.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with existing FAA regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located within an airport land use plan area.

Construction activities associated with the new Waterfront Destination Park would occur within Review Area 2 for SDIA. Implementation of Option 1 would occur in compliance with FAA regulation and ALUC review and approval to ensure consistency with the ALUCP. Thus, construction under Option 1 would not result in any additional or more severe impacts related to being located within an airport land use plan area than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with existing FAA regulations and agency oversight, implementation of the proposed PMPU, including PD3, would result in a less-than-significant impact associated with being located within an airport land use plan area.

Construction activities associated with the expanded Lane Field Setback Park would occur within Review Area 2 for SDIA. Implementation of Option 2 would occur in compliance with FAA regulation and ALUC review and approval to ensure consistency with the ALUCP. Thus, construction under Option 2 would not result in any additional or more severe impacts related to being located within an airport land use plan area than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with existing FAA regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located within an airport land use plan area.

Construction activities associated with the new park space that could be developed under Option 3 would occur within Review Area 2 for SDIA. Implementation of Option 3 would occur in compliance with FAA regulation and ALUC review and approval to ensure consistency with the ALUCP. Thus, construction under Option 3 would not result in any additional or more severe impacts related to being located within an airport land use plan area than buildout of the proposed PMPU without Option 3.

Operation

All of the planning districts in the PMPU area are either entirely, or partially, within the AIA for either SDIA, NOLF Imperial Beach, or NAS North Island.

Implementation of the proposed PMPU would allow for the development of structures or land uses that exceed the height criteria in Federal Aviation Regulations Part 77 and/or may conflict with the land use compatibility and safety policies established in the ALUCPs for SDIA, NOLF Imperial Beach, and NAS North Island. In particular, new or expanded hotels or other commercial development allowed by planning district standards as well as designated primary uses could exceed the height limitations established by the FAA and the applicable ALUCP. Marine Terminal and Marine Industrial land uses may also result in the development of structures that would exceed height limitations (such as loading cranes for cargo ships). Introducing structures or buildings that exceed the height limitations established by the FAA and the applicable ALUCP could exacerbate existing safety hazards for people working within the proposed PMPU area.

Consultation with the FAA and, under certain circumstances where the operation of reasonably foreseeable future development projects is within Review Area 1 or 2, the ALUC, would be required for future development that would exceed the height criteria in Federal Aviation Regulations Part 77 and/or require a PMP Amendment to ensure the proposed structure would be consistent with the applicable ALUCP and would not exacerbate existing safety hazards. Project proponents would be required to engage in consultation pursuant to 14 CFR Part 77, which would reduce the potential for operation of these uses to result in conflicts with navigable airspace and alleviate the possibility of exacerbating an existing airport safety hazard for people working within the proposed PMPU area. Thus, the impact would be less than significant.

Portions of PD2 and PD3 are within the noise overlay area for SDIA, and a portion of PD1 is within the noise overlay area for NAS North Island; thus, permanent workers and visitors related to future development under the PMPU in these areas could be exposed to noise generated by the airport, which could exacerbate the existing conditions in the PMPU area by exposing additional people to excessive noise. Water and land use changes in PD1, PD2 and PD3 under the PMPU include additional recreation or retail facilities that could result in additional visitors and workers within the noise overlay areas. However, the water and land uses are not introducing a new use within the planning districts; rather, they are expanding or changing the square footage of these uses within the planning districts. In addition, future development would be required to comply with noise-related regulation from the California Building Code (CBC) (Title 24, Chapter 12) to ensure noise levels within structures and buildings meet the established standards, as well as OSHA noise standards for occupational noise exposure (29 CFR 1904). Furthermore, SR Policy 1.1.7, SR Policy 1.1.8, and SR Policy 1.1.9 of the proposed PMPU would require future development within an ALUCP review area to be sited and designed to minimize potential safety risks and noise conflicts related to the regional ALUCPs. Therefore, the water and land uses proposed for PD1, PD2, and PD3 within the portions that overlap with the SDIA or NASNI noise overlay areas that could result in additional visitors or workers would not result in exacerbating of the existing noise levels from the SDIA or NASNI. Thus, there would not be a potentially significant impact related to the exposure of people to a safety hazard or excessive noise from locating future development under the PMPU within an airport noise overlay area zone.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU

and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with existing FAA regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located within an airport land use plan area.

Operational activities associated with the new Waterfront Destination Park would occur within Review Area 2 for SDIA. Implementation of Option 1 would occur in compliance with FAA regulation and ALUC review and approval to ensure consistency with the ALUCP. Thus, operation under Option 1 would not result in any additional or more severe impacts related to safety hazards or excessive noise associated with being located within an airport land use plan area than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with existing FAA regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located within an airport land use plan area.

Operational activities associated with the expanded Lane Field Setback Park would occur within Review Area 2 for SDIA. Implementation of Option 2 would occur in compliance with FAA regulation and ALUC review and approval to ensure consistency with the ALUCP. Thus, operation under Option 2 would not result in any additional or more severe impacts related to safety hazards or excessive noise associated with being located within an airport land use plan area than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with existing FAA regulations and agency oversight, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with being located within an airport land use plan area.

Operational activities associated with the new park space that could be developed under Option 3 would occur within Review Area 2 for SDIA. Implementation of Option 3 would occur in compliance with FAA regulation and ALUC review and approval to ensure consistency with the ALUCP. Thus, operation under Option 3 would not result in any additional or more severe impacts related to safety hazards or excessive noise associated with being located within an airport land use plan area than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

None of the proposed PMPU Element policies could result in impacts related to safety hazards or excessive noise associated with being located within an airport land use plan area. Furthermore, SR Policy 1.1.7, SR Policy 1.1.8, and SR Policy 1.1.9 of the proposed PMPU would require future development within an ALUCP review area to be sited and designed to minimize potential safety risks. The policies would restrict development of any project that would cause hazards to air

navigation located within airport approach and departure areas or known flight patterns within the application AIA, and thus would alleviate potential safety hazards and excessive noise for people working within the proposed PMPU area.

Impact Determination and Mitigation

Implementation of the proposed PMPU would occur within three airport land use plan areas, but would not result in a potential safety hazard or excessive noise for people working within the proposed PMPU area.

Threshold 6: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Impact Analysis

Construction

Emergency response and evacuation are the responsibility of the police and fire protection service providers, as detailed in Section 4.12, *Public Services and Recreation*. The District's Harbor Police Department provides waterside and landside law enforcement as well as marine firefighting services in and around the Bay for the District. Because the proposed PMPU area encompasses several jurisdictions, the police and fire departments of these jurisdictions also provide services to the landside portions of the proposed PMPU area. The County of San Diego Office of Emergency Services Operational Area Emergency Operations Plan facilitates cooperation and communication between jurisdictions and agencies throughout the County. Each jurisdiction is encouraged to adopt the Operational Area Emergency Operations Plan with specific modifications as needed (County of San Diego 2018). The District has developed an Emergency Operations Plan and supplemental preparedness plans in accordance with the SEMS and NIMS, the State and Federal emergency response standards, respectively.

Buildout of the proposed water and land uses is anticipated to increase visitors to the proposed PMPU area by facilitating an increase in public access, commercial recreational development, and expanding and enhancing recreational open space. Primary uses could include, but are not limited to, anchorage areas, overnight accommodations, recreational berthing and mooring, or ferry craft and water transportation landing. Future development or redevelopment projects associated with the proposed PMPU could include construction activities that have the potential to temporarily obstruct or interfere with emergency response by vehicle, helicopter, or vessel due to the presence of large construction equipment or the temporary partial closure of roadways.

In addition, planning district standards would allow for the realignment or redevelopment of existing roadways and driveways, which could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. Each future PMPU-related project would be required to comply with specific requirements set forth by the agencies responsible for emergency response at the future project site, as well as the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU. Furthermore, SR Policy 2.1.1, SR Policy 2.1.4, SR Policy 2.1.5, SR Policy 2.1.6, and SR Policy 2.1.7 would further reduce potential hazards related to conflicts with emergency response and evacuation plans because these policies ensure the District would

maintain and update all other emergency response and mitigation plans and regional or cross-jurisdictional response plans to be accurate and up-to-date. Future development allowed under the PMPU would be compliant with all applicable emergency response plans and measures. If construction activities of future projects would affect the roadways of adjacent local jurisdictions, those projects would be required to comply with traffic control regulations as stipulated by the appropriate jurisdiction and would be required to obtain a permit from the jurisdiction with authority over the roadway. In the City of San Diego, Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way, including sidewalks, as well as an accompanying traffic control plan. The City of Imperial Beach requires a Temporary Encroachment Permit for any work performed in any public right-of-way of the city (Municipal Code Section 12.04.020). City of Coronado Municipal Code Section 52.10 requires a Right-of-Way Permit for all work on public property, such as repairs to sidewalks, curbs and gutters, driveway aprons, and parkways (the area between the sidewalk and the curb), or to place equipment in the public right-of-way, such as a crane placed in the street to transport materials to an upper story (see Section 4.14.3.3 of Section 4.13, *Transportation, Circulation, and Mobility*, for more details). In addition, construction within State highway rights-of-way would require a Caltrans Encroachment Permit, which includes a Traffic Control Plan in compliance with the *Manual on Uniform Traffic Control Devices* (Traffic Control Plans Part 6). As part of these requirements, there are provisions for coordination with local emergency services, training for flagmen for emergency vehicles traveling through the work zone, temporary lane separators that have sloping sides to facilities crossover by emergency vehicles, and vehicle storage and staging area for emergency vehicles (see also Section 4.12, *Public Services and Recreation*, for further discussion). Therefore, compliance with the Operational Area Emergency Operations Plan, the District's Emergency Operations Plan, and supplemental plans, as well as compliance with applicable traffic control regulations, would ensure that necessary detours and safety plans are implemented. Therefore, potential impacts related to interference with an emergency response plan or emergency evacuation as a result of construction activities would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 6.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with applicable emergency plans and traffic control regulations, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the potential to impair or interfere with an existing emergency response plan or emergency evacuation plan.

Construction activities associated with the new Waterfront Destination Park would involve the closure of a roadway and could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. However, implementation of Option 1 would occur in compliance with the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU, as well as with City of San Diego Municipal Code Section 129.0702, which requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects. Compliance with these regulations would ensure consistency with the existing emergency response plans. Thus, construction under Option 1 would not result in any additional or more severe impacts related to impairment of an existing emergency response plan than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with applicable emergency plans and traffic control regulations, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the potential to impair or interfere with an existing emergency response plan or emergency evacuation plan.

Construction activities associated with the expanded Lane Field Setback Park could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. However, implementation of Option 2 would occur in compliance with the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU, as well as with City of San Diego Municipal Code Section 129.0702, which requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects. Compliance with these regulations would ensure consistency with the existing emergency response plans. Thus, construction under Option 2 would not result in any additional or more severe impacts related to impairment of an existing emergency response plan than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with applicable emergency plans and traffic control regulations, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact associated with the potential to impair or interfere with an existing emergency response plan or emergency evacuation plan.

Construction activities associated with the new park space that could be developed under Option 3 could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. However, implementation of Option 3 would occur in compliance with the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU, as well as with City of San Diego Municipal Code Section 129.0702, which requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects. Compliance with these regulations would ensure consistency with the existing emergency response plans. Thus, construction under Option 3 would not result in any additional or more severe impacts related to impairment of an existing emergency response plan than buildout of the proposed PMPU without Option 3.

Operation

Planning district standards would allow for roadway and driveway realignment in several planning districts in order to facilitate efficient circulation for vehicles, pedestrians, and bicycles. In addition, implementation of the proposed PMPU would result in the development of several types of primary and secondary uses, including, but not limited to, commercial, visitor-serving, and maritime industrial uses in all of the planning districts. This development would increase connectivity to the waterfront and is anticipated to result in an increase in guests and visitors to the proposed PMPU area. When future development or redevelopment projects are designed, they must comply with the safety standards of each applicable jurisdiction responsible for issuing building permits for the project. In addition, future projects would be required to incorporate acceptable driveway widths for emergency response vehicles, and provide sufficient emergency evacuation routes for the users of the project. The future development would be required to comply with any specific requirements by the police and fire agencies regarding emergency access prior to project approval. Furthermore, future development would be required to operate in compliance with the District's Emergency Operations Plan and supplemental preparedness plans. Therefore, impacts during operation would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 6.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the PD3, North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with applicable emergency plans and traffic control regulations, implementation of the proposed PMPU would result in a less-than-significant impact associated with the potential to impair or interfere with an existing emergency response plan or emergency evacuation plan.

Construction activities associated with the new Waterfront Destination Park would involve the closure of a roadway and could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. However, implementation of Option 1 would occur in compliance with the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU, as well as with City of San Diego Municipal Code Section 129.0702, which requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects. Compliance with these regulations would ensure consistency with the existing emergency response plans. Thus, construction under Option 1 would not result in any additional or more severe impacts related to impairment of an existing emergency response plan than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with applicable emergency plans and traffic control regulations, implementation of the proposed PMPU would result in a less-than-significant impact associated with the potential to impair or interfere with an existing emergency response plan or emergency evacuation plan.

Construction activities associated with the expanded Lane Field Setback Park could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. However, implementation of Option 2 would occur in compliance with the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU, as well as with City of San Diego Municipal Code Section 129.0702, which requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects. Compliance with these regulations would ensure consistency with the existing emergency response plans. Thus, construction under Option 2 would not result in any additional or more severe impacts related to impairment of an existing emergency response plan than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with applicable emergency plans and traffic control regulations, implementation of the proposed PMPU would result in a less-than-significant impact associated with the potential to impair or interfere with an existing emergency response plan or emergency evacuation plan.

Construction activities associated with the new park space that could be developed under Option 3 could temporarily block emergency access by vehicle or by helicopter, or evacuation routes during construction. However, implementation of Option 3 would occur in compliance with the requirements of the District's emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3 to be implemented as part of the proposed PMPU, as well as with City of San Diego Municipal Code Section 129.0702, which requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects. Compliance with these regulations would ensure consistency with the existing emergency response plans. Thus, construction under Option 3 would not result in any additional or more severe impacts related to impairment of an existing emergency response plan than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

None of the proposed PMPU Element policies would result in impacts related to impairing implementation of or physically interfering with an adopted emergency response plan or emergency evacuation plan. Furthermore, proposed PMPU policies would further reduce potential hazards related to conflicts with emergency response and evacuation plans because these policies ensure the District would maintain and update all other emergency response and mitigation plans and regional or cross-jurisdictional response plans to be accurate and up-to-date. Future development under the PMPU would comply with all noted emergency response plans and measures. Thus, these policies would minimize potential impacts related to the interference with or impairment of adopted emergency response plans due to the implementation of the proposed PMPU.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant, and no mitigation is required.

4.7.5 Cumulative Impact Analysis

A significant cumulative impact on hazards and hazardous materials would result if the proposed PMPU were to make a cumulatively considerable contribution to cumulative impacts related to the creation of a significant hazardous materials impact on the public or environment; hazardous materials emissions; being located on a listed hazardous materials site; safety hazards related to airport operations; and interference with an adopted emergency response plan when evaluated within the context of past, present, and probable future projects with related impacts.

4.7.5.1 Geographic Scope

The geographic scope for cumulative impacts associated with hazards and hazardous materials consists of areas that could be affected by implementation of the water and land use designations and policies of the PMPU, as well as areas affected by the future development allowed under the PMPU. In general, projects occurring within 0.25 mile of the proposed PMPU area were considered in this analysis due to the localized nature of potential impacts associated with the release of hazardous materials in the environment.

4.7.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Table 2-2 in Chapter 2, *Environmental Setting*, includes past, present, and probable future plans and programs in the vicinity of the proposed PMPU area. The Midway-Pacific Highway Community Plan Update, the City of Imperial Beach 2019 General Plan/Local Coastal Program Land Use Plan Update, the National City Bayfront Projects and Plan Amendments, the Chula Vista Bayfront Master Plan project, the Seaport San Diego project, the San Diego International Airport Development Plan, the San Diego County Regional Airport Authority Naval Air Station North Island Airport Land Use Compatibility Plan, and the SANDAG 2021 Regional Plan are located either within the proposed PMPU area or within 0.25 mile of the proposed PMPU area, and could have the potential to contribute to cumulative effects related to hazards and hazardous materials.

Present and probable future projects within the cumulative study area could disturb or result in the exposure of hazardous materials during construction activities. Ground disturbance during construction could encounter historic unauthorized releases of hazardous materials in soils, sediment, or groundwater or could encounter lead or organochlorine pesticides that have leached into soil from aboveground historic uses. For projects having the potential to disturb or result in the exposure of hazardous materials, there would be a significant impact should one or more of the cumulative projects encounter hazardous materials. Implementation of mitigation measures during construction, similar to those identified for the PMPU, would be included to reduce potential impacts to a level below significance. These projects, like the PMPU, are required to comply with all Federal, State, and local laws and regulations regarding hazards and hazardous materials, including

those described in Section 4.7.3, which would reduce potential releases of hazardous materials into the environment to levels below that which would constitute a health hazard. However, disturbance of historic known contamination, previously unknown contamination, or other use of hazardous materials that could result in risk to the environment or the public, could result in significant impacts that require the implementation of mitigation (similar to the proposed Plan). Therefore, because development associated with cumulative projects could result in significant impacts, cumulative effects related to hazardous materials from past, present, and reasonably foreseeable future projects would be cumulatively significant.

Probable future projects associated with the cumulative plans and programs could be located within the AIA for SDIA and NOLF Imperial Beach, and may result in the development of structures within the AIA. These projects would be required to receive FAA and ALUC review and determination at the implementation of the project, and would implement any requirements to reduce safety hazards related to airport operations. Therefore, cumulative effects related to airport safety would not be cumulatively significant.

4.7.5.3 Project Contribution

Implementation of the future development allowed under the proposed PMPU would involve the use of typical construction- and maintenance-related hazardous materials that could potentially be released during transport, storage, use, or disposal activities. However, compliance with the mandatory existing laws and regulations that govern the transport, storage, use, and disposal of hazardous materials would minimize impacts. These regulations are enforced by the local CUPA (County DEH), DTSC, DOT, USCG, San Diego RWQCB, California Highway Patrol, and Caltrans; and all probable future projects that transport, store, use, or dispose of hazardous materials would be required to comply with the existing regulatory requirements and process. Therefore, implementation of the proposed PMPU would not result in a cumulatively considerable contribution to less-than-significant cumulative impacts associated with the transport, storage, use, or disposal of hazardous materials.

Based on the history of uses along the bayfront and the extent of known contamination within the proposed PMPU area, it is possible soil, groundwater, or sediment contaminated by historic unauthorized releases of hazardous materials or the common use of lead-based paint and organochlorine pesticides as termiticides, could be encountered during ground- or sediment-disturbing activities throughout the proposed PMPU area and released into the environment (**Impact-C-HAZ-1** [i.e., known contamination] and **Impact-C-HAZ-2** [i.e., undocumented contamination]) which would result in a cumulatively considerable contribution to a significant cumulative impact. Mitigation measures **MM-HAZ-1** and **MM-HAZ-2** would be required to assess potential for contamination at a future project site, and to ensure the safe handling of previously undiscovered contaminated soil, groundwater, or sediment if it is encountered (see **MM-HAZ-1** and **MM-HAZ-2**). Implementation of **MM-HAZ-1** and **MM-HAZ-2** would reduce the impact so that it would not be considered cumulatively considerable after mitigation. The HMTS prepared for this project identified open cases with ongoing investigation or remediation in PD1, PD2, PD3, and PD4. Future development that may occur at a location of an open case could result in a cumulatively considerable contribution prior to mitigation. Future development would be required to comply with mitigation measures to correctly characterize the conditions of the site and to develop a soil, groundwater, and/or sediment management plan if contaminated media is determined to be present on the site; and such projects would be required to safely characterize and handle

contaminated media for reuse, export, or disposal (**MM-HAZ-1**). Implementation of **MM-HAZ-1** would reduce the impact so that the contribution of future development under the PMPU to this impact would not be considered cumulatively considerable after mitigation.

Ground-disturbing construction may also encounter soil contaminated with lead or organochlorine pesticides (**Impact-C-HAZ-3**) which would be a significant cumulatively considerable impact without mitigation. In order to reduce potential impacts related to the accidental release of lead-contaminated soil or organochlorine pesticide-contaminated soil to the environment, future development involving soil disturbance within the immediate area of a building built prior to 1980 would be required to prepare an environmental site assessment to investigate potential contamination (**MM-HAZ-1**). If undocumented hazardous material associated with buildings built prior to 1980 is discovered during construction activities, **MM-HAZ-2** would be implemented to minimize potential risk to workers and the environment. Implementation of **MM-HAZ-1** and **MM-HAZ-2** would reduce the impact so that the contribution of future development under the PMPU to this impact would not be considered cumulatively considerable after mitigation.

Typical construction-related hazardous materials would be used during construction and operation of future development under the proposed PMPU. It is possible that these materials could be released in small amounts during construction or maintenance activities. However, compliance with Federal, State, and local regulations described in Section 4.7.3 would minimize impacts. Consequently, future development under the proposed PMPU is not expected to cause or contribute to a significant hazard to the public or the environment through upset and accident conditions because no new hazardous materials would be introduced at the project site and the existing regulatory framework would minimize potential impact from spills or releases of hazardous materials. As such, the proposed PMPU's contribution to cumulative significant impacts related to accidental release of hazardous materials would not be cumulatively considerable.

There are no schools within the proposed PMPU area boundaries, but there are four within 0.25 mile of one or more planning districts. Implementation of the proposed PMPU would not include the use of acutely hazardous materials, substances, or waste, and would not result in hazardous emissions within 0.25 mile of a school. As such, the proposed PMPU's contribution to cumulative impacts related to creating or causing hazardous conditions close to schools would not be cumulatively considerable.

As previously mentioned, the HMTS identified cases listed on hazardous materials site databases pursuant to Government Code Section 65962.5 (**Impact-C-HAZ-4**), which would be a significant impact without mitigation. Future development would be required to comply with **MM-HAZ-1** and **MM-HAZ-2** to correctly characterize the conditions of the site and to develop a soil, groundwater, and/or sediment management plan if contaminated media is determined to be present on the site; and such projects would be required to safely characterize and handle contaminated media for reuse, export, or disposal. Implementation of **MM-HAZ-1** would reduce the impact so that the contribution of future development under the PMPU to this impact would not be considered cumulatively considerable after mitigation. Therefore, the proposed PMPU's contribution to the cumulative significant impacts related to being located on or near a site listed pursuant to Government Code Section 65962.5 would not be cumulatively considerable.

The proposed PMPU could result in future development projects that would be located within the AIA for SDIA, NASNI, or NOLF Imperial Beach. However, the future development would be required by Federal and State law to obtain FAA approval and ALUC review and determination of

construction and operation structures. Future development also would be required to implement any requirements identified in the ALUC and FAA determinations. Therefore, the proposed PMPU's contribution to cumulative impacts related to creating or causing a hazard to occur due to proximity to an airport would not be cumulatively considerable.

Construction and operation of future PMPU-related development would be required to comply with specific requirements set forth by the agencies responsible for emergency response at the future project site. If future PMPU-related development would affect the roadways of adjacent local jurisdictions, those projects would be required to comply with emergency plans and traffic control regulations as stipulated by the appropriate jurisdiction and would be required to obtain a permit from the jurisdiction with authority over the roadway. In addition, future development would be required to incorporate acceptable driveway widths for emergency response vehicles and comply with specific requirements by emergency response agencies as a condition of project approval. Therefore, implementation of the proposed PMPU would not impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan, and its contribution to cumulative impacts on emergency and/or evacuation plans would not be cumulatively considerable.

Therefore, hazardous materials and hazards impacts from PMPU-related construction and operation activities would be minimized through existing regulations, oversight by the applicable agencies, and the incorporation of mitigation measures. As such, when combined with past, present, and probable future projects' hazardous material impacts, the proposed PMPU's contribution would be less than cumulatively considerable.

4.7.5.4 Cumulative Impact Determination and Mitigation

Significant Impacts

Implementation of the proposed PMPU would result in a cumulatively considerable contribution to cumulative hazards and hazardous materials impacts (**Impact-C-HAZ-1** through **Impact-C-HAZ-4**).

Mitigation Measures

For **Impact-C-HAZ-1**:

Implement **MM-HAZ-1: Conduct an Environmental Site Assessment, Prepare a Remediation Plan, and Remediate Accordingly**, as specified under Threshold 2.

For **Impact-C-HAZ-2**, **Impact-C-HAZ-3**, and **Impact-C-HAZ-4**:

Implement **MM-HAZ-1**, as specified under Threshold 2.

Implement **MM-HAZ-2: Identify Unknown Hazardous Materials Encountered During Construction**, as specified under Threshold 2.

Level of Significance After Mitigation

As discussed above, the PMPU's incremental contribution to cumulative hazard and hazardous materials impacts would not be cumulatively considerable after mitigation and would be less than significant.

This page was intentionally left blank.

Section 4.8

Hydrology and Water Quality

4.8.1 Overview

This section describes the existing conditions and laws and regulations for hydrology and water quality, followed by an analysis of the proposed Port Master Plan Update's (PMPU's) potential to: (1) violate water quality standards or waste discharge requirements; (2) substantially decrease groundwater supplies; (3) substantially alter existing drainage patterns; (4) risk release of pollutants due to inundation from seiche, tsunami or flooding; and (5) conflict with the water quality control plan or sustainable groundwater management plan. Sea level rise and the PMPU's potential to exacerbate its effects are addressed in Section 4.13, *Sea Level Rise*.

Other hydrology and water quality issues identified in Appendix G of the California Environmental Quality Act (CEQA) Guidelines, including impacts on housing within a 100-year flood hazard area and exposure of people or structures to flooding as a result of the failure of a levee or a dam, were addressed in Section IX of the Initial Study/Environmental Checklist (Appendix A) and were determined to be less than significant. The analysis and conclusions regarding these impacts are also summarized in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*.

Table 4.8-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.8.4.4, *Project Impacts and Mitigation Measures*.

Table 4.8-1. Summary of Significant Hydrology and Water Quality Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-WQ-1: Disturbance of Contaminated Sediment During Construction	PD1, PD2, PD3, PD4	MM-WQ-1: Monitor Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance MM-WQ-2: Implement Best Management Practices During Construction-Related Sediment Disturbance MM-WQ-3: Apply Silt Curtains During Construction-Related Sediment	Significant and Unavoidable	MM-WQ-1 would require monitoring of water quality during construction where contaminants have been identified, and would ensure work would be halted if water quality objectives are violated. MM-WQ-2 would minimize resuspension, spillage, and misplaced sediment. MM-WQ-3 would require the use of silt curtains during dredging areas within constituents of concern (COCs). MM-WQ-4 would ensure dredging would be conducted while minimizing resuspension of contaminated sediments and ensure the proper disposal

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
		Disturbance with Contaminants of Concern MM-WQ-4: Implement a Dredging Management Program MM-WQ-5: Implement a Sediment Management Program MM-WQ-6: Implement Post-Construction Dredging Remediation MM-WQ-7: Remove and Dispose of Creosote Piles Properly		of contaminated sediments. MM-WQ-5 requires the preparation of a Sediment Management Program, and MM-WQ-6 requires remediation of a project site if sampling confirms exceedances of <u>preconstruction</u> COC levels after completion of a project. MM-WQ-7 would minimize potential exposure to creosote-treated piles during removal. However, it would still be possible that in-water construction could disturb contaminated sediment and release COCs to the water column. Additionally, approval of in-water construction methods is in the jurisdiction of both the District and RWQCB, so the District would not have sole authority to approve or reject such methods. As such, Impact-WQ-1 would remain significant and unavoidable.
Impact-WQ-2: Contribution to Water Quality Impairments from Future Marina Operations	<u>PD1</u> , PD2, PD3, PD9, PD10	MM-WQ-8: Prepare and Implement a Marina Best Management Practice Plan and Copper Reduction Measures	Significant and Unavoidable	MM-WQ-8 would reduce inputs of total and dissolved copper from vessel activity at marinas; however, the net increase in the number of vessels with copper-based paints would result in a significant and unavoidable impact.
Impact-WQ-3: Water Quality Degradation from Aquaculture Operations	All planning districts	MM-WQ-9: Conduct Water Quality Monitoring of Aquaculture Operations	Less than Significant	MM-WQ-9 would require future aquaculture operations to develop an aquaculture water quality monitoring plan that would require water quality monitoring before, during, and after aquaculture operations. The impact would be reduced to less than significant.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-WQ-1: Cumulative Disturbance of Contaminated Sediment During Construction	PD1, PD2, PD3, PD4	MM-WQ-1, MM-WQ-2, MM-WQ-3, MM-WQ-4, MM-WQ-5, MM-WQ-6, MM-WQ-7, as described above	Cumulatively Considerable and Unavoidable	MM-WQ-1 would require monitoring of water quality during construction where contaminants have been identified, and would ensure work would be halted if water quality objectives are violated. MM-WQ-2 would minimize resuspension, spillage, and misplaced sediment. MM-WQ-3 would require the use of silt curtains during dredging areas within COCs. MM-WQ-4 would ensure dredging would be conducted while minimizing resuspension of contaminated sediments and ensure the proper disposal of contaminated sediments. MM-WQ-5 requires the preparation of a Sediment Management Program, and MM-WQ-6 requires remediation of a project site if sampling confirms exceedances of <u>preconstruction COC levels</u> after completion of a project. MM-WQ-7 would minimize potential exposure to creosote-treated piles during removal. However, it would still be possible that in-water construction could disturb contaminated sediment and release COCs to the water column. Additionally, approval of in-water construction methods is in the jurisdiction of both the District and RWQCB, so the District would not have sole authority to approve or reject such methods. As such, Impact-WQ-1 would remain cumulatively considerable and unavoidable.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-WQ-2: Cumulative Contribution to Water Quality Impairments from Future Marina Operations	PD2, PD3, PD9, PD10	MM-WQ-8 , as described above	Cumulatively Considerable and Unavoidable	Although MM-WQ-8 would reduce inputs of total and dissolved copper from vessel activity at marinas, the net increase in the number of vessels with copper-based paints would result in a cumulatively considerable and unavoidable impact.
Impact-C-WQ-3: Cumulative Water Quality Degradation from Aquaculture Operations	All planning districts	MM-WQ-9 , as described above	Less than Cumulatively Considerable	MM-WQ-9 would require future aquaculture operations to develop an aquaculture water quality monitoring plan that would require water quality monitoring before, during, and after aquaculture operations.

4.8.2 Existing Conditions

This section describes the existing hydrology and water quality setting of the proposed PMPU area. Section 4.8.2.1 describes surface water hydrology related to local drainage conditions (i.e., storm water drainage or flooding resulting from direct rainfall) and flood hazards (i.e., flood hazard zones determined by the Federal Emergency Management Agency). Section 4.8.2.2 describes flood hazards related to storm surges, tsunamis, and seiches. Water quality is discussed in Section 4.8.2.3.

4.8.2.1 Surface Water Hydrology and Flood Hazards

The proposed PMPU area generally includes dense urban development and associated infrastructure (e.g., roads, sidewalks, gutters); therefore, much of the drainage area can be classified as highly impervious. San Diego Bay is the receiving water body for surface flow from much the proposed PMPU area. See Figure 4.8-1 for the surface water hydrological units in the PMPU area. The planning districts are underlain by city, San Diego Unified Port District (District), and other storm drain lines and conveyances that discharge to the Bay.

The Federal Emergency Management Agency (FEMA) has mapped zones of anticipated flooding using base flood elevations for 100-year flood events, as presented on the agency's Flood Insurance Rate Maps (FIRMs). Areas that are subject to 100-year flood events within each planning district are identified as 11 percent Annual Chance Flood Hazard Zones; moderate flood hazard areas are between the base flood and 500-year flood and are identified as 0.2 percent Annual Chance Flood Hazard Zones, as shown on Figures 4.8-2 through 4.8-9.

A general description of the existing drainage patterns and flood hazards (riverine and coastal) within each planning district is provided below.

Planning District 1: Shelter Island

The Shelter Island Planning District (PD1) is located within the northwest portion of the jurisdiction. Much of the stormwater within PD1 is collected by inlets, and it flows through conveyance structures and discharges into San Diego Bay through outfall structures, many of which are subject to tidal inundation. Existing drainage features within PD1 can be found on Figure 4.8-2.

Areas that are subject to 100-year flood events within PD1 include the boat marinas. Moderate flood hazard areas include the landside perimeter of Shelter Island Drive, the intersection of Anchorage Lane and Canon Street, the La Playa Trail, Qualtrough Street, and an area approximately 100 feet north of America's Cup Harbor. In addition, flooding is known to occur at the intersection of Anchorage Lane and Canon Street during periods of combined rainfall and high tide. FEMA flood zones within PD1 are shown on Figure 4.8-2.

Planning District 2: Harbor Island

The Harbor Island Planning District (PD2) is situated in the northern portion of the District's jurisdiction. Much of the stormwater within PD2 is collected by inlets, and it flows through conveyance structures before discharging into San Diego Bay through outfall structures, which are subject to tidal inundation. Existing drainage features within PD2 can be found on Figure 4.8-3.

Areas that are subject to 100-year flood events within PD2 include the boat marinas. Moderate flood hazard areas include a portion of North Harbor Drive along the eastern boundary of PD2. Areas between North Harbor Drive and Laurel Street to Pacific Coast Highway are known to flood during storms and high tides. This flooding occurs under existing conditions because stormwater runoff from the watershed upstream of the site is collected into storm drains that convey the runoff from the steep slope to more level ground. The leveled portion of the pipe, which occurs west of Interstate I-5, does not have capacity due to its sloped origin and becomes pressurized. When combined with a high tide event, pipe capacity is further affected, and the runoff conveyed from upstream emerges out of any openings such as catch basins. This area is considered an existing local drainage hazard and is not a mapped FEMA floodplain. FEMA flood zones within PD2 are shown on Figure 4.8-3.

Planning District 3: Embarcadero

The Embarcadero Planning District (PD3) is located within the northeast portion of the District's jurisdiction. Much of the stormwater within PD3 is collected by inlets, and it flows through conveyance structures and discharges into San Diego Bay through outfall structures, which are subject to tidal inundation. Existing drainage features within PD3 can be found on Figure 4.8-4.

Areas that are subject to 100-year flood events within PD3 include the San Diego Marriott Marquis boat marina and commercial docks in the northern portion of the planning district. Moderate flood hazard areas include a portion of North Harbor Drive along the northern perimeter of the planning district. FEMA flood zones within PD3 are shown on Figure 4.8-4.

Planning District 4: Working Waterfront

The Working Waterfront Planning District (PD4) is situated within the east-central portion of the District's jurisdiction. Much of the stormwater within the Tenth Avenue Marine Terminal (TAMT) is collected by inlets, and it flows through conveyance structures and discharges into San Diego Bay through outfall structures, which are subject to tidal inundation. Existing drainage features within PD4 can be found on Figure 4.8-5.

Areas that are subject to 100-year flood events within PD4 include the boat docks, the northeast portion of the TAMT and adjacent railroad, and a portion of the General Dynamics National Steel and Shipbuilding Company (NASSCO) facility along the southern boundary of the planning district. Moderate flood hazard areas include a portion of the railroad on the northern boundary. The NASSCO facility in the southern portion is identified predominantly as an area of undetermined flood hazard. Switzer Creek has an identified FEMA special flood hazard area (SFHA) of Zone A. Zone A includes areas subject to inundation by the 1 percent annual chance flood event generally determined using approximate methodologies. FEMA flood zones within PD4 are shown on Figure 4.8-5.

Planning District 7: South Bay

The South Bay Planning District (PD7) is situated within the southern portion of the District's jurisdiction. There are no developed lands within PD7, and storm drain inlets are limited to roadway drainage associated with Silver Strand Boulevard. Some stormwater discharges as sheet flow into San Diego Bay. Existing drainage features within PD7 can be found on Figure 4.8-6.

The majority of PD7 is subject to 100-year flood events. A portion of the southeast boundary is within a regulatory floodway. There are no moderate flood hazard areas within the planning district. FEMA flood zones within PD7 are shown on Figure 4.8-6.

Planning District 8: Imperial Beach Oceanfront

The Imperial Beach Oceanfront Planning District (PD8) is situated within the southwest portion of the District's jurisdiction. Much of the stormwater within PD8 is collected by inlets, and it flows through conveyance structures and discharges into the Pacific Ocean through outfall structures, which are subject to tidal inundation. Existing drainage features within PD8 can be found on Figure 4.8-7.

Areas that are subject to 100-year flood events within PD8 include a portion of the pier and the beach. Moderate flood hazard areas include the beach. FEMA flood zones within PD8 are shown on Figure 4.8-7.

Planning District 9: Silver Strand

The Silver Strand Planning District (PD9) is located within the southwest portion of the District's jurisdiction. Much of the stormwater within PD9 is collected by inlets, and it flows through conveyance structures and discharges into San Diego Bay through outfall structures, which are subject to tidal inundation. Existing drainage features within PD9 can be found on Figure 4.8-8.

Areas that are subject to 100-year flood events within PD9 include the boat marinas. Land area within PD9 is designated as an *Area of Minimal Flood Hazard*. FEMA flood zones within PD9 are shown on Figure 4.8-8.

Planning District 10: Coronado Bayfront

The Coronado Bayfront Planning District (PD10) is within the west-central portion of the District's jurisdiction. Much of the stormwater within PD10 is collected by inlets, and it flows through conveyance structures and discharges into San Diego Bay through outfall structures, which are subject to tidal inundation. Existing drainage features within PD10 can be found on Figure 4.8-9.

Areas that are subject to 100-year flood events within PD10 include boat marinas and portions of the shoreline. Moderate flood hazard areas include portions of the shoreline within the planning district. The FEMA flood zones within PD10 are shown on Figure 4.8-9.

4.8.2.2 Storm Surges, Storm Tides, Tsunamis, and Seiches

Storm surge is an abnormal rise of water generated by a storm, over and above the predicted astronomical tides. Storm surge should not be confused with *storm tide*, which is defined as the water level rise due to the combination of storm surge and the astronomical tide. This rise in water level can cause extreme flooding in coastal areas, particularly when storm surge coincides with normal high tide (NOAA 2020).

A *tsunami* is a series of extremely long-period waves caused by a large and sudden displacement of the ocean, usually the result of an earthquake below or near the ocean floor. A *seiche* is an oscillation of the surface of an enclosed body of water. Seiches may be triggered by strong winds, changes in atmospheric pressure, earthquakes, tsunamis, or tides.

The planning districts are adjacent to and within San Diego Bay, which includes areas of semi-enclosed water basins. As shown on Figure 4.8-10, each planning district is partially within a designated tsunami hazard zone; the waterside portion is entirely within the tsunami hazard zone, and a small portion of the landside frontage of the planning districts at some locations is within the designated tsunami hazard zone (Department of Conservation 2009). Furthermore, the County of San Diego tsunami map identifies portions of the planning districts as being within a potential tsunami flood area (County of San Diego 2016). In addition, the large water body of the Bay experiences tidal changes and, therefore, may encounter flooding from storm surges and storm tides. In sum, the planning districts are within or adjacent to areas that may encounter storm surges, storm tides, tsunamis, and seiches.

4.8.2.3 Surface and Waterbody Water Quality

The San Diego region is divided into 11 hydrologic units (HUs) for administrative purposes. Each of the HUs flows from elevated regions in the east to lagoons, estuaries, or bays in the west. The PMPU area is within three HUs: Pueblo San Diego (908.00), Otay (910.00), and Tijuana (911.00). Table 4.8-2 shows the hierarchical structure of the HUs and water bodies for each of the planning districts. Figure 4.5-17 in Section 4.5, *Geology and Soils*, shows each HU in reference to the planning districts.

Table 4.8-2. Planning Districts Hydrologic Units and Water Bodies

Hydrologic Unit	Planning District	Water Bodies (and adjacent shorelines)
Pueblo San Diego (908.00)	PD1	San Diego Bay
		San Diego Bay Shoreline (Shelter Island Yacht Basin, Shelter Island Shoreline Park, America's Cup Harbor)
	PD2	San Diego Bay
		San Diego Bay Shoreline (Harbor Island-East Basin, Harbor Island-West Basin, Spanish Landing)
	PD3	San Diego Bay
		San Diego Bay Shoreline (Downtown Anchorage, Marriott Marina, Vicinity of B Street and Broadway Piers, G Street Pier)
	PD4	San Diego Bay
		San Diego Bay Shoreline (between Sampson and 28th Streets, near Chollas Creek, near Coronado Bridge, Switzer Creek)
		Switzer Creek
		Chollas Creek
Otay (910.00)	PD7	San Diego Bay
		Otay River
	PD8	Pacific Ocean Shoreline, Imperial Beach Pier
		Pacific Ocean
	PD9	San Diego Bay
		San Diego Bay Shoreline (Coronado Cays)
Tijuana (911.0)	PD10	San Diego Bay

		Pacific Ocean

Sources: San Diego RWQCB 2016, 2018.

As indicated within Chapter 3, *Project Description*, PD5 and PD6 are not part of the proposed PMPU and are not analyzed within this PEIR.

San Diego Bay, Chollas Creek, Otay River, Switzer Creek, and the Pacific Ocean are the main receiving water bodies for the planning districts (see Table 4.8-2).¹ Water quality in these receiving waters is influenced by processes and activities that take place within the Pueblo San Diego, Otay, and Tijuana

¹ Additional surface water bodies within the District's jurisdiction include Paradise Creek (PD5 and PD6), Paleta Creek (PD5), Sweetwater River (PD5 and PD6), and Telegraph Creek (PD6). However, these surface water bodies are not included within the boundaries of the proposed PMPU area.

watersheds.² Because the proposed PMPU area is primarily developed, surface water quality in the planning districts is affected directly by stormwater runoff from adjacent streets and highways, as well as industrial and commercial areas, and inputs from upstream that are off District Tidelands.

Primary Pollutants of Concern

The principal constituents of concern for surface water quality in the proposed PMPU area include metals, toxic substances, and indicator bacteria.³ On past occasions, stormwater runoff, urban runoff, and sewer spills have led to high concentrations of coliform bacteria, resulting in beach advisories in all of the HUs. A description of the health and environmental effects from exposure to the primary pollutants of concern is provided below.

Metals

- **Copper**, at low levels, is important for good health (copper is an essential element for plants and animals, including humans); however, high levels of copper can be harmful to health or the environment. In humans and mammals, copper is absorbed from the stomach and small intestine. In excess, copper exposure is associated with gastrointestinal distress, liver and kidney damage, anemia, and immunosuppression (ATSDR 2004). Effects of exposure to copper for laboratory mammals include decreased growth for mice and rats and reduced reproduction (reduced kit survival) for mink (NTP 1993; Aulerich et al. 1982; Dodds-Smith et al. 1992). Reduced growth and survival in fish and birds have also been reported from exposure to dietary copper (Jensen and Maurice 1978; Kang et al. 2005; Lanno et al. 1985; Mehring et al. 1960; Mount et al. 1994; Poupoulis and Jensen 1976; Smith 1969).
- **Lead** exposure is associated with neurological, renal, cardiovascular, hematological, immunological, reproductive, and developmental effects. There is a particular concern with lead exposure and the neurological effects in infants and children (ATSDR 2020). The exposure of mammals to high concentrations of lead in the diet has been reported to cause anemia, weight loss, muscle atrophy, paralysis, brain damage, mortality, and reproductive effects (Eisler 1988) and reductions in growth and survival for both fish and birds (Mount et al. 1994; Kendall and Scanlon 1982; Hoffman et al. 1985; Pattee 1984; Edens et al. 1976). Sublethal concentrations of lead can accumulate in blood and tissues, and higher-trophic-level organisms may experience adverse effects as a result of consuming prey with accumulated lead concentrations.
- **Mercury** exposure is associated with a number of toxic effects to humans and wildlife, including adverse effects on the kidneys and nervous system, growth, reproduction, blood and serum chemistry, motor coordination, vision, hearing, histology, metabolism and survival, and can have teratogenic effects (Eisler 1987; ORNL 1998). The U.S. Environmental Protection Agency (EPA) has identified mercury chloride and methylmercury as possible human carcinogens. Adverse effects on growth, reproduction, and survival have been observed in mink after dietary mercury exposure from fish consumption (Wobeser et al. 1976a, 1976b; Aulerich et al. 1974; Dansereau et al. 1999). Changes in behavior of fish and avian species (i.e., predator avoidance, motor

² The Chula Vista Bayfront (PD6) is located in the Sweetwater HU, but because it is not part of the proposed PMPU, it is not discussed in this existing setting.

³ A detailed summary and assessment of these pollutants and concentrations is available in the San Diego Bay Water Quality Improvement Plan 2019-2020 Annual Report, Appendix 4 (Monitoring Results and Assessments) and the Tijuana River Watershed Management Area 2016 Water Quality Improvement Plan. These documents are incorporated by reference, and weblinks are included in Chapter 9, *References*, of this PEIR.

coordination) have also been observed in laboratory studies following exposure to mercury (Bouton et al. 1999; Heinz 1975; Kania and O'Hara 1974; Kreitzer and Heinz 1974; Matta et al. 2001; Webber and Haines 2003); the significance of these behavior alternations on ecological populations in the wild are unknown.

- **Zinc** is an essential element; while low levels of zinc are important for good health, high levels of zinc can be harmful to health or the environment. Toxicity studies have shown adverse effects from ingestion of zinc by laboratory mammals including anemia, pancreatic and kidney impairment, decreased immune function, and reproductive effects, including infertility (ATSDR 2005). Exposure to dietary zinc has been associated with adverse effects on growth in fish and wildlife, reproductive parameters in mammals (Persia et al. 2004; Roberson and Schaible 1960; Schlicker and Cox 1968; Sutton and Nelson 1937; Straube et al. 1980; Takeda and Shimma 1977). Toxicity values are generally affected by the age and nutrient status of the organism, changes in the physicochemical regimen, and interactions with other chemicals, especially copper salts.

Toxic Substances

- **Polycyclic aromatic hydrocarbons (PAHs)** are a human health and environmental concern. The focus on toxicity for PAHs is for 16 PAHs.⁴ A number of studies show increased incidence of cancer (lung, skin, and urinary cancers) in humans exposed to PAH mixtures from inhalation or dermal exposure (ATSDR 1995). Many individual PAH compounds have been classified as probable or possible carcinogens by entities such as the National Toxicology Program and EPA (2018). Non-carcinogenic chronic effects of PAHs involve pulmonary, gastrointestinal, renal, and dermatologic systems in humans. The toxicity, carcinogenicity, and mutagenicity of PAHs vary with the molecular weight of the compound, the degree of alkylation, and the mode of accumulation (water, food or sediment) by the organism (Neff 1979; Moore and Ramamoorthy 1984). LPAHs generally have significant acute toxicity, whereas HPAHs do not. However, several HPAHs are known to be carcinogenic and cause chronic toxicity. Dietary exposure of PAHs in animals have been linked to immunosuppression and reproductive effects. In fish, exposure to PAHs is known to cause narcosis (a generalized toxic effect) and developmental abnormalities in embryos (Schultz 1989). Fish exposed to PAH contaminated sediments through direct contact have been shown to exhibit increased incidence of skin and liver lesions and other deformities (Myers et al. 1994; Pinkney et al. 2000).
- **Polychlorinated biphenyls (PCBs)** are persistent in the environment and exist in San Diego Bay sediments and surrounding areas at levels requiring regulatory action. Because of their stability and lipophilicity, PCBs bioaccumulate through the food chain, and are stored in fatty tissues. In San Diego Bay, the concentration of PCBs in fish tissue, particularly of high trophic level species, has led to the publishing of fish consumption advisories for recreational fish caught in the Bay. Data from human and laboratory mammal studies provides evidence of the toxic potential of exposure to PCBs (ATSDR 2000). Dietary consumption appears to be a major source of PCB accumulation in humans and wildlife. Epidemiological and laboratory studies indicate an association between dietary PCB exposures and both reproductive functions and developmental effects. PCBs also have the potential for toxicity from dermal and inhalation exposure. PCBs have been reported to elicit a broad range of toxic effects in laboratory

⁴ The 16 PAHs that are the focus for evaluating PAH toxicity are: 7 LPAHs (i.e., acenaphthene, acenaphthylene, anthracene, fluoranthene, fluorene, naphthalene, and phenanthrene) and 9 HPAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b/j)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and pyrene).

mammals, including lethality, hepatotoxicity, porphyria, body weight loss, dermal toxicity, thymic atrophy, immunosuppressive effects, reproductive and developmental effects, carcinogenesis, and neurotoxicity (Safe 1991, 1992, 1994, 1984; Seegal 1996; Silberhorn et al. 1990; WHO 1993; Battershill 1994). Adverse effects on growth, reproduction, and behavior have also been observed in fish and birds exposed to PCBs (Bengtsson 1980; Fernie et al. 2001; Hansen et al. 1974; Haseltine and Prouty 1980; Hugla and Thome 1999; Peakall and Peakall 1973; Platonow and Reinhart 1973). Exposure to some PCB mixtures by workers through inhalation or dermal contact in humans can result in respiratory tract symptoms, gastrointestinal effects, mild liver effects, and effects on the skin and eyes such as chloracne, skin rashes, and eye irritation (ATSDR 2000). EPA has classified PCBs as a Group B2, probable human carcinogen (EPA 2018).

- **Polychlorinated terphenyls (PCTs)** are similar to high chlorinated PCBs in that they are stable, and bioaccumulate through food webs and are ubiquitous in the environment, including soil, sediment, and biological tissues. Toxicity of PCTs is also similar to those of PCBs. Adverse effects associated with chronic exposure to PCTs include liver damage, incidence of tumors, endocrine disruption, immunosuppression, and other reproductive effects (Jensen and Jorgensen 1983). In laboratory studies, PCT exposure was associated with reduction in growth, liver toxicity, and developmental effects (WHO 1993).
- **Indicator Bacteria** serve as surrogates used to measure the potential presence of fecal material and associated fecal pathogens. Fecal bacteria, such as fecal coliform and *Enterococcus*, are from the intestinal flora of warm-blooded animals and their presence in surface water are used as an indicator of human pathogens. Pathogens can cause illness in recreational water uses, however the detection and enumeration of all pathogens present is impractical in most circumstances. Indicator bacteria may not cause illness directly, but have demonstrated characteristics that make them indicators of potentially harmful pathogens in waterbodies. For example, fecal coliform bacteria in high quantities suggest the presence of disease-carrying organisms. Waters with high levels of fecal coliform bacteria increase the chance of developing illness including fever, nausea or stomach cramps. Diseases and illnesses that can be contracted in water with high fecal coliform counts include typhoid fever, hepatitis, gastroenteritis, dysentery and ear infections.
- **Pesticide** exposure in humans, wildlife, fish and other aquatic animals can result in toxicological effects depending on the biological availability, concentration, biomagnification, and persistence of pesticides in the environment, as well as the exposure conditions. Pesticides can cause both acute and chronic adverse effects. Some pesticides, such as the organophosphates and carbamates, affect the nervous system. Others may irritate the skin or eyes, while some pesticides may be carcinogens and others may affect the hormone or endocrine system in the body. Pesticides such as DDT and dieldrin are documented to cause eggshell thinning and have reproductive effects in avian species.
- **Diazinon** is an insecticide that breaks down relatively quickly in the environment and therefore is not likely to accumulate in animal tissues (ATSDR 2008). Diazinon is highly toxic to terrestrial wildlife, freshwater fish and invertebrates, and insects (EPA 2008). Exposure to lower levels of diazinon in animals, including aquatic species, can cause non-lethal impacts on the central nervous system which can result in a variety of health effects (e.g., restlessness, depressed respiration, anxiety, depression, and seizures). Similarly, human health effects from exposure to diazinon may include neurological effects (e.g., nausea, dizziness, muscle twitching, etc.) although diazinon is also considered a potential endocrine disruptor. Applications of diazinon

have resulted in bird kills and high levels of exposure in laboratory studies have resulted in reduced survival, reduced growth and reproductive impairment (Eisler 1986).

Beneficial Uses

The San Diego Regional Water Quality Control Board (RWQCB), which establishes region-wide and water-body-specific beneficial uses in the San Diego Basin Plan, has set numeric and narrative water quality objectives for several pollutants as well as parameters for specific surface waters in its region. The beneficial uses for surface waters in each planning district are shown in Table 4.8-3.

Table 4.8-3. Beneficial Uses for Surface Waters or Water Bodies with the Potential to Be Affected by the PMPU

	Planning District(s)	Designated Beneficial Uses
San Diego Bay	PD1, PD2, PD3, PD4, PD7, PD9, PD10	Industrial service supply; navigation; contact recreation; non-contact recreation; commercial and sport fishing; preservation of biological habitats of special significance; estuarine habitat; wildlife habitat; rare, threatened, or endangered species; marine habitat; fish migration; fish spawning; and shellfish harvesting
Chollas Creek	PD4	Contact water recreation (potential use), non-contact recreation, warm freshwater habitat, and wildlife habitat
Switzer Creek	PD4	Contact water recreation (potential use), non-contact recreation, warm freshwater habitat, and wildlife habitat (identified based on beneficial uses of “unnamed intermittent coastal streams” because Switzer Creek is not identified by name in the Basin Plan)
Otay River	PD7	Industrial service supply (potential use), contact water recreation (potential use), agricultural supply, non-contact recreation, warm freshwater habitat, wildlife habitat, preservation of rare, threatened, or endangered species
Pacific Ocean	PD8	Industrial service supply; navigation; contact water recreation; non-contact recreation; commercial and sport fishing; marine habitat; wildlife habitat; aquaculture; preservation of biological habitats of special significance; rare, threatened, or endangered species; migration of aquatic organisms; spawning; reproduction; and/or early development and shellfish harvesting

Source: San Diego RWQCB 2011.

As indicated within Chapter 3, PD5 and PD6 are not part of the proposed PMPU and are not analyzed within this PEIR. Water bodies within these two planning districts include Paradise Creek, Telegraph Creek, and Sweetwater River.

Water Quality Impairments and Total Maximum Daily Loads

Section 303(d) of the Clean Water Act (CWA) requires that the states make a list of waters that are not attaining standards after technology-based limits are put into place. For waters on this list (“303(d) List”), the states must develop total maximum daily loads (TMDLs). A TMDL is a calculation of the loading capacity of a specific pollutant that can be assimilated by a water body without impairing its designated beneficial uses. The current 303(d) list for California is from 2016 (updated from the 2014 Integrated Report). No indication of the next update to the 303(d) list was located; therefore, information below represents the most up to date information.

San Diego Bay

The entire Bay is listed on the 303(d) list for impairments from PCBs, mercury, and PAHs.

PCBs were first listed for in 2006. Sources of PCBs include contaminated sediments, dredging, historic land uses, illegal dumping, spills, urban runoff, and other unknown sources. A health advisory is in effect against consuming certain fish due to elevated levels of PCBs in fillet tissue (CalEPA 2018).

Mercury was first listed in 2014. Sources of Mercury include contaminated sediments, historic land uses, urban runoff, atmospheric deposition, and other unknown sources. A health advisory is in effect against consuming edible resident fish due to elevated levels of mercury in fillet tissue.

PAHs were first listed in 2014. Sources of PAHs include fueling operations, presence of creosote-coated pilings, presence in stormwater runoff entering the Bay, and combustion of PAH-containing products including gasoline and diesel engines.

Planning District 1: Shelter Island

Planning District 1 contains a few areas with impaired water quality, and two TMDLs are currently in place. Levels of dissolved copper in the Shelter Island Yacht Basin have been found to exceed numeric water quality objectives for copper and narrative objectives for toxicity and pesticides. Total coliform, fecal coliform, and *Enterococcus* densities along 0.4 mile of impaired shoreline within Shelter Island Shoreline Park have been found to exceed water quality objectives as well. America's Cup Harbor is also impaired for copper.

TMDLs were developed to meet water quality objectives at Shelter Island Yacht Basin and Shelter Island Shoreline Park and protect beneficial uses, but a TMDL has not yet been developed for America's Cup Harbor.

Shelter Island Yacht Basin TMDL for Dissolved Copper

Levels of dissolved copper in Shelter Island Yacht Basin have been found to exceed numeric water quality objectives for copper and narrative objectives for toxicity and pesticides.

Resolution R9-2005-0019 was adopted by the San Diego RWQCB, which incorporated a TMDL for dissolved copper in the Shelter Island Yacht Basin portion of San Diego Bay. The primary sources of copper have been identified as the passive leaching of copper antifouling paint and the in-water cleaning of the hulls coated with copper antifouling paints. Copper discourages fouling organisms such as barnacles and algae, but also slowly leaches into the water column and may also be released from the hull as particles that fall to the sediment. The copper in the paint is registered in California by the Department of Pesticide Regulation as a biocide that leaches into the water, causing contamination that may be harmful to marine life (District 2018c).

This TMDL requires loading of dissolved copper into the water column to be reduced by 76 percent, from the baseline of 2,163 kilograms per year (kg/yr) to 520 kg/yr over a 17-year period (RWQCB 2005). This time period extends to 2022, based on the official Shelter Island Yacht Basin TMDL, approved on February 9, 2005. The TMDL requires incremental reductions in dissolved copper loading of 10 percent within 7 years (2012), 40 percent within 12 years (2017), and 76 percent within 17 years (2022).

Shelter Island Shoreline Park in San Diego Bay TMDL for Indicator Bacteria

Resolution R9-2008-0027 was adopted as an amendment to the Water Quality Control Plan for the San Diego Basin (Basin Plan) to incorporate the TMDL for indicator bacteria in Shelter Island Shoreline Park in San Diego Bay. Total coliform, fecal coliform, and *Enterococcus* densities along 0.4 mile of impaired shoreline within Shelter Island Shoreline Park have been found to exceed water quality objectives. Sources of indicator bacteria include municipal separate storm sewer system (MS4) discharges, urban runoff, and natural and background sources of bacteria under both wet and dry conditions.

Planning District 2: Harbor Island

The San Diego East and West Harbor Basins in PD2 are 303d listed as impaired for copper. In addition, PD2 activities include marina operations, which have been associated with elevated levels of copper and zinc. Former PD2 activities include industrial operations, which have been associated with PCB, Mercury, and other contamination.

As detailed in Section 4.7, *Hazards and Hazardous Materials*, PD2 has several sites with contaminated bay sediments subject to regulatory action.

The former Teledyne Ryan (TDY) site located in PD2 resulted in two impacted areas. The first area is the TDY Convair Lagoon site which was capped by TDY in 1998, and the cap is currently maintained and monitored by TDY pursuant to waste discharge requirements issued by the San Diego RWQCB. The second TDY impact site is located in PD3 and described in further detail below.

In addition, the RWQCB issued Cleanup and Abatement Order No. R9-2017-0021 to Lockheed Martin Corporation [rescinded and reissued as Cleanup and Abatement Order No. R9-2022-0007] to cleanup and abate the effects of waste discharged from the former Tow Basin and the former marine terminal and railway facilities into the San Diego East Basin. The RWQCB has also issued Investigative Order No. R9-2011-0064 to investigate bay sediments at the Sunroad Resort Marina based on the discharge of copper and zinc from boat hulls in the marina.

Planning District 3: Embarcadero

San Diego Bay at the B Street/Broadway Piers and Downtown Anchorage in PD3 is 303d listed as impaired by contaminated sediment (PCBs, PAHs, chlordane, and zinc), and Marriott Marina is 303d listed as impaired by copper due to passive leaching of copper antifouling paint and the in-water cleaning of hulls coated with copper antifouling paints.

In addition, as detailed in Section 4.7, PD3 has four areas with the potential for contaminated bay sediments where San Diego RWQCB Investigative Orders (IOs) were issued. One is the downtown anchorage area along Harbor Drive. This area is impacted by the contaminants of concern that include metals, volatile organic compounds (VOCs), PCBs, PAHs, and total petroleum hydrocarbons (TPH), which have impacted soil, soil vapor, groundwater, and bay sediments. A portion of the downtown anchorage area underwent remediation in 2018. Multiple investigations are underway.

PD3 also includes the former Campbell Shipyard remediation site, located south of Embarcadero Marina Park South and north of TAMT. This site was remediated in 2008. The remediation of contaminated sediments within this former shipyard was accomplished by capping to prevent the release of solvents, PCBs, and metals from previous shipyard activities that had impacted sediments and surface water.

Planning District 4: Working Waterfront

San Diego Bay near Chollas Creek and near Coronado Bridge in PD4 are both listed as 303d impaired for sediment toxicity. In addition, as detailed in Section 4.7, PD4 has three sites with the potential for contaminated bay sediments. These three sites recently underwent San Diego RWQCB-directed contaminated sediment investigations per IOs that were sent to responsible parties in 2017. These IOs are referred to as (from north to south): (1) TAMT IO, (2) Continental Maritime Shipyard IO, and (3) BAE-SDG&E IO. The contaminants of concern for these investigations are PCBs and PCTs, metals, PAHs, and pesticides. Site investigations included both in-bay and upland contaminant characterization. Site investigation results for all three IOs were reported to the San Diego RWQCB in 2019 and 2020. The RWQCB issued new IOs to these same parties in 2022.

Chollas Creek TMDL for Diazinon

Resolution R9-2002-0123 was adopted by the San Diego RWQCB, which incorporated a TMDL for the organophosphate pesticide diazinon in Chollas Creek Watershed. The San Diego RWQCB adopted the TMDL on August 14, 2002. The State Water Resources Control Board (SWRCB) approved the TMDL on July 16, 2003. Diazinon is an organophosphate insecticide common in indoor, residential, landscape, and agricultural applications. In 2004, the sale of diazinon was banned for residential applications. It has been reported that there were no diazinon exceedances of waste load allocations for several years following TMDL implementation (Chollas Watershed Comprehensive Load Reduction Plan, 2012). Urban stormwater flows appear to be a primary source of diazinon to Chollas Creek. A diazinon TMDL was developed to meet the toxicity water quality objective in Chollas Creek, ensuring that water quality with respect to diazinon supports the aquatic life beneficial uses of the creek.

Chollas Creek TMDLs for Dissolved Copper, Lead, and Zinc

On June 13, 2007, the San Diego RWQCB adopted Resolution No. 2008-0054 (Chollas Creek Metals TMDLs) to address issues related to the toxicity caused by metals, which affects aquatic life in Chollas Creek. The resolution approved an amendment to the Basin Plan to incorporate TMDLs for dissolved copper, lead, and zinc in Chollas Creek. Concentrations of copper and zinc during storm events have exceeded acute and chronic criteria, while concentrations of cadmium and lead have exceeded chronic, and periodically exceeded acute, criteria. This TMDL requires that loading of copper, lead, and zinc be reduced to meet the water quality objectives of the California Toxics Rule (CTR), within 20 years from the order's effective date. On February 8, 2017, the San Diego RWQCB adopted Resolution No. R9-2017-0015 amending the San Diego Basin Plan to incorporate site specific water effect ratios (WERs) into water quality objectives for toxic pollutants and TMDLs for copper and zinc in Chollas Creek. This Basin Plan Amendment was approved by the SWRCB on September 17, 2019 and by the Office of Administrative Law on March 5, 2020. The EPA approved the TMDL Basin Plan Amendment on March 26, 2020.

Twenty Beaches and Creeks TMDL for Indicator Bacteria (includes Chollas Creek)

On February 10, 2010, the San Diego RWQCB adopted Resolution No. R9-2010-0001, an amendment incorporating Revised Bacteria TMDLs Project I, which includes Chollas Creek, into the San Diego Basin Plan. This TMDL Basin Plan amendment was subsequently approved by the SWRCB on December 14, 2010. Fecal bacteria originate from the intestinal biota of warm-blooded animals, and their presence in surface water is used as an indicator of human pathogens. Full implementation of the TMDLs for indicator bacteria must be completed within 10 to 20 years from the effective date of

the Basin Plan amendment. The compliance schedule for implementing the load and waste load reductions required to achieve the wet weather and dry weather TMDLs is phased in over time.

Planning District 7: South Bay

Planning District 7 does not have open cases associated with bay water quality or bay sediment contamination, and there are no TMDLs in place.

Planning District 8: Imperial Beach Oceanfront

The coastal shoreline within PD8 has been identified as impaired with PCBs, indicator bacteria, and trash and is on the 303(d) list. Trash is being addressed by action other than TMDL (collective effort of public, agencies, organizations, and permittees) with methods that include street sweeping, education programs on littering, and installation of trash-catching devices on storm drains. Additionally, sewage infrastructure inadequacies in the Tijuana River Watershed have created recurring sewage pollution problems on both sides of the California/Mexico border. Sewage flows can degrade adjacent coastal waters and pose public health risks. Sewage flows from the Tijuana River Watershed impact PD8. Recent events related to sewage releases in the Tijuana River Watershed are described below.

- In February 2017 untreated sewage was released into the Tijuana River Valley via the main channel of the river.
- On March 2, 2017, the San Diego RWQCB's Executive Officer sent a letter to the U.S. and Mexican International Boundary and Water Commission (IBWC) in response to the large cross-border release of untreated sewage in February 2017. The letter included recommendations with respect to improved communication, infrastructure, and water quality monitoring.
- On April 3, 2017, the IBWC released an investigative report entitled *Report of Transboundary Bypass Flows into the Tijuana River*, which was produced in response to the February 2017 incident. It was determined that 28 million gallons of untreated sewage were discharged into the Tijuana River from February 6–23, 2017, while the Tijuana municipal utilities department (Comisión Estatal de Servicios Públicos de Tijuana, CESPT) made repairs to the sewage collection system in central Tijuana.
- On May 14, 2018, the San Diego RWQCB and the California Attorney General, on behalf of the people of California, filed a Notice of Intent to Sue the United States Section of the IBWC for violations of the Clean Water Act related to transboundary discharges of waste.
- On March 2, 2018, the District, the City of Imperial Beach, and the City of Chula Vista, filed a Notice of Intent to sue the United States Section of the IBWC for discharges without a National Pollution Discharge Elimination System (NPDES) Permit, discharges in violation of a NPDES Permit, and endangerment under the Resource Conservation and Recovery Act.
- On February 5, 2020, the San Diego RWQCB issued Investigative Order No. R9-2020-0030, which requires the United States Section of the IBWC to submit technical reports pertaining to the investigation of pollution, contamination, and nuisance from transboundary flows in the Tijuana River Valley.
- On May 12, 2021, the San Diego RWQCB adopted Tentative Order No. R9-2021-0001, reissuing Waste Discharge Requirements for the United States Section of the International Boundary and

Water Commission, South Bay International Wastewater Treatment Plant, Discharge to the Pacific Ocean through the South Bay Ocean Outfall, San Diego County (NPDES No. CA0108928).

- On May 12, 2021, the San Diego RWQCB also adopted the revised Tentative Cease and Desist Order (CDO) for the United States Section of the International Boundary and Water Commission (USIBWC) South Bay International Wastewater Treatment Plant (SBIWTP) discharge to the Pacific Ocean through the South Bay Ocean Outfall (Tentative CDO No. R9-2021-0107). The Tentative CDO addresses discharges from the South Bay International Wastewater Treatment Plant that are taking place in violation of the requirements of Order No. R9-2014-0009 and threatening to take place in violation of the requirements of Tentative Order No. R9-2021-001.

Planning District 9: Silver Strand

Planning District 9 includes Coronado Cays, which is impaired for copper from the passive leaching of copper antifouling paint and the in-water cleaning of hulls coated with copper antifouling paints. Planning District 9 does not have open cases associated with bay sediment contamination.

Planning District 10: Coronado Bayfront

Planning District 10 includes a copper impairment at Glorietta Bay, from the passive leaching of copper antifouling paint and the in-water cleaning of hulls coated with copper antifouling paints, as well as an impairment for indicator bacteria at Tidelands Park. Planning District 10 does not have open cases associated with bay sediment contamination.

Table 4.8-4 lists CWA Section 303(d)-listed receiving water bodies and associated pollutant impairments within the planning districts.

Table 4.8-4. 303(d)-Listed Impairments for Water Bodies Within the Planning Districts

Water Body	303(d)-Listed Impairments	Potential Source	Estimated TMDL Completion ¹
Baywide			
San Diego Bay	Organic compounds (PCBs), PAHs, Mercury	Contaminated Sediment, dredging, historic land management activities, illegal dumping, spills, urban runoff/storm sewers	2019
		Source unknown	2025
		Atmospheric deposition, contaminated sediments, historic land management, other urban runoff, and source unknown	2027
Planning District 1: Shelter Island			
Shelter Island Yacht Basin	Dissolved copper	Copper-based antifouling paints used on boats	February 9, 2005
Shelter Island Shoreline Park in San Diego Bay	Indicator bacteria	Urban runoff; stormwater runoff	June 11, 2008
San Diego Bay Shoreline (Americas Cup Harbor)	Metals (copper)	Copper-based antifouling paints used on boats	2019

Water Body	303(d)-Listed Impairments	Potential Source	Estimated TMDL Completion ¹
Planning District 2: Harbor Island			
San Diego Bay Shoreline (Harbor Island-East Basin)	Metals (copper)	Copper-based antifouling paints used on boats	2019

¹ The TMDL completion dates listed in this table represent the dates in which the San Diego RWQCB was to have adopted the TMDLs and not the completion of full implementation of the TMDL and subsequent reductions of pollutant loads.

4.8.2.4 Groundwater

Groundwater is the water found underground in the cracks and spaces in soil, sand, and rock. It is stored in and moves slowly through geologic formations of soil, sand, and rocks called aquifers. For the most part, groundwater within the region occurs in alluvial aquifers, residuum (crystalline bedrock that has weathered in place), aquifers composed of semi-consolidated or consolidated sediments, and fractured crystalline rock. Sources of groundwater recharge in the region include creeks, precipitation, discharges from treatment plants, underflow from dams, and return flow.

The proposed PMPU area is within the Mission Valley Groundwater Basin and Coastal Plain of San Diego Groundwater Basin.⁵ The Mission Valley Groundwater Basin underlies an east-west trending valley, which empties into the San Diego River. The basin is bounded by the contacts of alluvium with the semi-permeable San Diego and Poway Formations and the impermeable Lindavista Formation. The southwestern boundary is the San Diego Bay. The average well production is about 1,000 gallons per minute (gpm), and the average specific yield is about 15 percent (DWR 2004a). Planning District 2 and a portion of PD3 are within the Mission Valley Groundwater Basin.

In 2016, Sweetwater Authority and City of San Diego Public Utilities Department collectively submitted an application to the State Department of Water Resources (DWR) to recognize the San Diego Formation aquifer system as an official groundwater basin of the state, and to consolidate into that basin the boundaries of three DWR-recognized alluvial groundwater basins: Lower Sweetwater River Valley, Otay River Valley, and Tijuana River Valley. DWR approved the application, and designated the new consolidated basin as the Coastal Plain of San Diego Basin (Basin 9-033) (DWR 2018a). The Coastal Plain of San Diego groundwater basin underlies the Cities of San Diego, National City, Chula Vista, Imperial Beach, and San Ysidro in southwestern San Diego County. The basin boundary represents the area underlain by the San Diego Formation. The basin is bound on the west by San Diego Bay and the Pacific Ocean. The basin is bound on the south by the international border with Mexico and is bound on the north by the alluvium of the Mission Valley Basin. The basin is bound on the east by the La Nacion fault and the lateral extents of the San Diego Formation and the alluvial areas in Otay Valley and Sweetwater Valley. The surface waters are drained westerly towards the Pacific Ocean by the Sweetwater River, the Otay River, the Tijuana River, and various creeks (DWR 2018b). A portion of PD3 and all of PD4, PD7, and PD8 are within the Coastal Plain of San Diego Groundwater Basin.

The groundwater quality in these basins is predominantly brackish. The coastal zone of San Diego County is mostly supplied with imported water from member agencies of the San Diego County Water Authority. Groundwater production is limited by a number of factors, including the limited geographic extent of the more productive sand and gravel (alluvial) aquifers, relatively shallow nature of most of the alluvial aquifers, lack of rainfall, and groundwater recharge and degraded water quality issues. Although groundwater opportunities are limited, groundwater is currently used to meet a portion of the municipal water demands outside of the District's jurisdiction.

Planning District 1: Shelter Island

Planning District 1 is located over the Mission Valley Groundwater Basin (Basin #9-14) in the San Diego Formation, as identified by the California Department of Water Resources, and is within the Pueblo San Diego HU. The average depth to groundwater within PD1 ranges from 4.78 to 9.26 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater within the Pueblo San Diego HU, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include Total Dissolved Solids (TDS) that exceed 3,000 milligrams per liter (mg/L) and basin contamination that cannot reasonably be treated for domestic use. The aquifer is regulated as a geothermal energy producing source, and the water source does not provide sufficient water to sustain a yield of 200 gallons per day (gpd).

⁵ Planning Districts 9 and 10 are not within a groundwater basin designated by DWR or in the San Diego Basin Plan.

Planning District 2: Harbor Island

Planning District 2 is located over the Mission Valley Groundwater Basin (Basin #9-14) in the San Diego Formation, as identified by the California Department of Water Resources, and is within the Pueblo San Diego HU. The average depth to groundwater within PD2 ranges from 7.44 to 13.18 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater within the Pueblo San Diego HU, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include TDS that exceed 3,000 mg/L and basin contamination that cannot reasonably be treated for domestic use. The water source does not provide sufficient water to sustain a yield of 200 gpd, and the aquifer is regulated as a geothermal energy producing source.

Planning District 3: Embarcadero

Planning District 3 is located over the Mission Valley Groundwater Basin (Basin #9-14) in the San Diego Formation and the Coastal Plain of San Diego Groundwater Basin (Basin #9-033), as identified by the California Department of Water Resources, and is within the Pueblo San Diego HU. The average depth to groundwater recorded at the Lane Field site was approximately 8 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater within the Pueblo San Diego HU, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include TDS that exceed 3,000 mg/L and basin contamination that cannot reasonably be treated for domestic use. The water source does not provide sufficient water to sustain a yield of 200 gpd, and the aquifer is regulated as a geothermal energy producing source.

Planning District 4: Working Waterfront

Planning District 4 is located over the Coastal Plain of San Diego Groundwater Basin (Basin #9-033), as identified by the California Department of Water Resources, and is within the Pueblo San Diego HU. The average depth to groundwater within PD4 ranges from 6.17 to 11.7 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater within the Pueblo San Diego HU, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include TDS that exceed 3,000 mg/L and basin contamination that cannot reasonably be treated for domestic use. The water source does not provide sufficient water to sustain a yield of 200 gpd, and the aquifer is regulated as a geothermal energy producing source.

Planning District 7: South Bay

Planning District 7 is located over the Coastal Plain of San Diego Groundwater Basin (Basin #9-033), as identified by the California Department of Water Resources, and is within the Otay Valley HU. According to the 2016 San Diego Region Basin Plan, beneficial uses of groundwater in the Otay Valley HU include municipal and domestic supply (MUN), agricultural supply (AGR) and industrial service supply (IND). The average depth to groundwater ranges from 5.5 to 32.6 feet.

Planning District 8: Imperial Beach Oceanfront

Planning District 8 is located over the Coastal Plain of San Diego Groundwater Basin (Basin #9-033), as identified by the California Department of Water Resources, which is within the Otay and Tijuana HUs. The average depth to groundwater ranges from 19.5 to 32.6 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater within the

hydrologic areas and subareas within PD8, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include TDS that exceed 3,000 mg/L and basin contamination that cannot reasonably be treated for domestic use. The water source does not provide sufficient water to sustain a yield of 200 gpd, and the aquifer is regulated as a geothermal energy producing source.

Planning District 9: Silver Strand

Planning District 9 is located in the San Diego Formation, and is not located over an identified groundwater basin, as identified by the California Department of Water Resources. The average depth to groundwater ranges from 5 to 20 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater underneath PD9, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include TDS that exceed 3,000 mg/L and basin contamination that cannot reasonably be treated for domestic use. The water source does not provide sufficient water to sustain a yield of 200 gpd, and the aquifer is regulated as a geothermal energy producing source.

Planning District 10: Coronado Bayfront

Planning District 10 is in the San Diego Formation, and is not located over an identified groundwater basin, as identified by the California Department of Water Resources. The average depth to groundwater within PD10 is generally between 5 and 10 feet. According to the 2016 San Diego Region Basin Plan, no beneficial uses are designated for the groundwater underneath PD10, and the area has been exempted by the RWQCB from the municipal use designation. Water quality issues include TDS that exceed 3,000 mg/L and basin contamination that cannot reasonably be treated for domestic use. The water source does not provide sufficient water to sustain a yield of 200 gpd, and the aquifer is regulated as a geothermal energy producing source.

4.8.3 Laws, Regulations, Plans, and Policies

This section provides an overview of pertinent Federal, State, and local laws and regulations governing hydrology and water quality for the proposed PMPU.

4.8.3.1 Federal

Federal Emergency Management Agency Regulations

FEMA administers the National Flood Insurance Program to provide subsidized flood insurance to communities that comply with FEMA regulations, which limit development in floodplains. FEMA also prepares FIRMs that identify which land areas are subject to flooding. These maps provide flood information and identify flood hazard zones in the community. The design standard for flood protection is established by FEMA. FEMA's minimum level of flood protection for new development is the 100-year flood event, also described as a flood that has a 1-in-100 chance of occurring in any given year. In addition, FEMA has developed requirements and procedures for evaluating earthen levee systems and mapping the areas affected by those systems. Levee systems are evaluated for their ability to provide protection from 100-year flood events, and the results of this evaluation are documented in the FEMA Levee Inventory System. Levee systems must meet minimum freeboard

standards and must be maintained according to an officially adopted maintenance plan. Other FEMA levee system evaluation criteria include structural design and interior drainage.

Clean Water Act

The primary goals of the CWA are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and make all surface waters fishable and swimmable. The EPA is the lead Federal agency responsible for water quality management. The CWA (33 United States Code Sections 1251–1387) amended the Federal Water Pollution Control Act of 1972 and is the primary Federal law that governs and authorizes water quality control activities by EPA as well as the states. The Federal CWA of 1977 established the basic structure for regulating discharges of pollutants into the waters of the United States (not including groundwater). Under the CWA, it is unlawful for any person to discharge any pollutant from a point source into navigable waters, unless an NPDES permit is obtained and implemented. In addition, the CWA requires the states to adopt water quality standards for receiving water bodies and have those standards approved by EPA. Water quality standards consist of designated beneficial uses for a particular receiving water body (e.g., wildlife habitat, agricultural supply, fishing), along with the water quality criteria necessary to support those uses.

CWA Section 303: Impaired Water Bodies (303(d) list) and Total Maximum Daily Loads

Under Section 303(d) of the CWA, the SWRCB is required to develop a list of impaired water bodies that do not meet water quality standards (promulgated under the National Toxics Rule [NTR] or the CTR) after the minimum technology-based effluent limitations have been implemented for point sources. Lists are to be priority ranked for development of a TMDL. A TMDL is a calculation of the total maximum amount of a pollutant that a water body can receive on a daily basis and still safely meet water quality standards. The California RWQCBs and EPA are responsible for establishing TMDL waste-load allocations and incorporating improved load allocations into water quality control plans, NPDES permits, and waste discharge requirements (WDRs). Section 305(b) of the CWA requires states to assess the status of water quality conditions and submit a report every 2 years. Both CWA requirements are addressed through development of a 303(d)/305(b) Integrated Report, which will provide both an update to the 303(d) list and a 305(b) assessment of statewide water quality. The SWRCB developed a statewide 2014 and 2016 California Integrated Report that was based on the Integrated Reports from each of the nine RWQCBs. The 2014 and 2016 California Integrated Report was approved by the SWRCB on October 3, 2017, and EPA issued its final decision and approval of the California 303(d) list on April 6, 2018.

Section 401: Water Quality Permits

Under Section 401 of the CWA, an applicant proposing to conduct any activity that may result in any discharge into waters of the United States must first obtain a Section 401 Water Quality Certification from the appropriate state agency, stating that the discharge is consistent with the state's water quality standards and criteria. In California, the authority to grant a water quality certification or waive the requirement is delegated by the SWRCB to the nine RWQCBs. A Section 401 Water Quality Certification is required for any activities requiring a Section 404 permit to discharge dredged or fill material into waters of the United States. In addition, an applicant under Section 10 of the Rivers and Harbor Act must also obtain a Section 401 Water Quality Certification.

Section 402: National Pollutant Discharge Elimination System Permits

Section 402(p) of the CWA was amended in 1987 to require EPA to establish regulations for permitting municipal and industrial (including active construction sites) stormwater discharges under the NPDES permit program. The NPDES program requires all industrial facilities and municipalities of a certain size that discharge pollutants into waters of the United States to obtain a permit. Stormwater discharges in California are commonly regulated through general and individual NPDES permits, which are adopted by the SWRCB or RWQCBs and administered by the RWQCBs. EPA requires NPDES permits to be revised to incorporate waste-load allocations for TMDLs when the TMDLs are approved (40 Code of Federal Regulations [CFR] 122).

NPDES permits generally identify effluent and receiving water limits for allowable concentrations and/or mass emissions of pollutants contained in a discharge; prohibitions on discharges that were not specifically allowed under the permit; and provisions that describe required actions to be taken by the discharger, including industrial pretreatment, pollution prevention, self-monitoring, toxicity testing or other activities.

Section 404: Permits for Dredged or Fill Material

Under Section 404, the U.S. Army Corps of Engineers (USACE) and EPA regulate the discharge of dredged and fill materials into waters of the United States. These waters are defined primarily as navigable waterways or water features (including wetlands) that have a significant nexus to navigable waters. Project sponsors must obtain authorization from USACE for all discharges of dredged or fill materials into waters of the United States before proceeding with a proposed activity. Individual Section 404 permits may be issued only for a least environmentally damaging practicable alternative. Compliance with CWA Section 404 requires compliance with several other environmental laws and regulations. USACE cannot issue an individual permit or verify the use of a general permit until the requirements of the National Environmental Policy Act of 1969, Endangered Species Act, Coastal Zone Management Act, and National Historic Preservation Act have been met. In addition, no permit can be issued or verified until a water quality certification, or waiver of certification, has been issued pursuant to CWA Section 401.

Section 404 of the CWA provides for the issuance of dredge/fill permits by the USACE. Permits are typically conditioned to minimize impacts on water quality. Conditions typically include, but are not limited to, the following:

- USACE review and approval of sediment quality analysis prior to dredging. Sediments are tested using approved EPA protocols.
- Detailed pre- and post-construction monitoring plan that includes disposal site monitoring.
- Timing and water quality restrictions on flow back of dredged water at the dredging site with flow-back water meeting RWQCB Waste Water Discharge and Receiving Water Monitoring Program requirements.
- Compensation for loss of wetlands.

As part of this regulatory/permitting process, monitoring requirements include measurements of water quality parameters such as dissolved oxygen, light transmittance (turbidity), pH, and suspended solids at varying distances from the dredging operations. In the unlikely event that dredging activities exceed any of the monitoring levels, the dredging permit would include corrective actions such as use of silt curtains and requiring a slower dredge bucket speed, which

would be implemented if the monitoring data indicate that water quality conditions outside of the silt curtain or mixing zone exceed the permit-specified limits.

Section 10 of the Rivers and Harbors Act of 1899

The Rivers and Harbors Act is the primary Federal law regulating activities that may affect navigation on the nation's waterways. Section 10 of the Rivers and Harbors Act grants USACE control over obstructions to navigable waters of the United States and gives USACE exclusive authority to approve construction of smaller structures, such as wharves, and bulkheads, as well as dredging and filling operations.

4.8.3.2 State

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (embodied in the California Water Code) of 1969 (Porter-Cologne Act) is California's statutory authority for the protection of water quality. Under the Porter-Cologne Act, the State must adopt water quality policies, plans, and objectives that protect its waters for the use and enjoyment of the people. Under the California Water Code, the State of California is divided into nine regions, which are governed by RWQCBs that, under the guidance and review of the SWRCB, implement and enforce provisions of the California Water Code and the CWA. The planning area is in Region 9, the San Diego region, and is governed by the San Diego RWQCB.

The Porter-Cologne Act also requires waste dischargers to notify the RWQCBs of their activities through the filing of "Reports of Waste Discharge" and authorizes the SWRCB and RWQCBs to issue and enforce WDRs, NPDES permits, Section 401 water quality certifications, and other approvals.

Section 13050 of the California Water Code defines what is considered pollution, contamination, or nuisance. Briefly defined, pollution means an alteration of water quality such that it unreasonably affects the beneficial uses of water. Contamination means an impairment of water quality to the degree that it creates a hazard to public health. Nuisance is defined as anything that is injurious to health, offensive to the senses, or an obstruction to use of a property, affecting a considerable number of people.

SWRCB Construction General Permit (Order 2009-0009-DWQ, amended by Order 2010-0014-DWQ and Order 2012-006-DWQ)

Construction activities that disturb 1 acre or more of land must obtain coverage under the SWRCB NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit) (Order 2009-0009-DWQ, as amended by Order 2010-0014-DWQ and Order 2012-006-DWQ). Under the terms of the permit, applicants must file complete and accurate Notice of Intent and permit registration documents with the SWRCB. Applicants must also demonstrate conformance with applicable construction best management practices (BMPs) and prepare a construction Stormwater Pollution Prevention Plan (SWPPP), containing a site map that shows the construction site perimeter; existing and proposed buildings; lots; roadways; stormwater collection and discharge points; general topography, both before and after construction; and the drainage patterns across the project site. The Construction General Permit also includes requirements for site water quality monitoring if the project meets certain Risk Level thresholds.

The SWPPP includes measures to eliminate or reduce pollutant discharges and describes the implementation and maintenance of BMPs to control stormwater and other runoff during and after construction. The SWPPP is required to include a menu of BMPs to be selected and implemented based on the phase of construction and the weather conditions to effectively control erosion, sediment, and other construction-related pollutants to meet the Best Available Technology Economically Achievable and Best Conventional Pollutant Control Technology standards. Erosion control BMPs are designed to prevent erosion, whereas sediment controls are designed to trap sediment once it has been mobilized. The following types of BMPs, as applicable, would be implemented during future construction activities:

Erosion Control

- Physical stabilization through hydraulic mulch, soil binders, straw mulch, bonded fiber matrices, and/or erosion control blankets (i.e., rolled erosion control products).
- Soil roughening of graded areas (through track walking, scarifying, sheepsfoot rolling, or imprinting) to slow runoff, enhance infiltration, and reduce erosion.
- Wind erosion (dust) control through the application of water or other dust palliatives as necessary to prevent and alleviate dust nuisance.

Sediment Control

- Perimeter protection through silt fences, fiber rolls, gravel bag berms, sandbag barriers, and straw bale barriers.
- Storm drain inlet protection.
- Sediment capture through sediment traps, storm drain inlet protection, and sediment basins.
- Velocity reduction through check dams, sediment basins, and/or outlet protection/velocity dissipation devices.
- Reduction in off-site sediment tracking through stabilized construction entrance/exit, construction road stabilization, and/or entrance/exit tire wash.

The Construction General Permit contains receiving water limitations that require stormwater discharges to not cause or contribute to a violation of any applicable water quality standard. Inspections of all BMPs are required throughout construction.

SWRCB Industrial General Permit (Order No. 2014-0057 DWQ)

Industrial facilities with specific standard industrial codes (SIC) that discharge stormwater to waters of the United States must obtain coverage and comply with the requirements of the General Permit for Stormwater Discharges Associated with Industrial Activities (Industrial General Permit), Order No. 2014-0057-DWQ (NPDES No. CAS000001), issued by the SWRCB. Under the Industrial General Permit, dischargers must demonstrate conformance with applicable industrial BMPs and prepare an industrial SWPPP, containing a site map that shows the site perimeter, areas where industrial activities occur, stormwater collection and discharge points, and drainage patterns across the site. The Industrial General Permit includes the required minimum BMP categories that must be implemented and maintained at industrial facilities to prevent pollutants from entering stormwater

discharges or reduce their levels. Additional information on the Permit, and its requirements, including BMPs are available online.⁶ The BMPs include the following:

Good Housekeeping

- Observe all outdoor areas associated with industrial activity, including stormwater discharge locations, drainage areas, conveyance systems, waste handling/disposal areas, and perimeter areas affected by off-facility materials or stormwater runoff, to determine housekeeping needs. Any identified debris, waste, spills, tracked materials, or leaked materials will be cleaned and disposed of properly.
- Minimize or prevent material tracking.
- Minimize dust generated from industrial materials or activities.
- Ensure that all facility areas affected by rinse/wash waters are cleaned as soon as possible.
- Cover all stored industrial materials that can be readily mobilized by contact with stormwater.
- Contain all stored non-solid industrial materials or wastes (e.g., particulates, powders, shredded paper) that can be transported or dispersed by the wind or contact with stormwater.
- Prevent disposal of any rinse/wash waters or industrial materials into the stormwater conveyance system.
- Minimize stormwater discharges from non-industrial areas (e.g., stormwater flows from employee parking area) that contact industrial areas of the facility.
- Minimize authorized non-stormwater discharges from non-industrial areas (e.g., potable water, fire hydrant testing) that contact industrial areas of the facility.

Preventive Maintenance

- Identify all equipment and systems used outdoors that may spill or leak pollutants.
- Observe the identified equipment and systems to detect leaks or identify conditions that may result in the development of leaks.
- Establish an appropriate schedule for maintenance of identified equipment and systems.
- Establish procedures for prompt maintenance and repair of equipment as well as maintenance of systems when conditions exist that may result in the development of spills or leaks.

Spill and Leak Prevention and Response

- Establish procedures and/or controls to minimize spills and leaks.
- Develop and implement spill and leak response procedures to prevent industrial materials from discharging through the stormwater conveyance system. Spilled or leaked industrial materials will be cleaned promptly and disposed of properly.
- Identify and describe all necessary and appropriate spill and leak response equipment, the location(s) of spill and leak response equipment, and spill or leak response equipment maintenance procedures.

⁶ https://www.waterboards.ca.gov/water_issues/programs/stormwater/igp_20140057dwq.html

- Identify and train appropriate personnel for spill and leak response.

Material Handling and Waste Management

- Prevent or minimize the handling of industrial materials or wastes that can be readily mobilized by contact with stormwater during a storm event.
- Contain all stored non-solid industrial materials or wastes (e.g., particulates, powders, shredded paper) that can be transported or dispersed by the wind or contact with stormwater during handling.
- Cover industrial waste disposal containers and industrial material storage containers that contain industrial materials when not in use.
- Divert run-on and stormwater generated from within the facility away from all stockpiled materials.
- Clean all spills of industrial materials or wastes that occur during handling in accordance with the spill response procedures (Industrial General Permit Section X.H.1.c).
- Observe and clean, as appropriate, any outdoor material or waste handling equipment or containers that can be contaminated by contact with industrial materials or wastes.

Erosion and Sediment Controls

- Implement effective wind erosion controls.
- Provide effective stabilization for all disturbed soils and other erodible areas prior to a forecast storm event.
- Maintain effective perimeter controls and stabilize all site entrances and exits to prevent erodible materials from discharging or being tracked off the site.
- Divert run-on and stormwater generated from within the facility away from all erodible materials.
- Employee Training Program
- Ensure that all team members who implement the various compliance activities of the SWPPP are properly trained in BMP implementation, BMP effectiveness evaluations, visual observations, and monitoring activities.
- Prepare or acquire appropriate training manuals or training materials.
- Identify which personnel need to be trained, their responsibilities, and the type of training they will receive.
- Provide a training schedule.
- Maintain documentation of all completed training classes and the personnel who received training in the SWPPP.

Quality Assurance and Record Keeping

- Develop and implement management procedures to ensure that appropriate personnel implement all elements of the SWPPP, including the Monitoring Implementation Plan.

- Develop a method of tracking and recording the implementation of the BMPs identified in the SWPPP.
- Maintain BMP implementation records, training records, and records related to any spills and cleanup-related response activities for a minimum of 5 years (Industrial General Permit Section XXI.J.4). In addition to the minimum BMPs, advanced BMPs, listed below, must be implemented and maintained to the extent feasible and necessary to reduce or prevent discharges of pollutants in stormwater discharges.

Exposure Minimization BMPs

- Storm-resistant shelters that prevent contact between stormwater and industrial materials or activities.

Stormwater Containment and Discharge Reduction BMPs

- BMPs that divert, infiltrate, reuse, contain, retain, or reduce the volume of stormwater runoff.

Treatment Control BMPs

- Implementation of one or more mechanical, chemical, biologic, or any other treatment technology that meets the treatment design standard. All new treatment control BMPs employed by the discharger to comply with advanced BMPs shall be designed to comply with design storm standards (volume or flow-based standards).

Other Advanced BMPs

- Any additional BMPs not described above that are necessary to meet the effluent limitations of the Industrial General Permit.

The associated SWPPP includes a Site Monitoring Implementation Plan, as required by the Industrial General Permit, that describes (1) the monthly dry-weather visual observation, (2) the stormwater visual observation, and (3) the facility-specific stormwater sampling program at the facility, which includes sample collection locations (discharge points), contaminants for analysis, and potential pollution sources.

When structural treatment controls are required by the Industrial General Permit, the design standard includes a volume-based treatment design that would treat the volume of runoff produced from an 85th-percentile, 24-hour storm event, as determined from local historical rainfall records. This design standard is consistent with the treatment control requirements necessary to meet the redevelopment project BMP requirements of the Municipal Stormwater Permit and District *BMP Design Manual*, as discussed under *Local* regulations in Section 4.8.3.3, below.

Public Resources Code Section 71204.5 (Ballast Water Management)

The State's Ballast Water Management regulation for vessels operating within the Pacific Coast Region is promulgated by the California State Lands Commission, pursuant to Public Resources Code Section 71204.5. The regulation established a Pacific Coast Region, defined essentially as coastal waters ranging from the Aleutian Islands to the tip of Baja California. It became effective on March 22, 2006. Vessels taking ballast from ports within this region and traveling on coastal voyages must perform a coastal exchange at a minimum distance of 50 miles out and 200 meters deep prior to discharge in California. Vessels arriving from outside an Exclusive Economic Zone, and therefore

outside of the Pacific Coast Region, are still required to perform a mid-ocean exchange (at a minimum distance of 200 miles out and a minimum of 2,000 meters deep) prior to discharging into California waters.

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act was enacted to better manage groundwater supplies in the state and directs local agencies (e.g., cities, counties, and water agencies) to adopt Groundwater Sustainability Plans for high- and medium-priority groundwater basins to ensure their long-term sustainability. In San Diego County, DWR has designated three of the county's basins as medium-priority and one basin as critically overdrafted. The three medium-priority groundwater basins include the San Diego River Valley, San Luis Rey Valley, and San Pasqual Valley Groundwater Basins, while the Borrego Valley is designated as critically overdrafted. These groundwater basins are all subject to Groundwater Sustainability Plan requirements of the SGMA. Within the proposed PMPU area, the Mission Valley Groundwater Basin is identified as very low priority and the Coastal Plain of San Diego Groundwater Basin is identified as low priority.

4.8.3.3 Local

Water Quality Control Plan (Basin Plan)

The preparation and adoption of water quality control plans, referred to as Basin Plans, is required by the California Water Code (Section 13240), as prescribed by the CWA. Section 303 of the CWA requires states to adopt water quality standards that “consist of the designated uses of the navigable waters involved and the water quality criteria for such waters based upon such uses.” According to Section 13050 of the California Water Code, Basin Plans designate beneficial uses to be protected, water quality objectives to be established to protect those uses, and a program of implementation needed for achieving the objectives for the waters within a specified area. A Basin Plan describes and quantifies water quality objectives that must be attained or maintained to protect beneficial uses and conform to the State's non-degradation policy. The water quality objectives are the levels of water quality constituents that must be met to protect beneficial uses. The water quality objectives designated for the waters of the San Diego Region are provided in the San Diego Basin Plan (San Diego RWQCB 2016b). Because beneficial uses, together with their corresponding water quality objectives, can be defined per Federal regulations as water quality standards, Basin Plans are regulatory references for meeting the State and Federal requirements for water quality control. To address water quality impairments TMDLs have been adopted in designated waterbodies.

Municipal Stormwater Permit (Order No. R9-2013-0001 as amended by Order Nos. R9-2015-001 and R9-2015-0100)

The Municipal Stormwater Permit (Order No. R9-2013-0001, as amended by Order Nos. R9-2015-001 and R9-2015-0100)⁷ is an NPDES permit that requires the owners and operators of MS4s within the San Diego region to implement management programs that limit discharges of pollutants and non-stormwater discharges to and from their MS4. The Municipal Stormwater Permit requires the District and other “co-permittees” to develop watershed-based Water Quality Improvement Plans (WQIPs) and Jurisdictional Runoff Management Plans (JRMP). The Municipal Stormwater

⁷ https://www.waterboards.ca.gov/sandiego/water_issues/programs/stormwater/sd_stormwater.html

Permit emphasizes watershed program planning and program outcomes. The intent of the permit is to enable each jurisdiction to focus its resources and efforts to:

- Reduce pollutants in stormwater discharges from its MS4.
- Effectively prohibit non-stormwater discharges to its MS4.

San Diego Bay Watershed Water Quality Improvement Plan

The Municipal Stormwater Permit requires development of the San Diego Bay WQIP. The purpose of the WQIP is to guide the municipal stormwater permit co-permittees, including the District, via its JRMP, toward improving water quality in MS4 discharges and receiving waters. In the WQIP, priorities and goals are established, and each jurisdiction identifies strategies to assist in attaining the goals. Numeric goals established in the WQIP may include multiple criteria and/or indicators designed to measure reasonable progress towards addressing the highest priority water quality conditions identified for the watershed management area. This approach establishes the foundation that the District uses to develop and implement its JRMP. The District implements the WQIP in collaboration with other local agencies that have jurisdiction within the San Diego Bay Watershed Management Area, which comprises three HUs: Pueblo San Diego, Sweetwater, and Otay. Note that the Sweetwater HU is located outside of the proposed PMPU area.

Jurisdictional Runoff Management Program

Under the Municipal Stormwater Permit, each jurisdiction is required to have a JRMP, which includes a component that addresses issues related to construction activities and a component that addresses issues related to existing development, and which requires co-permittees to establish adequate enforcement authority, develop education/outreach, and conduct monitoring. In addition, each co-permittee prepares and submits an annual report that describes program implementation and strategies to reduce the discharge of pollutants of concern to the MS4 and receiving waters to the maximum extent practicable.

The District's JRMP has been developed to meet the conditions of the Municipal Stormwater Permit and to assist the District in achieving the goals identified in the WQIP. District-specific WQIP-based strategies have been incorporated into the JRMP. The JRMP's focus is on controlling stormwater discharges to the MS4, with the overall goal of achieving improvements in receiving water quality. The District has developed a list of BMPs that are applicable to all persons, activities, and operations occurring on District Tidelands, and the JRMP utilizes District-specific jurisdictional activities and watershed-based strategies. Enforcement of the JRMP helps to prevent stormwater pollutants from entering local storm drains and, ultimately, the San Diego Bay.

Moreover, the Municipal Stormwater Permit (Provision E.4) requires the District to implement a Construction Management program in accordance with the strategies in the San Diego Bay Watershed WQIP in addition to core permit requirements. The core permit requirements include a project approval process that ensures appropriate BMPs are attached to conditions of approval for construction projects as well as ongoing construction site inventory updates and tracking and inspection. In addition, the District is required to establish minimum BMPs from the following categories: Project Planning, Non-Stormwater Management, Good Housekeeping/Waste Management, Erosion Control, Sediment Control, and Run-on and Run-off Control.

Jurisdictional Runoff Management Program BMP Standards

Best Management Practices Design Manual

As part of the District's JRMP, a *BMP Design Manual*⁸ was developed to provide guidelines for incorporating permanent post-construction BMPs into new and redevelopment projects. The *BMP Design Manual* identifies the required source-control and site-design BMPs to eliminate or reduce pollutants in stormwater runoff for all projects. For Priority Development Projects (PDPs), the *BMP Design Manual* also describes pollutant-control BMPs that must be incorporated into the site design and, where applicable, addresses potential hydromodification impacts from changes in flow and sediment supply. The *BMP Design Manual* is applicable for both tenant- and District-sponsored major maintenance or capital improvement projects, as required by the Municipal Stormwater Permit. Project proponents must submit a Storm Water Quality Management Plan (SWQMP) accurately describing how the project will meet source control site design and pollutant control BMP requirements. District staff provide technical review of and approve SWQMP documents and drainage design plans to ensure that pollutant control BMP requirements are met. The SWQMP is evaluated for compliance with the Municipal Stormwater Permit and with design criteria outlined in the District's *BMP Design Manual*. Once the approval process is complete, the project is able to commence and routine inspections are conducted throughout the duration of project construction.

Construction Best Management Practices Plan

If a project is not subject to the Construction General Permit (Order 2009-0009-DWQ, as amended by Order 2010-0014-DWQ and Order 2012-006-DWQ), a Construction BMP Plan is required pursuant to the JRMP. The Construction BMP Plan includes many of the same elements as a standard SWPPP except for most post-construction BMPs and a monitoring plan. The Construction BMP Plan applies to construction projects with less than 1 acre, but greater than 100 square feet of land disturbance, as well as construction projects that occur over water. District approval is required on all SWPPPs and Construction BMP Plans prior to any work beginning on a project. The Construction BMP Plan must identify the specific BMPs that would be implemented during construction, including temporary erosion control BMPs, temporary sediment control BMPs, temporary tracking control BMPs, temporary wind erosion control BMPs, non-stormwater management BMPs, and waste management and materials pollution control BMPs. It should be noted that the Construction BMP Plan requirements are updated regularly in accordance with regulation changes. The types of BMPs identified in the Construction BMP Plan include, but are not limited to, the following.

- Temporary erosion control BMPs
 - Preservation of existing vegetation
 - Hydraulic mulch
 - Hydroseeding
 - Straw mulch
- Temporary sediment control BMPs
 - Slit fence
 - Sediment basin

⁸ Port of San Diego BMP Design Manual and Appendices are available online at: <https://www.portofsandiego.org/stormwater-management>

- Sediment trap
- Fiber rolls
- Storm drain inlet protection
- Temporary tracking control BMPs
 - Stabilized construction entrance/exit
 - Stabilized construction roadway
 - Street sweeping and vacuuming
 - Entrance/outlet tire wash
- Temporary wind erosion control BMPs
 - Soil binder
 - Geotextiles, plastic covers, and erosion controls blankets/mats
 - Wood mulch
- Non-stormwater management BMPs
 - Water conservation practices
 - Dewatering operations
 - Paving and grinding operations
 - Illicit discharge/illegal dumping reporting
 - Vehicle and equipment cleaning
- Waste management and materials pollution control BMPs
 - Material delivery and storage
 - Spill prevention and control
 - Solid waste management
 - Hazardous waste management
 - Contaminated soil management

Minimum Best Management Practices for Construction Sites

The Municipal Stormwater Permit directs the District to require minimum BMPs at all construction and grading projects. The minimum BMPs are required to ensure reductions in potential pollutants from the project site to the maximum extent practicable and effectively prohibit non-stormwater discharges from construction sites to the MS4. These BMPs also ensure that all construction and grading activities will be in compliance with applicable District ordinances and other environmental laws and supportive of the WQIP goals.

The required minimum BMPs fall into several major categories, as outlined in the Municipal Stormwater Permit, including project planning, good site management, non-stormwater management, erosion control, sediment control, run-on and runoff controls, and, where applicable, active/passive sediment treatment. The BMPs chosen to be implemented at a particular project must be site specific, seasonally appropriate, and construction-phase appropriate. Notwithstanding

seasonal variation, projects occurring during the dry season will be required to plan for and address rain events that may occur.

The District also chose to include minimum BMPs that support the WQIP priorities and integrate WQIP strategies PO-12 and PO-13. Good-housekeeping BMPs prevent discharges of WQIP high-priority pollutants, including metals, bacteria, and trash, to the MS4. In addition, pursuant to strategy PO-13, the District requires sites to cover construction material stockpiles that contain metals, such as treated timber, during wet weather. The minimum BMPs for construction sites identified in the District's JRMP include, but are not limited to, the following.

- Project planning
 - Minimization of areas that are cleared and graded to only the portion of the site that is necessary for construction
 - Develop and implement a SWPPP or construction BMP plan
 - Contractor Training (formal training or District staff training)
- Non-stormwater management
 - Water conservation practices
 - Dewatering operations
 - Paving and grinding operations
 - Vehicle and equipment cleaning
- Good housekeeping/waste management
 - Cover construction material stockpiles, such as treated lumber, during wet weather
 - Material delivery and storage
 - Solid waste management
 - Spill prevention and control
- Erosion control
 - Preservation of existing vegetation
 - Minimization of exposure time of disturbed soil areas
 - Wood mulching
 - Soil preparation and roughening
- Sediment control
 - Silt fence
 - Sand bag barrier
 - Sediment trap
 - Gravel bag berms
- Run-on and runoff control
 - Protect site perimeter to prevent run-on from entering the site and site runoff

JRMP Enforcement Authority – District Code, Article 10

District Code, Article 10—the San Diego Unified Port District Stormwater Management and Discharge Control Ordinance—prohibits the deposit or discharge of any chemicals or waste into the Tidelands or San Diego Bay, and makes it unlawful to discharge pollutants directly into the non-stormwater, or indirectly into the stormwater conveyance system. Article 10 also requires the implementation of BMPs, stormwater plans, and other measures, as appropriate to control the discharge of pollution to Tideland or receiving waters. The District uses its enforcement authority established by Article 10. Article 10 satisfies the provision of the Municipal Stormwater Permit that requires each co-permittee to establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 through statute, ordinance, permit, contract, order, or similar means.

Dewatering General Permit (Order No. R9-2015-0013)

The General Waste Discharge Requirements for Groundwater Extraction Discharges to Surface Waters Within the San Diego Region (Dewatering General Permit) (Order No. R9-2015-0013) is an NPDES permit that regulates temporary discharges of groundwater extraction wastes to San Diego Bay, and its tributaries under tidal influence, from groundwater extraction due to construction and other groundwater extraction activities. Dischargers must meet the applicable criteria listed in the permit to be subject to WDRs under this permit. Receiving water limitations are based on water quality objectives contained in the Basin Plan and are a required part of the permit. The discharge of groundwater extraction waste from any site shall not, separately or jointly with any other discharge, cause violations of certain water quality objectives in San Diego Bay and establishes monitoring and reporting requirements.

The San Diego RWQCB also issues Conditional Waivers of Waste Discharge Requirements for Low Threat Discharges in the San Diego Region (Order No. R9-2019-0005), which covers certain categories of dewatering. The San Diego RWQCB has considered the types of discharges included in the Order and determined each to be in the public interest. Discharges from short-term construction dewatering operations to land require a Notice of Intent. Discharges which comply with the waiver conditions in the Order are not expected to pose a threat to the quality of waters of the State. Monitoring and reporting requirements are included in the Order to verify the adequacy and effectiveness of the waiver's conditions.

San Diego Unified Port District, Ordinance No. 2681 (In-Water Hull Cleaning Regulations)

The District adopted in-water hull cleaning regulations to reduce or eliminate copper pollution caused by in-water hull cleaning activities in San Diego Bay. Ordinance No. 2681 requires the use of BMPs for all in-water hull cleaning on recreational or commercial boats and requires permits for all hull cleaning businesses.

National Pollutant Discharge Elimination System Permits

Three San Diego shipyards (BAE Systems San Diego Ship Repair, Continental Maritime of San Diego, and NASSCO) were assigned individual NPDES permits and six additional facilities have active Notice of Intent under the Industrial General Permit with the San Diego RWQCB. These permits establish monitoring and reporting requirements and require a SWPPP. The SWPPP includes BMPs

required to prevent pollutants associated with industrial activities from entering surface waters and impacting water quality, particularly during storm events.⁹ Pollutants that may be associated with shipyard and maritime activities include heavy metals, oil and grease, pH, total organic carbon, total suspended solids, and other substances that may cause toxicity to marine organisms. The following list identifies the active, site-specific NPDES permits for each of the facilities:

Individual Permit:

- **R9-2015-0034** – BAE Systems San Diego Ship Repair
- **R9-2015-0009** – Continental Maritime of San Diego
- **R9-2016-0116** – National Steel & Shipbuilding Company (NASSCO)

Industrial General Permit:

- **WDID 9 37I018035** – San Diego International Airport
- **WDID 9 37I001827** – Solar Turbines Harbor Drive Test Facility
- **WDID 9 37I026133** – San Diego Hornblower Cruises & Events
- **WDID 9 37I026915** – Pacific Maritime Group
- **WDID 9 37I026057** – CP Kelco
- **WDID 9 37I027145** – San Diego Cold Storage

Each of these permits can be accessed from the San Diego RWQCB's website.¹⁰

Boatyard General Permit

In October 2019, the San Diego RWQCB adopted Order No. R9-2019-0008, making boatyards and boat maintenance and repair facilities adjacent to surface waters subject to WDRs of the CWA and Porter-Cologne Act. This order became effective in February 2020. Eight boatyard dischargers within the District's jurisdiction are subject to the Boatyard General Permit, six of which are within the proposed PMPU area, as summarized in Table 4.8-5. Boatyards and boat maintenance and repair facilities along San Diego Bay conduct industrial activities that have the potential to discharge pollutants into receiving waters when exposed to stormwater.¹¹ These potential pollutants include heavy metals, oil and grease, pH, chemical oxygen demand (COD), total organic carbon, total suspended solids, and other substances that may cause toxicity to marine organisms. A SWPPP is required, including BMPs, to address these potential pollutants as part of the Boatyard General Permit.

⁹ All three San Diego Bay shipyards employ systems that are designed to capture their storm water and divert it to the municipal sewer system.

¹⁰ The individual NPDES permits for the shipyards are available at:
https://www.waterboards.ca.gov/sandiego/water_issues/programs/regulatory/.

¹¹ These boatyards are considered Category 2 facilities according to the general NPDES permit, meaning each facility employs systems designed to capture stormwater that results from typical storms and divert it to the municipal sewer system.

Table 4.8-5. Dischargers Subject to the Boatyard General Permit within PMPU Area

Discharger	Name of Facility	Planning District
Driscoll, Inc.	Driscoll Boat Works/ Driscoll Custom Boats	PD1: Shelter Island
Driscoll, Inc.	Driscoll's West	PD1: Shelter Island
Koehler Kraft Company, Inc.	Koehler Kraft Company	PD1: Shelter Island
Nielsen Beaumont Marine	Nielsen Beaumont Marine	PD1: Shelter Island
Shelter Island Boatyard	Shelter Island Boatyard	PD1: Shelter Island

San Diego Harbor Safety Plan

The San Diego Harbor Safety Plan is designed to provide mariners who use the waters of San Diego Bay with an up-to-date guide to critical navigation issues to enhance vessel safety, with the ultimate goal of pollution prevention and protection of the region's valuable resources. This plan has been developed by the San Diego Harbor Safety Committee, as mandated in the California Oil Spill Prevention and Response Act of 1990 (Government Code Sections 8574.1 et seq.). The goals of the act are to improve the prevention, removal, abatement, response, containment, cleanup, and mitigation of oil spills in the marine waters of California. The act and its implementing regulations (California Code of Regulations Title 14, Sections 800–802) created harbor safety committees for the major harbors of California to “plan for the safe navigation and operation of tankers, barges, and other vessels within each harbor” by preparing “a harbor safety plan, encompassing all vessel traffic within the harbor.”

4.8.4 Project Impact Analysis

4.8.4.1 Methodology

The following impact analysis evaluates the potential effects on existing hydrologic and water quality conditions that could occur from future development consistent with the proposed PMPU. The methodology considers the existing hydrologic and water quality conditions established under Section 4.8.2, *Existing Conditions*, and the existing regulatory setting described under 4.8.3, *Laws, Regulations, Plans, and Policies*, to determine the proposed PMPU's potential to result in one or more impacts on hydrologic and/or water quality conditions.

The impact analysis first identifies any proposed laws, policies, or regulations that would assist with avoiding, eliminating, or reducing any impact associated with hydrology and water quality. The analysis then considers the potential hydrology and water quality impacts from the future development projects that could be constructed and operated consistent with the proposed PMPU's proposed water and land uses. Finally, the analysis considers any policies that may cause or contribute to any related hydrology and/or water quality impact (s).

To avoid redundancy in the analysis and present a concise discussion, the analysis discusses the planning districts collectively, as appropriate. When a planning district has unique or special existing conditions and/or may result in one or more unique significant impacts with mitigation specific to that planning district, the analysis presents a separate discussion of that planning district.

4.8.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of hydrology and water quality impacts associated with the proposed PMPU. The determination of whether a hydrology and water quality impact would be significant is based on the thresholds described below and the professional judgment of the District based on evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following.

1. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.
2. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge, such that the project may impede sustainable groundwater management of the basin.
3. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would:
 - a. Result in substantial erosion or siltation on- or off-site.
 - b. Substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site.
 - c. Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.
 - d. Impede or redirect flood flows.
4. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.
5. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

As discussed in Section VIII of the Initial Study prepared for the proposed PMPU (Appendix A), it was determined that the proposed PMPU would not result in significant impacts related to placing housing within a 100-year flood hazard area or exposing people or structures to flooding as a result of the failure of a levee or a dam. The conclusion and the supporting rationale are summarized in Chapter 5, *Additional Consequences of PMPU Implementation*. However, since the December 2018 update to the State CEQA Guidelines, these two questions have been removed from Appendix G. Therefore, all questions listed in Appendix G are addressed below.

4.8.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to avoid or reduce impacts associated with hydrology and water quality and are considered in the impact analysis that follows.

ECO Policy 2.1.1 The District shall prioritize and pursue opportunities for the protection and enhancement of water quality.

ECO Policy 2.1.3 Waste management strategies shall be implemented throughout Tidelands, including as part of development, with a focus on reducing trash entering waterways.

ECO Policy 2.1.4 Aquaculture, as interpreted by the California Department of Fish and Wildlife, is encouraged in Tidelands areas using species and sustainable practices that are approved by the in accordance with California Department of Fish and Wildlife processes and that do not degrade surrounding natural resources and minimize substantial environmental impacts. Future aquaculture operations may be subject to additional regulatory requirements, such as project- or site-specific monitoring and reporting.

ECO Policy 2.1.5 The District shall continue to conduct, or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay.

ECO Policy 2.1.6 The District shall implement initiatives to reduce copper loads from recreational vessels to protect marine life in and around the Bay.

ECO Policy 2.1.7 The District shall encourage the use of alternative, non-copper-based antifouling paints.

ECO Policy 2.1.8 In-water hull cleaning of copper-based antifouling paints shall be conducted in a manner that does not cause or contribute to a condition of nuisance or water quality impairment.

ECO Policy 2.1.9 Sewerage pump out facilities shall be accessible and available for use by the public either in fixed locations or through a mobile pump out service.

ECO Policy 2.2.1 The District shall prioritize and pursue opportunities for the protection and enhancement of sediment quality.

ECO Policy 2.2.2 Remediation and restoration efforts shall be implemented in a manner that maximizes ecological benefits, including water quality, ecosystems, and the use of Tidelands consistent with the Port Act.

ECO Policy 2.2.3 Development shall not result in degradation beyond regulatory or legal limits for fill, soil, and sediment quality and shall minimize exposure of adjacent communities to fill, soil, and sediment-based environmental contamination. Also, refer to ECO Policy 2.3.3.

ECO Policy 2.2.4 Through CDPs issued by the District, permittees shall, to the extent feasible and as allowed by regulations, promote beneficial reuse of safe and clean dredged sediments or other potential sediment sources to be used to restore, enhance, and create wetlands and eelgrass habitat, consistent with California Coastal Act Section 30233(b).

ECO Policy 2.3.1 Owners and operators of stormwater conveyances on Tidelands shall comply with the municipal stormwater permit (MS4) and other legal requirements to minimize pollution impacts in the Bay.

ECO Policy 2.3.2 Educational information shall be provided to the public and tenants regarding natural resources protection, runoff or increased runoff flows, and pollution prevention measures to minimize or reduce impacts on water and sediment quality.

ECO Policy 2.3.3 ~~Where~~In the event proposed development disrupts shoreline fill or Bay sediment, ~~if the development project~~ shall remove ~~the~~ contaminated fill or appropriately contain and remediate the fill in a manner consistent with applicable requirements.

ECO Policy 2.3.4 Permittees shall implement measures to prevent pollution impacts and adverse impacts from runoff flows from all development and maintenance activities.

ECO Policy 2.3.5 Development projects located in areas identified as impaired under Section 303(d) of the Clean Water Act shall implement measures to protect and improve water quality.

ECO Policy 4.1.3 The District shall establish and continue partnerships with regulatory agencies, research institutions, private parties, and nongovernmental organizations (NGOs) to improve water quality in the Bay and promote public awareness and understanding of water quality issues.

4.8.4.4 Project Impacts and Mitigation Measures

Threshold 1: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Impact Analysis

Impacts of Water and Land Uses

As described under Section 4.8.3, there are numerous Federal, State, and local laws, regulations, and programs that govern water quality standards or waste discharge requirements that help ensure surface- or groundwater quality is not degraded as a result of development projects. These laws, regulations, and programs would apply to future development that are consistent with the proposed PMPU water and land use designations and the policies contained therein, and where these development projects propose actions that are governed by these laws, regulations, and programs.

Construction

The proposed PMPU serves as a long-term planning blueprint for future development within the proposed PMPU area. Future development currently anticipated in the planned improvements or a planning district's Vision, as well as development consistent with the water or land use designation for the proposed development site, as described in Table 3.1.4, *Description of Water and Land Use Designations*, of the PMPU, may occur. Approval of the plan would not directly result in any specific construction project, including the construction of any buildings or infrastructure. Specifically, buildout of the proposed PMPU would allow for the construction of uses such as commercial, recreational, and maritime industrial. In-water uses could include additional vessel activity associated with more slips and docks with waterside uses that include anchorage, commercial fishing berthing, industrial and deep-water berthing, marine services berthing, navigation corridors, recreational berthing, and sportfishing berthing facilities. Although implementation of the proposed PMPU may allow for an increase in construction activity in the proposed PMPU area, the buildout of the proposed PMPU would take place over a 30-year timeframe, and construction activities would occur periodically throughout that timeframe.

Waterside Construction

Construction of the in-water components of future development allowed by the proposed PMPU may include uses such as anchorage, berthing infrastructure, and aquaculture, which could result in short-term water quality impacts associated with the removal of existing pilings (including piles treated with wood preservatives such as creosote) and piers, construction of new pilings/piers, moorings, floating docks, and aquaculture infrastructure such as buoys and growout lines. Placement of in-water structures could temporarily affect water quality in the absence of regulations. Pile placement and

other related construction activities would result in the short-term disturbance of localized sediments. As is typical for projects that involve in-water construction, disruption of sediments could adversely affect water quality by temporarily resuspending sediments and increasing turbidity. In addition, chemicals or contaminants that are present in the sediments could be released into the water column during resuspension, which could temporarily degrade water quality. Further, suspended sediments in the water column can lower levels of dissolved oxygen, increase salinity, increase concentrations of suspended solids, and possibly release chemicals present in sediments into the water and redeposit them at various locations on the bay floor, making them potentially bioavailable for marine organisms now that they would no longer be buried.

The degree of turbidity resulting from the suspended sediments would vary substantially with the quantity and duration of the construction activity and would also depend on the methods used, the quality of equipment, and the care of the operator. However, in-water BMPs would generally limit the spread of the turbidity plume outside the specific work area. As a result, in most cases increased turbidity levels would be relatively short-lived and generally confined to within a few hundred yards of the activity or within the area of containment outside the specific work area. After the activity causing the initial high turbidity levels within the specific work area ends, sediments would disperse, and background levels would be restored within hours of the disturbance for non-contaminated sites. In addition, tidal currents would slowly dissipate the oxygen-poor water and replenish ambient oxygen levels within one to several tidal exchanges. Therefore, except for areas with known contamination, only temporary water quality impacts related to suspended solids and depressed oxygen levels in the water column of the specific work area would be expected.

Any proposed construction-related dredging or in-water fill would be required to comply with Section 404 of the CWA and Section 10 of the Rivers and Harbors Act. This would include installation of pilings, docks, and other structures; sediment removal; and sediment/soil disposal, among other dredging/fill actions. In addition, construction-related dredging and/or fill would be required to obtain a corresponding Section 401 Water Quality Certification from the RWQCB. The RWQCB-issued Water Quality Certification would specify methods for ensuring the protection of water quality during construction activities, including water quality monitoring requirements in order to meet the Basin Plan water quality objectives and ensure beneficial uses are not impacted. The 401 Water Quality Certification would list specific conditions for the use of in-water construction BMPs to minimize the discharge of construction materials from construction activities, control floating debris, and provide spill containment and cleanup equipment to control potential accidental spills in order to meet the Basin Plan water quality objectives and beneficial uses. Mandatory compliance with these regulations would, in most cases, ensure that impacts from in-water construction activities occurring in areas without sediment contamination would be less than significant.

However, there are known contaminated sediments within several planning districts within the PMPU area. It is possible that in-water construction activities that disturb the Bay floor or that would directly penetrate the Bay floor would have the potential to disturb these sediments. If bottom-disturbing activities occur in areas with known or suspected contaminated sediments, it is possible that resuspended sediments may disperse within as well as outside of the project site boundaries. Dispersion of contaminated sediments may be short- or long-term depending on the duration of construction activities. Bottom-disturbing activities may uncover contaminated sediments that were previously buried deeper in the sediment column below uncontaminated sediments. In addition, dispersion of project-related contaminated sediments could potentially re-contaminate areas that have been previously remediated and/or capped. Resuspended contaminants could also dissolve in the water column, thereby affecting water quality, as well as

become available for uptake by biota within and outside of the project area. This would be a significant impact on Bay water and sediment quality as well as aquatic organisms (**Impact-WQ-1**). **Impact-WQ-1** would also potentially occur if contaminated sediments are disturbed or dredged, which would potentially degrade water quality by introducing sediments and contaminants into the water column that could increase turbidity and degrade water quality conditions. Lastly, **Impact-WQ-1** would potentially occur from the removal of creosote piles, which could result in resuspension of sediments contaminated with PAHs. Creosote is a wood preservative and water-proofing agent for marine pilings used to preserve wooden structures from attack by fungi, marine borers, and insects. Chemical formulations of creosote have varied over the production years, but it is generally reported that PAHs and alkylated PAHs account for up to 90 percent of creosote mixtures. Health effects of exposure to creosote include severe rash or skin irritation, mouth, throat and stomach pain, kidney or liver damage, convulsions, mental confusion, and cancer (CDC 2014). The degree of leaching is affected by salinity (greater in fresh water than in salt water), temperature (increases with increasing temperatures), flow, density of the wood, length of time since treatment of the wood (decreases with increasing age), and the surface area-to-volume ratio.

Mitigation measures are proposed to reduce the significance of **Impact-WQ-1**. Mitigation measure **MM-WQ-1** would require monitoring for turbidity and known constituents of concern during construction activities to verify the activities do not affect beneficial uses in San Diego Bay; **MM-WQ-2** is designed to minimize re-suspension, spillage, and misplaced sediment during construction activities; and **MM-WQ-3** would contain the resuspension of suspended sediments and prevent the dispersal of known constituents of concern outside the construction work area. Mitigation measure **MM-WQ-4** would require a Dredging Management Program that must include (A) a Dredging Operations Plan identifying the appropriate standard operating procedures and sediment control BMPs to be implemented, (B) a Contingency Plan to prepare for equipment or operational failures, (C) a Health and Safety Plan for Dredging Activities, and (D) a Notice of Planned Dredging Activities Communication Plan. Mitigation measure **MM-WQ-5** requires future project proponents to implement a (Waterside) Sediment Management Program that must contain (A) a Sampling Analysis Plan per the USACE and EPA sampling protocol, (B) a Contaminated Sediment Management Plan, (C) In-Water Activity Specific Procedures, and (D) Post-Construction Sampling and Analysis verification sampling. Mitigation measure **MM-WQ-6** requires future project proponents to propose and conduct remediation of the site if, after in-water construction activities ~~and dredging~~ are complete, post-construction site sampling shows exceedances of constituents of concern; and **MM-WQ-7** requires that removed creosote-treated piles be disposed of in a manner that precludes their further use.

In sum, future projects would be required to comply with existing regulatory requirements and successfully complete the CWA Section 404 Federal processes—both of which include obtaining a water quality certification under CWA Section 401 and implementing site-specific permit conditions imposed by the USACE and RWQCB, as well as common in-water construction BMPs. This would, in most cases, reduce any potential water quality impacts of in-water construction to less than significant.

In certain cases, however, future projects would potentially disturb contaminated sediments, which could be released back into the water column and spread contaminants beyond their existing locations (**Impact-WQ-1**). While implementation of **MM-WQ-1** through **MM-WQ-7** would minimize potential water quality impacts associated with sediment contamination (**Impact-WQ-1**), it cannot be determined with certainty that impacts would be reduced to less than significant because the timing, duration, location, and design specifications of future in-water development are not known at this time. As such, it is still possible that in-water construction activities could disturb

contaminated sediment and thereby release it into the water column. Additionally, the RWQCB and other Federal and State agencies have concurrent regulatory and permitting jurisdiction with the District over approval of the methods for in-water construction. As such, while the District has required measures to minimize impacts associated with contaminated sediment, the RWQCB and/or other Federal and State agencies also have regulatory authority to approve specific methods for in-water construction. Therefore, **Impact-WQ-1** would be significant and unavoidable despite the implementation of mitigation measures and mandatory compliance with regulations.

Landside Construction

Groundwater Quality

Groundwater is present within each of the planning districts in the PMPU area, ranging from approximately 2 to 44 feet below the ground surface, with groundwater in several of the planning districts present at depths of less than 10 feet and roughly corresponding to the water level in the Bay. Construction of projects proposed under the PMPU may result in short-term dewatering during construction of the foundations for developments such as hotels, restaurants, mobility hubs, and related project elements.

Future development projects proposed under the PMPU would be required to comply with dewatering requirements imposed by the San Diego RWQCB general WDRs for discharges from temporary groundwater extraction and similar waste discharges to San Diego Bay (Order No. R9-2015-0013 and R9-2019-0005). To obtain coverage under this order, a discharger must submit a complete Notice of Intent application package to the San Diego RWQCB office at least 60 days before proposed commencement of the discharge. The two orders require that discharges do not cause or contribute to a violation of any applicable water quality objectives and establish monitoring and reporting requirements. The discharger would be required to maintain compliance with the effluent limitations applicable to the receiving water, as specified in Order No. R9-2015-0013 (refer to Table 8 of the order). For example, the permit has effluent limitations for settleable solids, total suspended solids, turbidity, chronic toxicity, pH, and a number of additional parameters.

In addition, Order No. R9-2015-0013 identifies the monitoring and reporting program requirements. The purpose of the monitoring and reporting program is to determine and ensure compliance with effluent limitations and other requirements established in the order, assess treatment efficiency, characterize effluents, and characterize the receiving water and the effects of the discharge on the receiving water. The San Diego RWQCB may specify increased monitoring requirements to ensure that applicable water quality objectives are maintained in the receiving water.

Any dewatering or construction-related non-stormwater discharges would be controlled in compliance with the San Diego RWQCB permit for dewatering. The permit requires permittees to conduct monitoring of dewatering discharges and adhere to effluent and receiving water limitations contained within the permit so that water quality of surface waters is protected. Compliance with the applicable dewatering permit would further ensure that the impacts of these discharges would be less than significant.

Surface Water Quality

Landside construction activities associated with future development allowed under the proposed PMPU in PD2, PD3, PD8, and PD9 could result in activities such as demolition, grading and excavation, filling and compaction, and construction of aboveground facilities and buildings. In case

of heavy rain or wind conditions, during excavation or other ground-disturbing activities, erosion and sediment transport from the proposed PMPU project sites and on- and offsite staging areas could increase in the absence of regulations. Stormwater runoff (or wind) could carry the exposed or eroded sediments to the storm drain system or directly into the Bay. Erosion and sedimentation affects water quality through interference with photosynthesis, oxygen exchange, and the respiration, growth, and reproduction of aquatic species. Additionally, other pollutants, such as nutrients, metals, and hydrocarbons, can attach to sediment and be transported to the Bay.

In general, the addition to potential pollutant contributions from disturbed soil areas; the delivery, handling, and storage of construction materials and wastes; as well as the use of construction equipment could introduce a risk for stormwater contamination that could affect water quality. Spills or leaks from heavy equipment and machinery would potentially result in oil and grease contamination. On- and offsite staging areas or building sites can also be the source of pollution because of the use of paints, solvents, cleaning agents, and metals during construction. Materials from soil excavation could contain hazardous materials that may be exposed to stormwater. Larger pollutants, such as trash, debris, and organic matter, are also associated with construction activities. Furthermore, concrete used for structures, footings, and other paving materials could be potential sources of water quality pollution if any of these materials were spilled or deposited on unprotected surfaces. Other potential effects include health hazards such as skin conditions (e.g., dermatitis and burns) and eye irritation, and aquatic ecosystem damage associated with introduction of bacteria, viruses, and vectors, as well as toxic contamination and alteration in pH if waste management is not adequately implemented.

However, existing regulations are already required that minimize the potential for stormwater runoff and erosion from water and wind, as well as spills and adverse effects from machinery leaks. Construction activities proposed consistent with the PMPU that would disturb more than 1 acre of land would have to comply with the Construction General Permit, which would require development and implementation of a SWPPP by a Qualified SWPPP Developer. The SWPPP would identify what construction BMPs would be implemented in order to protect stormwater runoff and include a monitoring plan for measuring BMP effectiveness. BMPs are required to be inspected regularly by a Qualified SWPPP Practitioner to ensure BMPs are performing as anticipated. For projects that are not subject to the Construction General Permit (i.e., under 1 acre of land disturbance), PMPU construction activities would still need to comply with the District's JRMP, which requires preparation of a Construction BMP Plan.

In either case—SWPPP or Construction BMP Plan—a variety of construction BMPs would be required to be implemented throughout the various construction phases in order to protect water quality. At a minimum, BMPs would include practices to minimize the contact of construction materials, equipment, and maintenance supplies (e.g., fuels, lubricants, paints, solvents, adhesives) with stormwater. The construction SWPPP or Construction BMP Plan would specify properly designed, centralized storage areas that keep these materials away from rain and associated runoff. When grading is conducted during the rainy season, the primary BMPs selected would focus on erosion control (i.e., keeping sediment in place) and then on sediment control (i.e., keeping sediment on site). Measures would include a range of stormwater control BMPs: for example, installing erosion control such as silt fences, staked fiber rolls, and geofabric to prevent silt runoff to storm drains or waterways. Topsoil and backfill would be stockpiled, protected, and replaced at the conclusion of construction activities. Disturbed soil would be revegetated as soon as possible with the appropriate selection and schedule for turf, plants, and other landscaping vegetation.

Therefore, because construction activities would be required to comply with existing laws, regulations, and District programs (e.g., Construction General Permit, District's JRMP, Dewatering General Permit) and specific water quality BMPs must be implemented during construction activities as listed in the JRMP and subject to District approval, impacts associated with landside construction-related water quality violations and waste discharge requirements would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, may in certain cases result in a significant impact related to substantial degradation of water quality during in-water construction (**Impact-WQ-1**). This significant impact may still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new Waterfront Destination Park under Option 1 could include landside demolition, grading and excavation, and filling and compaction. While these activities have the potential to result in stormwater runoff and erosion, as well as the use of potential pollutants, construction of a Waterfront Destination Park under Option 1 would be conducted in compliance with the regulations described above, including the Construction General Permit, District's JRMP, and/or the Dewatering General Permit (if applicable), that would minimize the potential for erosion, sedimentation, runoff, or spills of pollutants during construction. Option 1 does not specifically include any in-water elements that could result in water quality impacts during in-water construction activities. Therefore, with compliance with regulations, construction under Option 1 would not result in any additional or more severe impacts related to the degradation of water quality than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, may in certain cases result in a significant impact related to substantial degradation of water quality during in-water construction (**Impact-WQ-1**). This significant impact may still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the expanded Lane Field Setback Park could include landside demolition, grading and excavation, and filling and compaction. While these activities have the potential to result in stormwater runoff and erosion, as well as the use of potential

pollutants, construction activities associated with Option 2 would be conducted in compliance with the regulations described above, including the Construction General Permit, District's JRMP, and/or the Dewatering General Permit (if applicable), that would minimize the potential for erosion, sedimentation, runoff, or spills of pollutants during construction. Option 2 does not specifically include any in-water elements that could result in water quality impacts during in-water construction activities. Therefore, with compliance with regulations, construction under Option 2 would not result in any additional or more severe impacts related to the degradation of water quality than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, may in certain cases result in a significant impact related to substantial degradation of water quality during in-water construction (**Impact-WQ-1**). This significant impact may still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new park space that could be developed under Option 3 could include landside demolition, grading and excavation, and filling and compaction. While these activities have the potential to result in stormwater runoff and erosion, as well as the use of potential pollutants that could impact water quality, construction activities associated with Option 3 would be conducted in compliance with the regulations described above, including the Construction General Permit, District's JRMP, and/or the Dewatering General Permit (if applicable), that would minimize the potential for erosion, sedimentation, runoff, or spills of pollutants during construction. Option 3 does not specifically include any in-water elements that could result in water quality impacts during in-water construction activities. Therefore, with compliance with regulations, construction under Option 3 would not result in any additional or more severe impacts related the degradation of water quality than buildout of the proposed PMPU without Option 3.

Operation

Future development currently anticipated in the planned improvements or the planning districts' Vision, as well as development consistent with the water or land use designation for the proposed development site, as described in Table 3.1.4, *Description of Water and Land Use Designations*, of the PMPU, may occur. For redevelopment projects, existing development would be replaced with more hydrologically beneficial features including providing onsite water retention or biofiltration, which are required by the District's JRMP for all projects. These design features would reduce stormwater runoff and improve water quality. Additionally, future development may result in operational activities both in water and on land that would have the potential to generate water quality pollutants. These operational activities are described below.

Waterside Operations

Impacts from Increased Commercial and Recreational Vessel Activity

Increased waterside commercial and recreational vessel activity associated with future development or redevelopment may include uses such as recreational boat berthing, commercial fishing, and sportfishing. Specifically, buildout of the proposed PMPU may result in 65 additional commercial fishing slips and 35 additional recreational boat slips in PD1, 225 recreational boat slips

in PD2, 150 recreational boat slips in PD3, 20 recreational boat slips in PD9, and 55 recreational boat slips in PD10.

An increase in the number of vessel slips would increase the chances of vessels discharging their gray water (galley and shower water) and black water (sewage) illegally directly into marine waters instead of into pump-out stations. In addition, pollutants generated from boat hull maintenance, in-water cleaning (including chemicals used in top-side and underwater cleaning), and leaking fuel and oil would negatively affect water quality. Furthermore, copper has been a standard ingredient in antifoulant hull paints for many decades and leaches into the water, which has led to water quality impairments in several planning districts. As discussed in Section 4.8.2.3, *Surface and Waterbody Water Quality*, 303(d)-listed impairments for dissolved copper are present within PD1 (Shelter Island Yacht Basin and America's Cup Harbor), PD2 (West Harbor Island and East Harbor Island), PD3 (Marriott Marina), PD9 (Coronado Cays), and PD10 (Glorietta Bay), all of which are attributed to copper paint leaching from vessel hulls. There is currently only one TMDL in place to address copper impairments, which is at the Shelter Island Yacht Basin. It is reasonably foreseeable that additional vessels using antifoulant copper-based paint for vessel hulls would potentially contribute to the existing copper impairments and may worsen the existing condition. Collectively, these impacts are considered significant (**Impact-WQ-2**). Copper loading to these water bodies results from both the passive leaching of antifoulant copper-based paints as well as in-water hull cleaning of these types of paints.

Water quality impacts from passive leaching of antifoulant copper-based paints can be reduced by converting to lower leach rate or non-copper alternative paints. In addition, water quality impacts from vessel maintenance and cleaning (including both top-side and in-water hull maintenance and cleaning) can be avoided or lessened by using non-toxic cleaning products and non-copper antifoulant paints, minimizing or eliminating toxic cleaning agents, and implementing practices that prevent or reduce opportunities for toxic products to contact surface water.

Mitigation measure **MM-WQ-8** is proposed to reduce copper impacts on water quality associated with the potential expansion of any marinas that could occur under the proposed PMPU. This mitigation measure requires development and implementation of a Marina Best Management Practice Plan and copper reduction measures, which would identify the specific use restrictions in accordance with recommendations described in current or future District and state-wide clean boating practices guidance or regulations (e.g., *San Diego Bay Boaters Guide* [District 2006] and the California State Parks Division of Boating and Waterways' and California Coastal Commission's Boating Clean and Green Program [California DBW 2017]). The Marina Best Management Practice Plan would also provide copper education and outreach to the marina occupants. Implementation of **MM-WQ-8** would also require future project proponents to implement measures that would reduce pollutant load runoff, reduce inputs of copper from passive leaching and in-water hull cleaning activities, and require ongoing monitoring of water quality to ensure that marina operations do not equal or exceed the Basin Plan water quality objectives. Should water quality objectives be worsened by the additional vessels (i.e., net new), additional BMPs would be required. With implementation of **MM-WQ-8**, impacts from copper loading would be lessened; however, the net increase in the number of vessels with copper-based paints used on their hulls would result in a significant and unavoidable impact (**Impact-WQ-2**).

Aquaculture, particularly shellfish and seaweed aquaculture, offers multiple co-benefits, such as fisheries enhancement, ecosystem restoration, bioremediation, carbon sequestration, mitigation banking, and habitat enhancement and otherwise improving water quality and ecosystem

productivity. Aquaculture within the proposed PMPU allows for the cultivation of shellfish and seaweed. Depending on the type of aquaculture operations proposed, the primary potential causes of water quality degradation include turbidity caused during harvesting and other similar operations, as well as biological oxygen demand, and therefore significant water quality impacts may occur during operation prior to mitigation (**Impact-WQ-3**). Aquacultural operations would be subject to water-quality regulations including Section 401 of the CWA and Article 10 of the District Code that regulate water quality, as well as the Magnuson-Stevens Fishery Conservation and Management Act, Endangered Species Act, and Marine Mammal Protection Act (NOAA 2021). In addition to compliance with applicable laws and regulations, **MM-WQ-9** would minimize impacts by requiring future aquaculture projects that may have significant impacts to (1) conduct a siting study to predict potential water quality impacts due to physical factors such as reduced flushing as well as any potential operational impacts, (2) develop an aquaculture water quality monitoring plan consistent with the requirements of the Shellfish Aquaculture Mitigation Plan, and (3) identify site-specific BMPs to be implemented during operation of the aquaculture facility to lessen or eliminate potential water quality impacts. With implementation of **MM-WQ-9**, impacts would be less than significant.

Impacts from Waterside Industrial Uses

The PMPU does not propose any changes to the waterside industrial land uses. As discussed within this threshold under *Landside Operations* below, SIC industrial uses are subject to regulation by the San Diego RWQCB through the Industrial General Permit, individual NPDES permits, or WDRs, and must include BMPs to prevent pollutants from entering stormwater discharges and runoff into the Bay. Development within the Industrial and Deep Water Berthing and Marine Services water designations would be subject to regulation by the San Diego RWQCB and would need to comply with existing regulations and all associated BMPs pertaining to marine-related industrial activities and services, including, but not limited to, the District's JRMP and Stormwater Ordinance, and the Industrial General Permit and WDRs. Therefore, water quality impacts from potential industrial operations would be less than significant by complying with all applicable existing water quality regulations and required BMPs specified in the Industrial General Permit and the District JRMP, as well as the water quality monitoring and reporting requirements and discharge limitations identified in the NPDES permit that may be issued to a future development by the San Diego RWQCB. Future development would be required to implement stringent BMPs (such as the design and implementation of a full-capture stormwater diversion system) in agreement with those currently in place at the other San Diego Bay shipyards.

Landside Operations

Typical pollutants associated with operations of future development may include, but are not limited to, pathogens, nutrients, pesticides, organic compounds, metals, trash/debris, and oil and grease. Consequently, operations from future development could increase the amount of pollutants generated on site that could impair water quality if not treated prior to discharge.

Operations from future development allowed under the proposed PMPU would be required to comply with the District's Stormwater Management and Discharge Control Ordinance (i.e., Article 10) and the JRMP, which include specific requirements for all development and redevelopment activities and the ongoing operation of municipal (e.g., parks, parking), commercial, and industrial facilities. Minimum BMPs consistent with the District *BMP Design Manual* require the use of site design BMPs and source control BMPs for all projects. The District's Article 10 also specifically requires pollutant control BMPs for all PDPs, which includes projects falling under the proposed PMPU. Projects considered a PDP

would be required to implement pollutant control BMPs, following the hierarchy described in the District's *BMP Design Manual* (retention, partial retention with biofiltration, biofiltration, or flow-through with participation in an Alternative Compliance Program). Stormwater pollutant control BMPs are engineered facilities that are designed to retain (i.e., intercept, store, infiltrate, evaporate, and evapotranspire), biofilter, and/or provide flow-through treatment of stormwater runoff generated on the project site. Additionally, a post-construction SWQMP must be prepared for all projects to identify the project-specific site design and source control BMPs (all projects) and pollutant control BMPs (for PDPs). The development planning requirements ensure that future development will incorporate structural design features to protect stormwater quality. In addition, once built and operational, future municipal, commercial, and industrial facilities are subject to a suite of operational BMPs required within the JRMP that serve as pollution prevention measures. Implementation of site-specific BMPs, in accordance with the applicable JRMPs, would filter potential pollutants from runoff prior to discharge into receiving waters.

The Marine Terminal, Maritime Services and Industrial, and Marine Sales and Services land use designations have the potential to generate pollutants that could discharge into the Bay and impair water quality because an increase in activities may increase the potential for contaminated runoff. Industrial uses identified with SICs would need to comply with individual NPDES Permits, and the Industrial General Permit as applicable, in addition to the requirements of Article 10 and the JRMP discussed above. Individual NPDES holders must demonstrate conformance with their permit requirements at all times. Under the Industrial General Permit, dischargers must demonstrate conformance with applicable industrial BMPs and prepare an industrial SWPPP that contains a site map that shows the site perimeter, areas where industrial activities occur, stormwater collection and discharge points, and drainage patterns across the site. BMPs must be implemented and maintained at industrial facilities to prevent pollutants from entering stormwater discharges or reduce their levels. Facilities without a SIC code would not be subject to the Industrial General Permit, but would generally be subject to WDRs and would similarly implement applicable industrial BMPs to reduce the discharge of pollutants to Bay waters. However, in general, all industrial uses within the proposed PMPU area would have a SIC code. Compliance with applicable permit requirements would ensure impacts on water quality are less than significant.

Therefore, by complying with the District's JRMP and Stormwater Management and Discharge Control Ordinance, as well as the SWRCB's General Industrial Permit, future landside development allowed under the proposed PMPU would not violate any water quality standards or waste discharge requirements. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to water quality due to the future operation of marinas (**Impact-WQ-2**) and aquaculture facilities (**Impact-WQ-3**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of the new Waterfront Destination Park under Option 1 would be similar to that of other recreational uses within the proposed PMPU area, which generally are not anticipated to generate pollutants that could impair water quality. In addition, operation of a new Waterfront Destination Park under Option 1 would comply with Article 10 and the District's JRMP, which would minimize impacts from stormwater discharge by requiring the implementation of permanent BMPs. Operation of Option 1 would not include operation of marinas or aquaculture facilities that would result in water quality impacts. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to degradation of water quality or violation of water quality standards or waste discharge requirements than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to water quality due to the future operation of marinas (**Impact-WQ-2**) and aquaculture facilities (**Impact-WQ-3**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of the expanded Lane Field Setback Park under Option 2 would be similar to that of other recreational uses within the proposed PMPU area, which generally are not anticipated to generate pollutants that could impair water quality. In addition, operation of new park space under Option 2 would comply with Article 10 and the District's JRMP, which would minimize impacts from stormwater discharge by requiring the implementation of permanent BMPs. Operation of Option 2 would not include operation of marinas or aquaculture facilities that would result in water quality impacts. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to degradation of water quality or violation of water quality standards or waste discharge requirements than the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to water quality due to the future operation of marinas (**Impact-WQ-2**) and aquaculture facilities (**Impact-WQ-3**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of new park space that could be developed under Option 3 would be similar to that of other recreational uses within the proposed PMPU area, which generally are not anticipated to generate pollutants that could impair water quality. In addition, operation of new park space under Option 3 would comply with Article 10 and the District's JRMP, which would minimize impacts from stormwater discharge by requiring the implementation of permanent BMPs.

Operation of Option 3 would not include operation of marinas or aquaculture facilities that would result in water quality impacts. Therefore, operations under Option 3 would not result in any additional or more severe impacts related to degradation of water quality or violation of water quality standards or waste discharge requirements than the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts on water quality related to violating water quality standards or waste discharge requirements or otherwise substantially degrading surface or ground water quality. Rather, the proposed PMPU policies listed in Section 4.8.4.3 would reduce potential impacts on water quality associated with violations of water quality standards by prioritizing the protection and enhancement of water quality (ECO Policy 2.1.1), committing to implementing initiatives to reduce copper loads from recreational vessels (ECO Policy 2.1.6), encouraging the use of alternative non-copper based antifouling paints (ECO Policy 2.1.7), committing to prioritizing and pursuing opportunities for the protection and enhancement of sediment quality (ECO Policy 2.2.1), reinforcing compliance with the MS4 permits and other legal requirements to minimize pollution impacts (ECO Policy 2.3.1), implementing measures to prevent pollution impacts and adverse impacts from runoff flows from all development and maintenance activities (ECO Policy 2.3.4), and implementing measures to protect and improve water quality from development projects located in areas identified as impaired under Section 303(d) of the CWA (ECO Policy 2.3.5).

Impact Determination and Mitigation

Implementation of the proposed PMPU would violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.

Significant Impacts

Impact-WQ-1: Disturbance of Contaminated Sediment During Construction. Contaminated sediments are present in PD1, PD2, PD3, and PD4. In-water construction activities within these areas have the potential to disturb contaminated sediments, which could be released back into the water column and resuspended, resulting in the spread of the contaminants. Dredging of contaminated sediment could also degrade water quality by resuspending contaminated sediments and releasing constituents of concern. In addition, constituents of concern could be released when sediments are suspended in the water column. Resuspended contaminants may dissolve into the water column and become available for uptake by biota. Redeposition may occur near the dredge or construction areas, or, depending on the environmental conditions and controls, resuspended sediment may be transported to other nearby locations in the water body. Resuspension of contaminated sediments and release of constituents of concern could impact water quality by increasing contaminant levels to levels toxic to aquatic receptors. Lastly, the removal of creosote piles could result in resuspension of sediments contaminated with PAHs.

Impact-WQ-2: Contribution to Water Quality Impairments from Future Marina Operations. Operation of future development and redevelopment of marinas may impair water quality by increasing the chances of accidental discharge of gray water or black water directly into marine waters. In addition, pollutants potentially generated from boat maintenance without appropriate BMPs, in-water hull cleaning of copper-based anti-fouling paint, and accidental discharges of fuel

and oil could negatively affect water quality. In addition, copper associated with anti-fouling hull paints has contributed to water quality impairments in San Diego Bay. The potential net increase in the number of vessel slips would potentially result in additional contributions to water quality impairments within the Bay.

Impact-WQ-3: Water Quality Degradation from Aquaculture Operations. Depending on the type of aquaculture being practiced and the methods used, water quality degradation, which could include turbidity caused during harvesting and other similar operations, as well as biological oxygen demand, may occur during operation of aquaculture facilities.

Mitigation Measures

For **Impact-WQ-1:**

MM-WQ-1: Monitor Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance. Prior to the approval of a future development project that would occur in an area with known or suspected contaminated sediments and would involve in-water construction activities that could disturb sediment (e.g., dredging, pile removal or installation, or other in-water construction-related activities that will disturb Bay floor sediment), the project proponent shall retain an expert in sediment and water quality monitor, approved by the District, who shall prepare a water quality monitoring plan and shall conduct water quality monitoring to demonstrate to the satisfaction of the District and the RWQCB that construction activities do not violate the Basin Plan or project-specific water quality objectives. Approval of the plan by the District and appropriate regulatory agencies is required before field activities can be initiated. The plan shall incorporate: (1) all permit-specific regulatory monitoring and reporting requirements and (2) a detailed description of the proposed water quality monitoring program. The plan will clearly identify the project boundaries, and chemical constituents of concern and water quality thresholds; and provide a detailed description of the water quality monitoring to be conducted prior to, during, and after construction activities to ensure compliance with this mitigation measure. The project proponent shall inform the District and the RWQCB of the results of water quality monitoring within 60 days after sample are taken. The monitoring plan will be robust enough to ensure that any exceedances of water quality objectives are identified. Depending upon the scope of the project and the potential for the release of project-derived contaminants, the water quality monitoring shall include visual inspections of turbidity and debris as well as water-column monitoring using appropriate and calibrated water quality monitoring field equipment to measure, at a minimum: turbidity, dissolved oxygen, pH, temperature, and salinity. The District, in consultation with the RWQCB and other resource agencies (as applicable), shall determine the types of constituents to be monitored, and appropriate water quality thresholds and standards for the project (e.g., San Diego Basin Plan, California Toxics Rule, applicable TMDLs, and/or other site-specific considerations). If water column monitoring indicates exceedances of water quality thresholds (e.g., turbidity or dissolved oxygen), then water column samples shall be collected and analyzed for project-specific chemicals of concern. The project proponent shall use a State of California Environmental Laboratory Accreditation Program (ELAP)–certified laboratory for all analytical testing.

The designated water quality monitor shall stop work to ensure that turbidity does not extend outside of the immediate construction area or silt curtain. If turbidity is 20 percent higher outside of the silt curtain the work area versus compared to a representative reference site

~~upstream inside the work area~~, the water quality monitor may direct the temporary halt of construction activities. The District shall direct the project proponent to implement additional control measures necessary to protect water quality per CWA Section 401 and 404 permits, the San Diego Basin Plan, and the project-specific permits. Depending upon the requirements in the permit, the project proponent and/or District may be required to alert the ~~regulatory agencies~~ RWQCB if a water quality violation is observed. In addition, the project proponent shall coordinate water quality monitoring efforts and shall provide copies of all monthly water quality monitoring data to the RWQCB and District throughout the duration of project construction, as outlined in the reporting schedule of the agency-approved monitoring plan or project-specific permits.

MM-WQ-2: Implement Best Management Practices During Construction-Related Sediment Disturbance. Prior to the approval of a future development project that involves dredging, pile removal (especially the removal of creosote-treated piles), pile installation, and other construction-related activities that may disturb Bay floor sediment within areas of known or suspected sediment contamination, the District shall identify BMPs necessary for minimizing resuspension, spillage, and misplaced sediment during construction activities, as the deposition of such material would increase turbidity and degrade water quality. BMPs shall be implemented by the project proponent and shall include, but shall not be limited to, the following:

- The project proponent shall not stockpile material on the bottom of the San Diego Bay floor and shall not sweep or level the bottom surface with the bucket.
- The project proponent shall use and maintain silt curtains for dredging operations that encircle the area of construction activities and shall minimize the times in which these curtains are temporarily opened (allowing only necessary openings for operation of the dredge and barge movements curtain), to contain suspended sediments, as more specifically described in **MM-WQ-3**.
- Based on a determination of the District and applicable Federal and/or State permitting agency (as applicable), air curtains in conjunction with silt curtains may be used to contain resuspended sediment, and allow barges containing dredge material or empty barges to transit into and out of the work area without the need to open and close silt curtain gates.
- *In-Water Activity-Specific Procedures (Pile Installation or Removal)*. The project proponent shall conduct pile installation or removal in a manner that implements applicable permit requirements, including the CWA Section 404 permit and CWA Section 401 Water Quality Certification. The following additional measures shall be required based on the type of pile installation, or removal, that occurs.

- Impact Hammer Pile Driving or Jetting

Turbidity curtains shall be installed for ~~District projects or non-District projects by the proponent~~ consistent with the District's Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District (District 2019).

- Spudding

~~Lifting S-spuds lifted during in-water construction~~ shall be done lifted slowly—at least a quarter of the speed that spuds are lifted during normal operation. Before the spud

reaches the subsurface of the Bay floor during removal, the operator shall conduct spud extraction in 2-minute intervals (repeated 2-minute extraction followed by 2-minute pause) to reduce turbidity or the disturbance of Bay sediment.

MM-WQ-3: Apply Silt Curtains During Construction-Related Sediment Disturbance with Contaminants of Concern. ~~Each future development~~ Any future project that involves dredging, pile installation, ~~and/or~~ other construction-related activities that will disturb Bay floor sediment within areas of known or suspected sediment contamination shall utilize silt curtains for containment of the contaminants of concern. Prior to the District's approval of each future project, the project proponent shall provide details about the silt curtain installation, curtain configurations, technologies, and actual locations to the District for its review and approval. During dredging activities where contaminated sediment conditions are present (based on the results of **MM-WQ-1** or based on other recent available evidence), the project proponent shall deploy inner- and outer-boundary floating silt curtains that enclose the construction area. The floating silt curtain shall consist of connected lengths of fabric. A continuous length of floating silt curtain shall be arranged to fully surround the construction equipment. The silt curtain shall be supported by a floating boom in open water areas (such as along the bayward side of the dredging areas). Along pier edges, the project proponent shall have the option of connecting the silt curtain directly to the structure. The project proponent shall continuously monitor the silt curtain for damage, dislocation, or gaps and immediately fix any locations where it is no longer continuous or where it has loosened from its supports. The bottom of the silt curtain shall be weighted with ballast weights or rods affixed to the base of the fabric that do not touch the Bay floor at the lowest tide even with curtain float/swing, where the District determines it is feasible and applicable based on specific site conditions and constraints such as water depth and habitat, as evidenced by a biological resource report paid for by the project proponent, ~~the floating silt curtains shall be anchored and deployed from the surface of the water to just above the substrate allowing for tidal action.~~ If deemed necessary by the District once project construction details and plans are available, silt curtains with tidal flaps shall be installed to facilitate curtain deployment in areas of higher flow. Based on a determination by the District and the Federal and/or State permitting agencies (as applicable), air curtains may be used in conjunction with silt curtains to contain resuspended sediment and allow barges containing dredge material or empty barges to transit into and out of the work area, without the need to open and close silt curtains.

MM-WQ-4: Implement a Dredging Management Program. Prior to the District's approval of a future ~~development project~~ project that involves dredging in known or suspected areas with sediment contamination, excluding maintenance dredging with low level constituents of concern (COCs) that would allow for beneficial reuse or other unconfined aquatic disposal options as approved by the EPA and USACE, the project proponent shall prepare and submit to the District for review and approval a Dredging Management Program (DMP) that complies with applicable permit requirements, including the CWA Section 404 permit and CWA Section 401 Water Quality Certification. The DMP shall be implemented by the project proponent prior to, during, and upon completion of dredging activities. The DMP shall contain the following elements, each of which have specific timing mechanisms as identified in the description of each element below:

- A. *Dredging Operations Plan.* The project proponent shall develop a Dredging Operations Plan that identifies the standard operating procedures (SOPs) that will be implemented during dredging activities. The Dredging Operations Plan shall include step-by-step procedures to complete dredging operations safely, in an efficient manner, and to avoid releases of

hazardous materials into the environment (i.e., from the resuspension of contaminated sediments as well as contaminants associated with construction activities such as oil or other equipment-related hazardous materials). The SOPs shall include guidance with respect to, among other things, the following:

- Proper operation of the dredge bucket.
- Proper positioning of the barge vessel to minimize propeller wash.
- Placement and maintenance of double silt curtains.
- Proper operation and maintenance of all construction equipment.

In addition, the Dredging Operations Plan shall identify sediment control BMPs to be implemented during dredging activities. The project proponent, or their contractor, shall at a minimum, implement the following BMPs for the safe handling of dredged material:

- **Sediment Unloading.** During dredging activities, the contractor shall reduce water column impacts by controlling the swing radius of the unloading equipment, using a spillage plate, and using a power wash unit to reduce impacts related to spillage from the excavator arm onto transport vehicles.
 - **Filling Transport Vehicles.** During dredging activities, the contractor shall ensure that truck volumes are limited to 90 percent based on visual observations, and that trucks shall be covered and secured per California Department of Transportation (Caltrans) regulations during transport to the disposal facility.
 - **Sediment Loading.** During dredging activities, the contractor shall ensure that trucks are loaded within a constructed loading zone to confine sediment spilled during the loading process.
- B. *Contingency Plan.* The project proponent shall develop a Contingency Plan, which shall be implemented in the case of equipment or operational failures, such as, but not limited to, silt curtain damage, spillage of sediment resulting from overloading the material barge, contact with sediment on or around the materials barge during loading, equipment failure of bucket or shear pin during loading procedures, or material barge or tugboat collision with another vessel. The Contingency Plan shall contain step-by-step procedures for response to equipment or operational failures and shall reduce the potential for the release of sediments to the water column outside the silt curtains.
- C. *Health and Safety Plan for Dredging Activities.* The project proponent shall prepare a Health and Safety Plan for Dredging Activities (Health and Safety Plan) and shall implement the Health and Safety Plan for the duration of the dredging activity. The Health and Safety Plan shall be prepared in general accordance with Federal Occupational Safety and Health Administration Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120) and California Code of Regulations, Title 8, Section 5192. The Health and Safety Plan shall provide procedures for workers for safe operation, personal protection, and emergency response during dredging operations.
- D. *Notice of Planned Dredging Activities Communication Plan.* The project proponent shall comply with RGP No. 72 (p. 13) and any update thereto that requires prepare a Communication Plan and operation guidelines for communications among between the U.S. Coast Guard, Harbor Police, and a local notice to mariners, all vessel operators to ensure the

safe movement of project vessels from the dredge site to the unloading area. The contractor shall comply with the notice requirements of RGP No. 72 (and related updates)~~implement the Communication Plan~~ throughout the duration of dredging activities.

MM-WQ-5: Implement a Sediment Management Program. Prior to the commencement of any in-water construction activities within an area of known or suspected sediment contamination, the project applicant shall retain a Qualified Professional, approved by the District, with substantial experience (i.e., more than 5 years) in marine sediment contamination, sediment sampling, and contamination remediation. The Qualified Professional shall prepare and oversee the implementation of a Sediment Management Program for the project area. The Sediment Management Program, which shall be the responsibility of the project applicant to implement, shall be in effect throughout the duration of in-water construction activities for the proposed project. ~~the District's approval of any future development involving dredging within an area of known or suspected sediment contamination, the project proponent shall prepare a Sediment Management Program to be implemented prior to and throughout the duration of waterside construction activities.~~ The Sediment Management Program shall be prepared and implemented in accordance with CWA Section 401 and 404 requirements, at a minimum, as well as other project-specific mitigation measures or enhanced BMPs. This will include the following elements, each of which have specific timing mechanisms, as identified in the description of each element below:

- A. *Sampling and Analysis Plan (SAP)*
- B. ~~Contaminated Sediment Management Plan (if contamination is found during implementation of the SAP)~~
- C. *Post-Construction Sampling and Analysis*

Sampling and Analysis Plan (SAP) Preparation and Implementation. The SAP shall be ~~approved by the USACE/EPA using USACE/EPA guidance documents for sediment testing based on either the "green book" or "inland testing manual," and shall determine and delineate the area of potential disturbance (Disturbance Area) ; implement the agency approved SAP; and compile the findings of the sediment testing program in a Sediment Characterization Report for submittal to the District and regulatory agencies.~~ The SAP, which shall include a Quality Assurance/Quality Control (QAPP) with Standard Operating Procedures (SOPs), shall apply to the entire project sediment disturbing activities ~~shall include project-specific details identified in regulatory guidance and shall set forth the methodology to be used, the locations where sampling would occur, analysis of the constituents of concern, and proper decontamination and disposal procedures, for both pre-construction and post-construction sampling and analysis.~~ The sediment samples shall be tested for the presence of the COCs. The sampling area and sampling methodology shall identify sample locations determined to be appropriate delineating the vertical and lateral extent and concentration of the project site's potential COCs, at the discretion of the USACE, EPA, and RWQCB (or other applicable agencies), in concurrence with the District to adequately characterize any Disturbance Area associated with dredging. Depending on the proposed actions and related disturbance to sediment, the SAP must be submitted to the District for concurrence by and the RWQCB, EPA, and USACE for approval, if required by state or federal law. Sediment sampling and analysis shall be performed in accordance with the requirements of the SAP to determine ~~whether the extent of sediment contamination is contaminated.~~

The results of all sediment sampling shall be documented in a Sediment Characterization Report and submitted to the District for concurrence and USACE, EPA, and RWQCB for their approval prior to any marine-side sediment-disturbing activities. The project shall be implemented in accordance with the regulatory permits and any project-specific conditions.

~~Contaminated Sediment Management Plan (Sediment Management Plan).~~ The Qualified Professional retained by the project applicant shall prepare a Sediment Management Plan based upon the findings of the Sediment Characterization Report described above in consultation with and subject to the approval of the RWQCB and the District. Once approved, the Sediment Management Plan shall be implemented by the project applicant and shall be subject to regulatory oversight of the RWQCB and the District. The Sediment Management Plan shall describe in detail the required actions that will be employed when disturbing sediment in the Disturbance Area to prevent waterside construction activity from creating contamination or exacerbating existing sediment contamination conditions documented in the Sediment Characterization Report. If contaminated sediment is identified based on sediment sampling, the project proponent shall prepare a Contaminated Sediment Management Plan, which shall be submitted to the District for concurrence and the appropriate regulatory agencies for approval. Once approved, the Contaminated Sediment Management Plan shall be implemented by the project proponent and be subject to permit compliance oversight by the appropriate regulatory agencies, such as the USACE (e.g., Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act) and the RWQCB (Section 13304 of the California Water Code and Section 401 of the CWA) as well as the District. The Contaminated Sediment Management Plan shall describe in detail the methods to be employed to minimize disturbance of contaminated sediment during waterside-in-water construction activities (as identified in the SAP) and the monitoring that will occur during in-water construction activities.

Post-Construction Sampling and Analysis. At the conclusion of in-water construction activities within an area with known or suspected COCs (not including areas of maintenance dredging that have been determined suitable for beneficial reuse or other unconfined aquatic disposal options as approved by the EPA and USACE), the project proponent shall conduct post-construction sediment quality confirmation sampling consistent with the SAP, which shall be compared to pre-construction sampling levels to determine if in-water sediment disturbance activities resulted in COCs above the preconstruction levels documented in the Sediment Characterization Report. The results of the post-construction sampling and analysis shall be submitted to the RWQCB and the District, within 30 days after concluding the sampling. This sampling will be performed in the manner and to the extent determined by the EPA, USACE, and RWQCB to be necessary to adequately characterize potential residual contamination resulting from construction activities. The project proponent shall prepare, for submittal to the District for concurrence and approval by the EPA, USACE, and RWQCB, a Post Construction Sampling Plan that shall outline the methodology to be used, the locations where sampling would occur, and the COCs to be analyzed.

MM-WQ-6: Implement Post-Construction Dredging Remediation. If, after the completion of any dredging sediment disturbing activity in an area with COCs, consistent with the requirements of **MM-WQ-4** and **MM-WQ-5**, post-dredge construction sediment quality confirmation sampling required by MM-WQ-5 shows that concentrations of COCs exceed preconstruction sampling levels also required under MM-WQ-5 ~~those set forth by the RWQCB or other regulatory agency with jurisdiction~~, the project proponent shall propose and conduct remediation additional dredging consistent with levels prescribed by the RWQCB or other

~~regulatory agency with jurisdiction, subject to approval by the RWQCB or other regulatory agency with jurisdiction, and concurrence by the District.~~ The project proponent's remediation approaches may include, but are not limited to, additional dredging, placement of sand cover, or Enhanced Monitored Natural Recovery sand containing active carbon. If additional dredging is required, the remediation shall be conducted with permitting oversight from the appropriate local, State, and Federal regulatory agencies. In addition, documentation evidencing the remediation work and completion thereof shall be submitted by the project proponent to the District. The project proponent shall monitor the remediation for its effectiveness, consistent with the standards, schedules, and reporting requirements set forth by the RWQCB. A monitoring report shall be submitted by the project proponent to the District and the RWQCB for their review at a frequency determined appropriate by the District and RWQCB.

If, after the completion of any ~~dredging remediation~~ activity within a disturbance area, consistent with the requirements of **MM-WQ-4** and **MM-WQ-5**, concentrations of COCs in the area of potential contamination do not exceed ~~those preconstruction levels set forth by the RWQCB~~, no further mitigation is required.

MM-WQ-7: Remove and Dispose of Creosote Piles Properly. Removal of creosote piles shall be conducted using vibratory extraction methods to the maximum extent feasible, as defined in PRC 21061.1. The project proponent shall submit evidence of infeasibility to the District for its concurrence, which shall explain all reasons for why this method is infeasible. If not determined feasible, extraction shall be conducted using a direct pull method. In all cases, rocking of piles shall be avoided. During extraction of creosote treated piles, if piles cannot be completely removed, the project proponent shall cut them at least ~~4 feet~~ 2 feet below the mud line. If treated piles are fully extracted or if they are cut below the mudline, the project proponent shall cap the holes or piles with appropriate material such as clean sand. The project proponent shall dispose of removed creosote-treated piles in a manner approved by the District and applicable agencies that precludes their further use. The methodology for removal of creosote-treated piles is the same as non-treated piles with the exception that ~~should~~ any pile cuttings shall be removed hand-collected and/or screened from the water for disposal at an appropriate waste facility (for creosote-treated wood guidelines, please see NOAA Fisheries Guidelines [NOAA Fisheries SW 2009] and EPA's Ecological Risk Assessment for Creosote [EPA 2008]). Creosote pile handling and disposal follows typical contaminated material methods with the manifest documented and the licensed landfill recorded (*Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District*, 2019).

The piles must be cut into manageable lengths for transport and disposal by the project proponent in an approved upland location. Extracted piles and debris ~~should~~ shall be placed by the project proponent in a lined stockpile area or directly loaded into a transport container or vehicle. Appropriate landside discharge controls (i.e., stormwater BMPs, including the use of tarps, wattles, and/or berms) approved by the District shall be identified by the project proponent prior to pile removal and implemented to prevent runoff from leaving the stockpile and entering surface- or groundwater.

Finally, use of creosote wood piles that would have the potential to contact water shall not be allowed for future development projects. This requirement is consistent with CDFW's recommendation that treated wood piles in contact with Bay waters are not consistent with Fish and Game Code Section 5650(6).

For **Impact-WQ-2:**

MM-WQ-8: Prepare and Implement a Marina Best Management Practice Plan and Copper Reduction Measures. To reduce potential impacts on water quality associated with marina-related projects, the project proponent of a marina-related project shall prepare a Marina Best Management Practice Plan specifically identifying best management practices that will be used within the Marina to (1) minimize the pollutant load, including measures to prevent, eliminate, and/or otherwise effectively protect water quality of the Bay and (2) reduce inputs of total and dissolved copper resulting from increased berthing of boats. Best management practices would be designed to adhere with the water quality criteria defined in the Basin Plan. The Marina Best Management Practice Plan and copper reduction measures shall be reviewed and approved by the District prior to the District's approval of a future development involving new or expanded marina operations. The project proponent shall be responsible for implementation and maintenance of the Marina Best Management Practice Plan and copper reduction measures. Such plans may include but are , which at a minimum, shall include, but not be limited to, the following:

- Use of educational materials provided to boat owners and their crews by the project proponent, that specify types of activities that shall be avoided and types of BMPs that shall be implemented in order to protect water quality (e.g., no in-slip refueling). Recommendations to reduce oil leaks include conducting periodic maintenance of all fuel lines, hoses, and gaskets; putting an oil-absorbent pad in the bilge; and installing a filtration system to remove oil from bilge water.
- Docking agreements containing specific use restrictions to prevent degradation of water quality, such as restricting boat repairs and cleaning operations within the marinas. These specific use restrictions shall be similar to the recommendations from the *San Diego Bay Boaters Guide* (District 2006) and the California State Parks Division of Boating and Waterways' and California Coastal Commission's Boating Clean and Green Program (California DBW 2017), both of which promote environmentally sound boating practices to marine business and boaters in California.
- Provide information to marinas and boat owners to support copper reduction, including hull-cleaning BMPs that comply with the District's in-water hull cleaning ordinance and other applicable laws and regulations (Ordinance No. 2681).¹²
- Consideration of ~~Implementation~~ of an incentive structure within the docking agreements' rent rates for occupants with non-copper hull paint boats.
- Identification of copper-free zones within the innermost portions of the marina, or limitation of copper hull paint boats to only well-flushed zones of the marina.
- Prohibition of hull bottom scraping and the use of toxic detergents to clean vessels topside, and no overwater repairs.
- Limitations on in-slip hull cleaning (restrict or limit number of cleanings per year).

¹² Ordinance No. 2681 terms and conditions addressing the use of best management practices for in-water hull cleaning state: "1. No Person shall perform In-Water Hull Cleaning without complying with Best Management Practices generally recognized by the industry as being effective and environmentally sound. 2. No Person shall perform In-Water Hull Cleaning that results in visible paint plume or cloud."

~~For marina-related projects proposing to add slips in impaired waters,~~ the project proponent shall include a baseline assessment of dissolved copper levels within the project footprint, prior to construction. Baseline conditions shall be compared to the periodic monitoring (annually at a minimum) to assess increases in copper directly attributed to project operations.

Dissolved copper levels shall be compared to Basin Plan and TMDL-specific water quality objectives.

The project proponent shall submit a baseline monitoring report and periodic monitoring reports (annually at a minimum) to the District for its review. ~~If the District determines that the project results in an adverse change in~~ If at any time during monitoring the water quality equals or exceeds the Basin Plan water quality objectives, the District shall require an update to the project's Marina Best Practice Management Plan to include additional BMPs to reduce copper attributed to the project and bring the water quality back into compliance with the Basin Plan.

For **Impact-WQ-3**:

MM-WQ-9: Conduct Water Quality Monitoring of Aquaculture Operations. Prior to the District's approval of an aquaculture project, the project proponent shall (1) conduct a siting study to predict potential water quality impacts due to physical factors such as reduced flushing as well as any potential operational impacts, (2) develop an aquaculture water quality monitoring plan consistent with the requirements of the Shellfish Aquaculture Mitigation Plan, and (3) identify site-specific BMPs to be implemented during operation of the aquaculture facility to lessen or eliminate potential water quality impacts. The project proponent shall submit the siting study, monitoring plan, and BMPs to the District for review and approval. The siting study shall include physical site-specific characteristics that may influence the local waterbody (e.g., hydrodynamic conditions, nearby natural resources, potential impacts on navigation). The water quality monitoring plan shall include an existing conditions report, an outline of water quality monitoring parameters and objectives as issued by relevant permitting authorities and resource agencies. Throughout the duration of the project's operations, the project proponent shall comply with relevant permit conditions issued by permitting authorities and shall implement the water quality monitoring plan, as issued, reviewed, and approved by the appropriate regulatory and resource agencies in coordination with the District, which shall ensure water quality is not impaired by the proposed aquaculture operation. If at any time during this monitoring, the water quality equals or exceeds the operational permit conditions, ~~Basin Plan's water quality objectives, as updated and amended,~~ the project proponent shall immediately notify the relevant permitting authorities and the District, and shall immediately identify specific actions that would eliminate the water quality impairments, approved by the relevant permitting authorities and the District.

Approved BMPs shall include a regular monitoring, reporting, and site inspection program, as issued through operational permit conditions by relevant permitting authorities and resource agencies, to ensure that the operations are in compliance with BMPs related to the specific type of aquaculture being implemented.

Level of Significance After Mitigation

In order to address both the possibility of contaminated sediment disturbance and its release into the water column (**Impact-WQ-1**) monitoring of turbidity and constituents of concern would be implemented to verify that dredging activities do adversely affect beneficial uses in San Diego Bay.

As required by **MM-WQ-1**, if water quality objectives are violated, the project proponent would temporarily halt activity and would implement all additional measures necessary to protect water quality per CWA Section 401 and 404 permits. To assist with avoiding exceeding the Basin Plan or project-specific water quality objectives, future projects would employ standard BMPs during in-water construction to minimize resuspension, spillage, and misplaced sediment (**MM-WQ-2**). Silt curtains would be used for activities resulting in sediment disturbance during dredging of areas with known or suspected sediment contamination and pile driving operations (**MM-WQ-3**), and to contain the resuspension of sediment and prevent the associated dispersal of constituents of concern and sediments outside the construction work area. Mitigation measure **MM-WQ-4** would require future project proponents to develop and implement a Dredging Management Program per EPA and USACE requirements to complete dredging operations safely, in an efficient manner, while minimizing the resuspension of contaminated sediments in the Bay (i.e., resuspension of contaminated sediments do not exceed turbidity measurements by 20%, taken in a designated reference location upstream nearby, but outside of the project area), and ensuring the proper disposal of any contaminated sediments in an approved disposal facility using best management practices. Mitigation measure **MM-WQ-5** requires future project proponents to implement a (Waterside) Sediment Management Program. **MM-WQ-6** requires future project proponents to propose and conduct additional dredging of the site if, after in-water construction activities and dredging are complete, sediment quality confirmation sampling shows exceedances of constituents of concern. Lastly, **MM-WQ-7** requires that removed creosote-treated piles be disposed of in a manner that precludes their further future use.

While implementation of **MM-WQ-1** through **MM-WQ-7** would minimize potential water quality impacts associated with sediment contamination (**Impact-WQ-1**), it is still possible that in-water construction activities could disturb contaminated sediment and thereby release it into the water column. Additionally, approval ~~authority~~ of the methods for in-water construction is within the jurisdiction of Federal and State agencies; the District has concurrent jurisdiction. As such, while the District has required measures to minimize impacts associated with contaminated sediment, the RWQCB, USACE and/or other Federal and State agencies also have regulatory authority to approve specific methods for in-water construction in concurrence with the District. As such, because the timing, location, and details of future development are unknown, the District ~~would not have final approval and thus~~ cannot guarantee that implementation of the mitigation measures would reduce the impact to less than significant. Consequently, **Impact-WQ-1** would be significant and unavoidable.

To address the potential for future expansion of marinas in PD1, PD2, PD3, PD9, and PD10 to contribute to, and potentially worsen, existing copper impairments (**Impact-WQ-2**), future project proponents would be required to develop a Marina Best Management Practice Plan to reduce inputs of total and dissolved copper resulting from increased vessel activity within the marinas (**MM-WQ-8**). With implementation of **MM-WQ-8**, impacts from copper leaching would be lessened; however, the net increase in the number of vessels with copper-based paints used on their hulls would result in a significant and unavoidable impact (**Impact-WQ-2**).

To address the potential impacts on water quality from aquaculture (**Impact-WQ-3**), **MM-WQ-9** requires future aquaculture operations to develop an aquaculture water quality monitoring plan, to comply with relevant permit conditions issued by permitting authorities, and to implement BMPs including water quality monitoring before, during, and after aquaculture operations are in place. Because any exceedances from aquaculture operations would be rectified with implementation of **MM-WQ-9**, **Impact-WQ-3** would be reduced to less than significant.

Threshold 2: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Impact Analysis

Impacts of Water and Land Uses

The proposed PMPU would increase the demand for water from water providers serving the proposed PMPU area, some of which is derived from groundwater sources. For the existing conditions of the groundwater supply within and adjacent to the proposed PMPU area, as well as the effects of groundwater demand from future development allowed under the proposed PMPU, see Section 4.15, *Utilities and Service Systems*. The impact analysis here focuses on physical interference with groundwater recharge associated with impervious surfaces.

Although groundwater is present at each of the planning districts, it is largely seawater and brackish water. According to the 2016 San Diego Region Basin Plan, none of the planning districts, with the exception of PD7 (see below), have beneficial uses designated for groundwater, and these areas have been exempted by the RWQCB from the municipal use designation.

Projects developed under the proposed PMPU could replace a portion of existing pervious surfaces that contribute to some groundwater recharge; however, those projects would not interfere substantially with groundwater recharge, such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. This is because the groundwater is mainly seawater infiltrating the soils under the planning districts, which, as indicated, is not used for municipal purposes. As such, groundwater recharge would not be reduced by the proposed PMPU. In addition, redevelopment of existing older development within the proposed PMPU area, which may not contain stormwater infiltration systems, would include the addition of biofiltration features and improve the potential for groundwater recharge compared to existing conditions. Similarly, because groundwater underlying the PMPU area is not used for municipal purposes, groundwater is unlikely to be extracted or decreased for municipal purposes. As such, the operation of future development projects allowed under the proposed PMPU would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge within the proposed PMPU area. Given the PMPU would not result in significant impacts on groundwater, the PMPU is not anticipated to conflict with sustainable management of the groundwater basin.

Planning District 7 is located over the Coastal Plain of San Diego Groundwater Basin.¹³ Future activities allowed in PD7 would be minor and would be primarily related to habitat conservation, restoration, enhancement, mitigation banking, aquaculture, scientific and environmental research, and marine technology. The portions of PD7 that are within the Coastal Plain of San Diego Groundwater Basin would still allow for groundwater recharge, and groundwater would not be expected to support these uses.

In sum, implementation of the proposed PMPU, including its ultimate buildout, would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge within the proposed PMPU area, and no conflict with the sustainable management of the groundwater basin would occur. Impacts would be less than significant.

¹³ The Basin Plan (San Diego RWQCB 2016) provides beneficial uses of groundwater hydrologic areas and subareas within the larger Coastal Plain of San Diego groundwater basin.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantial decrease of groundwater supplies or interfere with sustainable groundwater management.

Construction and operational activities associated with the new Waterfront Destination Park would include the development of biofiltration features and would improve the potential for groundwater recharge compared to existing conditions. Because groundwater underlying PD3 is not used for municipal purposes, groundwater is unlikely to be extracted or decreased for municipal purposes as part of Option 1. Therefore, construction and operation of Option 1 would not result in any additional or more severe impacts related to groundwater supply and the sustainable management of the groundwater basin than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantial decrease of groundwater supplies or interfere with sustainable groundwater management.

Construction and operational activities associated with the expanded Lane Field Setback Park would include the development of biofiltration features and would improve the potential for groundwater recharge compared to existing conditions. Because groundwater underlying PD3 is not used for municipal purposes, groundwater is unlikely to be extracted or decreased for municipal purposes as part of Option 2. Therefore, construction and operation of Option 2 would not result in any additional or more severe impacts related to groundwater supply and the sustainable management of the groundwater basin than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantial decrease of groundwater supplies or interfere with sustainable groundwater management.

Construction and operational activities associated with the new park space that could be developed under Option 3 would include the development of biofiltration features and would improve the potential for groundwater recharge compared to existing conditions. Because

groundwater underlying PD3 is not used for municipal purposes, groundwater is unlikely to be extracted or decreased for municipal purposes as part of Option 3. Therefore, construction and operation of Option 3 would not result in any additional or more severe impacts related to groundwater supply and the sustainable management of the groundwater basin than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no policies in the proposed PMPU relating to the protection of groundwater supplies or avoiding interfering substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin. Therefore, the impacts of the proposed PMPU Element Policies are neither adverse nor beneficial as they relate to groundwater recharge and management.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge, such that the project may impede sustainable groundwater management of the basin. Impacts would be less than significant, and no mitigation measures are required.

Threshold 3: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would:

i. Result in substantial erosion or siltation on- or off-site?

ii. Substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site, substantially affecting the existing environment?

iii. Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

iv. Impede or redirect flood flows?

Impact Analysis

Impacts of Water and Land Uses

Construction

Approval of the proposed PMPU would not directly result in any specific construction project, including the construction of any buildings or extension of roads into previously undeveloped areas. However, it is reasonably foreseeable that construction activities would result from future

development projects that meet the water and land use designation requirements and abide by the policies and standards set forth by the proposed PMPU.

Erosion and Siltation

Erosion is a group of natural processes, including weathering, dissolution, abrasion, corrosion, and transportation, by which material is worn away from the Earth's surface. Siltation is sediment suspended in stagnant water or carried by moving water, which often accumulates on the bottom of rivers, bays, and other bodies of water—which is known as sedimentation. Ground-disturbing activities associated with construction activities under the proposed PMPU could expose soils to the erosional forces of wind and water during storm events, potentially resulting in erosion and sedimentation on and off the planning districts, and result in the discharge of silt into the Bay in the absence of regulatory requirements.

To minimize the potential for erosion from water and wind, as well as siltation from runoff into the Bay, construction activities proposed consistent with the PMPU that would disturb more than 1 acre of land would be required to comply with the Construction General Permit, which would require development and implementation of a SWPPP by a Qualified SWPPP Developer. The SWPPP would be reviewed and approved by the District, and subject to review by the RWQCB, and would identify what construction BMPs would be implemented in order to protect stormwater runoff and include a monitoring plan for measuring BMP effectiveness. BMPs are required to be inspected regularly by a Qualified SWPPP Practitioner. The Qualified SWPPP Practitioner monitors the construction activities to ensure the BMPs listed in the SWPPP are implemented and performing as anticipated. For projects under 1 acre of land, PMPU construction activities would still need to comply with the District's JRMP, which requires preparation of a Construction BMP Plan that would be subject to review and approval by the District, and review by the RWQCB. The Construction BMP Plan requires the same construction BMPs as a SWPPP, but does not include as many post-construction BMPs. Projects that would disturb less than 1 acre, but more than 100 square feet, would need to prepare and implement a Construction BMP Plan.

In either case—a SWPPP or a Construction BMP Plan—the District would require the project applicant to implement a variety of construction BMPs (see Section 4.8.3 above for a list of potential BMPs) throughout the various construction phases in order to protect water quality. The construction SWPPP or Construction BMP Plan would specify properly designed, centralized storage areas that keep these materials away from rain and associated runoff. When grading is conducted during the rainy season, the primary BMPs selected would focus on erosion control (i.e., keeping sediment in place) and then on soil control (i.e., keeping soil on site). Measures would include a range of stormwater control BMPs: for example, installing erosion control such as silt fences, staked fiber rolls, and geofabric to prevent silt runoff to storm drains or waterways. Topsoil and backfill would be stockpiled, protected, and replaced at the conclusion of construction activities. Disturbed soil would be revegetated as soon as possible with the appropriate selection and schedule for turf, plants, and other landscaping vegetation.

Therefore, because construction activities are already regulated by existing laws, regulations, and District programs (e.g., Construction General Permit, District's JRMP, Dewatering Permit) and the District has specific water quality best practices during construction activities as listed in the JRMP and subject to District approval, substantial soil erosion or topsoil loss would not occur during construction activities. Impacts from erosion and siltation would be less than significant.

Stormwater Drainage System Sources of Additional Pollutants

As identified above, drainage systems may be temporarily modified during the construction of future development projects allowed under the proposed PMPU. However, implementation of the SWPPP or Construction BMP Plan would include several BMPs (examples of which are discussed above) that would slow onsite runoff and ensure that the available capacity of the existing stormwater facilities would be sufficient for anticipated increases in BMP-treated runoff water. As a result, construction of the projects that would be reasonably foreseeable under the proposed PMPU would not create or contribute runoff water that would exceed the available capacity of existing stormwater drainage systems. Moreover, as discussed above, BMPs would be implemented to reduce the discharge of construction pollutants. Impacts related to the alteration of existing drainage patterns during construction, which could exceed stormwater drainage system capacities or provide substantial sources of additional pollutants, would be less than significant.

The planning districts are generally flat areas and would not result in substantial erosion off site during construction activities with implementation of a SWPPP or a Construction BMP Plan. With implementation of BMPs during construction, substantial sources of additional pollutants would be reduced, and impacts would be less than significant.

Stormwater Drainage System Capacity/Impeding or Redirecting Flood Flow

The District will require project proponents to implement BMPs in accordance with the Construction General Permit and/or the District's JRMP (see Section 4.8.3 for a list of BMPs) during construction to ensure the drainage system stays operational and is not altered significantly from the existing condition, which would ensure water volumes and velocities would be accommodated from construction-related water use and during a storm event. Impacts related to the alteration of existing drainage patterns during construction, which could result in flooding, would therefore be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

Construction activities associated with the new Waterfront Destination Park could include ground-disturbing activities that could contribute to erosion, runoff, and siltation. However, construction under Option 1 would occur in compliance with the requirements of the Construction General Permit and the District's JRMP, which require BMPs that would reduce, filter, and treat stormwater runoff during construction. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to substantial alteration of the existing drainage pattern of the site or area than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

Construction activities associated with the new expanded Lane Field Setback Park could include ground-disturbing activities that could contribute to erosion, runoff, and siltation. However, construction under Option 2 would occur in compliance with the requirements of the Construction General Permit and the District's JRMP, which require BMPs that would reduce, filter, and treat stormwater runoff during construction. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to substantial alteration of the existing drainage pattern of the site or area than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive k

As discussed above, the implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

Construction activities associated with the new park space that could be developed under Option 3 could include ground-disturbing activities that could contribute to erosion, runoff, and siltation. However, construction under Option 3 would occur in compliance with the requirements of the Construction General Permit and the District's JRMP, which require BMPs intended to reduce, filter, and treat stormwater runoff during construction. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to substantial alteration of the existing drainage pattern of the site or area than buildout of the proposed PMPU without Option 3.

Operation

Erosion and Siltation

During operation of future development, the impervious surface area could be changed by individual projects compared to the pre-project conditions and could result in an increase of impervious surface area. Consequently, the amount of stormwater runoff would also increase, which could increase the amount of runoff entering the Bay. This increase, however, is anticipated to be minor given the planning districts are largely built out and unlikely to substantially change any drainage patterns that could result in increased erosion or siltation. However, it is reasonably foreseeable that there would be an increase in impervious surfaces in PD2 given the proposed planned improvements that could potentially occur. As discussed under Threshold 1, the District's JRMP requires post-construction BMPs, which are required to stabilize the disturbed soil areas to limit erosion following construction activities. In addition, stormwater facilities are currently required to retain (i.e., intercept, store, infiltrate, evaporate, and evapotranspire) and to reduce the discharge of runoff, which further limits the potential for erosion following construction activities. Therefore, with project proponents' compliance with these requirements, future development projects allowed under the proposed PMPU would not result in significant impacts related to erosion and siltation during operations.

Stormwater Drainage System Sources of Additional Pollutants

Similar to existing conditions, the operation of future development projects allowed under the proposed PMPU would be expected to generate pollutants of concern typically associated with commercial uses, restaurants, roads, parking areas, and landscaping. Such pollutants include trash and debris from site visitors, oil and grease from equipment and vehicles, oxygen-demanding substances, bacteria and pathogens from food disposal, heavy metals from equipment and structures, and organic compounds. Other potential pollutants of concern include pesticides and nutrients from landscape.

As described above, projects under the proposed PMPU would be operated in accordance with the District's JRMP and Article 10 and would be required to implement post-construction BMPs through the preparation and implementation of a project-specific SWQMP. The future development projects allowed under the proposed PMPU would implement site design, source control, and pollutant control BMPs consistent with the District's JRMP and *BMP Design Manual*. Site design and source control BMPs are the minimum management practices, control techniques, and design and engineering methods to be included in the planning design for all projects to reduce the discharge of pollutants from the development. Priority Development Projects must also implement pollutant control BMPs. Implementation of site design, source control, and pollutant control BMPs would not only result in a reduction in pollutants discharged from the project site, but also would reduce stormwater runoff generated by the project site. As a result, the future development projects would not create or contribute runoff water that would provide substantial additional sources of polluted runoff.

Stormwater Drainage System Capacity/Impeding or Redirecting Flood Flow

Areas within the proposed PMPU area that are prone to flooding under existing conditions are discussed in Section 4.8.2.1, *Surface Water Hydrology and Flood Hazards*. Most of the planning districts are largely built out (PD3) or would undergo little to no additional development (e.g., PD1, PD4, PD7, PD8, PD9, PD10). As such, the proposed PMPU would not result in a substantial increase in impervious surfaces compared to existing conditions. However, projects constructed within the

proposed PMPU area could result in some increase in impervious surfaces compared to the existing condition, particularly in PD2. This would be evaluated case by case as part of the site-specific Drainage Study for future projects under the proposed PMPU, and project-specific design features such as detention would be implemented when necessary. In addition, any future development would be required to comply with the drainage design guidelines, standards, and ordinances of the applicable member city in which the project is located. Moreover, future development projects would generally discharge directly to San Diego Bay and would not result in flooding off site due to the nature of the receiving Bay waters (i.e., not a typical channel with bed and banks subject to erosion or overtopping). Therefore, future development projects would not include substantial changes to the existing storm drain system that would result in substantial flooding on- or off site. As such, impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, operation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

The new Waterfront Destination Park could include impervious surfaces such as pedestrian pathways that could contribute to erosion, runoff, and siltation during operation. However, operation of recreational uses under Option 1 would occur in compliance with the District's JRMP and Article 10 which requires post-construction BMPs that would reduce, filter, and treat stormwater runoff. Moreover, it is anticipated that the new Waterfront Destination Park would consist primarily of pervious surfaces (e.g., grass), which would further reduce the potential for stormwater runoff. Therefore, operation of Option 1 would not result in any additional or more severe impacts related to substantial alteration of the existing drainage pattern of the site or area than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, operation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the

addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

The expanded Lane Field Setback Park could include impervious surfaces such as pedestrian pathways that could contribute to erosion, runoff, and siltation during operation. However, operation of recreational uses under Option 2 would occur in compliance with the District's JRMP and Article 10 which requires post-construction BMPs that would reduce, filter, and treat stormwater runoff. Moreover, it is anticipated that any new park space would consist primarily of pervious surfaces (e.g., grass), which would further reduce the potential for stormwater runoff. Therefore, operation of Option 2 would not result in any additional or more severe impacts related to substantial alteration of the existing drainage pattern of the site or area than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, operation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to substantially altering the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

New park space that could be developed under Option 3 could include impervious surfaces such as pedestrian pathways that could contribute to erosion, runoff, and siltation during operation. However, operation of recreational uses under Option 3 would occur in compliance with the District's JRMP and Article 10 which requires post-construction BMPs that would reduce, filter, and treat stormwater runoff. Moreover, it is anticipated that any new park space would consist primarily of pervious surfaces (e.g., grass), which would further reduce the potential for stormwater runoff. Therefore, operation of Option 3 would not result in any additional or more severe impacts related to substantial alteration of the existing drainage pattern of the site or area than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts associated with substantial alteration of the existing drainage pattern of the site or area, in a manner that would result in erosion, siltation, flooding, exceeding capacities of storm drains or redirecting flood flows. Rather, the proposed PMPU policies listed in Section 4.8.4.3 would reduce potential impacts from alteration of drainage patterns by prioritizing the protection and enhancement of water quality (ECO Policy 2.1.1), reinforcing compliance with the MS4 permits and other legal requirements to minimize pollution impacts (ECO Policy 2.3.1), and providing educational information to the public and tenants regarding natural resources protection, runoff or increased runoff flows, and pollution prevention measures to minimize or reduce impacts on water and sediment quality (ECO Policy 2.3.2).

Impact Determination and Mitigation

Implementation of the proposed PMPU would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner that would: result in substantial erosion or siltation on- or off site; result in flooding on- or off site; create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows. Compliance with applicable laws and regulations will ensure that impacts would be less than significant, and no mitigation measures are required.

Threshold 4: Risk release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones?

Impact Analysis

Impacts of Water and Land Uses

As shown on Figure 4.8-10, each planning district is partially within a designated tsunami hazard zone; the waterside portion is entirely within the tsunami hazard zone, and a small portion of the landside frontage of the planning districts at some locations is within the designated tsunami hazard zone (Department of Conservation 2009). Seiches would also be possible given the Bay geography and associated peninsulas, which act as semi-enclosed water bodies. Areas within the proposed PMPU area that are prone to flooding are discussed in Sections 4.8.2.1 and 4.8.2.3. As shown on Figures 4.8-2 through 4.8-9, each of the planning districts contains areas that are prone to flooding.

Industrial land uses typically have more hazardous materials and activities that result in pollutant discharges. As such, industrial land uses are more at risk for release of pollutants compared to recreational and commercial land uses. To the extent that the proposed PMPU would increase industrial land uses, these areas would have a slightly increased potential to risk release of pollutants if inundated.

While it is reasonably foreseeable that inundation from a tsunami or flooding could occur in certain areas of the proposed PMPU area, future development that is consistent with the proposed PMPU water and land uses would not significantly exacerbate the risk of pollutant release because of the limited amount of industrial development that is anticipated to occur and because new buildings would be designed to avoid inundation from flooding per FEMA regulations, which require that future structures proposed within a flood zone must be designed to ensure that the floor elevation is raised at least 1 foot above the floodplain elevation and meets the structural requirements of FEMA to avoid any damage to persons or structures as a result of a 100-year flood. In addition, as discussed in Section 4.7, *Hazards and Hazardous Materials*, the operation of future development consistent with these water and land uses would use common hazardous materials, such as petroleum-based substances for mechanical and motorized equipment, vessels, and vehicles; and solvents, lubricants, and cleaners for facility maintenance. However, the storage, use, and disposal of hazardous materials during operation of future development would be regulated by the applicable oversight agencies and regulations, including the local Certified Unified Program Agency (CUPA) (County Department of Environmental Health [DEH]), U.S. Department of Transportation (DOT) Hazardous Materials Regulations, Department of Toxic Substances Control (DTSC), U.S. Coast Guard (USCG), San Diego RWQCB, California Highway Patrol, and Caltrans (see Section 4.7.3 for additional

details). Therefore, impacts related to the risk of releasing pollutants due to project inundation in flood hazard, tsunami, or seiche zones would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts associated with the release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones.

Construction and operational activities associated with the closure of North Harbor Drive and a new Waterfront Destination Park under Option 1 would not introduce any new industrial land uses, which are the land uses most likely to result in a release of pollutants in the event of inundation from a tsunami or flooding. In addition, future development under Option 1 would be designed to avoid inundation from flooding per FEMA regulations, and would handle potentially hazardous materials in compliance with applicable oversight agencies and regulations, including the local CUPA (County DEH), DOT Hazardous Materials Regulations, DTSC, USCG, San Diego RWQCB, California Highway Patrol, and Caltrans. Therefore, construction and operation under Option 1 would not result in any additional or more severe impacts related to the release of pollutants as a result of inundation in flood hazard, tsunami, or seiche zones than would the buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts associated with the release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones.

Construction and operational activities associated with the expanded Lane Field Setback Park under Option 2 would not introduce any new industrial land uses, which are the land uses most likely to result in a release of pollutants in the event of inundation from a tsunami or flooding. In addition, future development under Option 2 would be designed to avoid inundation from flooding per FEMA regulations, and would handle potentially hazardous materials in compliance with applicable oversight agencies and regulations, including the local CUPA (County DEH), DOT Hazardous Materials Regulations, DTSC, USCG, San Diego RWQCB, California Highway Patrol, and Caltrans. Therefore, construction and operation under Option 2 would not result in any additional or more severe impacts related to the release of pollutants as a result of inundation in flood hazard, tsunami, or seiche zones than would the buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts associated with the release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones.

Construction and operational activities associated with the new park space that could be developed under Option 3 would not introduce any new industrial land uses which are the land uses most likely to result in a release of pollutants in the event of inundation from a tsunami or flooding. In addition, future development under Option 3 would be designed to avoid inundation from flooding per FEMA regulations, and would handle potentially hazardous materials in compliance with applicable oversight agencies and regulations, including the local CUPA (County DEH), DOT Hazardous Materials Regulations, DTSC, USCG, San Diego RWQCB, California Highway Patrol, and Caltrans. Therefore, construction and operation under Option 3 would not result in any additional or more severe impacts related to the release of pollutants as a result of inundation in flood hazard, tsunami, or seiche zones than would the buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts associated with the release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. Rather, the proposed PMPU policies listed in Section 4.8.4.3 would reduce potential impacts from potential release of pollutants from inundation by prioritizing the protection and enhancement of water quality (ECO Policy 2.1.1), reinforcing compliance with the MS4 permits and other legal requirements to minimize pollution impacts (ECO Policy 2.3.1), and implementing waste management strategies throughout Tidelands with a focus on reducing trash entering waterways (ECO Policy 2.1.3).

Impact Determination and Mitigation

Implementation of the PMPU would not risk release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones. Impacts would be less than significant, and no mitigation measures are required.

Threshold 5: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?**Impact Analysis****Impacts of Water and Land Uses****Conflict with or Obstruct Implementation of a Water Quality Control Plan**

Threshold 1 addresses the question of whether the PMPU would violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface- or groundwater quality. The analysis under that threshold addresses the San Diego Basin Plan, which is the region's water quality control plan and establishes water quality objectives and includes TMDLs.

Waterside Construction

As discussed under Threshold 1, future waterside construction activities that comply with existing regulatory requirements and successfully complete the CWA Section 404 Federal process, which includes obtaining a water quality certification under CWA Section 401 and implementing common in-water construction BMPs, would reduce any potential water quality impacts of in-water construction to less than significant.

Future projects that may be constructed would potentially disturb contaminated sediments, which could be released back into the water column and spread contaminants beyond their existing locations. This would be considered a significant impact if not mitigated (**Impact-WQ-1**). Mitigation measures are proposed to reduce the significance of **Impact-WQ-1** and include **MM-WQ-1**, which would require monitoring for turbidity and known constituents of concern during dredging activities that occur in areas with known or suspected sediment contamination, to verify the activities do not affect beneficial uses in San Diego Bay; **MM-WQ-2**, which is designed to minimize re-suspension, spillage, and misplaced sediment during construction activities; and **MM-WQ-3**, which would contain the resuspension of suspended sediments and prevent the dispersal of known constituents of concern outside the construction work area. Mitigation measure **MM-WQ-4** would require future project proponents to develop a Dredging Management Program that must include the development of: (A) a Dredging Operations Plan identifying the appropriate SOPs and sediment control BMPs to be implemented; (B) a Contingency Plan to prepare for equipment or operational failures; (C) Health and Safety Plan for Dredging Activities; and (D) a Communication Plan. Mitigation measure **MMWQ-5** requires future project proponents to implement a (Waterside) Sediment Management Program that must contain: (A) a SAP per the USACE and EPA sampling protocol; (B) Contaminated Sediment Management Plan; (C) In-Water Activity Specific Procedures; and (D) Post-Construction Sampling and Analysis verification sampling. Mitigation measure **MMWQ-6** requires future project proponents to propose and conduct additional dredging of the site if, after in-water construction activities and dredging are complete, site sampling shows exceedances of constituents of concern, and **MMWQ-7** requires that removed creosote-treated piles be disposed of in a manner that precludes their further use. Despite the implementation of **MM-WQ-1** through **MM-WQ-7** and compliance with regulations, **Impact-WQ-1** would be significant and unavoidable because the timing, location, and details of future development are unknown, because, while the District and the other applicable Federal and State agencies have concurrent jurisdiction, the District would not have final approval over in-water construction and dredging methods, and would not be able to ensure methods that mitigation e-would reduce the impact to less than significant levels ~~would be implemented~~.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to the conflict or obstruction of a water quality control plan or sustainable groundwater management plan (**Impact-WQ-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new Waterfront Destination Park could include landside demolition, grading and excavation, and filling and compaction. While these activities have the potential to result in stormwater runoff and erosion, as well as the use of potential pollutants, construction of a Waterfront Destination Park under Option 1 would be conducted in compliance with the regulations described above, including the Construction General Permit, District's JRMP, and/or the Dewatering General Permit (if applicable), that would minimize the potential for erosion, sedimentation, runoff, or spills of pollutants during construction. Option 1 does not specifically include any in-water elements that could result in water quality impacts during in-water construction activities. Therefore, with compliance with regulations, construction under Option 1 would not result in any additional or more severe impacts related to the degradation of water quality than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to the conflict or obstruction of a water quality control plan or sustainable groundwater management plan (**Impact-WQ-1**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the expanded Lane Field Setback Park could include landside demolition, grading and excavation, and filling and compaction. While these activities have the potential to result in stormwater runoff and erosion, as well as the use of potential pollutants, construction activities associated with Option 2 would be conducted in compliance with the regulations described above, including the Construction General Permit, District's JRMP, and/or the Dewatering General Permit (if applicable), that would minimize the potential for erosion, sedimentation, runoff, or spills of pollutants during construction. Option 2 does not specifically include any in-water elements that could result in water quality impacts during in-water construction activities. Therefore, with compliance with regulations, construction under Option 2 would not result in any additional or more severe impacts related to the degradation of water quality than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to the conflict or obstruction of a water quality control plan or sustainable groundwater management plan (**Impact-WQ-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with the new park space that could be developed under Option 3 could include landside demolition, grading and excavation, and filling and compaction. While these activities have the potential to result in stormwater runoff and erosion, as well as

the use of potential pollutants that could impact water quality, construction activities associated with Option 3 would be conducted in compliance with the regulations described above, including the Construction General Permit, District's JRMP, and/or the Dewatering General Permit (if applicable), that would minimize the potential for erosion, sedimentation, runoff, or spills of pollutants during construction. Option 3 does not specifically include any in-water elements that could result in water quality impacts during in-water construction activities. Therefore, with compliance with regulations, construction under Option 3 would not result in any additional or more severe impacts related the degradation of water quality than buildout of the proposed PMPU without Option 3.

Waterside Operation

Impacts from Increased Commercial and Recreational Vessel Activity

As also discussed under Threshold 1, operation of future development activities would have the potential to conflict with the San Diego Basin Plan. As noted under Threshold 1, prior to mitigation the increase in the number of slips would result in an increase in the number of recreational and commercial marine vessels in PD2, PD3, PD9, and PD10, which are already impaired by copper from the antifoulant paint used on vessel hulls to minimize biofouling. An increase in the number of vessels would potentially lead to additional contributions to the current copper impairments, which would be considered a significant impact (**Impact-WQ-2**). Implementation of **MM-WQ-8** would require project proponents to implement a Marina Best Management Practice Plan and copper reduction measures that would reduce pollutant load runoff and reduce inputs of copper from boat berthing, and would require ongoing monitoring of water quality to ensure that marina operations do not equal or exceed the Basin Plan water quality objectives. Should water quality objectives be worsened by the additional vessels (i.e., net new), additional BMPs would be required. With implementation of **MM-WQ-8**, impacts from copper leaching would be lessened; however, the net increase in the number of vessels with copper-based paints used on their hulls would result in a significant and unavoidable impact (**Impact-WQ-2**).

Impacts from Waterside Industrial Uses

Potential waterside industrial activities would continue to occur under the PMPU, and future waterside industrial activities may be proposed through 2050. As discussed under Threshold 1, SIC -coded industrial uses are subject to regulation by the San Diego RWQCB through the Industrial General Permit, individual NPDES permits, or WDRs, and must include BMPs to prevent pollutants from entering stormwater discharges and runoff into the Bay. Any addition of waterside industrial activities would be subject to regulatory oversight and would need to comply with applicable regulations and all associated BMPs pertaining to marine-related industrial activities and services, including, but not limited to, the District's JRMP and Stormwater Ordinance, and the Industrial General Permit and WDRs.

Impacts from Waterside Aquaculture Activities

As discussed under Threshold 1, depending on the type of aquaculture operations proposed, the primary potential causes of water quality degradation include turbidity caused during harvesting and other similar operations, as well as biological oxygen demand. Mitigation measure **MM-WQ-9** would minimize impacts by requiring future aquaculture projects that may result in significant impacts to: (1) conduct a siting study to predict potential water quality impacts due to physical factors such as reduced flushing as well as any potential operational impacts, (2) develop an

aquaculture water quality monitoring plan consistent with the requirements of the Shellfish Aquaculture Mitigation Plan, and (3) develop site-specific BMPs to be implemented during operation of the aquaculture facility to lessen or eliminate potential water quality impacts. With implementation of **MM-WQ-9**, impacts would be less than significant.

Landside Construction and Operation

As discussed under Threshold 1, the construction and operation of future development under the proposed PMPU would not result in any significant landside conflicts with the San Diego Basin Plan due to mandatory compliance with existing laws, regulations, and District programs (e.g., Construction General Permit, District's JUMP requirements, Dewatering Permit, Stormwater Management and Discharge Control Ordinance [Article 10], General Industrial Permit). Consequently, impacts from future landside construction and operation activities related to conflicting with or obstructing implementation of a water quality control plan would be less than significant.

Conflict with or Obstruct Implementation of a Sustainable Groundwater Management Plan

The Sustainable Groundwater Management Act was enacted to better manage groundwater supplies in the state and directs local agencies (e.g., cities, counties, and water agencies) to adopt Groundwater Sustainability Plans for high- and medium-priority groundwater basins to ensure their long-term sustainability. The proposed PMPU area is within two DWR-designated groundwater basins: the Mission Valley Groundwater Basin (very low priority) and the Coastal Plain of San Diego Groundwater Basin (low priority) (County of Water Authority 2021). Planning District 2 and a portion of PD3 are within the Mission Valley Groundwater Basin, while the remaining portion of PD3 as well as PD4, PD7, and PD8 are within the Coastal Plain of San Diego Groundwater Basin. Planning District 9 and PD10 are not within a recognized groundwater basin designated by DWR or in the San Diego Basin Plan. As such, the proposed PMPU area is not within a high- or medium-priority groundwater basin that is subject to a Groundwater Sustainability Plan, and there is no Groundwater Sustainability Plan or other groundwater management plan applicable to the proposed PMPU. Further, because groundwater is mainly seawater infiltrating the soils under the planning districts, groundwater recharge would not be reduced by the proposed PMPU. Moreover, the proposed PMPU does not include any uses that would directly draw groundwater within the proposed PMPU area (e.g., groundwater wells). In the event temporary groundwater dewatering is required during construction of future development, dewatering would comply with San Diego RWQCB permits and requirements (i.e., Order No. R9-2015-0013 and R9-2019-0005). As a result, there would be no impact on groundwater resources from construction activities. Therefore, the proposed PMPU would not conflict with or obstruct implementation of a sustainable groundwater management plan, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses.

Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to water quality due to the future operation of marinas (**Impact-WQ-2**) and aquaculture facilities (**Impact-WQ-3**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of the new Waterfront Destination Park under Option 1 would be similar to that of other recreational uses within the proposed PMPU area, which generally are not anticipated to generate pollutants that could impair water quality. In addition, operation of a new Waterfront Destination Park under Option 1 would comply with Article 10 and the District's JRMP, which would minimize impacts from stormwater discharge by requiring the implementation of permanent BMPs. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to degradation of water quality or violation of water quality standards or waste discharge requirements than the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to water quality due to the future operation of marinas (**Impact-WQ-2**) and aquaculture facilities (**Impact-WQ-3**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of the expanded Lane Field Setback Park under Option 2 would be similar to that of other recreational uses within the proposed PMPU area, which generally are not anticipated to generate pollutants that could impair water quality. In addition, operation of new park space under Option 2 would comply with Article 10 and the District's JRMP, which would minimize impacts from stormwater discharge by requiring the implementation of permanent BMPs. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to degradation of water quality or violation of water quality standards or waste discharge requirements than the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to water quality due to the future operation of marinas (**Impact-WQ-2**) and aquaculture facilities (**Impact-WQ-3**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of new park space that could be developed under Option 3 would be similar to that of other recreational uses within the proposed PMPU area, which generally are not anticipated to generate pollutants that could impair water quality. In addition, operation of new park space under Option 3 would comply with Article 10 and the District's JRMP, which would minimize impacts from stormwater discharge by requiring the implementation of permanent BMPs. Therefore, operations under Option 3 would not result in any additional or more severe impacts

related to degradation of water quality or violation of water quality standards or waste discharge requirements than the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to conflicting with or obstructing implementation of a water quality control plan or sustainable groundwater management plan. Rather, the proposed PMPU policies listed in Section 4.8.4.3 would reduce potential impacts related to compliance with a water quality control plan by prioritizing the protection and enhancement of water quality (ECO Policy 2.1.1), committing to implementing initiatives to reduce copper loads from recreational vessels (ECO Policy 2.1.6) and encourage the use of alternative non-copper based antifouling paints (ECO Policy 2.1.7), committing to prioritizing and pursuing opportunities for the protection and enhancement of sediment quality (ECO Policy 2.2.1), reinforcing compliance with the MS4 permits and other legal requirements to minimize pollution impacts (ECO Policy 2.3.1), implementing measures to prevent pollution impacts and adverse impacts from runoff flows from all development and maintenance activities (ECO Policy 2.3.4), and implementing measures to protect and improve water quality from development projects located in areas identified as impaired under Section 303(d) of the CWA (ECO Policy 2.3.5). As stated above, the proposed PMPU area is not within a high- or medium-priority groundwater basin that is subject to a Groundwater Sustainability Plan, and there is no Groundwater Sustainability Plan or other groundwater management plan applicable to the proposed PMPU.

Impact Determination and Mitigation

Implementation of the proposed PMPU would conflict with or obstruct implementation of a water quality control plan. No impacts would occur in regard to conflicts with a sustainable groundwater management plan.

Significant Impacts

Impact-WQ-1: Disturbance of Contaminated Sediment During Construction, as listed under Threshold 1.

Impact-WQ-2: Contribution to Water Quality Impairments from Future Marina Operations, as listed under Threshold 1.

Impact-WQ-3: Water Quality Degradation from Aquaculture Operations, as listed under Threshold 1.

Mitigation Measures

For **Impact-WQ-1**:

MM-WQ-1: Monitor Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance, as listed under Threshold 1.

MM-WQ-2: Implement Best Management Practices During Construction-Related Sediment Disturbance, as listed under Threshold 1.

MM-WQ-3: Apply Silt Curtains During Construction-Related Sediment Disturbance with Contaminants of Concern, as listed under Threshold 1.

MM-WQ-4: Implement a Dredging Management Program, as listed under Threshold 1.

MM-WQ-5: Implement a Sediment Management Program, as listed under Threshold 1.

MM-WQ-6: Implement Post-Construction Dredging Remediation, as listed under Threshold 1.

MM-WQ-7: Remove and Dispose of Creosote Piles Properly, as listed under Threshold 1.

For **Impact-WQ-2**:

MM-WQ-8: Prepare and Implement a Marina Best Management Practice Plan and Copper Reduction Measures, as listed under Threshold 1.

For **Impact-WQ-3**:

MM-WQ-9: Conduct Water Quality Monitoring of Aquaculture Operations, as listed under Threshold 1.

Level of Significance After Mitigation

In order to address both the possibility of contaminated sediment disturbance and its release into the water column (**Impact-WQ-1**), during construction the project proponent would monitor turbidity and constituents of concern to verify that dredging activities do not unreasonably affect beneficial uses in San Diego Bay. As required by **MM-WQ-1**, if water quality objectives are violated, the project proponent would temporarily halt activity and implement all additional measures necessary to protect water quality per CWA Section 401 and 404 permits. To assist with avoiding exceeding Basin Plan or project-specific water quality objectives, future projects would employ standard BMPs during in-water construction to minimize resuspension, spillage, and misplaced sediment (**MM-WQ-2**). One particular BMP that must be used for activities that would lead to substantial sediment disturbance for areas of known COC is the use of silt curtains (**MM-WQ-3**). Silt curtains would be used to contain the resuspension of sediment and prevent the associated dispersal of constituents of concern outside the construction work area. Mitigation measure **MM-WQ-4** would require future project proponents to develop and implement a Dredging Management Program per EPA and USACE requirements to complete dredging operations safely, in an efficient manner, while minimizing the resuspension of contaminated sediments in the Bay (i.e., resuspension of contaminated sediments do not significantly exceed turbidity measurements taken in a designated reference location nearby, but outside of the project area), and ensuring the proper disposal of any contaminated sediments in an approved disposal facility using best management practices. Mitigation Measure **MM-WQ-5** requires future project proponents to implement a (Waterside) Sediment Management Program, and **MM-WQ-6** requires future project proponents to propose and conduct additional dredging of the site if, after in-water construction activities and dredging are complete, sediment quality confirmation sampling shows exceedances of constituents of concern. Lastly, **MM-WQ-7** requires that removed creosote-treated piles be disposed of in a manner that precludes their further use in compliance with local regulations. Implementation of **MM-WQ-1** through **MM-WQ-7** would minimize potential water quality impacts associated with sediment contamination (**Impact-WQ-1**). The District's approval of in-water construction projects is conditional on the project proponent obtaining the necessary permits for construction from the USACE, RWQCB, and/or other Federal and State agencies. By obtaining permits to conduct in-water construction and implementing **MM-WQ-1** through **MM-WQ-7**, potential significant impacts would be reduced but remain significant and unavoidable.

To address the potential for future development or redevelopment of marinas to contribute to, and potentially worsen, existing copper impairments (**Impact-WQ-2**), project proponents would be required to develop a Marina Best Management Practice Plan to reduce inputs of total and dissolved copper resulting from increased vessel activity within the marinas (**MM-WQ-8**). With implementation of **MM-WQ-8**, impacts from copper leaching would be lessened, but the net increase in the number of vessels with copper-based paints used on their hulls would result in a significant and unavoidable impact (**Impact-WQ-2**).

To address the potential impacts on water quality from aquaculture (**Impact-WQ-3**), **MM-WQ-9** requires future aquaculture projects which may have significant impacts to (1) conduct a siting study to predict potential water quality impacts due to physical factors such as reduced flushing as well as any potential operational impacts, (2) develop an aquaculture water quality monitoring plan consistent with the requirements of the Shellfish Aquaculture Mitigation Plan, and (3) develop site-specific BMPs to be implemented during operation of the aquaculture facility to lessen or eliminate potential water quality impacts. With implementation of **MM-WQ-9**, impacts would be less than significant. Because any exceedances from aquaculture operations would be rectified with implementation of **MM-WQ-9**, **Impact-WQ-3** would be reduced to less than significant.

4.8.5 Cumulative Impact Analysis

A significant cumulative impact on hydrology and water quality would occur if the proposed PMPU were to make a cumulatively considerable contribution to impacts related to water quality standard violations; depletion of groundwater supplies or interference with recharge, alterations to drainage patterns leading to erosion or flooding, increased runoff in excess of available capacity, substantial additional sources of polluted runoff, the placement of structures within a 100-year flood hazard area that would impede or redirect flood flows, and/or exposure of people or structures to flooding risk from inundations by seiche or tsunami. These issues are evaluated within the context of past, present, and probable future projects. The proposed PMPU is not anticipated to result in impacts related to depletion of groundwater supplies or interference with recharge; alterations to drainage patterns leading to erosion or flooding; placement of structures within a 100-year flood hazard area; and/or the exposure of people or structures to flooding risk from inundations by dam and/or levee failure, seiche, or tsunami. As such, cumulative impacts related to these issues are not required to be evaluated.

4.8.5.1 Geographic Scope

The geographic scope for cumulative impacts associated with hydrology and water quality includes the receiving waters of San Diego Bay, which includes a number of the plans and programs listed in Table 2-2 in Chapter 2, *Environmental Setting*. Given the proposed PMPU area is located on the downstream end of the watershed, the proposed PMPU's cumulative contributions would be limited to the Bay waters.

4.8.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Table 2-2 includes past, present, and probable future plans and programs in the vicinity of the proposed PMPU area. Three plans and programs, the National City Bayfront Projects and Plan Amendments, the Chula Vista Bayfront Master Plan, and the Seaport San Diego project are located

within the District's jurisdiction and are within 0.25 mile of the proposed PMPU area. The other plans and programs in Table 2-2 are either approved or in preparation in adjacent jurisdictions. Features of several of these plans and programs may be within the same watershed as the proposed PMPU area. Many of the plans and programs listed in Table 2-2 are located on the landside portion of the Bay and would not involve in-water construction activities. The projects that would involve at least 1 acre of grading during construction would be required to comply with the NPDES Construction General Permit, which requires preparation of a SWPPP by a Qualified SWPPP Developer and implementation of BMPs by a Qualified SWPPP Practitioner to ensure runoff from individual projects meet current water quality standards. For projects under 1 acre, the Municipal Permit requires minimum BMPs at all construction and grading projects. The implementation of BMPs for all construction sites is required to ensure a reduction of potential pollutants from the project sites to the maximum extent practicable and to effectively prohibit non-stormwater discharges from construction sites to the Municipal Separate Storm Sewer System or directly to the Bay. Furthermore, many of these cumulative projects would replace existing development that was not constructed to modern MS4 permit requirements. Consequently, new cumulative development would be required to comply with all applicable laws and regulations and thus may improve baseline environmental conditions by increasing onsite water retention and reducing offsite stormwater flows in comparison to baseline conditions. Therefore, for the reasons discussed above, cumulative effects from past, present, and probable future plans and programs on landside water quality and hydrology would not be significant.

Past projects have contributed pollutants to San Diego Bay, as evidenced by the CWA Section 303(d) List of Water Quality Limited Segments Requiring Total Maximum Daily Loads. The entire San Diego Bay is a listed impaired water body for PCBs, PAHs, and mercury. Portions of the Bay shoreline are listed as impaired for benthic community effects, sediment toxicity, heavy metals, PAHs, and PCBs. This is primarily due to historic uses of the Bay and the surrounding area, as well as current uses. Current and probable future projects associated with cumulative plans and programs in Table 2-2 may involve activities that could worsen existing impacts on the water quality of the Bay, including disturbing contaminated sediment that is released into the water column. Current and probable future projects could also contribute pollutants such as oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens into the stormwater conveyance system and receiving waters.

Past projects have resulted in increases in impervious surfaces that reduce infiltration and affect recharge of the groundwater basin; however, past, present, and probable future projects in the proposed PMPU area and the surrounding vicinity would be located in areas where groundwater is mainly seawater infiltrating the soils and is brackish water that is not extracted for municipal purposes.

Past projects have also resulted in the construction of buildings, infrastructure, or other features that resulted in permanent changes in drainage patterns that could result in erosion, siltation, increased stormwater runoff, and increased stormwater pollutants, or exceed drainage system capacity or impede flood flows. Present and probable future projects have the potential to result in construction that could contribute to a change in drainage patterns. However, past, present, and probable future projects would be constructed in compliance with the Construction General Permit, the requirements of a project-specific SWPPP, the District's Article 10 and JRMP (if within the District's jurisdiction), Dewatering General Permit (if applicable), and other applicable regulations which minimize erosion and the increase of stormwater runoff.

Past, present, and probable future projects could be located within tsunami hazard zones or flood zones, which could result in the release of pollutants due to project inundation. However, projects would comply with the requirements of applicable laws and regulations that regulate the use, storage, and handling of potential pollutants, including the Construction General Permit, NPDES Permit, Industrial General Permit, the local CUPA (County DEH) regulations, DOT Hazardous Materials Regulations, DTSC regulations, USCG regulations, and Caltrans regulations.

Present and probable future projects would be subject to Clean Water Act regulations that require compliance with water quality standards, water quality control plans, or sustainable groundwater management plans, including State and local water quality regulations, District's JRMP, local *BMP Design Manual* (for projects within the District's jurisdiction), the Basin Plan, and any applicable stormwater ordinances of the adjacent cities, which identify water quality BMP requirements (for projects within adjacent city jurisdiction). In addition, projects affecting waters of the United States would also need to comply with CWA Section 404 and 401 regulations, requiring implementation of additional BMPs to protect water quality during construction. However, because San Diego Bay is currently an impaired water body and has been for some time, the cumulative effects of past, present, and probable future projects on water quality are significant.

4.8.5.3 Project Contribution

A cumulatively significant hydrology and water quality impact presently exists because of San Diego Bay's status as an impaired water body and the potential for present and probable future projects to further degrade water quality with the addition of similar pollutants as those already impairing the Bay.

Future development under the proposed PMPU would involve land-disturbing activities that would expose soils. Construction of projects proposed under the PMPU may result in short-term dewatering during construction of the foundations for developments such as hotels, restaurants, mobility hubs, and related project elements. Future development projects proposed under the PMPU would be required to comply with dewatering requirements imposed by the San Diego RWQCB general waste discharge requirements for discharges from temporary groundwater extraction and similar waste discharges to San Diego Bay (Order No. R9-2015-0013 and R9-2019-0005). This development would also be required to comply with the Construction General Permit if it would disturb more than 1 acre of land during construction. The Construction General Permit would require development and implementation of a SWPPP by a Qualified SWPPP Developer. The SWPPP would identify what construction BMPs would be implemented in order to protect stormwater runoff and include a monitoring plan for measuring BMP effectiveness. In addition, future development within the proposed PMPU area would be required to comply with the Municipal Stormwater Permit and the District's JRMP, which identifies construction BMPs that would be implemented in order to protect stormwater runoff. The District's JRMP requires preparation of a Construction BMP Plan for projects that would disturb less than 1 acre, but more than 100 square feet. Construction BMPs, identified in the Construction BMP Plan, would be required to be implemented throughout the various construction phases to protect water quality and would reduce impacts on water quality during future construction activities. Pursuant to the District's JRMP, post-construction BMPs are required for all projects falling under the Municipal Stormwater Permit. Post-construction BMPs are a subset of BMPs that include structural and nonstructural controls that detain, retain, and filter (i.e., treat) stormwater, and also include education on proper stormwater practices to prevent the release of pollutants to surface waters during operation. District Code Article 10 (Stormwater Management and Discharge Ordinance) also specifically requires pollutant control BMPs for all PDPs. Additionally, future project proponents would be required to prepare

a project-specific SWQMP for approval by the District that identifies low-impact development (LID) features (site design and source control BMPs) and pollutant control BMPs to reduce the discharge of pollutants to the maximum extent practicable. Therefore, future development would be required to implement BMPs consistent with the Construction General Permit (as applicable), the District's JRMP, the *BMP Design Manual*, District Code Article 10, and the SWQMP to ensure that water quality standards or wastewater discharge requirements are not violated and impacts on water quality would be less than significant during construction and operation. Consequently, construction and operation of future landside development in the proposed PMPU would not result in a cumulatively considerable contribution to the significant cumulative impact related to the violation of water quality standards and wastewater discharge requirements.

Implementation of the proposed PMPU would potentially result in impervious surfaces that reduce groundwater recharge; however, because groundwater in the proposed PMPU area is fed by the infiltration of seawater, and the proposed PMPU would not extract groundwater for municipal uses, the PMPU would not have an effect on groundwater levels. Thus, future development under the proposed PMPU would not decrease groundwater supplies or interfere substantially with groundwater recharge, or conflict with sustainable groundwater management plans. The proposed PMPU's contribution to decreased groundwater supply would not be cumulatively considerable.

Additionally, any open excavation occurring associated with utilities or soil removal for foundation preparation may serve to capture stormwater and impede its flow if unprotected; however, BMPs would be in place to divert runoff away from the construction site and toward proper drainage locations. As a result, future development under the proposed PMPU would not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. The proposed PMPU's contribution to polluted runoff would not be cumulatively considerable.

Similar to existing conditions, some future development on the landside portion of the proposed PMPU area could be within the FEMA 100-year floodplain. During future construction activities, construction equipment would be mobile and could move to higher ground if needed. Thus, the temporary presence of the construction-related equipment would not represent a permanent change to the floodplain, and would not impede or redirect flood flows. All future structures proposed within Flood Zone AE must be designed to ensure that the floor elevation is raised at least 1 foot above the floodplain elevation and meets the structural requirements of FEMA to avoid any damage to persons or structures as a result of a 100-year flood. In addition, the storage, use, and disposal of hazardous materials during operation of probable future development would be regulated by the applicable oversight agencies and regulations, including the local CUPA (County DEH), DOT Hazardous Materials Regulations, DTSC, USCG, San Diego RWQCB, California Highway Patrol, and Caltrans. Therefore, because the construction and operation of future development under the proposed PMPU would not exacerbate the flooding potential or the effects of flooding on the existing environment, including the risk of release of pollutants due to project inundation in flood hazard, tsunami, or seiche zones, impacts would be less than significant. The proposed PMPU's incremental contribution to this issue would not be cumulatively considerable.

In-water construction activities could result in short-term water quality impacts associated with the removal and replacement of existing pilings (including piles treated with wood preservatives such as creosote) and piers, construction of new pilings/piers, moorings, and floating docks, aquaculture infrastructure such as buoys and grow out lines, and dredging activities. Placement of pile structures could temporarily affect water quality in the absence of regulations. Pile placement would result in the short-term disturbance of localized sediments. The disruption of sediments from these activities could adversely affect water quality by temporarily resuspending sediments and increasing

turbidity. In addition, chemicals or contaminants that are present in the sediments could be released into the water column during resuspension, which could temporarily degrade water quality. Further, suspended sediments in the water column can lower levels of dissolved oxygen, increase salinity, increase concentrations of suspended solids, and possibly release chemicals present in sediments into the water and redeposit them at various locations on the Bay floor, making them potentially bioavailable for marine organisms now that they would no longer be buried. The disturbance of potentially contaminated sediments that would become suspended in the water column, resulting in the release of hazardous pollutants and degradation of water quality would be considered a cumulatively considerable impact related to the violation of water quality standards and conflict with the San Diego Basin Plan (**Impact-C-WQ-1**).

Future development under the proposed PMPU involving in-water work would be required to obtain a CWA Section 404 and potentially a Rivers and Harbors Act Section 10 permit (for the placement of any structures in navigable waters) from the USACE, and a corresponding CWA Section 401 Water Quality Certification from the RWQCB. These permits would require the implementation of construction BMPs that would minimize the discharge of materials; control debris; provide spill containment and cleanup equipment; minimize resuspension, spillage, and displaced sediment during dredging operations; contain suspended sediments with silt curtains; monitor water quality; and otherwise reduce impacts on water quality.

In addition to the required regulatory permits, **MM-WQ-7** would minimize potential impacts associated with sediment contamination during in-water construction activities, including dredging and pile installation/removal located within areas with contaminated sediment. Implementation of **MM-WQ-1** through **MM-WQ-7** would reduce the potential cumulatively considerable impact on water quality due to the suspension of contaminated sediments in the water column (**Impact-C-WQ-1**), but not to less than significant. ~~Because the District and applicable Federal and State agencies have concurrent jurisdiction over the approval of methods for in-water construction, the District would not have sole or final authority to determine the type of in-water construction methods required. Because the timing, location, and details of future development are unknown,~~ the District cannot guarantee that implementation of the mitigation measures would reduce the impact to less than significant. Thus, the proposed PMPU would result in a cumulatively considerable and unavoidable contribution to the significant cumulative impact after mitigation.

Implementation of the proposed PMPU would have the potential to result in additional vessels in PD2, PD3, PD9, and PD10 through the introduction of additional slips ~~and an increase in cruise ships calls at the Broadway and B Street piers~~ over the life of the plan. It is reasonably foreseeable that the net increase in the number of vessels using antifoulant copper-based paint for vessel hulls would potentially worsen the existing condition and result in a cumulatively considerable contribution to the existing copper impairments (**Impact-C-WQ-2**). Implementation of **MM-WQ-8** requires development and implementation of a Marina Best Management Practice Plan and copper reduction measures. The Marina Best Management Practice Plan would identify specific use restrictions, provide copper education and outreach to the marina occupants, and include measures that would reduce pollutant load runoff, reduce inputs of copper from boat berthing, and require ongoing monitoring of water quality to ensure that marina operations do not equal or exceed the Basin Plan water quality objectives. Implementation of **MM-WQ-8** would reduce the potential cumulatively considerable impact on water quality associated with worsening existing copper impairments (**Impact-C-WQ-2**), but not to less than significant; thus, the proposed PMPU would result in a cumulatively considerable and unavoidable contribution to the significant cumulative impact after mitigation.

Moreover, the proposed PMPU would allow for the development of aquaculture facilities. Depending on the type of aquaculture operation, the primary potential causes of water quality degradation

include turbidity caused during harvesting and other similar operations, as well as biological oxygen demand. Due to the existing water quality impairments in the Bay, the operation of certain aquaculture facilities could result in a cumulatively considerable contribution to water quality impacts depending on the type of aquaculture and the methods used (**Impact-C-WQ-3**). Implementation of **MM-WQ-9** requires future aquaculture projects to develop an aquaculture water quality monitoring plan, and implementation of BMPs—including implementation of water quality monitoring before, during, and after aquaculture operations. Mitigation measure **MM-WQ-9** would reduce the potential cumulatively considerable impact on water quality associated with operation of aquaculture operations (**Impact-C-WQ-3**) to less than significant; thus, the proposed PMPU would not result in a cumulatively considerable contribution to the significant cumulative impact after mitigation.

4.8.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's incremental contribution to cumulative hydrology and water quality impacts related to the violation of water quality standards and the conflict with the Basin Plan (**Impact-C-WQ-1** and **Impact-C-WQ-2**) would be cumulatively considerable following the implementation of **MM-WQ-1** through **MM-WQ-8**. With **MM-WQ-9** incorporated, **Impact-C-WQ-3** would not be cumulatively considerable.

4.9.1 Overview

Land use and planning issues refer to the proposed Port Master Plan Update's (PMPU's) compatibility with surrounding water and land uses and its consistency with applicable land use plans and policies that have regulatory jurisdiction over the PMPU area. This section describes the existing water and land uses that could be adversely affected by the proposed PMPU; outlines the laws and regulations related to water and land use and planning; and discusses any conflicts with applicable plans, policies, and regulations, such as the San Diego Unified Port District Act (Port Act), the Public Trust Doctrine, and California Coastal Act (CCA), including Chapter 3 and 8 policies. A discussion of the California Coastal Commission's (CCC's) Sea Level Rise Policy Guidance is included in Section 4.13, *Sea Level Rise*.

Impacts related to water and land use are considered significant if the proposed PMPU would: (1) physically divide an established community; or (2) cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

As discussed in Section 4.9.4.4, *Project Impacts and Mitigation Measures*, the proposed PMPU would not result in significant impacts related to land use and planning.

4.9.2 Existing Conditions

The proposed PMPU area comprises the majority of the District's jurisdiction, including approximately 1,636.89 acres of water and 1,014.18 acres of land¹ in and around San Diego Bay (the Bay) and along the Imperial Beach oceanfront. The proposed PMPU area supports a diverse range of water and land uses, including commercial, industrial, and recreational uses, some of which are water-dependent uses. Based on the Port Act, residential uses are not allowed within the Port District; therefore, none are proposed within the proposed PMPU area. The existing land uses for each planning district (PD) are described below (see Figures 2-2 through 2-9 in Chapter 2, *Environmental Setting*).

4.9.2.1 Planning District 1: Shelter Island

Planning District 1 is located on the southeastern side of the Point Loma Peninsula, at the entrance to the Bay, near upland communities, military installations, and the Cabrillo National Monument. The island segment of Shelter Island is a narrow strip of land, approximately 1 mile in length and less than 0.1 mile in width, that extends off the Point Loma peninsula via Shelter Island Drive. West Shelter Island wraps around the Shelter Island Yacht Basin, and includes a diverse mix of water-oriented development and activities, including marinas, yacht clubs, transient docking, resort hotels, restaurants, and boatyards. Recreational areas include Shelter Island Shoreline Park, the Yokohama

¹This excludes approximately 670 acres of land that is currently leased to the San Diego International Airport.

Friendship Bell, Shelter Island Pier, Shelter Island Boat Launch, La Playa Trail, La Playa Piers, and Kellogg Beach. East Shelter Island wraps around America's Cup Harbor and includes coastal-dependent marine services and fishing industries that provide for long-term economic viability and growth in the region. The predominant uses in this area consist of commercial recreation, marine sales and services, commercial fishing, and sportfishing. Development adjacent to PD1 includes single-family and multi-family residences, as well as restaurants and boutique retail shops.

4.9.2.2 Planning District 2: Harbor Island

With nearly 5 miles of waterfront, PD2 offers views of the Bay from the shoreline parks, shoreline path and play areas, and restaurants located on the water's edge of the western and eastern tips of Harbor Island. The island segment of PD2 primarily includes hotels, restaurants, and marinas that are located on the basin side of Harbor Island. Additionally, a portion of east Harbor Island includes surface parking lots, former off-airport rental car facilities, and the San Diego Harbor Police facility. Located east of Harbor Island is the U.S. Coast Guard Station San Diego with San Diego International Airport to the north. West of Harbor Island lies the U.S. Naval Training Center, and the residential neighborhood of Point Loma.

Spanish Landing Park, is a linear park located along the western basin of Harbor Island and adjacent to Harbor Drive. Existing amenities at Spanish Landing Park include pedestrian and bicycle paths, public art, a play structure, and a beach area. Additionally, this planning district includes the District Administration Building, former rental car services and off-airport parking, and surface parking lots associated with industrial maritime businesses along Pacific Highway.

4.9.2.3 Planning District 3: Embarcadero

Planning District 3 spans the length of the bayfront within the Downtown San Diego area, beginning at Laurel Street to the north (just south of San Diego International Airport) and ending roughly at Park Boulevard, which is south of the San Diego Convention Center and north of Tenth Avenue Marine Terminal (TAMT). Harbor Drive, which runs the length of this planning district, provides vehicular access and on-street parking to development along the Embarcadero. The Embarcadero Planning District consists of three subdistricts in the existing PMP: North Embarcadero, Central Embarcadero, and South Embarcadero. A description of the physical conditions within each of these subdistricts is provided below.

The North Embarcadero Subdistrict runs north to south and spans the Downtown bayfront from Laurel Street to the north to just before North Harbor Drive to the south (where it turns east, just north of Ruocco Park and Seaport Village). North Embarcadero provides a diverse waterside experience including water-based transit vessel berthing and commercial fishing activities at the Grape Street Piers, recreational vessel berthing and anchorage locations, and cultural facilities in the form of the Maritime Museum and USS Midway Museum. Cruise ship operations are located within North Embarcadero with facilities on B Street Pier and Broadway Pier connecting visitors to Tidelands and Downtown San Diego. A waterside promenade providing continuous waterside access extends along the entire North Embarcadero with public art features and plaza areas for visitors. A mix of visitor-serving commercial and recreational activities including hotels and restaurants are also located within the North Embarcadero. The U.S. Navy's Commander, Naval Base San Diego, and Naval Supply Center also occupy large areas on the eastern side of North Harbor Drive, adjacent to the North Embarcadero. The San Diego County Administration Building, Little Italy, and the central business district of Downtown San Diego are east of the North Embarcadero. Development adjacent

to the planning district is typical of a downtown and includes a mix of high-density residential dwellings, high- and medium-rise office buildings, restaurants, and retail establishments.

The Central Embarcadero provides a mix of recreational, visitor-serving commercial, and commercial fishing uses. Waterfront open spaces, such as Tuna Harbor Park, Ruocco Park, and Embarcadero Marina Park North, provide recreational opportunities and views of the water. Tuna Harbor Basin, home to San Diego's well-established historic commercial fishing industry, allows visitors to see activities such as net mending and fish offloading firsthand, as well as visit the commercial fishermen's Dockside Market. Old Police Headquarters, together with Seaport Village's small-scale commercial development located along the waterfront, provides visitors with a mix of restaurants and specialty retail. Downtown San Diego and the Gaslamp Quarter are east of the Central Embarcadero, which are dominated by dense urban development of mainly high- and medium-rise hotel, residential, and office buildings, along with restaurant and retail buildings.

The South Embarcadero is bounded to the north by Seaport Village and to the south by the TAMT. Development within the South Embarcadero area includes hotels, restaurants, the San Diego Convention Center, and public parks, including Embarcadero Marina Park South where a permanent performance venue is located. Marinas occupy the inlet created by the two L-shaped segments that form Embarcadero Marina Parks North and South. The South Embarcadero is adjacent to the Gaslamp Quarter of the City of San Diego, which includes high- and medium-rise residential buildings, medium-rise office buildings, Petco Park stadium, and numerous tourist-oriented facilities, such as hostels and hotels, restaurants, and boutique retail shops.

4.9.2.4 Planning District 4: Working Waterfront

Planning District 4 is composed predominantly of marine-related industrial facilities, including a strategic regional, State, and Federal port located on the TAMT, ship building facilities, and ship repair yards, as well as a waterfront park. This planning district contains a highly productive consolidation of marine terminal and maritime services and industrial land uses, facilitating maritime trade and providing large-scale coastal-dependent industrial activities with direct access to heavy rail service and deep-water berthing. The TAMT is located on a 96-acre parcel, which was formerly a landfill, and includes eight deep-water berths capable of accommodating four large ocean-going vessels. The TAMT is connected to the regional rail and roadway network, which provides critical connections and allows the transportation of cargo. Historically, the terminal has focused on the following cargo types: dry bulk, liquid bulk, refrigerated and nonrefrigerated containers, and multipurpose/break bulk. The area south of TAMT contains the BAE Systems San Diego Ship Repair Yard, the General Dynamics NAASCO shipbuilding and repair facility, a Chevron terminal, and other ship building facilities and ship repair yards, including marine-related engineering businesses. Nestled between the TAMT and the shipbuilding and ship repair facilities to the south, Cesar Chavez Park and the adjacent Cesar Chavez Pedestrian Pier provide valuable public access to the Bay and visitor-serving amenities. The community of Barrio Logan is located east/northeast of PD4. Barrio Logan includes single- and multi-family residential dwellings, as well as commercial and industrial development.

4.9.2.5 Planning District 7: South Bay

Planning District 7 encompasses the water and land area at the southern end of San Diego Bay. The area surrounding this planning district is composed of the Chula Vista Wildlife Reserve to the north, the San Diego Bay National Wildlife Refuge South San Diego Bay Unit managed by the United States

Fish and Wildlife Service to the south, and State Highway 75 to the west. In addition, PD7 includes a marshy habitat conservation area and a narrow inlet that extends between the salt evaporation ponds.

4.9.2.6 Planning District 8: Imperial Beach Oceanfront

Planning District 8 consists of a long, uninterrupted beach and the Imperial Beach Pier, an approximately 1,300-foot-long publicly accessible pier that includes a promenade and restaurant and provides public fishing opportunities. Adjacent to the beach is predominantly residential development, including single-family homes, condominium complexes, and multi-family apartment complexes, that are within the jurisdiction of the City of Imperial Beach.

4.9.2.7 Planning District 9: Silver Strand

Planning District 9 is located on the western side of San Diego Bay between the Bay and the Pacific Ocean, with Coronado located to the north and Imperial Beach to the south. Crown Cove is located in the northern portion of the planning district, which is adjacent to the Crown Cove Aquatic Center, offering recreational activities such as paddling, sailing, kayaking, surfing, and safe boating education. The Crown Cove Anchorage (A7) also provides transient docking and mooring for boaters. Continuing south onto Coronado Bay Road, Crown Isle includes visitor-serving commercial amenities, including a hotel and restaurants, as well as a recreational boat berthing marina. Piers and docks extend into the subdistrict from private residences located off Tidelands, connecting directly to the residences with no ability to provide public access due to physical constraints. Further, Grand Caribe Isle and South Cays include the small land mass east of the Coronado Cays that is connected to the Silver Strand by Grande Caribe Causeway. Additional piers and docks with no associated public access extend into the subdistrict from off Tidelands private residences. The northern portion of Grand Caribe Isle includes commercial recreation, marinas, and boat storage. The southern portion includes Grand Caribe Shoreline Park, which was created as a native plant garden and natural habitat restoration area. Development adjacent to PD9 includes single-family residences and park space.

4.9.2.8 Planning District 10: Coronado Bayfront

Planning District 10 is located along San Diego Bay on the southeastern side of the City of Coronado. Commercial development is concentrated toward the northern portion of the planning district, including the Ferry Landing Marketplace, which offers a number of restaurants and small boutique or visitor-serving retail. Additionally, the Coronado Ferry Landing offers public water-based transit to and from Downtown San Diego. Tidelands Park provides a variety of land-based recreational opportunities, including play fields, a public beach, and a skate park. Additionally, development along the southern portion of PD10 includes a marina, boat rental facilities, yacht clubs, hotels, and the Coronado Municipal Golf Course. North and west of the Coronado Bayfront, development includes Naval Air Station North Island, single- and multi-family residences, and commercial centers. South of the Coronado Bayfront the planning district includes high-rise condominiums, a community center and public parks, and the U.S. Naval Amphibious Base.

4.9.3 Laws, Regulations, Plans, and Policies

4.9.3.1 Federal

Coastal Zone Management Act of 1972

The U.S. Congress recognized the importance of meeting the challenge of continued growth in the coastal zone by passing the Coastal Zone Management Act in 1972. The act, administered by the National Oceanic and Atmospheric Administration (NOAA) Office of Ocean and Coastal Resource Management, provides for management of the nation's coastal resources and balances economic development with environmental conservation.

The Coastal Zone Management Act outlines two national programs. The National Coastal Zone Management Program includes 34 coastal programs that aim to balance competing water and land issues in the coastal zone. The National Estuarine Research Reserve System creates field laboratories that provide a greater understanding of estuaries and how humans affect them. The overall program objectives of the act are to “preserve, protect, develop, and, where possible, restore or enhance the resources of the nation's coastal zone.”

The Coastal Zone Management Act ensures that development projects in coastal areas are designed and sited in a manner that is consistent with coastal zone land uses, maximizes public health and safety, and ensures that biological resources (e.g., wetlands, estuaries, beaches, fish and wildlife and their habitat) within the coastal zone are protected. The enforceable policies of that document are found in Chapter 3 of the California Coastal Act of 1976 (as amended). The CCC enforces the Coastal Zone Management Act by certifying that a proposed project is consistent with the California Coastal Act.

National Wildlife Refuge System Administration Act of 1966

The National Wildlife Refuge System Administration Act of 1966 consolidated the various categories of lands, administered by the Secretary of the Interior through the U.S. Fish and Wildlife Service (USFWS), into a single National Wildlife Refuge System. The act establishes a unifying mission for the refuge system, a process for determining compatible uses of refuges, and a requirement for preparing comprehensive conservation plans. The act states, first and foremost, that the mission of the National Wildlife Refuge System is focused singularly on wildlife conservation. In addition, the act identifies six priority wildlife-dependent recreation uses, clarifies the secretary's authority to accept donations of money for land acquisition, and places restrictions on the transfer, exchange, or other disposal of lands within the refuge system (NOAA 2012).

San Diego Bay National Wildlife Refuge Final Comprehensive Conservation Plan and Environmental Impact Statement

The San Diego Bay National Wildlife Refuge is managed by USFWS as part of the National Wildlife Refuge System. A Comprehensive Conservation Plan is prepared pursuant to the National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997. USFWS manages the Sweetwater Marsh and South San Diego Bay units of the San Diego Bay National Wildlife Refuge in accordance with the approved Comprehensive Conservation Plan. The Comprehensive Conservation Plan provides long-range guidance on refuge management through its vision, goals, objectives, and strategies. The Comprehensive Conservation

Plan also provides a basis for a long-term adaptive management process, including implementing, monitoring progress, evaluating and adjusting, and revising plans accordingly (USFWS 2006).

4.9.3.2 State

California Coastal Act

The CCA went into effect on January 1, 1977 and granted the CCC authority to review and approve plans and projects located within the coastal zone. Under the CCA, cities and counties are encouraged to prepare Local Coastal Programs that guide implementation of conservation, development, and regulatory policies required by the CCA within the local coastal zone. Within port districts, PMPs serve this same function under the CCA. The draft PMP is then submitted to the CCC for certification, which ensures that the plan complies with the CCA. Once the PMP is certified, the port district is then authorized to issue Coastal Development Permits (CDPs), as prescribed by the adopted PMP for coastal zone projects within its jurisdiction.

The District's currently adopted PMP was originally certified by the CCC on January 21, 1981. As an update to the current PMP, the proposed PMPU is analyzed below for its consistency with the CCA, specifically Chapters 3 and 8 of the CCA. Public Resources Code Sections 30200 through 30265.5 establish the policies of Chapter 3 of the CCA, which include coastal resources planning and management policies that establish the standards by which the adequacy of local coastal programs and the permissibility of proposed developments subject to the provisions of the CCA are determined. Public Resources Code Sections 30700 through 30721 establish the policies of Chapter 8, Ports, of the CCA, which governs the portions of the District located within the coastal zone, excluding any wetland, estuary, or existing recreation area. Chapter 8 specifies that applicable California ports, including the District, must prepare and adopt a port master plan and, subsequently, submit it to CCC for review and certification as to conformance with the CCA. After such certification by CCC, either in its entirety or in part, coastal development permit (CDP) or CCA exclusion authority for development occurring within the District's jurisdiction resides with the District. Furthermore, for portions of the District's jurisdiction delineated in this Plan, the Board of Port Commissioners (Board) is authorized to grant CDPs pursuant to Chapter 8 of the CCA, and the District staff is authorized to issue CCA exclusions consistent with the District's CDP Regulations (adopted July 1, 1980, by Resolution No. 80-193 and subsequent amendments). The granting of a CCA approval (i.e., CDP or CCA exclusion) ensures that the development is consistent with the adopted and certified Port Master Plan, as required by the CCA and detailed in the District's CDP Regulations.

There are four categories of development on Tidelands in the coastal zone: appealable, non-appealable, excluded, and emergency. The types of development listed in Section 30715 of Chapter 8 of the CCA are considered appealable development and are subject to Chapter 3 (titled "Coastal Resources Planning and Management Policies") of the CCA. For appealable development, a port master plan must include policies that ensure consistency with both Chapters 3 and 8 of the CCA. Appealable projects as defined in the CCA include, but are not limited to,

- Developments for the storage, transmission, and processing of liquefied natural gas and crude oil in such quantities as would have a significant impact upon the oil and gas supply of the state or nation or both the state and nation. A development which has a significant impact shall be defined in the master plans.

- Wastewater treatment facilities; except for those facilities which process wastewater discharged incidental to normal port activities or by vessels.
- Roads or highways not principally intended for internal circulation within port boundaries.
- Office and residential buildings not principally devoted to the administration of activities within the port; hotels, motels, and shopping facilities not principally devoted to the sale of commercial goods utilized for water-oriented purposes; commercial fishing facilities, and recreational small craft marina related facilities.
- Oil refineries.
- Petrochemical production plants.
- Dredging required for the maintenance of developments specified above.

For appealable development, the District Board issues a CDP, which may be appealed to the CCC by the applicant, an interested party, or two CCC commissioners.

In addition, development located on wetlands, estuaries, or “existing recreation areas,” as delineated in the original 1975 Coastal Plan (Coastal Plan–delineated development), must also comply with Chapter 3 even if the proposed development is not the type listed in Section 30715 (see Section 1.3.1(A), Coastal Initiative - Proposition 20 (1971)². All other types of development that do not qualify for an exclusion from a CDP or an emergency CDP are non-appealable and need not seek approval of the CCC after certification of a port master plan. However, a port master plan must include policies that ensure that such developments are consistent with Chapter 8. All development and associated CCA approvals, whether appealable or non-appealable, must be consistent with the certified port master plan. Adjacent jurisdictions must, for informational purposes, incorporate the certified port master plan into their own local coastal programs.

The proposed PMPU will require certification from the CCC. Table 4.9-1 lists each policy from Chapters 3 and 8 of the CCA and analyzes the proposed PMPU’s consistency with these policies.

California Public Trust Doctrine

The Public Trust Doctrine is a common law doctrine that provides that public lands and waters are held by the State or its delegated trustee for the benefit of all of the people of California. All tidelands and submerged lands granted or ungranted, as well as navigable rivers, sloughs, etc., are covered under the Public Trust Doctrine. The Public Trust Doctrine, as overseen by California State Lands Commission (CSLC), restricts the types of water and land uses allowed on public lands, including within the District’s jurisdiction. The Public Trust Doctrine is an evolving doctrine, but generally

² In 1972, the State of California adopted a Coastal Initiative (Proposition 20) that established temporary regional coastal commissions and one statewide commission. These commissions were tasked with preparing a coastal plan with coastal policy and planning recommendations for the State. The Coastal Plan was certified in 1975, and many of these recommendations were brought forward into the Coastal Act, including the establishment of CCC. Part IV of the 1975 Coastal Plan provided specific policy recommendations to each region, with accompanying maps (refer to Figure 1.2 of the proposed PMPU, *San Diego Region Map from 1975 Coastal Plan*) that identify various landmarks and coastal resources. Chapter 8 (titled “Ports”) of the Coastal Act describes these maps as a resource for identifying wetland, estuary, and recreation areas in the coastal zone. The San Diego region map is still used in coastal development permitting today for the District because all development proposed in the identified wetlands, estuary, and recreation areas on Figure 1.2 of the proposed PMPU must comply with policies in Chapters 3 and 8 of the Coastal Act.

limits the uses of sovereign lands to waterborne commerce, navigation, fisheries, open space, water-oriented recreation, ecological habitat protection, or other recognized public trust purposes. While Public Trust uses originally focused upon navigation, commerce, and fisheries, Public Trust uses have been interpreted to include broad array of uses such as fishing, hunting, bathing, swimming, boating, anchoring, and general recreation. Trust lands may be devoted to purposes unrelated to the trust if such purposes are incidental to and accommodate trust uses.

Port Act

The Port Act (Appendix 1 of the California Harbor and Navigation Code) was adopted in 1962. Through the Port Act, the State of California delegated its authority to the District to own, manage and control certain tidelands and submerged waters. Specifically, the District was established for the development, operation, maintenance, control, regulation, and management of the tidelands and lands underlying the inland navigable waters of San Diego Bay. Under the Port Act, the District was granted broad police powers. The Port Act requires the District to exercise its land management authority and powers over (1) the tidelands and submerged lands granted to the District and (2) any other lands conveyed to or acquired by the District by any city or the County of San Diego or acquired by the District. The Port Act grants the District exclusive police power over property and development in its jurisdiction. Section 19 of the Port Act requires that the board “shall draft a master plan for harbor and port improvement and for the use of all of the tidelands and submerged lands which shall be conveyed to the district pursuant to the provisions of this act.”

In addition, Section 87, part (a), of the Port Act defines allowable uses that may occur on tidelands. These include harbors and all necessary structures or appliances necessary, or convenient, for the promotion and accommodation or commerce and navigation; commercial and industrial uses; airport, heliport, or other aviation facilities, including runways, terminal buildings, roadways, etc.; highways, streets, roadways, bridges, belt line railroads, parking facilities, power, telephone, telegraph or cable lines or landings, water and gas pipelines, etc.; public buildings, public assembly and meeting places, convention centers, parks, playgrounds, bathhouses and bathing facilities, and golf courses; small boat harbors and marinas, aquatic playgrounds and similar recreational facilities, snack bars, cafes, restaurants, motels, launching ramps, storage sheds, boat repair facilities, administration buildings, public restrooms, bait and tackle shops, chandleries, boat sales establishments, service stations and fuel docks, yacht club buildings, parking areas, pedestrian ways, and landscaped areas. Accordingly, under the Port Act, the PMP is the mechanism that dictates where such allowable uses are to be located and how they shall be improved.

4.9.3.3 Regional

San Diego Association of Governments San Diego Forward: The Regional Plan

San Diego Forward: The Regional Plan (Regional Plan) was adopted by the San Diego Association of Governments (SANDAG) Board of Directors on October 9, 2015, to establish a long-range blueprint for the San Diego region’s growth and development through the year 2050. The Regional Plan was developed in close partnership with the region’s 18 cities and the County government, and aims to provide innovative mobility choices and planning to support a sustainable quality of life in a healthy region, with a vibrant economy. The Regional Plan integrates both the 2004 Regional Comprehensive Plan and the 2050 RTP and Sustainable Communities Strategy (SCS) into one unified plan. By incorporating the SCS, the Regional Plan is in compliance with Senate Bill (SB) 375, which

identifies how the region will address greenhouse gas emissions to meet State-mandated levels and focuses on land use planning and transportation issues in an attempt to develop sustainable growth patterns on a regional level.

4.9.3.4 Local

Existing Port Master Plan

The currently adopted PMP, dated September 2020, guides the physical development of the lands within the District's jurisdiction and also serves as the District's coastal program for purposes of the CCA, as described above. The District's jurisdiction includes the public trust lands (i.e., Tidelands) bayward of the mean high-tide line, submerged lands generally to the U.S. Pierhead Line, and other upland properties, as acquired by or granted to the District. The District manages these lands in trust for the people of the State of California. The proposed PMPU replaces portions of the existing PMP, including defining new water and land use designations and goals and policies. Planning District 5, National City Bayfront, and PD6, Chula Vista Bayfront, and a portion of PD7, South Bay, are not part of the proposed PMPU.

Board of Port Commissioners Transition Zone Policy (Policy No. 725)

In June 2008, the District Board adopted the Transition Zone Policy with the purpose of protecting maritime industrial lands and provide a transition to adjoining residential areas by establishing guidelines to encourage the creation of transition zones between industrial lands and residential neighborhoods, in order to minimize conflicts between incompatible land uses. This policy directs the District to work with appropriate member cities, including the City of San Diego and the City of National City, to incorporate Transition Zone land use zoning and appropriate principles into member cities' general and community plans. The District may also acquire property to support maritime industrial uses or easements to preclude development of incompatible land uses within desired Transition Zone areas as it deems appropriate with or without public private partnerships. The specific areas under consideration in this policy include those lands from the northern boundary of the TAMT south to the Sweetwater Channel, bounded on the west by the District Tidelands, extending east from the existing Tidelands to the adjacent residential neighborhoods.

San Diego International Airport Land Use Compatibility Plan

The San Diego International Airport Land Use Compatibility Plan (ALUCP) was adopted on April 3, 2014, and amended on May 1, 2014, with the purpose of promoting compatibility between San Diego International Airport (SDIA) and surrounding land uses. Specifically, the intent of the ALUCP is to protect public health, safety, and welfare in areas around the airport and establishes policies and standards related to noise, safety, airspace protection, and overflight. The ALUCP defines an airport influence area (AIA), which is the boundary in which the ALUCP applies and is the "area in which current and projected future airport-related noise, safety, airspace protection, or overflight factors/layers may significantly affect land use or necessitate restrictions on land use."

The ALUCP establishes two zones within the AIA:

- Review Area 1: the combination of the 60 decibel community noise equivalent level noise contour, the outer boundary of all safety zones, and the Threshold Siting Surfaces (TSSs). A TSS is critical airspace that must be protected to allow for safe approaches to runways. Any objects

penetrating the TSS would cause the runway threshold to be further displaced, reducing available landing distances.

- Review Area 2: the combination of the airspace protection and overflight boundaries beyond Review Area 1.

Planning District 2 and PD3 are partially within Review Area 1 for SDIA, and PD1, PD2, PD3, PD4, and PD10 are within Review Area 2 of the SDIA AIA.

Naval Air Station North Island Airport Land Use Compatibility Plan

The Naval Air Station (NAS) North Island ALUCP was adopted on October 1, 2020, with the purpose of promoting compatibility between NAS North Island and surrounding land uses to protect public health, safety, and welfare in areas around the airport, to the extent that these areas are not already devoted to incompatible uses. As required by the California Public Utilities Commission (Section 21675(b)), the NAS North Island ALUCP is consistent with the safety and noise standards of the 2011 Air Installations Compatible Use Zones (AICUZ) study prepared by the U.S. Navy for NAS North Island. The AICUZ study recognizes that various land uses that are incompatible based on AICUZ guidance have already been developed within the noise contours and safety zones. Due to existing land uses, the AICUZ advises that local agencies avoid actions that would make an existing land use compatibility (or incompatibility) situation worse (for example, by allowing increased densities in the redevelopment of currently low density incompatible land uses) (NAS North Island 2020). The policies of the ALUCP ensure that existing incompatible land uses can be continued, maintained, and modified, subject to specified standards that would prevent an increase in the level of incompatibility.

NAS North Island is located on the western portion of the City of Coronado; PD1, PD2, PD3, PD4, PD7, PD9, and PD10 are located within the AIA for this ALUCP.

Naval Outlying Landing Field-Imperial Beach Airport Land Use Compatibility Plan

The Naval Outlying Landing Field-Imperial Beach (NOLF-IB) ALUCP was adopted on October 15, 2015, with the purpose of promoting compatibility between NOLF-IB and surrounding future land uses to provide for the orderly development of NOLF-IB and the area surrounding the facility and to protect public health, safety, and welfare in surrounding areas (NOLF-IB ALUCP 2015). Planning District 7, PD8, and PD9 are within Review Area 2 for NOLF-IB.

San Diego Harbor Safety Plan

The San Diego Harbor Safety Plan is designed to provide mariners who use the waters of San Diego Bay with an up-to-date guide to critical navigation issues to enhance vessel safety, with the ultimate goal of pollution prevention and protection of the region's valuable resources. This plan has been developed by the San Diego Harbor Safety Committee, as mandated in the California Oil Spill Prevention and Response Act of 1990 (Government Code Sections 8574.1 et seq.). The goals of the act are to improve the prevention, removal, abatement, response, containment, cleanup, and mitigation of oil spills in the marine waters of California. The act and its implementing regulations (California Code of Regulations Title 14, Sections 800–802) created harbor safety committees for the major harbors of California to “plan for the safe navigation and operation of tankers, barges, and other vessels within each harbor” by preparing “a harbor safety plan, encompassing all vessel traffic within the harbor.”

Tidelands Parking Guidelines

Adopted in January 2001, the *Tidelands Parking Guidelines* are intended to assist in the determination of how much parking should be provided to serve uses in each of the planning districts on Tidelands. The guidelines focus on the parking demands generated by a specific proposed use or development project on District Tidelands. The guidelines also distinguish between the parking demand generated by a potential use or development and the parking requirements that might result from development of a project on a specific site. However, the guidelines do not address any additional site-specific parking requirements that may occur as a result of developing a particular site. For example, the guidelines do not address the displacement of any existing parking that would occur from a proposed use or development. Factors influencing parking demand include the land use type of the proposed development, transit accessibility, airport accessibility, and pedestrian orientation, whereas factors influencing parking requirements include the demand plus any additional parking requirements created by the displacement of existing parking or other changes in the characteristics of parking in the area of the development (i.e., existing parking shortages and public bay access). The guidelines establish parking demand rates as well as adjustment factors for determining parking requirements of a development.

4.9.4 Project Impact Analysis

4.9.4.1 Methodology

The following impact analysis evaluates the water and land use and planning impacts that would result from future development projects should the proposed PMPU be adopted. The impact analysis under Threshold 1 considers the potential for the proposed PMPU water and land use designations, and future development occurring from implementation of the proposed PMPU, to result in the physical division of an established community. The physical division of an established community most often occurs when development of a large infrastructure project, such as a new freeway or train tracks, traverses an already developed area and divides existing uses, including residential neighborhoods and the neighborhood commercial uses they rely on. Therefore, this analysis considers the potential for the proposed PMPU to introduce any new roadway alignments or other improvements that could separate the components of an established community.

The impact analysis under Threshold 2 discusses any environmental impacts caused by the proposed PMPU due to a conflicts with any land use plans, policies, and regulations that apply to the District and were adopted for the purpose of avoiding or mitigating an environmental impact. The proposed PMPU would not be considered to conflict with the provisions of the identified regional and local plans if it meets the general intent of the applicable plans. A given project need not be in perfect conformity with every policy, nor does State law require precise conformity of a proposed project with every policy or water and land use designation. Courts have also acknowledged that plans attempt to balance a range of competing interests, and that it is nearly, if not absolutely, impossible for a project to be in perfect conformity with each and every policy set forth in the applicable plan. Additionally, in reaching such conclusions, the District may also consider the consequences of denial of a project, which can also result in conflict with other policies. The analysis below provides a brief overview of the most relevant planning documents and their primary goals. However, the District's conclusions on whether conflicts exist are based upon the planning documents as a whole.

Merely being in conflict with a land use plan, policy, or regulation is not necessarily a significant impact under the California Environmental Quality Act (CEQA). Rather, the conflict must result in a significant impact on the environment, which has not already been disclosed in the other resource chapters of this Program Environmental Impact Report (PEIR). In addition, the proposed PMPU must be consistent with the California Coastal Act, Port Act, and Public Trust Doctrine. Such consistency is addressed in the analysis below.

4.9.4.2 Thresholds of Significance

The following thresholds of significance are based on Appendix G of the State CEQA Guidelines and provide the basis for determining whether the water and land use and planning impacts resulting from implementation of the proposed PMPU are significant or less than significant. The determination of whether a water and land use and planning impact would be significant is based on the professional judgment of the District as Lead Agency and the recommendations of qualified personnel at ICF, all of which is based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following:

1. Physically divide an established community.
2. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

4.9.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to reduce or avoid impacts associated with water and land use and planning, as a result of implementation of the proposed PMPU and are considered in the impact analysis that follows.

WLU Policy 1.1.1 The District shall provide water and land use maps that illustrate the general pattern and relationship of various water and land use designations consistent with the Port Act. Refer to:

- Figure 3.1.1, Baywide Water and Land Use Designations;
- Table 3.1.2, Allowable Use Types for Water Use Designations; and
- Table 3.1.3, Allowable Use Types for Land Use Designations.

WLU Policy 1.1.2 Water and land uses shall be developed in accordance with:

- Figure 3.1.1, Baywide Water and Land Use Designations;
- Table 3.1.2, Allowable Use Types for Water Use Designations; and
- Table 3.1.3, Allowable Use Types for Land Use Designations.

Uses not specified in Table 3.1.2, Allowable Use Types for Water Use Designations and Table 3.1.3, Allowable Use Types for Land Use Designations, shall not be permitted unless otherwise allowed pursuant to Section 6.3, Development Conformance (Chapter 6, Plan Implementation and Development Conformance).

WLU Policy 1.1.3 Secondary uses shall be allowed only limited development potential to provide protection for primary uses under the following conditions:

- a. Secondary uses are permitted in water and on land only as identified in Table 3.1.2, Allowable Use Types for Water Use Designations and Table 3.1.3, Allowable Use Types for Land Use Designations.
- b. Development of specific secondary uses shall comply with applicable regulations (refer to Section 3.1.8, Secondary Use Calculations).
- c. Secondary uses must be consistent with the standards included in Chapter 4, Baywide Development Standards, and Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 1.1.6 Allowable water and land uses within the District shall be in accordance with one of ~~the five~~^{six} Public Trust–related categories (refer to Table 3.1.2, Allowable Use Types for Water Use Designations and Table 3.1.3, Allowable Use Types for Land Use Designations):

- a. Commerce
- b. Environmental Stewardship
- c. Fisheries
- d. Navigation
- e. Recreation
- ~~f. Government Facilities~~

WLU Policy 1.2.1 Allowable water and land uses listed in Table 3.1.2, Allowable Use Types for Water Use Designations and Table 3.1.3, Allowable Use Types for Land Use Designations, shall be categorized based on their locational and functional dependency to the water, consistent with the Coastal Act priorities, as follows:

- a. Coastal-dependent: Any development or use that requires a site on or adjacent to marine or coastal waters to be able to function.
- b. Coastal-related: Any development or use that is dependent on a coastal-dependent development or use.
- c. Coastal-enhancing: Any development or use that does not require a location directly near marine or coastal waters to be able to function but that provides visitor-serving functions and contributions that enhance the Public Trust responsibilities of the District.

Any additional water and land uses added to the Table 3.1.2, Allowable Use Types for Water Use Designations and Table 3.1.3, Allowable Use Types for Land Use Designations, under a future amendment to the Plan shall be categorized accordingly.

WLU Policy 1.3.1 The District shall prioritize allowable uses based on their location and functional dependency to the coast. The priority is as follows:

- a. Coastal-dependent
- b. Coastal-related
- c. Coastal-enhancing

These categories will be used to identify the type and extent of planned improvements or contributions that will be required of development, based on a development's mix of coastal-

dependent, coastal-related, and coastal-enhancing uses (refer to WLU Goal 7). These planned improvements facilitate public health and safety and the public welfare and provide public coastal access.

WLU Policy 2.1.1 The planning districts shall be established based on their physical, recognizable location and consideration of established municipal boundaries and shall be organized in the following manner (refer to Figure 3.1.1, Baywide Water and Land Use Designations):

- Planning District 1: Shelter Island
- Planning District 2: Harbor Island
- Planning District 3: Embarcadero
- Planning District 4: Working Waterfront
- Planning District 5: National City Bayfront – not a part of this Plan
- Planning District 6: Chula Vista Bayfront – not a part of this Plan
- Planning District 7: South Bay – Pond 20 portion not a part of this Plan
- Planning District 8: Imperial Beach Oceanfront
- Planning District 9: Silver Strand
- Planning District 10: Coronado Bayfront

WLU Policy 2.1.2 Planning districts shall be organized by subdistricts, as necessary, to differentiate their distinct character. For planning districts not containing subdistricts, reference to subdistrict visions, policies, and standards shall apply to the entire planning district.

WLU Policy 2.2.1 The District and its permittees shall implement planned improvements and special allowances to facilitate public health, safety, and welfare and provide public coastal access and enjoyment of the waterfront (refer to Chapter 5, Planning Districts, Planned Improvements).

WLU Policy 2.2.2 To maintain a planning district's distinct character, all development shall be in accordance with the associated subdistrict vision (refer to Chapter 5, Planning Districts, Subdistrict Vision) or planning district vision (refer to Chapter 5, Planning Districts, Vision), where applicable.

WLU Policy 2.2.3 Phased development shall be coordinated in a manner to ensure that landside and water access improvements are integrated in a cohesive and complementary fashion (refer to Chapter 5, Planning Districts, Planned Improvements).

WLU Policy 2.3.1 The District and its permittees shall support opportunities for strategic placement of interpretive informational signage and commemorative artifacts that convey Tideland's maritime and cultural history.

WLU Policy 2.3.2 The District and its permittees shall share the history of Tidelands by engaging in strategic engagement activities with the public.

WLU Policy 3.1.1 A network of pathways and water-based transfer points shall connect the comprehensive waterfront open space network and public realm areas on Tidelands.

WLU Policy 3.1.2 The District—independently, assigned through partnerships with the District, or through CDPs issued by the District—shall plan, design, and implement a comprehensive waterfront open space network that provides access to and throughout the public realm on Tidelands and

enhances proximate connections to the water for the public and priority coastal uses. These improvements shall be developed in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 3.1.3 The District and its permittees shall maintain, protect, and enhance existing public coastal-dependent recreational facilities, such as, but not limited to, boat ramps and piers that provide coastal access.

WLU Policy 3.1.4 Permittees of coastal-enhancing development shall provide direct access to the water's edge and increase physical accessibility to the water by providing overlooks, step-down areas, or similar opportunities for the public to access the water, especially in areas where those opportunities do not exist.

WLU Policy 3.1.5 Protect and, where feasible, expand waterside amenities, such as waterbased transfer points, overnight transient docking, free or lower cost short-term public docking, anchorages, launch areas for nonmotorized watercraft, and boat launch facilities.

WLU Policy 3.1.6 A waterside promenade shall be provided as part of development that abuts the waterfront, in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 3.1.7 Non-waterside development with obstructed public access shall provide physical connections (e.g., walkways) to the water, in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 3.1.8 Development adjacent to Recreation Open Space shall comply with, height limit, setback, and stepback requirements in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 4.1.1 There shall be no net loss of acreage designated as Recreation Open Space in a subdistrict or in a planning district if no subdistrict exists.

WLU Policy 4.1.2 Recreation Open Space should be designated along the water's edge.

WLU Policy 4.1.3 Recreation Open Space areas shall be publicly accessible to a diverse user group with the intent of providing a variety of water-oriented experiences.

WLU Policy 4.1.4 Public accessways and recreation facilities provided as part of development shall be maintained for public use over the anticipated life of the development with which they are associated.

WLU Policy 4.1.5 The design and location of Recreation Open Space shall be in accordance with Section 4.2, Recreation Open Space and Activating Features Standards (Chapter 4, Baywide Development Standards).

WLU Policy 4.1.6 The District shall require, where feasible, the integration of non-privatized, physically accessible public realm areas and amenities into development such as parks, courtyards, water features, gardens, passageways, paseos, and plazas.

WLU Policy 4.1.7 The District shall require permittees of coastal-enhancing development to allow, maintain, and promote free, public access to the public realm on their development site.

WLU Policy 4.1.8 No new private or quasi-private piers, gangways, or docks associated or connected to residential uses shall be permitted on Tidelands.

WLU Policy 4.2.1 The District shall require permittees of coastal-enhancing development to provide a wide array of uses for the public that:

- a. Offer a variety of recreational uses;
- b. Complement adjacent waterfront uses and activities; ~~and/or~~
- c. Maximize attributes of each location to offer a range of experiences to the user and appeal to a variety of visitors.

WLU Policy 4.2.2 The District shall encourage establishment of activating features that support existing amenities and introduce new activities in recreation areas. Permittees, of development containing Recreation Open Space within the leasehold, shall plan, design, and implement activating features, which are:

- a. Commensurate with the intensity of land uses within the permittee's development site;
- b. Consistent with an Activation Plan developed by the permittee and approved by the District;
- c. In accordance with Chapter 4, Baywide Development Standards; and
- d. In accordance with Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 4.2.3 Attractions are encouraged within the Commercial Recreation land use designation and shall be:

- a. Sited to increase the use of, and be integrated with, the waterfront experience;
- b. Located in areas supported by mobility hubs, curbside management, and pedestrian amenities to support multimodal access throughout Tidelands; and
- c. Complementary to other visitor-serving attractions.

WLU Policy 4.2.6 All parks, including those within leaseholds, shall be open to the general public during park hours for at least 85 percent of the year. Public access to parks shall not be limited (i.e., exclude the public or require an admission fee) for more than 15 percent of the year for permitted temporary large special events (in accordance with the District's procedures and guidelines, once established). The 15 percent shall be distributed throughout the year and not occur only in the summer months.

WLU Policy 4.3.1 The District shall encourage boating and pier access for recreational and subsistence fishing throughout Tidelands, where feasible, by requiring permittees of applicable development to provide public fishing or viewing piers and boating access. Maintenance may be provided by third parties.

WLU Policy 4.3.2 The District shall retain, where feasible, temporary anchorages for transient recreational vessels.

WLU Policy 4.3.3 Designated anchorage areas shall be located:

- a. To minimize interference with navigation; and
- b. Where support facilities are available.

WLU Policy 4.3.4 Permittees of recreational marina development shall incorporate low-cost transient docking slips in their recreational marina.

WLU Policy 4.3.5 Proposed recreational boating facilities in Tidelands shall, to the extent feasible, be designed and located in such a fashion so as not to interfere with the needs of the commercial fishing industry.

WLU Policy 5.1.1 The District shall continue to maintain, expand, and enhance District facilities consistent with the Port Act and in support of the District's mission. For more detail, refer to Chapter 1, Introduction.

WLU Policy 5.1.2 Conservation/Intertidal and Conservation Open Space use designations shall be enhanced, restored, and protected as further described in ECO Goal 1 (Chapter 3.3, Ecology Element).

WLU Policy 5.1.3 All development shall be located, designed, and constructed to:

- a. Give highest priority to the use of existing land space in harbors for coastal-dependent port purposes, including, but not limited to, navigational facilities, shipping industries, commercial fishing, sportfishing, maritime commerce, and necessary support and access facilities.
- b. Provide for other benefits consistent with the Public Trust, including, but not limited to: improved recreational opportunities in the public realm, including Recreation Open Space that is adjacent to the water's edge, or the conservation of adjacent wildlife habitat areas, to the extent feasible.

WLU Policy 5.2.1 The District shall encourage new development or rehabilitation of ~~District~~maritime assets, including improvements to maritime berthing facilities.

WLU Policy 5.2.2 Areas for deep-water berthing shall be preserved for uses and activities that depend on deep water, ~~such as~~ including but not limited to commercial fishing facilities, research vessels, cruise ships, cargo ships, ~~and visiting military vessels,~~ historic vessels, barges, and ferries. Deep-water berthing areas may be maintained by third parties through partnerships or leases with the District.

WLU Policy 5.2.3 Conversion of land use designations directly adjacent to deep-water berthing to an alternative designation that may be in conflict with or that may restrict access to the deep-water berthing operations or activities is discouraged.

WLU Policy 5.2.4 The District shall support maintenance and development of maritime berthing and related facilities to sustain the continued operations of maritime facilities.

WLU Policy 5.2.5 Maritime operations are inherently coastal-dependent or coastal-related uses and are important to the District and the region. Therefore, maritime operations may be allowed to limit waterside access opportunities in and around active operations, but alternative access shall be provided to promote coastal access to the maximum extent feasible.

WLU Policy 5.3.1 The District shall protect commercial fishing water and land use areas.

WLU Policy 5.3.2 Permittees of development shall prioritize and ensure the functionality of commercial fishing operations by locating landside support uses, such as parking, loading and offloading, and processing, immediately adjacent to associated berthing areas.

WLU Policy 5.3.3 The District shall support commercial fishing operations by facilitating improvements to piers and to storage, loading and offloading, and processing areas at existing commercial fishing facilities.

WLU Policy 5.3.4 The District shall promote the redevelopment of existing commercial fishing facilities.

WLU Policy 5.3.5 The District shall allow the redevelopment of sportfishing operations that do not interfere with commercial fishing operations.

WLU Policy 6.1.1 Permittees of development are encouraged to provide a variety of lower cost visitor and recreational facilities to improve coastal access.

WLU Policy 6.1.2 Recreation Open Space areas shall support programming and a variety of passive and active recreational activities, with a wide range of affordability and price points to ensure all visitors are able and encouraged to experience the waterfront.

WLU Policy 6.1.3 To offer flexibility to permittees, the District may offer a range of geographic options or a District-established in-lieu fee program for the development of new, or replacement, lower cost visitor and recreational facilities.

WLU Policy 6.1.4 The District may elect to establish an in-lieu fee program that permittees may participate in, to satisfy the requirement for provision of lower cost visitor and recreational facilities, with the following conditions:

- a. The in-lieu fee program shall apply only where the provision of lower cost visitor and recreational facilities is not feasible either on the existing development site or elsewhere on Tidelands.
- b. Any collected in-lieu fees shall be used on Tidelands for the provision of lower cost visitor and recreational facilities.
- c. For lower cost overnight accommodations only, the following exceptions apply:
 - 1) In assessing the feasibility for on-Tidelands lower cost accommodations, the District may consider whether the required amount of new or replaced lower cost overnight accommodations can be accomplished in one development.
 - 2) Collected in-lieu fees shall be used to develop only lower cost overnight accommodations (in order of priority):

- i. On Tidelands, or
- ii. In the San Diego County Coastal Zone, if on Tidelands is not feasible.

WLU Policy 6.2.1 Lower cost visitor and recreational facilities, including lower cost overnight accommodations, shall be protected in the aggregate on Tidelands. The number of existing overnight accommodations should be maintained and any future loss of lower cost overnight accommodations should be mitigated. Protection of existing facilities allows for preventive maintenance, major maintenance, or facility upgrades even if temporary closure or limited public access to the facility occurs during these activities and times.

WLU Policy 6.2.2 Replacement of lower cost overnight accommodations shall be provided (in order of priority) based on feasibility:

- a. On the existing development site;
- b. Elsewhere on Tidelands; or
- c. Through contribution to a District-established in-lieu fee program, if created, and the in-lieu fees are contributed before commencement of construction of new higher cost overnight accommodations and displacement of any lower cost overnight accommodations.

WLU Policy 6.2.3 Replacement of lower cost overnight accommodations occurring elsewhere on Tidelands or on an existing development site (refer to WLU Policy 6.2.2 [a-b]) shall apply one of the following conditions:

- a. Must be in place before the removal of the displaced lower cost overnight accommodations; or
- b. Must compensate for the temporary loss (i.e., a lower cost overnight accommodation[s] is removed before replacement lower cost overnight accommodations are approved for use or occupancy). This may be addressed through a District-established in-lieu fee program (refer to WLU Policy 6.1.3).

WLU Policy 6.2.4 Lower cost overnight accommodations displaced through new development, redevelopment, demolition, or closure shall be replaced with lower cost overnight accommodations at a ratio to be determined by a lower cost overnight accommodation offset program.

WLU Policy 6.2.5 Displaced lower cost visitor and recreational facilities, excluding overnight accommodations, shall be replaced with comparable facilities that may be of a similar or different type if specific conditions are demonstrated through a comparative demand study (refer to WLU Policy 6.2.6 and WLU Policy 6.2.7). The comparative demand study must be submitted and approved by the District before the project application is submitted to the District.

WLU Policy 6.2.6 For replacement of displaced lower cost visitor and recreational facilities, excluding overnight accommodations, with a facility (or facilities) of a similar type(s) (refer to WLU Policy 6.2.5), the comparative demand study must demonstrate:

- a. The new facility will likely result in an equal or increased amount of public use when compared to the facility being replaced; and
- b. When implemented, the new facility will be of a scale and size comparable to those of other, similar facilities in a coastal setting.

WLU Policy 6.2.7 For replacement of displaced lower cost visitor and recreational facilities with a facility (or facilities) of different type(s) (refer to WLU Policy 6.2.5), the comparative demand study must demonstrate:

- a. The new lower cost visitor and recreational facility will likely provide greater opportunities for a variety of visitors to access and recreate on Tidelands than the facility being replaced; and
- b. There is an increase in demand for the replacement lower cost visitor and recreational facility compared with the existing facility.

WLU Policy 6.3.1 Development containing higher cost overnight accommodations is required to provide lower cost overnight accommodations. The provision of lower cost overnight accommodations may be provided through:

- a. Construction of new facilities,
- b. Conversion of existing overnight accommodations to lower cost overnight accommodations, or
- c. Contribution to a District-established in-lieu fee program (refer to WLU Policy 6.1.3).

WLU Policy 6.3.2 Development that includes new higher cost overnight accommodations shall provide lower cost overnight accommodations units at an amount equivalent to 25 percent of the total number of the proposed higher cost overnight accommodation units.

WLU Policy 6.3.3 Lower cost overnight accommodations required because of development of higher cost overnight accommodations shall be provided on the existing development site. If it is proven that development of lower cost overnight accommodations is infeasible on-site, at the discretion of the District, the requirement for lower cost overnight accommodations may then be satisfied elsewhere on Tidelands, or lastly through a contribution to a District-established in-lieu fee program.

WLU Policy 7.1.1 Permittees of development derives benefits from its location on Tidelands and, accordingly, shall provide or contribute to planned improvements that facilitate public health and safety and the public welfare and provide public coastal access and enjoyment of the waterfront.

WLU Policy 7.1.2 Except as set forth under WLU Policy 7.3.3, permittees of all major development shall be required to provide or contribute toward planned improvements identified for a planning district in Chapter 5, Planning Districts, Planned Improvements. The three primary categories of planned improvements are defined below:

- a. Landside access: Improvements to transportation and mobility infrastructure that enhance the public's ability to access and explore the public realm and perform commerce on Tidelands. Landside access may include mobility hubs, improvements to a variety of accessways, and implementation of the bayfront circulator.
- b. Coastal access: Physical features designed to provide new or enhance existing water access. Examples include pier improvements, overnight transient docking and mooring, public water access, and short-term public docking.
- c. Visitor-serving commercial uses: Visitor-serving commercial uses provide opportunities for the public to access and enjoy Tidelands, including the use of non-water-oriented retail and overnight accommodations.

Permittees of minor development may be required to provide or contribute toward planned improvements as identified for a planning district in Chapter 5, Planning Districts, Planned Improvements and as supported by a subsequent program created by the District.

WLU Policy 7.2.1 The level of required contribution to planned improvements for permittees of major development shall be based on their assigned category, as described below and as identified in each corresponding planning district or subdistrict:

- a. Coastal-dependent: Development of coastal-dependent uses shall provide or contribute to mobility hub planned improvements to ensure the efficient movement of goods and people to, from, and around Tidelands and for public health and safety and for the public welfare.
- b. Coastal-related: Development of coastal-related uses shall provide or contribute to enhancement of transportation and mobility infrastructure and shall enhance the public's ability to access and explore the public realm and perform commerce on Tidelands. In addition, development of coastal-related uses shall provide or contribute to landside public access planned improvements. These features further public health and safety and the public welfare by providing safe and efficient access to the Bay.
- c. Coastal-enhancing: Development of coastal-enhancing uses shall be required to provide or contribute to landside public access and coastal access features as a part of such development. These features further public health and safety and the public welfare by providing safe and efficient access to the Bay.

Permittees of development may be required to provide similar contributions or less of a contribution toward planned improvements subject to the discretion of the District.

A list of planned improvements for development is set forth for each subdistrict (or planning district, where applicable). All requirements shall be provided concurrent with the proposed development consistent with the applicable Chapter 4, Baywide Development Standards, and Chapter 5, Planning Districts (including any development standards within the applicable planning district or subdistrict), to further public health and safety and the public welfare, the Coastal Act, the Port Act, and Port Master Plan goals.

WLU Policy 7.3.1 The District shall establish a program for the implementation of planned improvements, including how contributions may be made by development. In this program, the District may establish a financing mechanism as an alternative measure to satisfy the planned improvement requirements.

WLU Policy 7.3.2 Two or more new permittees of development may partner to contribute to the implementation and funding of one or more planned improvements.

WLU Policy 7.3.3 All major developments shall provide or contribute to planned improvements in a planning district or subdistrict. However, certain types of developments are excluded from this requirement. The following developments are excluded from providing or contributing to planned improvements:

- a. District-administered projects;
- b. Government agency facilities responsible for safety, security, and customs;
- c. Commercial fishing facilities;
- d. Lower cost visitor-serving overnight accommodations; and

- e. Any planned improvement (as listed in the subdistrict) developed independently or as part of a major development.

WLU Policy 7.3.4 Development implemented in phases shall submit to the District a project phasing plan that addresses how the development of proposed improvements will align with the phasing, financing, and construction of the proposed development. This phasing plan shall be submitted to the District for its approval before issuance of the first Coastal Act Approval for the development other than those needed for due diligence efforts.

WLU Policy 7.3.5 Locations of planned improvements shall be prioritized as follows:

- a. On-site;
- b. In the same subdistrict as the proposed development;
- c. In the same planning district as the proposed development activity; or
- d. Elsewhere on Tidelands in the Coastal Zone.

Further detail regarding planned improvements is specified in Chapter 5, Planning Districts, Planned Improvements.

WLU Policy 8.1.1 The District shall build on existing agency partnerships to strengthen communications, develop new methods to share information, and coordinate initiatives to improve the District's waterfront.

WLU Policy 8.1.2 The District shall provide opportunities for the public to learn about the District's mission and projects through community engagement, participation, and communication.

WLU Policy 8.1.3 The District shall continue to provide opportunities for interested and affected parties (including but not limited to tenants, agencies, stakeholders, and the general public) to engage in early, active, and ongoing participation in public decision-making processes.

WLU Policy 8.1.4 The District may coordinate with adjacent jurisdictions to align development standards for consistency between a subdistrict's development standards and those of the adjacent area, where feasible.

M Policy 1.2.43 The District shall encourage the development of mobility hubs rather than surface parking to provide proximate connections to the water and Tidelands, where feasible.

M Policy 1.2.7 The District shall require, in coordination with permittees of development, the planning, designing, and implementation of a comprehensive, nondigital wayfinding signage system to guide.

M Policy 1.3.4 Permittees of development that generated parking demand shall identify and secure, as appropriate, vehicular parking sufficient to serve that development's specific use without relying upon or reducing existing vehicular spaces dedicated to public uses and when alternative mobility modes that offset the need for parking are not feasible or sufficient to meet total parking demand. Parking shall be provided through one or more of the following means:

- a. On-site parking.
- b. Shared agreements with adjoining development.

- c. Agreements with off-site parking facilities, which may be located on or off Tidelands, within a quarter-mile walking distance from the uses they serve. A greater distance may be acceptable if a mobility plan, showing how patrons would connect to and from the parking, is provided and accepted by the District.
- d. Participation in the establishment of planned mobility improvements, such as mobility hubs or shared parking facilities as specified in the associated subdistrict and supported by WLU Goal 3 and WLU Goal 7 (Chapter 3.1, Water and Land Use Element, [of the PMPU]) and ECON Goal 1 (Chapter 3.6, Economics Element, [of the PMPU]).

M Policy 1.3.5 The District shall periodically monitor the public parking demand on Tidelands to ensure that public spaces are being efficiently managed and used and to review and update the District's parking guidelines, as necessary.

M Policy 1.3.6 The District's parking guidelines shall provide standards and direction for the requirements and process related to providing and accounting for established parking (supportive of associated specific uses), short-term parking (such as for construction vehicles), curbside management strategies, and event parking.

M Policy 1.3.7 The District shall reallocate or combine parking, where feasible, into mobility hubs or other consolidated parking facilities to allow for additional public open space, development, transit opportunities, and bicycle facilities. This policy applies both to parking allocated for specific developments and public parking. If parking is displaced as part of development, the following steps shall be taken:

- a. Conduct a study to determine the parking demand for the spaces that will be displaced;
- b. Identify a location to accommodate parking demand if the results of the study confirm the need for parking. Spaces should ideally be situated within a quarter-mile walking distance from the uses they serve, on or off Tidelands. A greater distance may be acceptable if a mobility plan showing how patrons would connect to and from the parking is provided and accepted by the District;
- c. Provide evidence that the new parking location has the capacity to accommodate the demand for displaced parking spaces and that needed parking spaces have been secured.

M Policy 1.3.8 New structured parking should be designed for vehicle use in the short term and then for repurpose to a nonvehicle use if parking demand decreases.

M Policy 1.3.9 The District may consider adjacent parking rates when setting or updating parking rates for parking areas on Tidelands.

SR Policy 1.1.7 Development within an Airport Land Use Compatibility Plan (ALUCP) defined safety compatibility zone shall be sited and designed to minimize the risk of personal injury to people and damage to property in the air and on the ground, consistent with ALUCP requirements.

SR Policy 1.1.8 The District shall:

- a. Restrict development of any project that would cause hazards to air navigation located within airport approach and departure areas or known flight patterns within the applicable Airport Influence Area (AIA), and

- b. Restrict future uses that may impact airport operations or not meet State or federal aviation standards, including the introduction of new incompatible uses within Runway Protection Zones (RPZs).

SR Policy 1.1.9 Permittees shall coordinate as appropriate, with the Federal Aviation Administration on proposed developments (structures and temporary equipment) that meet the notification criteria as defined by Code of Federal Regulations Title 14, Part 77.

ECON Policy 1.1.1 The District shall support and nurture long-term development partnerships that further Public Trust objectives.

ECON Policy 1.1.2 The District shall leverage public and private partnerships to invest in Tidelands' infrastructure and facilities that support the District's mission and fiduciary responsibilities.

ECON Policy 1.1.3 The District shall continue to implement existing, and explore new, joint programs with academic institutions, private industry, public agencies, and nongovernmental organizations to advance shared economic, social, and environmental goals ~~that lead to a prosperous planet, people, and portfolio.~~

ECON Policy 1.1.4 The District shall continue to pursue strategic partnerships with the military and military-focused industry to support U.S. Department of Defense Mission Readiness.

ECON Policy 1.2.2 The District shall continue to reinvest lease revenues to support financing and maintenance of public improvements in alignment with Coastal Act obligations, including lower cost visitor serving and recreational facilities such as parks, promenades, public piers, and public art.

ECON Policy 1.2.6 The District shall explore creation of an infrastructure program impact fee program, as an option to assist funding for future public infrastructure and amenities, (such as roadways, sidewalks, promenades, parks, recreational facilities, pier improvements) and if such a program is created, permittees of development shall contribute a fair share to the cost of public infrastructure and access improvements, in accordance with that program.

ECON Policy 2.1.1 The District shall maintain a mix of water and land uses that meet the need of established Tidelands industries and provide opportunities for emerging Public Trust-consistent uses. Existing commercial fishing and recreational boating harbor space shall not be reduced unless the demand for those facilities no longer exists or adequate substitute space has been provided.

ECON Policy 2.1.2 The District shall coordinate with permittees to provide infrastructure that supports a mix of water and land uses, including the needs of established Tidelands industries and emerging Public Trust-consistent businesses, while also providing environmental benefit.

ECON Policy 2.2.1 Maintain the District's marine terminals to the standards of the National Port Readiness Network and the Commercial Strategic Seaports Program, which are administered by the U.S. Department of Transportation's Maritime Administration. The Strategic Port designation commits the District to providing cargo and vessel operations in support of national defense efforts on short notice.

ECON Policy 2.2.2 The District shall coordinate with federal, State, regional, and local agencies, and utilities to develop and implement strategies for public improvements that provide the necessary services to support the District's Strategic Port responsibilities.

ECON Objective 2.3 Retain and encourage a diverse mix of coastal-dependent and supporting coastal-related industries and businesses.

ECON Policy 2.3.1 The District shall invest in opportunities to protect and preserve the functionality and accessibility of marine and maritime industrial areas and deep-water berthing piers for maritime and marine uses.

ECON Policy 2.3.2 The District and permittees shall coordinate the investment in improvements to marine terminal and maritime industrial operations that improve functionality and efficiency through modernization of terminal infrastructure and equipment, including electrification that supports optimization of cargo movement and reduces emissions.

ECON Policy 2.3.3 The District shall provide maritime and marine infrastructure for operation and maintenance of commercial and recreational vessels. Maritime and marine infrastructure may be provided by third parties, including District tenants through public-private partnerships and leases with the District.

ECON Policy 2.3.4 The District shall provide coastal-dependent and coastal-related industrial leasing opportunities to support the maritime and marine industry on Tidelands.

ECON Policy 2.3.5 The District shall strive to maintain a diverse mix of cargo and marine terminal activities for long-term economic resiliency.

ECON Policy 2.3.6 The District shall promote and designate areas for the shipbuilding, repair, and maintenance industry to support the U.S. military, research organizations, and other important commercial fleets (e.g., tugs or ferries) that are home-ported in Tidelands or other West Coast ports and harbors.

ECON Policy 2.3.7 The District shall coordinate with the cruise industry to identify infrastructure and marketing opportunities that improve the industry's economic viability and increase the contribution to the regional economy.

ECON Policy 2.3.8 The District shall coordinate with the cruise ship industry to implement modifications to relevant Tidelands support facilities to accommodate increases in cruise demand, both in terms of type and volume, such as landside transportation services for passengers, passenger processing, and baggage handling.

ECON Policy 2.3.9 The District and applicable permittees shall support existing recreational boating on Tidelands through maintenance of marina-related facilities, including docks, piers, slips, and boat launch ramps.

ECON Policy 2.3.10 The District and applicable permittees shall promote opportunities for the public to learn, share, and enjoy recreational boating through boating education programs, organizations, and clubs.

ECON Policy 2.3.11 The District shall coordinate with commercial fishing, recreational fishing, and sportfishing operations to identify and prioritize facility improvements that benefit the fishing business community.

ECON Policy 2.3.12 The District shall explore innovative financing mechanisms and partnerships to increase the economic prosperity and environmental sustainability of the fishing communities on Tidelands.

ECON Policy 2.3.13 The District shall support the promotion of fishing-related events and complementary visitor-serving opportunities in fishing areas to provide economic prosperity of fishing in the region.

ECON Policy 2.3.14 The District shall promote and support the commercial fishing industry and its longevity as a priority coastal-dependent use and economic contributor to Tidelands, the region, and California through such efforts as joint public-private marketing, fishing-related festivals, and other fishing events and activities.

ECON Policy 2.3.15 The District shall support commercial fishing on Tidelands and its enhancement by maintaining and improving existing commercial fishing-related infrastructure, such as docks, piers, slips, and landside support facilities.

ECON Policy 2.3.16 The District shall promote and support sportfishing charter industry as a priority coastal-dependent use and valuable economic contributor through such efforts as joint public-private marketing, fishing-related festivals, and other fishing events and activities.

ECON Policy 2.3.17 The District shall promote and support recreational fishing on Tidelands by providing informational signage about recreational fishing opportunities at public locations, such as fishing piers and boat launches, and promoting recreational fishing through joint public-private marketing, fishing-related festivals, and other fishing events and activities.

ECON Policy 2.4.1 The District encourages the provision of a variety of active and passive recreational opportunities to attract a diverse mix of visitors to Tidelands.

ECON Policy 2.4.2 The District shall promote the creation of diverse activating features in areas designated with a Recreation Open Space land use to provide a variety of opportunities for visitors to explore and enjoy Tidelands.

ECON Policy 2.4.3 The District shall promote and support implementation of visitor-serving development and amenities that celebrate the San Diego region's binational setting, natural resources, history, culture, and arts.

ECON Policy 2.4.4 The District shall promote and support a diversified hotel portfolio and corresponding elements of the hospitality industry and encourage their expansion.

ECON Policy 2.5.1 The District shall promote established and emerging coastal-dependent commercial and industrial sectors throughout Tidelands and may choose to promote through joint marketing campaigns and participation in conferences or other business development programs.

ECON Policy 2.5.2 The District shall periodically assess the water and land use needs of the recreational, commercial, and industrial sectors on Tidelands to assist in planning for and facilitating economic growth through surveys of existing occupants, tenants, and permittees and analysis of economic forecasts.

ECON Policy 3.1.1 The District shall examine the redevelopment of underused commercial and industrial water and land areas for established and emerging coastal-dependent industries.

ECON Policy 3.1.2 The District shall encourage innovative coastal-dependent endeavors through an assortment of programs and partnerships.

ECON Policy 3.1.3 The District shall explore and promote the creation of habitat mitigation banks on Tidelands in cooperation with regional, State, and Federal resource agencies to offset potential future development impacts and provide compensatory mitigation opportunities.

ECON Policy 3.1.4 The District shall support ecotourism through coordination with other public agencies, academic institutions, nonprofits, or private industry to promote conservation awareness and enjoyment of the Bay.

EJ Policy 3.1.2 The District shall collaborate with adjacent jurisdictions, occupants, tenants, permittees, and community stakeholders to provide transition zone areas adjacent to Tidelands between maritime industrial, commercial, and residential uses as well as other sensitive receptors in Portside Communities adjacent disadvantaged communities.

EJ Policy 3.1.4 Maritime industrial development that is sited abutting a Portside community shall incorporate industrial site design standards that consider the health and environmental quality of the Portside community, such as, but not limited to, truck route signage, setbacks from property lines, greening buffer, parking requirements, ingress/egress points, noise and light screening, air emission dispersion, and interior air quality for employees.

4.9.4.4 Project Impacts and Mitigation Measures

Threshold 1: Physically divide an established community?

Impact Analysis

Impacts of Water and Land Uses

Construction

The proposed PMPU serves as a long-term planning blueprint for future development on District Tidelands. Approval of the PMPU would result in new water and land uses that would guide future development throughout the proposed PMPU area. Construction activities related to future development projects could result in temporary changes to the area surrounding individual project sites related to the presence of construction equipment, construction noise, etc., which could also include temporary roadway or walkway closures requiring detours. However, such temporary features would not divide an established community, and physical access through such areas would be maintained. As also discussed in Section 4.14, *Transportation, Circulation, and Mobility*, under Threshold 1, encroachments into rights-of-way would typically be subject to local permits and associated traffic control plans designed to ensure detours are provided and access is maintained. Aside from temporary roadway or walkway closures adjacent to a project site, construction activities occurring under the proposed PMPU would largely be contained within individual parcel boundaries of a project site and would not result in the installation of substantial infrastructure or other features such that the physical division of a community could occur. Furthermore, the proposed PMPU would not involve the construction or removal of housing because, per the Public Trust Doctrine, residential uses are prohibited on Tidelands. As such, construction associated with implementation of the proposed PMPU would not result in the physical division of an established community and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would generally include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park at the foot of Navy Pier. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU.

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to the physical division of an established community.

Construction activities associated with Option 1 would be similar to those described above, including temporary changes to the area surrounding the project site related to the presence of construction equipment, construction noise, etc., which could also include temporary roadway or walkway closures requiring detours. Aside from temporary roadway or walkway closures adjacent to the project site, construction activities occurring under implementation of Option 1 would largely be contained within the individual parcel boundary of the project site and would not result in the installation of substantial infrastructure or other features such that the physical division of a community could occur. Furthermore, construction activities under Option 1 would not involve the construction or removal of housing because, per the Public Trust Doctrine, these uses are not allowed within the Tidelands. As such, construction and operation associated with implementation of Option 1 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to the physical division of an established community than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to the physical division of an established community.

Construction activities associated with Option 2 would be similar to those described above, including temporary changes to the area surrounding the project site related to the presence of construction equipment, construction noise, etc., which could also include temporary roadway or walkway closures requiring detours. Aside from temporary roadway or walkway closures

adjacent to the project site, construction activities occurring under implementation of Option 2 would largely be contained within the individual parcel boundary of the project site and would not result in the installation of substantial infrastructure or other features such that the physical division of a community could occur. Furthermore, construction activities under Option 2 would not involve the construction or removal of housing because, per the Public Trust Doctrine, these uses are not allowed within the Tidelands. As such, construction associated with implementation of Option 2 would result in a less-than-significant impact and would not result any additional or more severe impacts related to the physical division of an established community than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to the physical division of an established community.

Construction activities associated with Option 3 would be similar to those described above, including temporary changes to the area surrounding the project site related to the presence of construction equipment, construction noise, etc., which could also include temporary roadway or walkway closures requiring detours. Aside from temporary roadway or walkway closures adjacent to the project site, construction activities occurring under implementation of Option 3 would largely be contained within the individual parcel boundary of the project site and would not result in the installation of substantial infrastructure or other features such that the physical division of a community could occur. Furthermore, construction activities under Option 3 would not involve the construction or removal of housing because, per the Public Trust Doctrine, these uses are not allowed within the Tidelands and none currently exist within the Tidelands. As such, construction associated with implementation of Option 3 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to the physical division of an established community than buildout of the proposed PMPU without Option 3.

Operation

The proposed PMPU area encompasses a waterfront area that includes public parks, hotels, restaurants, marinas, yacht- or marina service-related businesses, marine terminal, ship building facilities, and ship repair yards. The proposed PMPU proposes adjustments to the acreages of water and land use designations throughout the proposed PMPU area that would enable future development intended to balance the demand of the various uses within the Tidelands. In addition, the PMPU proposes the reconfiguration of existing roadways including, among others, North Harbor Drive, the North Harbor Drive/West Harbor Drive right-of-way, and West Harbor Drive/East Harbor Drive between the Harbor Drive/Market Street intersection and Park Boulevard. Roadway improvements would involve enhancements within existing roadway alignments to accommodate multi-modal opportunities, including vehicular traffic, transit, pedestrian pathways, bikeways, and pedestrian crossings.

The proposed adjustments to water and land use designations, future development projects, and roadway improvements in the PMPU area would not introduce features, such as new roadway alignments or other infrastructure that would cut through or otherwise physically divide an established community. While several planning districts could include the development of additional recreational boat berthing slips, which would require the extension of existing docks or piers, any such improvement would be designed in coordination with the District's Maritime Department and the San Diego Bay Pilots Association to ensure that operation of expanded marinas

would not adversely affect existing navigation routes for water taxi/ ferries, shipping vessels, cruise ships, military vessels, recreational boats, etc. Furthermore, as noted above, the proposed PMPU would not involve removal of existing residential uses because those uses are not allowed within the Tidelands. In addition, the operation of future development projects would not involve activities that would physically divide established communities in the surrounding area.

The proposed PMPU contains several policies that promote connections within Tidelands. The District would implement planned improvements to provide public coastal access and enjoyment of the waterfront (WLU Policy 2.2.1); implement a comprehensive waterfront open space network that provides access to and throughout the public realm (WLU Policy 3.1.2); require permittees of coastal-enhancing development to provide direct access to the water's edge and increase physical accessibility to the water (WLU Policy 3.1.7); and require that non-waterside development with obstructed public access provide physical connections (e.g., walkways) to the water. The proposed PMPU would also require public accessways to be provided as part of development to be maintained for public use (WLU Policy 4.1.4); would require integration of non-privatized, physically accessible public realm areas and amenities into development (WLU Policy 4.1.6); and would not allow any new private or quasi-private piers connected to residential uses (WLU Policy 4.1.8). Additionally, the proposed PMPU would require the planning, designing, and implementation of a comprehensive, nondigital wayfinding signage system (M Policy 1.2.7). These policies would encourage public access and facilitate a more connected environment throughout the Tidelands. Based on the above, operations under the proposed the proposed PMPU would not physically divide an established community and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operational impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to the physical division of an established community.

For the most part, operations under Option 1 would involve similar activities as those described above, and would not introduce any new water or land uses that do not currently exist in the proposed PMPU area. Proposed adjustments to water and land use designations would not introduce any features, such as infrastructure, that would cut through or otherwise physically divide an established community. Option 1 would involve the permanent closure of a segment of Harbor Drive from Broadway to G Street in order to accommodate the Waterfront Destination Park at the foot of Navy Pier. While this would change vehicular circulation, it would not divide an established community because Option 1 would create a continuous connection with the existing parks in that area, such as the Lane Field Setback Park and Tuna Harbor Park.

Therefore, operations under Option 1 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to the physical division of an established community than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to physical division of an established community.

Operations under Option 2 would involve activities similar to those described above, and do not propose any new water or land uses that do not currently exist in the proposed PMPU area. Proposed adjustments to water and land use designations under this option would not introduce any features, such as new roadway alignments or other infrastructure, that would cut through or otherwise physically divide an established community. Therefore, operations under Option 2 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to the physical division of an established community than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to the physical division of an established community.

Operations under Option 3 would involve activities similar to those described above, and do not propose any new water or land uses that do not currently exist in the proposed PMPU area. Proposed adjustments to water and land use designations and roadway improvements would not introduce any features, such as new roadways or other infrastructure, that would cut through or otherwise physically divide an established community. Option 3 would result in the realignment of Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street; however, this realignment would not cut through or otherwise physically divide an established community. Therefore, operations under Option 3 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to the physical division of an established community than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would physically divide an established community.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not physically divide an established community. Impacts would be less than significant.

Threshold 2: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Impact Analysis

Impacts of Water and Land

The following analysis considers whether the proposed PMPU would cause a significant environmental impact due to a conflict with any land use policy, plan, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, including the CCA, the Port Act, the Public Trust Doctrine, SANDAG's Regional Plan, and the ALUCPs for SDIA, NAS North Island, and NOLF I-Beach. This analysis considered the goals, objectives, and policies established within each element of the proposed PMPU, as well as the water and land uses, special allowances, planned improvements and appealable projects, and standards proposed for each planning district.

As discussed in Section 4.9.3, *Laws, Regulations, Plans, and Policies*, the Port Act establishes that the District should develop, operate, maintain, control, regulate, and manage the Tidelands and required the District to create a master plan and establish allowable uses. Section 87, part (a), of the Port Act defines allowable uses that may occur on Tidelands. These include harbors and all necessary structures or appliances necessary, or convenient, for the promotion and accommodation or commerce and navigation; commercial and industrial uses; airport, heliport, or other aviation facilities, including runways, terminal buildings, roadways, etc.; highways, streets, roadways, bridges, belt line railroads, parking facilities, power, telephone, telegraph or cable lines or landings, water and gas pipelines, etc.; public buildings, public assembly and meeting places, convention centers, parks, playgrounds, bathhouses and bathing facilities, and golf courses; and small boat harbors and marinas, aquatic playgrounds and similar recreational facilities, snack bars, cafes, restaurants, motels, launching ramps, storage sheds, boat repair facilities, administration buildings, public restrooms, bait and tackle shops, chandleries, boat sales establishments, service stations and fuel docks, yacht club buildings, parking areas, pedestrian ways, and landscaped areas.

The Public Trust Doctrine is ever-evolving, but trust uses generally include waterborne commerce, navigation, fisheries, open space, water-oriented recreation, ecological habitat protection, and other recognized public trust purposes. While Public Trust uses originally focused upon navigation, commerce, and fisheries, they have been interpreted to include a broad array of uses such as fishing, hunting, bathing, swimming, boating, anchoring, and general recreation. Trust lands may be devoted to purposes unrelated to the trust if such purposes are incidental to and accommodate trust uses. Although the Public Trust Doctrine is not a plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect, discussion of the doctrine is included in this analysis to demonstrate its role in developing acceptable water and land uses in the proposed PMPU. In accordance with the Port Act, the District is updating its existing PMP, which was certified by the CCC in 1981 and subsequently amended, with the proposed PMPU. The proposed PMPU includes the Water and Land Use Element, which is intended to guide the future water and land uses and development on Tidelands and was prepared in conformance and consistent with the CCA, Public Trust Doctrine, and Port Act. Specifically, as stated in WLU Policy 1.1.6, the Water and Land Use Element, establishes allowable water and land uses in accordance with ~~six~~five broad Public Trust-related categories:

- a. Commerce
- b. Environmental Stewardship
- c. Fisheries
- d. Navigation
- e. Recreation
- f. ~~Government Facilities~~

As identified in PMPU Tables 3.1.2 and 3.1.3, the proposed PMPU establishes 9 water use designations and 10 land use designations, for which allowable use types or activities have been identified. These water and land use designations are in line with the ~~six~~five Port Act categories identified above. Water uses include:

- Anchorage
- Commercial Fishing Berthing
- Conservation/Intertidal
- Industrial and Deep-Water Berthing,
- Marine Services Berthing
- Navigation Corridor
- Open Bay/Water
- Recreational Berthing
- Sportfishing Berthing

Land uses include:

- Commercial Fishing
- Commercial Recreation
- Conservation Open Space
- Institutional/Roadways
- Marine Sales and Services
- Marine Terminal
- Maritime Services and Industrial
- Recreation Open Space
- Sportfishing
- Visitor-Serving Marine Terminal

The requirement for the creation of a port master plan that establishes a description of water and land uses is also included in the CCA, as is the requirement that a port master plan identify a list of appealable projects in sufficient detail to allow a determination of their consistency with the policies of Chapter 3 of the CCA. Chapter 5 of the proposed PMPU identifies a list of planned improvements for each planning district, including which of them qualify as appealable (also see Chapter 3, *Project*

Description, for a list of appealable projects). In addition to the requirement of establishing water and land uses and appealable projects, many of the CCA policies are concerned with protection of coastal-dependent uses such as maritime uses, commercial and recreational fishing, and other water-based recreational activities along the waterfront; physical and visual access to coastal resources; and protection of natural resources. Other CCA policies address coastal access, including the relationship to vehicle parking. Specifically, the CCA stipulates that, where appropriate, public facilities, which includes parking, must be distributed throughout an area in order to mitigate against overcrowding and overuse of any single area.³ The CCA also stipulates that the location and amount of new development should maintain and enhance public access to the coast by providing adequate parking facilities or providing substitute means of serving the development with public transportation.⁴ As detailed in Table 4.9-1, adherence to the proposed PMPU's policies and implementation of specific mitigation measures identified throughout this ~~Draft~~ Final PEIR would ensure that future development projects allowed under the proposed PMPU would not cause a significant environmental impact due to a conflict with the policies in Chapters 3 and 8 of the CCA.

As discussed under Section 4.9.3, the proposed PMPU area falls within the ALUCP review areas of three airports: SDIA, NAS North Island, and NOLF-IB. Future development projects that would exceed the height criteria in Federal Aviation Regulations Part 77 would require project proponents to consult with the Federal Aviation Administration and the ALUC if the development would be located within Review Area 1 or meet the review requirements for Review Area 2, as described in Section 4.7, *Hazards and Hazardous Materials*. Proposed PMPU Element policies, including SR Policy 1.1.7, SR Policy 1.1.8, and SR Policy 1.1.9, would require future development projects within an ALUCP review area to be sited and designed to minimize potential safety risks. The policies would restrict development of any project that would cause hazards to air navigation or other uses that may interfere with airport operations. The District would be responsible for conducting a consistency review of discretionary and ministerial projects located within the AIAs after implementation of the ALUCPs (Section 6.2.3, *Regional Water and Land Use Compatibility*, of the proposed PMPU identifies the implementation process). This consistency review would ensure there would be no conflict with the ALUCPs.

Finally, SANDAG's Regional Plan established a long-range blueprint for the San Diego region's growth and development through the year 2050. As discussed more fully in Section 4.11, *Population & Housing*, the proposed PMPU would not include any components that would result in substantial unplanned population growth and therefore would be consistent with the 2050 RTP. In addition, the proposed PMPU would result in alterations to the circulation system in order to improve efficiency and reduce traffic (vehicle miles traveled) along the roadways; to provide infrastructure for transit opportunities, and pedestrians and bicyclists with improved travel routes; and to establish mobility

³ Section 30212.5 of the CCA indicates that wherever appropriate and feasible, public facilities, including parking areas or facilities, shall be distributed throughout an area so as to mitigate against the impacts, social and otherwise, of overcrowding or overuse by the public of any single area.

⁴ Section 30252 of the CCA indicates that the location and amount of new development should maintain and enhance public access to the coast by (1) facilitating the provision or extension of transit service, (2) providing commercial facilities within or adjoining residential development or in other areas that will minimize the use of coastal access roads, (3) providing non-automobile circulation within the development, (4) providing adequate parking facilities or providing substitute means of serving the development with public transportation, (5) assuring the potential for public transit for high intensity uses such as high-rise office buildings, and by (6) assuring that the recreational needs of new residents will not overload nearby coastal recreation areas by correlating the amount of development with local park acquisition and development plans with the provision of onsite recreational facilities to serve the new development.

hubs distributed throughout the Tidelands to meet the needs of the visitors to the proposed PMPU area, avoid any overcrowding and overuse of any single area, and maintain and enhance public access to the coast. These proposed additions would be consistent with the goals of SB 375 and SANDAG's Regional Plan (see Table 4.9-1 below).

Based on the above, the proposed PMPU would not cause a significant environmental impact due to a conflict with any plans, policies, or regulations adopted for the purposes of avoiding or mitigating an environmental effect. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to a conflict with a plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect.

For the most part, operations under Option 1 would involve activities similar to those described above and would not introduce any new water or land uses that do not currently exist in the proposed PMPU area. Option 1 would involve the permanent closure of a segment of Harbor Drive from Broadway to G Street in order to accommodate the Waterfront Destination Park at the foot of Navy Pier, which would change vehicular circulation in that area and could conflict with SANDAG policies related to reducing bottlenecks. However, as noted in Table 4.9-1, the Safety and Resiliency Element addresses the District's objective of ensuring safe access to, from, and throughout Tidelands. In addition, while the closure of this roadway would require the redistribution of vehicular traffic onto adjacent roadways, it would still allow for use by pedestrians, bicycles, and pedicabs, and would therefore increase multi-modal transportation options. Therefore, operations under Option 1 would result in a less-than-significant impact and would not result in any additional or more severe environmental impacts due to a conflict with plans, policies, and regulations adopted for the purposes of avoiding environmental effects than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to a conflict with a plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect.

Operations under Option 2 would involve activities similar to those described above and do not propose any new water or land uses that do not currently exist in the proposed PMPU area.

Option 2 would be consistent the policies identified in Table 4.9-1. Therefore, operations under Option 2 would result in a less-than-significant impact and would not result in any additional or more severe environmental impacts due to a conflict with plans, policies, and regulations adopted for the purposes of avoiding environmental effects than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to a conflict with a plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect.

Operations under Option 3 would involve activities similar to those described above and do not propose any new water or land uses that do not currently exist in the proposed PMPU area. Option 3 would result in the realignment of Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street. This realignment would cause an impact to resources, as defined by CEQA, due to demolition of a portion of the County of San Diego Waterfront Park. However, this would not conflict with any of the policies identified in Table 4.9-1 below; therefore, this realignment would not conflict with any plans, policies, and regulations adopted for the purposes of avoiding environmental effects. Overall, Option 3 would be consistent the policies identified in Table 4.9-1. Therefore, operations under Option 3 would result in a less-than-significant impact and would not result in any additional or more severe environmental impacts related to a conflict with plans, policies, and regulations adopted for the purposes of avoiding environmental effects than buildout of the proposed PMPU without Option 3.

Table 4.9-1. Project Consistency with Relevant Goals, Objectives, and Policies

Goal, Policy, Objective	PMPU Consistency
California Coastal Act, Chapter 3, Coastal Resources Planning and Management Policies	
Section 30210. In carrying out the requirement of Section 4 of Article X of the California Constitution, maximum access, which shall be conspicuously posted, and recreational opportunities shall be provided for all the people consistent with public safety needs and the need to protect public rights, rights of private property owners, and natural resource areas from overuse.	Consistent. As discussed in Chapter 3 of this Draft <u>Final</u> PEIR, the proposed PMPU includes policies and planned improvements, including appealable projects, that would improve mobility, increase recreational open space area, and enhance coastal access in the proposed PMPU area. Development would include wayfinding signage consistent with Chapter 4, <i>Baywide Development Standards</i> , of the proposed PMPU and other District signage guidelines. Additionally, the Ecology Element of the proposed PMPU contains policies that would protect sensitive natural resources, including ECO Policy 1.1.2 through ECO Policy 4.2.1 (see Section 4.3, <i>Biological Resources</i> , of this Draft <u>Final</u> PEIR).
Section 30211. Development shall not interfere with the public's right of access to the sea where acquired through use or legislative authorization, including, but not limited to, the use of dry sand and rocky coastal beaches to the first line of terrestrial vegetation.	Consistent. The proposed PMPU would enhance access to the public realm and protect and provide access to Tidelands and waterside recreational facilities in accordance with the Water and Land Use Element of the proposed PMPU. In addition, coastal access and development standards are identified for each planning district, which include ways to increase direct access to the Bay by

Goal, Policy, Objective	PMPU Consistency
<p>Section 30212. (a) Public access from the nearest public roadway to the shoreline and along the coast shall be provided in new development projects except where: (1) it is inconsistent with public safety, military security needs, or the protection of fragile coastal resources, (2) adequate access exists nearby, or, (3) agriculture would be adversely affected. Dedicated accessway shall not be required to be opened to public use until a public agency or private association agrees to accept responsibility for maintenance and liability of the accessway.</p> <p>(b) For purposes of this section, "new development" does not include:</p> <p>(1) Replacement of any structure pursuant to the provisions of subdivision (g) of Section 30610.</p> <p>(2) The demolition and reconstruction of a single-family residence; provided, that the reconstructed residence shall not exceed either the floor area, height or bulk of the former structure by more than 10 percent, and that the reconstructed residence shall be sited in the same location on the affected property as the former structure.</p> <p>(3) Improvements to any structure which do not change the intensity of its use, which do not increase either the floor area, height, or bulk of the structure by more than 10 percent, which do not block or impede public access, and which do not result in a seaward encroachment by the structure.</p> <p>(4) The reconstruction or repair of any seawall; provided, however, that the reconstructed or repaired seawall is not a seaward of the location of the former structure.</p> <p>(5) Any repair or maintenance activity for which the commission has determined, pursuant to Section 30610, that a coastal development permit will be required unless the commission determines that the activity will have an adverse impact on lateral public access along the beach.</p> <p>As used in this subdivision "bulk" means total interior cubic volume as measured from the exterior surface of the structure.</p> <p>(c) Nothing in this division shall restrict public access nor shall it excuse the performance of duties and responsibilities of public agencies which are required by Sections 66478.1 to 66478.14, inclusive, of the Government Code and by Section 4 of Article X of the California Constitution.</p>	<p>enhancing existing or adding new public docking area, small-craft launching points, or step-down areas to enable the public to touch the water.</p> <p>Consistent. In accordance with WLU Goal 3 and subsequent policies, the proposed PMPU would enhance access to the water (or to the coast) and to the public realm through the implementation of a comprehensive open space network and enhancement of proximate connections to the water for the public and priority coastal uses. As outlined in WLU Policy 2.2.1, the District and its permittees would implement planned improvements and special allowances to facilitate public health, safety, and welfare and provide public coastal access and enjoyment of the waterfront. The proposed PMPU would require the District and its permittees to provide public coastal access in conjunction with future development projects and improvements. As discussed in Chapter 4 of the proposed PMPU, waterside promenades would be required as part of any development that abuts the waterfront and is not a coastal-dependent use. Additionally, development would be designed to integrate public access through the siting of walkways. Walkways would provide unobstructed physical access perpendicular to the waterfront, between the promenade and the public right-of-way.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30212.5. Wherever appropriate and feasible, public facilities, including parking areas or facilities, shall be distributed throughout an area so as to mitigate against the impacts, social and otherwise, of overcrowding or overuse by the public of any single area.</p>	<p>Consistent. In accordance with Mobility Element Objective 1.2 and subsequent policies, the District would implement a series of interconnecting mobility hubs throughout the Tidelands. These mobility hubs would connect to water-based access points throughout the Bay, where feasible. Parking areas may be included in mobility hubs or as standalone facilities. The District would encourage the development of mobility hubs rather than surface parking to provide proximate connections to the water and Tidelands, where feasible. The development of this mobility hub network would enhance circulation and promote coastal access throughout Tidelands, reducing the potential for crowding or overuse of any single area. In addition, in accordance with Mobility Element Objective 1.3 and subsequent policies, the District would require permittees of future development projects to identify and secure vehicular parking sufficient to serve the development's use. Parking could be provided through on-site parking, shared agreements with adjoining development, agreements with off-site parking facilities, and participation in the establishment of planned mobility improvements, including mobility hubs, etc. Per M Policy 1.3.5, the District would periodically monitor public parking demand on Tidelands to ensure that public spaces are being efficiently managed and used.</p>
<p>Section 30213. Lower cost visitor and recreational facilities shall be protected, encouraged, and, where feasible, provided. Developments providing public recreational opportunities are preferred.</p> <p>The commission shall not: (1) require that overnight room rentals be fixed at an amount certain for any privately owned and operated hotel, motel, or other similar visitor-serving facility located on either public or private lands; or (2) establish or approve any method for the identification of low or moderate income persons for the purpose of determining eligibility for overnight room rentals in any such facilities.</p>	<p>Consistent. WLU Goal 6 and subsequent objectives and policies would expand the collection of lower cost visitor and recreational facilities available to the public. These include facilities such as parks and waterside amenities such as public fishing piers, launch areas for motorized and nonmotorized watercraft, and overnight accommodations. As discussed in the Environmental Justice Element of the proposed PMPU, development would provide a range of free and lower cost recreational facilities throughout Tidelands that are accessible to disadvantaged communities. Additionally, the District—or through CDPs issued by the District—would maintain and, where feasible, expand free and lower cost recreational facilities, such as recreational fishing, parks, or viewing piers, on Tidelands adjacent to Portside and Tidelands Border Communities. In accordance with the Economics Element, the District would continue to reinvest lease revenues to support financing and maintenance of public improvements in alignment with CCA obligations, including lower cost visitor serving and recreational facilities such as parks, promenades,</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30214. (a) The public access policies of this article shall be implemented in a manner that takes into account the need to regulate the time, place, and manner of public access depending on the facts and circumstances in each case including, but not limited to, the following:</p> <ul style="list-style-type: none"> (1) Topographic and geologic site characteristics. (2) The capacity of the site to sustain use and at what level of intensity. (3) The appropriateness of limiting public access to the right to pass and repass depending on such factors as the fragility of the natural resources in the area and the proximity of the access area to adjacent residential uses. (4) The need to provide for the management of access areas so as to protect the privacy of adjacent property owners and to protect the aesthetic values of the area by providing for the collection of litter. <p>(b) It is the intent of the Legislature that the public access policies of this article be carried out in a reasonable manner that considers the equities and that balances the rights of the individual property owner with the public's constitutional right of access pursuant to Section 4 of Article X of the California Constitution. Nothing in this section or any amendment thereto shall be construed as a limitation on the rights guaranteed to the public under Section 4 of Article X of the California Constitution.</p> <p>(c) In carrying out the public access policies of this article, the commission and any other responsible public agency shall consider and encourage the utilization of innovative access management techniques, including, but not limited to, agreements with private organizations which would minimize management costs and encourage the use of volunteer programs.</p>	<p>public piers, and public art. In addition, PD2 and PD3 identify planned improvements that would include up to 1,720 lower cost overnight accommodations.</p> <p>Consistent. The proposed PMPU area is relatively flat, and topographic and geologic site characteristics would not hinder public access (see Section 4.5, <i>Geology and Soils</i>). Chapter 4 of the proposed PMPU establishes the requirements for waterside promenades as part of any future development project that abuts the waterfront and is not a coastal-dependent use, and planned improvements included throughout Chapter 5 of the proposed PMPU identify requirements for the provision or enhancement of public access and recreational areas. In accordance with WLU Policy 4.2.2, activating features within Recreation Open Space areas would be commensurate with the intensity of land uses within the permittee's development site. Fragile natural resources exist within the PMPU area (see Section 4.3 of this Draft Final PEIR). Public access opportunities would increase with implementation of the proposed PMPU, and future development may be sited adjacent to sensitive habitats; however, implementation of mitigation measures would ensure these natural resources are protected (see Section 4.3). Additionally, ECO Policy 1.1.3 requires future development adjacent to conservation areas and other sensitive habitats to be coordinated, sited, and designed to avoid impacts where feasible or where legally required. If avoiding impacts is not feasible, or avoidance is not legally required, impacts must be mitigated.</p> <p>In addition, amenity zones may include fixed or movable seating, shade structures, site furnishings, trash receptacles, signage, and other visitor-serving amenities.</p>
<p>Section 30220. Coastal areas suited for water-oriented recreational activities that cannot readily be provided at inland water areas shall be protected for such uses.</p>	<p>Consistent. As discussed in WLU Objective 1.2, the proposed PMPU would identify each water and land use's functional dependency to the water, consistent with the CCA priorities (coastal-dependent, coastal-related, and coastal-enhancing). As discussed in WLU Policy 1.3.1, the District would prioritize allowable uses based on their location and functional dependency to the coast.</p>
<p>Section 30221. Oceanfront land suitable for recreational use shall be protected for recreational use and development unless present and foreseeable</p>	<p>Consistent. Planning District 8 is adjacent to oceanfront land suitable for recreational use within the District's jurisdiction. As identified in WLU</p>

Goal, Policy, Objective	PMPU Consistency
<p>future demand for public or commercial recreational activities that could be accommodated on the property is already adequately provided for in the area.</p>	<p>Policy 5.1.3, all development shall be located, designed, and constructed to provide for other benefits consistent with the Public Trust, including improved recreational opportunities in the public realm, and Recreation Open Space on land adjacent to oceanfront areas suitable for recreational use and development.</p>
<p>Section 30222. The use of private lands suitable for visitor-serving commercial recreational facilities designed to enhance public opportunities for coastal recreation shall have priority over private residential, general industrial, or general commercial development, but not over agriculture or coastal-dependent industry.</p>	<p>Consistent. There are no private residential properties within the proposed PMPU area and no privately owned land. However, within PD9 there are piers and docks with no associated public access that extend into the Crown Isle Subdistrict and Grand Caribe Isle and South Cays Subdistrict from off-Tidelands private residences. These piers and docks connect directly to the residences with no ability to provide public access due to physical constraints. Additionally, quasi private/quasi-public piers exist within PD1, but as identified under the <i>Special Allowances for the West Shelter Island Subdistrict</i> in the proposed PMPU, the piers must be accessible to the public from sunrise to sunset with clearly posted signs indicating the availability for public use. Only the gangways and docks of these piers may remain closed to the public. In addition, as identified in WLU Policy 5.1.3, all development shall be located, designed, and constructed to give highest priority to the use of existing land space in harbors for coastal-dependent port purposes, including, but not limited to, navigational facilities, shipping industries, <u>commercial fishing, sportfishing, maritime commerce</u>, and necessary support and access facilities.</p>
<p>Section 30222.5. Oceanfront land that is suitable for coastal dependent aquaculture shall be protected for that use, and proposals for aquaculture facilities located on those sites shall be given priority, except over other coastal dependent developments or uses.</p>	<p>Consistent. Planning District 8 contains oceanfront land suitable for coastal-dependent aquaculture within the District’s jurisdiction. Aquaculture is identified as an allowable primary or secondary use within all water use designations except for anchorage uses and navigation corridors. In addition, as identified in ECO Policy 2.1.4, aquaculture, <u>as interpreted by the California Department of Fish and Wildlife</u>, is encouraged in Tidelands areas using species and sustainable practices that are approved by <u>in accordance with the California Department of Fish and Wildlife processes</u> and that do not degrade surrounding natural resources and minimize substantial environmental impacts. <u>Future aquaculture operations may be subject to additional regulatory requirements, such as project- or site-specific monitoring and reporting.</u></p>

Goal, Policy, Objective	PMPU Consistency
Section 30223. Upland areas necessary to support coastal recreational uses shall be reserved for such uses, where feasible.	Consistent. The proposed PMPU would include landside development that would support coastal recreational uses. As stipulated in WLU Objective 1.2, the proposed PMPU identifies each land use's functional dependency to the water, consistent with the CCA priorities (coastal-dependent, coastal-related, and coastal-enhancing). As discussed in WLU Policy 1.3.1, the District has prioritized allowable uses based on their location and functional dependency to the coast.
Section 30224. Increased recreational boating use of coastal waters shall be encouraged, in accordance with this division, by developing dry storage areas, increasing public launching facilities, providing additional berthing space in existing harbors, limiting non-water-dependent land uses that congest access corridors and preclude boating support facilities, providing harbors of refuge, and by providing for new boating facilities in natural harbors, new protected water areas, and in areas dredged from dry land.	Consistent. Planned improvements identified for PD1, PD2, PD3, PD 9, and PD10 allow for an increase in recreational boat berthing area for a total of approximately 485 slips. Increased anchorage moorings are identified for most of these planning districts as well, which would increase to up 75 additional moorings under the proposed PMPU. The proposed PMPU would not interfere with existing water transportation routes (i.e., the ferry and water taxi) or the navigational channels of other users of the Bay.
Section 30230. Marine resources shall be maintained, enhanced, and where feasible, restored. Special protection shall be given to areas and species of special biological or economic significance. Uses of the marine environment shall be carried out in a manner that will sustain the biological productivity of coastal waters and that will maintain healthy populations of all species of marine organisms adequate for long-term commercial, recreational, scientific, and educational purposes.	Consistent. Marine resources within the proposed PMPU area would be impacted by implementation of the proposed PMPU; however, implementation of mitigation measures would ensure that species of special biological or economic significance are protected (see Section 4.3 of this Draft <u>Final</u> PEIR). In addition, the goals, objectives, and policies of the Ecology Element are devoted to the enhancement, conservation, restoration, and maintenance of biological resources, including through the establishment of buffers around sensitive habitat and wetland enhancement. The District would prioritize and pursue opportunities for the protection, conservation, <u>creation</u> , restoration, and enhancement of sensitive habitats and State or Federally listed coastal species (ECO Policy 1.1.2); establish and maintain ecological buffers around sensitive habitats (ECO Policy 1.1.5); and identify locations throughout the Bay that could support habitat enhancement, restoration, and protection (ECO Policies 1.1.13, 1.1.15, 1.1.22, and 1.1.23). Furthermore, ECO Policy 1.1.3 requires future development adjacent to conservation areas and other sensitive habitats, such as riparian habitats and natural streams, to be coordinated, sited, and designed to avoid impacts where feasible or where legally required. If avoiding impacts is not feasible, or avoidance is not legally required, impacts must be mitigated. Mitigation measures have been identified to reduce any impacts the proposed PMPU may have on sensitive habitats (see Section 4.3 of this Draft <u>Final</u> PEIR).

Goal, Policy, Objective	PMPU Consistency
<p>Section 30231. The biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface waterflow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.</p>	<p>Consistent. The Ecology Element of the proposed PMPU identifies goals, objectives, and policies that focus on healthy ecosystems, a clean environment, and collaborative stewardship. ECO Policy 1.1.3 requires future development adjacent to conservation areas and other sensitive habitats, such as riparian habitats and natural streams, to be coordinated, sited, and designed to avoid impacts where feasible or where legally required. If avoiding impacts is not feasible, or avoidance is not legally required, impacts must be mitigated. As discussed in Section 4.8, <i>Hydrology and Water Quality</i>, PMPU policies would reduce potential impacts to violations of water quality by prioritizing the protection and enhancement of water quality (ECO Policy 2.1.1), committing to implementing initiatives to reduce copper loads from recreational vessels (ECO Policy 2.1.6) encouraging the use of alternative non-copper based antifouling paints (ECO Policy 2.1.7), committing to prioritizing and pursuing opportunities for the protection and enhancement of sediment quality (ECO Policy 2.2.1), reinforcing compliance with the MS4 permits and other legal requirements to minimize pollution impacts (ECO Policy 2.3.1), implementing measures to prevent pollution impacts and adverse impacts from runoff flows from all development and maintenance activities (ECO Policy 2.3.4), and implementing measures to protect and improve water quality from development projects located in areas identified as impaired under Section 303(d) of the Federal Clean Water Act (ECO Policy 2.3.5). Additionally, mitigation measures have been identified to ensure that implementation of the proposed PMPU would not adversely affect the marine environment (see Section 4.3 and Section 4.8 of this Draft <u>Final</u> PEIR).</p>
<p>Section 30232. Protection against the spillage of crude oil, gas, petroleum products, or hazardous substances shall be provided in relation to any development or transportation of such materials. Effective containment and cleanup facilities and procedures shall be provided for accidental spills that do occur.</p>	<p>Consistent. The PMPU does not propose any new or expanded oil, gas, petroleum facilities, or other new or expanded activities involving hazardous substances. However, future development under the proposed PMPU would be required to comply with all applicable regulations regarding spill prevention and handling of hazardous materials (see Sections 4.7 and 4.8 of this Draft <u>Final</u> PEIR). In addition, the District has developed an Emergency Operations Plan to address both natural and human-caused hazards and disasters, which would enable effective containment and cleanup for any accidental spills that may occur.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30233. (a) The diking, filling, or dredging of open coastal waters, wetlands, estuaries, and lakes shall be permitted in accordance with other applicable provisions of this division, where there is no feasible less environmentally damaging alternative, and where feasible mitigation measures have been provided to minimize adverse environmental effects, and shall be limited to the following:</p> <p>(1) New or expanded port, energy, and coastal-dependent industrial facilities, including commercial fishing facilities.</p> <p>(2) Maintaining existing, or restoring previously dredged, depths in existing navigational channels, turning basins, vessel berthing and mooring areas, and boat launching ramps.</p> <p>(3) In open coastal waters, other than wetlands, including streams, estuaries, lakes, new or expanded boating facilities and the placement of structural pilings for public recreational piers that would provide public access and recreational opportunities.</p> <p>(4) Incidental public service purposes, including but not limited to, burying cables and pipes or inspection of piers and maintenance of existing intake and outfall lines.</p> <p>(5) Mineral extraction, including sand for restoring beaches, except in environmentally sensitive areas.</p> <p>(6) Restoration purposes.</p> <p>(7) Nature study, aquaculture, or similar resource dependent activities.</p>	<p>Consistent. The proposed PMPU does not identify any planned improvements that would specifically require diking, filling, or dredging. However, should future development allowed under the proposed PMPU require the diking, filling, or dredging of open coastal waters, wetlands, or estuaries, in order to develop new and expanded port facilities, mitigation measures would be applied to minimize adverse environmental effects, as detailed in Sections 4.3, 4.7, 4.8, of this Draft <u>Final</u> PEIR.</p>
<p>(b) Dredging and spoils disposal shall be planned and carried out to avoid significant disruption to marine and wildlife habitats and water circulation. Dredge spoils suitable for beach replenishment should be transported for these purposes to appropriate beaches or into suitable longshore current systems.</p>	<p>Consistent. The proposed PMPU does not identify any planned improvements that would specifically require dredging. However, should future development allowed under the proposed PMPU require dredging and spoils disposal, the proposed PMPU includes numerous policies directing the protection and marine and wildlife habitats. In addition, ECO Policy 2.3.3 requires <u>proposed development that would disrupt shoreline fill or Bay sediment</u> to remove <u>the</u> contaminated fill or appropriately contain and remediate the fill <u>in a manner consistent with applicable requirements</u>. Furthermore, mitigation measures have been identified to ensure that dredging activities associated with future development occurring under implementation of the proposed PMPU would avoid significant disruption to marine and wildlife habitats (see Section 4.3 of this Draft <u>Final</u> PEIR).</p>

Goal, Policy, Objective	PMPU Consistency
<p>(c) In addition to the other provisions of this section, diking, filling, or dredging in existing estuaries and wetlands shall maintain or enhance the functional capacity of the wetland or estuary. Any alteration of coastal wetlands identified by the Department of Fish and Game, including, but not limited to, the 19 coastal wetlands identified in its report entitled, "Acquisition Priorities for the Coastal Wetlands of California," shall be limited to very minor incidental public facilities, restorative measures, nature study, commercial fishing facilities in Bodega Bay, and development in already developed parts of south San Diego Bay, if otherwise in accordance with this division.</p> <p>For the purposes of this section, "commercial fishing facilities in Bodega Bay" means that not less than 80 percent of all boating facilities proposed to be developed or improved, where the improvement would create additional berths in Bodega Bay, shall be designed and used for commercial fishing activities.</p>	<p>Consistent. Except for a small area designated for roadway uses, PD7 would be designated for conservation/intertidal uses. However, future development occurring as part of implementation of the proposed PMPU may involve development within a wetland or estuary. Any alteration of coastal wetlands would be in conformance with the limitations identified by the California Department of Fish and Wildlife. In addition, should future development allowed under the proposed PMPU require the diking, filling, or dredging in existing wetlands or estuaries, appropriate mitigation measures would be identified at the time of site-specific review to minimize adverse environmental effects, as detailed in Section 4.3 of this Draft <u>Final</u> PEIR.</p>
<p>(d) Erosion control and flood control facilities constructed on watercourses can impede the movement of sediment and nutrients that would otherwise be carried by storm runoff into coastal waters. To facilitate the continued delivery of these sediments to the littoral zone, whenever feasible, the material removed from these facilities may be placed at appropriate points on the shoreline in accordance with other applicable provisions of this division, where feasible mitigation measures have been provided to minimize adverse environmental effects. Aspects that shall be considered before issuing a coastal development permit for these purposes are the method of placement, time of year of placement, and sensitivity of the placement area.</p>	<p>Not applicable. The proposed PMPU would not involve development on a watercourse and would not implement erosion control or flood control facilities on a watercourse.</p>
<p>Section 30234. Facilities serving the commercial fishing and recreational boating industries shall be protected, and where feasible, upgraded. Existing commercial fishing and recreational boating harbor space shall not be reduced unless demand for those facilities no longer exists or adequate substitute space has been provided. Proposed recreational boating facilities shall, where feasible, be designed and located in such a fashion as not to interfere with the needs of the commercial fishing industry.</p>	<p>Consistent. As detailed in ECON Policy 2.1.1, the District would maintain a mix of water and land uses that meet the need of established Tidelands industries and provide opportunities for emerging Public Trust-consistent uses. The proposed PMPU would allow for an increase of commercial fishing berthing by up to 65 slips (in PD1) and would allow an increase of up to 485 recreational boat berthing slips throughout the proposed PMPU area. Additionally, ECON Policy 2.3.11 states that the District would coordinate with commercial fishing, recreational fishing, and sportfishing operations to identify and prioritize facility improvements that benefit the fishing business community.</p>

Goal, Policy, Objective	PMPU Consistency
Section 30234.5. The economic, commercial, and recreational importance of fishing activities shall be recognized and protected.	Consistent. The District intends to support commercial and recreational fishing. The economic, commercial, and recreational importance of fishing activities is described in ECON Policy 2.3.11 through ECON Policy 2.3.17 of the Economics Element. In addition, as noted above, the proposed PMPU would allow for an additional 65 commercial fishing berthing slips and an increase of up to 485 recreational boat berthing slips throughout the proposed PMPU area.
Section 30235. Revetments, breakwaters, groins, harbor channels, seawalls, cliff retaining walls, and other such construction that alters natural shoreline processes shall be permitted when required to serve coastal-dependent uses or to protect existing structures or public beaches in danger from erosion, and when designed to eliminate or mitigate adverse impacts on local shoreline sand supply. Existing marine structures causing water stagnation contributing to pollution problems and fishkills should be phased out or upgraded where feasible	Consistent. Shoreline protective devices that may be implemented, as part of the proposed PMPU, could include revetments, breakwaters, groins, harbor channels, seawalls, cliff retaining walls, and other such construction that alters natural shoreline processes. In accordance with SR Policy 3.3.10, when constructing, reconstructing, expanding, or replacing a shoreline protective device (per SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9), the District would require it be designed to minimize adverse impacts on local shoreline sand supply.
Section 30236. Channelizations, dams, or other substantial alterations of rivers and streams shall incorporate the best mitigation measures feasible, and be limited to (1) necessary water supply projects, (2) flood control projects where no other method for protecting existing structures in the flood plain is feasible and where such protection is necessary for public safety or to protect existing development, or (3) developments where the primary function is the improvement of fish and wildlife habitat.	Not Applicable. The proposed PMPU would not result in channelizations, dams, or other substantial alterations of rivers and streams.
Section 30240. (a) Environmentally sensitive habitat areas shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas. (b) Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.	Consistent. ECO Policy 1.1.3 requires future development adjacent to conservation areas and other sensitive habitats, such as riparian habitats and natural streams, to be coordinated, sited, and designed to avoid impacts where feasible or where legally required. If avoiding impacts is not feasible, or avoidance is not legally required, impacts must be mitigated. Mitigation measures have been identified to reduce any impacts the proposed PMPU may have on those habitats (see Section 4.3 of this Draft Final PEIR).
Section 30241. The maximum amount of prime agricultural land shall be maintained in agricultural production to assure the protection of the areas' agricultural economy, and conflicts shall be minimized between agricultural and urban land uses through all of the following: (a) By establishing stable boundaries separating urban and rural areas, including, where necessary, clearly defined buffer	Not Applicable. There is no prime agricultural land within the proposed PMPU area.

Goal, Policy, Objective	PMPU Consistency
<p>areas to minimize conflicts between agricultural and urban land uses. (b) By limiting conversions of agricultural lands around the periphery of urban areas to the lands where the viability of existing agricultural use is already severely limited by conflicts with urban uses or where the conversion of the lands would complete a logical and viable neighborhood and contribute to the establishment of a stable limit to urban development. (c) By permitting the conversion of agricultural land surrounded by urban uses where the conversion of the land would be consistent with Section 30250. (d) By developing available lands not suited for agriculture prior to the conversion of agricultural lands. (e) By assuring that public service and facility expansions and nonagricultural development do not impair agricultural viability, either through increased assessment costs or degraded air and water quality. (f) By assuring that all divisions of prime agricultural lands, except those conversions approved pursuant to subdivision (b), and all development adjacent to prime agricultural lands shall not diminish the productivity of such prime agricultural lands.</p>	
<p>Section 30241.5. (a) If the viability of existing agricultural uses is an issue pursuant to subdivision (b) of Section 30241 as to any local coastal program or amendment to any certified local coastal program submitted for review and approval under this division, the determination of "viability" shall include, but not be limited to, consideration of an economic feasibility evaluation containing at least both of the following elements: (1) An analysis of the gross revenue from the agricultural products grown in the area for the five years immediately preceding the date of the filing of a proposed local coastal program or an amendment to any local coastal program. (2) An analysis of the operational expenses, excluding the cost of land, associated with the production of the agricultural products grown in the area for the five years immediately preceding the date of the filing of a proposed local coastal program or an amendment to any local coastal program. For purposes of this subdivision, "area" means a geographic area of sufficient size to provide an accurate evaluation of the economic feasibility of agricultural uses for those lands included in the local coastal program or in the proposed amendment to a certified local coastal program. (b) The economic feasibility evaluation required by subdivision (a) shall be submitted to the commission, by the local government, as part of its submittal of a local coastal program or an amendment to any local coastal</p>	<p>Not Applicable. The proposed PMPU would not involve existing agricultural uses.</p>

Goal, Policy, Objective	PMPU Consistency
<p>program. If the local government determines that it does not have the staff with the necessary expertise to conduct the economic feasibility evaluation, the evaluation may be conducted under agreement with the local government by a consultant selected jointly by local government and the executive director of the commission.</p>	
<p>Section 30242. All other lands suitable for agricultural use shall not be converted to nonagricultural uses unless (1) continued or renewed agricultural use is not feasible, or (2) such conversion would preserve prime agricultural land or concentrate development consistent with Section 30250. Any such permitted conversion shall be compatible with continued agricultural use on surrounding lands.</p>	<p>Not Applicable. The proposed PMPU would not involve the conversion of agricultural land.</p>
<p>Section 30243. The long-term productivity of soils and timberlands shall be protected, and conversions of coastal commercial timberlands in units of commercial size to other uses or their division into units of noncommercial size shall be limited to providing for necessary timber processing and related facilities.</p>	<p>Not Applicable. There are no commercial timberlands within the proposed PMPU area.</p>
<p>Section 30244. Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required.</p>	<p>Consistent. As discussed in Sections 4.4, <i>Cultural Resources</i>, and 4.5, <i>Geology and Soils</i>, the proposed PMPU area may contain archaeological or paleontological resources. However, appropriate mitigation measures have been identified in Sections 4.4 and 4.5, which would be implemented by future development in order to reduce potential impacts on these resources.</p>
<p>Section 30250. (a) New residential, commercial, or industrial development, except as otherwise provided in this division, shall be located within, contiguous with, or in close proximity to, existing developed areas able to accommodate it or, where such areas are not able to accommodate it, in other areas with adequate public services and where it will not have significant adverse effects, either individually or cumulatively, on coastal resources. In addition, land divisions, other than leases for agricultural uses, outside existing developed areas shall be permitted only where 50 percent of the usable parcels in the area have been developed and the created parcels would be no smaller than the average size of surrounding parcels. (b) Where feasible, new hazardous industrial development shall be located away from existing developed areas. (c) Visitor-serving facilities that cannot feasibly be located in existing developed areas shall be located in existing isolated developments or at selected points of attraction for visitors.</p>	<p>Consistent. The proposed PMPU area would be adjacent and contiguous to an existing urbanized and developed area, and all planned improvements, including commercial or industrial development or visitor-serving uses, would occur within already developed areas. ECO Policy 1.1.3 requires any future development adjacent to conservation areas and other sensitive habitats, such as riparian habitats and natural streams, to be coordinated, sited, and designed to avoid impacts where feasible or where legally required. If avoiding impacts is not feasible, or avoidance is not legally required, impacts must be mitigated. The proposed PMPU area is adequately served by existing public services (see Section 4.12, <i>Public Services and Recreation</i>). The proposed PMPU would not involve the division of land.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30251. The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas such as those designated in the California Coastline Preservation and Recreation Plan prepared by the Department of Parks and Recreation and by local government shall be subordinate to the character of its setting.</p>	<p>Consistent. The proposed PMPU identifies scenic vistas and view corridor extensions that must be protected. In addition, the proposed PMPU employs goals, policies, and objectives as well as development standards to ensure the protection of the visual resources throughout the proposed PMPU area. Specifically, WLU Objective 2.2 requires development to be implemented in a manner that blends with and enhances the surrounding character and qualities. WLU Policy 3.2.1 requires that visual access locations (scenic vista areas, view corridor extensions, Window to the Bay, and walkways) be maintained and protected, as shown on the <i>Planning Districts: Coastal Access Views and Pathways Maps</i> in Chapter 5 of the proposed PMPU. In addition, baywide development standards established in Chapter 4 of the PMPU, as well as development standards established for each planning district in Chapter 5, identify height limits and setback requirements, etc., to maintain visual quality throughout the proposed PMPU area. As discussed in Section 4.1, <i>Aesthetics and Visual Resources</i>, of this Draft <u>Final</u> PEIR the proposed PMPU would not degrade the visual quality of the proposed PMPU area and would be visually compatible with the character of the surrounding areas.</p>
<p>Section 30252. The location and amount of new development should maintain and enhance public access to the coast by</p> <p>(1) facilitating the provision or extension of transit service</p>	<p>Consistent. The proposed PMPU would implement mobility hubs throughout the PMPU area, which would connect to the overall system through land-based transit (the District's bayfront circulator and other transit options) and water-based transit (ferries and water taxis).</p>
<p>(2) providing commercial facilities within or adjoining residential development or in other areas that will minimize the use of coastal access roads</p>	<p>Not Applicable. Per the Public Trust Doctrine, residential uses are not allowed within the Tidelands, and the proposed PMPU would not provide new commercial facilities within or adjoining residential development.</p>
<p>(3) providing non-automobile circulation within the development</p>	<p>Consistent. The proposed PMPU would implement mobility hubs throughout the proposed PMPU area, which would provide connections to bicycle and pedestrian facilities and amenities. Pedestrian connections would be provided adjacent to visitor attractions and uses that are located within 0.25-mile of a Regional Mobility Hub. Connections would be provided to an onsite or adjacent regional bicycle facility, such as a Class I Multi-Use Path or a Class IV Cycle Track. Additionally, bicycle parking and wayfinding signage to key destinations would be provided at each Regional Mobility Hub.</p>

Goal, Policy, Objective	PMPU Consistency
(4) providing adequate parking facilities or providing substitute means of serving the development with public transportation	<p>Consistent. Transit services that serve Tidelands include local and express buses, a trolley, heavy passenger rail, and commuter rail. In accordance with Mobility Objective 1.2 in the Mobility Element and subsequent policies, the District would implement a series of interconnecting mobility hubs throughout the Tidelands. Regional Mobility Hubs would provide a direct connection to a regional transit stop, such as a trolley or bus stop, and a bayfront circulator stop. Additionally, these mobility hubs would connect to water-based access points throughout the Bay, where feasible. Parking areas may be included in mobility hubs or as standalone facilities. The District would encourage the development of mobility hubs rather than surface parking to provide proximate connections to the water and Tidelands, where feasible. The development of the mobility hub network and extension of the baywide circulator, combined with existing public transportation options, would provide substitute means of serving the development with public transportation. In addition, in accordance with Mobility Element Objective 1.3 and subsequent policies, the District would require permittees of future development to identify and secure vehicular parking sufficient to serve the development's use. Parking could be provided through on-site parking, shared agreements with adjoining development, agreements with off-site parking facilities, and participation in the establishment of planned mobility improvements, including mobility hubs, etc. Per M Policy 1.3.5, the District would periodically monitor public parking demand on Tidelands to ensure that public spaces are being efficiently managed and used.</p> <p>Additionally, in accordance with Mobility Objective 1.3 and subsequent policies, the District would provide public parking to meet evolving demands. The District will seek to balance the competing demands of the CCA for adequate parking with those of SB 743 and related laws and regulations to reduce GHG emissions. Permittees of development that generated parking demand would be required to identify and secure, as appropriate, vehicular parking sufficient to serve that development's specific use without relying upon or reducing existing vehicular spaces dedicated to public uses and when alternative mobility modes that offset the need for parking are not feasible or sufficient to meet total parking demand (Mobility Policy 1.3.4). The District would also periodically monitor the public parking demand on Tidelands to ensure that</p>

Goal, Policy, Objective	PMPU Consistency
	public spaces are being efficiently managed and used and to review and update the District's parking guidelines, as necessary (Mobility Policy 1.3.5).
(5) assuring the potential for public transit for high intensity uses such as high-rise office buildings	Consistent. Due to its proximity to existing public transit facilities, the proposed PMPU would assure public transit options within the proposed PMPU area.
(6) assuring that the recreational needs of new residents will not overload nearby coastal recreation areas by correlating the amount of development with local park acquisition and development plans with the provision of onsite recreational facilities to serve the new development.	Consistent. Residential development on District Tidelands is prohibited by the Public Trust Doctrine and Port Act and is not being proposed. The proposed PMPU would not involve residential development and would not increase the residential population in the project vicinity. (See Section 4.11, <i>Population & Housing</i> .) The proposed PMPU would increase public access opportunities to the waterfront.
Section 30253. New development shall do all of the following: (a) Minimize risks to life and property in areas of high geologic, flood, and fire hazard.	Consistent. The District will review future development allowed under the proposed PMPU to minimize risks to life and property due to geologic, flood, or fire hazards (see Sections 4.5, 4.7, 4.8 of this Draft <u>Final</u> PEIR). Future development allowed under the proposed PMPU would be required to comply with all applicable laws and regulations, including the building codes identified in Section 4.5, and would restrict development within Alquist-Priolo Zones or other areas where active faults are known. All future development would be sited at least 50 feet away from an active fault, in accordance with the Alquist-Priolo Act. Moreover, the proposed PMPU includes SR Policy 1.1.6, which requires compliance with the seismic safety standards of all applicable seismic provisions and criteria in the most recent version of California State and applicable municipal codes and the incorporation of siting and design techniques to address any such geologic hazards. As discussed in Section 4.7 of this Draft <u>Final</u> PEIR, there are numerous hazardous materials and hazardous waste laws and regulations that would apply to future development projects within the proposed PMPU area. Specifically, the Federal Department of Transportation (DOT) Hazardous Materials Regulations (49 Code of Federal Regulations [CFR] 100–185) Parts 107 (Hazard Materials Program), 130 (Oil Spill Prevention and Response), 172 (Emergency Response), 173 (Packaging Requirements), 177 (Highway Transportation), 178 (Packaging Specifications), and 180 (Packaging Maintenance) would reduce impacts associated with transportation of hazardous materials. The Spill Prevention, Control, and Countermeasure

Goal, Policy, Objective	PMPU Consistency
(b) Assure stability and structural integrity, and neither create nor contribute significantly to erosion, geologic instability, or destruction of the site or surrounding area or in any way require the construction of protective devices that would substantially alter natural landforms along bluffs and cliffs.	(SPCC) Plan (40 CFR 112.7) enforced by County Department of Environmental Health (DEH) would reduce impacts associated with spills of fuel or oil to navigable waters. Federal Occupational Safety and Health Administration (OSHA) requirements would reduce impacts related to workers' exposure to hazardous materials at the workplace. California Code of Regulations (CCR) Title 8 and Title 22 would reduce potential impacts related to the handling of hazardous materials and management of hazardous materials facilities, as well as the testing, abatement, and disposal of asbestos-containing materials (ACMs) and lead-based paint (LBP). For a detailed explanation of the applicable regulations, see Section 4.7.3. Furthermore, new buildings would be designed to avoid inundation from flooding per Federal Emergency Management Agency (FEMA) regulations, which require that future structures proposed within a flood zone must be designed to ensure that the floor elevation is raised at least 1 foot above the floodplain elevation and meets the structural requirements of FEMA to avoid any damage to persons or structures as a result of a 100-year flood. Future projects would be subject to site-specific review to minimize risks to life and property due to geologic, flood, or fire hazards.
(c) Be consistent with requirements imposed by an air pollution control district or the State Air Resources Board as to each particular development.	<p>Consistent. The proposed PMPU area contains a human-made shoreline and is not located along a bluff or cliff, and no natural landforms would be altered by the future development occurring under the proposed PMPU.</p> <p>Consistent. The proposed PMPU proposes numerous policies for reducing air pollution emissions, including ECO Policy 3.1.2, which requires permittees to implement clear air action measures, ECO Policy 3.1.3, which involves advancing maritime clean air strategies to help improve local air quality, ECO Policy 3.1.4, which requires permittees to implement infrastructure and clean vessel technologies, and ECO Policy 3.1.5, which directs the District to explore financing programs in coordination with regional, State, and Federal partners to implement recommended clean air measures. In addition, as described in Section 4.2, <i>Air Quality and Health Risk</i>, mitigation measures have been identified to reduce potential air quality impacts of future development and to be consistent with applicable requirements of the San Diego Air Pollution Control District (SDAPCD) and the California Air Resources Board (CARB).</p>

Goal, Policy, Objective	PMPU Consistency
(d) Minimize energy consumption and vehicle miles traveled.	<p>Consistent. The proposed PMPU includes numerous policies targeting reduction in energy consumption, including, but not limited to, SR Policy 3.1.1, SR Policy 3.1.2, and SR Policy 3.1.3. In addition, the PMPU proposes implementation of new mobility hubs and roadway modifications to increase multi-modal transportation options, including increased use of transit as well as improved bicycle and pedestrian accessibility. Finally, the proposed PMPU would <u>incorporate sustainability measures in all development in the PMPU area</u> comply with San Diego Unified Port District Climate Action Plan Measures (MM-AQ-96), which require <u>includes</u> energy efficient design features that exceed 2019-applicable Title 24 California Building Energy Efficiency Standards. As noted above, the proposed PMPU would be located proximal to public transit services. However, as documented in Section 4.14, <i>Transportation, Circulation, and Mobility</i>, the proposed PMPU is anticipated to result in an increase in vehicle miles traveled (VMT) from certain uses in PD2, PD3, PD8, PD9, and PD10. As such, mitigation has been identified that would require the District to <u>establish and implement a transportation impact fee program-VMT Infrastructure Mitigation Program</u> for the funding <u>installation of multi-modal transportation infrastructure improvements that would reduce both existing and future VMT within the District (MM-TRA-1)</u>, require future development <u>project-level VMT impacts and reduce project-induced VMT impacts either through participation in the District's VMT Infrastructure Mitigation Program or by implementing VMT-reducing infrastructure contribute fair share impact fees (MM-TRA-2)</u>, and require future development projects to implement Transportation Demand Management Plans (MM-TRA-3), which would minimize energy consumption and reduce VMT.</p>
(e) Where appropriate, protect special communities and neighborhoods that, because of their unique characteristics, are popular visitor destination points for recreational uses.	<p>Consistent. The proposed PMPU organizes planning districts by subdistricts, as necessary, to differentiate their distinct character (WLU Policy 2.1.2) and requires new development to be implemented in a manner that is compatible with and enhances the surrounding character and qualities (WLU Objective 2.2). In order to maintain a planning district's distinct character, all development is required to be in accordance with the associated subdistrict vision or planning district vision (WLU Policy 2.2.2), thus protecting the unique characteristics of special communities.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30254. New or expanded public works facilities shall be designed and limited to accommodate needs generated by development or uses permitted consistent with the provisions of this division; provided, however, that it is the intent of the Legislature that State Highway Route 1 in rural areas of the coastal zone remain a scenic two-lane road. Special districts shall not be formed or expanded except where assessment for, and provision of, the service would not induce new development inconsistent with this division. Where existing or planned public works facilities can accommodate only a limited amount of new development, services to coastal dependent land use, essential public services and basic industries vital to the economic health of the region, state, or nation, public recreation, commercial recreation, and visitor-serving land uses shall not be precluded by other development.</p>	<p>Not applicable. The proposed PMPU does not involve development near State Highway Route 1 in rural areas of the coastal zone.</p>
<p>Section 30254.5. Notwithstanding any other provision of law, the commission may not impose any term or condition on the development of any sewage treatment plant which is applicable to any future development that the commission finds can be accommodated by that plant consistent with this division. Nothing in this section modifies the provisions and requirements of Sections 30254 and 30412.</p>	<p>Not applicable. The proposed PMPU does not involve development of sewage treatment plants.</p>
<p>Section 30255. Coastal-dependent developments shall have priority over other developments on or near the shoreline. Except as provided elsewhere in this division, coastal-dependent developments shall not be sited in a wetland. When appropriate, coastal-related developments should be accommodated within reasonable proximity to the coastal-dependent uses they support.</p>	<p>Consistent. Per WLU Objective 1.2, the proposed PMPU identifies each land use's functional dependency to the water, consistent with the CCA priorities (coastal-dependent, coastal-related, and coastal-enhancing). As discussed in WLU Policy 1.3.1, the District would prioritize allowable uses based on their location and functional dependency to the coast. In addition, future development would be required to establish and maintain ecological buffers of 100 feet between the landside development and saltmarsh to preserve and protect the wetland habitat for the anticipated life of the development (ECO Policy 1.1.5).</p>
<p>Section 30260. Coastal-dependent industrial facilities shall be encouraged to locate or expand within existing sites and shall be permitted reasonable long-term growth where consistent with this division. However, where new or expanded coastal-dependent industrial facilities cannot feasibly be accommodated consistent with other policies of this division, they may nonetheless be permitted in accordance with this section and Sections 30261 and 30262 if (1) alternative locations are infeasible or more environmentally</p>	<p>Consistent. In accordance with ECON Policy 2.3.4, the District would provide coastal-dependent and coastal-related industrial leasing opportunities to support the maritime and marine industry on the Tidelands. Additionally, the District would examine the redevelopment of underused commercial and industrial water and land areas for established and emerging coastal-dependent industries (ECON Policy 3.1.1). As documented throughout this Draft <u>Final</u> PEIR, future development would be required to mitigate potential environmental effects.</p>

Goal, Policy, Objective	PMPU Consistency
damaging; (2) to do otherwise would adversely affect the public welfare; and (3) adverse environmental effects are mitigated to the maximum extent feasible.	
<p>Section 30261. Multicompany use of existing and new tanker facilities shall be encouraged to the maximum extent feasible and legally permissible, except where to do so would result in increased tanker operations and associated onshore development incompatible with the land use and environmental goals for the area. New tanker terminals outside of existing terminal areas shall be situated as to avoid risk to environmentally sensitive areas and shall use a monobuoy system, unless an alternative type of system can be shown to be environmentally preferable for a specific site. Tanker facilities shall be designed to (1) minimize the total volume of oil spilled, (2) minimize the risk of collision from movement of other vessels, (3) have ready access to the most effective feasible containment and recovery equipment for oil spills, and (4) have onshore de-ballasting facilities to receive any fouled ballast water from tankers where operationally or legally required.</p>	<p>Not applicable. The proposed PMPU does not involve the development of new tanker facilities.</p>
<p>Section 30262. a) Oil and gas development shall be permitted in accordance with Section 30260, if the following conditions are met: (1) The development is performed safely and consistent with the geologic conditions of the well site. (2) New or expanded facilities related to that development are consolidated, to the maximum extent feasible and legally permissible, unless consolidation will have adverse environmental consequences and will not significantly reduce the number of producing wells, support facilities, or sites required to produce the reservoir economically and with minimal environmental impacts. (3) Environmentally safe and feasible subsea completions are used when drilling platforms or islands would substantially degrade coastal visual qualities unless use of those structures will result in substantially less environmental risks. (4) Platforms or islands will not be sited where a substantial hazard to vessel traffic might result from the facility or related operations, as determined in consultation with the United States Coast Guard and the Army Corps of Engineers. (5) The development will not cause or contribute to subsidence hazards unless it is determined that adequate measures will be undertaken to prevent damage from such subsidence. (6) With respect to new facilities, all oilfield brines are reinjected into oil-producing zones unless the Division of Oil and Gas, Geothermal</p>	<p>Not applicable. The proposed PMPU does not involve oil and gas development.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Resources of the Department of Conservation determines to do so reduce environmental risks. Exceptions to reinjections will be granted consistent with the Ocean Waters Discharge Plan of the State Water Resources Control Board and where adequate provision is made for the elimination of petroleum odors and water quality problems. (7)(A) All oil produced offshore California shall be transported onshore by pipeline only. The pipelines used to transport this oil shall utilize the best achievable technology to ensure maximum protection of public health and safety and of the integrity and productivity of terrestrial and marine ecosystems. (B) Once oil produced offshore California is onshore, it shall be transported to processing and refining facilities by pipeline. (C) The following guidelines shall be used when applying subparagraphs (A) and (B): (i) "Best achievable technology," means the technology that provides the greatest degree of protection taking into consideration both of the following: (I) Processes that are being developed, or could feasibly be developed, anywhere in the world, given overall reasonable expenditures on research and development. (II) Processes that are currently in use anywhere in the world. This clause is not intended to create any conflicting or duplicative regulation of pipelines, including those governing the transportation of oil produced from onshore reserves. (ii) "Oil" refers to crude oil before it is refined into products, including gasoline, bunker fuel, lubricants, and asphalt. Crude oil that is upgraded in quality through residue reduction or other means shall be transported as provided in subparagraphs (A) and (B). (iii) Subparagraphs (A) and (B) shall apply only to new or expanded oil extraction operations. "New extraction operations" means production of offshore oil from leases that did not exist or had never produced oil, as of January 1, 2003, or from platforms, drilling island, subsea completions, or onshore drilling sites, that did not exist as of January 1, 2003. "Expanded oil extraction" means an increase in the geographic extent of existing leases or units, including lease boundary adjustments, or an increase in the number of well heads, on or after January 1, 2003. (iv) For new or expanded oil extraction operations subject to clause (iii), if the crude oil is so highly viscous that pipelining is determined to be an infeasible mode of transportation, or where there is no feasible access to a pipeline, shipment of crude oil may be permitted over land by other modes of transportation, including trains or trucks, which meet all applicable rules and regulations, excluding any waterborne</p>	

Goal, Policy, Objective	PMPU Consistency
<p>mode of transport. (8) If a state of emergency is declared by the Governor for an emergency that disrupts the transportation of oil by pipeline, oil may be transported by a waterborne vessel, if authorized by permit, in the same manner as required by emergency permits that are issued pursuant to Section 30624. (9) In addition to all other measures that will maximize the protection of marine habitat and environmental quality, when an offshore well is abandoned, the best achievable technology shall be used. b) Where appropriate, monitoring programs to record land surface and near-shore ocean floor movements shall be initiated in locations of new large-scale fluid extraction on land or near shore before operations begin and shall continue until surface conditions have stabilized. Costs of monitoring and mitigation programs shall be borne by liquid and gas extraction operators. c) Nothing in this section shall affect the activities of any state agency that is responsible for regulating the extraction, production, or transport of oil and gas.</p>	
<p>Section 30263. (a) New or expanded refineries or petrochemical facilities not otherwise consistent with the provisions of this division shall be permitted if (1) alternative locations are not feasible or are more environmentally damaging; (2) adverse environmental effects are mitigated to the maximum extent feasible; (3) it is found that not permitting such development would adversely affect the public welfare; (4) the facility is not located in a highly scenic or seismically hazardous area, on any of the Channel Islands, or within or contiguous to environmentally sensitive areas; and (5) the facility is sited so as to provide a sufficient buffer area to minimize adverse impacts on surrounding property. (b) New or expanded refineries or petrochemical facilities shall minimize the need for once-through cooling by using air cooling to the maximum extent feasible and by using treated waste waters from inplant processes where feasible.</p>	<p>Not applicable. The proposed PMPU does not involve new or expanded refineries or petrochemical facilities.</p>
<p>Section 30264. Notwithstanding any other provision of this division, except subdivisions (b) and (c) of Section 30413, new or expanded thermal electric generating plants may be constructed in the coastal zone if the proposed coastal site has been determined by the State Energy Resources Conservation and Development Commission to have greater relative merit pursuant to the provisions of Section 25516.1 than available alternative sites and related facilities for an applicant's service area which have been determined to be acceptable pursuant to the provisions of Section 25516.</p>	<p>Not applicable. The proposed PMPU does not involve new or expanded thermal electric generating plants.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30265. The Legislature finds and declares all of the following: (a) Transportation studies have concluded that pipeline transport of oil is generally both economically feasible and environmentally preferable to other forms of crude oil transport. (b) Oil companies have proposed to build a pipeline to transport offshore crude oil from central California to southern California refineries, and to transport offshore oil to out-of-state refiners. (c) California refineries would need to be retrofitted if California offshore crude oil were to be used directly as a major feedstock. Refinery modifications may delay achievement of air quality goals in the southern California air basin and other regions of the state. (d) The County of Santa Barbara has issued an Oil Transportation Plan which assesses the environmental and economic differences among various methods for transporting crude oil from offshore California to refineries. (e) The Governor should help coordinate decisions concerning the transport and refining of offshore oil in a manner that considers state and local studies undertaken to date, that fully addresses the concerns of all affected regions, and that promotes the greatest benefits to the people of the state.</p>	<p>Not applicable. The proposed PMPU does not involve pipeline transport of oil or the construction of refineries.</p>
<p>Section 30265.5. (a) The Governor, or the Governor's designee, shall coordinate activities concerning the transport and refining of offshore oil. Coordination efforts shall consider public health risks, the ability to achieve short- and long-term air emission reduction goals, the potential for reducing California's vulnerability and dependence on oil imports, economic development and jobs, and other factors deemed important by the Governor, or the Governor's designees. (b) The Governor, or the Governor's designee, shall work with state and local agencies, and the public, to facilitate the transport and refining of offshore oil in a manner which will promote the greatest public health and environmental and economic benefits to the people of the State. (c) The Governor, or the Governor's designee, shall consult with any individual or organization having knowledge in this area, including, but not limited to, representatives from the following: (1) State Energy Resources Conservation and Development Commission (2) State Air Resources Board (3) California Coastal Commission (4) Department of Fish and Game (5) State Lands Commission (6) Public Utilities Commission (7) Santa Barbara County (8) Santa Barbara County Air Pollution Control District (9) Southern California Association of Governments (10) South Coast Air Quality Management Districts (11)</p>	<p>Not applicable. The proposed PMPU does not involve the transport or refining of offshore oil.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Oil industry (12) Public interest groups (13) United States Department of the Interior (14) United States Department of Energy (15) United States Environmental Protection Agency (16) National Oceanic and Atmospheric Administration (17) United States Coast Guard (d) This act is not intended, and shall not be construed, to decrease, duplicate, or supersede the jurisdiction, authority, or responsibilities of any local government, or any state agency or commission, to discharge its responsibilities concerning the transportation and refining of oil.</p>	
California Coastal Act, Chapter 8, Ports	
<p>Section 30700. For purposes of this division, notwithstanding any other provisions of this division except as specifically stated in this chapter, this chapter shall govern those portions of the Ports of Hueneme, Long Beach, Los Angeles, and San Diego Unified Port District located within the coastal zone, but excluding any wetland, estuary, or existing recreation area indicated in Part IV of the coastal plan.</p>	<p>Consistent. Chapter 8 of the CCA includes policies 30700 through 30721, and as documented below, the proposed PMPU would be consistent with Chapter 8 of the CCA.</p>
<p>Section 30701. The Legislature finds and declares that: (a) The ports of the State of California, including the Humboldt Bay Harbor, Recreation, and Conservation District, constitute one of the state's primary economic and coastal resources and are an essential element of the national maritime industry. (b) The location of the commercial port districts within the State of California, including the Humboldt Bay Harbor, Recreation, and Conservation District, are well established, and for many years such areas have been devoted to transportation and commercial, industrial, and manufacturing uses consistent with federal, state and local regulations. Coastal planning requires no change in the number or location of the established commercial port districts. Existing ports, including the Humboldt Bay Harbor, Recreation, and Conservation District, shall be encouraged to modernize and construct necessary facilities within their boundaries in order to minimize or eliminate the necessity for future dredging and filling to create new ports in new areas of the state.</p>	<p>Consistent. Implementation of the proposed PMPU would modernize and construct necessary facilities within the Tidelands in order to minimize or eliminate the necessity for future dredging and filling to create new ports in new areas of the State.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30702. For purposes of this division, the policies of the state with respect to providing for port-related developments consistent with coastal protection in the port areas to which this chapter applies, which require no commission permit after certification of a port master plan and which, except as provided in Section 30715, are not appealable to the commission after certification of a master plan, are set forth in this chapter.</p>	<p>Consistent. As documented throughout this table and the discussion above, the proposed PMPU considers the policies of the State with respect to proposed port-related developments.</p>
<p>Section 30703. The California commercial fishing industry is important to the State of California; therefore, ports shall not eliminate or reduce existing commercial fishing harbor space, unless the demand for commercial fishing facilities no longer exists or adequate alternative space has been provided. Proposed recreational boating facilities within port areas shall, to the extent it is feasible to do so, be designed and located in such a fashion as not to interfere with the needs of the commercial fishing industry.</p>	<p>Consistent. As detailed in ECON Policy 2.1.1, the District would maintain a mix of water and land uses that meet the need of established Tidelands industries and provide opportunities for emerging Public Trust-consistent uses. Existing commercial fishing and recreational boating berthing space would increase under the proposed PMPU by 15 slips and 485 slips, respectively. Additionally, proposed recreational boating facilities in Tidelands would, to the extent feasible, be designed and located in such a fashion so as not to interfere with the needs of the commercial fishing industry (WLU Policy 4.3.5).</p>
<p>Section 30705. (a) Water areas may be diked, filled, or dredged when consistent with a certified port master plan only for the following: (2) New or expanded facilities or waterfront land for port-related facilities. (3) New or expanded commercial fishing facilities or recreational boating facilities. (4) Incidental public service purposes, including, but not limited to, burying cables or pipes or inspection of piers and maintenance of existing intake and outfall lines. (5) Mineral extraction, including sand for restoring beaches, except in biologically sensitive areas. (6) Restoration purposes or creation of new habitat areas. (7) Nature study, mariculture, or similar resource-dependent activities. (8) Minor fill for improving shoreline appearance or public access to the water. (b) The design and location of new or expanded facilities shall, to the extent practicable, take advantage of existing water depths, water circulation, siltation patterns, and means available to reduce controllable sedimentation so as to diminish the need for future dredging. (c) Dredging shall be planned, scheduled, and carried out to minimize disruption to fish and bird breeding and migrations, marine habitats, and water circulation. Bottom sediments or sediment elutriate shall be analyzed for toxicants prior to dredging or mining, and where water quality standards are met, dredge spoils may be deposited in open coastal water sites designated to minimize potential adverse impacts on marine organisms, or in confined coastal waters designated as fill sites by the master plan where such spoil can</p>	<p>Consistent. The proposed PMPU does not identify any planned improvements that would specifically require diking, filling, or dredging. However, should future development occur as part of the proposed PMPU that requires the diking, filling, or dredging of open coastal waters, wetlands, or estuaries, in order to develop new and expanded port facilities, this would only occur only when there is no feasible or less environmentally damaging alternative. In addition, mitigation measures have been identified, which would be implemented by future development to minimize potential adverse environmental effects as detailed in Sections 4.3, 4.7, and 4.8 of this Draft <u>Final</u> PEIR.</p>

Goal, Policy, Objective	PMPU Consistency
<p>be isolated and contained, or in fill basins on upland sites. Dredge material shall not be transported from coastal waters into estuarine or fresh water areas for disposal. (d) For water areas to be diked, filled, or dredged, the commission shall balance and consider socioeconomic and environmental factors.</p>	
<p>Section 30706. In addition to the other provisions of this chapter, the policies contained in this section shall govern filling seaward of the mean high tide line within the jurisdiction of ports:</p> <p>(a) The water area to be filled shall be the minimum necessary to achieve the purpose of the fill. (b) The nature, location, and extent of any fill, including the disposal of dredge spoils within an area designated for fill, shall minimize harmful effects to coastal resources, such as water quality, fish or wildlife resources, recreational resources, or sand transport systems, and shall minimize reductions of the volume, surface area, or circulation of water. (c) The fill is constructed in accordance with sound safety standards which will afford reasonable protection to persons and property against the hazards of unstable geologic or soil conditions or of flood or storm waters. (d) The fill is consistent with navigational safety.</p>	<p>Consistent. The proposed PMPU does not identify any planned improvements that would specifically require diking, filling, or dredging. However, should future development occur as part of the proposed PMPU that requires the diking, filling, or dredging of open coastal waters, wetlands, or estuaries, in order to develop new and expanded port facilities, this would only occur when there is no feasible or less environmentally damaging alternative. In addition, compliance with appropriate water quality regulations and implementation of mitigation measures would ensure the future development does not adversely affect open water habitat function, water quality, wildlife resources, or water circulation, as detailed in Sections 4.3 and 4.8 of this Draft <u>Final</u> PEIR.</p>
<p>Section 30707. New or expanded tanker terminals shall be designed and constructed to do all of the following: (a) Minimize the total volume of oil spilled. (b) Minimize the risk of collision from movement of other vessels. (c) Have ready access to the most effective feasible oil spill containment and recovery equipment. (d) Have onshore deballasting facilities to receive any fouled ballast water from tankers where operationally or legally required.</p>	<p>Not applicable. The proposed PMPU does not involve the construction of new or expanded tanker terminals.</p>
<p>Section 30708. All port-related developments shall be located, designed, and constructed so as to:</p> <p>(a) Minimize substantial adverse environmental impacts.</p> <p>(b) Minimize potential traffic conflicts between vessels.</p>	<p>Consistent. As documented throughout this Draft <u>Final</u> PEIR, the proposed PMPU would minimize substantial adverse environmental impacts through the implementation of mitigation measures and PMPU policies.</p> <p>Consistent. Projects involving future development of waterside uses would be designed in coordination with the District's Maritime Department and the San Diego Bay Pilots Association to ensure that operation of expanded marinas would not adversely affect existing navigation routes for water taxi/ ferries, shipping vessels, cruise ships, military vessels, recreational boats, etc. Additionally, the Harbor Safety Plan provides mariners with specific information on key issues and initiatives that affect vessel safety in San Diego Bay. The use of the Harbor Safety Plan, in conjunction with required vessel navigation and</p>

Goal, Policy, Objective	PMPU Consistency
(c) Give the highest priority to the use of existing land space within harbors for port purposes, including, but not limited to, navigational facilities, shipping industries, and necessary support and access facilities.	safety standards, would minimize potential traffic conflicts between vessels.
(d) Provide for other beneficial uses consistent with the public trust, including, but not limited to, recreation and wildlife habitat uses, to the extent feasible.	Consistent. As discussed in WLU Objective 1.2, the proposed PMPU would identify each land use's functional dependency to the water, consistent with the CCA priorities (coastal-dependent, coastal-related, and coastal-enhancing). As discussed in WLU Policy 1.3.1, the District would prioritize allowable uses based on their location and functional dependency to the coast. The <i>TAMT Redevelopment Plan</i> includes a variety of infrastructure investments that may be undertaken over the long term to accommodate an increase of the terminal's capabilities and capacity (Resolution 2016-200; UPD# EIR-2015-39; SCH# 2015031046; Clerk Document No. 66093). Other ship building activities in PD4 could potentially continue through the life of the proposed PMPU. The proposed PMPU does not change the area designated with marine-related industrial uses in any substantive way that would preclude the continued operation of these uses.
(e) Encourage rail service to port areas and multicompany use of facilities.	Consistent. As identified in WLU Policy 5.1.3, all development shall be located, designed, and constructed to provide for other benefits consistent with the Public Trust, including improved recreational opportunities in the public realm, such as Recreation Open Space that is adjacent to the water's edge, or the conservation of adjacent wildlife habitat areas.
Section 30710. Within 90 days after January 1, 1977, the commission shall, after public hearing, adopt, certify, and file with each port governing body a map delineating the present legal geographical boundaries of each port's jurisdiction within the	Consistent. Transit services that serve Tidelands include local and express buses, a trolley, heavy passenger rail, and commuter rail. In accordance with Mobility Objective 1.2 and subsequent policies, the District would implement a series of interconnecting mobility hubs throughout the Tidelands. Regional Mobility Hubs would provide a direct connection to a regional transit stop, such as a trolley stop or bus stop, and a bayfront circulator stop. In addition, freight rail services are provided to the working waterfront areas, largely by BNSF Railways. Furthermore, the TAMT Redevelopment Plan includes a Demolition and Initial Rail Component, which includes on-terminal rail upgrades that would encourage rail use at TAMT to provide rail service to port areas and multicompany use of facilities.
	Not Applicable. This section identifies CCC responsibilities.

Goal, Policy, Objective	PMPU Consistency
<p>coastal zone. The Commission shall, within such 90-day period, adopt and certify after public hearing, a map delineating boundaries of any wetland, estuary, or existing recreation area indicated in Part IV of the coastal plan within the geographical boundaries of each port.</p>	
<p>Section 30711. (a) A port master plan that carries out the provisions of this chapter shall be prepared and adopted by each port governing body, and for informational purposes, each city, county, or city and county which has a port within its jurisdiction shall incorporate the certified port master plan in its local coastal program. A port master plan shall include all of the following: (1) The proposed uses of land and water areas, where known. (2) The projected design and location of port land areas, water areas, berthing, and navigation ways and systems intended to serve commercial traffic within the area of jurisdiction of the port governing body. (3) An estimate of the effect of development on habitat areas and the marine environment, a review of existing water quality, habitat areas, and quantitative and qualitative biological inventories, and proposals to minimize and mitigate any substantial adverse impact. (4) Proposed projects listed as appealable in Section 30715 in sufficient detail to be able to determine their consistency with the policies of Chapter 3 (commencing with Section 30200) of this division. (5) Provisions for adequate public hearings and public participation in port planning and development decisions. (b) A port master plan shall contain information in sufficient detail to allow the commission to determine its adequacy and conformity with the applicable policies of this division.</p>	<p>Consistent. The District currently has a certified PMP, which would be amended with adoption of the proposed PMPU. As proposed, the PMPU includes sections required by this section of the CCA, including an identification of water and land uses and a list planned improvements that qualify as “appealable” per Section 30715 of the CCA. This Draft <u>Final</u> PEIR provides an estimate of the effects of future development on habitat areas, the marine environment, and water quality. The proposed PMPU identifies appealable projects with sufficient detail to allow the CCC to determine their adequacy and conformity with the applicable policies of Chapter 3 of the CCA.</p>
<p>Section 30712. In the consideration and approval of a proposed port master plan, the public, interested organizations, and governmental agencies shall be encouraged to submit relevant testimony, statements, and evidence which shall be considered by the port governing body. The port governing body shall publish notice of the completion of the draft master plan and submit a copy thereof to the commission and shall, upon request, provide copies to other interested persons, organizations, and governmental agencies. Thereafter, the port governing body shall hold a public hearing on the draft master plan not earlier than 30 days and not later than 90 days following the date the notice of completion was published.</p>	<p>Consistent. The proposed PMPU was circulated in both April 2019 and October 2020, to allow the public, interested organizations, and governmental agencies to comment on and submit relevant testimony, statements, and evidence to the District. The District will publish a notice of completion for the draft PMPU <u>no less than 30 to 90</u> days before the draft PMPU (as well as this <u>Final</u> PEIR) is anticipated to be presented to the Board of Port Commissioners for adoption. A public hearing by the Board of Port Commissioners will be held not earlier than 30 days and not later than 90 days following the date of the notice of completion.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Section 30714. After public notice, hearing, and consideration of comments and testimony received pursuant to Sections 30712 and 30713, the port governing body shall adopt its master plan and submit it to the commission, after public hearing, shall certify the plan or portion of a plan and reject any portion of a plan which is not certified. The commission may not modify the plan as submitted as the condition of certification. If the commission rejects any portion of a plan, it shall base that rejection upon written findings of fact and conclusion of law. If the commission fails to take action within the 90-day period, the port master plan shall be deemed certified. The commission shall certify the plan, or portion of a plan, if the commission finds both of the following: (a) The master plan, or certified portions thereof, conforms with and carries out the policies of this chapter. (b) Where a master plan, or certified portions thereof, provide for any of the developments listed as appealable in Section 30715, the development or developments are in conformity with all the policies of Chapter 3 (commencing with Section 30200).</p>	<p>Consistent. The District will follow the procedures outlined in this section.</p>
<p>Section 30715. (a) Until such time as a port master plan or any portion thereof has been certified, the commission shall permit developments within ports as provided for in Chapter 7 (commencing with Section 30600). After a port master plan or any portion thereof has been certified, the permit authority of the commission provided in Chapter 7 (commencing with Section 30600) shall no longer be exercised by the commission over any new development contained in the certified plan or any portion thereof and shall at that time be delegated to the appropriate port governing body, except that approvals of any of the following categories of development by the port governing body may be appealed to the commission: (1) Developments for the storage, transmission, and processing of liquefied natural gas and crude oil in such quantities as would have a significant impact upon the oil and gas supply of the state or nation or both the state and nation. A development which has a significant impact shall be defined in the master plans. (2) Wastewater treatment facilities, except for those facilities which process wastewater discharged incidental to normal port activities or by vessels. (3) Roads or highways which are not principally for internal circulation within the port boundaries. (4) Office and residential buildings not principally devoted to the administration of activities within the port; hotels, motels, and shopping facilities not principally devoted to the sale of commercial goods</p>	<p>Consistent. Any development occurring prior to certification of the proposed PMPU would be considered for approval under the provisions of the currently certified PMP.</p>

Goal, Policy, Objective	PMPU Consistency
<p>utilized for water-oriented purposes; commercial fishing facilities; and recreational small craft marina related facilities. (5) Oil refineries. (6) Petrochemical production plants. (b) If maintenance dredging is part of, or is associated with, any category of development specified in paragraphs (1) to (6), inclusive, of subdivision (a), the commission shall not consider that maintenance dredging in its review and approval of those categories.</p>	
<p>Section 30716. (a) A certified port master plan may be amended by the port governing body, but an amendment shall not take effect until it has been certified by the commission. Any proposed amendment shall be submitted to, and processed by, the commission in the same manner as provided for submission and certification of a port master plan. (b) The commission shall, by regulation, establish a procedure whereby proposed amendments to a certified port master plan may be reviewed and designated by the executive director of the commission as being minor in nature and need not comply with Section 30714. These amendments shall take effect on the 10th working day after the executive director designates such amendments as minor. (c)(1) The executive director may determine that a proposed certified port master plan amendment is de minimis if the executive director determines that the proposed amendment would have no impact, either individually or cumulatively, on coastal resources, is consistent with the policies of Chapter 3 (commencing with Section 30200), and meets the following criteria: (A) The port governing body, at least 21 days prior to the date of submitting the proposed amendment to the executive director, has provided public notice, and provided a copy to the commission, which specifies the dates and places where comments will be accepted on the proposed amendment, contains a brief description of the proposed amendment, and states the address where copies of the proposed amendment are available for public review, by one of the following procedures: (i) Publication, not fewer times than required by Section 6061 of the Government Code, in a newspaper of general circulation in the area affected by the proposed amendment. If more than one area will be affected, the notice shall be published in the newspaper of largest circulation from among the newspapers of general circulation in those areas. (ii) Posting of the notice by the port governing body both onsite and offsite in the area affected by the proposed amendment. (iii) Direct mailing to the owners and occupants of contiguous property shown on the latest equalized</p>	<p>Consistent. As documented in Section 3.5, <i>PMPU Review and Approvals</i>, of Chapter 3 of this Draft <u>Final</u> PEIR, the District will submit the proposed PMPU to the CCC for certification and final action.</p>

Goal, Policy, Objective	PMPU Consistency
<p>assessment roll. (B) The proposed amendment does not propose any change in land use or water uses or any change in the allowable use of property.</p> <p>(2) At the time that the port governing body submits the proposed amendment to the executive director, the port governing body shall also submit to the executive director any public comments that were received during the comment period provided pursuant to subparagraph (A) of paragraph (1).</p> <p>(3)(A) The executive director shall make a determination as to whether the proposed amendment is de minimis within 10 working days from the date of submittal by the local government. If the proposed amendment is determined to be de minimis, the proposed amendment shall be noticed in the agenda of the next regularly scheduled meeting of the commission, in accordance with Section 11125 of the Government Code, and any public comments forwarded by the port governing body shall be made available to the members of the commission. (B) If three members of the commission object to the executive director's determination that the proposed amendment is de minimis, the proposed amendment shall be set for public hearing in accordance with the procedures specified in subdivision (a) or, at the request of the port governing body, returned to the port governing body. If set for public hearing under subdivision (a), the time requirements set by this section and Section 30714 shall commence from the date on which the objection to the de minimis designation was made. (C) If three or more members of the commission do not object to the de minimis determination, the de minimis amendment shall become a part of the certified port master plan 10 days from the date of the commission meeting. (4) The commission may, after a noticed public hearing, adopt guidelines to implement this subdivision, which shall be exempt from review by the Office of Administrative Law and from Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code. The commission shall file any guidelines adopted pursuant to this paragraph with the Office of Administrative Law.</p>	
<p>Section 30717. The governing bodies of ports shall inform and advise the commission in the planning and design of appealable developments authorized under this chapter, and prior to commencement of any appealable development, the governing body of a port shall notify the commission and other interested persons, organizations, and governmental agencies of the approval of a proposed appealable</p>	<p>Consistent. The District will follow the procedures outlined in this section for appealable projects, which have been identified for each planning district in Chapter 5 of the proposed PMPU.</p>

Goal, Policy, Objective	PMPU Consistency
<p>development and indicate how it is consistent with the appropriate port master plan and this division. An approval of the appealable development by the port governing body pursuant to a certified port master plan shall become effective after the 10th working day after notification of its approval, unless an appeal is filed with the commission within that time. Appeals shall be filed and processed by the commission in the same manner as appeals from local government actions as set forth in Chapter 7 (commencing with Section 30600) of this division. No appealable development shall take place until the approval becomes effective.</p>	
<p>Section 30718. For developments approved by the commission in a certified master plan, but not appealable under the provisions of this chapter, the port governing body shall forward all environmental impact reports and negative declarations prepared pursuant to the Environmental Quality Act of 1970 (commencing with Section 21000) or any environmental impact statements prepared pursuant to the National Environmental Policy Act of 1969 (42 U.S.C. 4321, et seq.) to the commission in a timely manner for comment.</p>	<p>Consistent. The District has consistently submitted, and will continue to submit, environmental impact reports and negative declarations for non-appealable projects to the CCC for review and comment.</p>
<p>Section 30719. Any development project or activity authorized or approved pursuant to the provisions of this chapter shall be deemed certified by the commission as being in conformity with the coastal zone management program insofar as any such certification is requested by any federal agency pursuant to the Federal Coastal Zone Management Act of 1972 (16 U.S.C. 1451, et seq.), National Oceanic and Atmospheric Administration, and memoranda of understanding between the state and federal governments relative thereto.</p>	<p>Not Applicable. The District is not subject to this section of the CCA because it is not located on Federal land.</p>
<p>Section 30720. If the application of any port master plan or part thereof is prohibited or stayed by any court, the permit authority provided for in Chapter 7 (commencing with Section 30600) shall be reinstated in the commission. The reinstated permit authority shall apply as to any development which would be affected by the prohibition or stay.</p>	<p>Consistent. The District will follow the procedures outlined in this section, as applicable.</p>
<p>Section 30721. (a) The Legislature recognizes that Port Hueneme is unique in its relationship to the coast in that it is the only deep water port operated by a harbor district, and is without access to city or county funds. Therefore, the governing body of Port Hueneme may claim reimbursement of costs it incurs in the preparation and certification of a port master plan as required by this chapter. (b) Prior to submitting any claim for reimbursement, the governing body of the port shall submit its proposed</p>	<p>Not applicable. The proposed PMPU does not involve Port Hueneme.</p>

Goal, Policy, Objective	PMPU Consistency
<p>claims to the executive director of the commission for review and approval and shall provide adequate documentation to enable the executive director to make the following determinations: (1) That the work done was directly attributable to the operation of this chapter. (2) That the work done is reasonably related to, and appears to be necessary for, the preparation of a certifiable port master plan for the geographic area within the port's jurisdiction as identified by the commission pursuant to Section 30710. (3) That the governing body of a port is not reimbursed for the costs of the work from any other source. The executive director of the commission shall, within 60 days after receipt of the necessary information, approve the proposed claim, if the director can make the determinations set forth in this subdivision. (c) After a proposed claim has been reviewed and approved by the executive director of the commission pursuant to subdivision (b), the governing body of the port may submit its claim for reimbursement to the Controller who shall then process and pay any such claim as provided for in Section 2231 of the Revenue and Taxation Code.</p>	
SANDAG's Regional Plan	
<p>Focus growth in areas that are already urbanized, allowing the region to set aside and restore more open space in our less developed areas.</p>	<p>Consistent. The proposed PMPU area is located within three cities that are classified as urban locations. Therefore, all land development would occur in urbanized areas. Some water uses could be located offshore from those urbanized areas and may provide transitional structures to connect land uses to the potential, future water uses, such as piers, docks, marinas and mobility hubs, water-based transfer points, and boat slips. slips. Furthermore, ECO Policy 1.1.2 directs the District to prioritize and pursue opportunities for the protection, restoration, creation, and enhancement of sensitive habitats and State and Federally listed coastal species, which, per ECO Policies 1.1.13, 1.1.15, 1.1.21, 1.1.22, and 1.1.23, would involve identifying locations for preservation and protection for of sensitive habitat. The increase in the water area designated for conservation area as well as these policies would further ensure that undeveloped water areas would be set aside and restored.</p>
<p>Protect and restore our region's urban canyons, coastlines, beaches, and water resources.</p>	<p>Consistent. The proposed PMPU area does not contain any urban canyon areas. However, the proposed PMPU would not involve any development at beaches or coastlines within PD8, Kellogg Beach in PD1, and the beach area in Spanish Landing Park in PD2. In addition, protection and restoration of water resources is</p>

Goal, Policy, Objective	PMPU Consistency
Invest in transportation projects that provide access for all communities to a variety of jobs with competitive wages.	<p>emphasized in the proposed PMPU in the Ecology Element in ECO Policy 2.1.1 through ECO Policy 3.2.4.</p> <p>Consistent. As discussed in Section 4.11, <i>Population and Housing</i>, there are many competitive jobs within the proposed PMPU area, and much of the proposed PMPU area is adjacent to higher intensity areas, including Downtown San Diego, which also include a high concentration of various jobs with competitive wages. The proposed PMPU would implement mobility hubs throughout the proposed PMPU area, which are intended to serve both visitors and employees as they access and travel throughout Tidelands. Regional Mobility Hubs would provide a direct connection to a regional transit stop, such as a trolley or bus stop, and incorporation of a bayfront circulator stop, all of which would encourage the use of transit. Additionally, these mobility hubs would connect to water-based access points throughout the Bay, where feasible. In addition, the proposed PMPU would improve access to and circulation within the proposed PMPU area by implementing mobility hubs throughout the proposed PMPU area, which would provide connections to bicycle and pedestrian facilities and amenities. In addition, the proposed PMPU would include modifications to existing roadways in order to incorporate multi-modal options, such as bicycle and pedestrian paths.</p>
Build infrastructure that makes the movement of freight in our community more efficient and environmentally friendly.	<p>Consistent. As discussed in Mobility Goal 2 and subsequent policies, the District would provide an integrated, efficient, diverse, and sustainable network that facilitates the movement of goods. Goods Movement Standards are incorporated into the development standards of the proposed PMPU and address requirements specific to truck routes, shipyards, freight movement and shipping, goods conveyance, and parking. In addition, roadway improvements identified in the proposed PMPU also incorporate an information technology system and signalization improvements that can be modified or adjusted during peak and nonpeak hours to better accommodate traffic demand (see Roadway Improvements for PD4). Furthermore, the District would seek investment and grant opportunities for infrastructure, equipment, and technologies that enable the District's marine terminals to efficiently transfer goods, as well as collaborate with public and private entities to invest in terminal infrastructure that supports the optimization of cargo movement.</p>

Goal, Policy, Objective	PMPU Consistency
<p>Make transportation investments that result in cleaner air, environmental protection, conservation, efficiency, and sustainable living.</p>	<p>Consistent. The PMPU proposes implementation of new mobility hubs and roadway modifications to increase multi-modal transportation options, including increased use of transit, and improved bicycle and pedestrian accessibility. As noted above, the proposed PMPU area is generally located proximally to public transit services. The PMPU proposes numerous policies aimed at reducing greenhouse gas and air pollution emissions, including ECO Policy 3.1.2 through ECO Policy 3.1.5, which involve implementation of clear air action measures, advancement of maritime clean air strategies, implementation of clean vessel technologies, and financing programs to implement recommended clean air measures. In addition, as described in Sections 4.2 and 4.14 of this Draft <u>Final</u> PEIR, mitigation measures have been identified to reduce air quality and VMT impacts, respectively. As documented throughout this Draft <u>Final</u> PEIR, the proposed PMPU would minimize substantial adverse environmental impacts through the implementation of mitigation measures. The District would coordinate with permittees to provide infrastructure that supports a mix of water and land uses, including the needs of established Tidelands industries and emerging Public Trust-consistent businesses, while also providing environmental benefit (ECON Policy 2.1.2). Additionally, the District would engage with stakeholders, such as railway companies, trucking companies, cargo and freight shipping lines, and service providers, to identify and implement feasible sustainable freight strategies in accordance with the District's environmental and operational regulations and plans and the State's sustainability objectives.</p>
<p>Support energy programs that promote sustainability.</p>	<p>Consistent. The proposed PMPU requires permittees to implement new technology where possible to incorporate clean air action measures, which may include vehicles, vessels, and advanced technologies powered by alternative fuels or electric powered (ECO Policy 3.1.2). Additionally, the District would require permittees to implement infrastructure and clean vessel technologies, for both while in transit and at berth, such as advancing alternative fuels and expansion of marine terminal electrification, when applicable (ECO Policy 3.1.4). As new opportunities and technologies become available in the areas of renewable energy, battery storage, and electrification of mobile sources, the District would actively seek to advance programs and projects</p>

Goal, Policy, Objective	PMPU Consistency
Provide safe, secure, healthy, affordable, and convenient travel choices between the places where people, live, and play.	<p>that reduce emissions in partnership with its tenants and other stakeholder agencies.</p> <p>Consistent. The policies in the Environmental Justice Element emphasize the District's commitment to coastal access, public participation, and a healthy environment through: improved mobility and transit linkages from adjacent disadvantaged communities throughout Tidelands and additional free and lower cost recreational opportunities; greater opportunities to participate in the District's planning and decision-making processes; reduced pollution, which may disproportionately affect disadvantaged communities; and enhanced collaboration locally and regionally, as well as deepening relationships with indigenous communities, so that all communities are cleaner and thriving places to work, live, and play. The proposed PMPU would implement mobility hubs throughout the proposed PMPU area, which would provide connections to bicycle and pedestrian facilities and amenities. Regional Mobility Hubs would provide a direct connection to a regional transit stop, encouraging the use of transit in communities. The implementation of these transportation improvements would support the development of healthy and sustainable communities.</p>
Take advantage of new technologies to make the transportation system more efficient and accessible.	<p>Consistent. As noted above, implementation of the proposed PMPU would involve installation of a number of mobility hubs, including Regional Mobility Hubs, Local Gateway Mobility Hubs, and Connector Mobility Hubs, which have specific siting and amenities criteria in order to increase the reliability and convenience of multi-modal travel options. Another intent of the mobility hubs is to consolidate public parking to allow on-street or surface parking lots to be repurposed into Recreation Open Space uses. Planned improvements discussed in Chapter 5 of the proposed PMPU involve roadway modifications that would seek to create more efficient circulation and efficiently accommodate vehicular traffic. Roadway improvements in the proposed PMPU would incorporate an information technology system and signalization improvements that can be modified or adjusted during peak and nonpeak hours to better accommodate traffic demand (see Roadway Improvements for PD4). Additionally, in accordance with Mobility Policy 2.2.5, the District—in coordination with permittees of development, tenants, adjacent jurisdictions, and regional transportation agencies—would maintain and develop improvements to linkages between the</p>

Goal, Policy, Objective	PMPU Consistency
<p>Collaborate with Native American tribes, Mexico, military bases, neighboring counties, infrastructure providers, the private sector, and local communities to design a transportation system that connects to the mega-region and national network, works for everyone, and fosters a high quality of life for all.</p>	<p>marine terminals and landside networks, including roadways, to enable efficient movement of goods along those networks and to support the working waterfront.</p> <p>Consistent. The District does not have jurisdiction over regional transportation facilities that would provide direct connection to Mexico or neighboring counties. However, the proposed PMPU includes mobility options within the proposed PMPU area, such as Regional Mobility Hubs that are intended to improve connectivity with regional transit stops, encouraging the use of transit in communities. In addition, in accordance with EJ Objective 2.2 and subsequent policies, the District would provide meaningful engagement opportunities for disadvantaged and indigenous communities <u>and tribes</u>, to participate in the District’s planning and public involvement processes. This would include ensuring that the expressed concerns of people from disadvantaged and indigenous communities <u>and tribes</u> are acknowledged and considered as part of the District’s planning and development decisions (EJ Policy 2.2.1). Additionally, the proposed PMPU expressly includes goals and policies that support the collaboration and planning of interconnected transportation networks for in part, military operations. The Mobility Element addresses the maintenance of the Strategic Highway Network (STRAHNET) for military mobilization and deployment of the military personnel and materiel. This is found within the Mobility Element at Goal 3 and its relevant objectives and policies. The Mobility Element Purpose (Section 3.2.1 of the Mobility Element) describes the District maintaining and enhancing travel options and an interconnected mobility network in part, for the future demands of the military.</p>
<p>As we plan for our region, recognize the vital economic, environmental, cultural, and community linkages between the San Diego region and Baja California.</p>	<p>Not Applicable. The District’s jurisdiction is limited to the Tidelands, and the proposed PMPU does not specifically address linkages between San Diego and Baja California. However, as detailed in the Environmental Justice Element, the proposed PMPU encourages enhanced collaboration locally and regionally and deepening relationships with indigenous communities so that all communities are cleaner and thriving places to work, live, and play. While the goals and policies are not specific to links between San Diego and Baja California, they do promote greater inclusivity for the benefit of all stakeholder communities</p>

Goal, Policy, Objective	PMPU Consistency
Create great places for everyone to live, work, and play.	Consistent. The proposed PMPU directs the District to plan, design, and implement a comprehensive waterfront open space network that provides access to and throughout the public realm. These include facilities, such as parks and waterside amenities, as well as public fishing piers, launch areas for motorized and nonmotorized watercraft, and overnight accommodations. As discussed in the Environmental Justice Element of the proposed PMPU, development would provide a range of free and lower cost recreational facilities throughout Tidelands that are accessible to disadvantaged communities. Additionally, the District, or CDPs issued by the District— would maintain and, where feasible, expand free and lower cost recreational facilities, such as recreational fishing, parks, or viewing piers, on Tidelands adjacent to Portside and Tidelands Border Communities. In accordance with the Economics Element, the District shall continue to reinvest lease revenues to support financing and maintenance of public improvements in alignment with CCA obligations, including lower cost visitor serving and recreational facilities such as parks, promenades, public piers, and public art. In addition, WLU Goal 6 and subsequent objectives and policies would expand the collection of lower cost visitor and recreational facilities available to the public. Planning District 2 and PD3 identify planned improvements that would include up to approximately 1,900 lower cost overnight accommodations. Expansion of mobility hubs and roadway modifications to increase multi-modal transportation options would ensure access to jobs, services, and recreation within the Tidelands.
Connect communities through a variety of transportation choices that promote healthy lifestyles, including walking and biking.	Consistent. The PMPU proposes implementation of new mobility hubs and roadway modifications to increase multi-modal transportation options, including increased use of transit as well as improved bicycle and pedestrian accessibility.
Increase the supply and variety of housing types – affordable for people of all ages and income levels in areas with frequent transit service and with access to a variety of services.	Not Applicable. As discussed in Section 4.11, the proposed PMPU does not propose residential development within the proposed PMPU area because residential use is not an allowable use on the Tidelands.

Impacts of Proposed PMPU Element Policies

None of the proposed PMPU policies would result in impacts related to a conflict with a land use plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect. Instead, as documented in Table 4.9-1, policies proposed in the PMPU would promote

consistency with applicable plans, policies, and regulations adopted for the purposes of avoiding or mitigating an environmental effect.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not cause a significant environmental impact due to a conflict with a plan, policy, or regulation adopted for the purposes of avoiding or mitigating an environmental effect. Impacts would be less than significant.

4.9.5 Cumulative Impact Analysis

Cumulatively considerable impacts from past, present, and probable future projects are determined by whether there are cumulative inconsistencies with the applicable land use plans that have resulted or will result in significant physical impacts or by the past, present, or future physical division of established communities.

4.9.5.1 Geographic Scope

The geographic scope of analysis for cumulative land use and planning impacts to which the proposed PMPU may contribute includes the San Diego Region. This analysis considers a number of the plans and programs listed in Table 2-2.

4.9.5.2 Cumulative Effects

Table 2-2 includes past, present, and probable future plans and programs in the vicinity of the proposed PMPU area.

Past projects within the Downtown area have been subject to local regulations governing land use decisions and have resulted in the development of a highly urbanized metropolitan city center. Throughout the development of past projects, the Downtown area has generally maintained its street grid system and has not resulted in the division of a neighborhood. The District's existing PMP, as amended, has been certified by the CCC, and all past development projects within District's jurisdiction have been approved pursuant to the adopted PMP, ensuring review and general conformity with the coastal zone management program. Since adoption and certification of the current PMP, there have been cases where PMP amendments were required to implement various development projects. However, these amendments have undergone District review and environmental review and District approval, and have been certified by the CCC, when required. As a result, impacts from past projects have not been cumulatively significant.

The National City Bayfront Projects and Plan Amendments EIR, the Chula Vista Bayfront Master Plan project, the Seaport San Diego project, and the Wetland Mitigation Bank at Pond 20 project are located within the District's jurisdiction. The other plans and programs in Table 2-2 are either approved or in preparation in adjacent jurisdictions. The Midway-Pacific Highway Community Plan Update, the City of Imperial Beach 2019 General Plan/Local Coastal Program Land Use Plan Update, the San Diego International Airport Development Plan, the San Diego County Regional Airport Authority NAS North Island Airport Land Use Compatibility Plan, and the SANDAG 2021 Regional Plan are all located either within or adjacent to the proposed PMPU area. As such, because the street system in Downtown San Diego is established and none of the current or probable future plans

propose changes to the circulation system, and current cumulative projects and probable future projects in the Downtown area would be required to demonstrate consistency with the San Diego Downtown Community Plan, it is not expected that these projects would physically divide the established Downtown neighborhood. The Cities of Coronado and Imperial Beach are primarily developed, and future plans would not physically divide the established existing neighborhoods.

Within the District's jurisdiction, public access and use of the waterfront continues to be a priority. Proposed plans are held to strict standards and consistency with the PMP, in terms of public access. Proposed plans would be required to demonstrate consistency with public access requirements of the PMP. Consequently, there are no current or probable future development plans within the proposed PMPU's cumulative geographic scope that would physically divide an established community or result in a land use inconsistency. Therefore, cumulative land use and planning impacts associated with past, present, and probable future projects are less than significant.

4.9.5.3 Project Contribution

The proposed PMPU would facilitate the construction of future visitor-serving uses within the proposed PMPU area, such as new hotels and lower cost accommodations, restaurants and entertainment venues, park space and promenades, retail, convention and meeting space, office space, and other uses. As discussed in Section 4.9.4.4 above, future development under the proposed PMPU, including Options 1, 2, and 3, would not physically divide an established community and impacts would be less than significant and not make cumulatively considerable contribution to cumulative impacts. Additionally, the proposed land use changes under the proposed PMPU would not result in uses that would be incompatible with existing PMP land uses within the District's jurisdiction or surrounding areas. As demonstrated previously, the proposed PMPU would be consistent with all applicable policies in the governing land use documents, and impacts would be less than significant.

As noted above, a cumulatively significant land use impact does not exist, and the proposed PMPU would not make cumulatively considerable contribution to cumulative impacts such that a cumulatively significant impact would be created. The proposed PMPU's contribution to inconsistencies with land use and planning policies would be less than cumulatively considerable.

4.9.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's incremental contribution to cumulative land use and planning impacts would not be cumulatively considerable and would be less than significant.

Section 4.10 Noise and Vibration

4.10.1 Overview

This section describes the existing conditions and laws and regulations related to noise and vibration. The section also discusses the proposed Port Master Plan Update's (PMPU's) potential to increase noise and vibration in the vicinity during construction and operation. Noise and vibration impacts related to private airport/airstrips were analyzed in Section XII of the proposed PMPU's Initial Study/Environmental Checklist (Appendix A) and were determined to be less than significant. The analysis and conclusions regarding these impacts are included in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*.

Table 4.10-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.10.6.4, *Project Impacts and Mitigation Measures*.

Table 4.10-1. Summary of Significant Noise and Vibration Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-NOI-1: Exceed Noise Thresholds at Parks During Construction	All planning districts	MM-NOI-1: Notify Users of Impacted Parks	Less than Significant	Mitigation would enable park users to avoid excessive noise and utilize similar alternative parks in the vicinity.
Impact-NOI-2: Exceed Noise Thresholds at Other Noise-Sensitive Receptors During Construction	All planning districts	MM-NOI-2: Avoid or Reduce Construction Noise from Pile Driving MM-NOI-3: Implement General Best Practices for Construction Noise Abatement MM-NOI-4: Install Temporary Noise Barriers to Shield Noise-Sensitive Receptors from Excessive Construction Noise Levels	Significant and Unavoidable	Because the design and location of future development projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts.
Impact-NOI-3: Exceed Local Noise Limits for Construction	All planning districts	MM-NOI-5: Prohibit Exterior Construction Activities Outside of the Permitted Construction Hours	Significant and Unavoidable	Because the design and location of future development projects allowed under the proposed PMPU are unknown at this time,

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
During Prohibited Hours				it is not possible to determine the extent to which construction activity may be feasibly constrained to the locally-permitted construction hours.
Impact-NOI-4: Excessive Traffic Noise Increases on Existing Roadways Above Local Standards	PD2 and PD3	MM-NOI-6: Conduct Project-Specific Traffic Noise Analyses for Projects that Would Double the Traffic Volume on One or More Affected Streets	Significant and Unavoidable	Because the timing and location of specific impacts due to projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent MM-NOI-6 would be feasible and effective in abating or reducing the impacts.
Impact-NOI-5: Substantial Traffic Noise Increases Due to Roadway Improvements and Modifications	PD1, PD2, PD3, and PD4	MM-NOI-7: Design Roadway Improvement and Modification Projects to Avoid Noise Increases Greater than 3 dB CNEL	Significant and Unavoidable	Because the design and location of future roadway improvement and modification projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent MM-NOI-7 would be feasible and effective in abating or reducing the impacts.
Impact-NOI-6: Significant Noise Impact from Regional Mobility Hubs	PD2 and PD3	MM-NOI-8: For Regional Mobility Hubs Within 125 Feet of Noise-Sensitive Receptors, Design and Construct Facilities to Control Noise from New Sources Such as Parking Lots	Significant and Unavoidable	Because the design and location of future regional mobility hub projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent MM-NOI-8 would be feasible and effective in abating or reducing the impacts.

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-NOI-7: Exceed Local Noise Limits for Commercial Developments	PD1, PD2, PD3, PD4, PD8, PD9, and PD10	MM-NOI-9: Design, and Construct, <u>and Operate</u> New Commercial Uses to Control Noise from All Onsite Equipment and Activities	Significant and Unavoidable	Because the design and location of future commercial projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent MM-NOI-9 would be feasible and effective in abating or reducing the impacts.
Impact-NOI-8: Exceed Local Noise Limits for Outdoor Use Areas and Outdoor Special Events	PD1, PD2, PD3, PD8, PD9, and PD10	MM-NOI-10: Design and Operate Outdoor Activity Areas to Control Operational Noise MM-NOI-11: Incorporate Operational/Contract Specifications to Minimize Exterior Special Event Noise and Regulate Special Events at New Parks	Significant and Unavoidable	Because the design and location of future outdoor activity areas and the details of outdoor special events allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts.
Impact-NOI-9: Exceed Caltrans Guideline Criteria for Potential Building Damage During Construction	All planning districts	MM-NOI-12: Avoid or Reduce Potentially Damaging Vibration at Nearby Buildings from Project Construction	Less than Significant	MM-NOI-12 would avoid or minimize groundborne vibration affecting nearby buildings and repair any damage caused by project construction.
Impact-NOI-10: Exceed Caltrans Guideline Criteria for Potential Human Annoyance at Sensitive Receptors During Project Construction	All planning districts	MM-NOI-13: Avoid or Reduce Potentially Annoying Vibration at Occupied Sensitive Buildings During Project Construction	Significant and Unavoidable	MM-NOI-13 would reduce impacts; however, it may not be possible to fully implement this measure and reduce groundborne vibration to less than “barely perceptible” (0.04 in/s PPV) at all nearby sensitive receptors due to the

* PD5 and PD6 are not considered in this table because they are not addressed in the proposed PMPU.

4.10.2 Noise Fundamentals

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air or water) to a hearing organ, such as a human ear. Noise is often defined as sound that is objectionable because it is unwanted, disturbing, or annoying.

In the science of acoustics, the fundamental model consists of a sound (or noise) source, a receptor, and the propagation path between the two. The loudness of the noise source and the obstructions or atmospheric factors, which affect the propagation path to the receptor, determine the sound level and the characteristics of the noise perceived by the receptor.

The following sections provide an explanation of key concepts and acoustical terms used in the analysis of environmental and community noise. Some of these concepts are also applicable to underwater noise, which is discussed further in Section 4.3, *Biological Resources*.

4.10.2.1 Frequency, Amplitude, and Decibels

Continuous sound can be described by its *frequency* (pitch) and *amplitude* (loudness). A low-frequency sound is perceived as low in pitch; a high-frequency sound is perceived as high-pitched. Frequency is expressed in terms of cycles per second, or Hertz (Hz) (e.g., a frequency of 250 cycles per second is referred to as 250 Hz). High frequencies are sometimes more conveniently expressed in kilohertz (kHz), or thousands of Hz. The audible frequency range for humans is generally between 20 Hz and 20,000 Hz.

The amplitude of pressure waves generated by a sound source correlates with the loudness of that source. The amplitude of a sound is typically described in terms of *sound pressure level* (SPL), also referred to simply as the sound level. The SPL refers to the root-mean-square (RMS)¹ pressure of a sound wave and is measured in units called micro Pascals (μPa). One μPa is approximately one hundred-billionth (0.0000000001) of normal atmospheric pressure. Sound pressure amplitudes for different kinds of noise environments can range from less than 100 to over 100,000,000 μPa. Because of this large range of values, sound is rarely expressed in terms of μPa. Instead, a logarithmic scale is used to describe the SPL in terms of decibels, abbreviated dB. The decibel is a logarithmic unit that describes the ratio of the actual sound pressure to a reference pressure (20 μPa is the standard reference pressure level for acoustical measurements in air). Specifically, a sound pressure level, in decibels, is calculated as follows:

$$SPL = 20 \times \log_{10} \left(\frac{X}{20 \mu Pa} \right)$$

where X is the actual sound pressure and 20 μPa is the standard reference pressure level for acoustical measurements in air. The threshold of hearing for young people is about zero dB, which corresponds to 20 μPa.

Decibel Calculations

Because decibels represent noise levels using a logarithmic scale, sound pressure levels cannot be added, subtracted, or averaged through ordinary arithmetic. On the dB scale, a doubling of sound energy corresponds to a 3-dB increase. In other words, when two identical sources are each producing sound of the same loudness, their combined sound level at a given distance would be 3 dB higher than one source under the same conditions. For example, if one bulldozer produces a sound pressure level of 80 dB, two bulldozers would not produce a combined sound level of 160 dB. Rather, they would combine to produce 83 dB. However, where ambient noise levels are high in comparison to a new noise source, there will be a small change in noise levels. For example, when an ambient noise level of 70 dBA is combined with a noise source generating 60 dBA, the resulting noise level equals 70.4 dBA. The cumulative sound level of any number of sources can be determined using decibel addition. The same decibel addition is used for A-weighted decibels described below.

Similarly, the arithmetic mean (average) of a series of noise levels does not accurately represent the overall average noise level. Instead, the values must be averaged using a linear scale before converting the result back into a logarithmic (dB) noise level. This method is typically referred to as calculating the “energy average” of the noise levels.

4.10.2.2 A-Weighting

The dB scale alone does not adequately characterize how humans perceive noise. The dominant frequencies of a sound have a substantial effect on the human response to that sound, and the loudness or human response is determined by characteristics of the human ear.

¹ Because sound pressure fluctuates between positive and negative values, the arithmetic average is essentially zero. Root-mean-square (RMS) describes a more meaningful value related to the average magnitude of the pressure fluctuations. RMS is calculated by squaring all of the amplitudes over the period of interest, determining the mean of the squared values, and then taking the square root of the mean of the squared values.

Human hearing is limited in the range of audible frequencies as well as in the way it perceives the SPL in that range. In general, people are most sensitive to the frequency range of 1,000 to 5,000 Hz and perceive sounds within that range better than sounds of the same amplitude in higher or lower frequencies. To approximate the response of the human ear, sound levels in various frequency bands are adjusted (or “weighted”), depending on the human sensitivity to those frequencies. The resulting SPL is expressed in A-weighted decibels, abbreviated dBA.

The A-weighting scale approximates the frequency response of the average young ear when listening to most ordinary sounds. When people make judgments regarding the relative loudness or annoyance of a sound, their judgments correlate well with the A-weighted sound levels of those sounds. Table 4.10-2 describes typical A-weighted sound levels for various noise sources.

Table 4.10-2. Typical Noise Levels in the Environment

Common Outdoor Noise Source	Sound Level (dBA)	Common Indoor Noise Source
	— 110 —	Rock band
Jet flying at 1,000 feet		
	— 100 —	
Gas lawn mower at 3 feet		
	— 90 —	
Diesel truck at 50 feet at 50 mph		Food blender at 3 feet
	— 80 —	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawn mower at 100 feet	— 70 —	Vacuum cleaner at 10 feet
Commercial area		Normal speech at 3 feet
Heavy traffic at 300 feet	— 60 —	
		Large business office
Quiet urban daytime	— 50 —	Dishwasher in next room
Quiet urban nighttime	— 40 —	Theater, large conference room (background)
Quiet suburban nighttime		
	— 30 —	Library
Quiet rural nighttime		Bedroom at night
	— 20 —	
		Broadcast/recording studio
	— 10 —	
Lowest threshold of human hearing	— 0 —	Lowest threshold of human hearing

dBA = A-weighted decibels.

4.10.2.3 Noise Descriptors

Because sound levels can vary markedly over a short period of time, various descriptors or noise “metrics” have been developed to quantify environmental and community noise. These metrics generally describe either the average character of the noise or the statistical behavior of the

variations in the noise level. Some of the most common metrics used to describe environmental noise, including those metrics used in this report, are described below.

Equivalent Sound Level (L_{eq}) is the most common metric used to describe short-term average noise levels. The L_{eq} describes the average acoustical energy content of noise for an identified period of time, commonly 1 hour. For many noise sources, the L_{eq} will vary, depending on the time of day. A prime example is traffic noise, which rises and falls, depending on the amount of traffic on a given street or freeway.

Maximum Sound Level (L_{max}) and **Minimum Sound Level (L_{min})** refer to the maximum and minimum sound levels, respectively, that occur during the noise measurement period. More specifically, they describe the root-mean-square sound levels that correspond to the loudest and quietest 1-second intervals that occur during the measurement.

Percentile-Exceeded Sound Level (L_{xx}) describes the sound level exceeded for a given percentage of a specified period. For example, the L_{50} is the sound level exceeded 50 percent of the time (such as 30 minutes per hour), and L_{25} is the sound level exceeded 25 percent of the time (such as 15 minutes per hour). Many municipalities use L_{xx} metrics in their noise ordinances to define permissible noise limits, allowing different noise levels depending on the duration of the noise within a particular hour.

Community Noise Equivalent Level (CNEL) is a measure of the 24-hour average A-weighted noise level that is also time-weighted to “penalize” noise that occurs during the evening and nighttime hours when noise is generally recognized to be more disturbing (because people are trying to rest, relax, and sleep during these times). 5 dBA is added to the L_{eq} during the evening hours of 7 p.m. to 10 p.m.², and 10 dBA is added to the L_{eq} during the nighttime hours of 10 p.m. to 7 a.m.³ and the energy average is then taken for the whole 24-hour day.

Day-Night Sound Level (L_{dn}) is very similar to the CNEL described above. L_{dn} is also a time-weighted average of the 24-hour A-weighted noise level. The only difference is that no “penalty” is applied to the evening hours of 7 p.m. to 10 p.m. 10 dBA is added to the L_{eq} during the nighttime hours of 10 p.m. to 7 a.m. and the energy average is then taken for the whole 24-hour day.

It is noted that various Federal, State, and local agencies have adopted CNEL or L_{dn} as the measure of community noise. While not identical, CNEL and L_{dn} are normally within 1 dBA of each other when measured in typical community environments, and many noise standards/regulations use the two interchangeably.

4.10.2.4 Sound Propagation

When sound propagates over a distance, it changes in both level and frequency content. The manner in which noise is reduced with distance depends on the following important factors.

Geometric Spreading. Sound from a single source (i.e., a “point” source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates (or drops off) at a rate of 6 dBA for each doubling of distance. Highway noise is not a single stationary point source of sound. The movement of vehicles on a highway makes the source of the sound

² A 5 dB noise increase is generally considered to be a readily perceptible change in the noise level for a listener.

³ A 10 dB noise increase is generally perceived as a doubling of the noise level for a listener.

appear to emanate from a line (i.e., a “line” source) rather than from a point. This results in cylindrical spreading rather than the spherical spreading resulting from a point source. The change in sound level (i.e., attenuation or decrease) from a line source is 3 dBA per doubling of distance.

Ground Absorption. Usually the noise path between the source and the observer is very close to the ground. The excess noise attenuation from ground absorption occurs due to acoustic energy losses on sound wave reflection. For acoustically absorptive or “soft” sites (i.e., sites with an absorptive ground surface, such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dBA per doubling of distance is normally assumed. When added to the geometric spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dBA per doubling of distance for a line source and 7.5 dBA per doubling of distance for a point source.

Atmospheric Effects. Research by the California Department of Transportation (Caltrans 2013) and others (Harris 1998, ADOT 2005) has shown that atmospheric conditions can have a major effect on noise levels. Factors include wind, air temperature (including vertical temperature gradients), humidity, and turbulence. Receptors downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas receptors upwind can have lower noise levels. Increased sound levels can also occur over relatively large distances because of temperature inversion conditions (i.e., increasing air temperature with elevation).

Shielding by Natural or Human-Made Features. A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by this shielding depends on the size of the object, proximity to the noise source and receptor, surface weight, solidity, and the frequency content of the noise source. Natural terrain features (such as hills and dense woods) and human-made features (such as buildings and walls) can substantially reduce noise levels. Walls are often constructed between a source and a receptor with the specific purpose of reducing noise. In addition to the noise that diffracts over the top of a barrier, noise will also diffract around the ends of the barrier leading to “flanking” noise that can reduce the overall efficacy of the barrier. Assuming it is long enough to minimize the effects of flanking noise, a barrier that breaks the line of sight between a source and a receptor will typically result in at least 5 dB of noise reduction. A taller barrier may provide as much as 20 dB of noise reduction.

4.10.2.5 Human Response to Noise

Noise-sensitive receptors (also called “receivers”) are locations where people reside or where the presence of unwanted sound may adversely affect the use of the land (see Section 4.10.2.6, *Noise-Sensitive Land Uses*, below). Noise can have a range of effects on people including hearing damage, sleep interference, speech interference, performance interference, physiological responses, and annoyance. Each of these is briefly described below:

Hearing Damage. A person exposed to high noise levels can suffer either gradual or traumatic hearing damage. Gradual hearing loss occurs with repeated exposure to excessive noise levels and is most commonly associated with occupational noise exposures in heavy industry or other very noisy work environments. Traumatic hearing loss is caused by sudden exposure to an extremely high noise level, such as a gunshot or explosion at very close range. The potential for noise-induced hearing loss is not generally a concern in typical community noise environments. Noise levels in neighborhoods, even in very noisy airport environs, are not sufficiently loud as to cause hearing loss.

Sleep Interference. Exposure to excessive noise levels at night has been shown to cause sleep disturbance. Sleep disturbance refers not only to awakening from sleep, but also to effects on the quality of sleep such as altering the pattern and stages of sleep. World Health Organization (WHO) guidelines recommend noise limits of 30 dBA L_{eq} (8-hour average) for continuous noise and 45 dBA L_{max} for single sound events inside bedrooms at night to minimize sleep disturbance (WHO 1999).

Speech Interference. Speech interference can be a problem in any situation where clear communication is desired, but is often of particular concern in learning environments (such as schools) or situations where poor communication could jeopardize safety. Normal conversational speech inside homes is in the range of 50 to 65 dBA (EPA 1977), and any noise in this range or louder may interfere with speech. As background noise levels rise, the intelligibility of speech decreases and the listener will fail to recognize an increasing percentage of the words spoken. A speaker may raise his or her voice in an attempt to compensate for higher background noise levels, but this in turn can lead to vocal fatigue for the speaker.

Performance Interference. Excessive noise has been found to have various detrimental effects on human performance, including information processing, concentration, accuracy, reaction times, and academic performance. Intrusive noise from individual events can also cause distraction. These effects are of obvious concern for learning and work environments.

Physiological Responses. Acute noise has been shown to cause measurable physiological responses in humans, including changes in stress hormone levels, pulse rate, and blood pressure. The extent to which these responses cause harm or are signs of harm is not clearly defined, but it has been postulated that they could contribute to stress-related diseases, such as hypertension, anxiety, and heart disease. However, research indicates links between environmental noise and permanent health effects are generally weak and inconsistent. Statistically significant health risks have been found for extended exposure to very high noise level, such as for workers exposed to high levels of industrial noise for 5 to 30 years (WHO 1999).

Annoyance. The subjective effects of annoyance, nuisance, and dissatisfaction are possibly the most difficult to quantify, and no completely satisfactory method exists to measure these effects. This difficulty arises primarily from differences in individual sensitivity and habituation to sound, which can vary widely from person to person. What one person considers tolerable can be quite unbearable to another of equal hearing acuity. An important tool in estimating the likelihood of annoyance due to a new sound is by comparing it to the existing baseline or “ambient” environment to which that person has adapted. In general, the more the level or tonal (frequency) variations of a sound exceed the previously existing ambient sound level or tonal quality, the less acceptable the new sound will be, as judged by the exposed individual.

In most cases, effects from sounds typically found in the natural environment would be limited to annoyance or interference. Physiological effects and hearing loss would be more commonly associated with manmade noise, such as in an industrial or an occupational setting. Studies have shown that under controlled conditions in an acoustics laboratory, a healthy human ear is able to discern changes in sound levels of 1 dBA. However, it is widely accepted that a doubling of sound energy, which results in a change of 3 dBA in the normal environmental noise, is considered just noticeable to most people. A change of 5 dBA is readily perceptible, and a change of 10 dBA is perceived as being twice as loud. Accordingly, a doubling of sound energy (e.g., doubling the volume of traffic on a highway) resulting in a 3 dBA increase in sound would generally be barely detectable.

4.10.2.6 Noise-Sensitive Land Uses

Noise sensitivity varies by land use and time of day. The San Diego Unified Port District (District) considers the following land uses noise-sensitive:

- **Residences** (including hospitals, nursing facilities, or intermediate care facilities with overnight patient stays).
- **Schools and childcare facilities** are typically only considered noise sensitive during daytime and evening hours when children are onsite or special events occur in the evening.
- **Hotels and other guest lodgings** are typically only considered noise sensitive during the evening and nighttime hours (i.e., 7:00 p.m. to 7:00 a.m.) due to overnight accommodation expectations of hotel guests. However, hotels and other guest lodgings are not considered noise sensitive during the daytime hours due to the transient nature of their use during the day.
- **Parks and other public outdoor areas** are typically only considered noise sensitive during hours of operation (typically 6:00 a.m. to 10:30 p.m.) because they should generally be unoccupied outside of these hours.

4.10.3 Groundborne Vibration Fundamentals

Groundborne vibration is a small, rapidly fluctuating motion transmitted through the ground. The effects of groundborne vibrations are typically limited to causing nuisance or annoyance to people, but at extreme vibration levels damage to buildings may also occur.

In contrast to airborne sound, groundborne vibration is not a phenomenon that most people experience every day. The ambient groundborne vibration level in residential areas is usually much lower than the threshold of human perception (FTA 2018). Most perceptible indoor vibration is caused by sources within buildings, such as mechanical equipment while in operation, people moving, or doors slamming. Typical outdoor sources of perceptible groundborne vibration are heavy construction activity (such as blasting, pile driving, or earthmoving), steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the groundborne vibration from traffic is rarely perceptible, even in locations close to major roads. The strength of groundborne vibration from typical environmental sources diminishes (or attenuates) fairly rapidly over distance.

For the prediction of groundborne vibration, the fundamental model consists of a vibration source, a receptor, and the propagation path between the two. The power of the vibration source and the characteristics and geology of the intervening ground, which affect the propagation path to the receptor, determine the groundborne vibration level and the characteristics of the vibration perceived by the receptor.

Groundborne noise occurs when vibration propagating through a building causes room surfaces to vibrate and radiate noise into interior spaces. Many vibration sources, such as heavy construction and steel-wheeled trains, also generate substantial levels of airborne noise. This airborne noise typically dominates the overall noise level such that any groundborne noise contribution is negligible to a person inside the building. Groundborne noise is typically only an issue for scenarios that do not generate high levels of airborne noise at the receiver location. Examples include subway or tunnel operations where there is no airborne noise path or situations where people are located in buildings with substantial sound insulation, such as a recording studios. Groundborne noise is typically quantified using the A-weighted sound level.

The following sections provide an explanation of key concepts and terms used in the analysis of environmental groundborne vibration.

4.10.3.1 Displacement, Velocity, and Acceleration

When a vibration source (blasting, dynamic construction equipment, train, etc.) impacts the ground, it imparts energy to the ground creating vibration waves that propagate away from the source along the surface and downward into the earth. As vibration waves travel outward from a source, they excite the particles of rock and soil through which they pass and cause them to oscillate. The distance that these particles move is referred to as the *displacement* and is typically very small, usually only a few ten-thousandths to a few thousandths of an inch. *Velocity* describes the instantaneous speed of the motion and *acceleration* is the instantaneous rate of change of the speed. Each of these measures can be further described in terms of *frequency* and *amplitude*, as discussed below.

Groundborne vibration is most commonly described in terms of velocity or acceleration because displacement does not provide any information about the speed of the vibration. In addition, most transducers used to measure vibration directly measure velocity or acceleration, not displacement.

4.10.3.2 Frequency and Amplitude

The frequency of a vibrating object describes how rapidly it is oscillating. The unit of measurement for the frequency of vibration is Hz (the same as used in the measurement of noise), which describes the number of cycles per second.

The amplitude of displacement describes the distance that a particle moves from its resting (or equilibrium) position as it oscillates and can be measured in inches. The amplitude of vibration velocity (the speed of the movement) can be measured in inches per second (in/s). The amplitude of vibration acceleration (the rate of change of the speed) can be measured in inches per second squared (in/s²).

4.10.3.3 Vibration Descriptors

As noted above, there are various ways to quantify groundborne vibration based on its fundamental characteristics. Because vibration can vary markedly over a short period of time, various descriptors have been developed to quantify vibration. The two most common descriptors used in the analysis of groundborne vibration are peak particle velocity and vibration velocity level, each of which are described below.

Peak Particle Velocity (PPV) is defined as the maximum instantaneous positive or negative peak amplitude of the vibration velocity. The unit of measurement for PPV is in/s. Unlike many quantities used in the study of environmental acoustics, PPV is typically presented using linear values and does not employ a dB scale. Because it is related to the stresses that are experienced by buildings, PPV is generally accepted as the most appropriate descriptor for evaluating the potential for building damage (both the Federal Transit Administration (FTA) and Caltrans guidelines recommend using PPV for this purpose). It is also used in many instances to evaluate the human response to groundborne vibration (Caltrans guidelines recommend using PPV for this purpose).

Vibration Velocity Level (L_v) describes the root-mean-square vibration velocity. Due to the typically small amplitudes of groundborne vibrations, vibration velocity is often expressed in decibels, calculated as follows.

$$L_v = 20 \times \log_{10} \left(\frac{V}{V_{ref}} \right)$$

where V is the actual RMS velocity amplitude and V_{ref} is the reference velocity amplitude. It is important to note that there is no universally accepted value for V_{ref} , but the accepted reference quantity for vibration velocity in the United States is 1 micro-inch per second (1×10^{-6} in/s). The abbreviation VdB is commonly used for vibration decibels to distinguish from noise level decibels. L_v is often used to evaluate human response to vibration levels (FTA guidelines recommend using L_v for this purpose).

4.10.3.4 Vibration Propagation

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations reduce much more rapidly than low frequencies, so that low frequencies tend to dominate the spectrum at large distances from the source. The propagation of groundborne vibration is also influenced by geological variations. Geological factors that influence the propagation of groundborne vibration include the following:

- **Soil Conditions.** The type of soil is known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil. Hard, dense, and compacted soil, stiff clay soil, and hard rock transmit vibration more efficiently than loose, soft soils, sand, or gravel.
- **Depth to Bedrock.** Shallow depth to bedrock has been linked to efficient propagation of groundborne vibration. One possibility is that shallow bedrock acts to concentrate the vibration energy near the surface, reflecting vibration waves back toward the surface that would otherwise continue to propagate farther down into the earth.
- **Soil Strata.** Discontinuities in the soil strata (i.e., soil layering) can also cause diffractions or channeling effects that affect the propagation of vibration over long distances.
- **Frost Conditions.** Vibration waves typically propagate more efficiently in frozen soils than in unfrozen soils. Propagation also varies depending on the depth of the frost.
- **Water Conditions.** The amount of water in the soil can affect vibration propagation. The depth of the water table in the path of the propagation also appears to have substantial effects on groundborne vibration levels.

Specific conditions at the source and receiver locations can also affect the vibration levels. For instance, how the source is connected to the ground (e.g., direct contact, through rails, or via a structure) will affect the amount of energy transmitted into the ground. There are also notable differences when the source is underground (such as in a tunnel) versus on the surface. At the receiver, vibration levels can be affected by variables such as the foundation type, the building construction, and the acoustical absorption inside the rooms where people are located. When vibration encounters a building, a ground-to-foundation coupling loss⁴ will usually reduce the

⁴ A loss is experienced at the interface between the soil and the structure because not all of the vibrational energy will be transmitted into the foundation. Some vibration waves will be refracted around the foundation or be reflected back into the soil.

overall vibration level. However, under certain circumstances, the ground-to-foundation coupling may also amplify the vibration level due to structural resonances of the floors and walls.

4.10.3.5 Effects of Groundborne Vibration

Vibration can result in effects that range from annoyance to structural damage. Annoyance or disturbance of people may occur at vibration levels substantially below those that would pose a risk of damage to buildings. Each of these effects is discussed below.

Potential Building Damage

When groundborne vibration encounters a building, vibrational energy is transmitted to the structure causing it to vibrate, and, if the vibration levels are high enough, damage to the building may occur. Depending on the type of building and the vibration levels this damage could range from cosmetic architectural damage (e.g., cracked plaster, stucco, or tile) to more severe structural damage (e.g., cracking of floor slabs, foundations, columns, beams, or walls). Buildings can typically withstand higher levels of vibration from transient sources than from continuous or frequent intermittent sources. Transient sources are those that create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment. Older, fragile buildings (which may include important historical buildings) are of particular concern. Modern commercial and industrial buildings can generally withstand much higher vibration levels before potential damage becomes a problem.

Human Disturbance/Annoyance

Groundborne vibration can be annoying to people and can cause serious concern for nearby neighbors of vibration sources, even when vibration is well below levels that could cause physical damage to structures. Groundborne vibration is almost exclusively a concern inside buildings and is rarely perceived as a problem outdoors, where the motion may be discernible but there is less adverse reaction without the effects associated with the shaking of a building. The normal frequency range of most groundborne vibration that can be felt generally starts from a low frequency of less than 1 Hz to a high of about 200 Hz.

When groundborne vibration waves encounter a building, vibrational energy is transmitted to the building foundation and then propagates throughout the remainder of the structure causing building surfaces (walls, floors, and ceilings) to vibrate. This movement may be felt directly by building occupants and may also generate a low-frequency rumbling noise as sound waves are radiated by the vibrating surfaces. At higher frequencies, building vibration can cause other audible effects such as rattling of windows, building fixtures, or items on shelves or hanging on walls. These audible effects due to groundborne vibration are referred to as groundborne noise. Groundborne vibration levels that result in groundborne noise are often experienced as a combination of perceptible vibration and low-frequency noise. However, sources that have the potential to generate groundborne noise are likely to produce airborne noise impacts that mask the radiated groundborne noise. Any perceptible effect (vibration or groundborne noise) can lead to annoyance. The degree to which a person is annoyed depends on the activity in which they are participating at the time of the disturbance. For example, someone sleeping or reading will be more sensitive than someone who is engaged in any type of physical activity. Recurring vibration effects often lead

people to believe that the vibration is damaging their home, although vibration levels are well below minimum thresholds for damage potential (Caltrans 2020).

Numerous studies have been conducted to characterize the human response to vibration, and, over the years, numerous vibration criteria and standards have been suggested by researchers, organizations, and governmental agencies. These studies suggest that the thresholds for perception and annoyance vary according to duration, frequency, and amplitude of vibration. For transient vibration sources (single isolated vibration events such as blasting), the human response to vibration varies from barely perceptible at a PPV of 0.04 in/s, to distinctly perceptible at a PPV of 0.25 in/s, and severe at a PPV of 2.0 in/s. For continuous or frequent intermittent vibration sources (such as impact pile driving or vibratory compaction equipment), the human response to vibration varies from barely perceptible at a PPV of 0.01 in/s, to distinctly perceptible at a PPV of 0.04 in/s, and severe at a PPV of 0.4 in/s (Caltrans 2020).

4.10.3.6 Vibration-Sensitive Land Uses

As discussed above, the potential effects of groundborne vibration can be divided into two categories: building damage and potential human disturbance/annoyance. Because building damage would be considered a permanent negative effect at any building, regardless of land use, any type of building would typically be considered sensitive to this type of impact. Fragile structures, which often include historical buildings, are most susceptible to damage and are of particular concern. Older buildings

Sensitivity to human disturbance/annoyance caused by vibration varies by land use and time of day. Vibration effects are typically only considered inside occupied buildings and not at outside areas such as residential yards, parks, or open space. As such, the District does not consider parks to be vibration-sensitive, but may consider any occupied buildings within parks to be sensitive to vibration. The District considers the following building types to be vibration sensitive with respect to potential disturbance of occupants:

- **Residences** (including hospitals, nursing facilities, or intermediate care facilities with overnight patient stays).
- **Schools and childcare facilities** are typically only considered vibration sensitive during daytime and evening hours when children are inside or special events occur inside during the evening.
- **Hotels and other guest lodgings** are typically only considered noise sensitive during the evening and nighttime hours (i.e., of 7:00 p.m. to 7:00 a.m.) due to overnight accommodation expectations of hotel guests. However, hotels and other guest lodgings are not considered noise sensitive during the daytime hours due to the transient nature of their use during the day.

4.10.4 Existing Conditions

Due to the large geographical area and varied land uses within the planning area, the existing noise environment varies widely at and around the Port. Notable noise sources include the following.

- Transportation sources such as traffic, aircraft (civilian and military), watercraft (recreational, commercial, and military), and rail (passenger, freight, and trolley).

- Industrial activities such as ship operations and cargo-handling activities at and around Port terminals; shipbuilding and repair; manufacturing activities; and storage, loading, and shipping operations.
- Activities at various Navy installations.
- Commercial and recreational activities such as operations at the San Diego Convention Center, area hotels, restaurants, parks, marinas, and cruise ship terminals.

4.10.4.1 Noise Monitoring

In order to quantify the existing ambient noise conditions, long-term (LT) and short-term (ST) noise monitoring was conducted at multiple locations near or within the analyzed PMPU planning districts (PDs). The locations were selected primarily to represent noise-sensitive land uses such as residences, hotels, schools, and parks. Where access could be secured, measurements were taken directly on the subject property; otherwise, measurements were obtained at adjacent accessible public areas such as promenades or sidewalks that were determined to be acoustically equivalent (i.e., that experienced approximately the same noise exposure from the same ambient noise sources). These locations are considered representative of other noise-sensitive receptors in proximity thereto. Long-term measurements were set up to gather hourly data for at least 24 hours. Short-term measurements were approximately 15 to 30 minutes in duration. Each measurement location is identified with a label that indicates the measurement duration (LT for long-term or ST for short-term) and relevant planning district. For example, measurements starting with “LT01” are long-term measurements conducted in or near PD1, and measurements starting “ST04” are short-term measurements conducted in or near PD4. All measurement locations are indicated on Figure 4.10-1. The locations were selected to document the existing noise environment in or near the eight planning districts considered in this Program Environmental Impact Report (PEIR) (i.e., PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10). The sound level meters (SLM) used for both the long- and short-term noise monitoring were field-calibrated prior to each measurement to ensure accuracy, using a Larson Davis CAL200 acoustical calibrator; the calibration was also re-checked at the conclusion of each measurement. All measurement microphones were fitted with a wind screen to reduce the effects of wind-related interference. Field noise survey sheets are provided in Appendix H.

Long-Term Noise Measurements

Long-term ambient noise measurements were conducted at 15 locations near or within the analyzed planning districts. Type 2 SLM⁵ were used to capture daily noise level patterns and statistics continuously over 1-hour intervals. Complete noise measurement data are provided in Appendix H. Table 4.10-3 summarizes the results of the long-term noise measurements in terms of the range of daytime (7 a.m. to 7 p.m.), evening (7 p.m. to 10 p.m.), and nighttime (10 p.m. to 7 a.m.) average noise levels (L_{eq}); maximum noise levels (L_{max}); and CNEL. A description of each measurement is provided below. These locations are considered representative of other receptors in proximity thereto.

LT01-1. Harbor Police Department, Shelter Island Station (within PD1). The measurement microphone was mounted on a tripod, approximately 5 feet above the ground within a chain-link

⁵ Models Piccolo SLM-P3 and Piccolo II SLM manufactured by Soft dB and Model NL-21 manufactured by Rion. Type 2 sound level meters are considered general-purpose grade for field use.

fenced storage area on the east side of the police station building. This location had unobstructed views of San Diego Bay to the east and south.

LT01-2. Shelter Island Shoreline Park (within PD1). The SLM was mounted on a tree in the park, approximately 8 feet above the ground, across the street from the Best Western Plus Island Palms Hotel on Shelter Island.

LT02-1. Harbor Island Park (within PD2). The SLM was mounted on a tree in the park, approximately 8 feet above the ground, located at the south side of Harbor Island West, across the street from the Marina Cortez parking lot.

LT03-1. Wyndham San Diego Bayside (within PD3). The SLM was mounted on a tree, approximately 7 feet above the ground, 15 feet south of the Wyndham San Diego Bayside Hotel at the approximate setback of the hotel rooms from North Harbor Drive.

LT03-2. B Street Pier (within PD3). The measurement microphone was mounted on a tripod, approximately 5 feet above the ground on the west end of the B Street Pier with an unobstructed view of the Bay to the west.

LT03-3. Marriott Marquis San Diego Hotel and Marina (within PD3). The SLM was mounted on a light pole, approximately 9 feet above the ground, adjacent to the Embarcadero Promenade south of the Marriott Marquis San Diego Hotel along the marina.

LT03-4. Harbor Club San Diego (approximately 160 feet northeast of PD3). The SLM was mounted on a light pole, approximately 9 feet above the ground on the west side of 3rd Avenue, just north of K Street. This location is adjacent to the Harbor Club condominium towers at 100 Harbor Drive with direct line of sight to the San Diego Convention Center to the southwest with Harbor Drive, the trolley line, railroad tracks, and the Martin Luther King Promenade in between.

LT03-5. Embarcadero Marina Park South (within PD3). The SLM was mounted on a tree approximately 7 feet above the ground at the easternmost corner of Embarcadero Marina Park South.

LT04-1. Cesar Chavez Park (within PD4). The SLM was mounted on a tree, approximately 8 feet above the ground, adjacent to a seating area within Cesar Chavez Park.

LT04-2. Mercado Apartments (approximately 1,140 feet northeast of PD4). The SLM was mounted on a tree in the parking lot at the southwest corner of the Mercado Apartments at 2001 Newton Avenue.

LT04-3. 2644 Boston Avenue (approximately 800 feet northeast of PD4). The measurement microphone was mounted on a tripod, approximately 5 feet above the ground within the yard of a single-family residence at 2644 Boston Avenue.

LT08-1. Imperial Beach Lifeguard Tower (within PD8). The measurement microphone was mounted on a tripod, approximately 5 feet above the exterior deck of the lifeguard tower at the Dempsey Holder Safety Center in Imperial Beach. The deck was on the third floor of the tower with an unobstructed view of the ocean and the Imperial Beach Pier to the west.

LT09-1. Residential neighborhood on Kingston Court (approximately 220 feet west of PD9). The SLM used for this measurement was mounted on a tree, approximately 8 feet above the ground, within an open landscaped area on Kingston Court.

LT10-1. Coronado Municipal Golf Course (within PD10). The SLM was mounted on a tree, approximately 9 feet above the ground, facing south toward Glorietta Bay with unobstructed views of San Diego Bay and Glorietta Bay to the east and south. This location was close to the fence on the side of the golf course's driving range.

LT10-2. Coronado Tidelands Park (within PD10). The SLM was mounted on a tree at the northeast corner of Coronado Tidelands Park, approximately 90 feet west of San Diego Bay and 50 feet south of guest accommodations at the Coronado Island Marriott Resort and Spa.

Short-Term Noise Measurements

Short-term measurement locations were selected to supplement long-term measurements near or within the analyzed planning districts. Short-term noise measurements were conducted at 15 locations using a Type 1 SLM.⁶ Each measurement lasted between 15 and 30 minutes and was conducted with the meter mounted on a tripod at a height of 5 feet above the ground, with a wind screen to reduce the effects of wind-related interference. Complete noise measurement data are provided in Appendix H. Table 4.10-3 summarizes the results of the short-term noise measurements in terms of average noise levels (L_{eq}) and maximum noise levels (L_{max}). Short-term monitoring locations and noise conditions at the time of the measurements are described below. These locations are considered representative of other receptors in proximity thereto.

ST01-1. Holiday Inn San Diego Bayside (within PD1). The SLM was positioned 11 feet northwest of the hotel at the approximate setback of the guest rooms from Nimitz Boulevard. The dominant noise sources at this location were traffic on Nimitz Boulevard and frequent overflying aircraft. Additional noise sources included people talking at the hotel pool and hotel maintenance crew activity.

ST02-1. Sheraton San Diego Hotel & Marina (within PD2). The SLM was positioned 17 feet south of the hotel, at the approximate setback of the guest rooms from Harbor Island Drive. The dominant noise source at this location was traffic on Harbor Island Drive. Additional noise sources included distant overflying commercial aircraft and bird vocalizations.

ST03-1. Manchester Grand Hyatt San Diego (within PD3). The SLM was positioned 30 feet northwest of the hotel, at the approximate setback of the guest rooms from Martin Luther King Promenade. The dominant noise source at this location was traffic on Martin Luther King Promenade. Additional noise sources included occasional light rail trains passing by and pedestrian traffic.

ST03-2. Embarcadero Marina Park North (within PD3). The SLM was positioned 66 feet southeast of the gazebo located near the southeastern end of the Embarcadero Marina Park North, at the approximate setback of the gazebo and usable area of park. The dominant noise sources at this location were from pedestrian traffic and passing boats in San Diego Bay. Other noise sources included distant industrial noise, distant aircraft noise, distant traffic noise from Martin Luther King Promenade, and bird vocalizations.

ST03-3. Fifth Avenue Landing Park (within PD3). The SLM was positioned near the center of the park, approximately 35 yards east of San Diego Bay. The noise environment was defined primarily by overflying aircraft. Other sources present included watercraft (both civilian and military), distant

⁶ Models 831, LxT1, and LxT2 manufactured by Larson Davis.

intermittent traffic passing by on Park Boulevard and Harbor Drive, and pedestrian traffic along the Bay and in front of the Hilton San Diego Bayfront Hotel.

ST03-4. Hilton Bayfront Hotel (within PD3). The SLM was located on the Embarcadero Promenade immediately southwest of the hotel, adjacent to the pool area, approximately 130 yards south of the Park Boulevard Pier. The noise environment was defined almost entirely by activities at the neighboring Tenth Avenue Marine Terminal to the southeast. Other sources included watercraft (both civilian and military) and activities at the hotel pool.

ST04-1. Monarch School (approximately 380 feet east of PD4). The SLM was positioned near the outdoor use area of Monarch School, 10 feet southwest from the fence that separates the school from the parking lot of the industrial building located southwest of the school. The noise sources at this location were distant traffic on East Harbor Drive and children playing in the play area of the school.

ST04-2. Perkins Elementary School (approximately 1,030 feet northeast of PD4). The SLM was positioned on the sidewalk adjacent to the southeast corner of the school, near the intersection of Beardsley Street and Main Street. The dominant noise source at this location was roadway traffic and rail traffic. Additional noise sources included distant pedestrian conversation.

ST04-3. 1843 Newton Avenue (approximately 1,350 feet northeast of PD4). The SLM was positioned in front of 1843 Newton Avenue, 10 feet from the street curb. The dominant noise source at this location was sparse traffic on Newton Avenue. Additional noise sources were from pedestrian traffic and bird song.

ST07-1. Adjacent to Pond 20 (at south boundary of PD7). The SLM was positioned at the northwestern corner of the mobile home park located north of Palm Avenue. The meter was placed near spot 75, 17 feet east of the fence separating the mobile home park from Bayside Palms Mobile Home Village and 4 feet south of the northern fence. The noise sources present in this area included distant aircraft flyovers and birdsong.

ST08-1. 777 Seacoast Drive (approximately 50 feet east of PD8). The SLM was positioned 11 feet south of the apartment building located at 777 Seacoast Drive, at the approximate setback of the building. The dominant noise source at this location was from traffic on Seacoast Drive. Additional noise sources present included distant aircraft flyovers, children playing at the playground across the street, and bird vocalizations.

ST09-1. Coronado Cays Park (approximately 1,470 feet southwest of PD9). The SLM was positioned 55 feet south of the seating area located near the southern end of Coronado Cays Park, at the approximate setback of the park benches from Coronado Cays Boulevard. The dominant noise source at this location was from traffic on Coronado Cays Boulevard. Additional noise sources present included distant aircraft flyovers.

ST10-1. 1536 Glorietta Boulevard (approximately 140 feet west of PD10). The SLM was positioned 15 feet northeast of the single-family residence located at 1536 Glorietta Boulevard, at the approximate setback of the home. The dominant noise source at this location was from traffic on Pomona Avenue. Additional noise sources present included distant rustling leaves on trees and bird vocalizations.

ST10-2. Centennial Park (at southwest boundary of PD10). The SLM was mounted on a signpost, approximately 7 feet above the ground. The meter was positioned approximately 90 feet southwest

of the water, at the approximate setback of the Coronado Point Apartments, 75 yards from the pool of the apartment complex. The noise environment within the park was defined primarily by foot traffic and watercraft (both civilian and military). Other sources present included people talking at picnic areas within the park and activity at nearby hotel pools.

ST10-3. Harborview Park (approximately 290 feet southwest of PD10). The SLM was positioned in the park, 21 feet southeast from the fence line of the single-family residence at 817 First Street, at the approximate setback of the home from First Street. The primary noise source at this location was from traffic on First Street. On occasion, jet engine noise from the nearby Naval Air Station would dominate the noise environment during aircraft takeoff. Additional noise sources included distant commercial aircraft and bird vocalizations.

N/A = not applicable; MFR = multi-family residence; SFR = single-family residence.

Barrio Logan Nighttime Noise Study

In addition to the noise measurements described above, the District commissioned a nighttime noise study for the Barrio Logan community that was published in June 2020 (District 2020). The study was conducted to identify nighttime noise sources in the Barrio Logan community between the hours of 10:00 p.m. and 6:00 a.m., with a focus on 1:00 a.m. to 4:00 a.m., and to recommend measures that avoid, minimize, and/or mitigate adverse nighttime noise-generating sources. This detailed report includes almost 90 pages of noise monitoring results gathered at numerous locations in and around PD4 between the hours of 12:00 a.m. and 6:00 a.m. on all days of the week. No daytime or evening noise levels were reported as part of the study. Table 4.10-4 summarizes nighttime noise levels measured at eight sites with continuous noise monitoring between 12:00 a.m. and 6:00 a.m. repeated over multiple days. These locations are considered representative of other receptors in proximity thereto.

Table 4.10-4. Summary of Barrio Logan Nighttime Noise Levels, 12:00 a.m. to 6:00 a.m.

Site	Location (Nearest Cross Streets)	Date	Range of Typical Hourly L_{eq} Values, dBA	Average for All Measured Hours, dBA
A	Main Street and Beardsley Street	10/25 to 10/31 and 11/11 to 11/24, 2019	55-70	62.6
B	National Avenue and Cesar Chavez Parkway	10/25 to 10/31 and 11/11 to 11/24, 2019	55-69	60.7
C	National Avenue and Evans Street	10/25 to 10/31 and 11/11 to 11/24, 2019	47-60	55.6

4.10.4.2 Traffic Noise

Existing traffic noise in the study area was analyzed based on data from the Transportation Impact Analysis (TIA) for the proposed PMPU (Appendix D), using a proprietary traffic noise model, with calculations based on data from the Federal Highway Administration (FHWA) Traffic Noise Model, Version 2.5, Look-Up Tables (FHWA 2004). The methodology is described in further detail in Section 4.10.6.1, *Methodology*. The results are summarized in Table 4.10-5, and the noise modeling is provided in Appendix H.

Note: There are no roadway segments in the traffic study area that are located in, or adjacent to, PD7 that were included within the study area.

4.10.4.3 Aircraft Noise

Aircraft from various civilian and military installations (airports/airfields) contribute to existing ambient noise levels within the planning area. Noise contours for each airport/airfield are published in their Airport Land Use Compatibility Plans (ALUCPs) or Air Installations Compatible Use Zones (AICUZ) studies. A review of these sources indicates that the proposed PMPU area is affected by notable noise contours (60 dB CNEL or higher) from both the San Diego International Airport (SDIA) and Naval Air Station (NAS) North Island. Noise contour maps for each of these are shown in Figures 4.10-2 and 4.10-3. Also nearby (but without noise contours that overlap the PMPU area) is Naval Outlying Landing Field (NOLF) Imperial Beach.

4.10.5 Laws, Regulations, Plans, and Policies

The District has not formally adopted noise or vibration standards. Therefore, the following sections discuss various laws, regulations, and guidelines related to noise and vibration.

4.10.5.1 Federal Standards

Noise Control Act of 1972

The Federal Noise Control Act of 1972 (Public Law 92 574) established a requirement that all Federal agencies administer their programs to promote an environment free of noise that would jeopardize public health or welfare. The U.S. Environmental Protection Agency (EPA) was given responsibility for the following.

- Providing information to the public regarding identifiable effects of noise on public health and welfare.
- Publishing information on the levels of environmental noise that will protect the public health and welfare with an adequate margin of safety.
- Coordinating Federal research and activities related to noise control.
- Establishing Federal noise emission standards for selected products distributed in interstate commerce.

As part of its responsibility, EPA published *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety* in 1974 (EPA 1974). This report identifies sound levels less than or equal to 55 L_{dn} as being appropriate outdoors for residential areas and other places in which quiet is a basis for uses to avoid annoyance and interference with outdoor activity (EPA 1974).

4.10.5.2 State Regulations

California requires each city and county to perform noise studies and implement a noise element as part of its general plan. The purpose of regulating noise is to limit the exposure of a community to excessive noise levels. The State provides guidelines for evaluating the compatibility of various land uses as a function of community noise exposure.

Title 24, California Code of Regulations

Title 24, Part 2, Section 1206.3 of the California Code of Regulations, “Allowable interior noise levels,” establishes minimum noise insulation standards to protect people in new hotels, motels, lodging houses, apartments, dwellings, dormitories, condominiums, shelters for homeless persons, congregate residences, employee housing, factory-built housing, and other types of dwelling containing sleeping accommodations. Under this regulation, interior noise levels attributable to exterior noise sources cannot exceed 45 dB CNEL or L_{dn} in any habitable room (the noise metric must be either L_{dn} or CNEL, consistent with the noise element of the local general plan). Compliance with the code is achieved through various noise attenuation features including building insulation, sound-rated doors and windows.

California Department of Transportation

Some (but not all) of the local regulations discussed below provide standards regarding groundborne vibration. However, these standards are generally quite conservative because they restrict acceptable vibration to the limit of human perception. While this may represent a reasonable goal for vibration from long-term project operations, it is overly restrictive for vibration from short-term temporary construction activity. Caltrans has produced the widely referenced *Transportation and Construction Vibration Guidance Manual* (Caltrans 2020) that specifically addresses potential groundborne vibration impacts from construction. This manual provides guidance for two types of potential impact: (1) damage to structures and (2) annoyance to people. Guideline criteria for each are provided in Tables 4.10-6 and 4.10-7.

Table 4.10-6. Caltrans Guideline Vibration Damage Criteria

Structure and Condition	Maximum PPV (in/s)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Source: Caltrans 2020.

Note: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Table 4.10-7. Caltrans Guideline Vibration Annoyance Criteria

Human Response	Maximum PPV (in/s)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.9	0.10
Severe	2.0	0.4

Source: Caltrans 2020.

Note: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

4.10.5.3 Local

County of San Diego

San Diego County Code of Regulatory Ordinances – Operational Noise

Title 3, Division 6, Chapter 4 of the San Diego County Code of Regulatory Ordinances provides the Noise Abatement and Control regulations for operational noise. Section 36.404 makes it unlawful for any person to cause or allow the creation of any operational noise that exceeds the 1-hour average sound level limits in Table 4.10-8 when measured at the property line of the property on which the noise is produced or at any location on a property that is receiving the noise.

Table 4.10-8. County of San Diego Noise Limits

Land Use Zone	Time of Day	1-Hour L_{eq} (dBA)
RS, RD, RR, RMH, A70, A72, S80, S81, S90, S92, RV, and RU with a General Plan Land Use Designation density of less than 10.9 dwelling units per acre. ¹	7 a.m. to 10 p.m.	50
	10 p.m. to 7 a.m.	45
RRO, RC, RM, S86, FB-V5, RV and RU with a General Plan Land Use Designation density of 10.9 or more dwelling units per acre. ²	7 a.m. to 10 p.m.	55
	10 p.m. to 7 a.m.	50
S94, FB-V4, AL-V2, AL-V1, AL-CD, RM-V5, RM-V4, RM-V3, RM-CD and all commercial zones. ³	7 a.m. to 10 p.m.	60
	10 p.m. to 7 a.m.	55
M50, M52, and M54. ⁴	Anytime	70
S82, M56, and M58. ⁵	Anytime	75

Source: San Diego County Code of Regulatory Ordinance.

¹ Low-density residential use that is not representative of typical land uses in the proposed PMPU area.

² Residential use that is more representative of typical land uses in the proposed PMPU area.

³ General commercial land uses.

⁴ General and limited-impact industrial uses.

⁵ High-impact industrial and extractive uses.

Notes:

The sound level limit at a location on a boundary between two zones is the arithmetic mean of the respective limits for the two zones.

The table has been condensed to remove categories that only applied to specific geographic areas that are not relevant to the proposed PMPU.

These operational noise limits are not applicable to emergency work, school related noise, permitted sports, entertainment, and public events, emergency generators, agricultural activities, preempted State and Federal activities (which typically include operation of airplanes, ships, trains, and vehicles on public roads) (Section 36.417).

San Diego County Code of Regulatory Ordinances – Construction Noise

The County's code regulates both the permissible times of construction activities and the noise levels these activities can generate. Section 36.408 prohibits construction between the hours of 7:00 p.m. and 7:00 a.m. on any day or on Sundays or holidays. Section 36.409 provides construction noise limits, making it unlawful for any person to conduct any construction activity that exceeds an average sound level of 75 dBA for an 8-hour period, between 7:00 a.m. to 7:00 p.m., when measured at the boundary line of the property where the noise source is located or on any occupied property where the noise is being received.

City of San Diego

City of San Diego General Plan

The City of San Diego General Plan, Noise Element, provides information, goals, and policies related to the noise environment within the city. The Noise Element presents Land Use – Noise Compatibility Guidelines for the compatibility of various land uses with different noise exposures, defined using the CNEL. There are three different tiers of compatibility: (1) Compatible, (2) Conditionally Compatibility, and (3) Incompatible. The compatibility is described in the City of San Diego's Table NE-3, which is reproduced, below, as Table 4.10-9. As part of the table, interior noise standards are provided for certain noise-sensitive land uses to ensure adequate exterior-to-interior noise reduction is provided if these uses are located within "Conditionally Compatibility" noise environments.

Table 4.10-9. City of San Diego General Plan Land Use – Noise Compatibility Guidelines

Land Use Category	Exterior Noise Exposure (dBA CNEL)				
	60	65	70	75	
<i>Parks and Recreational</i>					
Parks, Active and Passive Recreation					
Outdoor Spectator Sports, Golf Courses; Water Recreational Facilities; Indoor Recreation Facilities					
<i>Agricultural</i>

Visitor Accommodations		45	45	45	
<i>Offices</i>					
Business & Professional; Government; Medical, Dental & Health Practitioner; Regional & Corporate Headquarters			50	50	

Land Use Category				Exterior Noise Exposure (dBA CNEL)			
				60	65	70	75
Vehicle and Vehicular Equipment Sales and Services Use							
Commercial or Personal Vehicle Repair & Maintenance; Commercial or Personal Vehicle Sales & Rentals; Vehicle Equipment & Supplies Sales & Rentals; Vehicle Parking							
Wholesale, Distribution, Storage Use Category							
Equipment & Materials Storage Yards; Moving & Storage Facilities; Warehouse; Wholesale Distribution							
Industrial							
Heavy Manufacturing; Light Manufacturing; Marine Industry; Trucking & Transportation Terminals; Mining & Extractive Industries							
Research & Development						50	
	Compatible	Indoor Uses	Standard construction methods should attenuate exterior noise to an acceptable indoor noise level.				
		Outdoor Uses	Activities associated with the land use may be carried out.				
45, 50	Conditionally Compatible	Indoor Uses	Building structure must attenuate exterior noise to the indoor noise level indicated by the number (45 or 50) for occupied areas.				
		Outdoor Uses	Feasible noise mitigation techniques should be analyzed and incorporated to make the outdoor activities acceptable.				
	Incompatible	Indoor Uses	New construction should not be undertaken.				
		Outdoor Uses	Severe noise interference makes outdoor activities unacceptable.				

Source: TABLE NE-3, City of San Diego General Plan, Noise Element.

City of San Diego Municipal Code 59.5.0401 (Noise Ordinance)

The Noise Ordinance sets operational noise level limits and makes it unlawful for any person to cause noise by any means to the extent that the 1-hour L_{eq} exceeds the applicable limit given in Table 4.10-10 at any location in the City of San Diego on or beyond the boundaries of the property on which the noise is produced.

Table 4.10-10. City of San Diego Noise Limits

Land Use	Time of Day	1-Hour L_{eq} (dBA)
Single Family Residential	7 a.m. to 7 p.m.	50
	7 p.m. to 10 p.m.	45
	10 p.m. to 7 a.m.	40
Multi-Family Residential (up to a maximum density of 1/2,000)	7 a.m. to 7 p.m.	55
	7 p.m. to 10 p.m.	50
	10 p.m. to 7 a.m.	45
All other Residential	7 a.m. to 7 p.m.	60
	7 p.m. to 10 p.m.	55
	10 p.m. to 7 a.m.	50
Commercial	7 a.m. to 7 p.m.	65
	7 p.m. to 7 a.m.	60
Industrial or Agricultural	Any time	75

Source: City of San Diego Municipal Code.

Note: The sound level limit at a location on a boundary between two zoning districts is the arithmetic mean of the respective limits for the two districts.

City of San Diego Municipal Code 59.5.0404 (Construction Noise)

The City of San Diego's Noise Ordinance also regulates construction noise levels. Specifically, construction that creates disturbing, excessive, or offensive noise is prohibited between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day, and on legal holidays as specified in Section 21.04 of the City of San Diego Municipal Code, with the exception of Columbus Day and Washington's Birthday, and on Sundays unless a permit is granted by the Noise Abatement and Control Administrator.

In granting a permit, the Administrator must consider whether the construction noise in the vicinity of the proposed work site would be less objectionable at night than during the daytime because of different population densities or different neighboring activities; whether obstruction and interference with traffic particularly on streets of major importance, would be less objectionable at night than during the daytime; whether the type of work to be performed emits noises at such a low level as to not cause significant disturbances in the vicinity of the work site; the character and nature of the neighborhood of the proposed work site; whether great economic hardship would occur if the work were spread over a longer time; and whether proposed night work is in the general public interest. Also, the Administrator shall prescribe such conditions, working times, types of construction equipment to be used, and permissible noise levels as deemed to be required in the public interest.

Except under special circumstances related to emergency work as detailed in the Noise Ordinance, construction activity that creates an average sound level greater than 75 dB during the 12-hour period from 7:00 a.m. to 7:00 p.m. at or beyond the property lines of any property zoned residential is prohibited by ordinance.

City of Imperial Beach

City of Imperial Beach General Plan

The City of Imperial Beach General Plan, Noise Element, provides information, goals, and policies related to the noise environment within Imperial Beach. The Noise Element describes the noise sensitivity of various land uses in terms of how acceptable different noise exposures are for various land uses, defined using L_{dn} or CNEL. There are three different tiers of compatibility: (1) Acceptable, (2) Conditionally Acceptable, and (3) Unacceptable. The guidelines are illustrated in Figure N-3 of the General Plan, which is reproduced below as Table 4.10-11.

Table 4.10-11. City of Imperial Beach Land Use Compatibility Guidelines for Development

Land Use			Community Noise Exposure L_{dn} or CNEL					
			55	60	65	70	75	80
Residential, Theaters, Auditoriums, Music Halls, Meeting Halls, Churches								
Transient Lodging – Motels, Hotels								
Schools, Libraries, Museums, Hospitals, Nursing Homes								
Playgrounds, Parks								
Commercial and Office Buildings								
	Acceptable	Specified land use is satisfactory. No noise mitigation measures are required.						
	Conditionally Acceptable	Use should be permitted only after careful study and inclusion of protective measures as needed to satisfy the policies of the Noise Element.						
	Unacceptable	Development is usually not feasible in accordance with the goals of the Noise Element.						

Source: City of Imperial Beach General Plan, Noise Element, Figure N-3 (p. N-4), 2015.

City of Imperial Beach Municipal Code – Operational Noise

Chapter 9.32 of the City of Imperial Beach Municipal Code regulates noise. Operational noise is addressed qualitatively and the code makes it “unlawful for any person, firm, association, or corporation to disturb the peace, quiet and comfort of the community or any portion thereof or neighborhood therein by creating or causing to be created any unreasonably loud or disturbing unnecessary noises in the city.”

City of Imperial Beach Municipal Code – Construction Noise

Regarding construction noise Section 9.32.020(H) of the City of Imperial Beach Municipal Code prohibits “The use of any tools, power machinery or equipment so as to cause noises disturbing to the comfort and repose of any person residing or working in the vicinity, or in excess of seventy-five decibels, between the hours of ten p.m. and seven a.m., except when the same is necessary for emergency repairs.”

City of Coronado

City of Coronado General Plan

The City of Coronado General Plan, Noise Element, provides information, goals, and policies related to the noise environment within Coronado. The Noise Element describes the noise sensitivity of

various land uses in terms of how acceptable different noise exposures are for various land uses, defined using the CNEL. There are four different tiers of compatibility: (1) Clearly Acceptable, (2) Normally Acceptable, (3) Normally Unacceptable, and (4) Clearly Unacceptable. The guidelines are illustrated in Figure 2 of the General Plan, which is reproduced, below, as Table 4.10-12.

Table 4.10-12 City of Coronado Noise Sensitivity of Land Use

Land Use	CNEL Value					
	45	55	65	75	85	95
Mobile Homes						
Single Family, Townhouses, Apartments						
High Rise Residence						
Hotels, Motels						
Schools, Churches, Libraries						
Auditoriums, Concert Halls						
Parks, Playgrounds

City of Coronado Municipal Code – Operational Noise

Title 41 of the City of Coronado Municipal Code provides the Noise Abatement and Control Regulations. Section 41.10.010 makes it unlawful for any person to cause noise by any means to the extent that the 1-hour L_{eq} exceeds the applicable limit given in Table 4.10-13 below, at any location in the City of Coronado on or beyond the boundaries of the property on which the noise is produced.

Table 4.10-13. City of Coronado Noise Limits

Land Use Zone	Time of Day	1-Hour L_{eq} (dBA)
All R-1A; R-1B (Single-Family Residential)	7 a.m. to 7 p.m.	50
	7 p.m. to 10 p.m.	45
	10 p.m. to 7 a.m.	40
All R-3; R-4; R-PCD; and R-5 (Multi-Family Residential and Planned Community Development Residential)	7 a.m. to 7 p.m.	55
	7 p.m. to 10 p.m.	50
	10 p.m. to 7 a.m.	45

Land Use Zone	Time of Day	1-Hour Leq (dBA)
Commercial (C); Commercial Recreation (C-R); Hotel/Motel (HM); Civic Use (C-U); Open Space (OS); and Parking Overlay (P-1)	7 a.m. to 10 p.m. 10 p.m. to 7 a.m.	60 50

Source: City of Coronado Municipal Code, Chapter 41.10.

Note: The sound level limit at a location on a boundary between two zoning districts is the arithmetic mean of the respective limits for the two districts.

City of Coronado Municipal Code – Construction Noise

The City of Coronado Municipal Code regulates both the permissible times of construction activities and the noise levels these activities can generate. Section 41.10.040 provides a construction noise curfew, which prohibits construction between the hours of 7:00 p.m. and 7:00 a.m. on any day or on legal holidays and Sundays (unless a noise control permit has been applied for and granted beforehand by the Noise Control Officer). Section 41.10.050 provides construction noise limits, making it unlawful for any person to conduct any construction activity so as to cause, at or within the property lines of any property zoned residential, an average sound level greater than 75 dBA during a 1-hour period, any time between the hours of 7:00 a.m. to 7:00 p.m. (unless a variance has been applied for and granted by the Noise Control Officer).

San Diego International Airport Land Use Compatibility Plan

Noise compatibility standards for aircraft operations are provided in Table 2-1 of the ALUCP for SDIA (Airport Land Use Commission, San Diego County Regional Airport Authority 2014). The noise compatibility standards address a broad range of land uses including residential, commercial, educational, institutional, public services, industrial, transportation, communication, utilities, recreation, parks, open space, and agriculture.

Naval Air Station North Island Airport Land Use Compatibility Plan

Noise compatibility standards for aircraft operations are provided in Table 4 of the ALUCP for NAS North Island (Airport Land Use Commission, San Diego County Regional Airport Authority 2020). The noise compatibility standards address a broad range of land uses including residences and lodging, manufacturing, transportation, communication, utilities, trade, services, culture, entertainment, recreation, and resource production and extraction.

4.10.6 Project Impact Analysis

4.10.6.1 Methodology

The following impact analysis evaluates the potential effects on noise and vibration conditions that could occur from future development consistent with the proposed PMPU. The methodology considers the existing noise and vibration conditions established under Section 4.10.4, *Existing Conditions*, and the thresholds of significance established under Section 4.10.6.2, *Thresholds of Significance*, to determine the proposed PMPU's potential to result in one or more impacts relative to existing noise and vibration conditions.

To avoid redundancy in the analysis and present a concise discussion, the analysis discusses the planning districts collectively, as appropriate. When a planning district has unique or special existing conditions and/or may result in one or more unique significant impacts with mitigation specific to that planning district, the analysis presents a separate discussion of that planning district.

Where feasible, potential impacts have been quantified based on general development descriptions provided in the proposed PMPU. In such cases, noise and vibration levels from construction or operations have been estimated based on existing data for similar projects. In general, those analyses use conservative assumptions to encompass a broad range of project possibilities.

A summary of the methodology is provided below. For potential future actions under the proposed PMPU that cannot be usefully quantified, a qualitative discussion is provided.

General Assumptions for Noise Calculations

Three of the most important variables affecting the noise level experienced at a noise-sensitive receptor are (1) the distance between the noise source and the receptor, (2) the ground conditions between the two, and (3) the acoustical shielding between the two. These are summarized below.

Source-to-Receiver Distances

Depending on the source in question and the noise metric to be assessed, one of two definitions can be used to describe the source-to-receiver distance, as summarized below.

Closest Distance. The closest source-to-receptor distance is very straightforward and describes the shortest distance between the noise-sensitive receptor and the closest part of the noise source, such as an individual piece of equipment or the closest edge of an active construction site.

Acoustical Average Distance. The acoustical average distance is used to represent noise sources that are mobile or distributed over an area (such as a construction site, sports field, or parking lot); it is calculated by multiplying the shortest distance between the receiver and the noise source area by the farthest distance and then taking the square root of the product:

$$\text{Acoustical average distance} = \sqrt{\text{Distance}_A \times \text{Distance}_B}$$

where Distance_A is the shortest distance between the receiver and the noise source area (i.e., the active construction site) and Distance_B is the longest distance between the receiver and the noise source area.

For a small stationary noise source, such as an individual piece of mechanical equipment, there is usually negligible difference between the closest distance and the acoustical average distance. However, the acoustical average distance is generally a more accurate description for larger distributed noise sources; in such cases, the acoustical average distance is always larger than the closest distance.

Ground Conditions

Noise levels were conservatively assumed to decrease at a rate of 6 dB per doubling of distance, which is the standard assumption for acoustically hard (i.e., reflective) ground surfaces such as asphalt, concrete, water, and packed dirt. In reality, the attenuation rate may be higher due to the presence of acoustically soft ground conditions (i.e., unpaved areas with ground cover such as packed dirt, soft dirt, turf, grass, or other vegetation).

Acoustical Shielding

Another conservative assumption in the modeling was to neglect barrier effects (acoustical shielding) that might be provided by walls, fences, buildings, topography, and other solid barriers.

Construction Noise

Construction-related noise was analyzed using data and modeling methodologies from FHWA's Roadway Construction Noise Model (RCNM) Version 1.1 (FHWA 2008), which predicts average noise levels at nearby receptors by analyzing the type of equipment, the distance from source to receptor, usage factor, and the presence or absence of intervening shielding between source and receptor. Although the proposed PMPU is not specifically a roadway construction project, the model is broad enough to be applicable, providing noise data for all equipment types typically required during conventional construction.

In order to facilitate quantitative construction noise analysis, it was necessary to make assumptions about the type of construction activity that might occur that would be associated with development consistent with the proposed PMPU. The most intensive future construction activities would be demolition, foundations, framing, and in-water pile driving. Therefore, representative construction scenarios have been assumed based on previous analyses for development within the District. Equipment schedules for the following construction scenarios were used.

1. **Typical mobilization/demolition.** Mobilization and demolition not requiring the loudest equipment associated with demolishing concrete structures (concrete saws and mounted impact hammers).
2. **Major mobilization/demolition.** Mobilization and demolition requiring the loudest equipment associated with demolishing concrete structures.
3. **Building foundations without pile driving.** Construction of building foundations that do not require pile driving, or during days when pile drivers are not used.
4. **Building foundations with one pile driver.** Construction of building foundations using a single pile driver.
5. **Building foundations with two pile drivers.** Construction of building foundations using two pile driving rigs simultaneously.
6. **Structural framing.** Construction of building framing.
7. **Marina construction without pile driving.** Construction of waterside elements that do not require pile driving, or during days when pile drivers are not used.
8. **Marina construction with pile driving.** Construction of waterside elements requiring pile driving.

These examples provide a range of realistic possibilities for waterside and landside construction, including typical worst-case (i.e., loudest) scenarios with pile driving. The equipment schedule for each construction activity is summarized in Table 4.10-14.

Table 4.10-14. Representative Construction Scenarios

Construction Phase/ Activity		Equipment (Number of Pieces)
1	Typical mobilization/ demolition	AC cold planer (1), loader (1), dump truck (2), backhoe loader (1), water truck (1)
2	Major mobilization/ demolition	Concrete saw (1), mounted impact hammer (1), loader (1), dump truck (2), backhoe loader (1), water truck (1)
3	Building foundations without pile driving	Grader (1), excavator (2), loader (2), dump truck (2), backhoe loader (2), water truck (1)
4	Building foundations with one pile driver	Grader (1), excavator (2), loader (2), dump truck (2), backhoe loader (2), water truck (1), pile driving rig (1)
5	Building foundations with two pile drivers	Grader (1), excavator (2), loader (2), dump truck (2), backhoe loader (2), water truck (1), pile driving rig (2)
6	Structural framing	Crane (2), concrete pump (2), all terrain forklifts (2), backhoe loader (1), water truck (1)
7	Marina construction without pile driving	Forklift (1), portable crane (1), derrick barge (1), push boat (1), skiffs (2)
8	Marina construction with pile driving	Forklift (1), portable crane (1), derrick barge (1), push boat (1), skiffs (2), pile driver (1), jet pump (1)

Because construction noise is assessed against L_{eq} noise limits of varying durations (1-hour, 8-hour, or 12-hour), depending on the city in which the construction takes place, both the duration of construction and the combination of construction equipment operating simultaneously are important. To provide a conservative analysis for each phase, the noise level was calculated as a 1-hour L_{eq} assuming all equipment for that phase would operate during the hour. (This is considered to be conservative because it does not consider equipment downtime that would occur over a longer 8- or 12-hour calculation period.) Using this methodology, potential impact distances were calculated for the various construction phases that could be necessary at future projects. These results can be used in the future as screening distances beyond which the various construction activities would not generate significant impacts.

Operation

Traffic

The analysis was conducted using a proprietary traffic noise model, with calculations based on data from the FHWA Traffic Noise Model, Version 2.5, Look-Up Tables (FHWA 2004). The inputs used in the traffic noise modeling included the average daily traffic (ADT) data; assumed traffic mix and daily distribution data (i.e., the percentage of automobiles versus medium trucks and heavy trucks during each hour of the day); and traffic speeds, based on the posted speed limits. The ADT data was provided by Chen Ryan Associates (the traffic engineer for the proposed PMPU). The data was provided for two scenarios: (1) existing conditions and (2) horizon year with PMPU development. The noise modeling (including the model inputs and outputs) is provided in Appendix H.

Onsite Operation

At a programmatic level, the proposed PMPU plans for a wide assortment of possible future development. Examples of allowable development are provided in Chapter 3, *Project Description*,

and future development (i.e. planned improvements) is discussed under Section 3.5.3 and within Table 3-4. Moreover, as indicated in Chapter 3, development consistent with the proposed PMPU's goals, objectives, and policies, including the Water and Land Use Element, as well as the development standards of the individual planning districts, could be proposed in the future during the life of the proposed PMPU even if it is not included in Table 3-4. Noise from onsite operations is mostly discussed qualitatively. Quantitative assessments are provided where adequate data is available.

Vibration

Construction-related vibration was analyzed using data and modeling methodologies provided by Caltrans' *Transportation and Construction Vibration Guidance Manual* (Caltrans 2020). This guidance manual provides typical vibration source levels for various types of construction equipment, as well as methods for estimating the propagation of groundborne vibration over distance. Because potential vibration impacts are assessed based on peak levels, rather than long-term average levels, the source-to-receptor distances used in the analyses were the closest distances between the relevant construction activity and each receptor. Table 4.10-15 provides the reference PPV for various types of construction equipment expected to be used over the course of the proposed PMPU. The levels are provided for a reference distance of 25 feet.

Table 4.10-15. Construction Equipment Reference Vibration Levels

Equipment Item	Reference PPV at 25 feet, in/s ¹
Pile driver (impact or vibratory)	0.650
Hydraulic breaker ²	0.240
Vibratory roller	0.210
Large bulldozer ³	0.089
Drilling ⁴	0.089
Jackhammer	0.035
Small bulldozer ⁵	0.003

¹ Obtained from Caltrans 2020.

² Also commonly referred to as a hoe ram.

³ Considered representative of other heavy earthmoving equipment such as excavators, graders, and backhoes.

⁴ Based on caisson drilling.

⁵ Considered representative of other smaller earthmoving equipment such as a Bobcat® or skid steer.

The following equation from the guidance manual was used to estimate the change in PPV levels over distance.

$$PPV_{rec} = PPV_{ref} \times (25/D)^n$$

where PPV_{rec} is the PPV at a receptor, PPV_{ref} is the reference PPV at 25 feet from the equipment, D is the distance from the equipment to the receiver in feet, and n is a value related to the vibration attenuation rate through ground (the default recommended value for n is 1.1).

Using this methodology, potential impact distances were calculated for the various types of vibration-generating construction equipment that could be used at future projects. Impact distances were calculated relative to thresholds for both potential building damage and for potential human

annoyance. These results can be used in the future as screening distances beyond which the various construction activities would not generate significant impacts.

Supplemental Noise Guidelines

The City of San Diego's California Environmental Quality Act (CEQA) Significance Determination Thresholds outline the criteria and thresholds used by the city to determine whether project impacts are significant (City of San Diego 2016). The thresholds for traffic-generated noise, which are reproduced below as Table 4.10-16, are used in this PEIR for assessing traffic noise impacts within the city (see Section 4.10.6.2, *Thresholds of Significance*).

Table 4.10-16. City of San Diego Traffic Noise Significance Thresholds

Structure or Proposed Use that Would Be Impacted by Traffic Noise	Interior Space (CNEL)	Exterior Usable Space ¹ (CNEL)	General Indication of Potential Significance
Single-Family Detached	45 dB	65 dB	Structure or outdoor usable area ² is <50 feet from the center of the closest (outside) lane on a street with existing or future ADT >7,500
Multi-Family, Schools, Libraries, Hospitals, Day Care, Hotels, Motels, Parks, Convalescent Homes	Development Services Department ensures 45 dB pursuant to Title 24	65 dB	
Offices, Churches, Business, Professional Uses	N/A	70 dB	Structure or outdoor usable area is <50 feet from the center of the closest lane on a street with existing or future ADT of >20,000
Commercial, Retail, Industrial, Outdoor Spectator Sports Uses	N/A	75 dB	Structure or outdoor usable area is <50 feet from the center of the closest lane on a street with existing or future ADT of >40,000

Source: City of San Diego, CEQA Significance Determination Thresholds, Table K-2, p. 51, 2016.

¹ If a project is currently at or exceeds the significance thresholds for traffic noise described above, and noise levels would result in less than a 3 dB increase, then the impact is not considered significant.

² Exterior usable areas do not include residential front yards or balconies, unless the areas such as balconies are part of the required usable open space calculation for multi-family units.

ADT = average daily traffic.

4.10.6.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines (2018) and the various laws, regulations, and guidelines discussed in Section 4.10.5, *Laws, Regulations, Plans, and Policies*, and provide the basis for determining significance of impacts from noise and vibration associated with the implementation of the proposed PMPU. The determination of whether a noise impact would be significant is based on the thresholds described below, the professional judgment of the District as Lead Agency, and the recommendations of qualified personnel at ICF and are supported by substantial evidence in the record.

The District has not adopted its own specific thresholds of impact for potential noise and vibration impacts and, therefore, uses, where appropriate, the standards and guidelines of other agencies, such as its member cities or Caltrans. Significance criteria for each issue area may be subdivided to address distinct noise sources (e.g., construction, onsite operations, traffic). All thresholds would apply at the location of the affected sensitive receptor and not at the project site boundaries unless the boundary is shared with the sensitive receptor.

The development of these criteria does not imply that quantitative analyses are necessary in all cases for all future projects that tier from this PEIR. Depending on the specific characteristics of the project under consideration, it may be obvious that there would be no significant impacts related to noise/vibration issue areas. In such cases, a qualitative discussion, backed by substantial evidence, would be sufficient.

Impacts are considered significant if the proposed PMPU would result in any of the following.

1. The project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

For construction activity:

- a. Construction activity fails to comply with the construction noise standards of the applicable member city, typically provided by the municipal code, in which the project is to be constructed. In the event that the applicable city does not have quantitative construction noise limits, the applicable noise standard shall be an 8-hour L_{eq} of 75 dBA between 7 a.m. and 7 p.m.

For onsite (stationary) noise sources:

- a. Noise from onsite operational activity exceeds the exterior noise standards of the applicable member city, typically provided by the municipal code, in which the project is proposed. For the City of Imperial Beach, which does not have any quantitative standards, the standards of the County of San Diego shall be applied; or
- b. Noise from onsite operational activity increases ambient noise levels by 5 dBA or more (a readily perceptible change) if the resulting combined noise level is less than or equal to the applicable municipal code standard; or
- c. Noise from onsite operational activity increases ambient noise levels by 3 dBA or more (a barely perceptible change) if the resulting combined noise level is greater than the applicable municipal code standard.

For traffic noise:

- a. Based on existing-plus-project conditions, the project increases existing traffic noise levels by 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member city, or any traffic noise increase of 5 dB CNEL or more. For the City of San Diego, the applicable standards are contained in the City of San Diego's CEQA Significance Determination Thresholds. For all other cities, the applicable standard/guideline shall be taken from the noise-land use compatibility matrix of the noise element of their general plan; noise levels classified as "Compatible," "Conditionally Compatible," "Acceptable," "Clearly Acceptable," "Normally Acceptable," "Conditionally

Acceptable,” or similar shall be considered to comply with applicable standards for the purposes of analyzing traffic noise impacts.

2. The project would result in generation of excessive groundborne vibration or groundborne noise levels.

For construction activity:

- a. Groundborne vibration exceeds Caltrans’ guideline vibration criteria for damage to structures at any nearby buildings or annoyance to people (distinctly perceptible vibration) at any vibration-sensitive location, based on the most recent Caltrans’ *Transportation and Construction Vibration Guidance Manual* (2020 or newer).

For onsite operational sources of vibration:

- b. Groundborne vibration exceeds 0.01 in/s over the range of 1 to 100 Hz at or beyond the property boundary of the source.
3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, the project would expose people residing or working in the project area to excessive noise levels.
 - a. The project exacerbates existing aircraft-related noise conditions at noise-sensitive receptors such that exposure to aircraft noise levels in excess of the standards of the applicable ALUCP/AICUZ would result or, where no applicable ALUCP/AICUZ exists, the standards of the general plan for the city in which the project is to be constructed. “Exacerbates” shall be interpreted as an increase of 5.0 dB or more where ambient noise levels are less than 60 dB, 3.0 dB or more where ambient noise levels are 60–65 dB, or 1.5 dB or more where ambient noise levels are greater than 65 dB (L_{dn} or CNEL).

4.10.6.3 Policies that May Avoid or Reduce Impacts

There are no policies of the proposed PMPU Elements that directly address noise or vibration. Therefore, no specific potential noise or vibration impacts would be reduced or avoided because of the proposed PMPU policies.

Chapter 6, *Plan Implementation and Development Conformance*, of the Port Master Plan (PMP) requires that all development under the PMP conforms with various requirements to be consistent with the PMP. While these requirements are not strictly PMP policies, they nonetheless include actions that would avoid and reduce impacts related to aircraft noise. Specifically, Section 6.2.3, *Regional Water and Land Use Compatibility*, of the PMP discusses how the District will achieve consistency with the applicable ALUCPs, including noise/land use compatibility:

“Upon completion of the following actions, the ALUCPs will be implemented and the District will be responsible for the consistency review of discretionary and ministerial projects located within the AIAs listed above.

1. The District shall coordinate with the ALUC to ensure consistency with the ALUCPs as follows:
 - a. In the preparation of future amendments or updates to the ALUCPs to ensure the compatibility of District water and land uses with airport operations; and

- b. For submission of all future PMPAs to the ALUC for a determination of consistency with the adopted ALUCPs. This should typically occur prior to any BPC or CCC approval of a subject PMPA.
- 2. After a PMPA has been determined by the ALUC to be consistent with applicable ALUCPs, the District shall:
 - a. Coordinate with the ALUC to implement the ALUCPs as required under California Government Code §65302.3(a), (b) and (c). Legislative actions (Port Master Plan amendments) will continue to be forwarded to the ALUC for consistency review; and
 - b. Use the applicable ALUCP as guidance/reference during consistency review of discretionary and ministerial developments on Tidelands that are within an AIA. For ALUCPs that have not been implemented, the District shall continue to submit all developments that are within an AIA to the ALUC for review (refer to *SR Policies 1.1.7 through 1.1.9 [Chapter 3.4, Safety and Resiliency Element]* regarding guidance for safe development in the AIA)."

4.10.6.4 Project Impacts and Mitigation Measures

Impacts associated with the proposed PMPU are discussed below. Each topic analyzed is divided into specific issues, based on potential impacts, and addresses construction- and operation-related impacts separately wherever relevant. The discussion of potential impacts is based on the applicable threshold of significance (see below) for each issue.

An analysis of each of the possible three project options is also provided following the proposed PMPU analysis—consistent with applicable thresholds and at the same level of review as the PMPU. For reference, the details of each option are described in Chapter 3.

Threshold 1: Result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the proposed PMPU in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Impact Analysis

Impacts of Water and Land Uses

Construction

The potential for significant construction noise impacts would depend on the combination of construction equipment used, the proximity of the work to sensitive receptors, and the time of day at which the work occurs. The exact thresholds of impact vary depending on the city in which the construction activity is located and are summarized in Table 4.10-17.

Table 4.10-17. Summary of Construction Noise Thresholds by City

City	Municipal Code Section	Construction Hours Prohibited	Construction Noise Level Limits
Coronado	41.10	7:00 p.m. – 7:00 a.m. Monday through Saturday; Sundays; legal holidays	75 dBA $L_{eq(h)}$ (1-hour average)
Imperial Beach	9.32	10:00 p.m. – 7:00 a.m.	75 dBA $L_{eq(8)}$ (8-hour average) ¹
San Diego	59.5	7:00 p.m. – 7:00 a.m. Monday through Saturday; Sundays; certain legal holidays	75 dBA $L_{eq(12)}$ at residential properties (12-hour average)

¹ Duration of noise is not specified in the City of Imperial Beach Municipal Code; 8-hour average is assumed for consistency with the County of San Diego Municipal Code.

The timing, location, and duration of construction activities associated with future development allowed under the proposed PMPU, are not known at this time. However, using the methodology described in Section 4.10.6.1, the impact distances, within which construction noise would potentially exceed 75 dBA L_{eq} , were calculated for the range of representative construction scenarios. The analyses are provided in Appendix H, and the results are summarized in Tables 4.10-18 and 4.10-19. Table 4.10-18 is provided for comparison purposes and illustrates the relative noise level for each scenario at a reference distance of 50 feet. Table 4.10-19 shows the calculated distance from each phase of construction at which the noise level would be reduced to 75 dBA L_{eq} . These can be considered screening distances for the range of construction activities anticipated to occur under the proposed PMPU. The appropriate screening distance for construction scenarios or phases not specifically described in Table 4.10-19 can be determined based on the equipment lists provided in Table 4.10-14, with particular attention paid to any inclusion of high-noise equipment, such as concrete saws, impact hammers, or pile drivers. Similar construction activities conducted in the future would not be expected to cause significant impacts at noise-sensitive receptors beyond the relevant distances from a project site. In general, these distances may be considered conservative because they do not consider the potential noise reduction that may occur because of the presence of acoustically soft ground cover or barrier effects provided by intervening buildings, walls, fences, or topography. For the simplest and most conservative screening approach the distances may be considered the closest allowable distances between the active construction zone and a given receiver. However, if the equipment is expected to be mobile across a work area, then these distances will more accurately correspond to acoustical average distances.

Table 4.10-18. Construction Noise Levels from Representative Construction Scenarios

Construction Scenario	L_{eq} at Reference Distance of 50 feet, dBA (1-hour, 8-hour, or 12-hour average)
1 Typical mobilization/demolition	82.3
2 Major mobilization/demolition	87.5
3 Building foundations without pile driving	85.9
4 Building foundations with one pile driver	94.9
5 Building foundations with two pile drivers	97.6
6 Structural framing	82.5

Construction Scenario		L_{eq} at Reference Distance of 50 feet, dBA (1-hour, 8-hour, or 12-hour average)
7	Marina construction without pile driving	84.6
8	Marina construction with pile driving	94.8

Table 4.10-19. Distances Required to Reduce Construction Noise Levels to 75 dBA L_{eq}

Construction Scenario		Distance from Construction Activity Required to Reduce Noise Levels to 75 dBA L_{eq} or Less (feet)¹
1	Typical mobilization/demolition	115
2	Major mobilization/demolition	215
3	Building foundations without pile driving	175
4	Building foundations with one pile driver	495
5	Building foundations with two pile drivers	680
6	Structural framing	120
7	Marina construction without pile driving	155
8	Marina construction with pile driving	495

¹ For screening purposes these distances may conservatively be considered the closest allowable distances between the active construction zone and a given receiver. However, if the equipment operating on any given day is expected to be mobile across a work area, then these distances may be considered acoustical average distances.

The largest impact distances are all associated with construction scenarios that include pile driving (i.e., scenarios 4, 5, and 8), with the worst-case scenario (scenario 5) utilizing two pile drivers simultaneously. Without pile driving, impacts are limited to distances of 215 feet or less. The proposed PMPU considers a wide range of future development potential, from adding pedestrian and bike paths and resurfacing piers, to creating mobility hubs of varying sizes, improving and reconfiguring roadways, and installing large-scale commercial developments (including hotels, retail, restaurants, and meeting space). Because the exact construction details and locations of future development are unknown, project-level impacts cannot be quantified. However, noise-sensitive water and land uses are located throughout and adjacent to all of the planning districts and could be located within the applicable impact distances of future construction. As a result, it is possible that construction noise generated under the proposed PMPU will exceed the threshold of 75 dBA L_{eq} at parks (**Impact-NOI-1**) or other noise-sensitive receptors (**Impact-NOI-2**) in any of the planning districts, or within 680 feet of a planning district boundary. In addition, the possibility of construction activity during prohibited days and hours cannot be ruled out. Noise from any such activity that is not reduced to comply with applicable evening and nighttime standards for stationary noise sources (refer to Tables 4.10-8, 4.10-10, and 4.10-13) would also cause a significant construction noise impact (**Impact-NOI-3**). As a result, the impact is significant prior to mitigation.

As discussed in PEIR, Chapter 3, Project Description, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction noise impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the PMPU, including within PD3, would result in significant construction noise impacts (**Impact-NOI-1**, **Impact-NOI-2**, and **Impact-NOI-3**). These significant impacts would still occur within PD3 under Option 1 because of the same future development that could still occur outside of the Option 1 boundary within PD3.

The types of construction that would occur for Option 1 would fall within the range of scenarios analyzed above. Assuming Option 1 would not include substantial buildings or waterside improvements that would require pile driving, noise impacts could occur at sensitive receptors located within approximately 215 feet of the construction area. The impact distance would increase to 495 to 680 feet if pile driving is required. Depending on the final construction methods and project footprint, sensitive receptors within these distances that could experience construction noise levels in excess of 75 dBA L_{eq} could include parks such as Tuna Harbor Park or the County Administration Center (CAC) Waterfront Park (**Impact-NOI-1**) and also existing residences (condominiums) on Pacific Highway (**Impact-NOI-2**). In addition, the possibility of construction activity during prohibited days and hours cannot be ruled out. Noise from any such activity that is not reduced to comply with applicable evening and nighttime standards for stationary noise sources (refer to Tables 4.10-8, 4.10-10, and 4.10-13) would also cause a significant construction noise impact (**Impact-NOI-3**). However, these would not be additional or more severe impacts than buildout of the PMPU, without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the PMPU, including within PD3, would result in significant construction noise impacts (**Impact-NOI-1**, **Impact-NOI-2**, and **Impact-NOI-3**). These significant impacts would still occur within PD3 under Option 2, as a result of the same future development that could still occur outside of the Option 2 boundary, within PD3.

The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. Assuming Option 2 would not include substantial buildings or waterside improvements that would require pile driving, noise impacts could occur at sensitive receptors located within approximately 215 feet of the construction area. The impact distance would increase to 495 to 680 feet if pile driving is required. Depending on the final methods of construction, sensitive receptors within these distances that could experience construction noise levels in excess of 75 dBA L_{eq} could include parks such as the CAC Waterfront Park or Lane Field Park (**Impact-NOI-1**) and also existing residences (condominiums) on Pacific Highway (**Impact-NOI-2**). In addition, the possibility of construction activity during prohibited days and hours cannot be ruled out. Noise from any such activity that is not reduced to comply with applicable evening and nighttime standards for stationary noise sources (refer to Tables 4.10-8, 4.10-10, and 4.10-13) would also cause a significant construction noise impact (**Impact-NOI-3**).

However, these would not be additional or more severe impacts than buildout of the PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the PMPU, including within PD3, would result in significant construction noise impacts (**Impact-NOI-1**, **Impact-NOI-2**, and **Impact-NOI-3**). These significant impacts would still occur within PD3 under Option 3, as a result of the same future development that could still occur outside of the Option 3 boundary within PD3.

The types of construction that would occur for Option 3 would fall within the range of scenarios analyzed above. Assuming Option 3 would not include substantial buildings or waterside improvements that would require pile driving, noise impacts could occur at sensitive receptors located within approximately 215 feet of the construction area. The impact distance would increase to 495 to 680 feet if pile driving is required. Depending on the final construction methods and project footprint, sensitive receptors within these distances that could experience construction noise levels in excess of 75 dBA L_{eq} could include parks, such as the CAC Waterfront Park or Lane Field Park (**Impact-NOI-1**) and also existing residences (condominiums) on Pacific Highway (**Impact-NOI-2**). Depending on the phasing of construction, some noise impacts at parks may be eliminated by the closure of those parks as part of Option 3 (for instance closing parts of CAC Waterfront Park to make way for the realigned Harbor Drive). In addition, the possibility of construction activity during prohibited days and hours cannot be ruled out. Noise from any such activity that is not reduced to comply with applicable evening and nighttime standards for stationary noise sources (refer to Tables 4.10-8, 4.10-10, and 4.10-13) would also cause a significant construction noise impact (**Impact-NOI-3**). However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Option 3.

Traffic

Traffic noise levels were estimated along each of the 47 roadway segments analyzed by the traffic study. The traffic noise analysis is provided in Appendix H, and the results are summarized in Table 4.10-20. The table shows the existing traffic noise levels, the future (2050) noise levels, and the resulting increase. Referring to the summarized results, noise levels at 50 feet from the centerline of the studied roadways range from approximately 52–77 dB CNEL under existing conditions and from approximately 53–75 dB CNEL under 2050 conditions. The changes in traffic noise adjacent to any individual roadway range from approximately -3 to +6 dB. (A doubling of traffic would increase traffic-related noise by 3 dB [CODOT, n.d.]) The future traffic noise impacts in the list below are anticipated with implementation of the proposed PMPU and are considered significant (**Impact-NOI-4**). The roadway segments with predicted noise impacts are highlighted in Table 4.10-20. All the identified impacts occur within the City of San Diego. The affected noise-sensitive land uses consist of hotels/motels, parks, and condominiums. Based on the City of San Diego traffic noise significance thresholds, the exterior traffic noise threshold for all of these uses is 65 dB CNEL.

- Harbor Island Drive between North Harbor Drive and Harbor Island Drive southern terminus, due to a noise increase of 3 dB or more (4.6 dB) at a hotel, with a resulting noise level in excess of 65 dB CNEL (69.4 dB CNEL).

- Harbor Island Drive from the western terminus, due to a noise increase of 3 dB or more (5.5 dB) at hotels and Harbor Island Park, with a resulting noise level in excess of 65 dB CNEL (67.2 dB CNEL).
- Pacific Highway between West Laurel Street and West Hawthorn Street, due to a noise increase of 3 dB or more (5.0 dB) at hotels/motels, with a resulting noise level in excess of 65 dB CNEL (69.9 dB CNEL).
- Pacific Highway between West Ash Street and West Broadway, due to a noise increase of 3 dB or more (3.1 dB) at condominiums and hotels, with a resulting noise level in excess of 65 dB CNEL (68.9 dB CNEL).
- West Ash Street between North Harbor Drive and Pacific Highway, due to a noise increase of 3 dB or more (3.2 dB) at a hotel and CAC Waterfront Park, with a resulting noise level in excess of 65 dB CNEL (66.2 dB CNEL).

It is important to note that the above impacts are identified based on the available plan-level traffic data for an approximately 30-year time horizon. If and when such impacts would actually occur is unclear and would depend on the pace of buildout and the details of the individual projects implemented under the proposed PMPU.

In addition to the predicted changes in traffic volumes, impacts may occur as a result of the various roadway improvement and modification projects planned under the proposed PMPU. Specific potential impacts due to those roadway projects cannot be predicted because project design details are not available. The roadway changes would not create a significant impact unless they would increase traffic noise levels at a sensitive receptor by at least 3 dB CNEL (possibly 5dB, depending on the resulting noise level). A 3 dB increase correlates to a doubling of acoustical energy, which would generally occur as a result of one of the following.

- Removing acoustical shielding between the roadway and an adjacent noise-sensitive receptor, either by removing a physical barrier or substantially changing the vertical alignment of the street so that existing barrier(s) are no longer efficient.
- Horizontally realigning the roadway so that the distance between the traffic and the receiver is reduced by at least 50 percent.

The potential for these conditions to occur is small because the planning districts are largely built out and there is generally not enough room to substantially realign existing streets. Nonetheless, the possibility of significant traffic noise impacts cannot be ruled out, and the impact is significant **(Impact-NOI-5)**.

Table 4.10-20. Existing and Future Traffic Noise Levels

Planning District/Roadway	Segment	Existing Traffic Noise Levels ¹	Future (2050) with PMPU ¹	Increase Over Existing

¹ At 50 feet from roadway centerline (dB CNEL).

* Noise levels that result in significant impacts. The impacts occur at adjacent noise-sensitive receptor(s) due to a combination of future noise levels and the associated increase over existing noise levels.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the traffic noise effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Traffic noise impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant traffic noise impacts (**Impact-NOI-4** and **Impact-NOI-5**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the Option 1 boundary within PD3.

Option 1 has the potential to change traffic circulation in the vicinity due to the possibility of closing of North Harbor Drive to automobile circulation. As a result, traffic noise levels adjacent to streets in the vicinity could change, including on streets adjacent to noise-sensitive land uses such as hotels/motels, parks, and residences. Because specific future traffic volumes as a result of Option 1 are currently unknown, future traffic noise levels cannot be calculated and potentially significant traffic noise increases cannot be ruled out. Therefore, it is concluded that significant traffic noise impacts could occur at nearby noise-sensitive receivers due to Option 1 (**Impact-NOI-4**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant traffic noise impacts (**Impact-NOI-4** and **Impact-NOI-5**). These significant impacts would still occur within PD3 under Option 2 because of the same future development that could still occur outside of the Option 2 boundary within PD3.

Option 2 would provide additional park space but would not alter the existing roadway system and is not anticipated to double the traffic volumes on any roadway segment(s). As a result, Option 2 would not generate a substantial traffic noise increase (3 dB or more) at any noise-sensitive receiver and traffic noise impacts would be less than significant, and mitigation would not be required for Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant traffic noise impacts (**Impact-NOI-4** and **Impact-NOI-5**). These significant impacts would still occur within PD3 under Option 3 because of the same future development that could still occur outside of the Option 3 boundary within PD3.

Option 3 would relocate traffic on North Harbor Drive to the east of its current location and could also potentially change traffic circulation on other roadways in the vicinity. As a result, traffic noise levels at adjacent land uses, including at noise-sensitive land uses such as hotels/motels, parks, and residences, could change. Because specific future traffic volumes as a result of Option 3 are currently unknown, future traffic noise levels cannot be calculated and potentially significant traffic noise increases cannot be ruled out. Therefore, it is concluded that significant traffic noise impacts could occur at nearby noise-sensitive receivers due to Option 3 (**Impact-NOI-4**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Onsite Stationary Sources

The proposed PMPU includes a range of planned or potential future development that would generate various levels of operational noise. Some examples include hotels, mobility hubs, and waterside vessel use from additional slips. A complete list of development projections and the increase in future development authorized by the PMPU is included in Chapter 3, *Project Description*, within Table 3-4, *Baywide Development Projections*. The precise location, design, and operational details of this future development are unknown. In some cases, these uses will be large distances (hundreds to thousands of feet) from the closest noise-sensitive receptors, and the resulting noise levels would likely be below existing ambient noise levels. However, due to the mix of existing uses, including noise-sensitive receptors, within and adjacent to the various planning districts, it is likely that some future development will be close to noise-sensitive receptors. The following sections discuss the noise effects of various types of anticipated development.

Mobility Hubs and Water-Based Transfer Points

Mobility hubs and water-based transfer points are proposed to aid navigation of visitors to and within the Tidelands. Water-based transfer points, which may operate as part of a mobility hub or standalone, would consist primarily of landing areas to load/unload passengers, which would not be expected to generate high noise levels. There are three types of proposed mobility hubs: Connector Mobility Hubs, Local Gateway Mobility Hubs, and Regional Mobility Hubs. Table 4.10-21 summarizes the number and location of mobility hubs proposed as part of the proposed PMPU.

Table 4.10-21. Proposed Mobility Hubs by Planning District

Planning District	Number of Proposed Mobility Hubs by Type		
	Connector Mobility Hub	Local Gateway Mobility Hub	Regional Mobility Hub
PD1	2	1	0
PD2	0	1	1
PD3	0	2	1
PD4	0	0	0
PD7	0	0	0
PD8	1	0	0
PD9	1	0	0
PD0	0	1	0

Notes: PD5 and PD6 are not included because they are not part of the proposed PMPU.

Connector Mobility Hubs would not generate substantial noise levels because they consist of passive and transient uses such as bus stops and bike share stations. Local Gateway Mobility Hubs are generally slightly larger with close access to additional transit facilities, including nearby parking; these hubs would be developed around public open space and/or plazas and would not be expected to substantially increase existing noise levels. Regional Mobility Hubs would be the largest hubs and may provide new parking facilities that could increase ambient noise levels at nearby noise-sensitive receptors. Guidance from the FTA (2018) provides screening criteria for noise impacts from parking facilities. The noise screening procedure is intended to be conservative and, as such, assumes facilities are operating under relatively high-capacity conditions. In the case of parking facilities, 1,000 vehicle movements (i.e., vehicles either arriving or departing) per hour are assumed. For these assumptions, the FTA indicates that noise would be expected to drop below 50 dBA 1-hour L_{eq} at an unobstructed distance of 125 feet. For locations with intervening buildings (that would provide acoustical shielding), this distance is reduced to 75 feet. The 50 dBA 1-hour L_{eq} corresponds to the most stringent daytime noise limit at noise-sensitive receptors in the relevant municipal codes (County of San Diego, City of San Diego, and City of Coronado). As a result, significant noise impacts may occur if a Regional Mobility Hub is located within 125 feet of a noise-sensitive receptor (**Impact-NOI-6**). As noted in Table 4.10-21, Regional Mobility Hubs are only proposed in PD2 and PD3.

Waterside Slips/Berthing

Increases in waterside slips are proposed in PD1, PD2, PD3, PD9, and PD10. The increases are relatively small in proportion to existing conditions, ranging from 3 percent in PD1 (100 proposed versus 2,946 existing) to 29 percent in PD3 (150 proposed versus 523 existing). Assuming the increases cause a corresponding increase in overall activity, noise increases would be up to 1.1 dB, which would be inaudible, and the impact would be less than significant.

Passive Uses

The proposed PMPU includes various uses that can be considered passive from a noise perspective. These are facilities that do not include permanent noise sources and which people will use temporarily without generating high noise levels. Examples include sidewalks, promenades, trails, bike paths, and pedestrian bridges. Noise levels from these uses would be less than significant.

Commercial Uses and Recreational Open Space

Planned or potential future development under the proposed PMPU could include a range of commercial uses and recreational open space. Commercial uses could include, but are not limited to, hotels, restaurants, retail, meeting space, marine services, and secondary uses such as aquaculture. Commercial uses may include noise sources associated with various building systems such as mechanical equipment (e.g., heating, ventilation, and air conditioning [HVAC] systems; air handlers; cooling towers; exhaust fans), plumbing systems (e.g., boilers, pumps), and trash compactors. Commercial uses and recreational open space can also generate noise due to parking lots and outdoor activity areas. The potential noise levels from building systems can vary dramatically depending on the type, size, number, and location of equipment items. Example noise levels were obtained from a prior study conducted for a large hotel. Manufacturers' data for individual mechanical equipment items indicate sound power levels of approximately 81 to 106 dBA, which

equates to noise levels of 46 to 71 dBA at a distance of 50 feet.⁷ With noise limits in the range of 40 to 65 dBA 1-hour L_{eq} , depending on the city, the receiving land use, and the time of day, it is clear that noise levels from commercial developments could exceed local standards if projects are located close to existing noise-sensitive receptors. This would be a significant impact prior to mitigation (**Impact-NOI-7**).

Planned development within PD2, PD3, and PD8 would be similar to the existing development. As a result, noise from many day-to-day activities would be similar to the existing ambient environment. However, higher noise levels may be associated with outdoor uses that have amplified music, such as patios or pool decks, especially those associated with restaurants and bars. Noise from these areas could occur regularly (often daily), but noise levels would likely vary throughout the year (for instance, many uses would be busier during the summer). It is also possible that some of the proposed new developments, including parks, could host less frequent but larger outdoor special events such as weddings, exhibits, social gatherings, fundraisers, concerts, music festivals, and art exhibits, which would be attended by large numbers of people and would include live or recorded music. Although noise from outdoor operations would be regulated by the local noise ordinance, noise from outdoor events and activities could exceed relevant noise standards, which is considered a significant impact prior to mitigation (**Impact-NOI-8**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes onsite stationary noise impacts associated with each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Noise impacts from onsite stationary sources associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operational noise impacts from stationary sources (**Impact-NOI-6**, **Impact-NOI-7**, and **Impact-NOI-8**). These significant impacts would still occur within PD3 under Option 1 because of the same future development that could still occur outside of the Option 1 boundary within PD3.

Passive uses at the Waterfront Destination Park created under Option 1, such as people walking, sitting, talking, picnicking, or exercising, would create low operational noise levels. These noise levels would not substantially change the existing ambient noise in the vicinity and the noise impacts from these passive uses would be less than significant. Consequently, no significant noise impacts associated with Regional Mobility Hubs, or commercial land uses would occur under Option 1 and the changes this option would propose within PD3. However, high noise levels could be generated if special events are conducted at the park, especially if these events

⁷ $SPL = SWL - 20 \times \log(D) - 0.6$, where SPL is the sound pressure level (noise level) in dBA, SWL is the sound power level in dBA, and D is the distance in feet.

include amplified speech, live or recorded music, and/or large crowds. Noise levels from such events could potentially exceed applicable noise thresholds at nearby noise-sensitive receptors and the impact would be significant (**Impact-NOI-8**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operational noise impacts from stationary sources (**Impact-NOI-6**, **Impact-NOI-7**, and **Impact-NOI-8**). These significant impacts would still occur within PD3 under Option 2 because of the same future development that could still occur outside of the Option 2 boundary within PD3.

Passive uses at the park created under Option 2, such as people walking, sitting, talking, picnicking, or exercising, would create low operational noise levels. These noise levels would not substantially change the existing ambient noise in the vicinity, and the noise impacts from these passive uses would be less than significant. Consequently, no significant noise impacts associated with Regional Mobility Hubs, or commercial land uses would occur under Option 2 and the changes this option would propose within PD3. However, high noise levels could be generated if special events are conducted at the park, especially if these events include amplified speech, live or recorded music, and/or large crowds. Noise levels from such events could potentially exceed applicable noise thresholds at nearby noise-sensitive receptors and the impact would be significant (**Impact-NOI-8**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including in PD3, would result in significant operational noise impacts from stationary sources (**Impact-NOI-6**, **Impact-NOI-7**, and **Impact-NOI-8**). These significant impacts would still occur within PD3 under Option 3 because of the same future development that could still occur outside of the Option 3 boundary within PD3.

Passive uses at the park created under Option 3, such as people walking, sitting, talking, picnicking, or exercising would create low operational noise levels. These noise levels would not substantially change the existing ambient noise in the vicinity, and the noise impacts from these passive uses would be less than significant. Consequently, no significant noise impacts associated with Regional Mobility Hubs, or commercial land uses would occur under Option 2 and the changes this option would propose within PD3. However, high noise levels could be generated if special events are conducted at the park, especially if these events include amplified speech, live or recorded music, and/or large crowds. Noise levels from such events could potentially exceed applicable noise thresholds at nearby noise-sensitive receptors and the impact would be significant (**Impact-NOI-8**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would directly result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project

that exceed standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact Determination and Mitigation

Significant Impacts

Impact-NOI-1: Exceed Thresholds at Parks During Construction. Proposed construction activities may exceed the construction noise thresholds during permissible construction hours, as summarized in Table 4.10-17 (i.e., 75 dBA L_{eq} 1-hour average for projects in Coronado, 75 dBA L_{eq} 8-hour average for projects in Imperial Beach, and 75 dBA L_{eq} 12-hour average for projects in San Diego), at existing parks. These impacts could occur if one or more project construction phase(s) occur within the relevant screening distances of a park, as identified in Table 4.10-19. (Actual impact distances could be shorter depending on site-specific details such as ground conditions and the presence of any acoustical screening.)

Impact-NOI-2: Exceed Thresholds at Other Noise-Sensitive Receptors During Construction. Proposed construction activities may exceed the construction noise thresholds during permissible construction hours, as summarized in Table 4.10-17 (i.e., 75 dBA L_{eq} 1-hour average for projects in Coronado, 75 dBA L_{eq} 8-hour average for projects in Imperial Beach, and 75 dBA L_{eq} 12-hour average for projects in San Diego), at existing noise-sensitive receptors. These impacts could occur if one or more project construction phase(s) occur within the relevant screening distances of noise-sensitive receptors, as identified in Table 4.10-19. (Actual impact distances could be shorter depending on site-specific details such as including ground conditions and the presence of any acoustical screening.)

Impact-NOI-3: Exceed Local Noise Limits for Construction During Prohibited Hours. Although construction during prohibited hours (evening, nighttime, Sundays, or holidays) is not specifically proposed as part of the PMPU, it cannot be ruled out. Unless associated noise levels at existing noise-sensitive receptors can be reduced to comply with the stationary noise source limits of the applicable municipal code (refer to Tables 4.10-8, 4.10-10, and 4.10-13), construction noise impacts will be significant.

Impact-NOI-4: Excessive Traffic Noise Increases on Existing Roadways Above Local Standards. Traffic on some roadways may increase noise levels at existing noise-sensitive receptors by 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member city. This impact may occur at hotels/motels, parks, and homes adjacent to segments of Harbor Island Drive, Pacific Highway, and West Ash Street.

Impact-NOI-5: Substantial Traffic Noise Increases Due to Roadway Improvements and Modifications. This impact may occur for proposed roadway improvement and modification projects if they remove acoustical shielding between the roadway and an adjacent noise-sensitive receptor, or horizontally realign the roadway so that the distance between traffic and the receiver is reduced by at least 50 percent.

Impact-NOI-6: Significant Noise Impact from Regional Mobility Hubs. Regional Mobility Hubs that provide new parking facilities may generate significant noise impacts if located within 125 feet of a noise-sensitive receptor.

Impact-NOI-7: Exceed Local Noise Limits for Commercial Developments. Building systems (e.g., mechanical equipment, plumbing systems, trash compactors) and other activities at commercial developments may generate noise at existing noise-sensitive receptors in excess of applicable local limits for stationary noise sources.

Impact-NOI-8: Exceed Local Noise Limits for Outdoor Use Areas and Outdoor Special Events. If new developments include outdoor use areas (e.g., parks, outdoor dining, patios, roof decks, pool decks) with amplified music, or host large outdoor special events such as weddings, exhibits, social gatherings, fundraisers, concerts, music festivals, and art exhibits, such activities may exceed applicable local noise limits at existing noise-sensitive receptors, especially if events are attended by large numbers of people or would include live or recorded music.

Mitigation Measures

For **Impact-NOI-1:**

MM-NOI-1: Notify Users of Impacted Parks. ~~As part of a development application, the project proponent~~ Prior to the approval of a future project, the District shall determine whether construction noise will exceed 75 dBA L_{eq} at any nearby parks, ~~if applicable, based on evidence provided by the project proponent as part of the project review process.~~ This determination may be based on the construction noise impact (screening) distances summarized in Table 4.10-19. ~~Alternatively, the project proponent shall~~ may be required to retain a qualified acoustical consultant, approved by the District, to conduct a new or more detailed analysis based on project- and site-specific details, if construction noise has the potential to exceed the established noise thresholds. If construction noise levels at parks are determined to exceed 75 dBA L_{eq} , the District and/or project proponent shall provide advanced notice and consultation with the local jurisdiction. Exception to this consultation requirement is provided for any emergency work where time is of the essence to rectify an unexpected condition requiring an immediate response (e.g., important utility repair, urgent health and safety-related issues). In addition, for non-emergency work, the project proponent ~~or its construction contractor~~ shall post public noticing at affected parks not less than 48 hours prior to the start of construction activities. The signage shall notify users of possible high noise levels and provide details of alternative parks that are open nearby. The project proponent shall include this measure in the construction specification documents for the project. Prior to issuance of the construction specification documents for bid, the project proponent shall submit a copy of the documents and the proposed public notice sign to the District's ~~Development Services Department~~ for review and approval. Prior to the commencement of construction activities, the project proponent shall submit documentation (including photographs) to the District's ~~Development Services Department~~ demonstrating compliance with this measure.

For **Impact-NOI-2:**

MM-NOI-2: Avoid or Reduce Construction Noise from Pile Driving. During construction activities associated with a future project, the project proponent shall require all contractors to take steps to reduce pile driving noise, if any, associated with the project by implementing one of the following noise reduction methods:

- Avoid impact and vibratory pile driving by using quieter alternative installation methods, such as press-in piles or drilled piles (e.g., cast-in-drilled-hole, poured-in-place piles).

- Use an acoustical shroud around impact pile driving. The shroud will be constructed of materials that provide a minimum sound transmission class (STC) of 28 (e.g., sound-rated acoustical blankets).

MM-NOI-3: Implement General Best Practices for Construction Noise Abatement. During construction of a future project, the project proponent shall require all contractors to adhere to the following noise abatement measures:

- All construction equipment and vehicles using internal combustion engines will be equipped with mufflers; air-inlet silencers where appropriate; and any other shrouds, shields, or other noise-reducing features in good operating condition that meet or exceed original factory specification.
- All mobile or fixed construction equipment used on the project that is regulated for noise output by a local, State, or Federal agency will comply with such regulation while in the course of project activity.
- All construction equipment will be properly maintained and serviced.
- All construction equipment will be operated only when necessary and ~~will be switched off when not in use,~~ and stationary construction equipment shall be located as far from sensitive receptors as possible.
- Construction employees will be trained in the proper operation and use of the equipment to avoid careless or improper operation of equipment that could increase noise levels.
- Construction site speed limits will be established and enforced during the construction period.
- The use of noise-producing signals, including horns, whistles, alarms, and bells, will be for safety warning purposes only.
- The contractor will provide advance written notification of construction activities to residences within 300 feet of the construction site for projects that do not include pile driving, and to residences within 700 feet of the construction site for projects that include pile driving. Notification will include a brief overview of the proposed construction activity and its purpose and schedule. It also will include the name and contact information of the project manager or representative responsible for resolving any noise concerns.

MM-NOI-4: Install Temporary Noise Barriers to Shield Noise-Sensitive Receptors from Excessive Construction Noise Levels. ~~As part of a development application, a project proponent~~ Prior to the approval of a future project, the District shall ascertain whether construction noise will exceed 75 dBA L_{eq} at any noise-sensitive receptors based on evidence provided by the project proponent as part of the project review process. If so, prior to commencing construction, the project proponent shall install temporary noise barrier(s) between construction activities and noise-sensitive receptor(s) where noise levels exceed 75 dBA L_{eq} . Barriers may be constructed around the site perimeter or, when construction activities are restricted to a smaller portion of the site, around that smaller portion of the site, or around any noisy stationary construction equipment, such as generators or dewatering pumps. All such barriers must be at least 8 feet high and of sufficient height to break the line of sight between the construction equipment and the ground floor of any noise-sensitive receiver. These barriers shall be constructed in one of the following ways that the project proponent establishes, in

writing and to the satisfaction of the District, will achieve a minimum sound transmission class (STC) rating of 28:

- From acoustical blankets hung over or from a supporting frame. The blankets should be firmly secured to the framework. The blankets should be overlapped by at least 4 inches at seams and taped and/or closed with hook-and-loop fasteners (i.e., Velcro®) so that no gaps exist. The largest blankets available should be used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier.
- From commercially available acoustical panels lined with sound-absorbing material (the sound-absorptive faces of the panels should face the construction equipment).
- From common construction materials such as plywood.

For **Impact-NOI-3**:

MM-NOI-5: Prohibit Exterior Construction Activities Outside of the Permitted

Construction Hours. The project proponent shall not conduct typical exterior construction activities during the prohibited hours summarized in Table 4.10-17 (based on the city in which the construction site is located). Also, material or equipment deliveries and collections shall be prohibited during these hours to the extent feasible unless otherwise allowed by the noise ordinance of the City where the project is located. Except for construction personnel specifically working on interior construction tasks within a completed building shell, construction personnel shall not start construction equipment on the job site during the prohibited hours. Subject to the District's review and approval, non-typical time-sensitive construction activities may occur outside during the permitted hours summarized in Table 4.10-17. Examples may include, but are not limited to, large concrete pours that must occur continuously once started, or activities requiring road closures that are deemed to be safer or less disruptive when implemented at night.

For **Impact-NOI-4**:

MM-NOI-6: Conduct Project-Specific Traffic Noise Analyses for Projects that Would

Double the Traffic Volume on One or More Affected Streets. As part of a development application Prior to the approval of a future project, the project proponent District shall ascertain whether project implementation would double the vehicular traffic volume on any affected street(s) based on evidence provided by the project proponent as part of the project review process. If no such increase is predicted, then no further traffic noise analysis is required. However, if such an increase is anticipated has potential to occur, the project proponent shall retain a qualified traffic-transportation consultant and a qualified acoustical consultant, each approved by the District. The consultants shall identify the roadways that would be affected by the project, quantify daily traffic volumes with and without the project, and determine what, if any, additional analysis is required to quantify traffic noise levels and identify potential noise control measures. If significant impacts are predicted, the assessment shall identify traffic noise abatement or reduction measures to be implemented by the project proponent as necessary to ensure project traffic does not cause: (1) an increase of 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member city, or (2) any traffic noise increase of 5 dB CNEL or more, at a noise-sensitive receptor. Such measures may include, but would not be limited to:

- Noise barriers.
- Quiet pavement.
- Increased separation between roadways and sensitive land uses.
- Upgrades, such as retrofitted sound-rated windows and doors for impacted sensitive buildings.
- Traffic calming or other measures to reduce traffic speeds.

For **Impact-NOI-5:**

MM-NOI-7: Design Roadway Improvement and Modification Projects to Avoid Noise Increases Greater than 3 dB CNEL. During the design phase for specific roadway improvements and modifications, the project proponent shall ensure the proposed design does not: (1) remove existing noise barriers (if any) between the roadway and adjacent noise-sensitive receptors, without replacing such barriers with like-kind, or (2) reduce the distance between the closest traffic travel lane and the receiver by 50 percent or more. As an example of the latter condition, in a hypothetical case where the current distance between the center of the closest travel lane and the receiver is 1,000 feet, a project shall not be allowed to modify the roadway to shorten the distance between the roadway and the receiver by more than 499 feet, which is less than 50 percent of the distance. Therefore, the closest distance between the closest traffic lane and a receiver that would be allowed under this mitigation measure would be 501 feet under the project condition.

For **Impact-NOI-6:**

MM-NOI-8: For Regional Mobility Hubs Within 125 feet of Noise-Sensitive Receptors, Design and Construct Facilities to Control Noise from New Sources Such as Parking Lots. During the architectural and engineering design phases of a Regional Mobility Hub, and prior to the District's approval of a Regional Mobility Hub, the project proponent shall retain an acoustical consultant approved by the District to evaluate the potential noise impacts of new parking lots or other proposed potential noise sources. The consultant shall assess the project details and ~~prepare~~ submit a written report to the District that identifies what, if any, additional analysis is required to quantify operational noise levels and potential noise abatement measures. Based on the consultant's written report, the District shall determine whether additional technical analysis is necessary to quantify operational noise levels and to identify noise abatement measures in order to meet the noise standards specified below. Noise abatement or reduction measures, if required, may include, but are not limited to, reorientation or relocation of noise sources, administrative controls on the times and intensity of use, control of mechanical equipment noise (such as parking garage exhaust fans), or the addition of noise barriers or other acoustical screening. Noise abatement or reduction measures shall be implemented by the project proponent to ensure the Regional Mobility Hub does not cause: (1) an increase of 3 dBA or more over ambient noise levels resulting in a combined noise level greater than the applicable municipal code standard (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at a noise-sensitive receptor, or (2) any increase of 5 dBA or more over ambient noise levels at a noise-sensitive receptor. The noise report will be subject to the District's review and approval, and no future project shall proceed until the noise report is deemed acceptable to the District.

For **Impact-NOI-7:**

MM-NOI-9: Design, and Construct, and Operate New Commercial Uses to Control Noise from All Onsite Equipment and Activities. The project proponent shall design, and construct, and operate all proposed commercial uses to ensure their compliance with the applicable municipal code noise limits (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at noise-sensitive receptors. To achieve this performance standard, during the architectural and engineering design, and prior to the District's approval of the applicable a future commercial development project deemed consistent with the PMPU, the project proponent shall retain an acoustical consultant approved by the District to evaluate the proposed design and provide written recommendations to the District, as necessary, to abate or reduce noise from all onsite equipment and activities. Such recommendations may include, but are not limited to, changes in site layout or equipment locations; sound power limits or specifications; rooftop parapet walls; acoustical absorption, louvers, screens, or enclosures; intake and exhaust silencers; or administrative controls (such as restricting the location or hours of certain activities to daytime hours). The District shall identify the noise abatement or reduction measures to be implemented by the project proponent, which are necessary to ensure compliance with the applicable municipal code noise limits. If such compliance is infeasible, a project-level environmental review shall be required. The noise abatement measures will be subject to the District's review and approval and no future project shall proceed until the District deems the noise abatement measures sufficient to reduce noise levels to below established thresholds. If the future project cannot meet applicable thresholds, subsequent CEQA review shall be required.

For **Impact-NOI-8:**

MM-NOI-10: Design and Operate Outdoor Activity Areas to Control Operational Noise. The project proponent and any future owner/operator of proposed developments shall design, construct, and operate outdoor activity areas (e.g., outdoor dining areas, patios, roof decks, pool decks), to ensure their compliance with the applicable municipal code noise limits (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at noise-sensitive receptors. To achieve this performance standard, as part of the site-specific environmental review of a proposed project, the project proponent shall retain an acoustical consultant approved by the District to evaluate the proposed design and provide written recommendations to the District, as necessary, to abate or reduce noise from all outdoor activity areas. Such recommendations may include, but are not limited to, changes in location and layout, sound power limits or specifications for audio systems, loudspeaker placement and direction, acoustical shielding (barriers, walls, or roofs), or acoustical absorption. The District shall identify the noise abatement or reduction measures to be implemented by the project proponent that are necessary to ensure compliance with the applicable relevant municipal code noise limits. If such compliance is infeasible, a project-level environmental review shall be required. Any recommendations will be subject to the District's review and approval, and no future project shall proceed until the District deems the recommended noise abatement measures sufficient to reduce noise levels to below the established thresholds to the extent feasible, as defined in CEQA Guidelines 15364.

MM-NOI-11: Incorporate Operational/Contract Specifications to Minimize Exterior Special Event Noise and Regulate Special Events at New Parks. Special events may include, but not be limited to, occasional outdoor gatherings, public dances, shows, sporting events, entertainment events (including concerts), parades, and civic functions. Such events at new parks proposed under the PMPU shall be properly regulated for noise control and shall observe

the requirements identified below. In addition, the project proponent and any future owner/operator of proposed developments hosting exterior special events shall observe the following requirements and incorporate them into the contract specifications for outdoor events:

1. Any special event at a new park and any exterior special events at proposed developments shall not exceed the ~~relevant~~applicable municipal code noise limits (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at a noise-sensitive receptor.
2. Any event that fails to comply with requirement 1, above, shall only be permitted if an applicable event permit, or variance or exemption from the code, has been sought and granted by the ~~appropriate agency (city or District)~~.
3. The project shall comply with ~~all city and~~ District noise requirements related to hosting outdoor events.
4. All amplified public address systems shall be oriented away from adjacent sensitive receptors.

Level of Significance After Mitigation

Construction

Implementation of **MM-NOI-1** would reduce **Impact-NOI-1** to less than significant by redirecting noise-sensitive park users to alternative locations away from construction noise.

Implementation of **MM-NOI-2**, **MM-NOI-3**, and **MM-NOI-4** would reduce **Impact-NOI-2**. In some cases, noise impacts may be reduced to less than significant. However, because the design and location of future development projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts. As a result, it may not be possible to fully reduce all construction noise levels to comply with the applicable 75 dBA L_{eq} noise limits. Limitations may include the inability to use alternative pile driving methods or acoustical shrouds due to engineering, constructability, or safety considerations. In addition, it may not be practical to construct efficient temporary noise barriers due to local terrain conditions, or engineering, constructability, or safety considerations. **Impact-NOI-2** would remain significant and unavoidable.

Implementation of **MM-NOI-5** would reduce **Impact-NOI-3** to less than significant, if it can be fully implemented. However, because the design and location of future development projects allowed under the proposed PMPU are unknown at this time, it is not possible to determine the extent to which construction activity may be feasibly constrained to the locally-permitted construction hours. Certain construction activities (e.g., large concrete pouring operations) may have to occur overnight. As a result, **Impact-NOI-3** would remain significant and unavoidable.

Operation

Implementation of **MM-NOI-6** would reduce **Impact-NOI-4**. In some cases, traffic noise impacts may be reduced to less than significant. However, because the timing and location of specific impacts due to projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective

in abating or reducing the impacts. As a result, it may not be possible to fully mitigate all traffic noise levels. **Impact-NOI-4** would remain significant and unavoidable.

Implementation of **MM-NOI-7** would reduce **Impact-NOI-5** to less than significant if it can be fully implemented. However, because the design and location of future roadway improvement and modification projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts. As a result, **Impact-NOI-5** would remain significant and unavoidable.

Implementation of **MM-NOI-8** would reduce **Impact-NOI-6** to less than significant if it can be fully implemented. However, because the design and location of future Regional Mobility Hub projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts. As a result, **Impact-NOI-6** would remain significant and unavoidable.

Implementation of **MM-NOI-9** would reduce **Impact-NOI-7** to less than significant if it can be fully implemented. However, because the design and location of future commercial projects allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts. As a result, **Impact-NOI-7** would remain significant and unavoidable.

Implementation of **MM-NOI-10** and **MM-NOI-11** would reduce **Impact-NOI-8** to less than significant if they can be fully implemented. However, because the design and location of future outdoor activity areas (including parks) and the details of outdoor special events allowed under the proposed PMPU are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing the impacts. As a result, **Impact-NOI-8** would remain significant and unavoidable.

Threshold 2: Result in generation of excessive groundborne vibration or groundborne noise levels?

Impact Analysis

Impact of Water and Land Uses

Construction

The potential for significant vibration impacts would depend on the type of construction equipment used and the proximity of the work to sensitive receptors. As described in Section 4.10.3.6, *Vibration-Sensitive Land Uses*, all buildings (regardless of land use) are considered sensitive with respect to potential damage effects. Although building damage due to construction activities is rare, District tenants who occupy older buildings may have increased concerns about this potential impact. Buildings that would be sensitive with respect to human annoyance impacts are residences (including hospitals, nursing facilities, or intermediate care facilities with overnight patient stays), schools and childcare facilities (typically only vibration sensitive during hours of operation), and hotels and other guest lodgings. Certain occupied buildings within parks may also be considered sensitive. The sensitivity would depend on whether the uses in the building would coincide with any

nearby construction activity (for instance, the Bayside Performance Center may be considered sensitive but may not be in use during typical construction hours).

Potential Building Damage

Using the methodology described in Section 4.10.6.1, the distances for potential vibration damage impacts at various receiver building categories were calculated for a range of construction equipment. The results are summarized in Table 4.10-22. These can be considered screening distances, beyond which a given construction activity would not be expected to generate significant groundborne vibration with respect to potential building damage. While all receiver building categories were included in the analysis, it is noted the likelihood of projects occurring close to the most sensitive building categories (“Extremely Fragile Historic Buildings, Ruins, Ancient Monuments” and “Fragile Buildings”) is considered very low.

A project that employs any of the construction equipment types included in the table has the potential to generate groundborne vibration impacts if the activity occurs within the specified distances. Depending on the equipment used, these distances range from 1 to 168 feet. Because the exact building categories and their distances from future construction work are currently not known, it is possible that proposed or future projects would exceed the applicable thresholds for potential building damage, which would be a significant impact prior to mitigation (**Impact-NOI-9**).

Table 4.10-22. Distances to Potential Vibration Damage from Program Construction

Equipment Item	Building Category:	Extremely Fragile Historic Buildings, Ruins, Ancient Monuments	Fragile Buildings	Historic Buildings	Older Residential Structures	New Residential Structures	Modern Industrial/ Commercial Buildings
	Vibration Damage Impact Criteria, PPV, in/s ¹	0.08	0.1	0.25	0.3	0.5	0.5
Pile driver (impact or vibratory)	Distance to Impact Criteria (feet)	168	138	60	51	32	32
Hydraulic breaker ²		68	56	25	21	13	13
Vibratory roller		61	50	22	19	12	12
Large bulldozer ³		28	23	10	9	6	6
Drill ⁴		28	23	10	9	6	6
Jackhammer		12	10	5	4	3	3
Small bulldozer ⁵		2	2	1	1	1	1

Source: Appendix H.

¹ All criteria are based on the values for continuous/frequent intermittent sources (all of the anticipated sources fall into this category).² Also commonly referred to as a hoe ram.³ Considered representative of other heavy earthmoving equipment such as excavators, graders, and backhoes.⁴ Based on caisson drilling.⁵ Considered representative of other smaller earthmoving equipment such as a Bobcat® and skid steer.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction vibration damage potential of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction vibration damage impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related vibration impact associated with the potential to cause building damage (**Impact-NOI-9**). This significant impact would still occur within PD3 under Option 1 because of the same future development that could still occur outside of the Option 1 boundary within PD3.

The types of construction that would occur for Option 1 would fall within the range of scenarios analyzed above. The distances for potential vibration damage impacts at various receiver building categories, due to a range of construction equipment, are summarized in Table 4.10-22. These can be considered screening distances, beyond which a given construction activity would not be expected to cause building damage. The most vibration-sensitive structures close to Option 1 include historical buildings, as identified in Section 4.4, *Cultural Resources*, Section 4.4.4.4, *Project Impacts and Mitigation Measures*). Referring to Table 4.10-22 and assuming Option 1 would not require pile driving, vibration damage impacts could occur at structures located within 25 feet of the construction area. The impact distance would increase to 60 feet if pile driving is required. Depending on the final construction methods and project footprint, sensitive receptors may exist within the calculated impact distances, and construction activities could exceed the applicable thresholds for potential building damage, which would be a significant impact (**Impact-NOI-9**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related vibration impact associated with the potential to cause building damage (**Impact-NOI-9**). This significant impact would still occur within PD3 under Option 2 because of the same future development that could still occur outside of the Option 2 boundary within PD3.

The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. The distances for potential vibration damage impacts at various receiver building categories, due to a range of construction equipment, are summarized in Table 4.10-22. These can be considered screening distances, beyond which a given construction activity would not be expected to cause building damage. The most vibration-sensitive structures close to Option 2 include historical buildings as identified in Section 4.4.4.4. Referring to Table 4.10-22

and assuming Option 2 would not require pile driving, vibration damage impacts could occur at structures located within 25 feet of the construction area. The impact distance would increase to 60 feet if pile driving is required. Depending on the final construction methods and project footprint, sensitive receptors may exist within the calculated impact distances, and construction activities could exceed the applicable thresholds for potential building damage, which would be a significant impact (**Impact-NOI-9**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related vibration impact associated with the potential to cause building damage (**Impact-NOI-9**). This significant impact would still occur within PD3 under Option 3 because of the same future development that could still occur outside of the Option 3 boundary within PD3.

The types of construction that would occur for Option 3 would fall within the range of scenarios analyzed above. The distances for potential vibration damage impacts at various receiver building categories, due to a range of construction equipment, are summarized in Table 4.10-22. These can be considered screening distances, beyond which a given construction activity would not be expected to cause building damage. The most vibration-sensitive structures close to Option 3 include historical buildings as identified in Section 4.4.4.4. Referring to Table 4.10-22 and assuming Option 3 would not require pile driving, vibration damage impacts could occur at structures located within 25 feet of the construction area. The impact distance would increase to 60 feet if pile driving is required. Depending on the final construction methods and project footprint, sensitive receptors may exist within the calculated impact distances, and construction activities could exceed the applicable thresholds for potential building damage, which would be a significant impact (**Impact-NOI-9**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Potential Human Annoyance

Using the methodology described in Section 4.10.6.1, the distances at which various levels of human vibration perception are expected were calculated for a range of construction equipment. The results are summarized in Table 4.10-23. While exact vibration sensitivity varies by individual, the “distinctly perceptible” criterion of 0.04 in/s PPV is selected as the threshold of impact. For many construction scenarios that could occur under the proposed PMPU, higher levels may be tolerable for several reasons. For instance, the duration of perceptible vibration may be very brief or vibration could occur at times when residents/occupants are out of the buildings or engaged in activities that are not particularly sensitive to vibration. Nonetheless, the criterion of 0.04 in/s PPV is applied uniformly to assess impacts at any affected sensitive receptor. The distances at which a vibration is reduced to a level of 0.04 in/s PPV can be considered screening distances, beyond which a given construction activity would not be expected to generate significant groundborne vibration with respect to potential human annoyance. A project that employs any of the construction equipment types included in Table 4.10-23 has the potential to generate human annoyance if the activity occurs within the specified distances of sensitive buildings for a PPV of 0.04 in/s. This would be a significant impact prior to mitigation at any time at a residential building, during operational hours at any schools or childcare facility, or between the hours of 7:00 p.m. to 7:00 a.m. at any hotel or other guest lodging (**Impact-NOI-10**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction vibration annoyance associated with each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction vibration annoyance impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related vibration impact associated with the potential to cause human annoyance (**Impact-NOI-10**). This significant impact would still occur within PD3 under Option 1 because of the same future development that could still occur outside of the Option 1 boundary within PD3.

The types of construction that would occur for Option 1 would fall within the range of scenarios analyzed above. The distances at which “distinctly perceptible” groundborne vibration of 0.04 in/s PPV would occur due to a range of construction equipment are summarized in Table 4.10-23. These can be considered screening distances, beyond which a given construction activity would not be expected to cause human annoyance. Referring to Table 4.10-22 and assuming Option 1 would not require pile driving, vibration annoyance impacts could occur at sensitive buildings located within 128 feet of the construction area. The impact distance would increase to 316 feet if pile driving is required. Depending on the final construction methods and project footprint, the closest residences (condominiums on the east side of Pacific Highway) and hotels may be within the calculated impact distances, and construction activities could exceed the applicable thresholds for human annoyance. This would be a significant impact (**Impact-NOI-10**) at any time at a residential building, or between the hours of 7:00 p.m. to 7:00 a.m. at any hotel. However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related vibration impact associated with the potential to cause human annoyance (**Impact-NOI-10**). This significant impact would still occur within PD3 under Option 2 because of the same future development that could still occur outside of the Option 2 boundary within PD3.

The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. The distances at which “distinctly perceptible” groundborne vibration of 0.04 in/s PPV would occur due to a range of construction equipment are summarized in Table 4.10-23. These can be considered screening distances, beyond which a given construction activity would not be expected to cause human annoyance. Referring to Table 4.10-22 and assuming Option 2 would not require pile driving, vibration annoyance impacts could occur at

sensitive buildings located within 128 feet of the construction area. The impact distance would increase to 316 feet if pile driving is required. Depending on the final construction methods and project footprint, the closest residences (condominiums on the east side of Pacific Highway) and hotels may be within the calculated impact distances, and construction activities could exceed the applicable threshold for human annoyance. This would be a significant impact (**Impact-NOI-10**) at any time at a residential building, or between the hours of 7:00 p.m. to 7:00 a.m. at any hotel. However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a significant construction-related vibration impact associated with the potential to cause human annoyance (**Impact-NOI-10**). This significant impact would still occur within PD3 under Option 3 because of the same future development that could still occur outside of the Option 3 boundary within PD3.

The types of construction that would occur for Option 3 would fall within the range of scenarios analyzed above. The distances at which “distinctly perceptible” groundborne vibration of 0.04 in/s PPV would occur due to a range of construction equipment are summarized in Table 4.10-23. These can be considered screening distances, beyond which a given construction activity would not be expected to cause human annoyance. Referring to Table 4.10-22 and assuming Option 3 would not require pile driving, vibration annoyance impacts could occur at sensitive buildings located within 128 feet of the construction area. The impact distance would increase to 316 feet if pile driving is required. Depending on the final construction methods and project footprint, the closest residences (condominiums on the east side of Pacific Highway) and hotels may be within the calculated impact distances, and construction activities could exceed the applicable threshold for human annoyance. This would be a significant impact (**Impact-NOI-10**) at any time at a residential building, or between the hours of 7:00 p.m. to 7:00 a.m. at any hotel. However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Table 4.10-23. Distances to Potential Human Effects from Program Construction Vibration

Equipment Item	Human Perceptibility:	Barely Perceptible ²	Distinctly Perceptible (Threshold of Impact)	Strongly Perceptible ²	Severe ²
	Vibration Perception Criteria, PPV, in/s ¹	0.01	0.04	0.1	0.4
Pile driver (impact or vibratory)	Distance to Impact Criteria (feet)	1,112	316	138	39
Hydraulic breaker ³		450	128	56	16
Vibratory roller		399	113	50	14
Large bulldozer ⁴		183	52	23	7
Drilling ⁵		183	52	23	7
Jackhammer		79	23	10	3
Small bulldozer ⁶		9	3	2	1

Source: Appendix H.

¹ All criteria are based on the values for continuous/frequent intermittent sources (all of the anticipated sources fall into this category).² Included for informational purposes only.³ Also commonly referred to as a hoe ram.⁴ Considered representative of other heavy earthmoving equipment such as excavators, graders, and backhoes.⁵ Based on caisson drilling.⁶ Considered representative of other smaller earthmoving equipment such as a Bobcat® and skid steer.

Onsite Stationary Sources

Most land uses do not generate substantial levels of groundborne vibration. Typical mechanical equipment could produce some perceptible vibration within the buildings at which they are installed, but such equipment would not be large enough to generate noticeable groundborne vibration at offsite locations. Vibration impacts from onsite stationary sources would be less than significant.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would directly result in generation of excessive groundborne vibration or groundborne noise levels.

Impact Determination and Mitigation

Significant Impacts

Construction

Impact-NOI-9: Exceed Caltrans Guideline Criteria for Potential Building Damage During Construction. Vibration levels due to various construction activities could exceed recommended criteria for potential building damage. The actual impacts, if any, would depend on the equipment used and the distance to the affected structure(s). Specifically, a significant impact would occur if project construction occurs within one or more of the threshold distances identified in Table 4.10-22 based on the actual construction equipment to be used.

Impact-NOI-10: Exceed Caltrans Guideline Criteria for Potential Human Annoyance at Sensitive Receptors During Project Construction. Vibration levels due to various construction activities could exceed recommended criteria for potential human annoyance. The actual impacts, if any, would depend on the equipment used and the distance to the affected sensitive buildings. Specifically, a significant impact would occur if project construction occurs within the “distinctly perceptible” threshold distance of an occupied sensitive building, as identified in Table 4.10-23, based on the actual construction equipment to be used.

Operation

No significant operational groundborne vibration impacts were identified.

Mitigation Measures

Construction

For **Impact-NOI-9:**

MM-NOI-12: Avoid or Reduce Potentially Damaging Vibration at Nearby Buildings from Project Construction. During construction activities, the project proponent shall avoid working within the potential damage threshold distances identified in Table 4.10-22 based on the construction equipment to be used and the type, age, and condition of nearby structures (including structures owned or occupied by neighboring District tenants). In the event the District determines that it is not feasible for the project proponent to avoid construction

activities within the potential damage threshold distances, the project proponent shall reduce the potential impact ~~to the maximum extent feasible~~ through the implementation of alternate construction equipment or techniques approved by the District such as, but not limited to, the following:

- Replacing impact pile driving with press-in piles or drilled piles (e.g., cast-in-drilled-hole, poured-in-place piles).
- Using smaller categories of equipment, such as a Bobcat or skid steer instead of full-size graders or bulldozers.

If the District determines that these techniques cannot be fully implemented or are not sufficient to place the affected receivers outside of the applicable threshold distance, then the project proponent shall take the following additional steps to protect buildings within the potential damage threshold distances for construction vibration damage:

- The project proponent/contractor shall retain a qualified structural or geotechnical engineer to conduct preconstruction surveys of neighboring structures (including photographing and/or videotaping) to document existing building conditions for future comparison if any vibration-related damage is suspected or results from construction-related activities.
- Based on professional judgment and review of the specific buildings involved, the structural/geotechnical engineer shall provide written recommendations to the District for updated vibration thresholds and revised impact distances for potentially affected buildings.
- If considered appropriate by the District, the project proponent shall conduct monitoring during construction to check for vibration-related damage during pile driving. Such monitoring may include vibration measurements obtained inside or outside of the buildings or other tests and observations deemed necessary by the District.
- If any damage to existing buildings is determined to occur because of project construction, the project proponent shall be financially responsible for the necessary repairs, structural or cosmetic, to return the damaged building to its pre-existing state.

For Impact-NOI-10:

MM-NOI-13: Avoid or Reduce Potentially Annoying Vibration at Occupied Sensitive Buildings During Project Construction. During construction activities, the project proponent shall avoid working within the distinctly perceptible threshold distances identified in Table 4.10-23 from occupied sensitive buildings, based on the construction equipment to be used. In the event the District determines that it is not feasible for the project proponent to avoid construction activities within the potential annoyance threshold distances, the project proponent shall reduce the potential impact ~~to the extent feasible~~ through the implementation of alternate construction equipment or techniques approved by the District such as, but not limited to, the following:

- Replacing impact pile driving with press-in piles or drilled piles (e.g., cast-in-drilled-hole, poured-in-place piles).
- Using smaller categories of equipment, such as a Bobcat or skid steer instead of full size graders or bulldozers.

- Other construction techniques or measures that are as effective and approved by the District.

Operation

No mitigation is required.

Level of Significance After Mitigation

Construction

Implementation of **MM-NOI-12** would reduce **Impact-NOI-9** to less than significant by requiring future project proponents to avoid working within the potential damage threshold distances. In the event that it is not feasible to avoid construction activities within the potential damage threshold distances, **MM-NOI-12** requires the implementation of alternate construction equipment or techniques approved by the District, as well as implementation of additional steps to protect buildings within the potential damage threshold distances. Finally, **MM-NOI-12** would require the project proponent to repair any cosmetic or structural damage that is demonstrated to occur because of groundborne vibration from project construction.

Implementation of **MM-NOI-13** would reduce **Impact-NOI-10**. However, because the design, location, and construction methods of future development projects allowed under the proposed PMPU, as well as the Embarcadero Planning District Options, are unknown at this time, it is not possible to quantify whether and to what extent the recommended mitigation measures would be feasible and effective in abating or reducing groundborne vibration to less than 0.04 in/s PPV at all nearby sensitive receptors. **Impact-NOI-10** would remain significant and unavoidable.

Operation

Impacts would be less than significant and no mitigation is required.

Threshold 3: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels?

Impact Analysis

Impacts of Water and Land Uses

As discussed in Section 4.10.4.3, *Aircraft Noise*, existing civilian and military installations (airports/airfields) in the vicinity of the tidelands include SDIA, NAS North Island, and NOLF Imperial Beach. The PMPU does not propose any new airports or airstrips, and it would not alter any existing airports or airstrips. While visitor growth anticipated under the proposed PMPU would likely result in some additional passengers travelling through SDIA, the proportion would be very small compared to the overall number of passengers, with 24 million passengers served in 2018 (SDIA 2019). As a result, airstrip and airport noise levels would not change appreciably due to implementation of the proposed PMPU.

Future development under the proposed PMPU would include new noise-sensitive receptors (primarily hotels) that would be subject to noise from aircraft operations. However, as discussed in Section 4.10.6.3, *Policies that May Avoid or Reduce Impacts*, the District would be responsible for conducting a consistency review of discretionary and ministerial projects to ensure there would be no conflict with the applicable ALUCPs, including with the noise/land use compatibility requirements. This process would address the siting of new noise-sensitive developments, as well as requiring proper design of new buildings to control exterior-to-interior noise transmission and provide acceptable interior noise levels. Such new development would also be subject to Title 24, Part 2, Section 1206.3 of the California Code of Regulations (refer to Section 4.10.5.2, *State Regulations*), which would similarly require exterior-to-interior noise control for any habitable room at noise-sensitive developments. With these processes and requirements in place, all future development would be consistent with the ALUCPs, appropriate exterior-to-interior noise control would be provided, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the potential to expose people to aircraft noise associated with each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Airport noise impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to excessive airport noise.

Option 1 does not propose any new airports or airstrips, and it would not alter any existing airports or airstrips. The closest airport to Option 1 is SDIA. As shown on Figure 4.10-2 and in Table 4.10-9, aircraft noise levels at the location of the proposed park would be less than 70 dB CNEL, which would be compatible under the City's noise compatibility guidelines. The impact would be less than significant, and Option 1 would not result in any additional or more severe impacts related to excessive airport noise than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to excessive airport noise.

Option 2 does not propose any new airports or airstrips, and it would not alter any existing airports or airstrips. The closest airport to Option 2 is SDIA. As shown on Figure 4.10-2 and in Table 4.10-9, aircraft noise levels at the location of the proposed park would be less than 70 dB CNEL, which would be compatible under the City's noise compatibility guidelines. The impact would be less than significant, and Option 2 would not result in any additional or more severe impacts related to excessive airport noise than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to excessive airport noise.

Option 3 does not propose any new airports or airstrips, and it would not alter any existing airports or airstrips. The closest airport to Option 3 is SDIA. As shown on Figure 4.10-2 and in Table 4.10-9, aircraft noise levels at the location of the proposed park would be less than 70 dB CNEL, which would be compatible under the City's noise compatibility guidelines. The impact would be less than significant, and Option 3 would not result in any additional or more severe impacts related to excessive airport noise than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would expose people residing or working in the project area to excessive noise levels from aircraft operations.

Impact Determination and Mitigation

Implementation of the proposed PMPU, with or without Options 1, 2, and 3, would not expose people residing or working in the PMPU area to excessive noise levels within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport. Impacts would be less than significant, and no mitigation measures are required.

4.10.7 Cumulative Impact Analysis

4.10.7.1 Geographic Scope

The geographic scope of analysis for cumulative noise and vibration impacts related to the proposed PMPU (construction and operations) is the area within 1,000 feet of the PMPU area's boundaries. This relatively large distance has been selected because future development under the proposed PMPU may involve pile driving, which has the potential to generate noise impacts over a large area. The geographic scope of analysis for cumulative noise impacts related to traffic is defined by the roadway segments analyzed previously in the assessment of direct noise impacts.

4.10.7.2 Cumulative Effects From Past, Present, and Probable Future Projects

Table 2-2, *Additional Cumulative Plans and Programs*, includes past, present, and probable future projects in the vicinity of the proposed PMPU area. Each of these projects would potentially add noise sources that would increase local noise levels. Because the region is already developed with numerous noise sources—including freeways, roads, railroads airports, and onsite operations—the additional noise from any one project would typically be incremental relative to existing conditions. Because noise and vibration attenuate quite rapidly with distance from the source, the effects from an individual project are quite localized to the project site or the facility (roadway, railroad, etc.) affected. In general, all cumulative projects will be subject to some combination of Federal, State, and local guidelines that will help to control individual noise levels. Nonetheless, past and present

development has increased, and probable future development will increase, the number of people working and/or living in the proposed PMPU area and adjacent cities, which will tend to increase overall noise levels over time. At some sensitive land uses in the proposed PMPU vicinity, the overall noise or vibration levels currently do, or will in the future, exceed standards or guidelines established in local noise ordinances or general plan noise elements, or other applicable standards. As a result, cumulative effects related to noise and vibration would be cumulatively significant at some locations in the vicinity of the proposed PMPU area.

4.10.7.3 Project Contribution

Construction Noise

The timing, location, and duration of construction activities associated with future development allowed under the proposed PMPU is not known at this time. However, as discussed above under Threshold 1, future projects constructed under the proposed PMPU, with or without Options 1, 2, or 3, may generate substantial noise levels as a result of pile driving and other heavy construction activities. These noise levels would likely exceed applicable noise standards at some sensitive land uses surrounding the Port. It is also possible that one or more cumulative projects could involve construction activities that would occur during prohibited hours (evening, nighttime, Sundays, or holidays), which may generate noise in excess of local limits for stationary noise sources at existing noise-sensitive receptors. If this construction were to occur simultaneously and in proximity to PMPU-related construction projects, cumulative noise levels may be exacerbated at nearby sensitive receptors. As such, implementation of the proposed PMPU, with or without Options 1, 2, or 3, would result in a cumulatively considerable contribution to significant construction noise impacts (**Impact-C-NOI-1** and **Impact-C-NOI-2**). Mitigation measures **MM-NOI-1** through **MM-NOI-5** would reduce construction-related noise levels to the extent possible, but the impact would likely remain significant and unavoidable at some locations. If construction noise from the proposed PMPU were to affect receivers exposed to construction noise from related projects, there would be the potential to exacerbate noise levels and contribute to overall levels in excess of applicable standards. This scenario would arise if two or more construction projects occur close to the same noise-sensitive receptor(s) simultaneously. This scenario cannot be ruled out and could occur over the life of the proposed PMPU. Therefore, implementation of the proposed PMPU, with or without Options 1, 2, or 3, would result in a cumulatively considerable and unavoidable contribution to construction noise levels after mitigation.

Traffic Noise

The traffic analysis presented under Threshold 1 above includes future growth under the proposed PMPU. The results indicate significant traffic noise impacts could occur at several locations depending on the pace of buildout and the details of the individual projects implemented under the proposed PMPU, with or without Options 1, 2, or 3. The impacted land uses would all be adjacent to roadways experiencing traffic growth related to the proposed PMPU. This growth, and the resulting traffic noise increase could be exacerbated by additional traffic from cumulative development. Therefore, implementation of the proposed PMPU, with or without Options 1, 2, or 3, would result in a cumulatively considerable contribution to traffic noise levels (**Impact-C-NOI-3**). Mitigation measures **MM-NOI-6** and **MM-NOI-7** would reduce traffic noise levels to the extent possible, but impacts may remain significant and unavoidable at some locations.

Onsite Stationary Noise Sources

Future development under the proposed PMPU may generate substantial noise levels as a result of onsite operational activities. These noise levels may exceed applicable noise standards at some sensitive land uses surrounding the proposed PMPU area. If operational noise from PMPU, with or without Options 1, 2, or 3, were to affect receivers exposed to noise from related projects, there would be the potential to exacerbate noise levels and contribute to overall levels in excess of applicable standards. This scenario would arise if two or more projects occur close to the same noise-sensitive receptor(s). This scenario cannot be ruled out and could occur over the life of the proposed PMPU. Therefore, implementation of the proposed PMPU, with or without Options 1, 2, or 3, would result in a cumulatively considerable contribution to operational noise levels from stationary sources (**Impact-C-NOI-4**). Mitigation measures **MM-NOI-8** through **MM-NOI-11** would reduce noise levels to the extent possible, but the impact may remain significant and unavoidable at some locations.

Groundborne Vibration

The timing, location, and duration of construction activities associated with future development allowed under the proposed PMPU are not known at this time. However, above under Threshold 2, future projects constructed under the proposed PMPU, with or without Options 1, 2, or 3, may generate substantial groundborne vibration levels as a result of pile driving and other heavy construction activities. These vibration levels could exceed thresholds for potential building damage or human annoyance at nearby buildings. If groundborne vibration from future projects constructed under the proposed PMPU were to affect occupied sensitive building exposed to vibration from related projects, there would be the potential to exacerbate vibration levels in excess of established guideline criteria. This scenario would arise if two or more construction projects occur close to the same sensitive building(s) simultaneously. This scenario cannot be ruled out and could certainly occur over the life of the proposed PMPU. Therefore, implementation of the proposed PMPU, with or without Options 1, 2, or 3, would result in a cumulatively considerable contribution to building damage (**Impact-C-NOI-5**) or human annoyance (**Impact-C-NOI-6**) due to groundborne vibration from construction activities. Implementation of **MM-NOI-12** would reduce the potential for building damage (**Impact-C-NOI-5**) to a less-than-significant level. Implementation of **MM-NOI-13** would avoid or reduce human annoyance at nearby buildings (**Impact-C-NOI-6**) to the extent possible, but the impact would likely remain significant and unavoidable at some locations.

4.10.7.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's incremental contribution to cumulative impacts related to construction, traffic, and stationary operational noise would be cumulatively considerable prior to mitigation. The potential cumulatively considerable impacts are as follows.

Impact-C-NOI-1: Exceed the Established 75 dBA L_{eq} Thresholds at Noise-Sensitive Receptors. Cumulative construction activities may exceed the established 75 dBA L_{eq} thresholds at noise-sensitive receptors during permissible construction hours.

Impact-C-NOI-2: Generate Noise in Excess of Local Limits. Cumulative construction activities occurring during prohibited hours (evening, nighttime, Sundays, or holidays) may generate noise in excess of local limits for stationary noise sources at existing noise-sensitive receptors.

Impact-C-NOI-3: Increase Noise Levels at Existing Noise-Sensitive Receptors by 3 dB CNEL or More. Cumulative traffic on some roadways could increase noise levels at existing noise-sensitive receptors by 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member City.

Impact-C-NOI-4: Generate Noise at Sensitive Receptors in Excess of Local Limits. Cumulative operation of future developments may generate noise at sensitive receptors in excess of local limits for stationary noise sources.

Impact-C-NOI-5: Exceed Caltrans Guideline Criteria for Potential Building Damage. Cumulative groundborne vibration may exceed Caltrans guideline criteria for potential building damage during project construction.

Impact-C-NOI-6: Exceed Caltrans Guideline Criteria for Potential Human Annoyance at Sensitive Receptors. Cumulative groundborne vibration may exceed Caltrans guideline criteria for potential human annoyance at sensitive receptors during project construction.

Mitigation Measures

For **Impact-C-NOI-1:**

Implement **MM-NOI-1, MM-NOI-2, MM-NOI-3, and MM-NOI-4**, as described under Threshold 1 above.

For **Impact-C-NOI-2:**

Implement **MM-NOI-5**, as described under Threshold 1 above.

For **Impact-C-NOI-3:**

Implement **MM-NOI-6 and MM-NOI-7**, as described under Threshold 1 above.

For **Impact-C-NOI-4:**

Implement **MM-NOI-8, MM-NOI-9, MM-NOI-10, and MM-NOI-11**, as described under Threshold 1 above.

For **Impact-C-NOI-5:**

Implement **MM-NOI-12**, as described under Threshold 2 above.

For **Impact-C-NOI-6:**

Implement **MM-NOI-13**, as described under Threshold 2 above.

Level of Significance After Mitigation

Implementation of **MM-NOI-1 through MM-NOI-13** would reduce the remaining cumulative noise and vibration impacts to the extent feasible. However, the design and location of future development projects allowed under the proposed PMPU are unknown at this time, as are the details and timing of cumulative projects that may occur during the same time period. Therefore, it is not possible to quantify whether, and to what extent, the recommended mitigation measures would be feasible and effective at abating or reducing the impacts. As a result, the proposed PMPU's incremental

contribution to cumulative noise and vibration impacts (**Impact-C-NOI-1, Impact-C-NOI-2, Impact-C-NOI-3, Impact-C-NOI-4, and Impact-C-NOI-6**) would remain cumulatively considerable.

Implementation of **MM-NOI-12** would reduce **Impact-C-NOI-5** (the proposed PMPU's contribution to potential building damage due to groundborne vibration) to less than cumulatively considerable.

This page was intentionally left blank.

4.11.1 Overview

This section describes the existing population and employment conditions in the San Diego Unified Port District's (District's) jurisdiction and the broader San Diego County region, as well as related laws and regulations. Impacts related to population are considered significant if the proposed Port Master Plan Update (PMPU) would induce substantial unplanned population growth in an area, either directly or indirectly, and one or more significant physical impacts on the environment are attributed to the unplanned population growth. Other population and housing-related issues, including impacts related to displacement of people and existing housing, were analyzed in Section XIII of the Initial Study/Environmental Checklist (Appendix A) and were determined not to be significant. The analysis and conclusions regarding these impacts are included in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*. It should be noted that the powers and authorized uses of District lands stated in the San Diego Unified Port District Act (Port Act) do not include residential development. No residential uses currently exist within the proposed PMPU area or are planned for within the proposed PMPU area, and the proposed PMPU would not displace substantial numbers of existing people or housing. Therefore, impacts associated with housing are not addressed in this Program Environmental Impact Report (PEIR).

As discussed in Section 4.11.4.4, *Project Impacts and Mitigation Measures*, impacts associated with unplanned population growth would be less than significant.

4.11.2 Existing Conditions

The following describes the existing and projected population and employment within the five member cities surrounding the proposed PMPU area: Chula Vista, Coronado, Imperial Beach, National City, and San Diego.

4.11.2.1 Population

The majority of the District's jurisdiction falls within or adjacent to developed and highly urbanized areas within the cities of Chula Vista, Coronado, Imperial Beach, National City, and San Diego (such as downtown San Diego).

The San Diego Association of Governments (SANDAG), as the Metropolitan Planning Organization, is the principal land use and transportation-planning agency for the San Diego region, including the region's 18 municipalities. As part of its planning efforts, SANDAG produces growth forecasts of population, housing, employment, income, and land use for the San Diego region. Based on SANDAG's most recent data, the San Diego regional population is forecast to increase from approximately 3,316,187 persons in 2016 to 4,011,145 persons in 2050 (SANDAG 2019)—an increase of 21 percent. Table 4.11-1 provides a breakdown of existing and projected regional population, and population within the five member cities surrounding the proposed PMPU area.

Notably, the District, consistent with the Public Trust Doctrine and Port Act, does not have residential uses and correspondingly, there is no residential population.

Table 4.11-1. Existing and Projected Population by Jurisdiction

Jurisdiction	2016 Population	2025 Population	2035 Population	2050 Population	Average Annual Growth Rate	Percent Change Between 2016 and 2050
Chula Vista	267,917	280,162	280,162	340,279	0.68%	27%
Coronado	24,543	24,634	24,634	24,945	0.05%	1.64%
Imperial Beach	27,510	30,406	33,284	34,129	0.71%	24.06%
National City	61,210	64,906	69,679	75,084	0.67%	22.67%
San Diego (City)	1,406,318	1,533,992	1,652,833	1,742,652	0.70%	24%
Total Population of PMPU Adjacent Cities	1,787,498	1,934,100	2,060,592	2,217,089	0.71%	24%
San Diego Region	3,316,187	3,545,073	3,753,630	4,011,145	0.62%	21%

Source: SANDAG 2019.

4.11.2.2 Employment

The State of California Employment Development Department's (EDD) is responsible for State programs involving job service, unemployment insurance, State disability insurance, workforce investment, and labor market information. The Labor Market Information Division of EDD collects, analyzes, and publishes information about California's labor markets, including employment and unemployment data. According to the EDD's labor force data, in December 2019 the San Diego County area had 1,569,400 jobs, an available labor force of 1,614,200 persons, and an average annual unemployment rate of 3.2 percent (EDD 2020a). With the onset of COVID-19 and the associated stay-at-home orders issued in California, the unemployment rate in San Diego County increased from 3.3 percent in January 2020 to as high as 15.2 percent in May 2020. As of September 2020, the unemployment rate was approximately 9.0 percent, and was further reduced to 6.4 percent by May 2021 (EDD 2020b, 2021).

In addition, SANDAG produces employment forecasts for the San Diego region, including the region's 18 municipalities. Based on SANDAG's projections, employment in the San Diego region is forecast to increase from 1,714,741 employment opportunities in 2016 to 2,051,356 employment opportunities in 2050, which represents a 20 percent increase. SANDAG's *San Diego Forward: The Regional Plan* (Regional Plan) projects centers of employment will continue to expand through 2050. For example, according to the Regional Plan, downtown San Diego is projected to add 30,000 employment opportunities by 2050, and Chula Vista is projected to add approximately 50,000 employment opportunities by 2050 (SANDAG 2015). Table 4.11-2 provides a breakdown of existing (2016) and projected regional employment, as well as employment for the District's five adjacent

cities, which includes the proposed PMPU area (as indicated on the population and employment density maps in the Regional Plan).

Table 4.11-2. Existing and Projected Employment by Jurisdiction

Jurisdiction	2016 Employment (Jobs)^{1,2}	2025 Employment (Jobs)^{1,2}	2035 Employment (Jobs)^{1,2}	2050 Employment (Jobs)^{1,2}	Increase in # of Jobs Average Annual Growth Rate	Percent Change Between 2016 and 2050
Chula Vista	71,638 74,078	75,595 83,027	85,091 98,701	11,942 116,185	42,107 1.20%	41 57%
Coronado	27,548 26,888	27,822 27,283	28,514 27,978	29,362 28,771	1,883 0.19%	6.58 7%
Imperial Beach	4,916 5,621	5,045 5,948	5,357 6,407	5,777 6,946	1,325 0.52%	18 24%
National City	37,289 42,218	38,471 54,193	41,274 57,419	45,038 60,875	18,657 0.61%	21 44%
San Diego (City)	915,295 892,828	957,496 953,977	1,036,088 1,046,814	1,125,661 1,140,676	247,848 0.68%	23 28%
Total Employment of PMPU Adjacent Cities	1,041,633 1,056,686	1,124,428 1,104,429	1,237,319 1,196,324	1,353,453 1,306,780	311,820 0.70%	24 30%
San Diego Region	1,714,741 1,646,419	1,723,744 1,761,747	1,870,403 1,921,475	2,051,356 2,086,318	439,899 0.58%	20 27%

Source: SANDAG ~~2019~~2021.

¹ Includes both military and civilian jobs, where applicable.

² Projections for civilian jobs based on developed employment acre (industrial, retail, office, schools, and half of mixed-use acres).

Employment opportunities in the proposed PMPU area include the hospitality, retail, commercial, and industrial sectors. Commercial recreation activities provide full- and part-time employment opportunities in construction, warehousing, trucking, custodial, and personal services, all of which contribute to the economic base of the region (District 2020). According to an economic impact study prepared for the District, total employment within the proposed PMPU area for 2017 was estimated at 37,000 jobs (District 2019). However, 2020/2021 employment within the proposed PMPU area is likely to be less than employment in 2017 due to COVID-19 conditions.

4.11.3 Laws, Regulations, Plans, and Policies

4.11.3.1 State

California Public Trust Doctrine

The Public Trust Doctrine is a common law doctrine that provides that public lands and waters are held by the State or its delegated trustee (e.g., the California State Lands Commission [CSLC]) for the benefit of all people. All tide and submerged lands, granted or ungranted, as well as navigable rivers, sloughs, etc., are subject to the Public Trust. In granting such lands to local municipalities, the courts have explained that it is within the wisdom and power of the Legislature, acting within the scope of its duties as trustee, to determine whether Public Trust uses should be modified or extinguished.

The Public Trust Doctrine, as overseen by the CSLC, restricts the type of land uses allowed on public lands, including the District Tidelands. The Public Trust Doctrine limits the uses of sovereign lands to waterborne commerce, navigation, fisheries, open space, water-oriented recreation, ecological habitat protection, or other recognized Public Trust purposes. While Public Trust uses originally focused upon navigation, commerce, and fisheries, they have been interpreted to include a broad array of uses such as fishing, hunting, bathing, swimming, boating, anchoring, and general recreation. Trust lands may be devoted to purposes unrelated to the trust if such purposes are incidental to and accommodate trust uses. The public uses to which tidelands are subject are sufficiently flexible to encompass changing public needs, which include both maritime and terrestrial uses (including activities for the non-boating public). In administering the trust, the District is not burdened with an outmoded classification favoring one mode of utilization over another.

As such, no residential uses are present within the proposed PMPU area, as they are not considered a permitted use under the Public Trust Doctrine.

San Diego Unified Port District Act

The Port Act, Appendix 1 of the California Harbor and Navigation Code, was adopted in 1962. Through the Port Act, the State of California delegated its authority to the District to manage and control certain tidelands and submerged waters. Specifically, the District was established for the development, operation, maintenance, control, regulation, and management of the tidelands and lands underlying the inland navigable waters of San Diego Bay. The Port Act requires the District to exercise its land management authority and powers over (1) the tidelands and submerged lands granted to the District and (2) any other lands conveyed to the District by any city or the County of San Diego, or acquired by the District. The Port Act grants the District exclusive police power over property and development subject to its jurisdiction. A Port Master Plan (PMP) is also required by the Port Act that must specify the water and land uses within the District's jurisdiction.

California Coastal Act

The California Coastal Act (CCA) of 1976 (Public Resources Code, Section 30000 et seq.) was enacted by the Legislature as a comprehensive scheme to govern land use planning for the entire coastal zone of California. A combination of local land use planning procedures and enforcement to achieve maximum responsiveness to local conditions, accountability, and public accessibility, as well as continued State coastal planning and management through the CCC, is relied upon to ensure

conformity with the provisions of the act (Section 30004 (a) and (b)). Chapter 8, Article 3 of the CCA establishes a framework for ports, including the Port of San Diego, to develop a PMP by which to designate water and land uses and issue individual coastal development permits within their jurisdictions. Individual PMPs require review and certification by the CCC, including any amendments to the certified PMP. The CCC must certify a PMP or PMP Amendment (PMPA) if it finds that the PMP or PMPA meets the requirements of, and is in conformity with, the CCA. Additionally, Chapter 3 of the CCA, *Coastal Resources Planning and Management Policies*, provides broad statewide policies for public access to the coast, recreation, marine environment, land resources, development, and sea-level rise.

4.11.3.2 Regional

San Diego Association of Government's San Diego Forward: The Regional Plan

SANDAG is the San Diego region's primary public planning, transportation and research agency. SANDAG provides the public forum for regional policy decisions about growth and planning. In 2015, SANDAG adopted the Regional Plan, which includes an implementation program for growth within the San Diego region through 2050. The Regional Plan is built on an integrated set of public policies, strategies, and investments to maintain, manage, and improve the transportation system. Furthermore, the Regional Plan, including its Sustainable Communities Strategy (SCS), commits to reducing emissions from transportation sources to comply with Senate Bill 375, improving public health, and meeting the National Ambient Air Quality Standards. The SCS included in the Regional Plan envisions reducing greenhouse gas emissions through strategies such as focusing on housing and job growth in urbanized areas where there is existing and planned transportation infrastructure, employing smart growth land use policies, investing in a transportation network, addressing the housing needs of all economic segments or the population, and implementing the Regional Plan through incentives and collaboration (SANDAG 2015).

4.11.4 Project Impact Analysis

4.11.4.1 Methodology

This section analyzes the potential environmental impacts associated with unplanned population growth that could occur under buildout of the proposed PMPU. The impact analysis considers whether buildout of the proposed PMPU would induce substantial unplanned population growth, primarily through the introduction of new businesses and/or provision of new jobs, that would consequently require the construction of new infrastructure (e.g., new roads, utilities) or other improvements within the proposed PMPU area not previously identified in applicable plans to accommodate growth.

Potential direct impacts are determined by applying employment density factors to the development assumptions to estimate the employment that could occur with implementation of the proposed PMPU, and determine whether these jobs would induce unplanned growth in the San Diego region. Potential indirect impacts would be determined by identifying whether the proposed water and land use development scenarios that could occur under the proposed PMPU would result in the extension of infrastructure into areas where none currently exists, and whether this extension would induce unplanned growth in the San Diego County region. The analysis determines if the

physical construction of these new facilities would result in a significant impact on the environment and if mitigation is necessary to reduce significant impacts. As noted above, the Port Act prohibits residential development on District tidelands; therefore, no residential uses are proposed in the proposed PMPU.

4.11.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining significance of impacts associated with population and housing resulting from the proposed project. The determination of whether a population and housing impact would be significant is based on the professional judgment of the District as Lead Agency, all of which is based on the evidence in the administrative record.

Impacts are considered significant if the proposed project would result in any of the following.

1. Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure).
2. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

Population-related issues that were addressed in Section XIII of the Initial Study/Environmental Checklist (Appendix A) and determined to be less than significant include impacts associated with the displacement of substantial numbers of existing housing and people, necessitating the construction of replacement housing elsewhere. The analysis and conclusions regarding these impacts are summarized in Chapter 5.

4.11.4.3 Policies that May Avoid or Reduce Impacts

There are no proposed PMPU policies that would have the potential to reduce or avoid impacts associated with substantial unplanned population growth.

4.11.4.4 Project Impacts and Mitigation Measures

Threshold 1: Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Impact Analysis

Construction

The PMPU serves as a long-term planning blueprint for future development on District Tidelands. Approval of the plan would facilitate future development subject to the future proposed developments obtaining a Coastal Development Permit or exclusion. However, the plan would not extend roads or result in new development in previously undeveloped areas that could induce unplanned growth as the project area is already urbanized.

Construction activities would result from future development projects that are consistent with the proposed water and land use designations and abide by the goals, objectives, policies and development standards set forth in the proposed PMPU. As such, the PMPU would indirectly result in the need for additional temporary construction jobs as these future development projects are constructed over the approximately 30-year life of the plan. Specifically, buildout of the proposed PMPU would potentially include the construction of a variety of types of development, including, but not limited to, new hotels and lower cost accommodations, restaurants and entertainment venues, park space and promenades, retail, convention and meeting space, and other uses that either are water dependent or help to enhance the waterfront experience. In addition, the proposed PMPU would potentially lead to improvements to existing facilities.

Although implementation of the proposed PMPU would increase the number of temporary construction jobs in the proposed PMPU area, the buildout of the proposed PMPU would take place over a 30-year timeframe and development is expected to occur throughout that timeframe. Consequently, the need for construction jobs would not occur all at once. In addition, construction workers account for approximately 4.3 percent of the total employment in San Diego County (approximately 66,000 employees) (BLS 2019), and the existing construction labor force would be sufficient to meet the future construction demands in the proposed PMPU area. Therefore, additional jobs would not increase the population because future employees are anticipated to be drawn from existing and future residents of the San Diego region, the population of which will also be growing alongside growth at the Port consistent with the population growth projections provided in SANDAG's Regional Plan. Therefore, construction indirectly associated with the proposed PMPU would have a less-than-significant impact on the inducement of unplanned population and employment growth.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within Planning District (PD) 3, would result in a less-than-significant impact related to population and housing.

The construction of a new Waterfront Destination Park and closure of a segment of North Harbor Drive would not require a greater number of construction workers than what is analyzed for the proposed PMPU above. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to population and housing than buildout of the proposed PMPU without Option 1. Impacts related to the inducement of unplanned population and employment growth would be less than significant.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant-impact related to population and housing.

Option 2 would involve the replacement of land designated for Commercial Recreation uses by Recreation Open Space area, differing from what is analyzed for the proposed PMPU above. This could result in a minor decrease in hotel rooms or retail/restaurant square footage, which may result in a slight decrease in construction worker employment from what is analyzed above. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to population and housing than buildout of the proposed PMPU without Option 2. Impacts related to the inducement of unplanned population and employment growth would be less than significant.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to population and housing. This less-than-significant impact would still occur under Option 3.

Option 3 would involve the realignment of North Harbor Drive in a way that would result in a minor reduction in Commercial Recreation uses from what is analyzed for the proposed PMPU above. This would also result in a slight reduction in the need for construction workers related to development of Commercial Recreation uses from what is analyzed above. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to population and housing than buildout of the proposed PMPU without Option 3. Impacts related to the inducement of unplanned population and employment growth would be less than significant.

Operation

Future permanent employment opportunities in the proposed PMPU area would include jobs in the hospitality, retail, industrial, and commercial sectors, consistent with existing employment opportunities within the Port. Commercial recreation-oriented businesses provide full- and part-time employment opportunities in construction, warehousing, trucking, custodial, and personal services (District 2019). Industrial uses at the Port support cargo and goods movement, ship building and repair, and other similar maritime-related industries and businesses. Buildout of the proposed PMPU would result in the development of future visitor-serving uses throughout the proposed PMPU area, such as hotels, restaurants, and retail. Economic growth could occur as these new visitor-serving businesses are established or existing businesses expand, creating new sources of employment. While a majority of the planning districts would experience some level of growth and development, PD2 and PD3 would have the greatest development potential, and thus would have the potential to generate the greatest number of permanent employment opportunities.

Employment that could occur within the proposed PMPU area was estimated using standard employee density factors provided by regional or industry-specific sources. SANDAG identifies factors for retail and industrial employment in their Regional Transportation Congestion Improvement Plan (RTCIP) Impact Fee Nexus Study (SANDAG 2007). Hotel employment was

estimated at 1.37 employees per room (Oxford Economics 2019).¹ According to the development assumptions provided in Chapter 3, landside development occurring under the proposed PMPU could add approximately 6,173 new hotel rooms, a total of 356,622 square feet of new restaurant and retail space (standalone retail and restaurant space would increase by 79,373 square feet, and restaurant and retail within hotels by 187,250), and 26,136 square feet of commercial fishing space. In addition, 524 new jobs would be added within PD4 with the Tenth Avenue Marine Terminal Redevelopment Plan. However, due to the existing built-out nature and physical constraints that restrict expansion opportunities for the shipyards, these uses are not expected to experience growth and employment increases under the proposed PMPU and would remain at a constant existing employment of approximately 7,900 employees based on data from the U.S. Bureau of Labor Statistics (2018).² Based on the potential growth identified above, Table 4.11-3 shows the potential increase in employment that could occur under implementation of the proposed PMPU.

Table 4.11-3. Estimated Baywide Employment with Implementation of the Proposed PMPU

Land Use	Proposed New Square Feet/Rooms	Employment Density Factor ^{1,2}	New Employment
Total New Hotel Rooms	6,173	1.37 employees/room	8,457
Total Retail/Restaurant (square feet)	356,622	500 square feet/employee	713
Tenth Avenue Marine Terminal	NA	NA	524 ³
Commercial Fishing (landside square feet)	26,136	900 square feet/employee	29 ⁴
Total Employment			9,723

Sources: SANDAG 2007, Oxford Economics 2019.

¹ Hotel employment was estimated using a factor of 1.37 employees per room based on an average hotel producing 137 direct jobs for every 100 occupied rooms (Oxford Economics 2019).

² Retail employment was estimated using a density factor of 500 sf/employee (SANDAG 2007).

³ Employment for PD4 was taken from the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component Final Environmental Impact Report (District 2016).

⁴ Commercial fishing employment was estimated using the employment density factor for industrial uses of 900 sf/employee (SANDAG 2007).

As shown in Table 4.11-3, employment within the proposed PMPU area is estimated to increase by 9,723 jobs by buildout of the proposed PMPU (2050), which would be a 26 percent increase in jobs in the area. As identified in Section 4.11.2.2, *Employment*, SANDAG anticipates employment in the San Diego region to increase to 2,051,356 jobs by 2050, or an increase of 336,615 jobs over existing conditions. The 9,723 new jobs created by the proposed PMPU would account for approximately 2.8 percent of the projected employment growth, which would be well within the planned growth for the region. Given that many of these jobs would involve retail or hotel positions and that San Diego County had an average annual unemployment rate of 3.3 percent prior to the effects of COVID-

¹ An economic analysis conducted for the American Hotel & Lodging Association concluded that an average hotel with 100 occupied rooms supports 137 direct jobs.

² Employment estimates for PD5 and PD6 are not included because they are not being updated as part of the PMPU. Employment estimates for PD7 are not included because there are no development projections for this planning district.

19 (approximately 61,165 unemployed individuals),³ future employees are anticipated to be drawn from existing and future residents of the San Diego region. As such, the proposed PMPU would not result in substantial unplanned population growth due to the introduction of new employees into the region and would not result in any indirect effects, such as demand for new housing, that would result from unplanned population growth. In addition, the proposed PMPU would primarily involve future infill development within areas that are already developed and would not involve the extension of new roadways or other new infrastructure into currently undeveloped areas. Therefore, because the increased employment would be well within anticipated growth and could be filled by the existing or projected population, the proposed PMPU would not induce substantial unplanned population growth, either directly by proposing new homes and businesses or indirectly through the extension of infrastructure into areas where none currently exists. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to population and housing.

Operational activities under Option 1 would consist of routine maintenance and upkeep of the Waterfront Destination Park, similar to other existing parks on District Tidelands, which would require permanent employees to maintain the park. However, this would not require a greater number of permanent workers than what is analyzed above. None of the other components of Option 1, including the closure of North Harbor Drive from the prolongation of West G Street to Broadway and the corresponding removal of parking, would require permanent employees once these improvements are complete. Operation of these uses would not affect the potential employment shown in Table 4.11-3. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to population and housing than buildout of the proposed PMPU without Option 1.

In addition, while Option 1 would increase the amount of Commercial Recreation space by about 1.5 acres, this would not result in a substantial increase in employees compared to those estimated for the proposed PMPU. Impacts would be less than significant.

³ As discussed in Section 4.11.2.2, the unemployment rate in San Diego County increased from 3.3% in January 2020 to as high as 15.2% in May 2020 due to the onset of COVID-19 and associated stay-at-home orders. As of September 2020, the unemployment rate was approximately 9.0%, and was further reduced to 6.4% by May 2021.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to population and housing.

Operational activities under Option 2 would consist of routine maintenance and upkeep of the expanded Lane Field Setback Park, similar to other existing parks on District Tidelands, which would require permanent employees to maintain the park. However, Option 2 would involve the replacement of land designated for Commercial Recreation uses to Recreation Open Space area. This could result in a minor decrease in hotel rooms or retail/restaurant area, which would result in a slight decrease in permanent employment associated with Commercial Recreation uses shown in Table 4.11-3. Therefore, operation of Option 2 would not result in any additional or more severe impacts related to population and housing than buildout of the proposed PMPU without Option 2. Impacts would be less than significant.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to population and housing.

Operational activities under Option 3 would consist of routine maintenance and upkeep of the additional park space added under this option, similar to other existing parks on District Tidelands, which would require permanent employees to maintain the park. However, Option 3 would involve the realignment of North Harbor Drive in a way that would result in a minor reduction in Commercial Recreation uses. This would also result in a slight reduction in permanent employment related to Commercial Recreation uses shown in Table 4.11-3. Therefore, operation of Option 3 would not result any additional or more severe impacts related to population and housing than buildout of the proposed PMPU without Option 3. Impacts would be less than significant.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would result in impacts related to substantial unplanned population growth.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure). Impacts would be less than significant.

4.11.5 Cumulative Impact Analysis**4.11.5.1 Geographic Scope**

The geographic scope for cumulative impacts associated with population and housing is the San Diego County region. Factors that influence regional population and housing growth include, but are not limited to, large-scale land use changes (e.g., General Plan and Community Plan Updates); the effectiveness of the transportation system; and the availability of jobs, housing, and infrastructure.

4.11.5.2 Cumulative Effects

The determination of cumulative effects relies on both regional forecasted growth as well as regionally significant plans and programs. The projection approach is applicable as growth, land use change, and development across the region can substantially affect and modify population and employment by supporting and facilitating the generation of jobs and population on a regional scale. In the San Diego region, SANDAG serves as the regional transportation planning agency responsible for forecasting the region's population growth. The Series 14 Regional Growth Forecast, the most current growth forecast model in use at the time of this analysis, represents a combination of economic and demographic projections, existing land use plans and policies, and potential land use plan changes that may occur in the region between 2025 and 2050. According to the Series 14 Regional Growth Forecast, SANDAG projects the region's population will grow by approximately 437,443 people by 2035 and nearly 694,958 people by 2050 (SANDAG 2019). In addition to regional forecasted growth, Table 2-2 in Chapter 2, *Environmental Setting*, of this PEIR identifies additional regionally significant plans and programs that have been adopted, or are currently in the planning phase, since adoption of the Series 13 Regional Growth Forecast.

The past, present, and reasonably foreseeable future plans and programs identified in Table 2-2 primarily include community plan or general plan updates. While these plans were adopted after the most recently conducted growth and employment forecasts, as noted above, land use changes included in these plans are intended to accommodate the population and employment growth projected by SANDAG. The Chula Vista Bayfront Master Plan would introduce residential and commercial uses, which would increase population and employment within the master plan area, but again, as noted in the environmental impact report for the Chula Vista Bayfront Master Plan, these uses are also considered to be growth accommodating (District 2008). In addition, the National City Bayfront Projects and Plan Amendments would increase lodging opportunities and commercial space. It is unlikely the new employees generated by these uses within that project's 75-acre area would exceed the projected employment growth for the region. Similar to the proposed PMPU, additional jobs would not increase the population because future employees are anticipated to be drawn from existing and future residents of the San Diego region.

Therefore, past, present, and reasonably foreseeable future plans and programs would not result in substantial unplanned population growth, and cumulative effects associated with unplanned population and employment growth would be less than cumulatively significant.

4.11.5.3 Project Contribution

The PMPU would facilitate the construction of future visitor-serving uses within the proposed PMPU area, such as new hotels and lower cost accommodations, restaurants and entertainment venues, park space and promenades, retail, convention and meeting space, office space, and other uses. As discussed in Section 4.11.4.4 above, the proposed PMPU would indirectly result in additional temporary construction jobs as these future development projects are constructed over the approximately 30-year life of the proposed PMPU. As discussed above, it is anticipated that construction-related additional jobs would not increase the population because future employees are anticipated to be drawn from existing and future residents of the San Diego region. Consequently, a cumulatively significant impact related to construction from past, present, and probable future projects is not present.

Additionally, economic growth could also occur as new visitor-serving businesses are established or existing businesses expand, creating new sources of permanent employment; and buildout and operation of allowable water and land uses, including secondary uses over the next 30 years would generate new permanent employment opportunities. However, as demonstrated in Section 4.11.4.4, this employment would fall well within the planned projections for population and employment growth within the region and would not induce substantial unplanned growth. Therefore, the number of permanent jobs generated by buildout of the proposed PMPU, when combined with the number of permanent jobs generated by buildout of the past, present, and reasonably foreseeable future plans and programs identified in Table 2-2, would not have the potential to indirectly induce substantial unplanned population growth within the San Diego region. Therefore, the proposed PMPU would not result in a cumulatively considerable impact related to cumulative unplanned population growth.

4.11.5.4 Cumulative Impact Determination and Mitigation

The PMPU's incremental contribution to cumulative population and housing impacts would not be cumulatively considerable. Cumulative impacts would be less than significant.

This page was intentionally left blank.

Section 4.12

Public Services and Recreation

4.12.1 Overview

This section describes the existing public services and recreational facilities that could be affected by the proposed Port Master Plan Update (PMPU) and the laws and regulations related to public services and recreational facilities, and concludes with an analysis of the proposed PMPU's potential to require or result in new or expanded facilities for: (1) fire protection and emergency medical response, (2) police protection, (3) schools, and (4) parks and other recreation, as well as discussion of whether construction of such facilities would result in significant environmental impacts.

Table 4.12-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.12.4, *Project Impact Analysis*.

Table 4.12-1. Summary of Significant Public Services and Recreation Impacts and Mitigation Measures

Summary of Potentially Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-PS-1: Potential to Result in Substantial Adverse Physical Impacts from the Provision of New or Physically Altered Police Protection Facilities Associated with Operation of Future Development Projects Consistent with the Proposed PMPU.	PD1–PD4	MM-PS-1: Conduct Project-Specific Reviews of the Adequacy of Police Protection Services with the SDPD and Coast Guard to Determine if a New or Expanded Government Facility Will be Required.	Significant and Unavoidable	MM-PS-1 would not ensure that the impact would be less than significant because the specific location and design specifications for future expansion or construction of new police facilities are not known at this time.
Impact-PS-2: Potential to Result in Substantial Adverse Physical Impacts from the Construction of New or Physically Altered Parks Implemented Under the Proposed PMPU.	PD1–PD4	Implement MM-AQ-2 through MM-AQ-8 , as described in Section 4.2, <i>Air Quality and Health Risk</i> ; implement MM-BIO-2 , MM-BIO-5 , MM-BIO-8 , and MM-BIO-9 , as described in Section 4.3, <i>Biological Resources</i> ; implement	Significant and Unavoidable	For the reasons discussed in Sections 4.2, 4.4, and 4.10, construction impacts related to air quality, cultural resources, and noise would remain significant and unavoidable even after implementation of mitigation.

Summary of Potentially Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
		MM-CUL-1 through MM-CUL-3, as described in Section 4.4, <i>Cultural Resources and Tribal Cultural Resources</i> ; implement MM-GEO-1, as described in Section 4.5, <i>Geology and Soils</i> ; implement MM-GHG-2, as described in Section 4.6, <i>Greenhouse Gas Emissions</i> ; implement MM-NOI-1 through MM-NOI-5, as described in Section 4.10, <i>Noise and Vibration</i> ; and MM-HAZ-1 and MM-HAZ-2, as described in Section 4.7, <i>Hazards and Hazardous Materials</i> .		
Impact-PS-3: Potential to Result in Substantial Adverse Physical Impacts from the Operation of New or Physically Altered Parks Implemented Under the Proposed PMPU.	PD1–PD4	Implement MM-AQ-9, through MM-AQ-12, as described in Section 4.2, <i>Air Quality and Health Risk</i> ; implement MM-BIO-5, as described in Section 4.3, <i>Biological Resources</i> ; and implement MM-GHG-1 and MM-GHG-2, as described in Section 4.6, <i>Greenhouse Gas Emissions</i> .	Significant and Unavoidable	For the reasons discussed in Section 4.2, operational air quality impacts would remain significant and unavoidable even after implementation of mitigation.
Impact-REC-1: Potential to Result in Substantial Adverse Physical Impacts from the Construction of New or Expanded Recreational Facilities Implemented	PD1–PD4	Implement MM-AQ-2 through MM-AQ-8, as described in Section 4.2, <i>Air Quality and Health Risk</i> ; implement MM-BIO-2, MM-BIO-5, MM-BIO-8, and MM-BIO-9, as described in Section 4.3, <i>Biological Resources</i> ; implement	Significant and Unavoidable	For the reasons discussed in Sections 4.2, 4.4, 4.8, and 4.10, construction impacts related to air quality, cultural resources, water quality, and noise would remain significant and unavoidable even after implementation of mitigation.

Significant and Unavoidable	For the reasons discussed in Sections 4.2 and 4.8, operational impacts related to air quality and water quality would remain significant and unavoidable.

4.12.2 Existing Conditions

The following describes the agencies that provide, police, fire, and other public services for the water and land uses within the San Diego Unified Port District's (District's) jurisdiction.

4.12.2.1 Fire Protection and Emergency Response

The District does not operate its own fire department. Rather, it participates in standing Mutual Service Agreements with the fire departments of the adjacent cities to respond to landside fire-related emergencies. In addition, the San Diego Harbor Police Department (HPD) cross-trains all officers as marine firefighters so it can respond to any fire-related call in San Diego Bay, including marinas, anchorages, moorings, shipyards, and cargo and cruise ship terminals. The agencies that provide fire protection and emergency response services to the proposed PMPU area are described below.

San Diego Harbor Police Department (Marine Firefighting and Emergency Response)

The San Diego HPD provides law enforcement services to the District, as well as marine firefighting services in the San Diego Bay area for the District. The HPD jurisdiction includes the San Diego Bay, San Diego International Airport, and the tidelands within the five neighboring cities: Chula Vista, Coronado, Imperial Beach, National City, and San Diego. The HPD's 140 sworn officers provide law enforcement, marine firefighting, and emergency response services (District 2021a).

All HPD officers are cross-trained in marine firefighting. HPD vessels are equipped with firefighting equipment so as to quickly respond to a fire emergency on or adjacent to the Bay, as well as inner and outer coastal waters. In addition, under a mutual aid agreement, HPD assists City of San Diego lifeguards in Mission Bay. The HPD fleet can also accommodate dive equipment in the case of a dive-rescue related incident that requires the HPD Dive Team. For further information about the landside

law enforcement duties of the HPD, see Section 4.12.2.2, *Police Protection*. HPD is composed of the following departments as they pertain to fire protection and emergency response.

- **Marine Firefighting:** Marine firefighter officers with HPD are unique because they are cross-trained as both land- and marine-based firefighters. The patrol boats also serve as firefighting boats that respond to fire emergencies in the Bay. Each officer is highly trained and fully equipped with firefighting equipment, and each boat includes a water cannon capable of shooting a stream of water several hundred feet. The fireboats can handle small electrical fires or a large vessel engulfed in flame by containing the fire, knocking it down, rescuing trapped victims, and protecting adjacent vessels in a marina. The fireboats can be cooperatively used with the City of San Diego's Fire-Rescue Department (SDFD) if necessary, and SDFD takes control of fire protection service upon arrival at the scene.
- **Vessel Patrol:** HPD vessels patrol San Diego Bay, its associated waterways, and coastal areas, similar to the way HPD patrols on land. These vessels are staffed 24 hours a day, in all types of weather. Their primary function is the ability to respond to all types of law enforcement-related issues. Additionally, part of the fleet is designed for response to any fire and rescue-related calls. All of HPD's vessels can also accommodate the Dive Rescue Team and the different missions they handle (District 2021a). HPD provides two 35-foot patrol boats crewed by two officers with the primary objective of enforcing the rules of the water as they pertain to private watercraft. A third boat is available for peak events in San Diego Bay.

City of San Diego Fire-Rescue Department

The SDFD provides fire protection, emergency medical, lifeguard, and emergency management services. The jurisdiction of the SDFD covers 343 square miles, including 17 miles of coastline extending 3 miles offshore, and serves approximately 1,420,571 citizens (SANDAG 2020). Structures that are attached to land, such as docks, are also under the jurisdiction of SDFD, even though the structures are located over water. However, SDFD and HPD provide joint-response to fire incidents at docks and on the water. The SDFD has 51 fire stations, as well as an airport station, an Emergency Command and Data Center, and a Fire-Rescue Logistics Center; and employs 892 uniformed fire personnel. The SDFD also includes 9 permanent lifeguard stations, 31 seasonal stations, and 98 permanent uniformed lifeguard personnel. The SDFD employs 246 civilian personnel, for a total of 1,236 total employees (SDFD 2021a). Per the Public Facilities, Services, and Safety Element of the City of San Diego General Plan, SDFD has established a response time goal of 7.5 minutes from receipt of call to arrival of first-due unit for small fires and medical patients. For serious emergencies requiring multiple unit response, the response time goal is 10.5 minutes from time of call to arrival of an effective firefighting force (City of San Diego 2018).

An existing area of concern for SDFD is the lack of significant water-based firefighting resources, such as fire boats. As such, large fires on the water are currently difficult to address (Webber pers. comm.). SDFD and HPD provide mutual assistance for incidents in San Diego Bay, including fires at boat docks as well as out on the water. On the ground, SDFD has adequate resources to cover landside firefighting needs. However, one other area of concern is the volume of Emergency Medical Services (EMS) responses in the Downtown area. SDFD currently has the proper equipment to respond to these types of calls in the Downtown area, but will likely need to add additional staff to cover the increased call volumes from population growth in the area in order to maintain adequate response times (Webber pers. comm.). In addition, SDFD and the District have a Municipal Services

Agreement for providing fire and emergency services on District property. These agreements are reevaluated every 5 years, at which time service needs are also reassessed (Webber pers. comm.).

In 2020, an *All-Risk Maritime Response Capabilities Assessment* was commissioned by SDFD, in cooperation with the District, to assess the current maritime fire and emergency medical risks to be protected in San Diego Bay. This report identified a series of gaps in the marine emergency response system that currently exists in the District's operational area and found that the HPD firefighting program is very capable, but only equipped and trained for pleasure craft fires and moderately sized emergency medical events. The HPD can handle moderate emergencies on party and event vessels but not on large tourism attraction or commercial vessels (Citygate Associates 2020).

The SDFD uses a variety of apparatus to serve the City of San Diego. The fire stations are all generally equipped with fire engines, paramedic units, fire trucks, brush engines, battalion chief's vehicles, and/or water tenders. The SDFD could also utilize a fast response squad (FRS), reserve fire engine, urban search and rescue (US&R) rig, and/or an aerial truck to respond to fire and other emergency situations. The SDFD fire stations that would provide fire protection and emergency services in PD1, PD2, PD3, and PD4 are described in Table 4.12-2.

Table 4.12-2. SDFD Fire Stations Serving PMPU Planning Districts

Fire Station Number	Address	Types of Equipment	Size of Service Area	Planning District Served
Fire Station 22	1055 Catalina Boulevard	1 Engine	5.97 square miles	PD1
Airport Station	3698 Pacific Highway	4 aircraft crash and rescue trucks	San Diego International Airport	PD2
Fire Station 1	1222 1 st Avenue	1 battalion 2 engines 1 truck 1 light and air unit 1 chemical rig 1 medic unit 1 mobile canteen 1 x-ray unit	Engine 1 covers 0.78 square miles and Engine 201 covers 0.54 square miles	PD3
Fire Station 2	875 W. Cedar Street	1 engine, 1 urban search and rescue unit, 1 utility rig	Little Italy and Downtown west of the train and trolley tracks	PD3
Fire Station 3	725 West Kalmia Street	1 engine	2.24 square miles	PD2 and PD3
Fire Station 4	404 8 th Avenue	1 engine	0.66 square miles	PD3
Fire Station 7	944 Cesar E. Chavez Parkway	1 engine	1.71 square miles	PD4

Source: SDFD 2021b.

City of Coronado Fire Department

The Coronado Fire Department and Lifeguard Services (CFD) provide fire protection, emergency medical services, and lifeguard services. CFD deploys a fire engine with a team of firefighters and paramedics on board as responders. Daily staffing includes 1 engine company, 1 truck company, one paramedic ambulance, and a duty battalion chief, for a total of 10 personnel operating 24/7. CFD also responds to medical incidents on boat docks/slips and responds jointly with HPD for fire incidents on boat docks/slips (Peake pers. comm.). CFD has 30 fire suppression personnel staffing two fire stations around the clock. One fire station is located at 1001 6th Street, and the Coronado Cays Station is located at 101 Grand Caribe Causeway. The CFD also employs 7 permanent lifeguards, 2 administrative staff, and 1 Emergency Management Coordinator (City of Coronado 2020). In addition to the District, the CFD has mutual aid agreements with other governmental agencies such as the Navy, SDFD, and the City of Imperial Beach. The CFD also relies heavily on District (HPD) assistance for fighting fires in the Bay (City of Coronado 2005). The CFD would respond to emergency situations within PD9 and PD10.

City of Imperial Beach Fire-Rescue Department

PD8 would be served by the Imperial Beach Fire-Rescue Department (IBFRD), which has one fire station located at 865 Imperial Beach Boulevard, staffed with 12 suppression personnel, 1 Administrative Assistant, 1 Assistant Fire Marshal, and 1 Fire Chief. The City of Imperial Beach contracts with the City of Chula Vista for emergency medical transportation (French pers. comm.). There were approximately 27,448 citizens within Imperial Beach in 2019 (SANDAG 2020). The IBFRD aims to respond to 90 percent of ambulance calls within 12 minutes, has a fire response goal of 8 minutes for 90 percent of fire protection calls, and is currently meeting its response time goals (French pers. comm.). The IBFRD has identified the Imperial Beach Pier and associated water pipes as an existing area of concern. Currently, the Imperial Beach Pier will not support the weight of a fire engine and existing water pressure is not sufficient for firefighting (French pers. comm.).

4.12.2.2 Police Protection

San Diego Harbor Police Department

The HPD, as described above in Section 4.12.2.1, provides police protection, investigation, and marine fire-fighting services to the District in the Bay, surrounding Tidelands, and at the San Diego International Airport. The HPD's jurisdiction includes areas within five neighboring cities: Coronado, Chula Vista, Imperial Beach, National City, and San Diego. The HPD would serve all of the planning districts. The HPD headquarters is located at 3380 N. Harbor Drive, San Diego. There are three substations within the proposed PMPU area: the Shelter Island Station located at 1401 Shelter Island Drive, San Diego; the South Bay Station located at 950 Marina Way, Chula Vista; and the San Diego International Airport, located at 3225 North Harbor Drive, Terminal 1.

The HPD has a fleet of vessels that patrol the Bay, inner and outer coastal waters, and Mission Bay as part of an aid agreement with the City of San Diego Police Department. The HPD also has a fleet of vehicles that patrol the District Tidelands to provide safety and assistance to the Port tenants and visitors. In addition to these services, the HPD includes a Vessel Collision Team, Traffic Enforcement Team, Bike Team, Vehicle Patrol, Airport Law Enforcement, Explosives Detection Canine Team, and Narcotic Detection Canine Team. There are also a number of specialized units and task forces designed to address specific needs, such as terrorism, narcotics and money smuggling, immigration

and customs, and civil disobedience. The HPD works in conjunction with Federal agencies such as the U.S. Coast Guard, U.S. Customs and Border Protection, Homeland Security, and the Federal Bureau of Investigations for the operation of many of these task forces (District 2021a).

City of San Diego Police Department

The City of San Diego Police Department (SDPD) is divided into nine divisions. Planning District 1 and PD2 are within the Western Division, PD3 and PD4 are within the Central Division, and PD7 is within the Southern Division. Western Division Headquarters are at 5215 Gaines Street, Central Division Headquarters are at 2501 Imperial Avenue, and Southern Division Headquarters are at 1120 27th Street. The Western Division serves the neighborhoods of Hillcrest, La Playa, Linda Vista, Loma Portal, Midtown, Midway District, Mission Hills, Valley West, Morena, Ocean Beach, Old Town, Point Loma Heights, Roseville-Fletridge, Sunset Cliffs, University Heights, and Wooded Area, which encompasses a total of 22.7 square miles. The population of the Western Division is approximately 129,709 people (City of San Diego 2021a). Central Division encompasses the neighborhoods of Balboa Park, Barrio Logan, Core-Columbia, Cortez, East Village, Gaslamp, Golden Hill, Grant Hill, Harborview, Horton Plaza, Little Italy, Logan Heights, Marina, Park West, Petco, Sherman Heights, South Park, and Stockton, which covers 9.7 square miles. The Central Division serves a population of approximately 103,524 people (City of San Diego 2021b). The Southern Division serves a 31.5-square-mile area including the neighborhoods of Border, Egger Highlands, Nestor, Ocean Crest, Otay Mesa, Otay Mesa West, Palm City San Ysidro, and Tijuana River Valley. The population of the Southern Division is approximately 107,631 people (City of San Diego 2021c). Per the Public Facilities, Services, and Safety Element of the City of San Diego General Plan, SDPD has established the following response time goals:

- Priority E Calls (imminent threat to life) within 7 minutes.
- Priority 1 Calls (serious crimes in progress) within 12 minutes.
- Priority 2 Calls (less serious crimes with no threat to life) within 30 minutes.
- Priority 3 Calls (minor crimes/requests that are not urgent) within 90 minutes.
- Priority 4 Calls (minor requests for police service) within 90 minutes.

City of Coronado Police Department

The City of Coronado Police Department (CPD) would respond to criminal or emergency situations in PD9 and PD10. The CPD employs 67 paid employees and 40 civilian volunteers (City of Coronado 2021a). The CPD provides public safety and law enforcement services to a population of approximately 24,199 (as of 2019) on the island of Coronado (SANDAG 2020).

San Diego County Sheriff's Department – Imperial Beach Substation

The Imperial Beach Substation of the San Diego County Sheriff's Department, located at 845 Imperial Beach Boulevard, provides contract law enforcement services to the City of Imperial Beach and the unincorporated communities of Bonita, Chula Vista, Lincoln Acres, Proctor Valley, San Miguel, and Otay Valley. The division has approximately 40 sworn personnel assigned to the substation (SDCSD 2021). Imperial Beach has a population of approximately 27,448 residents and covers about a 4-square-mile area (SANDAG 2020). Units operating out of the Imperial Beach Substation include the following:

- **Patrol Deputies:** Patrol deputies respond to calls for service 24 hours a day.
- **Traffic Deputies:** Traffic deputies handle vehicle code enforcement, traffic collision investigations, and traffic control within the City of Imperial Beach.
- **Detectives:** Detectives investigate cases involving theft, physical assaults (excluding homicides), sexual assaults, vandalism, burglaries, annoying phone calls, and other crimes. Specialized investigative units such as homicide, bomb/arson, financial crimes, domestic violence, child abuse, and narcotics handle specific crimes for the entire Sheriff's jurisdiction, including the Imperial Beach Station.
- **Crime Prevention Specialists:** Crime Prevention Specialists provide information and presentations about several topics, including, but not limited to residential and commercial security techniques, internet safety, identify theft protection, robbery prevention, and neighborhood watch.
- **Senior Volunteers:** The Senior Volunteer Patrol program provides assistance to existing staff by conducting home vacation security checks, visiting the homebound, enforcing handicapped parking regulations, assisting Crime Prevention Specialists with presentations, and conducting residential and businesses security checks.

U.S. Coast Guard

The 11th U.S. Coast Guard District covers more than 3.3 million square miles, including California, Arizona, Nevada, and Utah; the coastline; and over 1,000 miles of offshore waters (USCG 2021). Coast Guard Sector San Diego is at 2710 North Harbor Drive and responds to emergency calls related to hazardous materials and oil spills, homeland security issues, marine vehicle incidents, and search and rescue cases. The Coast Guard is responsible for operations from the Mexican border northward to above San Mateo Point, and offshore as far as 200 miles. Coast Guard Sector San Diego works with the HPD to respond to emergency situations in District Tidelands. Some Coast Guard Sector San Diego personnel are located in the Joint Harbor Operations Center (JHOC), along with Harbor Police and city law enforcement agencies for an integrated approach to protection of the Bay and bayfront. They also work side-by-side with the Navy, National Guard, and U.S. Customs/Border Protection to handle issues of homeland security.

4.12.2.3 Public Schools

There are no schools located within the proposed PMPU boundaries; however, there are four schools within 0.25 mile of the proposed PMPU area. Table 4.12-3 lists the school districts and schools within 0.25 mile of the planning districts. Note, PD5 and PD6 are not part of the proposed PMPU area and therefore schools within 0.25 mile of those planning districts are listed.

Table 4.12-3. Schools in the Vicinity of the Planning Districts

School District	Schools	Distance to Planning District(s)
San Diego Unified School District	Cabrillo Elementary School	0.14 mile northwest of PD1
	Perkins Elementary School	0.22 mile northeast of PD4
Sweetwater Union High School District	National City Adult School	0.20 mile east of PD5

School District	Schools	Distance to Planning District(s)
San Diego County Office of Education	Monarch School (Special Education)	0.07 mile east of PD4

San Diego Unified School District

Planning Districts 1, 2, 3, 4, and 10 are within the jurisdiction of the San Diego Unified School District (SDUSD), which serves more than 121,000 students from pre-kindergarten through high school, and also provides adult school programs (SDUSD 2021). There are two school facilities within 0.25 mile of the planning districts. Cabrillo Elementary School is located 0.14 mile northwest of PD1, and Perkins Elementary School is located 0.22 mile northeast of PD4.

Sweetwater Union High School District

The Sweetwater Union High School District (SUHSD) serves more than 40,000 students in grades 7 through 12 in the cities of Chula Vista, Imperial Beach, National City, and San Diego. Within the city of San Diego, SUHSD operates schools in Bonita, Eastlake, Otay Mesa, San Ysidro, and south San Diego. SUHSD also has adult learning facilities, which serve approximately 22,000 adult students (SUHSD 2021). There are no school facilities within 0.25 mile of the planning districts.

San Diego County Office of Education

The San Diego County Office of Education (SDCOE) runs school facilities for students with special needs. The SDCOE supports 780 schools and more than 500,000 students across the county (SDCOE 2021). There is one school facility within 0.25 mile of the planning districts. Monarch School is a K–12 public school serving needs of children impacted by homelessness, and is located 0.07 mile east of PD4.

4.12.2.4 Parks and Recreational Facilities

Park and recreational facility capacity within the proposed PMPU area is not quantified and depends upon activities that vary on a daily basis. For example, a grass field might be nearly empty several days of the week, used for a sporting event on another day, and support a music concert the next. Generally, parks within the proposed PMPU area tend to be busier on holiday weekends. If certain facilities are being used, individuals may participate in the current activity (e.g., a public festival), identify a portion of the park separated from the activity, or choose one of several alternative recreational areas within the proposed PMPU area.

In addition, there are no District-specific park planning standards to consider. However, as discussed in Section 4.12.3.2, the California Coastal Act of 1976 (CCA) includes requirements for the provision of public access and recreational opportunities within the coastal zone.

State of California

The California Department of Parks and Recreation operates Silver Strand State Beach, a day-use and overnight park located on Silver Strand, along 2.5 miles of oceanfront and 0.5 mile of bayfront. Silver Strand State Beach is within PD9.

San Diego Unified Port District

The District manages ~~22~~ parks and ~~miles of~~ walking and biking trails along the waterfront ~~to make up approximately 284.1 acres of Recreation Open Space~~ within the District Tidelands (Figure 4.12-1) (District 2021b). The District maintains these recreation spaces and issues permits for group use ~~for 13 of the 22 parks~~. The District's jurisdiction also includes ~~750.1 acres of open bay areas~~ available for recreational use.

Figure 4.12-1
Existing Parks within the PMPU Area
Port Master Plan Update

City of San Diego

The City of San Diego operates 49 parks within 2 miles of the planning districts. A portion of Children's Park is located within PD3. The remaining portion of Children's Park, as well as King Promenade and Marina Linear Park, are located 0.02 mile east of PD3. Additionally, Naval Training Center Park is located 0.05 mile west of PD2.

City of Imperial Beach

The City of Imperial Beach has a Parks and Recreation Committee that advises the City Council on matters of the park facilities and recreational programs (City of Imperial Beach 2021b). Imperial Beach has six parks within its jurisdiction.

City of Coronado

The City of Coronado Recreation and Golf Services Department operates several recreational facilities, including a community center, boathouse, golf course, tennis center, skate park, and 19 outdoor parks (City of Coronado 2021b). One park operated by the City of Coronado, Centennial Park, is partially located within the District's jurisdiction. Three parks are directly adjacent to water area within PD10, including Glorietta Bay Park Promenade, and Pocket Park.

4.12.3 Laws, Regulations, Plans, and Policies

4.12.3.1 Federal

United States Coast Guard Marine Safety Program

Code of Federal Regulations (CFR) Title 33 regulates the navigation and navigable waters of the U.S. 33 CFR Chapter 1 provides the rules and regulations to be enforced by the Coast Guard to ensure the safety of vessels within Coast Guard jurisdictional waterways. Pursuant to 33 CFR Part 100, the Coast Guard implements the Marine Safety Program, which is designed to ensure the safety of life during regattas and marine events conducted on navigable waters events.

4.12.3.2 State

California Coastal Act

The CCA established a coastal zone boundary within which specific planning and development requirements must be met in order to protect and preserve the State's coastal resources. These requirements are enforced by the Coastal Commission and are implemented through the District's Port Master Plan. Chapter 3, Articles 2 and 3, of the CCA includes policies that govern public access and recreational opportunities. Policies included in Article 2 pertain to maintaining access to the coast, providing coastal access from the nearest public roadway to the shoreline, and avoiding overcrowding along the coast. Article 3 includes policies promoting recreational boating in coastal waters and maintaining areas suited for water-oriented recreational activities.

California Building Code – Title 24, Part 9

The 2019 Fire and Building Code establishes the minimum requirements consistent with nationally recognized good practices to safeguard the public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises, and to provide safety and assistance to firefighters and emergency responders during emergency operations. The provisions of this code apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure or any appurtenances connected or attached to such building structures throughout the state.

More specifically, the Fire Code is included in Title 24 of the California Code of Regulations (CCR). California Fire Code Title 24, Part 9, Chapter 7 addresses Fire-Resistances – Rated Construction; California Building Code (Part 2) Chapter 7A addresses Materials and Construction Methods for Exterior Wildfire Exposure; Fire Code Chapter 8 addresses fire related Interior Finishes; Fire Code Chapter 9 addresses Fire Protection Systems; and Fire Code Chapter 10 addresses fire related Means of Egress, including Fire Apparatus Access Road width requirements. Fire Code Section 4906 also contains existing regulations for vegetation and fuel management to maintain clearances around structures.

California Code of Regulations, Title 8

Title 8 of the CCR is a rule developed by the Federal Occupational Safety and Health Administration in 1993 and adopted by the State of California. This rule is comparable to the Federal standards described above. Occupational safety standards exist in Federal and State laws to minimize worker safety risks from both physical and chemical hazards in the workplace. These standards would be applicable to both construction and operation of probable future projects proposed under the PMPU. Sections 1500-1962 of Title 8 contain Construction Safety Orders. Section 1509 requires the implementation of an Injury and Illness Prevention Program. Section 1512 requires employers to ensure the availability of emergency medical services and trained first aid personnel. Sections 1597-1599 contain regulations governing vehicles, traffic control, flaggers, barricades, and warning signs. Section 1920 requires the establishment of an effective fire prevention program to be followed throughout all phases of the construction work. This section also requires well-maintained fire-fighting equipment to be freely accessible at all times and placed in a conspicuous location. Additionally, Section 1921 requires an adequate water supply to be available for firefighting if combustible materials accumulate on site, and Section 1922 contains provisions for fire extinguisher maintenance and locations. Furthermore, CCR Title 8 contains regulations governing safe practices and personal protection (Sections 3300-3416), fire protection during operation (Sections 6150-6184), and control of hazardous substances (Sections 5139-5223).

California Public Trust Doctrine

The Public Trust Doctrine is a common law doctrine that provides that public lands and waters are held by the State or its delegated trustee (i.e., the California State Lands Commission [CSLC]) for the benefit of all the people of California. All tidelands and submerged lands, granted or ungranted, as well as navigable rivers, sloughs, etc., are covered under the Public Trust Doctrine. The Public Trust Doctrine, as overseen by CLSC, restricts the types of land uses allowed on public lands, including within the District's jurisdiction. The Public Trust Doctrine limits the uses of sovereign lands to

waterborne commerce, navigation, fisheries, open space, water-oriented recreation, ecological habitat protection, or other recognized public trust purposes.

California Department of Transportation Encroachment Permit

Construction within state highway rights-of-way would require a California Department of Transportation (Caltrans) Encroachment Permit, which includes a Traffic Control Plan in compliance with the *Manual on Uniform Traffic Control Devices* (MUTCD) (Traffic Control Plans Part 6). As part of these requirements, there are provisions for coordination with local emergency services, training for flagmen for emergency vehicles traveling through the work zone, temporary lane separators that have sloping sides to facilities crossover by emergency vehicles, and vehicle storage and staging area for emergency vehicles.

San Diego Unified Port District Act

The San Diego Unified Port District Act (Port Act) (Appendix 1 of the California Harbor and Navigation Code) was adopted in 1962. Through the Port Act, the State delegated its authority to the District to manage and control certain tidelands and submerged waters. Specifically, the District was established for the development, operation, maintenance, control, regulation, and management of the tidelands and lands underlying the inland navigable waters of San Diego Bay, and for the promotion of commerce, navigation, fisheries, and recreation. Under the Port Act, the District was granted broad police powers. The Port Act requires the District to exercise its land management authority and powers over (1) the tidelands and submerged lands granted to the District and (2) any other lands conveyed to the District by any city or the County of San Diego or acquired by the District. The Port Act grants the District exclusive police power over property and development subject to its jurisdiction. A Port Master Plan (PMP) is also required by the Port Act, which must specify the water and land uses within the District's jurisdiction. The following sections of the Port Act pertain to public services and recreation.

- **Section 56** – the board shall make and enforce such local police and sanitary regulations relative to the construction, maintenance, operation, and use of all public services and public utilities in the district, operated in connection with or for the promotion or accommodation of commerce, navigation, fisheries, and recreation therein as are now vested in the District.
- **Section 57** – the board may acquire, construct, erect, maintain or operate within the District, all improvements, utilities, appliances or facilities which are necessary or convenient for the promotion and accommodation of commerce, navigation, fisheries and recreation, or their use in connection therewith upon the lands and waters under the control and management of the board, and it may acquire, maintain and operate facilities of all kinds within the District (Amended 1963).
- **Section 87(a)(5) and (6)** – the tide and submerged lands conveyed to the District by any city included in the district shall be held by the District and its successors in trust and may be used for purposes in which there is a general statewide purpose, as follows:
 - (5) For the construction, reconstruction, repair, maintenance, and operation of public buildings, public assembly and meeting places, convention centers, parks, playgrounds, bathhouses and bathing facilities, recreation and fishing piers, public recreation facilities, including, but not limited to, public golf courses, and for all works, buildings, facilities,

utilities, structures, and appliances incidental, necessary, or convenient for the promotion and accommodation of any such uses.

- (6) For the establishment, improvement, and conduct of small boat harbors, marinas, aquatic playgrounds, and similar recreational facilities, and for the construction, reconstruction, repair, maintenance, and operation of all works, buildings, facilities, utilities, structures, and appliances incidental, necessary, or convenient for the promotion and accommodation of any of those uses, including, but not limited to, snack bars, cafes, restaurants, motel, launching ramps, and hoists, storage sheds, boat repair facilities with cranes and marine ways, administration buildings, public restrooms, bait and tackle shops, chandleries, boat sales establishments, service stations and fuel docks, yacht club buildings, parking areas, roadways, pedestrian ways, and landscaped area.

School Funding

The CCR Title 5, Education, governs all aspects of education within the State. California State Assembly Bill (AB) 2926—School Facilities Act of 1986—was enacted by the State of California in 1986 and added to the California Government Code (Section 65995). It authorized school districts to collect development fees, based on demonstrated need, and generate revenue for school districts for capital acquisitions and improvements. It also established that the maximum fees which may be collected under this and any other school fee authorization are \$1.50 per square foot for residential development and \$0.25 per square foot for commercial and industrial development. AB 2926 was expanded and revised in 1987 through the passage of AB 1600, which added Section 66000 et seq. of the Government Code. Under this statute, payment of statutory fees by developers serves as exclusive mitigation under the California Environmental Quality Act (CEQA) to satisfy the impact of development on school facilities.

As part of the further refinement of the legislation enacted under AB 2926, the passage of Senate Bill (SB) 50 in 1998 defined the Needs Analysis process in Government Code Sections 65995.5–65998. Under the provisions of SB 50, school districts may collect fees to offset the costs associated with increasing school capacity as a result of development. SB 50 generally provides for a 50/50 State and local school facilities match. SB 50 also provides for three levels of statutory impact fees. The application level depends on whether State funding is available; whether the school district is eligible for State funding; and whether the school district meets certain additional criteria involving bonding capacity, year-round schools, and the percentage of moveable classrooms in use.

California Government Code sections 65995–65998 implements SB 50. Specifically, in accordance with Section 65995(h), the payment of statutory fees is “deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization...on the provision of adequate school facilities.”

Pursuant to Government Code Section 65995(i), “[a] State or local agency may not deny or refuse to approve a legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization as defined in section 56021 or 56073 on the basis of a person’s refusal to provide school facilities mitigation that exceeds the amounts authorized pursuant to this section or pursuant to section 65995.5 or 65995.7, as applicable.”

California Education Code Section 17620(a)(1) states that the governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement against any construction within the boundaries of the district, for the purpose of funding the construction or reconstruction of school facilities.

SDUSD collects school impact fees on commercial/industrial construction in the PMPU area within its boundaries (SDUSD 2020), including PD1, PD2, PD3, and PD4. The Sweetwater Union High School District collects fees for non-residential projects for the PMPU area within its boundaries, including PD8 (Sweetwater Union High School District 2018). The Coronado Unified School District collects fees on non-residential construction in the PMPU area within its boundaries, including PD10 (City of Coronado 2018).

4.12.3.3 Local

City of San Diego

Municipal Code Section 129.0702

Municipal Code Section 129.0702 requires the Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way including sidewalks. The permit requires the preparation and submittal of a traffic control plan that must conform to the 2014 California Manual on Uniform Traffic Control Devices, and Standard Specifications for Public Works Construction, including Regional Supplemental Amendments and City of San Diego Supplemental Amendments.

Municipal Code Section 142.0640

San Diego Municipal Code Section 142.0640 requires the payment of Development Impact Fees (DIF) prior to issuance of Building Permits in areas where Development Impact Fees have been established by City Council resolution or ordinance. DIFs are assessed throughout the City of San Diego and can also employ the Facilities Benefit Assessment methodology. A DIF in a Facilities Benefit Assessment community historically has provided 100 percent of funds for public facilities projects within that community and are identified in a Public Facilities Financing Plan. Portions of the PMPU area—including PD1, PD3, and portions of PD4—fall within Facilities Benefit Assessment communities.

Additionally, the City Manager may also require the payment of a DIF prior to issuance of any construction permit issued or required for development that would increase demand for public facilities and/or result in the need for new public facilities. Future private development allowed under the proposed PMPU within PD1 through PD4 would be required to obtain building permits from the City of San Diego, and therefore would be subject to San Diego Municipal Code Section 142.0640.

City of Imperial Beach

Municipal Code Section 12.04.020

Municipal Code Section 12.04.020 states that “[e]xcept as may otherwise be expressly provided by ordinance of the City, no work shall be performed in any public right-of-way of the City without the

person, firm or corporation which is going to perform the work or which is going to cause the work to be performed first having obtained a permit from the Director of Public Works of the City authorizing the performance of the work.” Work within the public right-of-way in Imperial Beach requires a Temporary Encroachment Permit.

Construction Impact Fees

The City of Imperial Beach construction impact fee program applies a Sewer Impact Fee and a School Impact Fee to new commercial development. Any future development projects in PD8 would be subject to Imperial Beach construction impact fees.

City of Coronado

Municipal Code Section 52.08

Section 52.08 of the City of Coronado Municipal Code outlines the requirements for Encroachment Permit applications for any private, permanent/fixed improvements proposed within the public right-of-way, and outlines the process for the City of Coronado Engineer to receive and review applications for encroachments, stating that “no such application shall be approved if a determination is made that the encroachment structure will adversely affect the public health, safety or general welfare.” This process allows Coronado to condition projects to protect public access and is designed to prevent undue inconvenience to the public.

Municipal Code Section 52.10

Under Section 52.10 of the City of Coronado Municipal Code, it is unlawful for anyone to place, remove, or replace any item within the public right-of-way or on public property or to do any work in the public right-of-way or on public property without first having obtained a Right-of-Way Permit. A Right-of-Way Permit is required for all work on public property, such as repairs to sidewalks, curbs and gutters, driveway aprons, and parkways (the area between the sidewalk and the curb) or to place equipment in the public right-of-way, such as a crane placed in the street to transport materials to a second story. A Right-of-Way Permit authorizes a contractor to temporarily occupy the public right-of-way for construction of said improvement. Section 52.10.060 includes specific requirements for traffic control around the work site. Permittees are required to place and maintain all necessary barrier, guards, lights, signs, flagmen, and watchmen to adequately control vehicular and pedestrian traffic around the work site and to advise the public of detours and construction hazards. Such control devices must be installed to the satisfaction of the City Engineer, and, where the permittee fails to satisfactorily control traffic and warn of safety hazards, the City Engineer may require additional control devices to be erected at the expense of the permittee.

Public Facilities Fees and School Impact Fees

Chapter 8.20 of the City of Coronado Municipal Code imposes Public Facilities Fees on new construction in order to accommodate additional development without lowering the level of public service. Public Facilities Fees allow new development to mitigate at least a portion of its impacts on the City of Coronado’s capital facilities. Additionally, the City of Coronado applies School Impact Fees to non-residential construction.

4.12.4 Project Impact Analysis

4.12.4.1 Methodology

This section analyzes the potential impacts on public services and recreational facilities associated with future development projects allowed under the proposed PMPU. The impact analysis considers whether the construction of new or expanded public facilities would be required to accommodate demand from future PMPU-related development. If required, the analysis determines if the physical construction would result in a significant impact on the environment and if mitigation is necessary. It should be noted that the need for additional public services based on delayed response times or inadequate service ratios is not considered an impact on the environment (*City of Hayward v. Board of Trustees of the California State University* [2012]). Likewise, the potential safety hazards associated with delayed response times do not mandate a finding of significance under State CEQA Guidelines Section 15065. Rather, it is the physical impacts associated with the construction of new or expanded facilities that would potentially constitute a significant impact.

Similarly, recreational impacts are considered relative to the proposed PMPU's potential to accelerate the physical deterioration of existing recreational facilities. In addition, the proposed PMPU designates parcels within the proposed PMPU area for Recreation Open Space uses, which would potentially result in the construction of recreational amenities that would have the potential to directly result in a physical impact on the environment.

In addition to a review of relevant plans and policies, fire, emergency and police protection service providers were contacted to determine if the proposed PMPU would potentially lead to new or physically altered facilities. Their responses are summarized in Section 4.11.4.4, *Project Impacts and Mitigation Measure*.

4.12.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining significance of public services and recreation impacts resulting from the implementation of the proposed PMPU. The determination of whether public services or recreation impacts would be significant is based on the thresholds described below, the methodology described in Section 4.12.4.1, and the professional judgement of the District as the Lead Agency, based on the evidence in the administrative record.

Impacts are considered significant if the PMPU would:

1. Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services?
2. Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection services?

3. Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools?
4. Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks?
5. Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?
6. Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

4.12.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to reduce or avoid impacts associated with adverse impacts on the environment associated with the need for, or provision of, new or physically altered government facilities in order to maintain acceptable service criteria, due to implementation of the PMPU and are considered in the impact analysis that follows.

SR Policy 1.2.2 Development shall incorporate project design features, including, but not limited to crime prevention through enhanced security measures that create a safe environment on the development site without limiting public access.

SR Policy 1.3.1 The District shall provide public safety facilities on water and on land for the HPD to maintain public safety capabilities in alignment with the Port Act.

WLU Policy 1.1.6 Allowable water and land uses within the District shall be in accordance with one of the six Public Trust–related categories or ancillary uses that support and accommodate Public Trust uses (refer to Table 3.1.2, Allowable Use Types for Water Use Designations and Table 3.1.3, Allowable Use Types for Land Use Designations):

- a. Commerce
- b. Environmental Stewardship
- c. Fisheries
- d. Navigation
- e. Recreation
- f. ~~Government Facilities~~

WLU Policy 3.1.3. The District and its permittees shall maintain, protect, and enhance existing public coastal-dependent recreational facilities, such as, but not limited to, boat ramps and piers that provide coastal access.

WLU Policy 3.2.5 Development shall be set back from the water’s edge and recreation open space to avoid creating a walling-off effect.

WLU Policy 4.1.1 There shall be no net loss of acreage designated as Recreation Open Space in a subdistrict or in a planning district if no subdistrict exists.

WLU Policy 4.1.2 Recreation Open Space should be designated along the water's edge.

WLU Policy 4.1.3 Recreation Open Space areas shall be publicly accessible to a diverse user group with the intent of providing a variety of water-oriented experiences.

WLU Policy 4.1.4 Public accessways and recreation facilities provided as part of development shall be maintained for public use over the anticipated life of the development with which they are associated.

WLU Policy 4.1.5 The design and location of Recreation Open Space shall be in accordance with Section 4.2, Recreation Open Space and Activating Features Standards (Chapter 4, Baywide Development Standards).

WLU Policy 4.1.6 The District shall require, where feasible, the integration of non-privatized, physically accessible public realm areas and amenities into development such as parks, courtyards, water features, gardens, passageways, paseos, and plazas.

WLU Policy 4.1.7 The District shall require permittees of coastal-enhancing development to allow, maintain, and promote free, public access to the public realm on their development site.

WLU Policy 4.2.1 The District shall require permittees of coastal-enhancing development to provide a wide array of uses for the public that:

- a. Offer a variety of recreational uses;
- b. Complement adjacent waterfront uses and activities; ~~and/or~~
- c. Maximize attributes of each location to offer a range of experiences to the user and appeal to a variety of visitors.

WLU Policy 4.2.2 The District shall encourage establishment of activating features that support existing amenities and introduce new activities in recreation areas. Permittees, of development containing Recreation Open Space within the leasehold, shall plan, design, and implement activating features, which are:

- a. Commensurate with the intensity of land uses within the permittee's development site;
- b. Consistent with an Activation Plan developed by the permittee and approved by the District;
- c. In accordance with Chapter 4, Baywide Development Standards; and
- d. In accordance with Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 4.2.3 Attractions are encouraged within the Commercial Recreation land use designation and shall be:

- a. Sited to increase the use of, and be integrated with, the waterfront experience;
- b. Located in areas supported by mobility hubs, curbside management, and pedestrian amenities to support multimodal access throughout Tidelands; and
- c. Complementary to other visitor-serving attractions.

WLU Policy 4.2.6 All parks, including those within leaseholds, shall be open to the general public during park hours for at least 85 percent of the year. No more than 15 percent of the year shall permitted temporary large special events (in accordance with the District's procedures and guidelines, once established) limit public access (i.e., exclude the public or require admission for entry) in parks. The 15 percent shall be distributed throughout the year and not occur only in the summer months.

WLU Policy 4.3.1 The District shall encourage boating and pier access for recreational and subsistence fishing throughout Tidelands, where feasible, by requiring permittees of applicable development to provide public fishing or viewing piers and boating access. Maintenance may be provided by third parties.

WLU Policy 4.3.2 The District shall retain, where feasible, temporary anchorages for transient recreational vessels.

WLU Policy 4.3.3 Designated anchorage areas shall be located:

- a. To minimize interference with navigation; and
- b. Where support facilities are available.

WLU Policy 4.3.4 Permittees of recreational marina development shall incorporate low-cost transient docking slips in their recreational marina

WLU Policy 4.3.5 Proposed recreational boating facilities in Tidelands shall, to the extent feasible, be designed and located in such a fashion so as not to interfere with the needs of the commercial fishing industry.

WLU Policy 5.1.3 All development shall be located, designed, and constructed to:

- a. Give highest priority to the use of existing land space in harbors for coastal-dependent port purposes, including, but not limited to, navigational facilities, shipping industries, commercial fishing, sportfishing, maritime commerce, and necessary support and access facilities.
- b. Provide for other benefits consistent with the Public Trust, including, but not limited to: improved recreational opportunities in the public realm, including Recreation Open Space that is adjacent to the water's edge, or the conservation of adjacent wildlife habitat areas, to the extent feasible.

WLU Policy 6.1.1 Permittees of development are encouraged to provide a variety of lower cost visitor and recreational facilities to improve coastal access.

WLU Policy 6.1.2 Recreation Open Space areas shall support programming and a variety of passive and active recreational activities, with a wide range of affordability and price points to ensure all visitors are able and encouraged to experience the waterfront.

WLU Policy 6.1.3 To offer flexibility to permittees, the District may offer a range of geographic options or a District-established in-lieu fee program for the development of new, or replacement, lower cost visitor and recreational facilities.

WLU Policy 6.1.4 The District may elect to establish an in-lieu fee program that permittees may participate in to satisfy the requirement for provision of lower cost visitor and recreational facilities, with the following conditions:

- a. The in-lieu fee program shall apply only where the provision of lower cost visitor and recreational facilities is not feasible either on the existing development site or elsewhere on Tidelands.
- b. Any collected in-lieu fees shall be used on Tidelands for the provision of lower cost visitor and recreational facilities.
- c. For lower cost overnight accommodations only, the following exceptions apply:
 1. In assessing the feasibility for on-Tidelands lower cost accommodations, the District may consider whether the required amount of new or replaced lower cost overnight accommodations can be accomplished in one development.
 2. Collected in-lieu fees shall be used to develop only lower cost overnight accommodations (in order of priority):
 - i. On Tidelands, or
 - ii. In the San Diego County Coastal Zone, if on Tidelands is not feasible.

WLU Policy 6.2.1 Lower cost visitor and recreational facilities, including lower cost overnight accommodations, shall be protected in the aggregate on Tidelands. The number of existing overnight accommodations should be maintained and any future loss of lower cost overnight accommodations should be mitigated. Protection of existing facilities allows for preventive maintenance, major maintenance, or facility upgrades even if temporary closure or limited public access to the facility occurs during these activities and times.

WLU Policy 6.2.5 Displaced lower cost visitor and recreational facilities, excluding overnight accommodations, shall be replaced with comparable facilities that may be of a similar or different type if specific conditions are demonstrated through a comparative demand study (refer to WLU Policy 6.2.6 and WLU Policy 6.2.7). The comparative demand study must be submitted and approved by the District before the project application is submitted to the District.

WLU Policy 6.2.6 For replacement of displaced lower cost visitor and recreational facilities, excluding overnight accommodations, with a facility (or facilities) of a similar type(s) (refer to WLU Policy 6.2.5), the comparative demand study must demonstrate:

- a. The new facility will likely result in an equal or increased amount of public use when compared to the facility being replaced; and
- b. When implemented, the new facility will be of a scale and size comparable to those of other, similar facilities in a coastal setting.

WLU Policy 6.2.7 For replacement of displaced lower cost visitor and recreational facilities with a facility (or facilities) of different type(s) (refer to WLU Policy 6.2.5), the comparative demand study must demonstrate:

- a. The new lower cost visitor and recreational facility will likely provide greater opportunities for a variety of visitors to access and recreate on Tidelands than the facility being replaced; and
- b. There is an increase in demand for the replacement lower cost visitor and recreational facility compared with the existing facility.

WLU Policy 7.1.1 Permittees of development derives benefits from its location on Tidelands and, accordingly, shall provide or contribute to planned improvements that facilitate public health and safety and the public welfare and provide public coastal access and enjoyment of the waterfront.

WLU Policy 7.1.2 Except as set forth under WLU Policy 7.3.3, permittees of all major development shall be required to provide or contribute toward planned improvements identified for a planning district in Chapter 5, Planning Districts, Planned Improvements. The three primary categories of planned improvements are defined below:

- a. Landside access: Improvements to transportation and mobility infrastructure that enhance the public's ability to access and explore the public realm and perform commerce on Tidelands. Landside access may include mobility hubs, improvements to a variety of accessways, and implementation of the bayfront circulator.
- b. Coastal access: Physical features designed to provide new or enhance existing water access. Examples include pier improvements, overnight transient docking and mooring, public water access, and short-term public docking.
- c. Visitor-serving commercial uses: Visitor-serving commercial uses provide opportunities for the public to access and enjoy Tidelands, including the use of non-water-oriented retail and overnight accommodations.

Permittees of minor development may be required to provide or contribute toward planned improvements as identified for a planning district in Chapter 5, Planning Districts, Planned Improvements and as supported by a subsequent program created by the District.

EJ Policy 1.1.4 The District shall coordinate with members of the public to explore and expand public transit options that allow and encourage access to Tidelands for all people.

EJ Policy 1.2.1 All appealable development shall provide a range of free and lower cost recreational facilities throughout Tidelands that are accessible to disadvantaged communities, where feasible.

EJ Policy 1.3.1 Avoid a net loss of recreational open space acreage adjacent to disadvantaged communities, measured in both the size and the quality of the resource, due to development.

EJ Policy 1.3.2 Through CDPs issued by the District, permittees shall protect and, where feasible, expand free and lower cost recreational facilities, including but not limited to recreational fishing or swimming opportunities, parks, or viewing piers, on Tidelands adjacent to Portside and Tidelands Border Communities, and other disadvantaged communities.

EJ Policy 2.1.1. Continue to work with partners promote and expand awareness of recreational opportunities for the people from disadvantaged communities and relevant indigenous communities and tribes to explore Tidelands.

ECON Policy 2.3.3 The District shall provide maritime and marine infrastructure for operation and maintenance of commercial and recreational vessels. Maritime and marine infrastructure may be provided by third parties, including District tenants through public-private partnerships and leases with the District.

ECON Policy 2.3.9 The District and applicable permittees shall support existing recreational boating on Tidelands through maintenance of marina-related facilities, including docks, piers, slips, and boat launch ramps.

ECON Policy 2.3.10 The District and applicable permittees shall promote opportunities for the public to learn, share, and enjoy recreational boating through boating education programs, organizations, and clubs.

ECON Policy 2.3.11 The District shall coordinate with commercial fishing, recreational fishing, and sportfishing operations to identify and prioritize facility improvements that benefit the fishing business community.

ECON Policy 2.4.1 The District encourages the provision of a variety of active and passive recreational opportunities to attract a diverse mix of visitors to Tidelands.

ECON Policy 2.4.2 The District shall promote the creation of diverse activating features in areas designated with a Recreation Open Space land use to provide a variety of opportunities for visitors to explore and enjoy Tidelands.

ECON Policy 2.4.3 The District shall promote and support implementation of visitor-serving development and amenities that celebrate the San Diego region's binational setting, natural resources, history, culture, and arts.

4.12.4.4 Project Impacts and Mitigation Measures

Threshold 1: Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services?

Impact Analysis

Construction

With implementation of the proposed PMPU, landside and waterside construction activities would be probable in PD1–PD3 and PD8–PD10. Construction of future development in these planning districts could require fire protection services for potential construction-related injuries or accidental fire incidents due to the use of flammable materials and certain equipment, or due to upgrades or installation of electricity utilities. Fire and medical emergency response within the proposed PMPU area would be provided by HPD, SDFD, IBFRD, and/or CFD, which have fire stations in or near each planning district, as described in Section 4.12.2, *Existing Conditions*. For incidents that would occur during in-water construction activities, HPD provides marine firefighting services in and around San Diego Bay for the District. In addition to watercraft enforcement, HPD patrol boats can also serve as firefighting boats that respond to fire emergencies in the Bay. Construction of the future in-water development may generate an increased need for HPD's fireboats should any waterside emergencies occur. HPD's fireboats cooperate with the adjacent cities' fire departments and emergency responders, if necessary. Vessels would respond in the event of a marine-firefighting incident from either the Shelter Island HPD substation or the Chula Vista HPD substation, depending on who is closest at the time of the call.

Future development projects within the proposed PMPU area would comply with Sections 1500–1962 of CCR Title 8, Construction Safety Orders. Section 1509 requires the implementation of an Injury and Illness Prevention Program, Section 1512 requires employers to ensure the availability of emergency medical services and trained first aid personnel, and Sections 1597–1599 contain regulations governing vehicles, traffic control, flaggers, barricades, and warning signs. Section 1920 requires the establishment of an effective fire prevention program to be followed throughout all phases of the construction work. This section also requires well-maintained fire-fighting equipment to be freely accessible at all times and placed in a conspicuous location. Additionally, Section 1921 requires an adequate water supply to be available for fire-fighting if combustible materials accumulate on site and Section 1922 contains provisions for fire extinguisher maintenance and locations. Therefore, compliance with these regulations would reduce the potential for construction-related injuries or accidental fire incidents requiring fire protection services from providers within the proposed PMPU area. Adherence with CCR regulations would ensure that fire and injury prevention measures are implemented at construction sites, and, thus, construction activities would not increase demand on fire protection services to the extent that new or expanded facilities would be required to maintain adequate service. SDFD confirmed that construction activities currently occurring within the proposed PMPU area do not significantly increase call volume due to these existing safety regulations (Webber pers. comm.).

Regarding emergency access, as discussed in Section 4.7, *Hazards and Hazardous Materials*, each future PMPU-related project would be required to comply with specific requirements set forth by the agencies responsible for emergency response at the future project site, including Sections 1500–1962 of CCR, Title 8, which requires implementation of injury and prevention programs, provision of emergency medical services and trained first-aid personnel, and establishment of effective fire prevention programs to be followed throughout all phases of the construction work. In addition, the District requires emergency response plans and emergency operations plan, as identified in SR Policy 2.1.2 and SR Policy 2.1.3, to be implemented as part of the proposed PMPU. Furthermore, as discussed in Section 4.14, *Transportation, Circulation, and Mobility*, project proponents would be required to obtain a temporary encroachment and/or right-of-way permit from the appropriate jurisdiction(s) prior to commencing construction to ensure that adequate emergency access would be maintained during construction (see Section 4.14.3.3 for applicable local regulations). Compliance with these existing regulatory requirements would ensure that construction of future PMPU-related development would not result in inadequate emergency access.

Implementation of the proposed PMPU would occur within a developed area, with most of the future development projects occurring in PD2 and PD3, near Downtown San Diego. While the number of construction sites fluctuates based on the local economic and market conditions, these are areas where construction activities take place regularly and where fire protection services are already provided by nearby fire stations.

Construction activities occurring under implementation of the proposed PMPU would experience a similar fluctuation based on local economic conditions and would occur intermittently throughout the 30-year life of the PMPU depending on market conditions. Consequently, future development projects consistent with the proposed PMPU are not anticipated to increase the intensity or frequency of construction activities simply with its adoption and implementation. Rather, implementation of the proposed PMPU would be the continuation of this type of activity and would not increase the overall demand for fire services for construction-related activities. Based on the above, temporary construction activities associated with implementation of the proposed PMPU are not expected to increase the demand on fire protection services such that there would be a need for

new or expanded permanent fire protection facilities (Webber pers. comm.). Therefore, no new or physically altered government facilities would be required that would result in physical impacts on the environment due to construction activities. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded fire protection facilities.

Construction activities associated with Option 1 could result in incidents that may require fire or medical emergency response; however, construction would occur within a developed area of PD3, in Downtown San Diego. While the number of construction sites fluctuates based on the local economic conditions, construction activities take place regularly in the Downtown area, and construction of Option 1 would be a continuation of these activities. In addition, construction of Option 1 would be required to adhere to the regulations described above, including Sections 1500–1962 of CCR Title 8, etc., which would reduce the potential for construction-related injuries or accidental fire incidents requiring fire protection services. Therefore, construction under Option 1 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to fire protection services than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded fire protection facilities.

Construction activities related to the implementation of Option 2 could also result in incidents that may require fire or medical emergency services; however, construction would occur within a developed area of PD3, in Downtown San Diego. While the number of construction sites fluctuates based on the local economic conditions, construction activities take place regularly in the Downtown area, and construction of Option 2 would be a continuation of these activities. In addition, construction of Option 2 would be required to adhere to the regulations described above, including Sections 1500–1962 of CCR Title 8, etc., which would reduce the potential for construction-related injuries or accidental fire incidents requiring fire protection services. Therefore, construction activities under Option 2 would result in less-than-significant impacts

and would not result in any additional or more severe impacts related to fire protection services than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU would result in a less-than-significant impact related to the need for new or expanded fire protection facilities.

Construction activities related to the implementation of Option 3 could also result in incidents that may require fire or medical emergency services; however, construction would occur within a developed area of PD3, in Downtown San Diego. While the number of construction sites fluctuates based on the local economic conditions, construction activities take place regularly in the Downtown area, and construction of Option 3 would be a continuation of these activities. In addition, construction of Option 3 would be required to adhere to the regulations described above, including Sections 1500–1962 of CCR Title 8, etc., which would reduce the potential for construction-related injuries or accidental fire incidents requiring fire protection services. Therefore, construction activities under Option 3 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to emergency response services than buildout of the proposed PMPU without Option 3.

Operation

The operation of future development projects allowed under the proposed PMPU would not include residential development, which is prohibited by the Port Act. As such, there would not be new permanent residents in the District's jurisdiction that would increase demand on fire protection services. Additionally, as the proposed PMPU area is a defined area and new development occurring under the proposed PMPU would primarily involve infill development, implementation of the proposed PMPU would not expand the current service areas of public service providers. However, visitor-serving facilities that could be developed as part of PMPU implementation may include up to approximately 3,910 new hotel rooms, in new hotel establishments or expanded existing hotel facilities; 339,489 square feet of new retail and restaurant space; and 485 new recreational boat slips above existing conditions. In addition, planned improvements in the PMPU would allow for the renovation or replacement-in-kind of hotel rooms, retail, restaurant, and/or meeting space to the same or lesser size, such as in PD1 or PD10.

New buildings associated with visitor-serving land uses would be required to adhere to the latest fire code standards, which would require compliance with California Fire Code Title 24, Part 9. Within Part 9, Chapter 7 provides requirements to maintain the fire-resistance ratings of building elements and to limit fire spread, Chapter 8 provides requirements for interior finishes so they do not add to or create fire hazards in buildings, Chapter 9 prescribes requirements for fire protection systems, and Chapter 10 contains criteria for design of means of egress, including width requirements for fire apparatus access roads. Fire Code Section 4906 also contains existing regulations for vegetation and fuel management to maintain clearances around structures.

The replacement of older buildings with new buildings with up-to-date fire standards would improve fire safety as compared to existing conditions. Implementation of the proposed PMPU would also allow for in-water development, including dock maintenance, vessel slip reconfiguration and enhancement in the water basin, modification of marina capacity, enhancement or modifications to the existing anchorage area supporting transient vessel berthing, and the addition of aquaculture within the proposed PMPU area.

The development of additional visitor-serving uses such as new hotels or expanded hotel buildings, additional retail and restaurant space, as well as expanded marinas would result in additional structures and spaces that would require landside and waterside fire protection services. Increased visitor-serving facilities would result in higher daily visitation to the Tidelands, which may result in a higher demand for fire or medical emergency response services. The following sections describe the potential effects on service demand for each fire protection service provider that could result in the need for new or physically altered fire protection facilities.

Harbor Police Department

The HPD would provide marine-fire protection services on the waterside portions of all of the planning districts, except for PD8. HPD does not provide landside fire protection services within the proposed PMPU area. Rather, landside fire protection services are provided by the member city in which the planning district is located. As such, the following discussion focuses on waterside development allowed under the proposed PMPU.

Implementation of the proposed PMPU would facilitate in-water development that would result in additional structures and visitors in PD1, PD2, PD3, PD9, and PD10. Future in-water development for these planning districts over a 30-year timeframe could entail the development of a total of approximately ~~485~~⁵⁷⁵ new slips for recreational, and commercial fishing boats and anchorage moorings. The increase in visitors, vessels, and recreational boats would increase the demand on marine-fire protection services of the HPD. This increased demand could result in the need for additional staffing or require additional equipment, the accommodation of which may exceed the capacity of existing HPD facilities, resulting in the need to construct new or expand existing government facilities in order to accommodate additional personnel or equipment.

Proposed PMPU SR Policy 1.3.1 would require the District to provide public safety facilities on water and on land for the HPD to maintain public safety capabilities in alignment with the Port Act. While the SDFD has indicated that adequate resources for in-water fire and emergency response services is an area of concern and future in-water development occurring under the proposed PMPU, such as an increased number of recreational boat slips, could require new equipment and new personnel (Webber pers. comm.), both the HPD and SDFD indicated that any additional demand for new equipment and personnel due to implementation of the proposed PMPU would not require new or expanded facilities (Nichols pers. comm.; Fernandez pers. comm.; Webber pers. comm.). Therefore, buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant.

City of San Diego Fire Department

The SDFD would provide fire protection and medical emergency response services to PD1 through PD4, as described in Section 4.12.2. Future development projections for these planning districts over a 30-year timeframe would entail the development of approximately 3,910 new hotel rooms, in either new hotel establishments or expanded existing hotel facilities; 339,489 square feet of new retail or restaurant space; 162,000 square feet of meeting space; 180,000 square feet of convention space; and up to 485 new recreational boat slips. This would result in additional visitor-serving facilities, and a corresponding increase of visitors, to the SDFD service area, which would increase demand on SDFD fire protection and emergency services. As noted above, new visitor-serving development would likely involve infill development and may replace some older structures with

new structures that implement the latest fire code standards, which would help reduce demand on fire protection services.

The potential future development that could occur under the proposed PMPU would increase call volumes, which would have a corresponding effect on response times. Until any additional resources are put in place, the development could affect SDFD's ability to meet both 7.5-minute and 10.5-minute response time goals. However, SDFD has the capability to improve response times in ways other than constructing a new fire station. For example, existing fire stations currently serving the proposed PMPU area (e.g., Fire Stations 22 and 4) have the capacity to house two fire engines, but only have one engine currently. Providing additional equipment (e.g., fire engines) would help address any effects on response times caused by increased development. SDFD may also need to add additional response units to existing fire stations to help accommodate the increase in calls. In addition, SDFD is currently planning for a new fire station near the San Diego Police Department headquarters in East Village, which would serve the proposed PMPU area in addition to the Downtown San Diego area. The need for this facility is not attributed specifically to buildout under the proposed PMPU, but instead is needed to accommodate growth and development within the Downtown area more generally. There would not be any new facilities needed to serve the proposed PMPU area beyond what is already being planned for by SDFD (Webber pers. comm.).

As noted above, the SDFD has indicated that the primary area of concern regarding buildout of the proposed PMPU is related to insufficient equipment and personnel, and that they would likely require new equipment and additional staff to address the increase in recreational boat slips that could occur with buildout of the proposed PMPU. However, SDFD would not require new or expanded facilities in order to accommodate any new equipment or staff (Webber pers. comm.). As such, buildout of the proposed PMPU would not require new or physically altered government facilities, or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant.

City of Imperial Beach Fire Department

Planning District 8 is served by the IBFRD. Implementation of the proposed PMPU would allow for the future development of approximately 18,000 square feet of new retail and restaurant space within PD8. Given the limited amount of future development that could occur in PD8, it is not anticipated that this development would generate a substantial number of additional visitors to the area, such that there would be an increased demand on the fire and emergency services of the IBFRD. In addition, the IBFRD confirmed that buildout of the proposed PMPU within PD8 would not require new or expanded facilities to accommodate buildout of the proposed PMPU within PD8 (French pers. comm.). Therefore, there would not be a need for new or physically altered IBFRD fire protection and medical emergency response facilities, and impacts would be less than significant.

City of Coronado Fire Department

The CFD would provide fire protection and medical emergency response services to PD9 and PD10, as described in Section 4.12.2. Implementation of the proposed PMPU would allow for the development of approximately 20 new recreational boat slips and 5 anchorages in PD9 and 55 new recreational boat slips and 25 anchorages in PD10, and does not include any new landside development. Future development in PD9 and PD10 is not anticipated to generate a substantial amount of additional visitors to the area, such that there would be an increased demand on the fire and emergency services of the CFD. CFD confirmed that buildout of the proposed PMPU would not

require new or expanded facilities to accommodate buildout of the proposed PMPU within PD9 and PD10 (Peake pers. comm.). Additionally, because future development within PD9 and PD10 would consist of waterside features, fire protection services would be provided by the HPD, which provides marine firefighting services for the District. Therefore, there would not be a need for new or physically altered CFD fire protection facilities, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to fire protection and emergency response services.

Operations under Option 1 would result in more visitors to the waterfront, which could result in higher demand for medical emergency response services from SDFD but would not increase the demand for fire protection services. As noted above, SDFD has indicated that the area of concern is related to in-water development, such as new recreational boat slips, which may require the need for new equipment and/or staff. However, this would not result in the need for new or expanded facilities for the reasons described above. In addition, Option 1 would not involve any in-water development. Therefore, operations under Option 1 would be less than significant and would not result in any additional or more severe impacts related to emergency response services than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to fire protection services.

Operations under Option 2 would result in more visitors to the waterfront, which could result in higher demand for fire or medical emergency response services from SDFD but would not increase the demand for fire protection services. As noted above, SDFD has indicated that the area of concern is related to in-water development, such as new recreational boat slips, which may require the need for new equipment and/or staff. However, this would not result in the need for new or expanded facilities for the reasons described above. In addition, Option 2 would not involve any in-water development. Therefore, operations under Option 2 would result in less than significant impacts and would not result in any additional or more severe impacts related to fire protection services than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to fire protection services.

Operations under Option 3 would result in more visitors to the waterfront, which could result in higher demand for fire or medical emergency response services from SDFD but would not increase the demand for fire protection services. As noted above, SDFD has indicated that the area of concern is related to in-water development, such as new recreational boat slips, which may require the need for new equipment and/or staff. However, this would not result in the need for new or expanded facilities for the reasons described above. In addition, Option 3 would not involve any in-water development. Therefore, operations under Option 3 would result in less than significant impacts and would not result any additional or more severe impacts related to fire protection services than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in physical impacts on the environment related to the construction of new or expanded government facilities in order to maintain service ratios for fire protection and medical emergency response services. As noted above, proposed PMPU SR Policy 1.3.1 would require the District to provide public safety facilities on water and on land for the HPD to maintain public safety capabilities in alignment with the Port Act. However, no new or expanded facilities are anticipated to maintain adequate fire protection.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. Impacts would be less than significant.

Threshold 2: Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection services?

Impact Analysis**Construction**

Police services within the proposed PMPU area would be provided by the HPD, SDPD, San Diego County Sheriff, CPD, and Coast Guard Sector San Diego, which have stations in or adjacent to the proposed PMPU area, as described in Section 4.12.2. Under the proposed PMPU, construction activities would be probable in PD1–PD3 and PD8–PD10. Construction of future development projects in these planning districts could require police protection due to the potential for accidents or safety concerns such as loitering at the construction site, theft, and burglary of construction

equipment and materials left unattended. However, implementation of the proposed PMPU would occur within a developed area, with most of the future development occurring in PD2 and PD3, near Downtown San Diego. While the number of construction sites fluctuates based on local economic conditions, these are areas where construction activities regularly occur. While the proposed PMPU provides policy and water/land use guidance for future development projects, construction activities occurring under the proposed PMPU would experience similar fluctuations subject to local economic conditions, and would occur intermittently throughout the 30-year life of the proposed PMPU. As such, implementation of the PMPU would not increase the overall demand for police services due to future construction activities.

Therefore, construction activities associated with increased future development allowed under the proposed PMPU are not expected to require new or expanded police facilities that would result in physical impacts on the environment. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to police protection services.

Construction activities associated with the implementation of Option 1 would occur within developed areas in PD3, in Downtown San Diego, where construction activities are common. While incidents may occur as a result of construction, there would not be an increase in demand for police protection services such that new or physically altered government facilities would be required resulting in physical impacts on the environment. Therefore, construction activities under Option 1 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to police protection services than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to police protection services.

Construction activities associated with the implementation of Option 2 would occur within developed areas in PD3, in Downtown San Diego, where construction activities are common. While incidents may occur as a result of construction, there would not be an increase in demand for police protection services such that new or physically altered government facilities would be required, resulting in physical impacts on the environment. Therefore, construction activities

under Option 2 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to police protection services than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to police protection services.

Construction activities associated with the implementation of Option 3 would occur within developed areas in PD3, in Downtown San Diego, where construction activities are common. While incidents may occur as a result of construction, there would not be an increase in demand for police protection services such that new or physically altered government facilities would be required, resulting in physical impacts on the environment. Therefore, construction activities under Option 3 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to police protection services than buildout of the proposed PMPU without Option 3.

Operation

Implementation of the proposed PMPU would include the operation of up to approximately 3,910 new hotel rooms, in new hotel establishments or expanded existing hotel facilities; 339,489 square feet of new retail and restaurant space; and 485 new recreational boat slips. Future development would increase the number of annual visitors to the waterfront over the proposed PMPU's planning horizon, which would result in an increased demand on police protection agencies because a higher density of visitors to the area could potentially result in more incidents that require police services. The following describes the potential effects on service demand for each police protection service provider that could result in the need for new or physically altered police protection facilities.

Harbor Police Department

The HPD would provide police protection services to all planning districts, except for PD8, which is served by the San Diego County Sheriff's Department.

Implementation of the proposed PMPU would facilitate waterside and landside development for visitor-serving uses that would result in the increase of visitors to the Tidelands, resulting in a corresponding increase in demand on the HPD for police protection services associated with crime, traffic, and emergency response, along with other police responsibilities. The HPD would work together with the adjacent cities' police protection agencies to provide these services to the planning districts. However, future development implemented consistent with the projections of the proposed PMPU could still require the expansion of policing facilities in order for the HPD to meet the increased demand.

Proposed PMPU SR Policy 1.3.1 would require the District to provide public safety facilities on water and on land for the HPD to maintain public safety capabilities in alignment with the Port Act, which would be beneficial by ensuring that adequate services are provided by HPD. In addition, per SR Policy 1.2.2, future development under the proposed PMPU would incorporate project design features including, but not limited to, crime prevention through enhanced security measures that create a safe environment on the development site without limiting public access, thereby enhancing safety and security for visitors within new and redeveloped areas.

As indicated by the HPD, while implementation of the proposed PMPU may increase demand on HPD services such that new personnel or equipment may be required, this would not result in the need for new or expanded HPD facilities (Nichols pers. comm.). Therefore, buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant.

City of San Diego Police Department

The SDPD would provide police protection services to PD1 through PD4. Future development projects for these planning districts could entail the development of approximately 3,910 new hotel rooms, in new hotel establishments or expanded existing hotel facilities; 339,489 square feet of new retail or restaurant space; and 485 new recreational boat slips. This development would result in an increase in daily visitors to the proposed PMPU area, as well as overnight visitors staying in hotels in the proposed PMPU area. Additional visitors could result in an increase in demand for police protection services and emergency response needs, particularly having to do with traffic, crime prevention, and crowd control. An increase in demand for these services could increase demand on personnel and equipment, and make it more difficult for the SDPD to meet adopted response time goals or service ratios. As a result, SDPD may need to add additional personnel or equipment, which may exceed the capacity of their existing facilities. Therefore, it is possible SDPD may need to construct new or expanded facilities in the vicinity of the proposed PMPU area, the construction of which could result in physical impacts on the environment.

Examples of the potential impacts from the construction of new or expanded police protection facilities include construction-related air emissions, greenhouse gas (GHG) emissions, noise and vibration, and energy use. Moreover, depending on the location of a new or expanded facility, impacts may also include disturbance of biological resources, cultural resources, tribal cultural resources, and/or contaminated soils, and impacts from the expanded connection of utilities to serve the new or expanded police protection facility. Once operational, the new or expanded police protection facility may result in operational activity that was not previously located at the site or may result in increased operational activity. Operational impacts could include new or additional siren noise near sensitive receptors that may cause ambient noise levels to exceed hourly or 24-hour noise level standards of the City's Municipal Code and General Plan, increased vehicle miles traveled (VMT) and the associated effects on air quality, GHGs, and energy use. Finally, because the police facility would be located outside of the District's jurisdiction, the District would have limited authority to require and enforce mitigation measures to lessen any significant impacts.

Therefore, because future development, consistent with the proposed PMPU, is entirely based on market conditions and the proposed PMPU does not propose any development or identify any specific locations for a future SDPD facility, the timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities, and the feasibility of the District to mitigate any impacts to less-than-significant levels, are all unknown at this time. As such, the potential physical impacts on the environment from the future construction of any police protection facility are considered significant (**Impact-PS-1**).

County of San Diego Sheriff – Imperial Beach Substation

The County of San Diego Sheriff's Office provides police protection services to PD8 from the Imperial Beach Substation. The implementation of the proposed PMPU would allow for the development of

18,000 square feet of new retail and restaurant space in PD8. Given the limited amount of future development that could occur in PD8, it is not anticipated that this development would generate a substantial number of additional visitors to the area, such that there would be an increased demand on the police protection services of the County of San Diego Sheriff's Office. Therefore, there would not be a need for new or physically altered County of San Diego Sheriff's Office police protection facilities, and impacts would be less than significant.

City of Coronado Police Department

The CPD would provide police protection services to PD9 and PD10. The proposed PMPU would allow for the development of approximately 20 new recreational boat slips and 5 anchorages in PD9 and 55 new recreational boat slips and 20 anchorages in PD10, and does not include any new landside development. Future development in PD9 and PD10 is not anticipated to generate a substantial amount of additional visitors to the area, such that there would be an increased demand on the police protection services of the CPD. Additionally, as development within PD9 and PD10 would consist of waterside features, police protection services would be provided by the HPD, which provides both landside and waterside law enforcement for the District. Therefore, there would not be a need for new or physically altered CPD police protection facilities, and impacts would be less than significant.

Coast Guard Sector San Diego

Coast Guard Sector San Diego would respond to service demands in the proposed PMPU area in San Diego Bay, the shoreline, the coastline along the oceanfront, and offshore waters. The Coast Guard generally responds to issues related to hazardous materials and oil spills, homeland security issues, marine vehicles incidents, and search and rescue cases. These types of issues generally are not directly tied to the type of visitor-serving services that would be increasing in the proposed PMPU area, such as hotels, recreational facilities, and commercial uses. The increase in visitors to the waterfront due to the implementation of the proposed PMPU would not likely increase the service demands on Coast Guard Sector San Diego. However, the proposed PMPU could result in the addition of up to 485 slips in the Bay. While the adjacent cities would respond to incidents at the marinas and HPD would respond to incidents at the anchorages, increased recreational boat slips would increase the number of boats navigating in the Bay and/or the open ocean, which could result in an increase in marine vehicle incidents or search and rescue cases that the Coast Guard would need to respond to. Therefore, the implementation of the proposed PMPU could result in physical construction of new or expanded government facilities for the Coast Guard in order to maintain service ratios or response times which would result in significant environmental impacts. Impacts are considered significant (**Impact-PS-1**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses.

Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact regarding the need for new physical construction of new or expanded police protection facilities (**Impact-PS-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of Option 1 could result in an increase of visitors to the waterfront in PD3, which could result in an increased demand for SDPD police protection services. As discussed above, additional visitors could result in an increase in demand for police protection services and emergency response needs, particularly having to do with traffic, crime prevention, and crowd control. However, given that Option 1 would consist of a new Waterfront Destination Park, operations under this option would not result in an increase in demand for police protection services such that new or physically altered government facilities would be required that would result in physical impacts on the environment. Therefore, operations under Option 1 would result in a less-than-significant impact on police protection services.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact regarding the need for new physical construction of new or expanded police protection facilities (**Impact-PS-1**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of Option 2 could result in an increase of visitors to the waterfront in PD3, which could result in an increased demand for SDPD police protection services. As discussed above, additional visitors could result in an increase in demand for police protection services and emergency response needs, particularly having to do with traffic, crime prevention, and crowd control. However, given that Option 2 would consist of new park space, operations under this option would not result in an increase in demand for police protection services such that new or physically altered government facilities would be required that would result in physical impacts on the environment. Therefore, operations under Option 2 would result in a less-than-significant impact on police protection services.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact regarding the need for new physical construction of new or expanded police protection facilities (**Impact-PS-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operation of Option 3 could result in a substantial increase of visitors to the waterfront in PD3, which could result in an increased demand for SDPD police protection services. As discussed above, additional visitors could result in an increase in demand for police protection services and emergency response needs, particularly having to do with traffic, crime prevention, and

crowd control. However, given that Option 2 would consist of new park space, operations under this option would not result in an increase in demand for police protection services such that new or physically altered government facilities would be required that would result in physical impacts on the environment. Therefore, operations under Option 3 would result in a less-than-significant impact on police protection services.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in physical impacts on the environment related to the construction of new or expanded government facilities in order to maintain service ratios for police protection services. Proposed PMPU policies require the District to provide public safety facilities on water and on land for the HPD to maintain public safety capabilities in alignment with the Port Act. Implementation of this policy would not result in adverse physical impacts, but could be beneficial by ensuring that adequate services are provided by HPD.

Impact Determination and Mitigation

Implementation of the proposed PMPU would potentially result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection services.

Significant Impacts

Impact-PS-1: Potential to Result in Substantial Adverse Physical Impacts from the Provision of New or Physically Altered Police Protection Facilities Associated with Operation of Future Development Projects Consistent with the Proposed PMPU. Implementation of the proposed PMPU, which includes development and operation of future projects (including visitor-serving facilities) would result in higher daily visitation to the proposed PMPU area, creating a greater demand for police services, which could require the expansion of, or new construction of, police facilities. The timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities are all unknown at this time. Potential impacts from the construction of new or expanded police facilities include construction-related air emissions, GHG emissions, noise and vibration, and energy use; disturbance of biological resources, cultural resources, tribal cultural resources, and/or contaminated soils; drainage and soil-related impacts; and impacts from the expanded connection of utilities to serve the new or expanded government facility. Operational impacts could include new or additional siren noise near sensitive receptors that may cause ambient noise levels to exceed hourly or 24-hour noise level standards of the City's Municipal Code and General Plan, increased VMT, and the associated effects on air quality, GHGs, and energy use.

Mitigation Measures

For **Impact-PS-1:**

MM-PS-1: Conduct Project-Specific Reviews of the Adequacy of Police Protection Services with the SDPD and Coast Guard to Determine if a New or Expanded Government Facility Will Be Required. ~~During project-specific environmental review of future development projected under the proposed PMPU Prior to the approval of a future project, the District shall~~

require a site-specific study, consisting of coordination with the SDPD and/or Coast Guard (whichever agency[ies] provide police protection services to the area) regarding the future project, which shall include a written record of the results of the coordination, to determine whether the project would increase the demand on police services such that new or expanded facilities would be required to maintain adequate police services as determined by the SDPD and/or Coast Guard. Should it be determined that the future project would cause or contribute to the need for new or expanded police facilities, the District shall: (1) analyze the potential environmental effects of the construction and operation of the police facility in accordance with CEQA and ensure any impacts from the construction of any such facilities are mitigated to the extent feasible under the law; (2) confirm a CEQA document has been approved and certified for the new or expanded police facility and any associated mitigation required associated with its construction and operation; or (3) confirm a CEQA document is under preparation for construction and operation of the new or expanded police facility. If the District conducts the CEQA analysis as part of the project analysis, the analysis must consider all details about the needed police facility, including the known location, design, construction and operational details, and timing. In addition, the CEQA analysis must identify mitigation measures to reduce any significant impacts that could result from construction and operation of any new or expanded government facility. Mitigation measures as listed in the proposed PMPU's Mitigation Monitoring and Reporting Program (MMRP) shall be considered where needed to avoid a significant impact. Importantly, this mitigation measure shall also be required for **Impact-C-PS-1** and shall be applicable to potential cumulative fire protection facility-related impacts and require coordination with SDFD and HPD consistent with the direction provided within this mitigation measure.

Significance After Mitigation

Mitigation measures detailed in the proposed PMPU's MMRP would be required where necessary, which would be determined by implementing **MM-PS-1**. To effectively implement **MM-PS-1**, a specific location (including surrounding land uses), project timing, and project design specifications for a future expansion or construction of new police facility must be known. However, because the specific location, timing, and design specifications for future expansion or construction of new police facilities are not known at this time, it would be speculative to conclude that impacts would be less than significant. Moreover, because the police facility may be located outside of the District's jurisdiction, the District would have no authority to require and enforce mitigation measures to lessen any significant impacts. Therefore, it is probable that the future construction of any new or expanded police facilities would potentially result in significant and unavoidable environmental impacts. **Impact-PS-1** would remain significant and unavoidable after implementation of **MM-PS-1**.

Threshold 3: Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for public schools?

Impact Analysis

Construction

The PMPU does not propose or allow for any residential development, as such development is not allowed on District Tidelands under the Port Act. As such, there would not be new permanent residents in the District's jurisdiction that would directly increase demand on schools. Construction of future development projects could occur throughout the planning horizon of the proposed PMPU (i.e., 2050). Construction workers are anticipated to come from the San Diego region (see also Section 4.11, *Population and Housing*); it is not anticipated workers would move to the area to work on development projects associated with the implementation of the proposed PMPU any more than under existing conditions because construction projects would be intermittent and dependent on local economic cycles, similar to existing conditions. Thus, the proposed PMPU would not result in an increase in the population due to construction workers that would result in an increased demand on school services. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded school facilities.

Construction associated with Option 1 would likely rely heavily on construction workers from the San Diego region. It is not anticipated workers would move to the area to meet the demand for construction workers; thus, Option 1 would not result in an increase in population due to construction that would result in an increased demand on public school services. Impacts would be less than significant. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to school facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded school facilities.

Construction associated with Option 2 would likely rely heavily on construction workers from the San Diego region. It is not anticipated workers would move to the area to meet the demand for construction workers; thus, Option 2 would not result in an increase in population due to construction that would result in an increased demand on public school services. Impacts would be less than significant. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to school facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded school facilities.

Construction of future development associated with Option 3 would likely rely heavily on construction workers from the San Diego region. It is not anticipated workers would move to the area to meet the demand for construction workers; thus, Option 3 would not result in an increase in population due to construction that would result in an increased demand on public school services. Impacts would be less than significant. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to school facilities than buildout of the proposed PMPU without Option 3.

Operation

The operation of future development projects allowed under the proposed PMPU would not include residential development, which is not allowed under the Port Act. As such, there would not be new permanent residents in the District's jurisdiction that would increase demand on public school services. Future permanent employment opportunities in the proposed PMPU area would include jobs in the hospitality, retail, industrial, and commercial sectors, consistent with existing employment opportunities within the Port. The service industry-related jobs generated from the commercial and recreational development within the proposed PMPU area are anticipated to be filled by the existing workforce in the San Diego region and would not be considered the cause for relocation to the San Diego region (see also Section 4.11). Thus, the additional jobs generated by development associated with the implementation of the proposed PMPU are not expected to result in additional workers moving from other areas in the country to the San Diego region in order to fill the new jobs. Therefore, the proposed PMPU would not result in an increase in the student population of public schools in the vicinity of the proposed PMPU area. In addition, new development occurring in the portions of the PMPU area falling within the SDUSD and Coronado Unified School District boundaries would be required to contribute to school impact fees for those schools districts, which would offset the demand created by any potential new students resulting from the additional jobs. Operation of the future development projects allowed under the proposed PMPU would not result in physical impacts on the environment related to the construction of new or altered public school facilities in order to maintain service ratios. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded school facilities.

Implementation of Option 1 would not include residential development or other uses that would generate population growth in the San Diego region. Thus, Option 1 would not be the cause of population growth in the region and would not increase demand on schools such that new facilities would be required. Impacts would be less than significant. Therefore, operation under Option 1 would not result in any additional or more severe impacts related to school facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded school facilities.

Implementation of Option 2 would not include residential development or other uses that would generate population growth in the San Diego region. Thus, Option 2 would not be the cause of population growth in the region and would not increase demand on schools such that new facilities would be required. Impacts would be less than significant. Therefore, operation under Option 2 would not result in any additional or more severe impacts related to school facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the need for new or expanded school facilities.

Implementation of Option 3 would not include residential development or other uses that would generate population growth in the San Diego region. Thus, Option 3 would not be the cause of population growth in the region and would not increase demand on schools such that new facilities would be required. Impacts would be less than significant. Therefore, operation under Option 3 would not result in any additional or more severe impacts related to school facilities than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would result in physical impacts on the environment related to the construction of new or expanded government facilities in order to maintain service ratios for public school services.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in significant environmental impacts due to the construction of new or physically altered government facilities in order to maintain acceptable service ratios for public school services. Impacts would be less than significant.

Threshold 4: Result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks?

Impact Analysis

The proposed PMPU designates land throughout the proposed PMPU area for park space under the Recreation Open Space designation, which is defined as land areas primarily for visitor-serving, public open spaces that provide public access, public views, activating features, or access to coastal areas. This designation includes parks, recreational facilities, golf courses, and associated facilities and is complementary to the recreational berthing, conversation/intertidal, and open bay/water use designations. Because future development projects under the proposed PMPU would be located entirely on District Tidelands, the District would be subject to the provisions listed within the proposed PMPU, but would not be required to meet any service ratios or performance objectives for parks per the Quimby Act, the City of San Diego, Civic San Diego, the City of Imperial Beach, or the City of Coronado.

Whereas cities or counties have land use plans that generally include residential uses and, therefore, often adopt a ratio of a certain amount of park land to each resident or a similar metric, the District does not contain any residential land uses, nor does the proposed PMPU propose any residential uses. Rather the District's mission is to "protect the Tidelands Trust resources by providing economic vitality and community benefit through a balanced approach to the maritime industry, tourism, **water and land recreation**, environmental stewardship and public safety" (emphasis added). As water and land recreation is a specific part of the District's mission, the District has a significant amount of recreational and park space within its jurisdiction. For example, there are 22 parks on District Tidelands, representing a large area under its jurisdiction relative to cities or counties. However, the provision and maintenance of parks is consistent with its responsibilities under the Port Act and CCA.

Although the District does not apply specific performance standards or service ratios for park space, the proposed PMPU would implement planning and development requirements consistent with enforced by the California Coastal Commission, including Chapter 3, Articles 2 and 3, of the CCA, which include policies that require future appealable projects to provide public access and recreational opportunities. Specifically, sections from Chapter 3 of the CCA requiring or encouraging development of, or requiring protection of, public access and recreational resources along the coast

include Sections 30211, 30212, 30213, 30220, 30221, 30222, 30223, and 30224. In addition, Sections 30240 and 30253(e) require that any development occurring adjacent to park and recreation areas be sited and designed to prevent impacts that would significantly degrade those areas and be compatible with the continuance of those recreation areas and protection of areas with unique characteristics that are popular destination points for recreational use.

The Water and Land Use Element of the proposed PMPU establishes goals and policies regarding public recreation, as listed in Section 4.12.4.3, and as stated in WLU Policy 4.1.1, the proposed PMPU stipulates that there shall be no net loss of acreage designated as Recreation Open Space in a subdistrict or in a planning district if no subdistrict exists. Future improvements identified in the proposed PMPU could involve reconfiguration of Shelter Island Drive, Harbor Island Drive, and Harbor Drive, which would allow for the expansion of landside Recreation Open Space in PD1, PD2, and PD3. The proposed PMPU also provides for the introduction of activating features within these expanded Recreation Open Space areas. Furthermore, the proposed PMPU would develop activating features within Dunes Park in PD8 and would expand Grand Caribe Shoreline Park within PD9. An analysis of potential impacts of the proposed PMPU on recreational facilities is provided under Thresholds 5 and 6 below.

Construction

The PMPU proposes to designate a total of 273.65 acres for Recreation Open Space uses, which would be an increase of 14.03 acres over existing conditions. Future development projects under the Recreation Open Space designation allowed under the proposed PMPU could include active and passive park space in each of the planning districts, including waterfront promenades, bike paths, parks, and piers. Potential impacts associated with the construction of park facilities, including active and passive park space, are analyzed throughout the applicable sections of this PEIR (specifically, Sections 4.1 through 4.15). Examples of the potential impacts from the construction of new or expanded park space include construction-related air emissions, noise and vibration, and energy use from the use of construction equipment, vehicles, and building materials. Moreover, depending on the location of a new or expanded facility, impacts may also include disturbance of biological resources, cultural resources, tribal cultural resources, paleontological resources, and/or hazardous materials. As discussed throughout Sections 4.1 through 4.15, mitigation measures have been identified for significant impacts associated with the construction of parks that could be developed under the proposed PMPU. To the extent feasible, the identified mitigation measures would reduce impacts to less than significant. Construction specific to future park projects would not result in any additional significant impacts beyond those already identified throughout this PEIR. However, because not all impacts associated with construction activities can be mitigated to less-than-significant levels, construction-related impacts related to new parks would be significant (**Impact-PS-2**) and would remain significant and unavoidable after implementation of **MM-AQ-2** through **MM-AQ-8**, **MM-BIO-2** and **MM-BIO-5**, **MM-CUL-1** through **MM-CUL-3**, **MM-GEO-1**, **MM-GHG-2**, **MM-NOI-1** through **MM-NOI-5**, and **MM-HAZ-1** and **MM-HAZ-2**.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a significant and unavoidable impact related to the need for new or expanded park facilities (**Impact-PS-2**). This significant impact would still occur within PD3 under Option 1 as a result of the same potentially significant impacts related to construction activities.

Option 1 proposes 3.98 more acres of park land designated as Recreation Open Space than are proposed in the proposed PMPU. Improvements associated with Option 1 would primarily include passive park uses, such as sidewalks, benches, and lawns. Potential impacts associated with construction of a Waterfront Destination Park for Option 1 are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15), and mitigation measures have been identified for significant impacts. Construction of the future park project proposed in Option 1 would not result in any additional significant impacts beyond those already identified throughout this PEIR. Therefore, construction under Option 1 would result in significant and unavoidable impacts but would not result in any additional or more severe impacts related to park facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a significant and unavoidable impact related to the need for new or expanded park facilities (**Impact-PS-2**). This significant impact would still occur within PD3 under Option 2 as a result of the same potentially significant impacts related to construction activities.

Option 2 would propose 7.35 more acres of area designated as Recreation Open Space than are proposed in the proposed PMPU. Improvements associated with Option 2 would primarily include passive park uses, such as sidewalks, benches, and lawns. Potential impacts associated with construction of Option 2 are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15), and mitigation measures have been identified for significant impacts. Construction of Option 2 would not result in any additional significant impacts beyond those already identified throughout this PEIR. Therefore, construction under Option 2 would be significant and unavoidable but would not result in any additional or more severe impacts related to park facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a significant and unavoidable impact related to the need for new or expanded park facilities (**Impact-PS-2**). This significant impact would still occur within PD3

under Option 2 as a result of the same potentially significant impacts related to construction activities.

Option 3 would propose 8.08 more acres of the area designated as Recreation Open Space than are proposed under the proposed PMPU. As such, implementation of Option 3 would have a beneficial impact on parks because it would increase the amount of park land and open space that presently exists or would exist under the proposed PMPU. Improvements associated with Option 3 would primarily include passive park uses, such as sidewalks, benches, and lawns. Potential impacts associated with construction of Option 3 are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15), and mitigation measures have been identified for significant impacts. Construction of Option 3 would not result in any additional significant impacts beyond those already identified throughout this PEIR. Therefore, construction under Option 3 would be significant and unavoidable but would not result in any additional or more severe impacts related to park facilities than buildout of the proposed PMPU without Option 3.

Operation

The PMPU proposes to designate a total of 273.65 acres for Recreation Open Space uses, which would be an increase of 14.03 acres over existing conditions. The PMPU proposes the expansion of landside Recreation Open Space in PD1, PD2, PD3, and PD9, and would provide activating features in recreational areas throughout the proposed PMPU area. Implementation of the proposed PMPU could result in new users of park space in the proposed PMPU area that would increase demand on existing park space and create a need for new or expanded park facilities if sufficient park space were not available. However, the proposed PMPU is consistent with the CCA requirements noted above of maintaining access to the coast and providing coastal access for waterside recreation from the nearest public roadway to the shoreline. In addition to designating land throughout the proposed PMPU area for Recreation Open Spaces uses, the PMPU identifies public realm development standards for each planning district that require future development to provide walkways to offer physical access to the waterfront or for waterfront development to provide a continuous waterside promenade. Additionally, PMPU policies, including WLU Policies 4.1.1 through 4.2.2, would require the District to maintain existing, or increase the amount of, active and passive park space within the proposed PMPU area as well as increasing public access to recreational amenities for a diverse set of users. The proposed PMPU would require retention of existing, and could also increase, Recreation Open Space within the PMPU area, and would be consistent with CCA requirements, and is not subject to any other performance objectives. However, implementation of the proposed PMPU could involve operation of new or expanded parks, and potential impacts associated with the operation of new or expanded parks are analyzed throughout the applicable sections of this PEIR (specifically Sections 4.1 through 4.15). Examples of the potential impacts from the operation of new or expanded parks include impacts related to air quality emissions, biological resources, and GHG emissions. As discussed throughout this PEIR, mitigation measures have been identified for significant impacts associated with the operation of recreational facilities that could be developed under the proposed PMPU, which would reduce impacts. However, because not all impacts associated with operational activities can be mitigated to less-than-significant levels, operation-related impacts related to the provision of new recreational facilities would be significant (**Impact-PS-3**) and would remain significant and unavoidable after implementation of **MM-AQ-9**, through **MM-AQ-12**; **MM-BIO-8** and **MM-BIO-9**; and **MM-GHG-1** and **MM-GHG-2**.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to the need for new or expanded park facilities (**Impact-PS-3**).

Option 1 proposes 3.98 more acres of park land designated as Recreation Open Space than are proposed in the proposed PMPU. Operation of Option 1 would increase visitors to the proposed PMPU area, which could increase demand on existing park space. However, the proposed PMPU is consistent with the CCA requirements of maintaining access to the coast and providing coastal access from the nearest public roadway to the shoreline. Additionally, Option 1 would involve increasing the amount of active and passive park space within the proposed PMPU area as well as increasing public access to recreational amenities for a diverse set of users by providing a new Waterfront Destination Park. Therefore, implementation of Option 1 would result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for parks. Impacts would be significant and unavoidable. However, operations under Option 1 would not result in any additional or more severe impacts related to the need for new or expanded park facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a significant impact related to the need for new or expanded park facilities (**Impact-PS-3**).

Option 2 would propose 7.35 more acres of area designated as Recreation Open Space than are proposed in the proposed PMPU. Operation of Option 2 would increase visitors to the proposed PMPU area, which could increase demand on existing park space. However, the proposed PMPU is consistent with the CCA requirements of maintaining access to the coast and providing coastal access from the nearest public roadway to the shoreline. Additionally, Option 2 would involve increasing the amount of active and passive park space within the proposed PMPU area as well as increasing public access to recreational amenities for a diverse set of users. Therefore, implementation of Option 2 would result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for parks. Impacts would be significant and unavoidable. However, operations under Option 2 would not result in any additional or more

severe impacts related to the need for new or expanded park facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a significant impact related to the need for new or expanded park facilities (**Impact-PS-3**).

Option 3 would propose 8.08 more acres of the area designated as Recreation Open Space than are proposed under the proposed PMPU. Operation of Option 3 would increase visitors to the proposed PMPU area, which could increase demand on existing park space. However, the proposed PMPU is consistent with the CCA requirements of maintaining access to the coast and providing coastal access from the nearest public roadway to the shoreline. Additionally, Option 3 would involve increasing the amount of active and passive park space within the proposed PMPU area as well as increasing public access to recreational amenities for a diverse set of users. Therefore, implementation of Option 3 would result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for parks. Impacts would be significant and unavoidable. However, operations under Option 3 would not result in any additional or more severe impacts related to the need for new or expanded park facilities than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in physical impacts on the environment related to the construction of new or expanded park facilities. Proposed PMPU policies identified in Section 4.12.4.3, including those identified under WLU Goal 4 (preserve and enliven the public realm), establish the District's commitment to the provision of publicly accessible Recreation Open Spaces throughout the proposed PMPU area and require the District and permittees of coastal-enhancing development to maintain existing and enhance active and passive recreation and open space within the proposed PMPU area as well as increase public access to recreational amenities for a diverse set of users. For example, WLU Policy 4.1.1 stipulates that there shall be no net loss of acreage designated as Recreation Open Space in any subdistrict or planning district, if no subdistrict exists, and WLU Policy 4.1.4 requires any accessways and recreation facilities to be maintained for public use. Implementation of these policies would not result in adverse physical impacts, but could be beneficial by ensuring that adequate park and recreational resources are provided.

Impact Determination and Mitigation

Implementation of the proposed PMPU would potentially result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for parks.

Significant Impacts

Impact-PS-2: Potential to Result in Substantial Adverse Physical Impacts from the Construction of New or Physically Altered Parks Implemented Under the Proposed PMPU.

Implementation of the proposed PMPU would include construction of new or expanded parks. Potential impacts from the construction of new or expanded parks include construction-related air emissions (**Impact-AQ-2**), biological resources (**Impact-BIO-2** and **Impact-BIO-5**), cultural resources (**Impact-CUL-1** and **Impact-CUL-2**), tribal cultural resources (**Impact-CUL-3**), paleontological resources (**Impact-GEO-1**), noise and vibration (**Impact-NOI-1** through **Impact-NOI-5**), and/or contaminated soils (**Impact-HAZ-1** and **Impact-HAZ-2**).

Impact-PS-3: Potential to Result in Substantial Adverse Physical Impacts from the Operation of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include new or expanded parks. Potential impacts from the operation of such new or expanded parks include operation-related air emissions (**Impact-AQ-9** through **Impact-AQ-12**), biological resources (**Impact-BIO-8** and **Impact-BIO-9**), and greenhouse gas emissions (**Impact-GHG-1** and **Impact-GHG-2**).

Mitigation Measures

For **Impact-PS-2**:

Implement **MM-AQ-2** through **MM-AQ-8**, as described in Section 4.2, *Air Quality and Health Risk*.

Implement **MM-BIO-2** and **MM-BIO-5**, as described in Section 4.3, *Biological Resources*.

Implement **MM-CUL-1** through **MM-CUL-3**, as described in Section 4.4, *Cultural Resources and Tribal Cultural Resources*.

Implement **MM-GEO-1**, as described in Section 4.5, *Geology and Soils*.

Implement **MM-GHG-2**, as described in Section 4.6, *Greenhouse Gas Emissions and Energy*.

Implement **MM-NOI-1** through **MM-NOI-5**, as described in Section 4.10, *Noise and Vibration*.

Implement **MM-HAZ-1** and **MM-HAZ-2**, as described in Section 4.7, *Hazards and Hazardous Materials*.

For **Impact-PS-3**:

Implement **MM-AQ-9** through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-BIO-8** and **MM-BIO-9**, as described in Section 4.3.

Implement **MM-GHG-1** and **MM-GHG-2**, as described in Section 4.6.

Significance After Mitigation

For the reasons discussed in Sections 4.3, 4.6, and 4.7, implementation of **MM-BIO-2**, **MM-BIO-5**, **MM-GEO-1**, **MM-GHG-2**, **MM-HAZ-1**, and **MM-HAZ-2** would reduce impacts associated with construction activities related to biological resources, paleontological resources, GHG emissions and energy, and hazards and hazardous materials to less-than-significant levels. However, as discussed in Sections 4.2, 4.4, and 4.10, construction impacts related to air quality, cultural resources, and noise would remain significant and unavoidable after implementation of **MM-AQ-2** through **MM-AQ-8**, **MM-CUL-1** through **MM-CUL-3**, and **MM-NOI-1** through **MM-NOI-5**. Therefore, **Impact-PS-2** is significant and unavoidable.

For the reasons discussed in Sections 4.3 and 4.6, implementation of **MM-BIO-8** and **MM-BIO-9** would reduce **Impact-BIO-8** and **Impact-BIO-9**, to less-than-significant levels and **MM-AQ-9** through **MM-AQ-12** and **MM-GHG-1** and **MM-GHG-2** would reduce **Impact-GHG-1** to less-than-significant levels. However, impacts related to air quality (**Impact-AQ-3** and **Impact-AQ-5**) would remain significant and unavoidable. Therefore, **Impact-PS-3** is significant and unavoidable.

Threshold 5: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?

Impact Analysis

The analysis below discusses the potential for future development allowed under the proposed PMPU to increase the use of existing recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated.

Under the proposed PMPU, the amount of berthing for recreational boats could increase by 75 anchorages (moorings) and 485 recreational berthing slips. In addition, land designated for Recreation Open Space uses would total 273.65 acres, which would be an increase of 14.03 acres over existing conditions. Potential landside development identified in the proposed PMPU would include reconfiguring Shelter Island Drive, Harbor Island Drive, and Harbor Drive, which would allow for the expansion of landside Recreation Open Space in PD1, PD2, and PD3. Within PD1 and PD2, the reconfiguration of Shelter Island Drive and Harbor Island Drive would allow for expanded waterside promenades, a series of garden spaces, amenity zones, and additional activating features. Within PD3, the reconfiguration of Harbor Drive would allow for the creation of Recreation Open Space along the west side of North Harbor Drive, including a series of garden spaces that are linked through pathways, as well as up to 16 activating features, 9 of which may be pavilions. Furthermore, the proposed PMPU would develop activating features within Dunes Park in PD8 and would expand Grand Caribe Shoreline Park within PD9. The Recreation Open Space designation allows for a variety of recreational features for visitors in the proposed PMPU area, which may include anchorage areas, watercraft launch ramps, public docking, restaurants, ~~overnight accommodations~~, retail facilities, sportfishing facilities, aquatic centers, attractions, boat rental operations, golf courses, museums, parks, plazas, performance venues, beach areas, recreational vehicle and camping areas, yacht clubs, and activating features such as shade structures, interactive activities, performances or other entertainment, education, games or play, exercise, or art (see Table 3.1.5 of the proposed PMPU). Development under the proposed PMPU would also include facilities that are intrinsically lower cost or no cost, which may include, but are not limited to, public recreational opportunities such as active and passive parks, open space, gardens, promenades, walkways, and bikeways/bike paths, wayfinding signage, seating, bicycle racks, step down areas to allow the public to touch the water, and other enhancements to public access areas.

The proposed PMPU would also expand transit opportunities in the PMPU area through the bayfront circulator and mobility hubs, which would allow visitors to move about more easily within Tidelands. Furthermore, the District would coordinate with other agencies that have transportation authority to explore opportunities to expand accessible transit service to Tidelands (M Policy 1.1.9)

Construction

As discussed above, the proposed PMPU identifies an expansion of Recreation Open Space uses throughout the proposed PMPU area. Please see Chapter 3 for the proposed acreage of Recreation Open Space for each planning district. Because these uses are part of the project, the impacts of constructing and operating these new Recreation Open Space areas have been considered throughout this PEIR, and impacts and mitigation measures have been identified where necessary. Construction activities within the proposed PMPU area would increase the number of construction workers in the area who may make use of the existing parks throughout the proposed PMPU area. Although it is reasonable to assume construction workers may take their lunch breaks in parks adjacent to construction sites within the proposed PMPU area, it is not expected that they would use existing neighborhood or regional parks or other recreational facilities to such a degree and for such a duration of time that there would be a substantial physical deterioration of the existing facilities. As a result, project construction would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of these facilities would occur or be accelerated. In addition, it is possible that existing parks would be temporarily closed to the public during the construction of planned development within the proposed PMPU area. However, these impacts would be temporary, and implementation of the proposed PMPU would ultimately increase the amount of land available for recreation within Tidelands, as detailed in Chapter 3 of this PEIR. As such, construction indirectly associated with the proposed PMPU would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of these facilities would occur or be accelerated. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the physical deterioration of existing recreational facilities.

Option 1 would result in slightly more Commercial Recreation and Recreation Open Space (1.49 and 3.98 acres, respectively) than proposed in the proposed PMPU. Construction activities associated with Option 1 would increase the number of construction workers in the area who may make use of the existing parks throughout the proposed PMPU area. Although it is reasonable to assume construction workers may take their lunch breaks in parks adjacent to construction sites within the proposed PMPU area, it is not expected that they would use existing neighborhood or regional parks or other recreational facilities to such a degree and for

such a duration of time that there would be a substantial physical deterioration of the existing facilities. As a result, construction of Option 1 would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of these facilities would occur or be accelerated. Impacts would be less than significant. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to the physical deterioration of existing recreational facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the physical deterioration of existing recreational facilities.

Option 2 would result in slightly more Recreation Open Space (7.35 acres) and slightly less Commercial Recreation (-3.34 acres) than proposed in the proposed PMPU. Construction activities associated with Option 2 would increase the number of construction workers in the area who may make use of the existing parks throughout the proposed PMPU area. Although it is reasonable to assume construction workers may take their lunch breaks in parks adjacent to construction sites within the proposed PMPU area, it is not expected that they would use existing neighborhood or regional parks or other recreational facilities to such a degree and for such a duration of time that there would be a substantial physical deterioration of the existing facilities. As a result, construction of Option 2 would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of these facilities would occur or be accelerated. Impacts would be less than significant. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to the physical deterioration of existing recreational facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to the physical deterioration of existing recreational facilities.

Option 3 would result in slightly more Recreation Open Space (8.08 acres) and slightly less Commercial Recreation (-0.84 acres) than proposed in the proposed PMPU. Construction activities associated with Option 3 would increase the number of construction workers in the area who may make use of the existing parks throughout the proposed PMPU area. Although it is reasonable to assume construction workers may take their lunch breaks in parks adjacent to construction sites within the proposed PMPU area, it is not expected that they would use existing neighborhood or regional parks or other recreational facilities to such a degree and for such a duration of time that there would be a substantial physical deterioration of the existing facilities. As a result, construction of Option 3 would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of these facilities would occur or be accelerated. Impacts would be less than significant. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to the physical deterioration of existing recreational facilities than buildout of the proposed PMPU without Option 3.

Operation

Future development under the proposed PMPU—including up to 3,910 hotel rooms, 162,000 square feet of meeting space, and 339,489 square feet of retail and restaurant space—would result in increased use of existing recreational facilities. Given the number of visitors that could occur under the proposed PMPU, increased use of existing recreational facilities would also occur. However, future development under the proposed PMPU would also increase the amount and accessibility of recreational facilities and features within the proposed PMPU area by 14.03 acres. The provision of these additional recreational facilities would help offset any additional demand placed on existing recreational facilities from increased visitors to the proposed PMPU area. In addition, the District currently manages 22 parks and miles of walking and biking trails along the waterfront to make up approximately 259.62 acres of Recreation Open Space within the District Tidelands. Many of these parks do not have a quantifiable capacity and depend upon activities that can vary on a day-to-day basis. If certain facilities are being used, individuals may elect to participate in ongoing activities or choose alternate activities in the proposed PMPU area. As such, the impact of increased use of the surrounding parks would be dispersed, and usage would not result in substantial physical deterioration of these facilities. Moreover, the District currently conducts routine maintenance of its existing park and recreational facilities and has a regular maintenance program that would repair or replace deteriorating facilities on an ongoing basis. The District would continue to maintain any new recreational facilities developed under the proposed PMPU. Therefore, the proposed PMPU would not result in the substantial or accelerated deterioration of these amenities, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact regarding the potential deterioration of existing recreational facilities.

Option 1 would increase the number of recreational facilities available to accommodate new visitors to the proposed PMPU area, which would help offset any additional demand placed on existing recreational facilities from increased visitors. As such, implementation of Option 1 would have a beneficial impact on recreation because it would increase the number of recreational facilities that presently exists or would exist under the proposed PMPU. Therefore, implementation of Option 1 would not cause an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated. Impacts would be less than significant, and Option 1

would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact regarding the potential deterioration of existing recreational facilities.

Option 2 would increase the number of recreational facilities available to accommodate new visitors to the proposed PMPU area, which would help offset any additional demand placed on existing recreational facilities from increased visitors. As such, implementation of Option 2 would have a beneficial impact on recreation because it would increase the number of recreational facilities that presently exists or would exist under the proposed PMPU. Therefore, implementation of Option 2 would not cause an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated. Impacts would be less than significant, and Option 2 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact regarding the potential deterioration of existing recreational facilities.

Option 3 would increase the number of recreational facilities available to accommodate new visitors to the proposed PMPU area, which would help offset any additional demand placed on existing recreational facilities from increased visitors. As such, implementation of Option 3 would have a beneficial impact on recreation because it would increase the number of recreational facilities that presently exists or would exist under the proposed PMPU. Therefore, implementation of Option 3 would not cause an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated. Impacts would be less than significant, and Option 3 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated. Proposed PMPU policies require the District to maintain existing or increase the amount of active and passive recreation and open space within the proposed PMPU area as well as increase public access to recreational amenities for a diverse set of users. Implementation of these policies would not result in adverse physical impacts but could be beneficial by ensuring that adequate park and recreational resources are provided.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in an increased use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility could occur or be accelerated, which could result in physical impacts on the environment. Impacts are less than significant.

Threshold 6: Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Impact Analysis

Construction

Implementation of the proposed PMPU could include construction of new recreational facilities throughout the proposed PMPU area. As indicated in Table 3.1.5 of the proposed PMPU, allowable uses under the Recreation Open Space designation include new anchorage moorings, watercraft launch ramps, public docking, aquatic centers, attractions, boat rental operations, golf courses, museums, parks, plazas, performance venues, beach areas, recreational vehicle and camping areas, yacht clubs, and activating features such as shade structures, interactive activities, performances or other entertainment, education, games or play, exercise, or art. Because recreational facilities are one of the types of future development that could occur under the proposed PMPU, the potential impacts associated with the construction of new or expanded recreational facilities are analyzed throughout the applicable sections of this PEIR (specifically Sections 4.1 through 4.15). Examples of the potential impacts from the construction of new or expanded recreational facilities would involve both waterside and landside activities, and would include construction-related air emissions, noise and vibration, and energy use from the use of construction equipment, vehicles, and building materials. Moreover, depending on the location of a new or expanded facility, impacts may also include disturbance of biological resources, cultural resources, tribal cultural resources, paleontological resources, and/or hazardous materials. As discussed throughout this PEIR, mitigation measures have been identified for significant impacts associated with the construction of recreational facilities that could be developed under the proposed PMPU, which would reduce impacts. Construction of new or expanded recreational facilities would not result in any additional significant impacts beyond those already identified throughout this PEIR. However, because not all impacts associated with construction activities can be mitigated to less-than-significant levels, construction-related impacts related to the provision of new recreational facilities would be significant (**Impact-REC-1**) and would remain significant and unavoidable after implementation of **MM-AQ-2** through **MM-AQ-8**; **MM-BIO-2** and **MM-BIO-5**; **MM-CUL-1** through **MM-CUL-3**; **MM-GHG-2**; **MM-HAZ-1** and **MM-HAZ-2**; **MM-NOI-1** through **MM-NOI-5**; and **MM-WQ-1** through **MM-WQ-7**.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 6.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant and unavoidable impact regarding the construction of new recreational facilities (**Impact-REC-1**).

Construction activities associated with a new Waterfront Destination Park under Option 1 would include primarily ground-disturbing activities. Because Option 1 consists of new recreational facilities, and Option 1 has been analyzed throughout this PEIR, the potential impacts associated with the construction of recreational facilities for Option 1 have also been analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Construction of Option 1 would not result in any additional impacts not already identified in this PEIR, and impacts would be significant and unavoidable. Therefore, construction activities under Option 1 would not result in any additional or more severe impacts related to recreational facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant and unavoidable impact regarding the construction of new recreational facilities (**Impact-REC-1**).

Construction activities associated with the expanded Lane Field Setback Park under Option 2 would include primarily ground-disturbing activities. Because Option 2 consists of new recreational facilities, and Option 2 has been analyzed throughout this PEIR, the potential impacts associated with the construction of recreational facilities for Option 2 have also been analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Construction of Option 2 would not result in any additional impacts not already identified in this PEIR, and impacts would be significant and unavoidable. Therefore, construction activities under Option 2 would not result in any additional or more severe impacts related to recreational facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant and unavoidable impact regarding the construction of new recreational facilities (**Impact-REC-1**).

Construction activities associated with the new park space that could be developed under Option 3 would include primarily ground-disturbing activities. Because Option 3 consists of new recreational facilities, and Option 3 has been analyzed throughout this PEIR, the potential impacts associated with the construction of recreational facilities for Option 3 have also been

analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Construction of Option 3 would not result in any additional impacts not already identified in this PEIR and impacts would be significant and unavoidable. Therefore, construction activities under Option 3 would not result in any additional or more severe impacts related to recreational facilities than buildout of the proposed PMPU without Option 3.

Operation

As described above, future development under the proposed PMPU would provide a variety of recreational features for visitors in the Tidelands, which, as identified in Table 3.1.5 of the proposed PMPU, may include anchorage areas, watercraft launch ramps, sportfishing facilities, aquatic centers, attractions, boat rental operations, golf courses, museums, parks, plazas, performance venues, beach areas, recreational vehicle and camping areas, yacht clubs, and activating features such as shade structures, interactive activities, performances or other entertainment, education, games or play, exercise, or art. Future development under the proposed PMPU would also include facilities that are intrinsically lower cost or no cost, which may include, but are not limited to, public recreational opportunities such as active and passive parks, open space, gardens, promenades, walkways, and bikeways/bike paths, wayfinding signage, seating, bicycle racks and other enhancements to public access areas. Potential impacts associated with the operation of new or expanded recreational facilities are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Examples of the potential impacts from the operation of new or expanded recreational facilities include impacts related to air quality emissions, biological resources, GHG emissions, and water quality. As discussed throughout this PEIR, mitigation measures have been identified for significant impacts associated with the operation of recreational facilities that could be developed under the proposed PMPU, which would reduce impacts. However, because not all impacts associated with operational activities can be mitigated to less-than-significant levels, operation-related impacts related to the provision of new recreational facilities would be significant (**Impact-REC-2**) and would remain significant and unavoidable after implementation of **MM-AQ-9**, through **MM-AQ-12**; **MM-BIO-8** and **MM-BIO-9**; **MM-GHG-1** and **MM-GHG-2**; and **MM-WQ-8**.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 6.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact regarding the operation of new recreational facilities (**Impact-REC-2**).

Operational activities associated with a new Waterfront Destination Park under Option 1 could include primarily passive park use such as walking or sitting on benches, or an occasional event, such as a concert. Potential impacts associated with the operation of recreational facilities are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Operation of Option 1 would not result in any additional impacts not already identified in this PEIR, and impacts would be significant and unavoidable. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to recreational facilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact regarding the operation of new recreational facilities (**Impact-REC-2**).

Operational activities associated with the expanded Lane Field Setback Park under Option 2 could include primarily passive park use such as walking or sitting on benches, or an occasional event, such as a concert. Potential impacts associated with the operation of recreational facilities are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Operation of Option 2 would not result in any additional impacts not already identified in this PEIR, and impacts would be significant and unavoidable. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to recreational facilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact associated with the operation of new recreational facilities (**Impact-REC-2**).

Operational activities associated with new park space that could be developed under Option 3 could include primarily passive park use such as walking or sitting on benches, or an occasional event, such as a concert. Potential impacts associated with the operation of recreational facilities are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15). Operation of Option 3 would not result in any additional impacts not already identified in this PEIR, and impacts would be significant and unavoidable. Therefore, operations under Option 3 would not result in any additional or more severe impacts related to recreational facilities than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment. Potential impacts associated with development of recreational facilities under the proposed PMPU are analyzed throughout the applicable sections of this PEIR (Sections 4.1 through 4.15).

Impact Determination and Mitigation

Implementation of the proposed PMPU would include recreational facilities or require the construction or expansion of recreational facilities, which would have an adverse physical effect on the environment. Impacts are potentially significant.

Significant Impacts

Impact-REC-1: Potential to Result in Substantial Adverse Physical Impacts from the Construction of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include construction of new or expanded recreational facilities. Potential impacts from the construction of new or expanded recreational facilities could involve construction-related air emissions (**Impact-AQ-2** and **Impact-AQ-4**); biological resources (**Impact-BIO-2** and **Impact-BIO-5**), cultural resources (**Impact-CUL-1** and **Impact-CUL-2**), tribal cultural resources (**Impact-CUL-3**), paleontological resources (**Impact-GEO-1**), noise and vibration (**Impact-NOI-1** through **Impact-NOI-5**), contaminated soils (**Impact-HAZ-1** and **Impact-HAZ-2**), and water quality (**Impact-WQ-1**).

Impact-REC-2: Potential to Result in Substantial Adverse Physical Impacts from the Operation of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include operation of new or expanded recreational facilities. Potential impacts from new or expanded recreational facilities could involve operation-related air emissions (**Impact-AQ-3** and **Impact-AQ-5**), biological resources (**Impact-BIO-8** and **Impact-BIO-9**), greenhouse gas emissions (**Impact-GHG-1**), and/or water quality (**Impact-WQ-2**).

Mitigation Measures

For **Impact-REC-1**:

Implement **MM-AQ-2** through **MM-AQ-9**, as described in Section 4.2.

Implement **MM-BIO-2** and **MM-BIO-5**, as described in Section 4.3.

Implement **MM-CUL-1** through **MM-CUL-3**, as described in Section 4.4.

Implement **MM-GEO-1**, as described in Section 4.5.

Implement **MM-GHG-2**, as described in Section 4.6.

Implement **MM-HAZ-1** and **MM-HAZ-2**, as described in Section 4.7.

Implement **MM-NOI-1** through **MM-NOI-5**, as described in Section 4.10.

Implement **MM-WQ-1** through **MM-WQ-7**, as described in Section 4.8.

For **Impact-REC-2**:

Implement **MM-AQ-9**, through **MM-AQ-12**, as described in Section 4.2.

Implement **MM-BIO-8** and **MM-BIO-9**, as described in Section 4.3.

Implement **MM-GHG-1** and **MM-GHG-2**, as described in Section 4.6.

Implement **MM-WQ-8**, as described in Section 4.8.

Significance After Mitigation

For the reasons discussed in Sections 4.3, 4.6, and 4.7, implementation of **MM-BIO-2** and **MM-BIO-5** would reduce corresponding impacts to less-than-significant levels; implementation of **MM-AQ-2** through **MM-AQ-12** would reduce **Impact-AQ-2** and **Impact-QA-4** to less-than-significant levels;

implementation of **MM-HAZ-1** and **MM-HAZ-2** would reduce **Impact-HAZ-1** through **Impact-HAZ-4** to less-than-significant levels; and implementation of **MM-NOI-1** would reduce **Impact-NOI-1** to a less-than-significant level. However, construction impacts related to air quality (**Impact-AQ-2** and **Impact-AQ-4**), cultural resources (**Impact-CUL-1** and **Impact-CUL-2**), tribal cultural resources (**Impact-CUL-3**), noise and vibration (**Impact-NOI-1** through **Impact-NOI-3**), and water quality (**Impact-WQ-1**) would remain significant and unavoidable for the reasons discussed in Sections 4.2, 4.4, 4.10, and 4.8, respectively). Therefore, **Impact-REC-1** is significant and unavoidable.

For the reasons discussed in Sections 4.3 and 4.6, implementation of **MM-BIO-8** and **MM-BIO-9** would reduce **Impact-BIO-8** and **Impact-BIO-9** to less-than-significant levels; and **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, and **MM-GHG-1** and **MM-GHG-2** would reduce **Impact-GHG-1** to less-than-significant levels. However, impacts related to air quality (**Impact-AQ-3** and **Impact-AQ-6**) and water quality (**Impact-WQ-2**) would remain significant and unavoidable, for the reasons discussed in Sections 4.2 and 4.8, respectively. Therefore, **Impact-REC-2** is significant and unavoidable.

4.12.5 Cumulative Impact Analysis

Cumulative impacts on public services, including fire and emergency services, police protection, schools, and parks, as well as recreational facilities could result when past, present, and probable future projects combine to increase demand on public services and recreation facilities such that additional facilities must be constructed to maintain acceptable levels of service, and the construction of such facilities would result in a physical impact on the environment.

4.12.5.1 Geographic Scope

The analysis of cumulative impacts for public services and recreational facilities is based on the plan method, which considers growth associated with applicable land use plans and population growth projections. Therefore, the cumulative setting for public services and recreation includes all of the plans and programs listed in Table 2-2. The geographic scope for cumulative public services includes the service area of the fire and police departments that serve the adjacent communities, which includes the cities of Coronado, Imperial Beach, and San Diego, as well as San Diego Bay.

4.12.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

As discussed in Section 4.12.2, fire services for the proposed PMPU area are provided by the San Diego HPD (Marine Firefighting and Emergency Response), the City of San Diego Fire Department, the City of Coronado Fire Department, and the City of Imperial Beach Fire Department. Police services are provided by the San Diego HPD, City of San Diego Police Department, City of Coronado Police Department, and the San Diego County Sheriff's Department – Imperial Beach Substation.

As discussed in Section 4.11, according to the Series 14 Regional Growth Forecast, SANDAG projects the region's population will grow by approximately 437,443 people by 2035 and nearly 694,958 people by 2050 (SANDAG 2019). The proposed updates to the regional, general, and community plans listed in Table 2-2 have increased, or would increase, the residential and non-residential development within the adjacent cities and the San Diego region. Within the District Tidelands, the

Chula Vista Bayfront Master Plan would introduce residential and commercial uses, which would increase population and employment within the master plan area, but again, as noted in the EIR for the Chula Vista Bayfront Master Plan, these uses are also considered to be growth accommodating (District 2008). In addition, the National City Bayfront Projects and Plan Amendments would increase lodging opportunities and commercial space within the National City Bayfront planning district. The new development has and will continue to introduce new residential and employee populations and would increase visitors to the San Diego region, which would increase demand on the region's public service providers and parks or recreational facilities and would result in the need for new or expanded facilities in order to maintain acceptable services ratios, response times, or other performance objectives. The construction of new or expanded facilities could result in significant environmental effects, and, therefore, impacts of past, present, and future projects on public services resources would be cumulatively significant.

4.12.5.3 Project Contribution

A project's contribution to a cumulative public service, park, or recreational facility impact is relative to the additional demand a project would place on a public services, park, or recreational resource for which a cumulatively considerable impact has been identified. The proposed PMPU does not have a residential component and, therefore, would not add an incremental contribution to cumulative school impacts, which generally occur from increases in permanent residents in an area.

Although the proposed PMPU would not have a significant impact on fire protection services and on police protection provided by HPD (as discussed under Threshold 1 above), the proposed PMPU's incremental contribution to the cumulatively significant impact on fire services and HPD police services would be considered cumulatively considerable (**Impact-C-PS-1**). Moreover, as determined under Threshold 2, the proposed PMPU's potential impacts on police protection services provided by SDPD and the Coast Guard are anticipated to be significant and unavoidable, and when combined with the significant cumulative impacts of past, present, and future development projects, the proposed PMPU's contribution on police protection facilities would be cumulatively considerable (**Impact-C-PS-1**). In addition, the proposed PMPU has the potential to introduce new or expanded park and recreational facilities within the proposed PMPU area, the construction and operation of which could result in impacts on the environment. Therefore, the proposed PMPU's contribution to demands on parks and recreational facilities would be cumulatively considerable (**Impact-C-PS-2**, **Impact-C-PS-3**, **Impact-C-REC-1**, and **Impact-C-REC-2**).

4.12.5.4 Cumulative Impact Determination and Mitigation

Potential cumulatively considerable impacts include:

Impact-C-PS-1: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Provision of New or Physically Altered Fire and Police Protection Facilities. Implementation of the proposed PMPU, when combined with past, present, and future development projects, would create a greater demand for fire and police protection services. This increased demand may require the construction of new or physically altered government facilities in order to maintain acceptable service ratios for the region. Because the timing, duration, location, and extent of any new or expanded fire and police facilities required to serve future development under the proposed PMPU are not known, construction of these facilities could result in physical impacts on the environment. In combination with other projects in or adjacent to the proposed PMPU area,

construction of new or expanded fire and police protection facilities could result in a cumulatively considerable contribution to a significant cumulative impact related to fire and police protection.

Impact-C-PS-2: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Construction of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include construction of new or expanded parks. Potential impacts from the construction of new or expanded parks could involve construction-related air emissions (**Impact-AQ-2**), biological resources (**Impact-BIO-1** and **Impact-BIO-2**), cultural resources (**Impact-CUL-1** and **Impact-CUL-2**), tribal cultural resources (**Impact-CUL-3**), energy use (**Impact-EN-1**), noise and vibration (**Impact-NOI-1** through **Impact-NOI-3**), and/or contaminated soils (**Impact-HAZ-1** through **Impact-HAZ-4**). In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded parks could result in a cumulatively considerable contribution to a significant cumulative impact related to parks.

Impact-C-PS-3: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Operation of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include new or expanded parks. Potential impacts from the operation of new or expanded parks could involve operation-related air emissions (**Impact-AQ-3** and **Impact-AQ-6**), biological resources (**Impact-BIO-8**, **Impact-BIO-12**, and **Impact-BIO-14**), and greenhouse gas emissions (**Impact-GHG-1**). In combination with other projects in or adjacent to the proposed PMPU area, operation of new or expanded parks could result in a cumulatively considerable contribution to a significant cumulative impact related to parks.

Impact-C-REC-1: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Construction of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include new or expanded recreational facilities. Potential impacts from the construction of new or expanded recreational facilities could involve construction-related air emissions (**Impact-AQ-2** and **Impact-AQ-4**), biological resources (**Impact-BIO-1**, **Impact-BIO-2**, **Impact-BIO-3**, **Impact-BIO-4**, and **Impact-BIO-11**), cultural resources (**Impact-CUL-1** and **Impact-CUL-2**), tribal cultural resources (**Impact-CUL-3**), energy use (**Impact-EN-1**), noise and vibration (**Impact-NOI-1** through **Impact-NOI-3**), contaminated soils (**Impact-HAZ-1** through **Impact-HAZ-4**), and/or water quality (**Impact-WQ-1**). In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded recreational facilities could result in a cumulatively considerable contribution to a significant cumulative impact related to recreational facilities.

Impact-C-REC-2: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Operation of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include operation of new or expanded recreational facilities. Potential impacts from new or expanded recreational facilities could involve operation-related air emissions (**Impact-AQ-3** and **Impact-AQ-6**), biological resources (**Impact-BIO-8**, **Impact-BIO-12**, and **Impact-BIO-14**), greenhouse gas emissions (**Impact-GHG-1**), and/or water quality (**Impact-WQ-2**). In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded recreational facilities could result in a cumulatively considerable contribution to a significant cumulative impact related to recreational facilities.

Significance After Mitigation

Because specific location, timing, and design specifications for future expansion or construction of new fire, police, parks, or recreational facilities are not known at this time and may be within the jurisdiction and control of other agencies, the District cannot determine with certainty whether **MM-PS-1** would avoid or reduce potential environmental effects related to increasing fire and police protection services to meet future demand (see Threshold 2 above). Therefore, the proposed PMPU's contribution to cumulative fire and police protection impacts would be cumulatively considerable and **Impact-C-PS-1** would be considered cumulatively considerable and unavoidable. In addition, mitigation measures identified to reduce impacts related to construction and operation of parks and recreational facilities (see Thresholds 4 and 6 above), would not reduce impacts to less-than-cumulatively considerable levels. Therefore, **Impact-C-PS-2**, **Impact-C-PS-3**, **Impact-C-REC-1**, and **Impact-C-REC-2** would be considered cumulatively considerable and unavoidable.

4.13.1 Overview

This section describes the existing conditions and laws and regulations for sea level rise. It also analyzes the proposed Port Master Plan's (PMPU's) potential to exacerbate the physical effects of sea level rise and be inconsistent with applicable sea level rise policies of the California Coastal Commission (CCC).

As discussed in Section 4.13.4.4, *Project Impacts and Mitigation Measures*, impacts associated with sea level rise would be less than significant and no mitigation measures are required.

4.13.2 Existing Conditions

This section describes the effects of global climate change and its relation to sea level rise.

4.13.2.1 Effects of Global Climate Change

Climate change is a complex phenomenon that has the potential to alter local climatic patterns and meteorology. Although modeling indicates that climate change will result in sea level rise (both globally and regionally), as well as changes in temperature and rainfall, there remains uncertainty with regard to characterizing precise *local* climate characteristics and predicting precisely how various ecological and social systems will react to any changes in the existing climate at the local level. Regardless of this uncertainty, it is widely understood that substantial climate change is expected to occur in the future. Consequently, the entire San Diego region, including the proposed PMPU area, will be affected by changing climatic conditions.

Research efforts coordinated through the California Air Resources Board, the California Energy Commission, the California Natural Resources Agency, the University of California system, as well as many others continue to examine the specific changes to California's climate that will occur as the Earth's surface warms. Potential impacts include rising sea levels along the California coastline; extreme heat conditions; an increase in heat-related human deaths, infectious diseases, and respiratory problems caused by deteriorating air quality; reduced snow pack and streamflow in the Sierra Nevada, affecting winter recreation and water supplies; potential increase in the severity of winter storms, affecting peak stream flows and flooding; potential increase in frequency and intensity of wildfires; changes in growing season conditions that could affect California agriculture, causing variations in crop quality and yield; and changes in the distribution of plant and wildlife species due to changes in temperature, competition from colonizing species, changes in hydrologic cycles, changes in sea levels, and other climate-related effects.

With respect to the San Diego region, the *San Diego Summary Report* produced under California's Fourth Climate Change Assessment provides a summary of potential climate change impacts in the region (Kalansky et al. 2018), which include the following:

- **Increased temperatures:** The San Diego region will very likely experience hotter and drier days and more frequent, more intense, and longer heat waves. Average annual temperatures are expected to increase by 5–10°F by the end of the century. In coastal regions, marine layer clouds can help mitigate temperature increases. However, the impact of clouds requires further research because current climate models do not represent them well (Kalansky et al. 2018).
- **More volatile precipitation:** Rainfall will continue to be highly variable, with wet and dry extremes intensifying. Droughts are expected to occur more often and be more severe, while individual precipitation events are expected to intensify. At the seasonal level, the region is expected to see wetter winters and drier springs (Kalansky et al. 2018).
- **Greater wildfire risk:** Drier autumns are expected to increase the risk of wildfires, particularly the risk of large, catastrophic wildfires driven by Santa Ana wind events (Kalansky et al. 2018).
- **Impacts on human health:** Climate change is expected to exacerbate public health impacts. Specifically, more intense heat waves, warmer temperatures, and wildfires are expected to exacerbate heat-related illness, adverse health impacts from wildfire smoke, and vector-borne diseases. Sea level rise and flooding could affect coastal residents/businesses through direct effects, such as evacuations and damages to property or important community structures. Indirect effects include the possibility of pooled water, which could result in enhanced exposure to vector-borne diseases, or increased runoff, which could result in increased pollutants. Certain populations are particularly vulnerable to these health impacts, including those with preexisting or underlying health conditions, those with chronic illnesses (e.g., asthma), the very young, the elderly, and those without health insurance (Kalansky et al. 2018).
- **Reductions in fresh water:** Climate change is expected to reduce the San Diego region's imported and local water supplies and increase water demand. By mid-century, two of the major imported water supplies are expected to decline. State Water Project imports are expected to drop by 10 percent or more, while Colorado River imports are expected to drop by 10 to 45 percent. Meanwhile, demand is projected to increase by 30 percent by 2040 (Kalansky et al. 2018).
- **Rising sea levels and increased storm surge:** Projected sea level rise, coastal erosion, and increasing storm surges (i.e., a temporary rise in sea level due to atmospheric pressure during a storm) may cause fragile sea cliffs to collapse, shrink beaches, and destroy coastal property and structures and ecosystems. Along the San Diego County coast, sea levels are expected to rise by around 1 foot by mid-century and rise rapidly through the end of the century by around 3 feet. Higher sea levels, combined with high-tide events, are expected to lead to higher extreme water levels (Kalansky et al. 2018). More information on sea level rise projections for the Port of San Diego is provided below.
- **Impacts on habitats:** Climate change is a significant stressor to San Diego's natural lands, which are among the most biodiverse in the United States. Climate stressors—such as rising temperatures (both air and water), ocean acidification, a greater portion of rainfall falling as extreme precipitation, more frequent and intense droughts, and rising sea levels—may also stress habitats and native species, thereby harming biodiversity. For instance, as sea levels rise, wetlands migrate upstream and inland. However, in heavily urbanized areas such as San Diego, migration is limited by development, causing wetlands and the populations that rely on them to shrink (Kalansky et al. 2018).

Given the proposed PMPU area's location along the waterfront, sea level rise is the primary concern as an effect of climate change and is discussed in more detail below.

Sea Level Rise

Over the past century, mean global sea level has risen approximately 1.7 millimeters (mm) per year (about 0.07 inch per year) accelerating to a rate of 3.2 mm per year since 1993 (IPCC 2013). From 1906 to 2019, the tide gauge in San Diego Bay suggests a rise of approximately 2.2 mm per year (about 0.09 inch per year), approximately 29% higher than the global rate (NOAA 2018). In total, sea levels rose 0.72 foot in San Diego during the twentieth century (NOAA 2018).

A variety of factors impact local relative sea level rise (i.e., the sea level rise projections for a specific location rather than the global average sea level rise projections), including vertical land movement, ocean dynamics, and changes in the Earth's gravitational and rotational fields (NRC 2012). Through 2100, San Diego is projected to subside at a rate of 1.4 mm/year, and the glacial geostatic adjustment¹ is projected to cause local relative sea level to increase by 0.4 mm/year (NRC 2012). These values are factored into the Ocean Protection Council's sea level rise projections and thus the San Diego Unified Port District's (District's) 2019 *Sea Level Rise Vulnerability Assessment and Coastal Resilience Report*.

Governor Schwarzenegger's Executive Order S-13-08, issued in November of 2008, directed State agencies to plan for sea level rise and coastal impacts. In response to this, several iterations of sea level rise guidance have been developed to help State agencies incorporate sea level rise into project planning and decision-making. In late 2018, the CCC released sea level rise policy guidance (CCC 2018), which draws on sea level rise projections, guidance, and best available science from 2017 and 2018 Ocean Protection Council documents and provides recommendations for addressing sea level rise in local coastal programs and coastal development permits. The sea level rise projections for San Diego Bay from these documents are summarized in Table 4.13-1.

Table 4.13-1 provides a single range of sea level rise estimates for the years 2030 and 2050 and multiple ranges for the year 2100. This range demonstrates the increasing uncertainty associated with estimating sea level rise in the long term, particularly in the latter half of the twenty-first century. The contribution of thermal expansion (i.e., ocean water volume expanding as ocean water warms) and the melting of small glaciers to sea level rise is relatively well-researched, while the impacts of climate change on large ice sheets are less understood. In addition, there are multiple scenarios that represent how global society may evolve over the coming century in its use of fossil fuels, technology, population growth, etc. These scenarios are known as Representative Concentration Pathways (RCPs). RCP 2.6 represents a moderately warmer future where global radiative forcing is projected to increase by 2.6 watts per square meter (m^2) by 2100. RCP 8.5 represents a much hotter future, where global radiative forcing is projected to increase by 8.5 watts/ m^2 by 2100. The latter represents "business-as-usual," whereby unsubstantial efforts are made to reduce greenhouse gas emissions. Until mid-century there is limited difference in the RCP projections so they are consolidated into a single set of projections; however, for 2100, it is valuable to consider the separate ranges of sea level rise under the various RCPs. In general, sea level rise is projected to accelerate towards the second half of the century.

¹ The Earth's crust is still reaching a state of equilibrium after the melting of the glaciers at the end of the last ice age. This process is called glacial geostatic adjustment. Some locations that were compressed due to the huge weight of the ice are still rebounding, while areas that were near, but not covered with glaciers were pushed up during the ice age and are still subsiding.

Table 4.13-1. San Diego Bay Probabilistic Sea Level Rise Projections in Feet (with Meters in Parentheses) Above 1991–2009 Mean Sea Level Baseline

Year	Median (50% exceedance probability)	Likely Range (67% probability sea level rise is between)	1-in-20 Chance (5% exceedance probability)	1-in-200 Chance (0.5% exceedance probability)	H++ Scenario (No associated probability)
2030	0.5 (0.15)	0.4–0.6 (0.12–0.18)	0.7 (0.21)	0.9 (0.27)	1.1 (0.33)
2050	0.9 (0.27)	0.7–1.2 (0.21–0.36)	1.4 (0.43)	2.0 (0.61)	2.8 (0.85)
2100 (RCP 2.6)	1.7 (0.52)	1.1–2.5 (0.34–0.76)	3.3 (1.01)	5.8 (1.77)	10.2 (3.11)
2100 (RCP 8.5)	2.6 (0.79)	1.8–3.6 (0.55–1.10)	4.5 (1.37)	7.0 (2.13)	10.2 (3.11)

Source: CCC 2018.

Projected sea level rise, as an effect of climate change, is expected to increase the geographic area and the frequency with which those areas experience coastal flooding along San Diego Bay and the open coast. Rising sea levels increase the frequency of flooding at *all levels*, from extreme to nuisance. For example, areas that used to experience monthly flooding may be permanently inundated, while areas that were flooded only during extreme storm surge events (e.g., the 50-year storm) may experience flooding on a regular basis. In summary, sea level rise is a concern for the future, particularly in combination with future storm surge events. A scenario with 100-year flood flows that coincides with high tides, taking into account sea level rise over a 50- or 100-year horizon, would dramatically increase the risk of flooding.

The District conducted a sea level rise vulnerability assessment and coastal resiliency report in accordance with Assembly Bill (AB) 691 to analyze potential effects from sea level rise and coastal flooding on the built environment and natural resources. Low lying built environment assets, such as boat launches and sewer lifts, are projected to experience inundation by 2030, and assets that provide public access and recreational opportunities become increasingly affected by potential inundation and storm surge by 2050. Critical infrastructure, such as roads, rail, and the stormwater system, could experience temporary coastal flooding from 100-year storm events by 2100. For natural environments, available area for salt marsh, beach/dune, and upland habitats declines as sea level rises. Significant financial effects are likely to come out of loss of transportation and other infrastructure, as well as from loss of ecosystem services (District 2019).

4.13.3 Laws, Regulations, Plans, and Policies

This section summarizes international, Federal, State, and local regulations and policies related to sea-level rise. These laws, regulations, and policies represent the current state of sea-level rise regulatory planning and guidance, although not all regulations and policies mentioned below are directly applicable to the proposed PMPU or the District.

4.13.3.1 Federal

There are no applicable Federal laws, regulations, or policies related to sea level rise and the proposed PMPU.

4.13.3.2 State

California has adopted statewide legislation and guidance addressing various aspects of sea level rise and climate change. Much of this establishes a broad framework for the State's long-term climate change adaptation program. The former and current governors of California have also issued several Executive Orders (EOs) related to the State's evolving climate change policy. Summaries of key policies, EOs, regulations, legislation, and guidance at the State level that are relevant to the proposed PMPU are provided below in chronological order. It should be noted that Senate Bill (SB) 379 requires the incorporation of climate adaptation and resiliency strategies into the safety element of city and county general plans on or before January 1, 2022. Because the District is not a city or county government, this regulation would not apply to the proposed PMPU or this Program Environmental Impact Report (PEIR). Although SB 379 does not apply to the District, the District has incorporated climate adaptation and resiliency strategies into the proposed PMPU.

California Coastal Act

The California Coastal Act (CCA or Coastal Act) of 1976 (Public Resources Code Sections 30000–30900) was enacted by the Legislature as a comprehensive scheme to govern land use planning for the entire coastal zone of California. The Coastal Act established the CCC to oversee future development along California's coastline. A combination of local land use planning procedures and enforcement to achieve maximum responsiveness to local conditions, accountability, and public accessibility are relied upon to insure conformity with the provisions of the act (Section 30004 (a) and (b)). Chapter 8, Article 3 of the CCA requires ports, including the Port of San Diego, to develop a Port Master Plan (PMP) by which to conduct project reviews and issue individual coastal development permits or exclusions within their jurisdictions. Individual PMPs require review and certification by the CCC for conformity with the Coastal Act, including any amendments to the certified PMP. Chapter 8 (Section 30715) also specifies which projects within a port are subject to Chapter 3 policies of the CCA, *Coastal Resources Planning and Management Policies*. Those policies provide guidance for public access to the coast, recreation, marine environment, land resources, development, and sea level rise.

With respect to coastal resources, sea level rise increases the risk of flooding, coastal erosion, and saltwater intrusion into freshwater supplies, including groundwater, which have the potential to threaten many of the resources that are integral to the California coast, including coastal development, coastal access and recreation, habitats (e.g., wetlands, coastal bluffs, dunes, and beaches), water quality and supply, cultural resources, community character, and scenic quality. (See Chapter 3 of the Coastal Act for more details on what constitutes a coastal resource, which include coastal habitats; coastal development; public access and recreation opportunities; cultural, archaeological, and paleontological resources; and scenic and visual qualities.)

Executive Order S-13-08 (2008)

EO S-13-08, signed by Governor Schwarzenegger in November 2008, required the Natural Resources Agency to request that the National Academy of Sciences convene an independent panel

to complete the California Sea Level Rise Assessment Report that advises how California should plan for future sea level rise. The order also requires all State agencies planning construction projects in areas vulnerable to future sea level rise to consider a range of sea level rise scenarios for the years 2050 and 2100 for planning purposes. Additionally, EO S-13-08 required the California Natural Resources Agency to develop a State Climate Adaptation Strategy. In response to the order, the *California Climate Adaptation Strategy* (CNRA 2009) was released in 2009, and updated in 2022, and includes adaptation strategies focused on public health, ocean and coastal resources, water supply and flood protection, agriculture, forestry, biodiversity and habitat, and transportation and energy infrastructure. Furthermore, EO S-13-08 required the Governor's Office of Planning and Research to provide State land use planning guidance related to sea level rise and other climate change impacts.

Assembly Bill 691 – Proactively Planning for Sea Level Rise Impacts (2013)

AB 691 required that certain grantees of State lands, including the District, prepare and submit to the California State Lands Commission (CSLC), no later than July 1, 2019, an assessment of how the grantees propose to address sea level rise on Tidelands. The bill also states that addressing the impacts of sea level rise shall be among the management priorities of a local trustee. In accordance with AB 691, the assessment was completed and submitted to CSLC and includes the following:

- An assessment of the impact of sea level rise on granted public trust lands as described by certain documents.
- Maps showing the areas that may be affected by sea level rise in the years 2030, 2050, and 2100. These maps shall include the potential impacts of 100-year storm events. The District may rely on appropriate maps generated by other entities.
- An estimate of the financial cost of the impact of sea level rise on District public trust lands. The estimate shall consider, but is not limited to, the potential cost of repair of damage to and the value of lost use of improvements and land, and the anticipated cost to prevent or mitigate potential damage.
- A description of how the District proposes to protect and preserve natural and human-made resources and facilities located on, or proposed to be located on, trust lands and operated in connection with the use of the trust lands. The description shall include, but is not limited to, how wetlands restoration and habitat preservation would mitigate impacts of sea level rise.

The District's *Sea Level Rise Vulnerability Assessment and Coastal Resiliency Report* (AB 691 Report) informed the development of the proposed PMPU policies and the methodology used for this PEIR. The report is included as Appendix I of this PEIR.

Assembly Bill 2516 – Planning for Sea Level Rise Database (2014)

AB 2516 requires the Natural Resources Agency, in collaboration with the Ocean Protection Council, to create, update biannually, and post online a Planning for Sea Level Rise Database that describes the steps being taken throughout the state to prepare for, and adapt to, sea level rise. The bill requires various public agencies and private entities to provide sea level rise planning information, defined as studies, programs, modeling, mapping, cost-benefit analyses, vulnerability assessments, adaptation, assessments, and local coastal programs that have been developed for the purposes of addressing or preparing for sea level rise, to the Natural Resources Agency and Ocean Protection Council for incorporation into the Planning for Sea Level Rise Database. The entities subject to AB 2516 include 13 State agencies, as well as all ports, airports, and electric and natural gas utilities

within the coastal zone and San Francisco Bay Area. The District has been complying with AB 2516 and providing sea level rise planning information to the Natural Resources Agency.

Executive Order B-30-15 (2015)

EO B-30-15, signed by Governor Brown in April 2015, directed State agencies to integrate climate change into all planning and investment and account for current and future climate conditions in infrastructure investments. In addition, the Governor's Office of Planning and Research was directed to assemble a Technical Advisory Group to develop a guidance document for implementing the order. In response to the order, the Technical Advisory Group prepared *Planning and Investing for a Resilient California: A Guidebook for State Agencies* (OPR 2018), which provides high level guidance on future conditions and how State agencies should approach planning in light of those conditions. Furthermore, EO B-30-15 established a statewide greenhouse gas emissions reduction target of 40 percent below 1990 levels by 2030.

California State Lands Commission Strategic Plan (2021)

The CSLC Strategic Plan (2021–2025), adopted on February 23, 2021, contains strategic focus areas and goals designed to guide CSLC in managing and protecting the important natural resources on public lands within the State of California, including the Tidelands and submerged lands within the jurisdiction of the District. Strategies related to sea level rise include the following.

- Convene collaborative dialogues to evaluate the need for policies that:
 - a. Carefully examine and proposed nonrenewable extractive practices on State lands, for pursuing a just transition to renewables.
 - b. Identify the appropriate response to significant land-use changes that may adversely affect public and private uplands as sea levels rise and the Commission's jurisdiction increases.
 - c. Enhance understanding of the Public Trust to increase advocacy for its appropriate use and protection.
 - d. Support our grantees, lessees, tribal partners, stakeholders, and partners in their efforts to build thriveability and balance sustainability and equity with economic growth.

Assembly Bill 2800 (2016)

AB 2800 requires State agencies to consider current and future impacts of climate change when planning, designing, building, operating, maintaining, and investing in state infrastructure. The bill, by July 1, 2017 and until July 1, 2020, required the Natural Resources Agency to establish a Climate-Safe Infrastructure Working Group to examine how to integrate scientific data of projected climate change impacts into infrastructure planning, design, and implementation. AB 2800 required the Climate-Safe Infrastructure Working Group to provide specific recommendations to the California State Legislature and Strategic Growth Council by July 1, 2018. In accordance with AB 2800, the Climate-Safe Infrastructure Working Group prepared *Paying it Forward: The Path Toward Climate-Safe Infrastructure in California* (CSIWG 2018), a report that summarizes the working group's findings and provides recommendations to the State Legislature for creating climate-safe infrastructure.

California Ocean Protection Council – Rising Seas in California: An Update on Sea Level Rise (2017)

In April 2017, the Ocean Protection Council released *Rising Seas in California: An Update on Sea Level Rise* (Rising Seas Report), a report that synthesizes the current state of sea level rise science, including advances in modeling and improved understanding of the processes that could drive extreme global sea level rise as a result of ice loss from the Greenland and Antarctic ice sheets. The Rising Seas Report was prepared and peer-reviewed by experts in coastal processes, climate and sea level rise science, observational and modeling science, the science of extremes, and decision-making under uncertainty. The science provided in this report helped form the basis for the Ocean Protection Council's updated sea level rise guidance, described further below.

California Ocean Protection Council – State of California Sea Level Rise Guidance (2018)

The California Ocean Protection Council released updated *State of California Sea Level Rise Guidance* in 2018 to reflect advances in sea level rise science. The 2018 update to the guidance was developed by the California Ocean Protection Council in coordination with the California Natural Resources Agency, Governor's Office of Planning and Research, and the California Energy Commission, and relies primarily on the scientific findings from the Ocean Protection Council's Rising Seas Report (described above). The updated guidance is intended to assist State agencies and local governments with incorporating sea level rise projections into their planning, permitting, investment, and other decisions in accordance with AB 691 and EO B-30-15. The State of California Sea Level Rise Guidance was initially released in 2010 and previously updated in 2013.

California Coastal Commission Sea Level Rise Policy Guidance (2018)

First adopted in 2015 by the CCC and updated in November 2018, the *Sea Level Rise Policy Guidance* provides a framework for addressing sea level rise in PMPs and Coastal Development Permits (CDPs). The guidance provides principles for addressing sea level rise in the coastal zone, an overview of the science behind sea level rise as well as a description of the potential consequences, and an outline of the steps for addressing sea level rise in PMPs or CDPs. The original 2015 guidance was amended in November 2018 based on updated sea level rise science in two new reports released by the Ocean Protection Council: the Rising Seas Report and State of California Sea Level Rise Guidance, described above.

Safeguarding California Plan: 2018 Update

The 2018 update to the *Safeguarding California Plan* (CNRA 2018) is a roadmap demonstrating how California is taking action to respond to climate change, including sea level rise, and lays out the next steps to achieve the State's goals as well as how those objectives will be achieved. Over 1,000 ongoing actions and next steps, organized by 76 policy recommendations across 11 policy sectors, were developed through the scientific and policy expertise of staff from 38 State agencies. The plan describes overarching strategies recommended by the California Natural Resources Agency, and outlines ongoing actions and cost-effective and achievable next steps to make California more resilient to climate change, including sea level rise. This roadmap serves as a transparent and accountable tool for the public to evaluate the State's progress. It should be noted that the *Safeguarding California Plan* is not intended to serve as a prescriptive policy document or guidelines for non-State government entities. Rather, it is intended to provide a comprehensive suite of

ongoing and needed adaptation actions, as well as principles and recommendations to guide and organize adaptation efforts, by State agencies.

Making California's Coast Resilient to Sea Level Rise: Principles for Aligned State Action (2020)

A group of State agencies, including the Ocean Protection Council, California Coastal Commission, California State Lands Commission, and California Department of Transportation, adopted a set of Principles for Aligned State Action in spring 2020, which compiles principles developed and endorsed by State and regional agencies. These principles aim to scale-up coastal resiliency efforts in California through aligned strategies that create consistent and efficient decision-making and improve collaboration across partners. The principles, one of which includes consideration of establishing a minimum of 3.5 feet of sea level rise by 2050, as a sea level rise projection, are focused on six key issues: Best Available Science, Partnerships, Alignment, Communications, Local Support, and Coastal Resilience Projects. The 3.5 feet of sea level rise corresponds to a 2100 "likely" sea level rise scenario, but the State agencies recommend that planning for that value begin sooner. The principles are non-regulatory guidelines that are meant to be used in planning, policy setting, project development, and decision-making by State agencies, and they serve as a living document, to which additional formal endorsement of other principles can be added.

4.13.4 Project Impact Analysis

4.13.4.1 Methodology

The sea level rise analysis consists of a geospatial assessment of future sea level rise and storm surge projections compared to the various planning district elevations and proposed water and land use designations. The analysis reviews historic and projected future rates of sea level rise and utilizes the U.S. Geological Survey (USGS) Coastal Storm Modeling System (CoSMoS) 3.0 sea level rise mapping scenarios to determine potential areas of flooding and inundation. CoSMoS² is a collection of sea level rise inundation maps produced for the California coast by USGS. CoSMoS combines 0.25-meter (9.8-inch) sea level rise increments (from 0 to 2 meters and a single 5-meter scenario) and four different storm return periods (daily, annual, 20-year, 100-year) into a series of inundation maps and other technical resources. USGS presents these modelled data independent of any projected analysis timeframe (i.e., they do not indicate when any given sea level rise increment will occur). As such, interpretation is required to determine the potential timeframe at which the various sea level rise elevations will occur.

In compliance with AB 691, the District prepared the *Sea Level Rise Vulnerability Assessment and Coastal Resiliency Report* (AB 691 Report) (District 2019), presented it to the Board of Port Commissioners in June 2019, and then submitted to the CSLC. This report is provided as Appendix I of this PEIR. AB 691 requires local trustees of public trust lands to collaborate with its lessees, local, State, and Federal government agencies, and users of the granted public trust lands to address projected sea level rise. District staff, regional stakeholders, and subject matter experts from public agencies, non-profit groups, and private companies were engaged during the development of the

² https://www.usgs.gov/centers/pcm/science/coastal-storm-modeling-system-cosmos?qt-science_center_objects=0#qt-science_center_objects

AB 691 Report to gather information and learn from projected sea level rise and coastal experts. Stakeholders included the U.S. Navy, Federal, State, regional, and local government agencies, academia, environmental interest groups, District tenants, and the San Diego Port Tenants Association.

Beginning in the fall of 2017 and concluding in the winter of 2018, stakeholders provided technical feedback and recommendations for the District's projected sea level rise approach, including selection of sea level rise projections to be used in the vulnerability assessment, coastal flood modeling, and assets to be evaluated. Stakeholders also provided input on the vulnerability assessment, flood maps, and the projected sea level rise planning process. The stakeholder process led to a deeper understanding of sea level rise projections, asset management, and potential impacts. The stakeholder process included the formation of a Sea Level Rise Ad-Hoc Committee within the District's Environmental Advisory Committee (EAC). In addition to a select number of EAC members, representatives from the District's member cities and the CCC also participated in the Sea Level Rise Ad-Hoc Committee to advise the District throughout the development of the vulnerability assessment.

The proposed PMPU impact analysis aligns the 2030 and 2050, 5 percent probability of exceedance of sea level rise projections (or 95% probability that sea level rise will not exceed these projections) and the 50 percent probability exceedance for 2100 (RCP 8.5) from the Ocean Protection Council's Rising Seas Report (OPC 2017) and the District's AB 691 Report (District 2019) to the nearest CoSMoS mapping increment (Table 4.13-2). These projections are consistent with the sea level rise projections selected and analyzed in the District's AB 691 Report and are within 2 inches of the CCC's medium-high risk aversion scenario.

The following scenarios are included for disclosure purposes, including:

- 3.3 feet (1 meter) of sea level rise by 2050.** As discussed in Section 4.13.3.2, the CCC has adopted a principle that recommends a minimum consideration of 3.5 feet of sea level rise by 2050 or the use of best available science. The CCC does not plan to update its current Sea Level Rise Policy Guidance to incorporate specific projections (CCC 2020), which is why this scenario is only included for disclosure purposes.
- 4.5 feet and 7 feet of sea level rise by 2100.** Due to the increased uncertainty in the 2100 projections and the benefits of understanding the incremental impacts of sea level rise, the potential exposure under the 5 percent (4.5 feet) and the 0.5 percent (7 feet) probability exceedance projections for 2100 (RCP 8.5) are included for disclosure. The H++ scenario was not further analyzed due to the evolving nature of the science and the significant uncertainty associated with that scenario. In 2019, new science was published that reduces the likelihood of the H++ scenario (Edwards et al. 2019).

Table 4.13-2. Alignment of San Diego Bay Sea Level Rise Projections with the CoSMoS Mapping

Year	Probability Sea Level Rise Meets or Exceeds Projection	Sea Level Rise Projection (feet)	Closest CoSMoS Mapping Increment	Analysis Purpose
2030	1-in-20 Chance (5% probability)	0.7*	0.25 meter (0.82 foot)	Impact Analysis
2050	1-in-20 Chance (5% probability)	1.4*	0.5 meter (1.64 feet)	Impact Analysis

Year	Probability Sea Level Rise Meets or Exceeds Projection	Sea Level Rise Projection (feet)	Closest CoSMoS Mapping Increment	Analysis Purpose
2050	Unknown	3.5	1 meter (3.3 feet)	For Disclosure Only
2100 (RCP 8.5)	Median (50% probability)	2.6*	0.75 meter (2.5 feet)	Impact Analysis
2100 (RCP 8.5)	1-in-20 Chance (5% probability)	4.5*	1.5 meters (4.92 feet)	For Disclosure Only
2100 (RCP 8.5)	1-in-200 Chance (0.5% probability)	7.0	2.0 meters (6.6 feet)	For Disclosure Only

Source: CCC 2018.

*Sea level rise (SLR) projections that were analyzed in the District's *Sea Level Rise Vulnerability Assessment & Coastal Resilience Report* (AB 691 Report at Appendix I to this PEIR)

For each CoSMoS mapping increment, both the daily inundation layers, as well as the 100-year storm layers are included in the analysis. Both the daily and 100-year storm elevations assume a mean high water tide (i.e., the average high tide elevation at the San Diego Bay tide gauge).³

The baseline analysis scenario for analysis is the CoSMoS zero-meter scenario. Zero meter of sea level rise from CoSMoS is approximately the 2010 mean high water level. This scenario is overlaid on the existing water and land use designation map to determine baseline exposure levels.

The sea level rise assessment was conducted geospatially by overlaying the CoSMoS projected inland extent of the future daily high tide and the 100-year storm surge (1% annual return probability) with the proposed water and land use designation map for each planning district. The impacts are reported as the acres of each water and land use designation that would be impacted under each sea level rise and storm surge scenario.

To understand what the acreages of flooded land could mean, the vulnerability of different future development types was qualitatively assessed. This approach is consistent with the CCC's Sea Level Rise Policy Guidance, which describes vulnerability as "a function of the character, magnitude, and rate of climate variation to which a system is *exposed*, as well as of non-climatic characteristics of the system, including its *sensitivity*, and its coping and *adaptive capacity*." Assessing risk adds the additional component of *consequences*. The sea level rise analysis includes these four components of vulnerability (exposure, sensitivity, adaptive capacity, and consequences):

- **Exposure:** This describes whether future development could be exposed to sea level rise, including increased flooding during storms.
- **Sensitivity:** This describes the degree to which future development may be affected by sea level rise. Sea level rise could result in direct harm to the future development or result in changing environmental conditions (e.g., geology, soil characteristics, hydrology, land cover and use) that could affect the development. Some types of development may be more sensitive than others. The analysis qualitatively rates the sensitivity of future types of development on this scale, which is consistent with the District's AB 691 approach:

³ The CoSMoS model is highly complex with many assumptions regarding wave formation, erosion, sediment transport, etc. More information on the model and its assumptions is available from the USGS's *CoSMoS v3.0 Phase 2 Southern California Bight: Summary of Methods*. Available at: <https://www.sciencebase.gov/catalog/item/57f1d4f3e4b0bc0bebfef139>.

- **Low:** If exposed, the future development or resource would suffer no or minor damage and can maintain functionality.
- **High:** If exposed, the future development or resource would experience major damage or long-term service interruptions, requiring significant effort to restore/rebuild to original condition.
- **Adaptive Capacity:** This describes the degree to which future development can successfully adapt to sea level rise impacts, including flooding, inundation, and/or erosion, through methods such as elevation or relocation. For natural resources such as beaches, wetlands, and other coastal habitats, adaptive capacity may include room to migrate inland and potential for habitat creation. The analysis qualitatively rates the adaptive capacity of future types of development on this scale, which is consistent with the District's AB 691 approach:
 - **Low:** The future development or resource has limited ability to adapt without substantial changes.
 - **High:** The future development or resource can easily be adapted or has the ability and conditions to adapt naturally.
- **Consequences:** This describes the implications of the physical damage to assets including changes to operations and services that may occur due to sea level rise impacts. Consequences can include disruptions of operations, safety threats to surroundings, increased pollution, loss of access to development, loss of habitats, and reduction of biological productivity and water quality.
 - **Low:** Sea level rise and storm surge damages would result in non-significant consequences to human health and sensitive resources.
 - **High:** Sea level rise and storm surge damages would result in significant consequences to human health and sensitive resources.

Rather than analyze each land use type individually for the sensitivity, adaptive capacity, and consequences, they have been grouped into broader categories of development types (e.g., natural habitat, park space, structures, infrastructure, open water, floating structures, underwater structures, fixed structures) with similar sea level rise consequences to avoid repetition and false precision at the plan level of analysis.

The proposed PMPU's consistency with applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance is evaluated qualitatively. A project is considered consistent with the provisions of these documents if it meets the general intent of increasing sea level rise resilience, in order to facilitate the achievement of adopted goals and does not impede attainment of those goals. As discussed in Section 4.9, *Land Use and Planning*, a given project need not be in perfect conformity with each and every planning policy or goal to be consistent with the proposed PMPU. A project would be consistent if it would further the objectives and not obstruct their attainment.

4.13.4.2 Thresholds of Significance

The California Environmental Quality Act (CEQA) does not direct agencies to analyze the environment's effects on a project but does require analysis when a project could exacerbate existing environmental hazards or conditions. As such, the analysis provided within this section focuses on the project's potential to exacerbate existing and projected future conditions associated

with sea level rise. See Section 4.6, *Greenhouse Gas Emissions and Energy*, for the project's impacts associated with increasing greenhouse gas (GHG) emissions and their contribution to climate change and sea level rise. This section focuses on the proposed PMPU's potential to result in changes in the physical environment resulting from siting of future development and whether these changes may exacerbate the adverse physical effects associated with future sea-level rise.

The following significance criteria provide the basis for determining significance of sea level rise impacts from implementation of the proposed PMPU. The determination of whether a sea level rise impact would be significant is based on the thresholds described below and the professional judgment of the District as Lead Agency, based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following:

1. Exacerbate any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, associated with reasonably foreseeable future sea level rise and storm surge.
2. Result in an inconsistency with the applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance adopted for the purpose of avoiding or mitigating an environmental effect from sea level rise.

To determine whether future development allowed under the proposed PMPU would exacerbate any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, associated with sea level rise and storm surge, the following methodology was used for each analysis scenario (i.e., 2030, 2050, and 2100).

- Development of proposed PMPU water and land uses within the geographic area exposed to a 0.7-foot sea level rise scenario (2030, 5% probability scenario) with a 100-year storm surge would be considered a significant impact if the development allowed under the proposed PMPU would exacerbate the physical effects associated with the rise of sea levels.
- Development of proposed PMPU water and land uses within the geographic area exposed to a 1.4-foot sea level rise scenario (2050, 5% probability scenario) with a 100-year storm surge would be considered a significant impact if the development allowed under the proposed PMPU would exacerbate the physical effects associated with the rise of sea levels.
- Development of proposed PMPU water and land uses within the geographic area exposed to a 2.6 feet sea level rise (2100 RCP 8.5, 50% probability scenario) with a 100-year storm surge would be considered a significant impact if the development allowed under the proposed PMPU would exacerbate the physical effects associated with the rise of sea levels.

4.13.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to reduce or avoid impacts associated with the potential to exacerbate any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge and are considered in the impact analysis that follows.

SR Policy 3.2.1 The District shall participate in research and continue to conduct monitoring that supplements its knowledge of projected coastal climate impacts and potential strategies to adapt to these impacts.

SR Policy 3.2.2 The District shall encourage pilot and demonstration projects that provide effective and innovative sea level rise adaptation and coastal resiliency approaches.

SR Policy 3.2.3 The District shall create and periodically update a sea level rise adaptation plan that:

- a. Considers best available science and applicable regional, State, and Federal adaptation planning guidance;
- b. Builds upon previous analyses of coastal hazards that are caused or exacerbated by projected sea level rise;
- c. Provides recommendations for adapting structures and facilities, coastal access, recreational areas, coastal-dependent development, contaminated sites, and other infrastructure and coastal resources to projected sea level rise conditions;
- d. Explores the potential for nature-based sea level rise adaptation strategies; and identify areas that could integrate natural resource protection, enhancement, and restoration solutions while providing appropriate SLR resiliency;
- e. Identifies alternative opportunities or plans for adapting to coastal hazards such as but not limited to: balance or realignment of natural habitat and the built environment, softening hardened shoreline structures, restoring or enhancing submerged habitats for coastal resiliency, or replacing in-kind public recreation areas, accessways, and other Public Trust resources that could be lost due to inundation or damage associated with sea level rise;
- f. Establishes a monitoring protocol and requirements for evaluating sea level rise impacts on all Tidelands uses over time; ~~and~~
- g. Establishes a schedule for performing future Tidelands' sea level rise vulnerability assessments and social vulnerability assessments;
- h. Includes an environmental justice component that addresses how development may affect potential flooding and inundation related to sea level rise in adjacent disadvantaged communities; and
- i. Includes an outreach and engagement process that would be focused on collaborative adaptation planning with adjacent disadvantaged communities.

SR Policy 3.3.1 Permittees shall submit a site-specific hazard report to the District using best available science and considering best practices as provided by Federal, State, or regional guidance on coastal resiliency.

At a minimum, the site-specific hazard report shall address anticipated coastal hazards over the anticipated life of the development, including, but not limited to inundation; flooding associated with storms of various return periods, including a 100-year storm; wave runup and overtopping; historic and projected future shoreline erosion; groundwater rise; saltwater intrusion; tsunamis; and changes to these hazards over time due to projected sea level rise at the site. The following requirements apply to the site-specific hazard analysis for the report:

- a. The analysis shall be conducted by a licensed engineer with experience in coastal processes and shall be submitted to the District for its review and approval.

- b. Using best available science and applicable regional, State, or Federal adaptation planning guidance documents, the analysis shall consider multiple sea level rise scenarios and projections associated with the anticipated life of the development and, when applicable, identify potential future impacts on on-site natural resources.
- c. The analysis shall identify threshold SLR amounts that could lead to impacts (e.g., the amount of SLR that could lead to overtopping of the proposed development).
- d. For development that does not meet the requirements that allow shoreline protective devices subject to SR Policy 3.3.3, SR Policy 3.3.6, or SR Policy 3.3.9, the hazard analysis shall be performed assuming no reliance upon future shoreline protective devices.
- e. If applicable, the report shall identify the coastal hazards that could trigger implementation of sea level rise adaptation strategies. If the development cannot fully minimize or avoid the impacts of coastal hazards for the anticipated life of the development, the report shall discuss possible adaptation responses to the hazards to reduce risk as feasible and mitigate impacts on coastal resources.
- f. As part of Coastal Act approval, the District shall review the report and require the development to implement the recommendations in the report and/or any other siting and design adaptation measures that the District determines are necessary to find that the development is consistent with the requirements of this Plan.

SR Policy 3.3.2 The District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, where feasible.

- a. If coastal hazards cannot be completely avoided, the District shall require planning, designing, and implementation of adaptation strategies, that:
 - 1. Address the hazards over the anticipated life of the development,
 - 2. Protect coastal resources, public access, and recreational facilities, and
 - 3. Minimize risks to life and property to the maximum extent feasible.

SR Policy 3.3.3 Permittees of coastal-dependent port structures and supportive coastal related development that are essential to maritime functions, public safety, and security may implement shoreline protective devices or other adaptation strategies for the protection from, or accommodation of, coastal hazards.

SR Policy 3.3.4 The District and permittees shall prioritize implementation of nature based adaptation strategies for coastal resiliency as an alternative to the placement of shoreline protective devices, where feasible and applicable.

SR Policy 3.3.5 The District shall require new landside accessways and recreational facilities be sited and designed to avoid impacts from coastal hazards and minimize environmental impacts while maximizing coastal access.

SR Policy 3.3.6 The District and permittees may implement shoreline protective devices or other adaptation strategies for protection from, or accommodation of, coastal hazards for existing landside accessways and recreational facilities where no adjacent in-kind alternative landside accessway or recreational facility exists on Tidelands.

SR Policy 3.3.7 If an existing landside accessway or recreational facility is deemed unsafe by the District because it has become permanently degraded by coastal hazards, the landside accessway or recreational facility shall, to the extent feasible, be retrofitted or relocated by the District or permittee ~~to the extent feasible~~, such that safe continuous coastal access will be maintained.

SR Policy 3.3.8 To improve coastal access, the District encourages incorporation of step-down areas into an existing shoreline protective device that abuts a sandy beach.

SR Policy 3.3.9 Appealable development that is considered coastal-dependent, an existing structure, or a public beach vulnerable to erosion shall be allowed to construct, reconstruct, expand, repair and maintain, and/or replace a shoreline protective device.

SR Policy 3.3.10 When constructing, reconstructing, expanding, or replacing a shoreline protective device (per SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9), the District shall require it be designed to:

- a. Minimize adverse impacts on local shoreline sand supply;
- b. Minimize impacts on recreation, habitat, scenic views, beach width, and other coastal resources;
- c. Encourage inland expansion of protective devices rather than further fill of coastal waters to minimize resource impacts; and
- d. Not substantially impair coastal access or other Public Trust uses.

SR Policy 3.3.11 Appealable development that does not qualify for protection per SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9, shall avoid the need for shoreline protective devices to avoid coastal hazards over the anticipated life of the development that may result from projected sea level rise.

SR Policy 3.3.12 The District shall allow the repair and maintenance of existing, legally established shoreline protective devices that are destroyed by a natural disaster or that protect uses that do not qualify for protection (per policies SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9) provided that:

- ~~a. Unless destroyed by natural disaster, replacement of a shoreline protection device that meets the definition of major development shall not be considered repair and maintenance;~~
- ~~ba.~~ Repair and maintenance do not lead to an expansion of the shoreline protective device; and
- ~~eb.~~ Applications for repair and maintenance of an existing, legally established shoreline protective device shall include a reassessment of the need for the device, the need for the repair and maintenance of the device, and the potential for the device's removal based on projected coastal hazards that may result from sea level rise.

SR Policy 3.3.13 Appealable development shall be removed and the affected area restored to its previous or natural condition, or that appealable development shall apply additional coastal hazard adaptation strategies (such as those identified through the site-specific hazard report developed for SR Policy 3.3.1, if a report was developed for that site), if the development becomes subject to coastal hazards to the point that:

- a. The District has ordered that the structures are no longer allowed to be occupied due to coastal hazards;

- b. The District has identified that critical services to the site (e.g., utilities, roads) can no longer be maintained; or
- c. The development requires new and/or augmented shoreline protective devices that are not in accordance with policies SR Policy 3.3.4, SR Policy 3.3.6, and SR Policy 3.3.9.

SR Policy 3.3.14 The District and permittees may use fill of coastal waters to facilitate sea level rise adaptation of coastal habitats in San Diego Bay, subject to requirements in Section 30233 of the Coastal Act.

SR Policy 3.3.15 When considering coastal hazard adaptation strategies, non-appealable development shall be located, designed, and constructed so as to minimize substantial adverse environmental impacts and provide for other uses consistent with the Public Trust.

SR Policy 3.4.1. The District shall collaborate with utility providers to ensure that Tidelands utility infrastructure is adequately upgraded, and receives ongoing maintenance and safety evaluations, to meet projected climate conditions and hazards, including but not limited to sea level rise.

EJ Policy 3.2.5 The District shall collaborate with the Portside Community, indigenous communities, and adjacent disadvantaged communities on District climate-related adaptation and resiliency planning to address existing and future environmental issues stemming from climate-related hazards.

4.13.4.4 Project Impacts and Mitigation Measures

Threshold 1: Exacerbate any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, associated with reasonably foreseeable future sea level rise and storm surge?

Impact Analysis

The District's AB 691 report (Appendix I) provides an analysis of the vulnerability of existing assets and natural infrastructure to sea level rise, but it does not address future development. As mentioned above, the sea level rise scenarios used in this PEIR align with those studied in the AB 691 report to provide continuity to the District's sea level rise analysis and planning. Sea level rise can be highly site-specific, and even within a single parcel, flood exposure can vary significantly. Because the exact location of future development consistent with the proposed PMPU is unknown, this PEIR analyzes the potentially exposed acreage of each water and land use designation and qualitatively discusses the potential implications of the flooding under various sea-level rise scenarios, including those with and without 100-year storm surge. Table 4.13-3 shows the acreage of PMPU water and land use designations potentially exposed to flooding at various sea level rise increments, while Table 4.13-4 shows the acreage of water and land use designations exposed to flooding under sea level rise and a 100-year storm. The displayed acreage values are incremental rather than cumulative. For example, under 0.25 meter (0.82 foot) of sea level rise in average conditions, 4.0 acres of Commercial Recreation could be exposed to flooding; under 0.5 meter (1.64 feet) of sea level rise, an additional 4.3 acres would be exposed, for a total of 8.3 acres exposed. Following the tables is a qualitative summary of the sensitivity and adaptive capacity of future development that could occur under the proposed PMPU water and land uses.

The water uses are inherently exposed to sea level rise and coastal flooding, thus explaining their significant existing exposure values. Additional exposure of water uses to higher levels of sea level rise are likely within the modeling margin of error rather than an accurate representation of increased risks. For example, the Conservation/Intertidal water use designation is shown to be highly exposed under the existing exposure and 0.25 meter (0.82 foot) of sea level rise scenarios due to its low-lying location along the shoreline and because areas designated as Conservation/Intertidal are already frequently submerged.

Table 4.13-3. Acreage Potentially Exposed to Sea Level Rise Scenarios Under Average Daily Conditions (i.e., with no storm event)

Water and Land Use Designation	Sea Level Rise Scenarios (meters)

² Correlates to the 2050 5% probability scenario used in the District's 2017 *Sea Level Rise Vulnerability Assessment & Coastal Resiliency Report (Appendix I)*.

³ Correlates to the 2100 RCP 8.5 50% probability scenario.

⁴ Shown for informational purposes only.

Some land uses that are directly in or over water (e.g., Commercial Fishing) are also not well represented in the modeling, which only covers areas landward of the shoreline. For example, piers or docks that are not landward of the shoreline are often not accounted for in the CoSMoS model; thus, these features may show flooding and inundation under future sea level rise scenarios even if in reality, they may not be as impacted. Similarly, those land uses that are right at the water's edge (e.g., Recreation Open Space, Commercial Recreation) with gradual slopes down to the water's edge show some existing exposure due to discrepancies in where the "water" starts between the sea level rise modeling and the land use maps.

As shown in Table 4.13-3, almost all land use designations (except for Commercial Fishing, Marine Sales and Service, Sportfishing, and the Visitor-Serving Marine Terminal) would be exposed to some degree of flooding under the 0.25 meter scenario (approximately 2030) of sea level rise during average daily conditions without a storm event. Additionally, Commercial Recreation, Conservation Open Space, Marine Terminal, Maritime Services and Industrial, and Recreation Open Space land use designations are likely to experience a substantial number of acres exposed to flooding under higher levels of sea level rise, particularly starting at the 1.5 meter scenario (approximately 2100) of sea level rise. As such, sea level rise would expose future development within the proposed PMPU area to inundation and flooding under future sea level rise scenarios during average daily conditions without a storm event.

The extent of flooding under various sea level rise scenarios is shown in Figures 4.13-1 through 4.13-8. The figures do not include a transparent flood layer over the existing areas of water because doing so impedes the ability of the reader to orient themselves relative to established landmarks. The modeling used to produce Table 4.13-3 and Table 4.13-4 do represent existing areas of water as "flooded" under all sea level rise scenarios.

Table 4.13-4 shows the acreage of water and land use designations exposed to flooding under sea level rise and a 100-year storm. During a 100-year storm, additional acres of PMPU water and land use designations are expected to be exposed to temporary flooding compared to average conditions. Therefore, sea level rise combined with a 100-year storm event would cause temporary flooding of future development of the proposed water and land use designations within the proposed PMPU area.

The extent of flooding during future 100-year storms under various sea level rise scenarios is shown in Figures 4.13-9 to 4.13-16.

The tables and maps provide information on exposure to sea level rise and storm surge, while the discussion that follows qualitatively describes sensitivities, adaptive capacity, and consequences of sea level rise and storm surge. Rather than looking at each water and land use designation individually, they have been grouped into broader categories of use types with similar sea level rise and storm surge impacts (i.e., natural habitat, park space, structures, infrastructure, open water, floating structures, underwater structures, fixed structures) to avoid repetition and false precision at this plan level of analysis.

Natural Habitat

Natural habitat includes conservation open space and land reserved for wildlife management and environmental protection.

Sensitivity

Natural habitats face high sensitivity to sea level rise. Inundation and coastal erosion could damage vegetation and the land that supports habitats. Sea water could intrude into freshwater sources, contaminating them. The District's AB 691 Report found that terrestrial habitats, such as salt marsh, beach/dune, and upland habitats, are projected to decline as sea levels rise.

Natural habitats face low sensitivity to temporary inundation from storm surge. Increased flooding could damage habitats; however, coastal habitats are already accustomed to a degree of regular temporary flooding.

Adaptive Capacity

Natural habitats have high adaptive capacity to sea level rise if they are able to keep pace with rising sea levels through natural accretion or by migrating to suitable higher elevations. Accretion is the process of gradual accumulation of additional layers of matter (this capability varies by species and sea level rise scenario). However, urban land uses adjacent to these habitats may hinder how far they can migrate.

Natural habitats have high adaptive capacity to temporary inundation from storm surge. Depending on the type of natural habitat, some areas may be able to absorb water from temporary flooding.

Consequences

Consequences from sea level rise to natural habitats are high. Damage from sea level rise could result in habitat loss, which may be especially significant if it affects endangered species. Intruding saltwater could also affect freshwater sources and push both aquatic and terrestrial habitats farther inland. Sea level rise and erosion may also result in other effects on natural habitats, such as changes in sediment and nutrient availability that further affect the distribution of species. Sea level rise may also result in a loss of public access and recreational opportunities on beaches; as beaches cannot migrate inland easily, they may become narrower or disappear.

Consequences from temporary inundation due to storm surge for natural habitats are low. Temporary flooding could result in periodic loss of access to coastal habitats and public beaches. However, normal operations may resume at recreational beach areas once waters recede.

Park Space

Park space includes Recreation Open Space such as community parks and gardens.

Sensitivity

Park space has high sensitivity to sea level rise. If improperly designed, permanent inundation and coastal erosion would limit access to parks and damage structures and vegetation.

Park space has low sensitivity to temporary inundation from storm surge. If the design does not account for it, periodic flooding may temporarily limit access to a park, but parks can generally reopen relatively easily once floodwaters recede.

Adaptive Capacity

Traditional park space has low adaptive capacity to sea level rise. Parks are not easily movable if permanent inundation occurs. However, more and more parks are being designed to accommodate sea level rise over time with terraced steps down to the waterfront that can gradually flood and landscape features that help prevent storm surge flooding from reaching inland areas.

Park space has high adaptive capacity to temporary inundation from storm surge. Implementation of porous ground materials and high use of natural infrastructure can help mitigate temporary flooding in parks.

Consequences

Consequences of sea level rise effects on park space are high. If improperly designed, inundation and coastal erosion could alter habitat types in parks and result in permanent loss of public access.

Consequences of temporary inundation from storm surge to park spaces are low. If improperly designed, flooding can potentially pose a threat to public safety; however, with proper closures, the public can be directed to other parks that have not been affected during temporary flooding events.

Structures

Structures include buildings for commercial and recreation purposes, such as marine and fishing facilities, visitor centers, hotels, retail, and restaurants.

Sensitivity

Future structures would be highly sensitive to sea level rise. If improperly designed, permanent inundation could result, rendering the structure unusable, and any services provided would potentially be halted.

Future structures would have high sensitivity to temporary flooding from storm surge. If improperly designed, storm-induced flooding could damage structures (e.g., drywall, flooring, electrical outlets), flood their contents, and temporarily limit access to and use of the facility. Parking areas that support structures are not sensitive to temporary flooding as they can return to service after being cleared of debris.

Adaptive Capacity

Future structures have low adaptive capacity to sea level rise. Individual future, new structures can be designed to be elevated during initial construction to avoid flooding due to sea level rise or can be designed to abandon the first floor when it becomes necessary. However, the infrastructure they rely on (e.g., access roads, utilities) may not be as resilient, which would essentially render the structure unusable.

Future structures have high adaptive capacity to temporary inundation from storm surge. Short-term solutions, such as temporary flood barriers and sandbags, can help prevent sea level rise

effects due to flooding. In addition, they can be designed to be elevated above the future floodplain or use wet or dry floodproofing methods.

Consequences

Consequences to structures from sea level rise are high. If improperly designed, loss of structures due to permanent inundation could result in costly replacements if no adaptation takes place. Furthermore, the loss of operations or services housed in a structure inundated by sea level rise may affect District or tenant operations.

The consequences of temporary flooding of structures are dependent on the level of flooding and resulting amount of damage to the structure. In general, short-term inaccessibility may occur but is unlikely to severely impact coastal dependent uses. If not properly addressed after a flood, mold can grow in the damaged structure, which can impact human health.

Infrastructure

Infrastructure includes roadways and land areas designated for critical functions, such as utility infrastructure.

Sensitivity

Infrastructure has a high sensitivity to both sea level rise and temporary inundation from storm surge. If improperly designed, regular or permanent inundation, flooding, and coastal erosion can cause structural damage to roadways. Electrical equipment that is part of utility infrastructure is also highly sensitive if designed without accounting for sea level rise, and even temporary flooding can result in costly damage. Sea level rise can also affect stormwater infrastructure. If improperly designed, inundation can cause drain pumps to continuously run, resulting in potential pump burnout and failure, and cause backup of water in outfalls, resulting in inland flooding at storm drains.

Adaptive Capacity

Adaptive capacity of infrastructure to sea level rise depends on the asset type. Some assets, such as water and wastewater infrastructure, work within a networked system and thus have redundancy if some infrastructure becomes permanently inundated. However, inundation that occurs at an electrical substation could affect many customers that rely on that asset for electricity, and costly adaptation may be required. Likewise, elevating or moving roads to address sea level rise is very costly and requires extensive planning.

Adaptive capacity of infrastructure to temporary inundation from storm surge is similar as it depends on asset type. For example, roadways may have high adaptive capacity to temporary inundation as drivers can take alternative routes for the time being. Likewise, vaults for underground utilities can usually be waterproofed or use submersible equipment. Aboveground utility infrastructure can install floodwalls and pumps to prevent damages during temporary flood events.

Consequences

Consequences of impacts from sea level rise and temporary inundation to infrastructure are high; even temporary flooding could render roadways inaccessible. If major roadways are permanently

inundated or eroded, new routes may need to be created. Infrastructure that serves critical functions may also require protection to avoid significant consequences, such as service outages or safety threats. However, stormwater infrastructure may be more difficult to adapt to sea level rise and may thus require more costly fixes or replacements.

Open Water

Open water includes the open bay and water areas used as navigation corridors. These water use types are not sensitive to sea level rise, so there are no expected consequences.

Floating Structures

Floating structures include marinas and water use types related to anchoring and berthing. These water use types are not sensitive to sea level rise, so there are no expected consequences.

Underwater Structures

Underwater structures include aquaculture, boat launches, and other underwater functions. These water use types are not sensitive to sea level rise, so there are no expected consequences.

Fixed Structures

Fixed structures include small piers and other structures in water that are affixed to land.

Sensitivity

Fixed structures have high sensitivity to sea level rise. If they are not designed to account for sea level rise, they may be subject to damage from erosion and permanent inundation over time. If this occurs, they may need to be raised or removed and replaced to resume full functionality. Even before the structures are overtopped with water, flooding of the bottom of the deck can increase deterioration and interfere with maintenance.

Fixed structures also have high sensitivity to temporary inundation from storm surge if they are not designed for it. They may be overtopped during storms, temporarily eliminating access and use.

Adaptive Capacity

Fixed structures have low adaptive capacity to sea level rise. They may not be easily removed and may have to be rebuilt or elevated to avoid permanent inundation.

Fixed structures have high adaptive capacity to temporary inundation from storm surge. Short-term solutions such as sandbags and temporary flood barriers can be used to protect structures and assets on the fixed structures. In addition, flood walls along the perimeter of the structure with removable barriers at access points can prevent flooding of the structures, though they may still be overtopped and need to be designed to not interfere with routine operations.

Consequences

Sea level rise and temporary flooding impacts on fixed structures are high. These structures may become inaccessible if inundation occurs and may affect coastal dependent uses. Higher water levels may also result in higher vessel positions, potentially increasing difficulty for cargo handling facilities.

Impact Analysis Conclusions

As identified in Section 4.13.4.3 above, the proposed PMPU includes several policies to reduce or avoid risks posed by sea level rise and storm surge, including existing structures, human health, and sensitive resources. These policies require, among other things, permittees to submit site-specific hazards reports to the District that address anticipated coastal hazards over the anticipated life of the development (SR Policy 3.3.1). Other proposed PMPU policies require permittees to site and design development to avoid effects from projected sea level rise considering the anticipated life of the development and, if coastal hazards cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Additionally, to reduce the risks posed to neighboring properties and the natural environment from coastal protection devices, the proposed PMPU requires the prioritization of nature-based adaptation strategies, where feasible (SR Policy 3.3.4). If coastal protection devices are used, they must be designed to minimize adverse effects on local sand supply, recreation, habitat, scenic views, beach width, coastal fill, and effects on coastal access and other Public Trust uses (SR Policy 3.3.10). Sea level rise and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1. Specific design approaches would be reviewed by the District as specific development proposals are submitted for development review.

All future development allowed under the proposed PMPU would be required to demonstrate consistency with the proposed PMPU policies related to sea level rise. Thus, the policies associated with the proposed PMPU would ensure that new development of water and land uses would not exacerbate any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge. Moreover, any flooding would occur irrespective of any future PMPU-related development. As such, the proposed PMPU would not exacerbate the potential for inundation due to projected sea level rise or storm surge, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to exacerbating any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge.

Based on available sea level rise modeling, the closed portions of North Harbor Drive and the Waterfront Destination Park are not projected to be exposed to permanent inundation under

the three analysis thresholds (i.e., 0.25 meter sea level rise by 2030, 0.5 meter sea level rise by 2050, 0.75 meter sea level rise by 2100). For the purposes of disclosure, if not designed to account for sea level rise, the southern portions of this area (e.g., West G Street and adjacent areas) would be inundated if sea levels rose by 1.5 meters, and the entire closed portions of North Harbor Drive and the Waterfront Destination Park would be permanently inundated with 2.0 meters of sea level rise. Permanent inundation would limit access to the park and damage structures and vegetation.

Through 2050 (i.e., 0.5 meter of sea level rise), no temporary inundation of the closed portions of North Harbor Drive and the Waterfront Destination Park is projected under a 100-year storm scenario. By 2100, under a 0.75 meter sea level rise scenario, temporary inundation could affect the southern portions of this area (e.g., West G Street and adjacent areas). For the purposes of disclosure, the entire closed portions of North Harbor Drive and the Waterfront Destination Park would experience flooding during a 100-year storm with 1.5 or more meters of sea level rise. If the design does not account for it, periodic flooding may temporarily limit access to a park, but parks can generally reopen relatively easily once floodwaters recede.

Per the proposed PMPU SR Policy 3.3.2, “the District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, where feasible.” This requirement would ensure that the development of the future Waterfront Destination Park accounts for these sea level rise impacts in its design.

Implementation of Option 1 would not result any additional or more severe impacts related to exacerbating any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge, than buildout of the proposed PMPU without Option 1. Impacts would be less than significant.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to exacerbating any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge.

The continuous park under Option 2 is not projected to be exposed to sea level rise under the analysis thresholds (i.e., 0.25 meter sea level rise by 2030, 0.5 meter sea level rise by 2050, 0.75 meter sea level rise by 2100). If the park is not designed to account for sea level rise, temporary flooding due to a 100-year storm under the 0.75 meter of sea level rise scenario would impact a small piece the northern portion of the park between Hawthorne Street and Grape Street. For the purposes of disclosure, this same portion of the park may experience permanent inundation with 1.5 meters of sea level rise. With 2 meters of sea level rise and a 100-year storm, large sections of the park area would experience temporary flooding. If the design does not account for it, periodic flooding may temporarily limit access to a park, but parks can generally reopen relatively easily once floodwaters recede.

Per the proposed PMPU SR Policy 3.3.2, “the District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the

anticipated life of the development, where feasible.” This requirement would ensure that the development of the future continuous park accounts for these sea level rise impacts in its design.

Implementation of Option 2 would not result any additional or more severe impacts related to exacerbating any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge, than buildout of the proposed PMPU without Option 2. Impacts would be less than significant.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to exacerbating any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge.

The realignment of North Harbor Drive and the 250-foot setback under Option 3 is not projected to be exposed to sea level rise under the analysis thresholds (i.e., 0.25 meter sea level rise by 2030, 0.5 meter sea level rise by 2050, 0.75 meter sea level rise by 2100). If the setback is not designed to account for sea level rise, temporary flooding due to a 100-year storm under the 0.75 meter of sea level rise scenario would affect a small piece the northern portion of the setback between Hawthorne Street and Grape Street. For the purposes of disclosure, this same portion of the setback may experience permanent inundation with 1.5 meters of sea level rise. With 2 meters of sea level rise and a 100-year storm, large sections of the setback area would experience temporary flooding. If the design does not account for it, periodic flooding may temporarily limit access to a park, but parks can generally reopen relatively easily once floodwaters recede.

Per the proposed PMPU SR Policy 3.3.2, “the District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, where feasible.” This requirement will ensure that the realignment of North Harbor Drive and the setback accounts for these sea level rise impacts in its design.

Implementation of Option 3 would not result any additional or more severe impacts related to exacerbating any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge, than buildout of the proposed PMPU without Option 3. Impacts would be less than significant.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to the potential exacerbation of existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association sea level rise and storm surge. Rather, the proposed PMPU policies listed in Section 4.13.4.3 would reduce potential impacts from sea level rise by requiring both the District and future permittees (i.e., project proponents) to address sea level rise using adaptation strategies. For example, SR Policy 3.2.3 requires the District to prepare, and periodically update, a sea level rise adaptation plan that would include several components, including but not limited to, providing recommendations for adapting structures and

facilities, coastal access, etc., and exploring the potential for nature-based sea level rise adaptation strategies. Other proposed PMPU policies require future permittees to complete site-specific coastal hazards analyses and identify adaptation strategies needed to address these hazards.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not exacerbate any existing and/or projected damage to the environment, including existing structures, human health, and sensitive resources, in association with sea level rise and storm surge. Impacts would be less than significant.

Threshold 2: Result in an inconsistency with the applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance adopted for the purpose of avoiding or mitigating an environmental effect from sea level rise?

Impact Analysis

The CCC Sea Level Rise Policy Guidance helps planners address sea level rise risks for their projects. It describes consequences from sea level rise and offers step-by-step guidance on addressing risks for local coastal programs and coastal development permits. The guidance also lists potential adaptation strategies to address sea level rise risks. The guidance is advisory and not a regulatory document or legal standard of review for the actions that the Commission or local jurisdictions may take under the Coastal Act.

The CCC guidance does not directly address port master plans; however, port master plans are similar to Local Coastal Plans (LCPs) since they govern land use and development in the coastal zone. Therefore, the analysis reviews the proposed PMPU's consistency with the CCC's sea level rise guidance for LCPs in Table 4.13-5, as well as the proposed PMPU's consistency with the goals for adaptation strategies in Table 4.13-6.

Table 4.13-5. PMPU Consistency with California Coastal Commission 2018 Sea Level Rise LCP Guidance

Guidance	PMPU Consistency
Determine range of sea level rise projections relevant to LCP planning	Consistent. As described in Section 4.13.4.1, <i>Methodology</i> , the District has drawn from the 2018 Ocean Protection Council's guidance, the CCC's Sea Level Rise Policy Guidance (i.e., the medium-risk aversion scenario), Making California's Coast Resilient to Sea Level Rise: Principles for Aligned State Action (i.e., 3.5 feet of sea level rise by 2050), and input from a technical stakeholder group to develop a range of sea level rise projections for use in planning (see Table 4.13-3). These projections consider multiple time horizons and climate scenarios, including 2030, 2050, and multiple scenarios for 2100, and the results from modeling these projections were used to inform the sea level rise portions of the proposed PMPU.
Identify potential sea level rise impacts in LCP planning	Consistent. As part of the AB 691 Report (Appendix I), the District reviewed the historical rates of sea level rise in the region and developed sea level rise and storm surge inundation maps for each planning district under the various sea level rise scenarios to understand the physical impacts of future sea level rise. This report served as a planning input for the proposed PMPU to identify the potential effects on existing and future uses on District Tidelands from

Guidance	PMPU Consistency
	sea level rise (see Section 3.4.2(C)-II-Adapting to Sea Level Rise in the proposed PMPU).
Assess potential risks from sea level rise to coastal resources and development in LCP planning area	Consistent. The AB 691 Report included an analysis of the exposure, sensitivity, and adaptive capacity of transportation assets, infrastructure, and natural resources to the various sea level rise and storm surge scenarios. The AB 691 Report also analyzed the financial consequences of sea level rise and potential changes in habitat distribution. This report served as a planning input for the proposed PMPU to identify the potential risks to existing and future coastal dependent uses on District Tidelands from sea level rise (see section 3.4.2(C)-II-Adapting to Sea Level Rise in the proposed PMPU).
Identify LCP adaptation strategies to minimize risks	Consistent. Building on the AB 691 Report, the proposed PMPU contains sea level rise policies meant to reduce the anticipated risks of sea level rise impacts (see Section 4.13.4.3 for a complete list).
Draft updated or new LCP for certification with the CCC	Consistent. The proposed PMPU is the update to the current PMP. It will be presented to the CCC for certification after Board consideration.
Implement LCP and monitor and revise as needed	Consistent. The proposed PMPU would be implemented after its certification by the CCC. SR Policy 3.2.3 of the proposed PMPU requires the District to prepare, and periodically update, a sea level rise adaptation plan that would involve several components, including but not limited to, considering the best available science and applicable regional, State, and Federal adaptation planning guidance; providing recommendations for adapting structures and facilities, coastal access, etc.; exploring the potential for nature-based sea level rise adaptation strategies <u>and identify areas that could integrate natural resource protection, enhancement, and restoration solutions while providing appropriate SLR resilience</u> ; and establishing a monitoring protocol and requirements for evaluating sea level rise impacts on Tidelands uses over time.

Chapter 7 of the CCC guidance describes specific adaptation strategies that planners can consider integrating in their planning and development review processes. The CCC is clear that this chapter should not be considered a checklist from which all adaptation strategies need to be used, nor an exhaustive list of all possible adaptation strategies, and that strategies should be selected based on specific vulnerabilities to the project site. Table 4.13-6 shows the proposed PMPU's consistency with adaptation strategy goals listed in the CCC guidance.

Table 4.13-6. PMPU Consistency with California Coastal Commission Sea Level Rise Adaptation Strategy Goals

Goal	PMPU Consistency
Coastal Development and Hazards	
Update land use designations, zoning maps, and ordinances to account for changing hazard zones	The AB 691 Report included an analysis of the exposure, sensitivity, and adaptive capacity of transportation assets, infrastructure, and natural resources to the various sea level rise and storm surge scenarios. The AB 691 Report also analyzed the financial consequences of sea level rise and potential changes in habitat distribution. This report served as a planning input for the proposed PMPU to identify the potential risks to existing and

Goal	PMPU Consistency
Include sea level rise in hazard analyses and policies	<p>future coastal dependent uses on District Tidelands from sea level rise (see Section 3.4.2(C)-II-Adapting to Sea Level Rise in the proposed PMPU).</p> <p>This goal is addressed through:</p> <p>SR Policy 3.3.2: The District shall require permittees to site and design development to avoid impacts from coastal hazards from projected SLR considering the anticipated life of the development, where feasible.</p> <p>a. If coastal hazards cannot be completely avoided, the District shall require planning, designing, and implementation of adaptation strategies, that:</p> <ol style="list-style-type: none"> 1. Address the hazards over the anticipated life of the development; 2. Protect coastal resources, public access, and recreational facilities, and 3. Minimize risks to life and property to the maximum extent feasible.
Plan and locate new development to be safe from hazards, not require protection over its entire lifespan, and be protective of coastal resources	<p>This goal is addressed through:</p> <p>SR Policy 3.3.1: Permittees shall submit a site-specific hazard report to the District using best available science and considers best practices as provided by Federal, State, or regional guidance on coastal resiliency. At a minimum, the site-specific hazard report shall address anticipated coastal hazards over the anticipated life of the development, including, but not limited to inundation; flooding associated with storms of various return periods, including a 100-year storm; wave runup and overtopping; historic and projected future shoreline erosion; groundwater rise; saltwater intrusion; tsunamis; and changes to these hazards over time due to projected SLR at the site. The following requirements apply to the site-specific hazard analysis for the report:</p> <ol style="list-style-type: none"> a. The analysis shall be conducted by a licensed engineer with experience in coastal processes and shall be submitted to the District for its review and approval. b. Using best available science and applicable regional, State, or Federal adaptation planning guidance documents, the analysis shall consider multiple SLR scenarios and projections associated with the anticipated life of the development and, when applicable, identify potential future impacts on on-site natural resources. c. The analysis shall identify threshold SLR amounts that could lead to impacts (e.g., the amount of SLR that could lead to overtopping of the proposed development). d. For development that does not meet the requirements that allow shoreline protective devices subject to SR Policy 3.3.3, SR Policy 3.3.6, or SR Policy 3.3.9, the hazard analysis shall be performed assuming no reliance upon future shoreline protective devices. e. If applicable, the report shall identify the coastal hazards that could trigger implementation of SLR adaptation strategies. If the development cannot fully minimize or avoid the impacts of coastal hazards for the anticipated life of the development, the report shall discuss possible adaptation responses to the hazards to reduce risk as feasible and mitigate impacts on coastal resources. f. As part of Coastal Act approval, the District shall review the report and require the development to implement the recommendations in the report and/or any other siting and design adaptation measures that the District determines are necessary to find that the development is consistent with the requirements of this Plan.

Goal	PMPU Consistency
Incorporate sea level rise adaptation into redevelopment policies	<p>This goal is addressed through the following policies:</p> <p>SR Policy 3.3.2: The District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, where feasible.</p> <p>a. If coastal hazards cannot be completely avoided, the District shall require planning, designing, and implementation of adaptation strategies, that:</p> <ol style="list-style-type: none"> 1. Address the hazards over the anticipated life of the development; 2. Protect coastal resources, public access, and recreational facilities, and 3. Minimize risks to life and property to the maximum extent feasible. <p>SR Policy 3.3.13: Appealable development shall be removed and the affected area restored to its previous or natural condition, or that appealable development shall apply additional coastal hazard adaptation strategies (such as those identified through the site-specific hazard report developed for SR Policy 3.3.1, if a report was developed for that site), if the development becomes subject to coastal hazards to the point that:</p> <p>a. The District has ordered that the structures are no longer allowed to be occupied due to coastal hazards;</p> <p>b. The District has identified that critical services to the site (e.g., utilities, roads) can no longer be maintained; or</p> <p>c. The development requires new and/or augmented shoreline protective devices that are not in accordance with SR Policy 3.3.4, SR Policy 3.3.6, and SR Policy 3.3.9.</p>
Encourage the removal of development that is threatened by sea level rise	<p>This goal is addressed through the following policies:</p> <p>SR Policy 3.3.13: Appealable development shall be removed and the affected area restored to its previous or natural condition, or that appealable development shall apply additional coastal hazard adaptation strategies (such as those identified through the site-specific hazard report developed for SR Policy 3.3.1, if a report was developed for that site), if the development becomes subject to coastal hazards to the point that:</p> <p>a. The District has ordered that the structures are no longer allowed to be occupied due to coastal hazards;</p> <p>b. The District has identified that critical services to the site (e.g., utilities, roads) can no longer be maintained; or</p> <p>c. The development requires new and/or augmented shoreline protective devices that are not in accordance with SR Policy 3.3.4, SR Policy 3.3.6, and SR Policy 3.3.9.</p>
Use “soft” or “natural” solutions as a preferred alternative for protection of existing endangered structures	<p>This goal is addressed through:</p> <p>SR Policy 3.3.4: The District and permittees shall prioritize implementation of nature based adaptation strategies for coastal resiliency as an alternative to the placement of shoreline protective devices, where feasible and applicable.</p>
Allow bluff and shoreline protective devices only to protect existing endangered structures	<p>This goal is addressed by limiting the situations in which shoreline protective devices can be used per:</p> <p>SR Policy 3.3.11: Appealable development that does not qualify for protection per SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9 shall avoid the need for shoreline protective devices to avoid coastal hazards</p>

Goal	PMPU Consistency
Require special considerations for critical infrastructure and facilities	<p>over the anticipated life of the development that may result from projected sea level rise.</p> <p>This goal is addressed through:</p> <p>SR Policy 3.3.3: Permittees of coastal-dependent port structures and supportive coastal related development that are essential to maritime functions, public safety, and security may implement shoreline protective devices or other adaptation strategies for the protection from, or accommodation of, coastal hazards.</p> <p>SR Policy 3.4.1: <u>The District shall collaborate with utility providers to ensure that Tidelands utility infrastructure is adequately upgraded, and receives ongoing maintenance and safety evaluations, to meet projected climate conditions and hazards, including but not limited to sea level rise.</u></p>
Protect transportation infrastructure	<p>Like all future projects, transportation projects will be subject to:</p> <p>SR Policy 3.3.2: The District shall require permittees to site and design development to avoid impacts from coastal hazards from projected SLR considering the anticipated life of the development, where feasible.</p> <p>a. If coastal hazards cannot be completely avoided, the District shall require planning, designing, and implementation of adaptation strategies, that:</p> <ol style="list-style-type: none"> 1. Address the hazards over the anticipated life of the development; 2. Protect coastal resources, public access, and recreational facilities, and 3. Minimize risks to life and property to the maximum extent feasible.
Public Access and Recreation	
Maximize public access and recreational use by protecting beaches and other coastal areas	<p>This goal is addressed through the following policies:</p> <p>SR Policy 3.3.8: To improve coastal access, the District encourages incorporation of step-down areas into an existing shoreline protective device that abuts a sandy beach.</p> <p>SR Policy 3.3.6: The District and permittees may implement shoreline protective devices or other adaptation strategies for protection from, or accommodation of, coastal hazards for existing landside accessways and recreational facilities where no adjacent in-kind alternative landside accessway or recreational facility exists on Tidelands.</p> <p>SR Policy 3.3.7: If an existing landside accessway or recreational facility is deemed unsafe by the District because it has become permanently degraded by coastal hazards, the landside accessway or recreational facility shall, <u>to the extent feasible</u>, be retrofitted or relocated by the District or permittee to the extent feasible, such that safe continuous coastal access will be maintained.</p> <p>SR Policy 3.3.10: When constructing, reconstructing, expanding, or replacing a shoreline protective device (per SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9), the District shall require it be designed to:</p> <ol style="list-style-type: none"> a. Minimize adverse impacts on local shoreline sand supply; b. Minimize impacts on recreation, habitat, scenic views, beach width, and other coastal resources; c. Encourage inland expansion of protective devices rather than further fill of coastal waters to minimize resource impacts; and d. Not substantially impair coastal access or other Public Trust uses.

Goal	PMPU Consistency
Protect lower cost visitor and recreational facilities and accessways	<p>This goal is addressed through the following policies:</p> <p>SR Policy 3.3.5: The District shall require new landside accessways and recreational facilities be sited and designed to avoid impacts from coastal hazards and minimize environmental impacts while maximizing coastal access.</p> <p>SR Policy 3.3.7: If an existing landside accessway or recreational facility is deemed unsafe by the District because it has become permanently degraded by coastal hazards, the landside accessway or recreational facility shall, <u>to the extent feasible</u>, be retrofitted or relocated by the District or permittee to the extent feasible, such that safe continuous coastal access will be maintained.</p>
Foster efforts to better understand impacts of sea level rise	<p>This goal is addressed through:</p> <p>SR Policy 3.2.1: The District shall participate in research <u>and continue to conduct monitoring</u> that supplements its knowledge of projected coastal climate impacts and potential strategies to adapt to these impacts.</p>
Coastal Habitats, ESHA, and Wetlands	
Protect, enhance, and restore sensitive habitats	<p>This goal is addressed through:</p> <p>ECO Objective 1.1: Enhance, conserve, restore, and maintain the biodiversity in Tideland areas.</p> <p>ECO Policy 1.1.1: The District shall maintain marine resources in alignment with Section 30230 of the California Coastal Act.</p> <p>ECO Policy 1.1.2: The District shall prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or Federally listed coastal species.</p> <p>ECO Policy 1.1.13: The District shall identify locations throughout the Bay that could support habitat enhancement, restoration, creation, and protection to benefit sensitive habitats and State and federally listed species. After specific locations are identified, the District shall:</p> <ol style="list-style-type: none"> Explore opportunities for specific restoration, creation, enhancement, and mitigation banking projects in these areas; and Coordinate with resource agencies and regulatory agencies to permit projects that provide multiple benefits to Tideland areas. <p>ECO Policy 1.1.14: Strive to achieve a net increase of wetland habitat acreage from baseline conditions throughout the Bay <u>from certification of this Plan</u>.</p>
Avoid significant disruption to habitats	<p>This goal is addressed through:</p> <p>ECO Policy 1.1.10: Development above the water or adjacent to sensitive habitat areas should use ecologically sensitive lighting that is shielded and directed away from the water or sensitive habitat areas, sensor activated, and of the lowest possible color temperature that also meets public safety requirements.</p> <p>ECO Policy 1.1.11: The District shall encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems, and to reduce stormwater pollution to the Bay.</p>
Avoid significant impacts on habitats from adjacent development	<p>This goal is addressed through:</p> <p>ECO Policy 1.1.3: Future development adjacent to conservation areas and other sensitive habitats shall:</p> <ol style="list-style-type: none"> Be coordinated, sited, and designed to avoid impacts where feasible or where legally required; if avoiding impacts is not feasible, or avoidance

Goal	PMPU Consistency
	<p>is not legally required, mitigate impacts in the following order of preference:</p> <ol style="list-style-type: none"> 1. On-site; 2. In a mitigation bank; 3. In the same ecoregion with the Bay; 4. Elsewhere in the Bay; or 5. In the same watershed of the Coastal Zone; <p>b. Require biological monitoring as determined by the District and/or the wildlife agencies; and</p> <p>c. When affecting disturbed sensitive habitat areas, restoration or enhancement must occur to the greatest extent feasible.</p> <p>ECO Policy 1.1.5: Landside development shall establish and maintain ecological buffers of 100 feet between the landside development and a saltmarsh wetland to preserve and protect the wetland habitat for the anticipated life of the development. The precise width of the buffer is to be based on the location, type of habitat. Exceptions to the width of ecological buffers area as follows:</p> <ol style="list-style-type: none"> a. A reduced buffer to a minimum of 50 feet may be allowed pursuant to a site-specific analysis in coordination with the wildlife agencies. The site-specific analysis may include evaluation of current habitat that is degraded, nonfunctioning, of poor quality; or located immediately adjacent to existing development; or b. An ecological buffer shall not be required for wetland areas in an urbanized area if such buffer would cause displacement or removal of existing development.
Manage sediment in ways that benefit habitats	<p>This goal is addressed through:</p> <p>ECO Policy 1.1.12: Science-based management practices shall be used on Tidelands to guide water, sediment, and natural resource decisions.</p>
Incorporate sea level rise into habitat management actions	<p>This goal is addressed through:</p> <p>ECO Policy 1.1.18: <u>Coastal flooding</u> Adaptation strategies or other natural resource management practices shall be implemented to protect coastal habitats and ecosystem function under a range of future sea level rise and climate change scenarios.</p>
Agricultural Resources	
Protect the maximum amount of prime agricultural land	Not applicable. The District has no prime agricultural land.
Limit conversion of lands suitable for agriculture to nonagricultural uses	Under Coastal Act, aquaculture is considered agriculture and under the PMPU, the district is not converting aquaculture land uses to non-aquaculture land uses.
Minimize impacts on water quality that could result from agricultural practices	<p>This goal is addressed through:</p> <p>MM-BIO-6: Develop a Shellfish Aquaculture Mitigation Program in Coordination with the Appropriate Resource Agencies and the District to Minimize the Potential for Degraded Essential Fish Habitat and Potential Benthic Impacts</p>
Promote water conservation efforts	<p>This goal is addressed through:</p> <p>SR Policy 3.1.7: Development shall include water conservation strategies to save water and energy on-site, where feasible.</p>

Goal	PMPU Consistency
Water Quality and Supply	
Control runoff and stormwater pollution	<p>This goal is addressed through:</p> <p>ECO Policy 2.3.1: Owners and operators of stormwater conveyances on Tidelands shall comply with the municipal stormwater permit (MS4) and other legal requirements to minimize pollution impacts in the Bay.</p> <p>ECO Policy 2.3.2: Educational information shall be provided to the public and tenants regarding natural resources protection, runoff or increased runoff flows, and pollution prevention measures to minimize or reduce impacts on water and sediment quality.</p> <p>ECO Policy 2.3.4: Permittees shall implement measures to prevent pollution impacts and adverse impacts from runoff flows from all development and maintenance activities.</p>
Minimize adverse effects of wastewater discharges and entrainment	<p>This goal is addressed through:</p> <p>ECO Policy 2.1.9: Sewerage pump out facilities shall be accessible and available for use by the public either in fixed locations or through a mobile pump out service.</p>
Prevent depletion of groundwater supplies from saltwater intrusion	<p>This goal is addressed through:</p> <p>SR Policy 3.3.1: Permittees shall submit a site-specific hazard report to the District using best available science and considers best practices as provided by Federal, State, or regional guidance on coastal resiliency. At a minimum, the site-specific hazard report shall address anticipated coastal hazards over the anticipated life of the development, including, but not limited to inundation; flooding associated with storms of various return periods, including a 100-year storm; wave runup and overtopping; historic and projected future shoreline erosion; groundwater rise; saltwater intrusion; tsunamis; and changes to these hazards over time due to projected SLR at the site.</p> <p>For more discussions related to groundwater within the proposed PMPU area, see Section 4.8, <i>Hydrology and Water Quality</i>, and Section 4.15, <i>Utilities and Service Systems</i>.</p>
Improve long-term water quality through research	<p>This goal is addressed through:</p> <p>ECO Policy 2.1.5: The District shall continue to conduct, or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay.</p>
Archaeological and Paleontological Resources	
Protect archaeological and paleontological resources	<p>As discussed in Sections 4.4, <i>Cultural Resources</i>, and 4.5, <i>Geology and Soils</i>, the proposed PMPU area may contain archaeological or paleontological resources, respectively. However, appropriate mitigation measures would be identified during site-specific review of future development to reduce potential impacts on these resources.</p>
Scenic and Visual Resources	
Protect views to and along the ocean and scenic coastal areas	<p>This goal is addressed through:</p> <p>SR Policy 3.3.10: When constructing, reconstructing, expanding, or replacing a shoreline protective device (per SR Policy 3.3.3, SR Policy 3.3.6, and SR Policy 3.3.9), the District shall require it be designed to:</p> <ol style="list-style-type: none"> Minimize adverse impacts on local shoreline sand supply; Minimize impacts on recreation, habitat, scenic views, beach width, and other coastal resources;

Goal	PMPU Consistency
	<p>c. Encourage inland expansion of protective devices rather than further fill of coastal waters to minimize resource impacts; and</p> <p>d. Not substantially impair coastal access or other Public Trust uses.</p> <p>WLU Objective 2.2: Implement new development in a manner that blends with and enhances the surrounding character and qualities.</p> <p>WLU Policy 3.2.1: Visual access locations (scenic vista areas, view corridor extensions, Window to the Bay, and walkways) shall be maintained and protected, as shown on the Chapter 5, Planning Districts: Coastal Access Views and Pathways Maps.</p> <p>WLU Policy 3.2.2: Permittees of development shall preserve visual access through scenic vista areas, view corridor extensions, and walkways, in accordance with:</p> <p>a. Chapter 4, Baywide Development Standards;</p> <p>b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict; and</p> <p>c. Chapter 5, Planning Districts applicable Coastal Access Views and Pathways Maps.</p>

Future development within the proposed PMPU area would require a CDP. If sea level rise is a hazard to a proposed project, then it must be included in the project analysis to obtain a CDP. According to Chapter 6 of the CCC Sea Level Rise Policy Guidance, development projects should go through the following steps to address sea level rise risks:

1. Determine the project's expected/proposed life.
2. Use these to pull the relevant sea level rise projections to be used in impact analyses.
3. Conduct a sea level rise impact analysis, looking at factors such as structural and geologic stability, erosion amount, flooding and inundation risks, and tipping points for sea level rise impacts specific to the project site.
4. Analyze impacts on coastal resources for current conditions and changes due to sea level rise and related impacts. These resources may include public access and recreation, water quality and surface and groundwater, coastal habitats, agricultural resources, natural landforms, and scenic resources. Overlay coastal resources with hazards to establish areas suitable for development and create site maps.
5. Conduct analysis of the proposed project and alternatives. Provide values for the amount of sea level rise used and its impacts on the proposed project and alternatives, identify current and future adaptation strategies, and identify avoidance and hazard minimization efforts through site maps.

Table 4.13-7 shows how the proposed PMPU's policies will require future development to be consistent with the CDP steps in the CCC sea level rise guidance.

Table 4.13-7. PMPU Consistency with California Coastal Commission Sea Level Rise CDP Guidance

Guidance	Consistency
California Coastal Commission Sea-Level Rise Policy Guidance – Addressing Sea Level Rise in Coastal Development Permits	
Establish the sea level rise range for the proposed project.	<p>Consistent. The proposed PMPU SR Policy 3.3.1 directly requires future development to address this step by requiring that “Permittees shall submit a site-specific hazard report to the District using best available science and considers best practices as provided by Federal, State, or regional guidance on coastal resiliency...”</p> <p>The following requirements apply to the site-specific hazard analysis for the report:</p> <p>b. Using best available science and applicable regional, State, or Federal adaptation planning guidance documents, the analysis shall consider multiple sea level rise scenarios and projections associated with the anticipated life of the development and, when applicable, identify potential future impacts on on-site natural resources...”</p>
Determine how sea level rise impacts may constrain the project site.	<p>Consistent. The proposed PMPU SR Policy 3.3.1 directly requires future development to address this step by requiring that “Permittees shall submit a site-specific hazard report to the District using best available science and considers best practices as provided by Federal, State, or regional guidance on coastal resiliency.</p> <p>At a minimum, the site-specific hazard report shall address anticipated coastal hazards over the anticipated life of the development, including, but not limited to inundation; flooding associated with storms of various return periods, including a 100-year storm; wave runup and overtopping; historic and projected future shoreline erosion; groundwater rise; saltwater intrusion; tsunamis; and changes to these hazards over time due to projected sea level rise at the site.”</p>
Determine how the project may impact coastal resources over time, considering sea level rise.	<p>Consistent. The proposed PMPU SR Policy 3.3.1 directly requires future development to address this step by requiring that “Permittees shall submit a site-specific hazard report to the District using best available science and considers best practices as provided by Federal, State, or regional guidance on coastal resiliency...”</p> <p>The following requirements apply to the site-specific hazard analysis for the report:</p> <p>a. The analysis shall be conducted by a licensed engineer with experience in coastal processes and shall be submitted to the District for its review and approval.</p> <p>b. Using best available science and applicable regional, State, or Federal adaptation planning guidance documents, the analysis shall consider multiple sea level rise scenarios and projections associated with the anticipated life of the development and, when applicable, identify potential future impacts on on-site natural resources.</p> <p>c. The analysis shall identify threshold SLR amounts that could lead to impacts (e.g., the amount of SLR that could lead to overtopping of the proposed development).</p> <p>d. For development that does not meet the requirements that allow shoreline protective devices subject to SR Policy 3.3.3, SR Policy 3.3.6, or SR Policy 3.3.9, the hazard analysis shall be performed assuming no reliance upon future shoreline protective devices.</p> <p>e. If applicable, the report shall identify the coastal hazards that could trigger implementation of sea level rise adaptation strategies. If the</p>

Guidance	Consistency
	<p>development cannot fully minimize or avoid the impacts of coastal hazards for the anticipated life of the development, the report shall discuss possible adaptation responses to the hazards to reduce risk as feasible and mitigate impacts on coastal resources.”</p> <p>In addition, SR Policy 3.3.2 states that “the District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, where feasible.</p> <p>a. If coastal hazards cannot be completely avoided, the District shall require planning, designing, and implementation of adaptation strategies, that:</p> <ol style="list-style-type: none"> 1. Address the anticipated life of the development; 2. Protect coastal resources, public access, and recreational facilities, and 3. Minimize risks to life and property to the maximum extent feasible.”
Identify project alternatives to both avoid resource impacts and minimize risks to the project.	<p>Consistent. SR Policy 3.3.2 directly requires that future development address this step by stating that “the District shall require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, where feasible.</p> <p>a. If coastal hazards cannot be completely avoided, the District shall require planning, designing, and implementation of adaptation strategies, that:</p> <ol style="list-style-type: none"> 1. Address the hazards over the anticipated life of the development; 2. Protect coastal resources, public access, and recreational facilities, and 3. Minimize risks to life and property to the maximum extent feasible.”
Finalize project design and submit permit application.	<p>Consistent. SR Policy 3.3.1 (f) directly requires that future development address this step by stating that “as part of Coastal Act approval, the District shall review the report and require the development to implement the recommendations in the report and/or any other siting and design adaptation measures that the District determines are necessary to find that the development is consistent with the requirements of this Plan.”</p>

As shown in the tables and analysis above, the proposed PMPU is consistent with the CCC’s sea level rise policy guidance. Therefore, implementation of the proposed PMPU, which would entail future projects that are proposed consistent with its policies and development standards, would not result in an inconsistency with the sea level rise guidance of the CCC. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses.

Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to consistency with the applicable policies of the CCC 2018 Sea Level Rise Policy Guidance.

The development that could occur under Option 1 would have to be consistent with the proposed PMPU sea level rise policies, which are consistent with the CCC Sea Level Rise Policy Guidance adaptation strategy goals and CDP guidance. Therefore, future development under Option 1 would be consistent with the applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance. Impacts would be less than significant, and implementation of Option 1 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreational Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to consistency with the applicable policies of the CCC 2018 Sea Level Rise Policy Guidance.

The development that could occur under Option 2 would have to be consistent with the proposed PMPU sea level rise policies, which are consistent with the CCC Sea Level Rise Policy Guidance adaptation strategy goals and CDP guidance. Therefore, future development under Option 2 would be consistent with the sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance. Impacts would be less than significant, and implementation of Option 2 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU would result in a less-than-significant impact related to consistency with the applicable policies of the CCC 2018 Sea Level Rise Policy Guidance.

The development that could occur under Option 3 would have to be consistent with the proposed PMPU sea level rise policies, which are consistent with the CCC Sea Level Rise Policy Guidance adaptation strategy goals and CDP guidance. Therefore, future development under Option 3 would be consistent with the applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance. Impacts would be less than significant, and implementation of Option 3 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to potential inconsistencies with the applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance adopted for the purpose of avoiding or mitigating an environmental effect from sea level rise. As discussed under Threshold 1, the proposed PMPU policies listed in Section 4.13.4.3 would require both the District and future permittees (i.e., project proponents) to address sea level rise using adaptation strategies. For example, SR Policy 3.2.3 requires the District to prepare, and periodically update, a sea level rise adaptation plan that includes several components, including but not limited to: considers the best available science and applicable regional, State, and Federal adaptation planning guidance; provides recommendations for adapting structures and facilities, coastal access, etc.; and explores the potential for nature-based sea level rise adaptation strategies. By periodically updating the adaptation plan, the District would ensure that the latest sea level rise projections are being used to identify and mitigate potential risks to coastal resources.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in an inconsistency with the applicable policies of the CCC 2018 Sea Level Rise Policy Guidance adopted for the purpose of avoiding or mitigating an environmental effect from sea level rise. Impacts would be less than significant.

4.13.5 Cumulative Impact Analysis

A cumulatively considerable contribution to cumulative sea level rise impact would occur if the proposed PMPU would exacerbate projected future conditions associated with sea level rise when combined with the past, present, and probable future plans and programs identified in Table 2-2 in Chapter 2, *Environmental Setting*. A cumulatively considerable contribution to cumulative sea level rise impact would also occur if the proposed PMPU, when evaluated within the context of past, present, and probable future plans and programs, would be inconsistent with the applicable sea level rise policies of the CCC, resulting in a cumulatively considerable physical impact on the environment.

4.13.5.1 Geographic Scope

The geographic scope of analysis for cumulative sea level rise impacts includes the area encompassed by the past, present, and probable future plans and programs identified in Table 2-2 that are situated along the entirety of the bayfront.

4.13.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Projected sea level rise is expected to increase the number of areas that experience coastal flooding along San Diego Bay. Coastal and low-lying areas are particularly vulnerable to future sea level rise, especially in combination with future storm events and coastal flooding. As discussed above, the District prepared the *Sea Level Rise Vulnerability Assessment and Coastal Resiliency Report*, which was presented to the Board of Port Commissioners in June 2019 (District 2019). This document provides cumulative projections (Table 4.13-1 above), which take into account global GHG emission projections.

Several plans, policies, guidance, and regulations related to sea level rise have been adopted and/or passed at the State level, the most notable for the District being the CCC Sea Level Rise Policy Guidance for plans and development within the District's jurisdiction. Development associated with present and probable future plans and programs within the geographic scope are all within the Coastal Zone, therefore they would be required to demonstrate consistency with the CCC Sea Level Rise Policy Guidance during project-specific environmental review. This guidance provides a framework for addressing sea level rise in LCPs and CDPs for addressing sea level rise in the Coastal Zone. Because the past, present, and probable future plans and programs within the geographic scope would be required to comply with all applicable State plans, policies, and regulations related to sea level rise (e.g., AB 691, AB 2516, California Coastal Act), cumulative effects related to sea level rise would not be significant.

4.13.5.3 Project Contribution

As discussed under Threshold 1, future development allowed under the proposed PMPU would not exacerbate any existing and/or projected damage to the environment, including existing structures, sensitive resources, and human health, due to sea level rise. Given to its coastal location, the proposed PMPU area is vulnerable to future sea level rise and storm surge events. When 100-year floodflows coincide with high tides, on top of future sea level rise, the risk of flooding of future development within the proposed PMPU area increases. As shown in Table 4.13-3, almost all land use designations,

and the future development that could occur within them, would be exposed to some degree of flooding under 0.25 meter of sea level rise during average daily conditions (approximately 2030). Additionally, Commercial Recreation, Institutional/Roadway, Marine Terminal, and Recreation Open Space land use designations and associated future development are likely to experience a substantial number of acres exposed to flooding under higher levels of sea level rise, particularly starting at 0.75 meter of sea level rise (approximately 2100). These effects are worsened when combined with a 100-year storm event, as shown in Table 4.13-4. Future development and any associated new shoreline protective devices within these land use designations could increase the risk of flooding and erosion on neighboring properties and adjacent natural habitats. Coastal protection measures deflect wave energy to adjacent areas rather than dampen it. Additionally, armored shorelines generally lack the rich structural complexity necessary for coastal ecosystems to establish themselves.

The proposed PMPU includes several policies intended to reduce or avoid risks posed by sea level rise and storm surge through the use of adaptation strategies. These policies require, among other things, the District to prepare, and periodically update, a sea level rise adaptation plan (SR Policy 3.2.3) and permittees (i.e., project proponents) to submit a site-specific hazards report to the District that addresses anticipated coastal hazards over the anticipated life of the development (SR Policy 3.3.1). Other policies require permittees to site and design development to avoid impacts from coastal hazards from projected sea level rise considering the anticipated life of the development, and, if coastal hazard cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Nature-based solutions shall be prioritized as an alternative to the placement of shoreline protective devices when considering adaptation strategies for development (see SR Policy 3.3.4). If shoreline protective devices are used, they must be designed to minimize adverse impacts on local sand supply, recreation, habitat, scenic views, beach width, coastal fill, and impacts on coastal access and other Public Trust uses (SR Policy 3.3.10). Sea level rise and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1. Specific design approaches would be reviewed by the District as specific development proposals are submitted for development review. All future development allowed under the proposed PMPU would be required to demonstrate consistency with the proposed PMPU policies related to sea level rise. Moreover, any flooding would occur irrespective of any future PMPU-related development. As such, the proposed PMPU would not exacerbate the potential for inundation due to projected sea level rise or storm surge.

As discussed under Threshold 2 and shown in Tables 4.13-5, 4.13-6, and 4.13-7 the proposed PMPU would be consistent with the sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance. Therefore, the proposed PMPU would not be inconsistent with the applicable sea level rise policies of the CCC 2018 Sea Level Rise Policy Guidance. Notably, a significant cumulative sea level rise effect from past, present, and probable future plans and programs within the geographic scope for cumulative sea level rise impacts does not exist. Therefore, the proposed PMPU’s contribution to cumulative sea level rise impacts would not be cumulatively considerable.

4.13.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU’s incremental contribution to sea level rise impacts would not be cumulatively considerable.

This page was intentionally left blank.

Section 4.14

Transportation, Circulation, and Mobility

4.14.1 Overview

This section describes the existing conditions and laws and regulations related to transportation, circulation, and mobility, followed by an analysis of the proposed Port Master Plan Update's (PMPU's) potential to (1) conflict with a program, plan, ordinance, or policy addressing the circulation system; (2) conflict or be inconsistent with California Environmental Quality Act (CEQA) Guidelines Section 15064.3, subdivision (b); (3) substantially increase hazards because of a geometric design feature or incompatible uses; or (4) result in inadequate emergency access.

The information provided in this section is summarized from the *Port Master Plan Update Transportation Impact Study (TIS) Vehicle Miles Traveled – SB 743 Analysis* prepared by Chen Ryan Associates in February 2020 (Appendix D). For a discussion and analysis of parking as it relates to public access pursuant to the California Coastal Act, please see Section 4.9, *Land Use and Planning*. In addition, the proposed PMPU does not propose any changes to industrial land uses or marine terminal uses within the PMPU area and does not propose any increase in related operations. Therefore, transportation impacts associated with industrial land uses and cargo operations related to marine terminals are not analyzed in this Draft Program Environmental Impact Report (PEIR). For an analysis of transportation-related impacts of growth at the Tenth Avenue Marine Terminal (TAMT), please see the *TAMT Redevelopment Plan and Demolition and Initial Rail Component Final Environmental Impact Report* (TAMT EIR, December 2016).

Table 4.14-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.14.4.4, *Project Impacts and Mitigation Measures*.

Table 4.14-1. Summary of Significant Transportation Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning Districts	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-TRA-1: Increase in Total VMT Associated with Future Development Consistent with the Proposed PMPU	PD1, PD2, PD3, PD8, PD9, and PD10	MM-TRA-1: Establish a <u>Vehicle Miles Traveled (VMT) Infrastructure Mitigation</u> Program MM-TRA-2: <u>Project Level Analysis and Mitigation</u> MM-TRA-3: Implement a Transportation Demand	Significant and Unavoidable	Implementation of MM-TRA-1 , MM-TRA-2 , and MM-TRA-3 would reduce total VMT; however, because the timing and location of future development and infrastructure is unknown a reduction below a level of significance cannot be guaranteed.

Summary of Significant Impact(s)	Applicable Planning Districts	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
		Management Plan		
Impact-TRA-2: Increase in VMT/Employee Associated with Future Development Consistent with the Proposed PMPU	PD2	MM-TRA-1, MM-TRA-2, and MM-TRA-3 (described above)	Significant and Unavoidable	Implementation of MM-TRA-1, MM-TRA-2, and MM-TRA-3 would reduce VMT/Employee; however, because the timing and location of future development and infrastructure is unknown a reduction below a level of significance cannot be guaranteed.
Impact-TRA-3: Increase in VMT Due to Transportation Infrastructure Improvements Associated with the Proposed PMPU	PD1, PD2, and PD3; PD8, PD9, PD10	MM-TRA-1, MM-TRA-2, and MM-TRA-3 (described above)	Significant and Unavoidable	Implementation of MM-TRA-1, MM-TRA-2, and MM-TRA-3 would reduce VMT due to transportation infrastructure improvements; however, because the timing and location of future development and infrastructure is unknown a reduction below a level of significance cannot be guaranteed.
Impact-C-TRA-1: Cumulative Increase in Total VMT	PD1, PD2, PD3, PD8, PD9, and PD10	MM-TRA-1, MM-TRA-2, and MM-TRA-3 (described above)	Significant and Unavoidable	Implementation of MM-TRA-1, MM-TRA-2, and MM-TRA-3 would reduce cumulative total VMT; however, because the timing and location of future development and infrastructure is unknown, a reduction to a level below significance cannot be guaranteed.
Impact-C-TRA-2: Cumulative Increase in VMT/Employee	PD2	MM-TRA-1, MM-TRA-2, and MM-TRA-3 (described above)	Significant and Unavoidable	Implementation of MM-TRA-1, MM-TRA-2, and MM-TRA-3 would reduce cumulative VMT/Employee;

Summary of Significant Impact(s)	Applicable Planning Districts	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
				however, because the timing and location of future development and infrastructure is unknown, a reduction below a level of significance cannot be guaranteed.
Impact-C-TRA-3: Cumulative Increase in VMT Due to Transportation Infrastructure Improvements	PD1 <u>PD2, and PD3</u> 2	MM-TRA-1, MM-TRA-2, and MM-TRA-3 (described above)	Significant and Unavoidable	Implementation of MM-TRA-1, MM-TRA-2, and MM-TRA-3 would reduce VMT due to cumulative transportation infrastructure improvements; however, because the timing and location of future development and infrastructure is unknown a reduction below a level of significance cannot be guaranteed.

4.14.2 Existing Conditions

Regional and local roadways, public transit systems, and bicycle/pedestrian facilities surrounding and within the proposed PMPU area are maintained by the respective municipal governments, including the San Diego Unified Port District (District), City of San Diego, City of Coronado, and City of Imperial Beach. Freeway facilities, which are outside of the proposed PMPU area, are within the jurisdiction of the California Department of Transportation (Caltrans). The following includes a detailed description of all transportation facilities in and around the proposed PMPU area.

4.14.2.1 Existing Transportation Conditions

Regional Facilities

Regional access to the proposed PMPU area is provided by the interstate and state freeway systems, which are under Caltrans' jurisdiction. The following freeways provide access to the planning area.

- Interstate (I)-5 provides both regional and national transit in a north-to-south route along the west coast, extending from the United States/Mexico border to the Washington State border with Canada. I-5 runs adjacent, or in proximity, to Planning District (PD) 2, PD3, PD4, and PD7.

- State Route (SR)-75 connects Downtown San Diego from I-5 to Coronado via the San Diego-Coronado Bay Bridge, and continues through Coronado and down the Silver Strand, terminating at the city limits of Imperial Beach. SR-75 provides access to PD4, PD8, PD9, and PD10.
- SR-15 begins just southeast of PD4 and travels in a northward direction. The southern terminus of SR-15 is at S. 32nd Street, which provides direct access to E. Harbor Drive. E. Harbor Drive serves as primary access to PD4.

Local Facilities

Roadways

There are several main roadways that traverse through the proposed PMPU area and provide access to the waterfront and adjacent Tidelands. Table 4.14-2 identifies each of the main roadways providing access through the planning area.

Table 4.14-2. Local Roadways

Roadway	Direction
PD1	
Harbor Drive	north-south
Shelter Island Drive	north-south
Nimitz Boulevard	east-west
PD2	
Harbor Island Drive	north -south
Harbor Drive	north-south
PD3	
Pacific Highway	north-south
PD4	
Harbor Drive	north-south
PD8	
Seacoast Drive	north-south
PD9	
Silver Strand Boulevard (SR-75)	north-south
PD10	
Silver Strand Boulevard (SR-75)	north-south

Public Transportation Services

Regional public transportation serving all or portions of the proposed PMPU area includes the COASTER commuter train, the San Diego Trolley, and local bus lines. Planned public transportation services are based on the San Diego Association of Governments' (SANDAG) adopted *San Diego Forward: The Regional Plan*, which identifies planned transit improvements that enhance access in the San Diego Downtown area and surrounding communities through the year 2050.

COASTER Commuter Train

The North County Transit District (NCTD) owns and operates the COASTER commuter train, which travels over a 41-mile route with eight stations along the San Diego coastline, extending between Oceanside and Downtown San Diego. The COASTER operates more than 125 trains each week, carrying about 4,915 passengers each weekday, totaling 1.5 million trips annually (NCTD 2019). The closest COASTER station to the proposed PMPU area is at the Santa Fe Depot, which is adjacent to PD3 to the east.

Amtrak Pacific Surfliner

Amtrak provides passenger rail service from San Diego to several destinations throughout the state and country. The main route serving San Diego is the Pacific Surfliner, which connects most of the major cities along California's coast, from San Diego in the south to San Luis Obispo in the north. The Pacific Surfliner served 2,654,800 riders in 2018 (RPA 2019). Amtrak currently accesses the Downtown San Diego area via Santa Fe Depot, which is located on the northwest corner of the Broadway and Kettner Boulevard intersection, adjacent and east of PD3. Amtrak riders can transfer to the San Diego Trolley system and bus routes from the Santa Fe Depot stop.

San Diego Trolley

The San Diego Trolley is a wholly owned subsidiary of the Metropolitan Transit System (MTS) and serves over 32 million annual passengers, with an average weekday ridership of 97,401 (MTS 2013). The San Diego Trolley system consists of four lines, including the UC San Diego Blue, Orange, Sycuan Green, and SDG&E Silver Lines, with a total of 53 stations and 54.3 miles of rail (MTS 2016). Each train consists of between one and four cars depending on need. Each car can hold between 96 and 104 passengers during commute times and up to 200 passengers during special events (referred to as *crush load*). The highest estimates of passengers during special events assume all passengers are standing up with very little space between them. Assuming a four-car train, this equates to between 384 and 416 passengers during commute times, and up to 800 passengers during special events.

Blue Line

The MTS Blue Line was the first light-rail line constructed in San Diego and was the start of the MTS Trolley System. In operation since 1981, the Blue Line began with service between Downtown San Diego and the San Ysidro Port-of-Entry. Blue Line service has been expanded four times since its inception and now provides service between the San Ysidro Port-of-Entry to the south and the Old Town Transit Center to the north. In total, the Blue Line currently services 15.4 miles and includes 18 stations. However, construction is currently under way to extend the Blue Line north to the University City community, also referred to as the Mid-Coast Corridor, and will serve major activity centers such as the University of California San Diego and Westfield UTC. Service is anticipated to begin in 2021 (SANDAG 2018).

The Blue Line currently runs at 7- to 8-minute headways during peak periods and 15-minute headways in off-peak periods. The Blue Line America Plaza stop is adjacent to (i.e., within 0.25 mile) of PD3; the 12th and Imperial stop, the Barrio Logan stop, and the Harborside stop are adjacent to PD4.

Orange Line

The MTS Orange Line was the second light-rail line implemented as part of the San Diego Trolley system. Service began in 1986, with the line operating between Downtown San Diego and Euclid Avenue to the east. Since its inception, the Orange Line has undergone four expansions, allowing service to now run between Downtown San Diego in the west and Gillespie Field (El Cajon) in the east. In total, the Orange Line services 18 miles and includes 19 stations.

In the Downtown San Diego area, the Orange Line operates along the C Street and Park Boulevard alignment prior to heading east toward the cities of Lemon Grove, La Mesa, and El Cajon. The Orange Line currently runs at 15-minute headways during peak periods and 30-minute headways in off-peak times. SANDAG's Regional Plan identifies frequency enhancements for the Orange Line by the year 2035. The Orange Line America Plaza stop is adjacent to PD3.

Green Line

The MTS Green Line was the third light-rail line implemented as part of the San Diego Trolley system. In the Downtown San Diego area, the Green Line operates along the east side of Pacific Highway until Market Street and then along the northeast side of Harbor Drive. The Green Line operates a 15-minute service Monday through Saturday and a 30-minute service on weekend mornings, Sundays, and evenings. In total, the Green Line services 23.6 miles and includes 27 stations.

Service began in 2005, when the 5.9-mile gap between Mission San Diego and Grossmont Transit Center was connected and operations began between Santee Town Center and Old Town. Additionally, the northern terminus of the Blue Line was reestablished at the Old Town Transit Center, and the Orange Line's eastern terminus was modified to serve the Gillespie Field Station. In September 2012, the Green Line was extended through Old Town and now terminates at 12th and Imperial via the Seaport Village, San Diego Convention Center, and Gaslamp Quarter stations. The Green Line Washington Street and Middletown stops are adjacent to PD2; the County Center/ Little Italy, Santa Fe Depot, America Plaza, Seaport Village, Convention Center, and Gaslamp Quarter stops are adjacent to PD3; and the 12th and Imperial stop is adjacent to PD4.

Silver Line

The SDG&E Silver Line is a 2.7-mile loop through Downtown San Diego that is traveled by a restored 1946 PCC streetcar, also referred to as the Vintage Trolley, operated by MTS. The Silver Line first began operation on August 27, 2011. The Silver Line Vintage Trolley departs from the 12th and Imperial Station along the Green Line to America Plaza and then along the Blue/Orange Line back to 12th and Imperial Station. The Silver Line Vintage Trolley operates on a limited schedule and currently departs every 30 minutes during select hours on Saturday and Sunday. The entire Downtown loop takes approximately 30 minutes to complete. The Silver Line has four stops adjacent to PD3, including the Seaport Village, Convention Center, Gaslamp Quarter, and 12th and Imperial Stations.

Local/Express Bus Services

Several MTS bus routes serve the proposed PMPU area, with several bus stops located in, or adjacent to, each of the planning districts. PD2, PD3, and PD10 have several bus stops within their boundaries, while the boundaries of PD1, PD4, PD8, and PD9 are adjacent to multiple MTS bus stops.

Ferry/Water Taxi

In addition to the aforementioned landside transit services, the following waterside transit services are provided within the proposed PMPU area.

- **Ferry:** Provides service between the Coronado and the San Diego Convention Center. There are ferry stops located in PD3 and PD10. Specifically, PD3 includes the Broadway Pier stop and the Convention Center stop (5th Avenue Landing), and the Coronado Ferry Landing is located within PD10.
- **Water Taxi:** Provides prearranged services for a minimum of 20 people at a time in the areas of Downtown San Diego, Coronado, and Point Loma in San Diego Bay. The water taxi stops are located in PD1, PD2, PD3, and PD10.

Pedestrian and Bicycle Facilities

The Bayshore Bikeway is a 24-mile regional bicycle facility consisting of bike paths and bike routes that circumnavigate the Bay. The Bayshore Bikeway travels through, or is adjacent to, four of the planning districts: PD3, PD4, PD9, and PD10. All of the planning districts except for PD7 and PD9 have Class I, II, or III bicycle facilities, within or adjacent to the planning district boundaries. Class I facilities are off-street, paved bike paths; Class II facilities are bike lanes that are generally identified as a separate lane of a roadway; and Class III facilities are bike routes that are shared with vehicles along a roadway (City of San Diego 2013).

Additional Mobility Options

In addition to public transit services and facilities, there are several other mobility options available throughout the proposed PMPU area that are provided by private entities. These generally include for-profit ride-share, bike-share, and scooter-share options. The availability of these options is subject to market conditions and can vary throughout the proposed PMPU area. A select number of shared mobility device operators are authorized/permitted for a 6-month period in the City of San Diego. Five micro-mobility providers were authorized to operate in the City of San Diego for the August 2020 to January 2021 period. Shared mobility device companies are not permitted in the City of Coronado.

Transit Priority Areas

A Transit Priority Area (TPA) is defined as an area within a 0.5-mile radius of an existing or planned major transit stop,¹ if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program (Public Resources Code [PRC] Section 21099). Additionally, Section 15064.3 of the State CEQA Guidelines also takes into consideration existing stops along a high quality transit corridor.² Section 15064.3, Subdivision (b)(1) indicates that lead agencies generally should presume that certain projects (including residential, retail, and office projects, as well as projects that are a mix of these uses proposed within a TPA) would have a less-than-significant impact on vehicle miles traveled (VMT). Areas that meet the screening criteria

¹ PRC Section 21064.3: “Major transit stop’ means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.”

² PRC Section 21155: “For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.”

below would be assumed to have a less-than-significant impact and therefore would not require mitigation. Areas not meeting the screening criteria would be further evaluated to determine if they would be associated with a transportation related impact based on their associated VMT generation. As noted in the Governor's Office of Planning and Research (OPR) Technical Advisory, projects within a TPA are generally presumed to have a less-than-significant VMT impact unless any of the following conditions are met:

- Has a Floor Area Ratio (FAR) less than 0.75.
- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking).
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization).
- Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

4.14.3 Laws, Regulations, Plans, and Policies

4.14.3.1 State

Senate Bill 743

Governor Jerry Brown signed Senate Bill (SB) 743 on September 27, 2013, which mandated a change in the way that public agencies evaluate transportation impacts of projects under CEQA, focusing on VMT rather than level of service (LOS) and other delay-based metrics. SB 743 states that new methodologies under CEQA are needed for evaluating transportation impacts that are better able to reduce greenhouse gas (GHG) emissions and traffic-related air pollution, promoting the development of a multimodal transportation system, and providing clean, efficient access to destinations. It further intended to balance the need for LOS standards with the State's need to build infill housing and mixed-use commercial developments within walking distance of mass transit facilities and downtowns or town centers. SB 743 allowed for measurements of transportation impacts that could include VMT, VMT per capita, automobile trip generation rates, or automobile trips generated. Accordingly, SB 743 required the OPR to amend the State CEQA Guidelines to reflect these changes.

State CEQA Guidelines Section 15064.3

In response to SB 743, the OPR added Section 15064.3 of the State CEQA Guidelines, as part of a comprehensive Guidelines update, adopted by the California Natural Resources Agency in December 2018. Section 15064.3 describes specific considerations for evaluating a project's transportation impacts and identifies VMT as the most appropriate measure to determine the significance of transportation impacts. Section 15064.3 generally states that a project's effect on automobile delay shall not constitute a significant environmental impact under CEQA. The specific criteria for analyzing transportation impacts are provided in Section 15064.3, subdivision (b) of the State CEQA Guidelines.

Technical Advisory on Evaluating Transportation Impacts in CEQA

In response to SB 743 and the addition of Section 15064.3 to the State CEQA Guidelines, the OPR adopted the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (Technical Advisory) in December 2018 to provide technical recommendations on methods for assessing VMT, thresholds of significance, and mitigation measures. The recommendations in the Technical Advisory are intended to provide guidance to agencies and the public for assessing VMT-related transportation impacts under CEQA. Details of the recommended thresholds of significance from the Technical Advisory are provided in Section 4.14.4.2, *Thresholds of Significance*, below.

Executive Order B-48-18: Zero-Emission Vehicles

On January 26, 2018, Governor Brown signed Executive Order B-48-18 requiring all State entities to work with the private sector to have at least 5 million zero-emission vehicles (ZEVs) on the road by 2030, as well as install 200 hydrogen fueling stations and 250,000 electric vehicle (EV) charging stations by 2025. It specifies that 10,000 of the EV charging stations should be direct current fast chargers. This order also requires all State entities to continue to partner with local and regional governments to streamline the installation of ZEV infrastructure. The Governor's Office of Business and Economic Development is required to publish a *Plug-in Charging Station Design Guidebook* and update the 2015 *Hydrogen Station Permitting Guidebook* (Eckerle and Jones 2015) to aid in these efforts. All State entities are required to participate in updating the 2016 Zero-Emissions Vehicle Action Plan, along with the 2018 ZEV Action Plan Priorities Update, which includes and extends the 2016 ZEV Action Plan (Governor's Interagency Working Group on Zero-Emission Vehicles 2016, 2018), to help expand private investment in ZEV infrastructure with a focus on serving low-income and disadvantaged communities. The GHG benefits of these provisions have not been accounted for in the impact analyses below.

Executive Order N-79-20: Zero Emission Drayage Vehicles

Governor Gavin Newsom signed Executive Order N-79-20 in September 2020, which sets a statewide goal that 100 percent of all new passenger car and truck sales in the state will be zero-emissions by 2035. It also sets a goal that 100 percent of statewide new sales of medium- and heavy-duty vehicles will be zero emissions by 2045, where feasible, and calls for all new sales of drayage trucks to be zero emissions by 2035. Additionally, the Executive Order targets 100 percent of new off-road vehicle sales in the state to be zero emission by 2035. CARB is responsible for implementing the new vehicle sales regulation. The GHG benefits of these provisions have not been accounted for in the impact analyses below.

General Order 88-B

General Order 88-B requires CPUC approval for highway rail crossing alteration projects, and requires temporary traffic controls, warning devices, and compliance with all applicable Commission General Orders.

4.14.3.2 Regional

San Diego Association of Governments

San Diego Forward: The Regional Plan

SANDAG's *San Diego Forward: The Regional Plan* (Regional Plan) was adopted by the SANDAG Board of Directors on October 9, 2015, to establish a long-range blueprint for the San Diego region's growth and development through the year 2050. The Regional Plan was developed in close partnership with the region's 18 cities and San Diego County government, and aims to provide innovative mobility choices and planning to support a sustainable quality of life in a healthy region with a vibrant economy. The Regional Plan integrates both the 2004 Regional Comprehensive Plan and the 2050 Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS) into one unified plan. By incorporating the SCS, the Regional Plan is in compliance with SB 375, which identifies how the region will address GHG emissions to meet State-mandated levels and focuses on land use planning and transportation issues in an attempt to develop sustainable growth patterns on a regional level.

California State Proposition 111, passed by voters in 1990, established a requirement that urbanized areas prepare and regularly update a Congestion Management Program (CMP). The requirements within the State CMP were developed to monitor the performance of the transportation system, develop programs to address near-term and long-term congestion, and better integrate transportation and land use planning. SANDAG provided regular updates for the State CMP from 1991 through 2008. In October 2009, the San Diego region elected to be exempt from the State CMP, and, since this decision, SANDAG has been abiding by 23 Code of Federal Regulations (CFR) 450.320 to ensure the region's continued compliance with the Federal congestion management process. The Regional Plan is the region's long-range transportation plan and SCS, and meets the requirements of 23 CFR 450.320 by incorporating the following Federal congestion management process: performance monitoring and measurement of the regional transportation system, multimodal alternatives and non-single occupant vehicle analysis, land use impact analysis, the provision of congestion management tools, and integration with the regional transportation improvement program process.

State law requires the RTP to be updated every 4 years. The State of California established climate mandates for regional planning organizations across the state in 2018, and the SANDAG Board of Directors approved a 2-year extension to develop the 2021 Regional Plan. A Draft 2021 Regional Plan was released for public review in spring 2021.

Riding to 2050, the San Diego Regional Bike Plan

Riding to 2050, the San Diego Regional Bike Plan (Regional Bike Plan) was developed to support the 2004 Regional Comprehensive Plan and the 2050 RTP in implementing the regional strategy for utilizing bicycles as a valid form of everyday travel. The Regional Bike Plan, as part of the SCS mandated by SB 375, provides for a detailed Regional Bike Network, as well as the programs that are necessary to support it. Implementation of the Regional Bike Plan would help the region meet its goals for reducing GHG emissions and improve mobility.

Airport Connectivity Steering Committee

The Airport Connectivity Subcommittee was established by the SANDAG Board of Directors on December 21, 2018, to study ways to modernize and improve access to the San Diego International Airport (SDIA). The Airport Connectivity Subcommittee is tasked to advise SANDAG and consists of the following member agencies:

- City of Poway
- City of San Diego
- County of San Diego
- Metropolitan Transit System (MTS)
- North County Transit District (NCTD)
- SANDAG
- San Diego County Regional Airport Authority
- San Diego Unified Port District
- Caltrans
- Navy Region Southwest, U.S. Department of Defense

The Airport Connectivity Subcommittee identified high-level concepts to improve transit connectivity to SDIA for SANDAG's Board of Directors. The concepts must be consistent with the San Diego County Regional Airport Authority's (Airport Authority) Airport Development Plan (ADP) and its Draft PEIR, as well as the District's PMPU and this Draft PEIR. In March 2019, the SANDAG Airport Connectivity Subcommittee directed SANDAG staff to focus on either the Space and Naval Warfare Systems (SPAWAR) site (approximately 200 acres in size), or the Intermodal Transit Center (ITC) Site (approximately 106 acres in size), as potential sites for a longer-term San Diego Grand Central Station concept. On September 25, 2019, this Subcommittee recommended approval of the conceptual transportation solutions for improved transit and road connectivity, for further study and environment analysis. The SANDAG Board of Directors approved the study and environmental analysis on September 27, 2019.

Caltrans Manual on Uniform Traffic Control Devices

Construction in rights of way subject to Caltrans Encroachment Permit requirements, typically require a Traffic Control Plan in compliance with the Manual on Uniform Traffic Control Devices. As part of these requirements, there are provisions for coordination with local emergency services, training for flagman for emergency vehicles traveling through the work zone, temporary lane separators that have sloping sides to facilitate crossover by emergency vehicles, detours for bike lanes on roads with lane closures of one travel direction, and vehicle storage and staging areas for emergency vehicles. Requirements also provide for construction work during off-peak hours and flaggers.³

³ The Manual on Uniform Traffic Control Devices is available online at <https://dot.ca.gov/programs/safety-programs/camutcd>.

4.14.3.3 Local

The proposed PMPU area is within the land use jurisdiction and control of the District. However, because the public streets and intersections serving the proposed PMPU area are maintained by the adjacent cities, local laws, regulations, and plans are included below in addition to District regulations.

San Diego Unified Port District

North Harbor Drive Mobility and Access Study

Based on direction from the Airport Authority Board, the Airport Authority initiated the Harbor Drive Mobility Committee (Airport Committee) in June 2017 to identify strategies that would improve traffic flow and reduce congestion around the SDIA, as part of their ADP. The Airport Committee's organization included a Policy Group to evaluate the technical analysis and provide policy-level recommendations, as well as a Working Group to generate ideas and alternatives based on research and technical analysis. Two Board of Port Commissioners served on the Airport Committee's Policy Group, and several District staff participated in the Airport Committee's Working Group.

The District volunteered to complete a comprehensive mobility and access study for the North Harbor Drive corridor in alignment with the expanded study scope suggested by the representatives of the regional agencies participating in the Airport Committee Working Group. With the collaboration of all the participating agencies, the District's North Harbor Drive Mobility and Access Study could serve as a foundation for identifying potential improvements for additional feasibility analysis, potential cost sharing arrangements, and/or pursuing future funding opportunities.

In December 2018, the Board of Port Commissioners (Board) accepted the District's North Harbor Drive Mobility and Access Study, which identified mobility-related improvements that could help accommodate preliminary growth projections contemplated by the proposed PMPU, the SDIA's ADP, and the surrounding Community Plans in the City of San Diego. While the mobility-related improvements identified in the District's study were not binding on any agency, the study helped generate interest within the region to address long-term mobility challenges associated with North Harbor Drive and the SDIA.

South Harbor Drive Multimodal Corridor Study

The Integrated Planning Framework Report (November 2015) served as the "bridge" between the Vision Statement and Guiding Principles that were accepted by the District Board for the proposed PMPU in August 2014, and the goals and policies established in the proposed PMPU's discussion draft that was circulated for public comment in April 2019. One of the comprehensive ideas identified in the Framework Report was a "Haul Road" concept along the District's working waterfront. In November 2017, the District initiated the South Harbor Drive Multimodal Corridor Study (South Harbor Drive Study) to further advance the haul road concept by building a holistic regional vision for the working waterfront segment of Harbor Drive. The study's scope was intentionally broadened to consider pedestrian, bicycle, transit, parking, and other single-passenger vehicular issues in addition to studying ways to accommodate truck traffic within the corridor. As such, the South Harbor Drive Study's purpose is to "[i]dentify opportunities to improve mobility,

safety and quality of life for everyone who lives, works or plays along Harbor Drive and in the surrounding communities near San Diego's working waterfront."

The South Harbor Drive Study area includes the segment of Harbor Drive between the TAMT and the National City Marine Terminal (NCMT), as well as major east-west arterial roadways from Harbor Drive and the interstate highway access points. Staff from the following agency partners comprise the South Harbor Drive's Technical Working Group:

- California Coastal Commission
- Caltrans
- City of San Diego
- City of National City
- MTS
- SANDAG
- San Diego Air Pollution Control District (SDAPCD)
- San Diego Unified Port District
- United States Department of the Navy (Navy Base San Diego)

The corridor's key mobility challenges have been identified, and over a hundred discrete improvement options have been identified and considered by the Technical Working Group. After a comprehensive public outreach effort with residents, businesses, and other key stakeholders during the Fall 2019, the study was completed. On December 10, 2019, the District Board heard the conclusions and the recommendations of the South Harbor Drive Study, which it accepted.

The study found that no single improvement could adequately address all the corridor's mobility challenges. Rather, the corridor requires a system of complementary improvements to enhance all modes of mobility, including freight, passenger vehicles, truck traffic, transit opportunities, pedestrian and bicycle connectivity. The South Harbor Drive Study organized these improvements into five distinct geographical areas and identified broader corridor-wide improvements. Based on collaboration with agency stakeholders, the study included preliminary design concepts for the following two projects:

- Harbor Drive 2.0
- National City Truck Parking along Tidelands Avenue

The District Board considered furthering improvements to the corridor with the Harbor Drive 2.0 concept.

Tenth Avenue Marine Terminal Redevelopment Plan

In December 2016, the District Board approved the Sustainable Terminal Capacity Alternative as the maximum amount of cargo throughput at TAMT, which was analyzed in the certified TAMT EIR (December 2016; SCH# 2015-031046).⁴ The TAMT EIR included a full analysis of transportation and greenhouse gas emission impacts and is incorporated by reference.

⁴ Available at <https://www.portofsandiego.org/projects/tenth-avenue-marine-terminal-redevelopment>.

The TAMT Redevelopment Plan provides laydown space and flexibility for each cargo type. The plan envisions three distinct cargo nodes within the existing footprint of the terminal and is focused on the following current core specialties:

- Project, roll-on/roll-off, and break-bulk cargo such as military equipment, wind energy parts, shipbuilding steel, and vehicles.
- Refrigerated containers for fresh produce such as bananas or other produce.
- Dry bulk cargo such as soda ash, aggregate and cement, used primarily in construction.

The plan includes a variety of infrastructure improvements that would be phased over time. Phase 1, also referred to as the TAMT Modernization Plan, is the only phase the District currently has scheduled. The scheduled work includes:

- Demolishing two transit sheds.
- Sitework improvements including earthwork, utilities, site lighting and pavement.
- 7,200 square feet of new modular buildings to house office space, utility enclosures, and restrooms.
- On-dock rail improvements.

Future phases of the redevelopment plan include:

- Increasing consolidated dry bulk storage capacity, which may include a new, 100,000-square-foot dry bulk structure or an equivalent vertical storage facility.
- Making enhancements to the existing conveyor system.
- Demolishing the existing molasses tanks.
- Demolishing Warehouse C.
- Creating additional storage space.
- Updating on-dock rail facility.
- Installing up to five gantry cranes (cranes on a rail).

City of San Diego

Downtown Community Plan—Mobility Section

The Mobility section of the Downtown Community Plan establishes a street system within Downtown San Diego through a hierarchy of roadway types, including Greenways, Cycleways, Transitways, Autoways, and Multi-Function Streets. The Mobility section replaced the previous Transportation section of the Downtown Community Plan, which was amended along with the adoption of the Downtown Mobility Plan in June 2016. In addition to the street system, the Mobility section provides goals and policies for pedestrian and bicycle movement, transit systems, parking, and transportation demand management. The Downtown San Diego Mobility Plan identifies numerous improvements for providing a balanced, multimodal network (Civic San Diego 2016).

Street Design Manual

The City's *Street Design Manual* (~~2002~~2017) provides information and guidance for the design of public right-of-way that accommodates a variety of potential users, including motorists, pedestrians, and bicyclists. The *Street Design Manual* is divided into six sections: Roadway Design, Pedestrian Design, Traffic Calming, Street Lighting, Parkway Configurations, and Design Standards. The guidelines are focused on the development of new or undeveloped areas as well as redeveloping areas and are not intended to supersede other guidelines developed in other local planning documents, such as community plans, specific plans, and RTPs.

Bicycle Master Plan

The City of San Diego Bicycle Master Plan (2002) and Bicycle Master Plan Update (2013) provide a framework for making cycling a more practical and convenient transportation option for San Diegans with different riding purposes and skill levels. The Bicycle Master Plan is a 20-year policy document that guides the development and maintenance of San Diego's bicycle network. The bicycle network includes all roadways that bicyclists have the legal right to use, support facilities, and non-infrastructure programs. The plan includes direction for policymakers on the expansion of the existing bikeway network, connecting gaps, addressing constrained areas, improving intersections, providing for greater local and regional connectivity, and encouraging more residents to bicycle more often. The 2013 update builds on the 2002 version by addressing changes to the bicycle network and overall infrastructure.

Pedestrian Master Plan

The Pedestrian Master Plan (City of San Diego 2006) provides guidelines to the City of San Diego that will enhance neighborhood quality and mobility options through the facilitation of pedestrian improvement projects. The Pedestrian Master Plan both identifies and prioritizes pedestrian improvement projects through technical analysis and community input programs, which are typically grant-funded.

Municipal Code Section 129.0702

City of San Diego Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work which encroaches into the public right-of-way, including sidewalks. The permit requires the preparation and submittal of a traffic control plan that must conform to the 2014 California Manual on Uniform Traffic Control Devices and Standard Specifications for Public Works Construction, including Regional Supplemental Amendments and City of San Diego Supplemental Amendments.

City of Imperial Beach

Bicycle Transportation Plan

The City of Imperial Beach Bicycle Transportation Plan (2008) was prepared as a comprehensive update to the 1994 City of Imperial Beach General Plan and Coastal Plan's Circulation Element to better address not only local bicycle travel needs, but also to better serve regional long-distance travel and promote eco-tourism. The Bicycle Transportation Plan objectives include establishing facility types to be implemented and identifying points where the City of Imperial Beach's bikeway system could integrate with the existing San Diego metropolitan regional bikeway system. The

plan's scope included documenting and evaluating Imperial Beach's existing bikeway facility system and its relationship to other systems such as mass transit, and recommending improvements wherever appropriate.

Municipal Code Section 12.04.020

City of Imperial Beach Municipal Code Section 12.04.020 states “[e]xcept as may otherwise be expressly provided by ordinance of the City, no work shall be performed in any public right-of-way of the City without the person, firm or corporation which is going to perform the work or which is going to cause the work to be performed first having obtained a permit from the Director of Public Works of the City authorizing the performance of the work.” Work within the public right-of-way in the City of Imperial Beach requires a Temporary Encroachment Permit.

City of Coronado

Comprehensive Active Transportation Plan and Complete Streets Strategy

The City of Coronado approved the *Comprehensive Active Transportation Plan and Complete Streets Strategy* in September 2018. The Active Transportation Plan (ATP) includes a Bicycle Master Plan, a Pedestrian Master Plan, and a Safe Routes to School Plan. The ATP includes goals and potential future projects designed to enhance Coronado's bike routes, streets, and sidewalks to be more accessible, safe, and comfortable for visitors of all ages and abilities. The Draft ATP was developed to comply with the Caltrans Active Transportation Program in order to be eligible for Active Transportation grant funds for the construction of transportation projects.

Municipal Code Section 52.08

Section 52.08 of the City of Coronado Municipal Code outlines the requirements for Encroachment Permit applications for any private, permanent/fixed improvements proposed within the public right-of-way, and outlines the process for the City Engineer to receive and review applications for encroachments, stating that and no such application shall be approved if a determination is made that the encroachment structure will adversely affect the public health, safety, or general welfare.

Municipal Code Section 52.10

Under Section 52.10 of the City of Coronado Municipal Code, it is unlawful for anyone to place, remove, or replace any item within the public right-of-way or on public property or to do any work in the public right-of-way or on public property without first having obtained a Right-of-Way Permit. A Right-of-Way Permit is required for all work on public property, such as repairs to sidewalks, curbs and gutters, driveway aprons, and parkways (the area between the sidewalk and the curb); or to place equipment in the public right-of-way, such as a crane placed in the street to transport materials to a second story. A Right-of-Way Permit authorizes a contractor to temporarily occupy the public right-of-way for construction of said improvement. Section 52.10.060 includes specific requirements for traffic control around the work site. Permittees are required to place and maintain all necessary barrier, guards, lights, signs, flagmen, and watchmen to adequately control vehicular and pedestrian traffic around the work site and to advise the public of detours and construction hazards. Such control devices must be installed to the satisfaction of the City Engineer; and where the permittee fails to satisfactorily control traffic and warn of safety hazards, the City Engineer may require additional control devices to be erected at the expense of the permittee.

4.14.4 Project Impact Analysis

4.14.4.1 Methodology

Potential transportation and circulation impacts associated with the proposed PMPU are summarized below based upon information contained in Appendix D of this Draft PEIR. Methods used to determine impacts are based in part on the OPR's *Technical Advisory on Evaluating Transportation Impacts in CEQA* (Technical Advisory), as well as input from the District and its consultants. The SB 743 framework was developed for this analysis. For more details related to the methods used, please see Chapter 2 of Appendix D. Additional discussion of methodology is provided below under the individual impact analyses.

Construction

The proposed PMPU provides goals and policies, as well as water and land use classifications, consistent with the San Diego Unified Port District Act (Port Act) and Public Trust Doctrine, for the physical development and conservation of District Tidelands. As such, the PMPU does not propose any site-specific physical development, but rather provides guidelines for future development throughout the 30-year planning horizon. The timing, location, and scale of future site-specific development are unknown at this time. Therefore, potential construction-related traffic impacts are analyzed at a general level in this Draft PEIR and are considered qualitatively; types of construction-related traffic hazards are considered and compared to the existing conditions of the proposed PMPU area.

For the purposes of analyzing construction-related VMT impacts as a result of implementation of the proposed PMPU, the analysis qualitatively considers the potential change in existing VMT conditions in the proposed PMPU area due to construction jobs, taking into account projected population and labor market growth.

Operation

Transportation Network VMT Metrics

Project-related VMT refers to the number of automobile trips and their associated travel distance. For land use development projects, OPR recommends three VMT-based metrics to determine if a project has a significant transportation related impact:

- *VMT/Capita* includes all vehicle-based person trips grouped and summed to the home location of individuals who are drivers or passengers on each trip. It includes both home-based and non-home-based trips. The VMT for each home is then summed for all homes in a particular census tract and divided by the population of that census tract to arrive at VMT/Capita. However, because residential land uses are not permitted within the District's jurisdiction, this metric was not used to determine project-related VMT impacts.
- *VMT/Employee* includes all vehicle-based person trips grouped and summed to the work location of individuals on the trip. This includes VMT associated with detours made during the work commute (e.g., additional stops at coffee shops, dry cleaners, grocery stores). The VMT for each work location is then summed for all work locations by census tract and then divided by the total number of employees of that census tract to arrive at the VMT/Employee. This metric is

used for future development that would have worker commute trips associated with it, such as hotels, restaurants, and marine terminal workers.

- *Total VMT* is the sum of all vehicle trips generated in an area multiplied by their associated trip lengths. This total includes all the generated vehicle miles for Internal-to-Internal (I-I), Internal-to-External (I-E), and External-to-Internal (E-I) trips in the area. For this analysis, the Total VMT was calculated for each planning district.

VMT Analysis Tool

The SANDAG Series 13 Activity Based Model (ABM)⁵ was customized for the District's jurisdictional area to incorporate the land use and transportation network changes proposed by the PMPU. The ABM is a travel demand forecasting model that incorporates census data and travel surveys to inform the algorithms of the model's projections. It uses a simulated population based on existing and projected demographics, to match residents to employment, and forecasts the daily travel on the regional transportation network. In addition, the model tracks the daily travel of individuals in the simulated population, including origins, destinations, travel distances, and mode choices. The Series 13 ABM has four forecast scenarios: Base Year 2012, which provides a forecast of the year the model inputs (land uses, mobility network, and socio-economic data) are based on, two interim years (2020 and 2035), and Horizon Year 2050. The Year 2020, 2035 and 2050 scenarios are derived based on the planned land uses and mobility improvements within the region, as well as population and employment projections. The different components of the proposed PMPU are projected to be implemented over 30 years with a buildout year of 2050. Although future development is expected to occur over an approximately 30-year period, the timing, location, and scale of individual development projects are unknown and will depend on future market conditions and other factors that also are not yet known. Therefore, it would be speculative to assume a level of development in interim years and the analysis in this section evaluates potential impacts associated with full buildout of future development allowed under the PMPU in 2050. Finally, it should be noted that the water and land uses specifically within the proposed PMPU area were assumed to be constructed to their buildout assumptions under Horizon Year 2050 conditions.

To calculate both the VMT/Employee and the Total VMT generated⁶ within each planning district, the proposed PMPU land uses were coded into their respective Transportation Analysis Zones (TAZs), and transportation network changes were also coded throughout the District's jurisdiction. The origin and destinations of trips generated within each planning district were tracked using a model select zone assignment, which was used to calculate the VMT per employee and total VMT for each planning district. The total VMT generated within the planning district was calculated based on the total number of trips (all trip types) generated by District land uses multiplied by the route distance between them. VMT/Employee was calculated by summing the Total VMT generated specifically by employees within each planning district and then dividing by the total number of jobs⁷ within the same planning district. VMT is then compared to the thresholds used to determine

⁵ Additional details of the SANDAG Series 13 Activity Based Model, including development and validation and calibration are available at <https://www.sandag.org/index.asp?subclassid=120&fuseaction=home.subclasshome#ModelIntegration>.

⁶ VMT Employee and Total VMT are the based on how SANDAG interprets and calculates the metrics based on OPR recommendations.

⁷ Total number of jobs was derived from the SANDAG Series 13 model. The SANDAG model projects the number of total jobs, under each horizon year, based on the projected/programmed land uses and the State's population growth projections.

significance, described below. As noted in Table 4.14-3, the VMT per employee threshold is applied to uses such as office, industrial, and hotel.

Impacts associated with VMT from retail uses were derived by comparing two SANDAG model scenarios. One version of the model included full buildout of the proposed PMPU land uses. The other version included full buildout of the proposed PMPU land uses with the exception of the retail uses, which remained consistent with the existing level. The total VMT generated by each planning district between the two models was used to isolate the net VMT associated with the proposed retail development. As shown in Table 4.14-3, a significant retail-related VMT impact would occur if there is a net increase in total VMT within the planning district, as it would indicate that the proposed retail uses would not be locally serving. Additional details on the VMT modeling are included in Appendix D, and input and output files are available upon request.

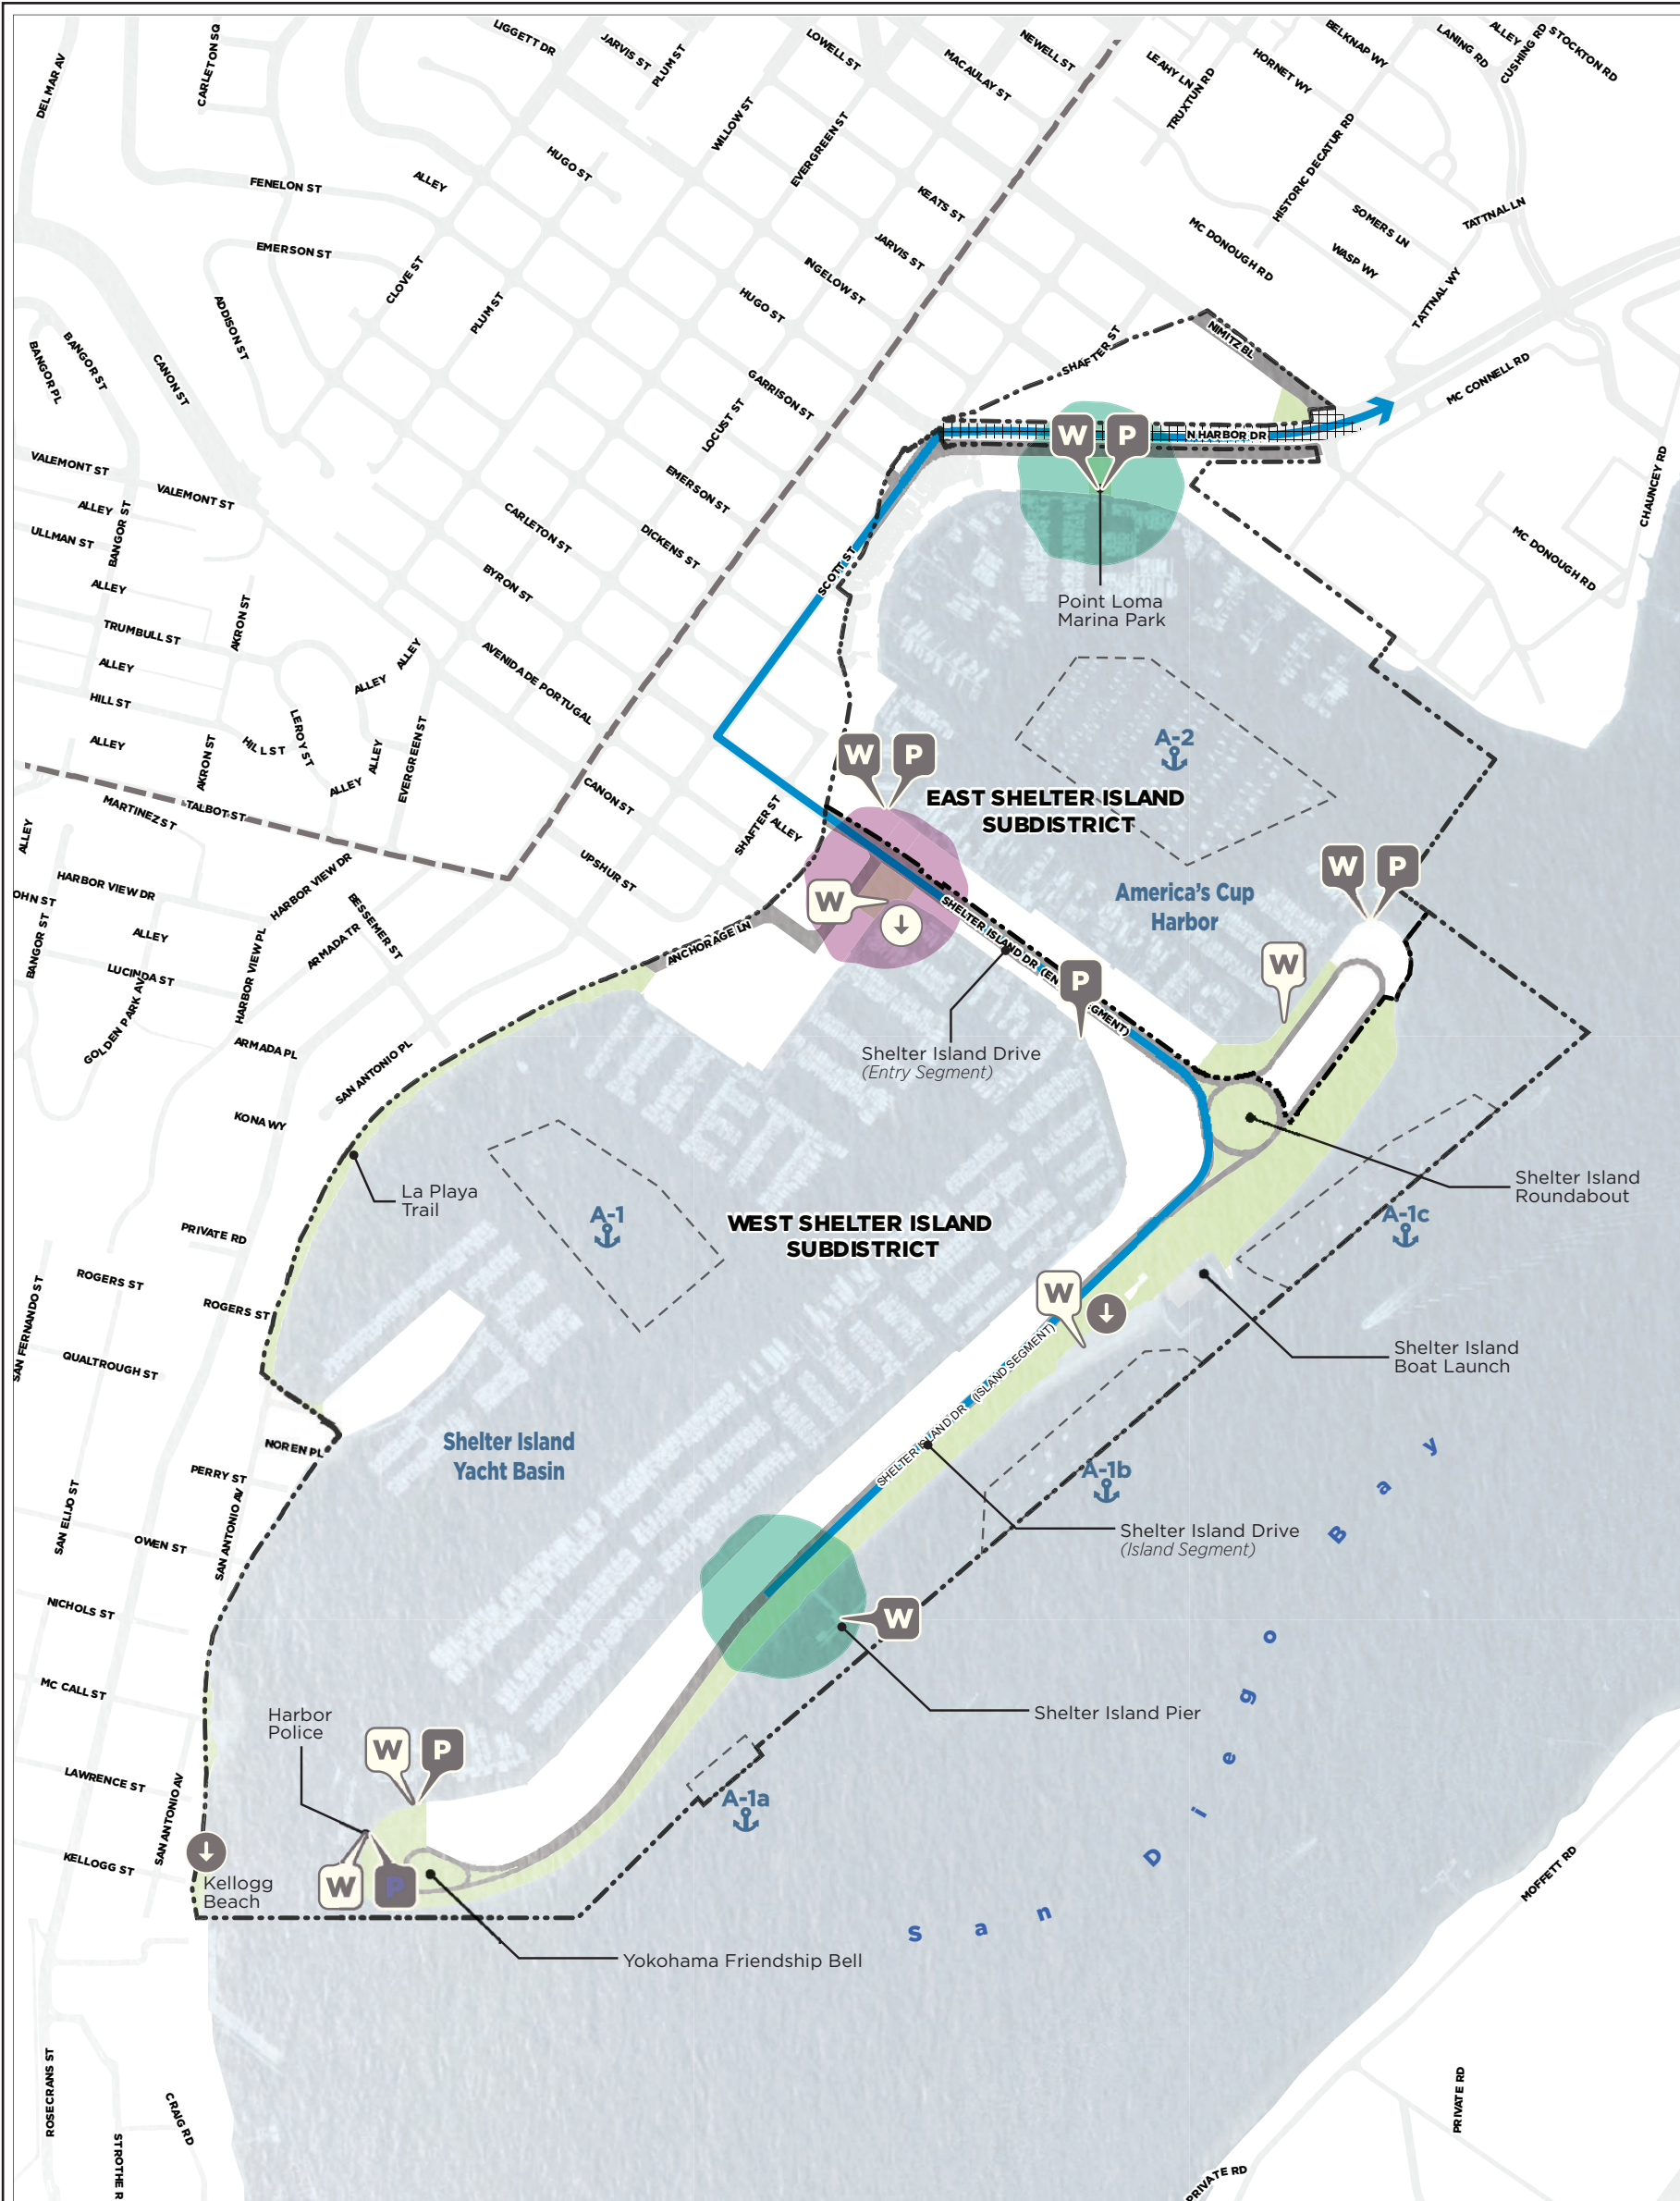

Mobility Hubs

As described in Chapter 3, *Project Description*, planning district standards would introduce mobility hubs in PD1, PD2, PD3, PD8, and PD10. A *mobility hub* is defined as a connection point in which visitors and workers accessing areas on tidelands are provided the opportunity to change from one mode of travel to another, as necessary, to reach their destination. A mobility hub includes, but is not limited to, landside modes—transit, personal auto, rideshare, biking, walking, and micro-mobility options—and water-based transit modes—water taxis, small craft vessels, and ferries. A mobility hub includes both water and landside connections where feasible. Mobility hubs are not defined by their physical footprint, but by their relationship, amenities, and connections with the surrounding area. There are three types of mobility hubs proposed as part of the planning district standards, which are described below and outlined in Table 4.14-3. The potential locations, sizes, and service areas for each planned mobility hub are provided in Chapter 5, *Planning Districts*, of the proposed PMPU, and are depicted by planning district in Figures 4.14.-1 through 4.14-7. For ease of reference, types of mobilities hubs are defined here.

A **Regional Mobility Hub** is intended to serve visitors and employees as they access and travel throughout Tidelands. They are intended to be used to consolidate public parking in the area, which will allow for existing on-street and/or surface parking to be repurposed as Recreation Open Space, such as esplanades, promenades, and plazas, and to connect to multimodal facilities, dedicated transit lanes, bicycle facilities (Class II Bike Lanes, Class IV Cycle Tracks, or Class I Multi-Use Paths), and other waterfront uses. Regional Mobility Hubs will help to reduce the amount of vehicle miles traveled throughout Tidelands and potentially in areas adjacent to Tidelands as they may connect to other regional mobility networks.

A **Local Gateway Mobility Hub** connects visitors to a group of attractions and other uses in a small and specific area. Local Gateway Mobility Hubs are intended to both draw visitors to Tidelands and act as a connection point for visitors who are already traversing Tidelands using other modes of transportation.

Table 4.14-3. Mobility Hub Requirements

Accessibility Requirements						Amenities					
Size	Transit	Roadway	Walking	Biking	Waterside	Amenities Required	Parking	Curbside Management	Micro-Mobility	Information	Commercial
Regional Gateway	Direct connection to a Regional Transit Stop (Trolley or MTS Bus Stop)	Takes access from a major roadway that provides a direction connection to the regional highway system roadway	75% of the attractions within a 0.5-mile radius are accessible through a quality walk ¹	Provides a direct bicycle connection (Level of Traffic Stress 2 or better) to the regional bicycle network	Provides a connection to one or more waterside facilities (transient vessel docking and/or waterside transit service)	4	Consolidates parking for public destinations (open space, recreation, public art) within the catchment area (0.5 mile) ² Offsite parking for leasehold destinations (retail, restaurants, hotels) can also be consolidated in mobility hubs ²	220 feet (10 car lengths) of dedicated linear curb length	Coordination with Micro-Mobility providers to ensure consistent service and supply Inclusion of Micro-Mobility hub with charging facilities and dedicated staging area	Signage and/or kiosks providing information on the available transportation modes, prices, near-by destinations, multimodal trip mapping, ticket vending, and wait time information	Small scale visitor serving uses such as restaurants, coffee shops and markets.
	Incorporation of a Bayfront Circulator stop (PD1, PD2, PD3)		Provides wayfinding signage to key destinations	Provides bike parking							
Local Gateway	Access to a local transit stop. Incorporation of a Bayfront Circulator stop (PD1, PD2, PD3)	Takes access from a public roadway	75% of the attractions within a 0.25-mile radius are accessible through a quality walk ¹	Provides a direct bicycle connection (Level of Traffic Stress 2 or better) to the regional bicycle network	Provides connections to waterside facilities (transient vessel docking and/or waterside transit service), if available	3	Within 500 feet of off-street public parking. May consolidate parking for public destinations (open space, recreation, public art) within the catchment area ² Offsite parking for leasehold destinations (retail, restaurants, hotels) may also be consolidated in the mobility hub ²	110 feet (5 car lengths) of dedicated linear curb length	Coordination with Micro-Mobility providers to ensure consistent service and supply	Signage and/or kiosks providing information on the available transportation modes, near-by destinations, and trip mapping ³	Onsite or adjacent small-scale visitor-serving uses, such as restaurants, coffee shops, and/or visitor-serving retail or kiosks
			Provides wayfinding signage to key destinations	Provides bike parking					Dedicated staging area from Micro-Mobility related vehicles		
Connection Point	Access to a local transit stop	Takes access from a public roadway	Provides a direct connection, through a quality walk, ¹ for all destinations within the immediate area	Provides bike parking	Provides connections to waterside facilities (transient vessel docking and/or waterside transit service), if available	2	Parking is not required, but is allowed	66 feet (3 car lengths) of dedicated linear curb length	Coordination with Micro-Mobility Providers to ensure service and supply	Signage and/or kiosks providing information on the available transportation modes, near-by destinations, and trip mapping ³	No commercial requirements
	Incorporation of a Bayfront Circulator stop (PD1, PD2, PD3)		Provides wayfinding signage to key destinations								

¹ Quality walk: Contiguous, non-circuitous, walking route with a Pedestrian Environment Quality Evaluation (PEQE) score of fair or good. PEQE score is based on the physical characteristics of the pedestrian facility, including safety, lighting, and separation from roadway. Source: Active Travel Assessments Integrating Bicycle and Pedestrian Evaluation in Long Range Planning, City of San Diego, December 2015.

² Parking demand study would be required to determine the number of spaces that need to be included in the hub.

³ Trip mapping services provide information on the various transportation modes in which a user can use to reach their destination, and locations in which they can change their modes, if desired (example: google maps).

This page intentionally left blank.

A **Connector Mobility Hub** connects visitors to a specific attraction or use. Connector Mobility Hubs are generally smaller than the other types of hubs and do not typically include vehicular parking or need to be linked to any parking facilities. They should generally be designed to organize converging transportation facilities through wayfinding signage, bicycle, and pedestrian improvements and the provision of transportation amenities.

4.14.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of transportation, circulation, and mobility impacts resulting from implementation of the proposed PMPU. The determination of whether a transportation, circulation, and mobility impact would be significant is based on the thresholds described below and the professional judgment of the District as the Lead Agency based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following:

1. Conflict with a program, plan, ordinance, or policy addressing the circulation system.
2. Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b).
3. Substantially increase hazards because of a geometric design feature or incompatible uses.
4. Result in inadequate emergency access.

4.14.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to reduce or avoid impacts associated with the transportation system as a result of implementation of the proposed PMPU and are considered in the impact analysis that follows.

WLU Policy 3.1.1 A network of pathways and water-based transfer points shall connect the comprehensive waterfront open space network and public realm areas on Tidelands.

WLU Policy 3.1.2 The District—independently, assigned through partnerships with the District, or through CDPs issued by the District—shall plan, design, and implement a comprehensive waterfront open space network that provides access to and throughout the public realm on Tidelands and enhances proximate connections to the water for the public and priority coastal uses. These improvements shall be developed in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 3.1.3 The District and its permittees shall maintain, protect, and enhance existing public coastal-dependent recreational facilities, such as, but not limited to, boat ramps and piers that provide coastal access.

WLU Policy 3.1.4 Permittees of coastal-enhancing development shall provide direct access to the water's edge and increase physical accessibility to the water by providing overlooks, step-down areas, or similar opportunities for the public to access the water, especially in areas where those opportunities do not exist.

WLU Policy 3.1.5 Protect and, where feasible, expand waterside amenities, such as water based transfer points, overnight transient docking, free or lower cost short-term public docking, anchorages, launch areas for nonmotorized watercraft, and boat launch facilities.

WLU Policy 3.1.6 A waterside promenade shall be provided as part of development that abuts the waterfront, in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 3.1.7 Non waterside development with obstructed public access shall provide physical connections (e.g., walkways) to the water, in accordance with:

- c. Chapter 4, Baywide Development Standards; and
- d. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

M Policy 1.1.8 The District shall coordinate with agencies that have transportation authority, and with adjacent jurisdictions and permittees, to plan mobility infrastructure in support of the safe movement of people and/or goods. Specific transit improvements included in this Plan are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

M Policy 1.1.9 The District shall coordinate with agencies that have transportation authority to explore opportunities to expand accessible transit service to Tidelands. Specific transit improvements included in this Plan are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

M Policy 1.1.10 The District shall provide areas for transit stops and transit lanes for expanded transit opportunities on Tidelands and explore a means for financing expanded transit opportunities with agencies that have transportation authority. Specific transit improvements included in this Plan are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

M Policy 1.1.11 The District shall require certain development, as applicable, to develop and comply with project-specific Transportation Demand Management (TDM) guidelines ~~and require development to comply with such guidelines,~~ with the intent to reduce dependence on single-occupancy vehicles and reduce vehicle miles traveled to, and from, ~~and within Tidelands the proposed development site. All proposed development shall also be required to provide a project-specific TDM program in accordance with the District's guidelines.~~

M Policy 1.1.12 Through CDPs issued by the District, permittees shall plan, design, and implement improvements to the mobility network that provide opportunities for a variety of users to access the public realm. These improvements shall be developed in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

M Policy 1.1.13 Shared or personal motorized mobility devices, except for those required for Americans with Disabilities Act purposes, shall not be permitted on facilities on which pedestrians are intended to travel, such as sidewalks, promenades, multi-use pathways (without a dedicated bicycle area), nature trails, and walkways.

M Policy 1.1.14 The District shall coordinate with agencies that have transportation authority to enhance coastal connectivity and access throughout Tidelands, particularly at mobility hub locations.

M Policy 1.1.15 Through CDPs issued by the District, permittees shall provide public access points along the Bay and may collaborate and coordinate with agency partners and adjacent jurisdictions to plan for, design, and reinforce linkages between those public access points and off-Tidelands areas.

M Policy 1.1.16 Through CDPs issued by the District, permittees shall advance as part of development, when feasible, the implementation of zero-emission/near-zero-emission passenger-related mobility options and supportive infrastructure improvements for the movement of people in alignment with District sustainability and maritime clean air strategies.

M Policy 1.1.17 The District may expand the summer shuttle service (Big Bay Shuttle) that operates along Harbor Drive, establishing year-round connections between Shelter Island and the Convention Center, as a mobility priority (refer to Figure 3.2.4, Bayfront Circulator).

M Policy 1.1.18 Development, adjacent to the bayfront circulator route as shown in Figure 3.2.4, Bayfront Circulator, shall provide hubs or stops to support operation of the bayfront circulator.

M Policy 1.1.19 The District shall prepare a curbside management program that will provide strategies and guidelines for the use of curb space along corridors fronted by predominantly commercial uses.

M Policy 1.1.20 Development shall implement curbside management strategies in accordance with the District's curbside management program, once established.

M Policy 1.1.21 The District – independently or in collaboration with other agencies with transportation authority and adjacent jurisdictions and permittees – may identify additional waterside or landside access opportunities in the future to enhance the mobility network for the movement of people.

M Objective 1.2 Implement a series of interconnecting mobility hubs throughout Tidelands

M Policy 1.2.1 The District shall require the planning, designing, and implementation of a network of mobility hubs (Regional, Local Gateway, and Connector) that provide the opportunity for users to change from one mode of travel to another (refer to Chapter 5, Planning Districts, Coastal Access Mobility maps, for mobility hub locations and specifications and Chapter 4, Baywide Development Standards, for the associated criteria of the development for each type of mobility hub). This requirement shall apply to all subdistricts and commensurate with development intensity in accordance with WLU Goal 7 (Chapter 3.1, Water and Land Use Element) and M Policy 1.2.2.

M Policy 1.2.2 Permittees of development shall contribute to the creation of mobility hubs through funding or construction, as shown in Chapter 5, Planning Districts, coastal access mobility maps.

M Policy 1.2.3 Mobility hubs shall connect to water-based access points throughout the Bay, where feasible.

M Policy 1.2.4 The District shall encourage the development of mobility hubs rather than surface parking to provide proximate connections to the water and Tidelands, where feasible.

M Policy 1.2.5 The District shall coordinate with adjacent jurisdictions to add wayfinding signage that identifies coastal access opportunities on Tidelands, including public walkways, docks and piers, beaches, and other public areas and amenities.

M Policy 1.2.6 Development shall provide and maintain legible wayfinding signage located in easily viewable areas in accordance with Chapter 4, Baywide Development Standards, and Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

M Policy 1.2.7 The District shall require, in coordination with permittees of development, the planning, designing, and implementation of a comprehensive, nondigital wayfinding signage system to guide visitors to and throughout Tidelands.

M Policy 1.3.9 The District may consider adjacent parking rates when setting or updating parking rates for parking areas on Tidelands.

M Policy 2.1.2 The District shall encourage the development of versatile infrastructure that can adapt to future needs and support multiple modes of travel for the transfer of freight between waterside and landside uses.

M Policy 2.1.5 The District shall seek investment and grant opportunities for infrastructure, equipment, and technologies that enable the District's marine terminals to efficiently and sustainably transfer goods between waterside and landside.

M Policy 2.1.6 The District shall collaborate with public and private entities to invest in terminal infrastructure that supports the optimization of cargo movement, cargo laydown areas, cargo handling equipment, and gate operations directly related to maritime cargo.

M Policy 2.1.7 The District, in coordination with permittees of development, tenants, and adjacent jurisdictions, shall maintain and develop improvements to linkages between the marine terminals and landside networks, including but not limited to roadways, rail, pipelines, and the electrical grid, to enable efficient movement of goods along those networks and to support the working waterfront.

M Policy 2.2.1 Through CDPs issued by the District, permittees shall plan, design, and implement improvements to the mobility network that provide opportunities for efficient and sustainable goods movement. These improvements shall be developed in accordance with Chapter 5, *Planning Districts*, including any development standards within the applicable planning district or subdistrict.

M Policy 2.2.3 The District shall engage with stakeholders, such as railway companies, trucking companies, cargo and freight shipping lines, and service providers, to identify and implement feasible sustainable freight strategies in accordance with the District's environmental and operational strategies, plans, and regulations, as well as the State's sustainability objectives.

M Policy 2.2.4 The District shall engage with railroad operators and agencies that have transportation authority to maintain, enhance, and expand access between the cargo terminals and the regional freight infrastructure.

M Policy 2.2.5 The District, in coordination with permittees of development, tenants, and adjacent jurisdictions, and regional transportation agencies, shall maintain and develop improvements to linkages between the marine terminals and landside networks, including but not limited to roadways, rail, and pipelines, to enable efficient movement of goods along those networks and to support the working waterfront.

M Policy 2.2.6 The District and permittees shall optimize off-terminal land-based freight networks to maintain, enhance, and expand the vitality of the working waterfront.

M Policy 2.2.7 In coordination with operators and stakeholders, the District shall plan for improvements to railroad corridors, such as spurs, rail storage facilities, switching facilities, and suitable rail trackage within the working waterfront, both on dock and near dock, to better interface the movement of cargo between ship and land carriers.

M Policy 2.2.9 The District shall coordinate with its tenants and the cities of National City or San Diego to enhance access and connectivity between the Tenth Avenue and National City marine terminals, on both the waterside and landside, to allow for the convenient transfer of goods. Specific improvements to enhance the connectivity between terminals are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

M Policy 3.1.1 The District shall engage with the U.S. military, local, regional, and State agencies with transportation authority to:

- a. Identify and document the transportation facilities located on Tidelands that either are part of the STRAHNET⁸ or provide a critical connection to strategic facilities located on or adjacent to Tidelands;
- b. Ensure that the critical components of the District's transportation network are available and maintained to meet the goals and standards of the STRAHNET; and
- c. Ensure that the identified critical transportation facilities located on Tidelands are clear of permanent obstructions that would prohibit or slow the movement of military use when needed for Department of Defense activities.

M Policy 3.1.2 The District shall engage with the U.S. military, local, regional, and State agencies with transportation authority to coordinate the maintenance of facilities that connect to the region's STRACNET⁹ rail corridor.

M Policy 3.2.1 The District shall engage with the U.S. military to identify and ensure the effectiveness of critical assets for military use, such as marine terminals, rail facilities, and docks and piers, that may be needed in times of emergency while allowing day-to-day access to strategic assets.

M Policy 3.2.2 The District shall plan and maintain its transportation network so that it has the capacity to evacuate operations located on terminals in a manner and timeframe consistent with the U.S. military's needs consistent with requirements under the Strategic Port designation.

SR Policy 1.1.3 The District shall coordinate with regional transportation agencies to design shared infrastructure that meets emergency needs, including evacuation, such as evacuation for post-seismic events and tsunamis.

SR Policy 1.1.5 The District shall coordinate with adjacent jurisdictions and State agencies to identify and address safety improvements at rail crossings.

EJ Policy 1.1.1 The District shall coordinate with adjacent jurisdictions to:

⁸ STRAHNET = Strategic Highway Network

⁹ STRACNET = Strategic Rail Corridor Network

- d. Identify multimodal improvements that would enhance connections between adjacent disadvantaged communities and Tidelands; and
- e. Prioritize the implementation of the identified multimodal improvements to enhance connections between adjacent disadvantaged communities and Tidelands.

EJ Policy 1.1.2 The District shall coordinate with regional agencies with transit authority, as well as adjacent jurisdictions, to explore and expand public transit points and provide a range of affordable transit options for people from adjacent disadvantaged communities to access Tidelands.

EJ Policy 1.1.3 Permittees of development, especially adjacent to disadvantaged communities, shall implement commuter programs and transportation demand management programs to encourage their current or future employees and guests to use alternative transit options.

EJ Policy 1.1.4 The District shall coordinate with members of the public to explore and expand public transit options that allow and encourage access to Tidelands for all people.

WLU Policy 3.1.5 ~~Protect and, where feasible, expand waterside amenities, such as water-based transfer points, overnight transient docking, free or lower cost short-term public docking, anchorages, launch areas for nonmotorized watercraft, and boat launch facilities.~~

ECON Policy 1.2.4 The District shall explore the creation of, and allow for the use of, different financing mechanisms to help fund the building of new infrastructure or improvement to existing infrastructure, including multimodal transportation facilities, water and stormwater systems, information and communication systems, and public space.

ECON Policy 1.2.5 The District shall explore the creation of parking districts to help fund and manage the changing parking needs ~~in on~~ Tidelands.

ECON Policy 1.2.6 The District shall create explore creation of an impact fee infrastructure program, as an option to assist funding for future public infrastructure and amenities, including and not limited to, roadways, sidewalks, promenades, parks, recreational facilities, pier improvements and if such a program is created, to help fund needed public infrastructure and public amenities whereby permittees of development shall contribute its a fair share to the cost of public infrastructure and access improvements, in accordance with that program.

4.14.4.4 Project Impacts and Mitigation Measures

Threshold 1: Conflict with an applicable program, plan, ordinance, or policy addressing the circulation system?

Impact Analysis

The plan consistency analysis describes existing regional and local plans and policies and fulfills State CEQA Guidelines Section 15125(d). The emphasis of the analysis is on potential conflicts between the proposed PMPU and existing applicable programs, plans, ordinances, or policies addressing the circulation system, and whether any conflicts would result in significant environmental effects in comparison to existing conditions, and which have not already been disclosed under the other significance thresholds in this Draft PEIR. The proposed PMPU is considered consistent with the provisions of the identified regional and local plans if it meets the general intent of the applicable plans. A given project need not be in perfect conformity with every

policy nor does State law require precise conformity of a proposed project with every policy or land use designation. Courts have also acknowledged that general and specific plans attempt to balance a range of competing interests, and that it is nearly, if not absolutely, impossible for a project to be in perfect conformity with each and every policy set forth in the applicable plan. Additionally, in reaching such consistency conclusions, the District may also consider the consequences of denial of a project, which can also result in other policy inconsistencies. The analysis below provides a brief overview of the most relevant planning documents and their primary goals. However, the District's conclusions regarding potential conflicts are based upon the planning documents, as a whole.

Impacts on transit circulation would occur if the proposed PMPU would conflict with the adopted policies, plans, or programs that support public transit. Existing light rail transit stops that serve the proposed PMPU area, from north to south, include the Washington Street, Middletown, County Center/Little Italy, Santa Fe Depot, America Plaza, Seaport Village, Convention Center, Gaslamp Quarter, 12th and Imperial, Barrio Logan, and Harborside Stations. Additionally, the COASTER commuter train and Amtrak Pacific Surfliner provide regional and interregional access, respectively, to the proposed PMPU area. Lastly, several MTS bus routes serve the PMPU area, with several bus stops located in, or adjacent to, each of the planning districts.

OPR's December 2018 Technical Advisory on Evaluating Transportation Impacts under CEQA explains: "When evaluating impacts to multimodal transportation networks, lead agencies generally should not treat the addition of new transit users as an adverse impact" (OPR Technical Advisory, page 19). As also discussed in OPR's SB 743 amendment package transmittal letter "[l]egislative findings in Senate Bill 743 plainly state that CEQA can no longer treat vibrant communities, transit, and active transportation options as adverse environmental outcomes." Therefore, increased transit use is not considered an adverse environmental impact in this Draft PEIR.

Impacts related to pedestrian and bicycle circulation would occur if the proposed PMPU would conflict with the adopted programs, plans, ordinances, or policies that support these alternative modes of transportation. Impacts on the pedestrian and bicycle circulation system were considered through a review of the proposed water and land use scenarios and existing pedestrian and bicycle facilities within each planning district.

Impacts of Water and Land Uses

The impact analysis below considers the following programs, plans, ordinances, and policies related to the circulation system.

- Riding to 2050, the San Diego Regional Bike Plan, SANDAG
- Downtown Community Plan, City of San Diego
- Street Design Manual, City of San Diego
- Bicycle Master Plan, City of San Diego
- Pedestrian Master Plan, City of San Diego
- Bicycle Transportation Plan, City of Imperial Beach
- Active Transportation Plan, City of Coronado

An analysis of the proposed PMPU's potential to conflict with the policies of SANDAG's Regional Plan is provided in Table 4.9-1 in Section 4.9, *Land Use and Planning*. As demonstrated in Table 4.9-1, the proposed PMPU would not conflict with the policy objectives of the Regional Plan.

Construction

The water and land use designations proposed by the PMPU would allow for the development of future projects through the 2050 Horizon Year. The construction of future projects would conform to the subdistrict development standards laid out in Chapter 5 of the proposed PMPU. Chapter 3 of this Draft PEIR provides a complete list of allowable uses and potential development that could occur in all planning districts.

Construction of these future development projects may include the use of roadways for construction worker vehicle trips and to deliver materials, haul construction debris, or conduct utility infrastructure development. Roadways, bikeways, transit, and pedestrian facilities could be blocked, or users could experience delays during construction activities. However, these delays or facility closures typically would be temporary and infrequent, would provide detours or alternate access, and would not permanently prevent the use of roadways, transit, pedestrian, or bicycle facilities. In addition, as discussed in Section 4.7, *Hazards & Hazardous Materials*, construction projects would be required to have the appropriate permits issued by the local municipality with jurisdiction over the circulation network to ensure emergency access is maintained and proper detours and safety measures are in place (i.e., City of San Diego for PD1, PD2, PD3, and PD4; City of Imperial Beach for PD8; and City of Coronado for PD9 and PD10).

Future construction projects allowed under the proposed PMPU may be subject to the requirements of encroachment and/or right-of-way permits from local jurisdictions including the City of San Diego, City of Coronado, or City of Imperial Beach, as well as Caltrans (see Sections 4.14.3.2 and 4.14.3.3). In the City of San Diego, Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way including sidewalks, as well as an accompanying traffic control plan. Future development within PD1, PD2, PD3, and PD4 would be subject to this requirement. For future development in PD8, the City of Imperial Beach requires a Temporary Encroachment Permit for any work performed in any public right-of-way of the city (Municipal Code Section 12.04.020). Lastly, future development in PD9 and PD10 would be subject to City of Coronado Municipal Code Section 52.10, which requires a Right-of-Way Permit for all work on public property, such as repairs to sidewalks, curbs and gutters, driveway aprons, and parkways (the area between the sidewalk and the curb); or to place equipment in the public right-of-way, such as a crane placed in the street to transport materials to a second story. Section 52.10.060 includes specific requirements for traffic control around the work site. Therefore, construction would not conflict with, or prevent implementation of, the programs, plans, ordinances, or policies addressing the circulation system.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and

certify this Draft PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, due to compliance with local regulations that manage the circulation network, implementation of the proposed PMPU would result in a less-than-significant impact associated with conflict with applicable plans, programs, ordinances or policies addressing the circulation system.

Construction activities associated with the new Waterfront Destination Park in PD3 under Option 1 would be subject to the requirements of encroachment and/or right-of-way permits from the City of San Diego for work that would encroach on road right-of-way. City of San Diego Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way including sidewalks, as well as an accompanying traffic control plan. Potential closure or partial blockage of roadways, sidewalks, or bike paths would be temporary, alternative routes would be provided, and would not conflict with the flow of traffic. As such, as these closures and/or detours would only be temporary in nature, they would not affect the ability to implement or maintain the applicable circulation plans, programs, ordinances, or policies on a long-term basis. Therefore, construction under Option 1 would not conflict with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan. Impacts would be less than significant and would not include any additional or more severe impacts related to conflict with applicable plans, programs, ordinances, or policies than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, due to compliance with local regulations that manage the circulation network, implementation of the proposed PMPU would result in a less-than-significant impact associated with conflict with applicable plans, programs, ordinances or policies addressing the circulation system.

Construction activities associated with Option 2 would be subject to the requirements of encroachment and/or right-of-way permits from the City of San Diego. City of San Diego Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way including sidewalks, as well as an accompanying traffic control plan. Potential closure or partial blockage of roadways, sidewalks, or bike paths would be temporary, alternative routes would be provided, and would not conflict with the flow of traffic. As such, as these closures and/or detours would only be temporary in nature, they would not affect the ability to implement or maintain the applicable circulation plans, programs, ordinances, or policies on a long-term basis. Therefore, construction associated with Option 2 would not conflict with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan. Impacts would be less than significant and would not include any additional or more severe impacts related to conflict with applicable plans, programs, ordinances, or policies than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, due to compliance with local regulations that manage the circulation network, implementation of the proposed PMPU would result in a less-than-significant impact associated with conflict with applicable plans, programs, ordinances, or policies addressing the circulation system.

Construction activities associated with the new park that could be developed under Option 3 would be subject to the requirements of encroachment and/or right-of-way permits from the City of San Diego. City of San Diego Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way including sidewalks, as well as an accompanying traffic control plan. Potential closure or partial blockage of roadways, sidewalks, or bike paths would be temporary, alternative routes would be provided, and would not conflict with the flow of traffic. As such, as these closures and/or detours would only be temporary in nature, they would not affect the ability to implement or maintain the applicable circulation plans, programs, ordinances, or policies on a long-term basis. Therefore, construction of Option 3 would not conflict with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan. Impacts would be less than significant and would not include any additional or more severe impacts related to conflict with applicable plans, programs, ordinances, or policies than buildout of the proposed PMPU without Option 3.

Operation

Implementation of the proposed PMPU would result in the operation of future development consistent with the proposed water and land uses as described in Chapter 3, which provides a complete list of allowable uses and potential development that could occur in all planning districts. The following describes the potential operational impacts associated with implementation of the proposed PMPU within each planning district.

Planning District 1: Shelter Island

The following planned improvements identified in the proposed PMPU could result in changes to the transportation system in PD1:

- Development of a Connector Mobility Hub on the western portion of Shelter Island Drive in West Shelter Island Subdistrict.
- Development of a Local Gateway Mobility Hub at the Shelter Island Yacht Basin in West Shelter Island Subdistrict.
- Enhancement of the public realm along Shelter Island Drive (Entry Segment).
- Reconfiguration of Shelter Island Drive to enhance the pedestrian experience, develop bike lanes, and reconfigure parking.
- Development of enhanced pedestrian crossing facilities.
- Development of a Connector Mobility Hub south of North Harbor Drive in East Shelter Island Subdistrict.
- Modify North Harbor Drive and Nimitz Boulevard to accommodate vehicular traffic, pathways, and bikeways in East Shelter Island Subdistrict.

- Other planned improvements would include development, enhancement, or maintenance of existing and new multi-use paths, development of up to four water-based transfer points, allowance of modifications to moorings to accommodate a cumulative increase of up to 10 moored vessels at existing Shelter Island Anchorages, and the development of up to 35 additional recreational boat slips and 65 additional commercial fishing slips in East Shelter Island Subdistrict.

A detailed description of anticipated development and improvements to transportation facilities is provided in Chapter 3. The reconfiguration of Shelter Island Drive would increase the multimodal transportation network and would promote non-automobile use. The multimodal improvements (including development or maintenance of pedestrian facilities, public trails, bike lanes, and water-based transit) would be consistent with the policies and goals of the local plans applicable to PD1, including but not limited to the City of San Diego Street Design Manual, the City of San Diego Bicycle Master Plan, the City of San Diego Pedestrian Master Plan, and the RTP (see Table 4.9-1 in Section 4.9), which all seek to enhance multimodal mobility options in the region. It should be noted that that only renovations of existing land uses and replacement in-kind could occur in PD1. The water uses include the potential addition of up to 35 recreational boat berthing slips, 30 new anchorage moorings, and 65 commercial fishing berthing slips. Therefore, implementation of the proposed transportation improvements in PD1 would not conflict with, or prevent implementation of, programs, plans, ordinances, or policies addressing the circulation system.

Planning District 2: Harbor Island

The following planned improvements identified in the proposed PMPU could result in changes to the transportation system in PD2.

West Harbor Island Subdistrict

- Develop a local Gateway Mobility Hub on the western portion of Harbor Island Drive.
- Narrow North Harbor Drive to four general travel lanes to accommodate vehicular traffic.
- Develop a multi-use path along the south side of North Harbor Drive.
- ~~Implement a potential dedicated transit lane(s) right-of-way~~ Implement a potential dedicated transit lane(s) along the south side of North Harbor Drive east of Harbor Island Drive that would support a bayfront circulator or other transit options.
- Modify the Entry Segment of Harbor Island Drive including new signage, an arrival gateway, and pedestrian connections.
- Modify the east-west portion of Harbor Island Drive (Island Segment) including narrowing Harbor Island Drive, reconfiguring off-street public parking, and pedestrian improvements.

East Harbor Island Subdistrict

- Develop a Regional Mobility Hub near the northwestern portion of the East Basin of Harbor Island.
- Narrow North Harbor Drive to four general travel lanes to accommodate vehicular traffic.
- Implement potential dedicated transit lane(s) along the south side of North Harbor Drive east of Harbor Island Drive that would support a bayfront circulator or other transit options.
- Develop an entry gateway on or adjacent to Harbor Island Drive (Entry Segment)

- Modify Liberator Way, which may include narrowing to two general travel lanes, on-street parking, crosswalks and other pedestrian improvements.

Future development allowed under the PMPU in PD2 would also include improvement of existing coastal access and marina facilities, which may also result in changes to the use and efficiency of the transportation system. The planned improvements to the water-based uses include additional water-based transfer points, public docking slips, recreational boat berthing vessel slips, moorings, and a nonmotorized watercraft launching area. Planned improvements related to land-based uses in PD2 include the development of additional retail, restaurant, or a combination of both; development of additional hotel rooms; and development of lower cost hotel accommodations, possibly as part of the Regional Mobility Hub. These land- and water-based improvements would be consistent with existing uses allowed in PD2 under the existing Port Master Plan (PMP), and would allow for the expansion of these uses in certain designated areas as specified in the proposed PMPU. These improvements would not conflict with the applicable policies and plans, including SANDAG's RTP (see Table 4.9-1 in Section 4.9), and the City of San Diego's Downtown Mobility Plan and Bicycle Master Plan, because the proposed improvements would not prevent implementation of transportation-related plans and programs in PD2.

The future development of mobility hubs, multi-use paths and other pedestrian improvements, and ~~potential dedicated transit lane(s) right-of-way improvements~~ would provide additional multimodal transportation options and would promote alternatives to automobile usage, which could result in a decrease in automobile trips and reduce the overall VMT in PD2. These proposed multimodal improvements would be consistent with the goals of the City of San Diego's Downtown Mobility Plan and Bicycle Master Plan, which seek to enhance pedestrian and bicycle movement and connect gaps in San Diego's bicycle network. New or improved roadways would be designed and constructed in compliance with the *City of San Diego Street Design Manual*. Therefore, proposed improvements in PD2 would not conflict with, or prevent implementation of, programs, plans, ordinances, or policies addressing the circulation system.

Planning District 3: Embarcadero

The following planned improvements identified in the proposed PMPU could result in changes to the transportation system in PD3:

North Embarcadero Subdistrict

- Develop a Regional Mobility Hub on the block bounded by Grape Street, North Harbor Drive, Hawthorn Street, and Pacific Highway.
- Develop a Local Gateway Mobility Hub between Ash and B Streets.
- Extend A Street to North Harbor Drive to provide a link between North Harbor Drive and Pacific Highway, for pedestrian, bicycle and vehicle use.
- Reconnect B Street between Pacific Highway and North Harbor Drive for pedestrian, bicycle and vehicle use, in addition to temporary truck and other staging associated with cruise ship operations.
- Reconfigure North Harbor Drive to more efficiently accommodate all modes of travel, including a lane for a Bayfront Circulator or comparable service.

Central Embarcadero Subdistrict

- Reconfigure the North Harbor Drive/West Harbor Drive ~~right-of-way~~ roadway to accommodate all modes of travel, including a lane for a Bayfront Circulator or comparable service.
- Improve the efficiency and safety of the intersection at G Street and North Harbor Drive.

South Embarcadero Subdistrict

- Modify, or replace-in-kind, the existing Local Gateway Mobility Hub near the Convention Center.
- ~~Coordinate with adjacent jurisdictions to evaluate pedestrian improvements at the intersection at West Harbor Drive and Market Street which may include a closure of Market Street between West Harbor Drive and Columbia Street to vehicular traffic, a pedestrian scramble, or roundabout at the West Harbor Drive/Market Street intersection.~~
- ~~Support Market Street closure between West Harbor Drive and Columbia Street, and provide a pedestrian scramble or roundabout at the West Harbor Drive/Market Street intersection, if determined feasible following coordination with adjacent jurisdiction.~~
- Reconfigure West Harbor Drive/East Harbor Drive between the Harbor Drive/Market Street intersection and Park Boulevard to more efficiently accommodate all modes of travel.

The potential improvements to pedestrian, bicycle, and roadway facilities are consistent with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan, which seek to remove barriers to walking and biking routes and to promote connectivity of these transit options through the Downtown area, where PD3 is located. Implementation of potential dedicated transit lane(s) ~~right-of-way~~ between SDIA and Santa Fe Depot would be consistent with the intent of the Airport Connectivity Subcommittee, which was assembled to improve transit opportunities to and from SDIA. Therefore, the proposed transportation system improvements would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD3.

Potential future improvements to coastal access could include improvements and expansion of existing uses in PD3, including development of water-based transfer points, public docking, a new transient dock with up to 20 vessel slips, a new public pier, a new marina, and an increase in vessel moorings and boat berthings. The future development of visitor-serving commercial uses in PD3 could include additional hotel rooms, retail and restaurant space, and museum space, and expanding the exhibit area, meeting rooms, ballrooms, and support space for the convention center. This future development would be new improvements or expansions of existing compatible uses within the planning district that would be consistent with both the existing surrounding land uses and the proposed land use designations of the PMPU. Sections 5.3.2(C), 5.3.3(C) and 5.3.4(C) of the proposed PMPU describe the type, size, and extent of the planned improvements for North Embarcadero Subdistrict, Central Embarcadero Subdistrict, and South Embarcadero Subdistrict, respectively. In addition, Sections 5.3.2 (D), 5.3.3(D), and 5.3.4(D) describe the development standards for the planned improvements and future development in each subdistrict, including requirements, size, location, siting, and orientation. Implementation of the planned improvements and the development standards ensures structures and waterside improvements would be constructed to be compatible with the existing setting and the vision of PD3. Because the planned improvements would not propose new incompatible uses or changes to the transportation infrastructure system, they would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD3.

Planning District 4: Working Waterfront

The following planned improvements identified in the proposed PMPU could result in changes to the transportation system in PD4:

Tenth Avenue Marine Terminal Subdistrict

- Modify the entire segment of northbound and southbound Harbor Drive within the District's jurisdiction by providing a multi-use pathway; and including a "flexible" lane in each direction that is dedicated for trucks, transit buses, and/or shuttles with an information technology system that can be modified or adjusted during peak and nonpeak hours.
- Coordinate with transportation agencies and adjacent jurisdictions to reconfigure portions of Harbor Drive outside of the District's jurisdiction to improve efficiency and safety for vehicular traffic, good movement, and pedestrian and bicycle facilities.

Cesar Chavez Park Subdistrict

- Modify Cesar Chavez Parkway to accommodate vehicular traffic while allowing for pedestrian, bicycle, and mobility enhancements.
- Modify or replace in-kind pathways to Cesar Chavez Park and the Cesar Chavez Pedestrian Pier and expand public access by providing a connection to the Bayshore Bikeway.

Harbor Drive Industrial Subdistrict

- Modify the entire segment of northbound and southbound Harbor Drive within the District's jurisdiction; the same as identified for the Tenth Avenue Marine Terminal Subdistrict.

The planned improvements to Harbor Drive and Cesar Chavez Parkway identified in the proposed PMPU would increase efficiency of the roadways, and would provide multimodal transit opportunities that could result in a decrease in automobile trips and reduce the overall VMT in PD4.

Planned improvements for water-based and land-based uses would include modifications of pedestrian pathways and the Cesar Chavez Pedestrian Pier, and development of a water-based transfer point. The planned improvements do not propose coastal or landside access improvements that would conflict with applicable programs, plans, policies, or ordinances related to the circulation system in PD4.

It should be noted, future increase in overall cargo throughput at TAMT, located in PD4, was evaluated and approved in the certified TAMT EIR. As noted in Section 4.10 of the TAMT EIR, the following assumptions were made for goods movement at the terminal.

- The percent of total cargo shipped via rail and barge from the TAMT will remain the same under buildout (i.e., 2035) as it is today.
- The ratio of metric tons to cargo that is carried by each truck will remain the same under buildout conditions (i.e., 2035).
- The destinations of the trucks will not change or vary significantly under buildout conditions (i.e., 2035).

Implementation of the proposed PMPU would not introduce any new water or land uses to PD4; however, it would allow aquaculture as a secondary use, which would not conflict with transportation and mobility plans. Therefore, the operations in PD4 would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD4.

Planning District 7: South Bay

A portion of PD7, Pond 20, is excluded from this analysis for the proposed PMPU because it is covered under a separate EIR, the Wetland Mitigation Bank at Pond 20 and Port Master Plan Amendment Project EIR, which was certified by the District Board in April 2021. The remaining portions of PD7 would not include any transportation improvements or water or land uses that would result in a change in operations. Therefore, implementation of the proposed PMPU in PD7 would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD7.

Planning District 8: Imperial Beach Oceanfront

Planned improvements to the transportation system identified in the proposed PMPU for PD8 would include:

- Develop a Connector Mobility Hub in the vicinity of Seacoast Drive and Elkwood Avenue.
- Modify public access to the shoreline, oceanfront, and Imperial Beach Pier to include wayfinding signage and pedestrian lighting.
- Develop bicycle parking at the Imperial Beach Pier Plaza.

In addition, planned improvements to water-based and land-based uses would include modifications to potentially expanding the pier, and adding 18,000 square feet of retail and/or retail with restaurant space at the existing pier buildings and on the Palm Avenue and Elkwood Avenue sites. The proposed water and land use changes and allowable primary and secondary uses would not conflict with the goals and policies of the City of Imperial Beach Bicycle Transportation Plan, which proposes bike facilities to benefit local and regional bicycle travel and to integrate with the existing bikeway system. Planned improvements would complement these goals by proposing the development of a connector mobility hub and bicycle parking at the Imperial Beach Pier Plaza. All future development and transportation improvements would be required to be consistent with the Imperial Beach Bicycle Transportation Plan. Therefore, implementation of the proposed PMPU in PD8 would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD8.

Planning District 9: Silver Strand

Approximately 2.83 acres of Commercial Recreation land will be changed to Recreation Open Space after an existing leasehold expires in 2034. Additionally, a Connector Mobility Hub, or larger hub, is identified in the proposed PMPU in the Crown Isle Subdistrict in PD9. Potential future development of recreational marina facilities could include developing up to 10 additional recreational boat berthing vessel slips and associated recreational marina-related facilities in the Crown Isle Subdistrict. Neither the proposed multimodal mobility hub nor the water-based and land-based planned improvements would conflict with the City of Coronado Active Transportation Plan. Therefore, there are no changes that would conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD9.

Planning District 10: Coronado Bayfront

The planned improvements identified in the proposed PMPU for PD10 would include the following improvements to the transportation system:

North Coronado Subdistrict

- Develop a Local Gateway Mobility Hub or larger hub, near the Ferry Landing.
- Maintain continuous public coastal access to the Coronado Bayfront via the Bayshore Bikeway.

Future development in PD10 could also include water-based improvements such as maintaining and replacing in-kind existing and developing new water-based transfer points, modifications to allow for an increase in moorings, development of an additional short-term public docking slip, and development of up to 55 additional recreational boat berthing vessel slips. There are no transportation system improvements identified in the South Coronado Subdistrict. Neither the transportation-related improvements nor the water-based improvements would conflict with or prevent implementation of applicable policies of the City of Coronado Active Transportation Plan. Therefore, there are no changes that would conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD10.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, one of three options within North Embarcadero could be selected by the Board if the proposed PMPU is approved. Each of these options would replace the water and land uses proposed within the same area of the proposed PMPU located along North Harbor Drive. Figures 3-5, 3-6, and 3-7 illustrate the locations. Operation-related impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area, which seek to increase the accessibility and connectivity of multimodal infrastructure throughout the Tidelands. Impacts would be less than significant.

The proposed closure of North Harbor Drive between West G Street and Broadway to vehicular traffic would still allow for pedestrian, bicycle, and transit access and would not conflict with City of San Diego Bicycle Master Plan or the City of San Diego Pedestrian Master Plan. The potential improvements to pedestrian, bicycle, and roadway facilities are consistent with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan, which seek to remove barriers to walking and biking routes and to promote connectivity of these transit options through the Downtown area, where PD3 is located. Therefore, the proposed transportation system improvements under Option 1 would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD3. Option 1 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to conflict with applicable programs, plans, policies, or ordinances related to the circulation system than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area, which seek to increase the accessibility and connectivity of multimodal infrastructure throughout the Tidelands. Impacts would be less than significant.

The operational changes to roadway facilities due to the 205-foot setback along North Harbor Drive would be consistent with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan, which seek to remove barriers to walking and biking routes and to promote connectivity of these transit options through the Downtown area, where PD3 is located. Therefore, the proposed improvements under Option 2 would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD3. Impacts under Option 2 would be less than significant and would not result in any additional or more severe impacts related to conflict with plans, programs, ordinances, or policies than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area, which seek to increase the accessibility and connectivity of multimodal infrastructure throughout the Tidelands. Impacts would be less than significant.

The potential realignment of North Harbor Drive and the establishment of a 205-foot setback would be consistent with the goals and policies of the Downtown Mobility Plan, the City of San Diego Bicycle Master Plan, and the City of San Diego Pedestrian Master Plan, which seek to remove barriers to walking and biking routes and to promote connectivity of these transit options through the Downtown area, where PD3 is located. The proposed realignment of North Harbor Drive between Hawthorne Street and B Street would continue to allow for pedestrian, bicycle, and transit access and would not conflict with the City of San Diego Bicycle Master Plan or the City of San Diego Pedestrian Master Plan. Therefore, operation of Option 3 would not conflict with, or prevent implementation of, programs, plans, policies, or ordinances related to the circulation system in PD3. Impacts under Option 3 would be less than significant and would not result in any additional or more severe impacts related to conflict with applicable plans, programs, ordinances, or policies associated with the circulation system than buildout of the proposed PMPU without Option 3.

Operations Conclusion

Implementation of the proposed PMPU may result in physical improvements to the transportation infrastructure in PD1, PD2, PD3, PD4, PD8, PD9, and PD10, as noted above. These changes would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area, which seek to increase the accessibility and connectivity of multimodal infrastructure throughout the Tidelands. Similarly, the proposed water and land use changes would also be consistent with the goals of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area. Therefore, the proposed PMPU would not conflict with, or prevent implementation of, applicable programs, plans, policies, or ordinances related to the circulation system in the proposed PMPU area.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies listed in Section 4.14.4.3 would not result in impacts related to a conflict with a program, plan, ordinance, or policy addressing the circulation system. Rather, the proposed PMPU policies listed in Section 4.14.4.3 would reduce and minimize potential impacts related to conflicts with existing circulation programs by ensuring coordination between agencies with transportation authority and with adjacent jurisdictions and permittees to plan shared mobility infrastructure in support of the safe movement of people and/or goods (M Policy 1.1.8); ensuring coordination with agencies to explore opportunities to expand accessible transit service to Tidelands (M Policy 1.1.9); requiring ~~the District~~certain development ~~and comply with project-specific~~ TDM guidelines to reduce VMT and dependence on single-occupancy vehicles ~~and requiring development to comply with such guidelines~~ (M Policy 1.1.11); ensuring coordination to enhance coastal connectivity and access throughout the Tidelands (M Policy 1.1.14); and requiring engagement with the U.S. Military, local, regional, and State agencies to ensure that critical transportation facilities are accessible for Department of Defense activities (M Policy 3.1.1).

Impact Determination and Mitigation

Implementation of the proposed PMPU would not conflict with a program, plan, ordinance, or policy addressing the circulation system. Impacts would be less than significant.

Threshold 2: Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Impact Analysis

State CEQA Guidelines Section 15064.3 recommends use of automobile VMT as the preferred CEQA transportation impact metric for land use projects. In the Technical Advisory, OPR has recommended a significance threshold for VMT reduction to meet the State's long-term climate goals. OPR recommended the threshold for per capita or per employee VMT to be set at 15 percent below that of the existing development, also referred to as the *base year average*. A 15 percent reduction in VMT is consistent with the intent of SB 743. As discussed under OPR's Technical Advisory, "[a] project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa." (OPR 2018:6.)

Accordingly, a significant impact for office/employment uses would occur if the proposed PMPU would result in less than a 15 percent reduction in VMT compared to the base year average per employee. The Technical Advisory provides recommended thresholds for the development types, outlined below, that would be reasonably foreseeable under the proposed PMPU.¹⁰

¹⁰ Residential land uses are prohibited on District Tidelands by the Port Act and therefore are not proposed by the PMPU.

Office

A project that would not reduce office-related VMT by 15 percent below existing regional VMT per employee would indicate a significant transportation impact.

Retail

A net increase in total VMT from a proposed retail development may indicate a significant transportation impact. Because new retail development typically redistributes shopping trips rather than creating new trips, estimating the total change in VMT (i.e., the difference in Total VMT in the area affected with and without a project) is the best way to analyze a retail project's transportation impacts.

Other Land Uses

Lead agencies, using more location-specific information, may develop their own thresholds, which may include other land use types. In developing thresholds for other project types, or thresholds different from those recommended here, lead agencies should consider the purpose described in PRC Section 21099 and regulations in the State CEQA Guidelines on the development of thresholds of significance (e.g., Section 15064.7).

Non-Commercial Employees

Non-commercial employees would include all those within the Tidelands who do not work within commercial offices or retail, which are both covered by the Technical Advisory. Most of the employment groups within the District have very similar travel patterns and trip generation rates. Therefore, the average VMT/Employee rate for these uses was compared to the average non-commercial VMT/Employee rate at the regional level. If the proposed PMPU's average VMT/Employee rate is not 15 percent below the existing regional VMT/Employee rate, it would indicate a significant transportation-related impact.

Table 4.14-4 provides a summary of the proposed PMPU proposed planned improvements, the evaluation criteria, and the impact threshold.

Table 4.14-4. Evaluation Criteria and Impact Thresholds by Proposed Planned Improvements

Development	Evaluation Criteria	Recommended Impact Threshold
Landside		
Hotel	VTM/Employee	15% below regional average
Retail (square feet)	VTM with vs. without proposed retail change	No increase in total planning district VMT
Restaurant (square feet)	VTM with vs. without proposed retail change	No increase in total planning district VMT
Retail and Restaurant – Standalone (square feet)	VTM with vs. without proposed retail change	No increase in total planning district VMT
Convention (square feet)	VTM/Employee	No increase in regional VMT
Institutional	Exempt	N/A
Commercial Fishing	VTM/Employee	15% below regional average
Conservation Open Space	Exempt	N/A

Development	Evaluation Criteria	Recommended Impact Threshold
Waterside		
Recreational Boat Berthing	VTM with vs. without proposed slips change	No increase in total Planning District VMT

Source: Appendix D

¹ Retail is included in the OPR Technical Advisory, restaurants are not.

Transportation Projects

State CEQA Guidelines Section 15064.3 indicates that a VMT analysis should be conducted for transportation projects, including roadway capacity projects. For roadway capacity projects, agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements. The Technical Advisory also refers to the potential for induced travel and its associated effects. Induced travel occurs when improvements to a roadway facility enhance traffic operations and/or relieve congestion to the point at which travelers have a higher incentive to make a vehicular trip in lieu of a different mode of travel, or not taking the trip at all. Appendix 2 of the Technical Advisory identifies the following five factors that contribute to overall induced travel:

- **Changes in Trip Length:** Increasing roadway capacity could result in the ability to travel a longer distance in a shorter period of time, thereby making farther away destinations more attractive and resulting in longer trip lengths and more VMT.
- **Changes in Mode Choice:** People may shift to automobile use from other travel modes due to reduced automobile travel time stemming from a roadway capacity project, resulting in more automobile trips and increased VMT.
- **Route Changes:** Changing routing may lead to faster travel time that may attract more drivers to a new route, which can increase or decrease vehicle travel depending on whether it shortens or lengthens trips.
- **Newly Generated Trips:** Faster travel speeds that may result from added roadway capacity could induce additional vehicle trips, resulting in increased VMT.
- **Land Use Changes:** Faster travel times from added roadway capacity could lead to land development farther out on the corridor, leading to a long-term incremental increase in trip lengths, resulting in increased VMT.

These five factors are utilized to evaluate and determine if the individual transportation infrastructure projects included within the proposed PMPU are anticipated to induce travel and ultimately increase VMT. If a transportation project is found to potentially conflict with one of these factors and increase VMT, it is considered to have a significant impact. It should be noted that the Technical Advisory identifies approximately 27 types of transportation projects that would not likely lead to a substantial or measurable increase in vehicle travel, and therefore generally should not require an induced travel analysis (OPR 2018:20).

OPR's Technical Advisory explains "[w]hen evaluating impacts to multimodal transportation networks, lead agencies generally should not treat the addition of new transit users as an adverse impact" (OPR 2018:19). As also discussed in OPR's SB 743 amendment package transmittal letter "[l]egislative findings in Senate Bill 743 plainly state that CEQA can no longer treat vibrant communities, transit, and active transportation options as adverse environmental outcomes."

Therefore, increased transit use is not considered an environmental impact in this Draft PEIR. Existing light rail transit stops that serve the proposed PMPU area, from north to south, include the Washington Street, Middletown, County Center/ Little Italy, Santa Fe Depot, America Plaza, Seaport Village, Convention Center, Gaslamp Quarter, 12th and Imperial, Barrio Logan, Harborside, E Street, and H Street Stations. Additionally, the COASTER commuter train and Amtrak Pacific Surfliner provide regional and interregional access, respectively, to the proposed PMPU area. Lastly, several MTS bus routes serve the PMPU area, with several bus stops located in, or adjacent to, each of the planning districts.

Impacts of Water and Land Uses

Construction

SB 743 was established to help California reduce GHG emissions associated with the transportation sector by 2030 and 2050. The goals of SB 743 in establishing VMT as the new criteria for determining transportation impacts include reducing GHG emissions and traffic-related air pollution, promoting the development of multimodal transportation systems, and providing clean, efficient access to destinations. The legislative intent of SB 743 focuses on VMT reductions through smart growth and planning, and the OPR Technical Advisory includes thresholds for residential, office, retail, and mixed-use land use projects, as well as transportation projects. Thus, the temporary generation of construction traffic was not an intended focus of SB 743 for the purposes of analyzing VMT under CEQA. The possible construction of future developments associated with the proposed PMPU is analyzed qualitatively and future construction would result in construction-related jobs. These jobs would be temporary and intermittent throughout the Horizon Year of the proposed PMPU (i.e., 2050). The VMT generated from construction traffic, including trips related to employees and truck deliveries, is not expected to substantially increase VMT in the region because such trips already exist and would continue to exist with implementation of a certified PMPU.

In 2020, the San Diego County labor market represented a labor force of 1,593,900 with an 8.0% unemployment rate (EDD 2021), and construction and extraction jobs represented 4.3% of the total labor market for San Diego-Carlsbad, California Metropolitan Statistical Area (U.S. Bureau of Labor Statistics 2020). Given the size and geographic extent of the San Diego labor market, it is reasonable to conclude that construction workers would be drawn from the local labor market and would not require importation of outside skilled laborers. Thus, the VMT associated with construction would not be newly generated, but rather redistributed from other areas of the region as workers transition from one construction job to another. As such, construction-related VMT is redistribution of VMT that would otherwise be generated by other temporary construction sites throughout the region.

A future proponent for a site-specific development that is consistent with the proposed PMPU, would be required to obtain a temporary encroachment and/or right-of-way permit from the appropriate jurisdiction(s) prior to commencing construction (see Section 4.14.3.3 for applicable local regulations). In the City of San Diego, Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way, including sidewalks, as well as an accompanying traffic control plan. Future development within PD1, PD2, PD3, and PD4 would be subject to this requirement. For future development in PD8, the City of Imperial Beach requires a Temporary Encroachment Permit for any work performed in any public right-of-way of the city (Municipal Code Section 12.04.020). Lastly, future development in PD9 and PD10 would be subject to City of Coronado Municipal Code Section 52.10, which requires a Right-of-Way Permit for all work

on public property, such as repairs to sidewalks, curbs and gutters, driveway aprons, and parkways (the area between the sidewalk and the curb); or to place equipment in the public right-of-way, such as a crane placed in the street to transport materials to a second story. Municipal Code Section 52.10.060 includes specific requirements for traffic control around the work site (see Section 4.14.3.3 above for more details). In some cases, the approval of these permits requires the preparation and implementation of a traffic control plan for the management of traffic during the period in which the construction activities encroach into the right-of-way. This would also include sidewalks or bike routes if any of these facilities are affected by the encroachment. Traffic control measures could include the use of flaggers or barriers to direct the flow of vehicular and non-motorized travel along blocked lanes, or signs to direct traffic to established detours along adjacent roadways in the area. The use of traffic control measures may alter the routes vehicles travel but would not substantially affect the total trips or miles vehicles take, as it would not induce more travel or change the length of existing routes substantially. Nor would the use of traffic control measures as a result of an encroachment permit prevent the use of non-motorized transit options as they would be considered in the measures that are implemented. Compliance with these existing regulatory requirements would ensure that construction of future PMPU-related development would not result in an impact on transit or non-motorized travel pursuant to State CEQA Guidelines Section 15064.3. Therefore, construction-related VMT impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, one of three options within the North Embarcadero Subdistrict could be selected by the Board, if the proposed PMPU is approved. Each of these options shows alternative project components from that of the proposed PMPU, as illustrated in Figures 3-5, 3-6, and 3-7. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would not result in an increase in VMT due to construction, and impacts would be less than significant.

Construction activities associated with the new Waterfront Destination Park would involve vehicle trips related to construction workers and material delivery trips. However, similar to other construction under the proposed PMPU, these trips would be redistributed existing construction-related trips in the region; thus, they would not be anticipated to result in increased VMT. Additionally, construction activities that would encroach on public right-of-way would be required to comply with applicable local ordinances and policies regulating traffic control during construction. This would ensure encroachment into the public right-of-way would not interrupt traffic flow and result in an increase in VMT. Thus, construction under Option 1 would not result in any additional impacts related to increased VMT than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would not result in an increase in VMT due to construction, and impacts would be less than significant.

Construction activities associated with Option 2 would involve vehicle trips related to construction workers and material delivery trips. However, similar to other construction under the proposed PMPU, these trips would be redistributed existing construction-related trips in the region; thus, they would not be anticipated to result in increased VMT. Additionally, construction activities that would encroach on public right-of-way would be required to comply with applicable local ordinances and policies regulating traffic control during construction. This would ensure encroachment into the public right-of-way would not interrupt traffic flow and result in an increase in VMT. Thus, construction under Option 1 would not result in any additional impacts related to increased VMT than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would not result in an increase in VMT due to construction, and impacts would be less than significant.

Construction activities associated with the new park space that could be developed under Option 3 would involve vehicle trips related to construction workers and material delivery trips. However, similar to other construction under the proposed PMPU, these trips would be redistributed existing construction-related trips in the region; thus, they would not be anticipated to result in increased VMT. Additionally, construction activities that would encroach on public right-of-way would be required to comply with applicable local ordinances and policies regulating traffic control during construction. This would ensure encroachment into the public right-of-way would not interrupt traffic flow and result in an increase in VMT. Thus, construction under Option 1 would not result in any additional impacts related to increased VMT than buildout of the proposed PMPU without Option 3.

Operation

Implementation of the proposed PMPU would result in the operation of future development within each planning district, which would affect future VMT within the proposed PMPU area. The summary provided below is taken from Appendix D.

In the analysis below, the proposed PMPU's VMT is compared to the Base Year Regional Average and the 2050 Regional Average. As noted above, "[a] project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa" (OPR 2018:6). Nevertheless, the analysis also conservatively provides a comparison to the future 2050 Regional Average. As shown, the 2050 Regional Average is lower because it includes planned and reasonably foreseeable future VMT-reducing improvements and programs and is therefore a more conservative impact threshold than the Base Year Regional Average.

Planning District 1: Shelter Island

There are no TPAs currently located within PD1. Therefore, VMT-related impacts that may potentially be associated with the assumed future development allowed by the proposed PMPU within PD1 must be analyzed to identify if they may be associated with a potential transportation-related impact.

Table 4.14-5 summarizes the existing development and anticipated future growth under the proposed PMPU within PD1.

Table 4.14-5. Planning District 1 (Shelter Island) Projected Future Development

Water and Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Hotel (rooms)	1,119 rooms	0 rooms	1,119 rooms
Retail (square feet)	4.0 ksf	0.0 ksf	4.0 ksf
Restaurant (square feet)	56.9 ksf	0.0 ksf	56.9 ksf
Retail and Restaurant – Standalone (square feet)	51.3 ksf	0.0 ksf	51.3 ksf
Commercial Fishing	6.6 acres	4.5 acres	11.1 acres
Recreational Boat Berthing	2,430 slips	35 slips	2,465 slips

ksf = thousand square feet

Employment, Retail, Restaurant, and Recreational VMT-Related Impacts

As shown in Table 4.14-5, the PMPU does not propose any additional landside development in PD1, but would allow for the development of up to 35 additional recreational boat slips. It should be noted that this increase would only account for approximately 1.5 percent of the total supply of recreational boat slips within the planning district and would not appreciably change the overall acreage of the Recreational Berthing water use. While the addition of recreational boat berthing slips would not affect employment-based VMT, it would still generate additional vehicle trips and associated VMT from marina users. Because the threshold for recreational boat berthing uses is no net increase in VMT, any additional VMT generated would be considered a significant impact. Therefore, there is the potential that the additional boat slips could result in a net increase in VMT within PD1. This would be a significant impact without mitigation (**Impact-TRA-1**).

Transportation Projects VMT-Related Impacts

State CEQA Guidelines Section 15064.3(b)(2) provides that transportation projects that reduce or have no impact on VMT should be presumed to have a less-than-significant impact. As described in Chapter 3, the proposed PMPU includes transportation infrastructure improvements to provide facilities for alternative travel modes (i.e., pedestrian and bicycle) to help balance all transportation modes within PD1. These improvements would include development of mobility hubs, enhancing pedestrian crossing facilities, developing bike lanes, and reconfiguring parking (specific improvements within PD1 related to the transportation system are listed in further detail in the Impact Analysis for Threshold 1).

Because these improvements would provide additional multimodal transportation options and would promote alternatives to automobile use, they are expected to result in fewer automobile trips and reduce overall VMT within PD1. Therefore, the transportation improvements in PD1 would not induce travel, and the impacts on the transportation system would be less than significant.

Accessibility Improvements

Planned improvements that would enhance existing accessibility features or develop new multimodal transit features in PD1 would include the development of a Local Gateway Mobility Hub in the West Shelter Island Subdistrict, the development of a Connector Mobility Hub in the East

Shelter Island Subdistrict, and the development and operation of a bayfront circulator that would provide access points from PD1 to PD2 and PD3. These planned improvements would encourage non-automobile use and would reduce VMT. Therefore, impacts would be less than significant.

Planning District 2: Harbor Island

There are no TPAs currently located within PD2. Therefore, VMT-related impacts that may potentially be associated with the assumed future development allowed by the proposed PMPU, within the planning district must be analyzed to identify if they may be associated with a potential transportation-related impact.

Table 4.14-6 summarizes the existing development and anticipated future growth under the proposed PMPU within PD2.

Table 4.14-6. Planning District 2 (Harbor Island) Projected Future Development

Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Hotel (rooms)	1,285 rooms	3,060 rooms	4,345 rooms
Retail (square feet)	2.1 ksf	62.3 ksf	64.4 ksf
Restaurant (square feet)	57.2 ksf	62.3 ksf	119.5 ksf
Retail and Restaurant – Standalone (square feet)	46.6 ksf	25 ksf	71.6 ksf
Recreational Boat Berthing	2,228 slips	225 slips	2,453 slips

ksf = thousand square feet

Employment VMT

As shown in Table 4.14-6, implementation of the proposed PMPU would result in development in PD2. Based on the evaluation criteria outlined in Table 4.14-4, the hotel land uses in PD2 would use VMT/Employee as an evaluation criterion for VMT impacts. To calculate the average VMT/Employee generated by PD2, the proposed PMPU-related development assumptions were incorporated into the SANDAG Series 13 Year 2050 Regional Model. Table 4.14-7 presents the results of VMT/Employee generated by the growth in PD2 associated with the proposed PMPU.

Table 4.14-7. Planning District 2 (Harbor Island) VMT Efficiency Metrics for Impact Analysis of Employment Uses

Land Use	Metric	Commercial Uses VMT/Employee
Hotel	Base Year Regional Average	25.9
	Threshold ¹	22.0
	PMPU	20.3
	PMPU vs. Significance Threshold	1.7 miles under threshold (21.6% below San Diego Regional Average)
	2050 Regional Average	21.2
	Significance Threshold ¹	18.0
	PMPU	20.3
	PMPU vs. Significance Threshold	2.3 miles over threshold (4.2% below 2050 Regional Average)

Land Use	Metric	Commercial Uses VMT/Employee
	Significant Impact?	Yes

Source: SANDAG Regional Transportation Model, July 2019

¹15% below San Diego Regional Average (see Section 4.14.4.1, *Methodology*)

As shown in Table 4.14-7, the proposed PMPU's employment uses would be more than 15 percent below Base Year Regional Average VMT; however, employment uses do not achieve a VMT reduction of 15 percent below 2050 Regional Average. Therefore, the increase in employment-related VMT within PD2 would be significant (**Impact-TRA-2**).

Retail, Restaurant, and Recreational VMT

Based on the evaluation criteria outlined in Table 4.14-4 and the development summarized in Table 4.14-6, the evaluation criteria for VMT impacts associated with the proposed water and land use changes in PD2 are the net changes in total VMT without and with reasonably foreseeable retail, restaurant, and recreational boat berthing development. Impacts are considered significant if future development of retail, restaurant, and recreational uses under the proposed PMPU would result in an increase in the total VMT for the planning district. Table 4.14-8 presents the 2050 Total Planning District VMT with and without the proposed PMPU.

Table 4.14-8. Planning District 2 (Harbor Island) Total VMT for Impact Analysis of Retail, Restaurant, and Recreational Uses

Land Use	2050 Total VMT			Significant Impact?
	PMPU Buildout with No New Retail and Recreational Uses	PMPU Buildout	Net Growth	
Retail				
Restaurant	404,347	429,844	+25,497 (+6%)	Yes
Recreational Boat Berthing				

As shown, the Total VMT in PD2 is expected to increase by 25,497 miles with implementation of the proposed PMPU, which would exceed the applicable significance threshold for retail, restaurant, and recreational boat berthing uses of no net growth by approximately 6 percent. Therefore, potential impacts related to VMT for these uses in PD2 would be significant (**Impact-TRA-1**).

Transportation Projects VMT

State CEQA Guidelines Section 15064.3(b)(2) provides that transportation projects that reduce or have no impact on VMT should be presumed to have a less-than-significant impact. As described in Chapter 3, implementation of the proposed PMPU would include transportation infrastructure improvements to provide facilities for non-automobile travel modes to help balance all transportation modes along the North Harbor Drive corridor. The transportation-related planned improvements in PD2 would include the development of mobility hubs; reconfiguring of existing roadways to accommodate vehicle, pedestrian, bicycle, and transit traffic; and the development of a multi-use path (specific improvements within PD2 related to the transportation system are listed in further detail in the Impact Analysis for Threshold 1).

Because the Class I multi-use path and transit right-of-way improvements would provide additional multimodal transportation options and would promote alternatives to automobile use, they would be expected to result in fewer vehicle trips and reduce overall VMT. Therefore, the transportation improvements in PD2 would not induce travel, and the impacts on the transportation system would be less than significant.

However, the closure of the Laurel Drive/North Harbor Drive intersection is anticipated to improve roadway operations along Harbor Drive by relocating airport traffic to Laurel Street. Additionally, the dedication of a two-way on-airport roadway, as is proposed within SANDAG's forthcoming Airport Access Study and the *North Harbor Drive Mobility & Access Study* (Chen Ryan 2018) will improve vehicular access to the SDIA by reducing the number of conflict points and signalized intersections through which vehicles need to travel between the regional transportation network and the airport terminals. Therefore, these improvements will result in improved travel times along Harbor Drive, which may lead travelers to take vehicular trips in lieu of other multimodal options. Therefore, these improvements are considered to induce travel based on route changes and newly generated trips, as described in Section 4.14.4.2.

Because some of the roadway network changes proposed as part of the proposed PMPU in PD2 would induce travel, the full buildout of the proposed PMPU in PD2 would result in a potentially significant impact (**Impact-TRA-3**). It should be noted that the total amount of induced VMT that may be associated with these improvements cannot be accurately quantified at this time because they will be made in conjunction with implementation of the broad PMPU, and not as a specific project. Additionally, the SANDAG Series 13 Transportation Forecast Model is only calibrated to calculate changes in VMT at a macro-level, and localized improvements at specific intersection locations or along single roadway segments cannot be accurately projected by the model. Finally, as noted in Section 4.14.4.2, the significance threshold for induced travel is no increase in overall VMT, meaning that if these improvements would incentivize any new vehicular trips or any increase in trip lengths, they would result in a significant impact. Therefore, based upon the analysis above, given that the impact of these improvements cannot be accurately quantified at this time due to the programmatic nature of the project, and that the threshold does not allow any increase in VMT, these improvements will result in some increase in VMT, therefore, resulting in a significant impact.

Accessibility Improvements

Planned improvements that would enhance existing accessibility features or develop new multimodal transit features in PD2 would include the development of a Local Gateway Mobility Hub in the West Harbor Island Subdistrict, a Regional Mobility Hub in the East Harbor Island Subdistrict, and the development and operation of a bayfront circulator that would provide access points through PD2, creating connections to PD1 and PD3. These planned improvements would encourage non-automobile use and would reduce VMT. Therefore, impacts would be less than significant.

Planning District 3: Embarcadero

All of PD3 is currently located within a TPA. Based on Section 15064(b)(1) of the State CEQA Guidelines alone, all PD3 VMT-related impacts associated with the future ~~PMPU-authorized~~ development, consistent with the PMPU, would normally be are considered less than significant. However, the District applied more conservative criteria for the VMT analysis and, as explained below, the PMPU-related future development would result in an increase in retail-based VMT and transportation project-based VMT, which the District determined to be significant.

Table 4.14-9 summarizes the existing development and anticipated future growth under the proposed PMPU within PD3.

Table 4.14-9. Planning District 3 (Embarcadero) Projected Future Development¹

Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Hotel (rooms)	5,189 rooms	850 rooms	6,039 rooms
Retail (square feet)	19.2 ksf	30 ksf	49.2 ksf
Restaurant (square feet)	237.2 ksf	27.5 ksf	264.7 ksf
Retail and Restaurant – Standalone (square feet)	256.8 ksf	24.5 ksf	281.3 ksf
Commercial Fishing	4.0 acres	0.6 acres	4.6 acres
Recreational Boat Berthing	418 slips	150 slips	568 slips

ksf = thousand square feet

Employment VMT

As shown in Table 4.14-9, implementation of the proposed PMPU would result in future development in PD3. Based on the evaluation criteria outlined in Table 4.14-4, the VMT/Employee evaluation criterion would be applied to the hotel and commercial fishing land uses in PD3 to determine VMT impacts. To calculate the average VMT/Employee generated by PD3, the proposed PMPU land uses described in Chapter 3 were incorporated into the SANDAG Series 13 Year 2050 Regional Model, the results of which are provided in Table 4.14-10. See Appendix D for all model output results.

Table 4.14-10. Planning District 3 (Embarcadero) VMT Efficiency Metrics for Impact Analysis of Employment Uses

Land Use	Metric	Commercial Uses VMT/Employee (miles/person)
Hotel and Commercial Fishing	Base Year Regional Average	25.9
	Threshold ¹	22.0
	PMPU	15.1
	PMPU vs. Significance Threshold	6.8 miles under threshold (41.7% below Base Year Regional Average)
	2050 Regional Average	21.2
	Significance Threshold ¹	18.0
	PMPU	15.1
	PMPU vs. Significance Threshold	2.8 miles under threshold (28.8% below 2050 Regional Average)
	Significant Impact?	No

Source: SANDAG Regional Transportation Model, July 2019

¹15% below San Diego Regional Average (see Section 4.14.4.1)

As noted, all of PD3 is located within a TPA; therefore, pursuant to State CEQA Guidelines Section 15064.3(b)(1), VMT-related impacts associated with the future development allowed by the proposed PMPU in PD3 ~~are~~ would generally be presumed ~~to be~~ less than significant. Additionally, as

shown in Table 4.14-10, the proposed PMPU's employment uses achieve a VMT reduction greater than 15 percent below the Base Year Regional Average VMT and 2050 Regional Average. Therefore, the increase in employment-related VMT uses within PD3 would be less than significant.

Retail, Restaurant, and Recreational VMT

Based on the evaluation criteria outlined in Table 4.14-4 and the development summarized in Table 4.14-9, the evaluation criteria for VMT impacts associated with the proposed water and land use changes in PD3 are the net changes in total VMT without and with the proposed retail, restaurant, and recreational boat berthing water and land uses. Impacts are considered significant if future development of retail, restaurant, and recreational uses under the proposed PMPU would result in an increase in the total VMT for the planning district. Table 4.14-11 presents the 2050 Total VMT without and with the proposed PMPU for PD3.

Table 4.14-11. Planning District 3 (Embarcadero) Total VMT for Impact Analysis of Retail Uses

Land Use	2050 Total VMT		Net Growth	Significant Impact?
	PMPU Buildout with No New Retail and Recreational Uses	PMPU Buildout		
Retail				
Restaurant	597,051	607,685	10,643 (2%)	Yes
Recreational Boat Berthing				

As shown in Table 4.14-11, the total VMT in PD3 is expected to increase by 10,634 miles with implementation of the proposed PMPU, which would exceed the applicable significance threshold for retail, restaurant, and recreational boat berthing uses of no net growth by approximately 2 percent. Therefore, potential impacts related to VMT for these uses in PD3 would be significant prior to mitigation (**Impact-TRA-1**). It should be noted that these assumed uses will be located within a TPA, and therefore are presumed to have a less-than-significant impact, per State CEQA Guidelines Section 15064(b)(1). However, as these uses were identified to be associated with a net increase in VMT within the planning district, and may not be local serving in nature, their impact is still considered to be significant prior to mitigation.

Transportation Projects VMT

State CEQA Guidelines Section 15064.3(b)(2) provides that transportation projects that reduce or have no impact on VMT should be presumed to have a less-than-significant impact. As described in Chapter 3 the proposed PMPU includes transportation infrastructure improvements to provide facilities for non-automobile travel modes to help balance all travel modes along the North Harbor Drive corridor. The future transportation-related improvements that may be developed in PD3 include the reconfiguration of existing roadways for more efficient accommodation of vehicular traffic; and the extension of facilities for pedestrian, bicycle, and vehicle use on A Street to North Harbor Drive; and the closure of Market Street between West Harbor Drive and Columbia Street (specific improvements within PD3 related to the transportation system are listed in further detail in the Impact Analysis for Threshold 1).

Because the multi-use pedestrian and bicycle facilities and transit right-of-way improvements would provide additional multimodal transportation options and would promote alternatives to

automobile use, they would be expected to result in fewer automobile trips and reduce VMT. Therefore, future transportation improvements in PD3 would not induce travel, and the effect on the transportation system would be beneficial, helping to reduce transportation-related impacts.

However, ~~the closure of Market Street between West Harbor Drive and Columbia Street would reduce delay at the Harbor Drive/Market Street intersection, resulting in reduced travel times along Harbor Drive. This reduction in travel time could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Similarly, the proposed extension of A Street between Pacific Highway and North Harbor Drive would reduce vehicular demand along parallel roadways such as Ash Street and Broadway. The reduction in vehicular demand along these roadways would result in improved traffic operations along both corridors and could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT.~~ Thus, implementation of ~~these~~this improvements could potentially induce travel based on route changes and newly generated trips, as described in Section 4.14.4.2. Because some of the roadway network changes included in the proposed PMPU for PD3 would potentially induce travel, there would be a significant impact (**Impact-TRA-3**). It should be noted that the total amount of induced VMT that may be associated with ~~these~~this improvements cannot be accurately quantified at this time because ~~they~~it will be made in conjunction with implementation of the broad PMPU, and not as a specific project. Additionally, the SANDAG Series 13 Transportation Forecast Model is only calibrated to calculate changes in VMT at a macro-level, and localized improvements at specific intersection locations or along single roadway segments cannot be accurately projected by the model. Finally, as noted in Section 4.14.4.2, the significance threshold for induced travel is no increase in overall VMT, meaning that if these improvements would incentivize any new vehicular trips or any increase in trip lengths, they would result in a significant impact. Therefore, based upon the analysis above, given that the impacts of ~~these~~this improvements cannot be accurately quantified at this time due to the programmatic nature of the project, and that the threshold does not allow any increase in VMT, it is assumed that ~~these~~this improvements would result in some increase in VMT, therefore, resulting in a significant impact.

Accessibility Improvements

Future improvements that may occur in PD3 include enhancing existing accessibility features or developing new infrastructure for improved accessibility to the bayfront. These include the development of a Regional Mobility Hub in North Embarcadero Subdistrict, and the modification or replacement-in-kind of the existing Local Gateway Mobility Hub in the South Embarcadero Subdistrict. The proposed PMPU would also develop and operate a bayfront circulator in PD3 that would connect to PD1 and PD2. These future improvements would encourage non-automobile use throughout PD3, and would reduce automobile trips and reduce VMT related to implementation of the PMPU. However, because it is not yet known when the mobility hubs and the circulator would be implemented in relation to the roadway improvements that may induce automobile travel in PD3, these accessibility improvements may not reduce VMT-related impacts from implementation of the PMPU to a less-than-significant level.

Planning District 4: Working Waterfront

The entirety of PD4 is currently located within a TPA. Therefore, per Section 15064(b)(1) of the State CEQA Guidelines, all VMT-related impacts associated with future development within PD4 are considered to be less than significant.

Table 4.14-12 summarizes the existing and future land uses within PD4, and the anticipated growth associated with these land uses.

Table 4.14-12. Planning District 4 (Working Waterfront) Projected Future Development

Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Annual Cargo Throughput	1,015,894 metric tons ¹	3,659,673 metric tons	4,675,567 metric tons ³
Marine Terminal Employees	850 employees ²	524 employees ³	1,374 employees
Working Waterfront Employees	5,400 employees ²	0 employees	5,400 employees

¹ Based on 2016 wharfinger data provided by the District.

² Source: SANDAG Series 13 Model Data.

³ Source: TAMT EIR.

Employment VMT

As shown in Table 4.14-12, the proposed PMPU does not propose any change in the amount of annual cargo throughput or the number of marine terminal employees previously analyzed in the certified TAMT EIR and approved by the District in the TAMT Redevelopment Plan. Information related to TAMT and the TAMT Redevelopment Plan is included for informational purposes only. In addition, there would be no change in permanent Working Waterfront employees (i.e., shipyard employees) as a result of the proposed PMPU given the built-out nature of the Working Waterfront. Based on the evaluation criteria outlined in Table 4.14-4 and the land uses summarized in in Table 4.14-12, the significance criterion used to determine the VMT impacts associated with the increase in employment in PD4 would be VMT/Employee. To calculate the average VMT/Employee generated by PD4, the proposed PMPU land uses were incorporated into the SANDAG Series 13 Year 2050 Regional Model, the results of which are provided in Table 4.14-13. Model output results are presented in Appendix D.

Table 4.14-13. Planning District 4 (Working Waterfront) VMT Efficiency Metrics for Impact Analysis of Employment Uses

Land Use	Metric	Non-Commercial Uses VMT/Employee (miles/person)
Marine Terminal	Base Year Regional Average	25.9
	Threshold (for informational purposes) ¹	22.0
	PMPU	17.2
	PMPU vs. Significance Threshold	4.8 miles under threshold (33.6% below Base Year Regional Average)
	2050 Regional Average	21.2
	Significance Threshold ¹	18.0
	PMPU	17.2
	PMPU vs. Significance Threshold	0.8 miles under threshold (18.9% below 2050 Regional Average)
	Significant Impact?	No

Source: SANDAG Regional Transportation Model, July 2019

¹ 15% below San Diego Regional Average (see Section 4.14.4.1)

As shown in the table above, the proposed PMPU's employment uses achieve a VMT reduction greater than 15 percent below the 2050 Regional Average. Therefore, the increase in employment-related VMT within PD4 would be less than significant.

Retail, Restaurant, and Recreational VMT

Based on the land uses summarized in Table 4.14-12, there is no anticipated growth for retail, restaurant, or recreational uses in PD4. Therefore, conditions would remain the same as existing conditions, and impacts on the transportation system would be less than significant.

Transportation Projects VMT

State CEQA Guidelines Section 15064.3(b)(2) provides that transportation projects that reduce or have no impact on VMT should be presumed to have a less-than-significant impact. Transportation-related improvements that may occur in PD4 would include modification of existing roadways, including Harbor Drive and Cesar Chavez Parkway, and modification of multi-use pathways. Transit right-of-way improvements would provide additional multimodal transportation options and would promote alternatives to automobile use, and therefore would be expected to result in fewer automobile trips and reduce VMT. Transportation improvements in PD4 would not induce travel, and the effect on the transportation system would be beneficial, helping to reduce transportation-related impacts. Therefore, impacts would be less than significant.

Accessibility Improvements

There are no planned improvements that would be considered accessibility improvements proposed for PD4.

Planning District 7: South Bay

There are no planned improvements in PD7 under the proposed PMPU; therefore, VMT impacts would be less than significant.

Planning District 8: Imperial Beach Oceanfront

The entirety of PD8 is currently located within a TPA. Therefore, per Section 15064(b)(1) of the State CEQA Guidelines, all VMT-related impacts associated with future development within PD8 are considered to be less than significant.

Table 4.14-14 summarizes the existing and future land uses within PD8, as well as the anticipated growth associated with each land use.

Table 4.14-14. Planning District 8 (Imperial Beach Oceanfront) Projected Future Development

Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Retail and Restaurant (square feet)	2.0 ksf	18 ksf	20 ksf

ksf = thousand square feet

Employment VMT

As shown in Table 4.14-14, the existing retail and restaurant space is proposed to increase by 17,200 square feet in PD8 with implementation of the proposed PMPU. Based on the evaluation

criteria outlined in Table 4.14-4 and the water and land uses summarized in Table 4.14-13, there are no proposed water or land uses in PD8 that would be subject to the VMT/Employee criterion; therefore, the employment VMT in PD8 would be less than significant.

Retail, Restaurant, and Recreational VMT

Based on the evaluation criteria outlined in Table 4.14-4 and the future development summarized in Table 4.14-13, the evaluation criterion for VMT impacts is the net change in the Total VMT (with and without the proposed retail and restaurant uses). Table 4.14-15 presents the 2050 Total VMT without and with the proposed PMPU. Potential impacts would be significant if future development of retail and restaurant uses allowed under the proposed PMPU in PD8 resulted in an increase in the total VMT for the planning district.

Table 4.14-15. Planning District 8 (Imperial Beach Oceanfront) Total Regional VMT for Impact Analysis of Retail Uses

Land Use	2050 Total VMT		Net Growth	Significant Impact?
	PMPU Buildout with No New Retail and Recreational Uses	PMPU Buildout		
Retail and Restaurant	8,398	10,062	+1,664 (+20%)	Yes

As shown, the total VMT in PD8 is expected to increase by 1,664 miles with implementation of the proposed PMPU, which would exceed the applicable significance threshold for retail and restaurant uses of no net growth by approximately 20 percent. Therefore, potential impacts related to VMT for retail and restaurant uses would be significant (**Impact-TRA-1**). It should be noted that these assumed uses would be located within a TPA, and therefore are presumed to have a less-than-significant impact pursuant to State CEQA Guidelines Section 15064.3 (b)(1). However, because these uses were identified as being associated with a net increase in VMT within the planning district, and may not be local serving in nature, their impact is still considered to be significant.

Transportation Projects VMT

There are no proposed transportation improvements in PD8.

Accessibility Improvements

The accessibility improvements proposed for PD8 would include the development of a Connector Mobility Hub in the vicinity of Seacoast Drive and Elkwood Avenue. Implementation of a mobility hub would encourage non-automobile travel, which would reduce automobile trips and contribute to the reduction of VMT.

Planning District 9: Silver Strand

There are no TPAs currently located within PD9. Therefore, VMT related impacts that may potentially be associated with the assumed future development allowed by the proposed PMPU, within the Planning District, must be analyzed to identify if they may be associated with a potential transportation related impact.

Table 4.14-16 summarizes the existing and future land uses within the planning district, as well as the anticipated growth associated with the land use changes.

Table 4.14-16. Planning District 9 (Silver Strand) Projected Future Development

Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Hotel with Retail and Restaurant (rooms)	440 rooms	0 rooms	440 rooms
Retail (square feet)	0 ksf	0.0 ksf	0 ksf
Recreational Boat Berthing (slips)	164 slips	20 slips	184 slips

ksf = thousand square feet

Employment VMT

Based on the evaluation criteria outlined in Table 4.14-4 and the water and land uses summarized in Table 4.14-15, there are no proposed water or land uses in PD9 that would be subject to the VMT/Employee criterion; therefore, the employment VMT in PD9 would be less than significant.

Retail, Restaurant, and Recreational VMT

As shown in Table 4.14-16, the proposed PMPU would allow for the development of up to 20 additional recreational boat berthing slips. While their addition would not affect employment-based VMT, it would still generate additional vehicle trips and associated VMT from marina users. Because the threshold for recreational boat berthing uses is no net increase in VMT, any additional VMT generated would be considered a significant impact. Therefore, the addition of 20 recreational boat slips in PD9 would result in a significant VMT-related impact (**Impact-TRA-1**).

Transportation Projects VMT

There are no planned transportation improvements in PD9.

Accessibility Improvements

The accessibility improvements proposed for PD9 would include the development of a Connector Mobility Hub, or larger hub, in the Crown Isle Subdistrict. Implementation of a mobility hub would encourage alternatives to automobile travel, and therefore would reduce automobile trips and contribute to the reduction of VMT.

Planning District 10: Coronado Bayfront

The northern portion of PD10, around the ferry landing, is located within a TPA. Outside of this area the VMT-related impacts that may potentially be associated with the assumed future development, allowed by the proposed PMPU, must be analyzed to identify if they may be associated with a potential transportation-related impact.

Table 4.14-17 summarizes the existing and future land uses within PD10, as well as the anticipated growth associated with the land use changes.

Table 4.14-17. Planning District 10 (Coronado Bayfront) Project Future Development

Land Use	Existing Quantity	Planned Growth Under PMPU	Total Quantity
Hotel Only (rooms)	300 rooms	0 rooms	300 rooms
Retail (square feet)	1.6 ksf	0.0 ksf	1.6 ksf
Restaurant (square feet)	17.3 ksf	0.0 ksf	17.3 ksf
Retail and Restaurant – Standalone (square feet)	47.5 ksf	0.0 ksf	47.5 ksf
Recreational Boat Berthing	364 slips	55 slips	419 slips

ksf = thousand square foot

Employment VMT

Based on the evaluation criteria outlined in Table 4.14-4 and the water and land uses summarized in Table 4.14-16, there are no proposed water or land uses in PD10 that would be subject to the VMT/Employee criterion. Therefore, the employment VMT in PD10 would be less than significant.

Retail, Restaurant, and Recreational VMT

As shown in Table 4.14-17, the proposed PMPU would allow for the development of up to 55 additional recreational boat berthing slips. While their addition would not affect employment-based VMT, it would still generate additional vehicle trips and associated VMT from marina users. Because the threshold for recreational boat berthing uses is no net increase in VMT, any additional VMT generated would be considered a significant impact. Therefore, the addition of 55 recreational boat slips in PD10 would result in a significant VMT-related impact (**Impact-TRA-1**).

Transportation Projects VMT

There are no planned transportation improvements in PD10.

Accessibility Improvements

The accessibility improvements proposed for PD10 would include the development of a Local Gateway Mobility Hub or larger hub, near the existing Coronado Ferry Landing. Implementation of a mobility hub would encourage alternatives to automobile travel, and therefore would reduce automobile trips and contribute to the reduction of VMT.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, one of three options within the North Embarcadero Subdistrict could be selected by the Board, if the proposed PMPU is approved. Each of these options shows alternative project components from that of the proposed PMPU, as illustrated in Figures 3-5, 3-6, and 3-7. Operational impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU would result in significant impacts related to the increase Total VMT associated with future development consistent with the proposed PMPU in PD1, PD2, PD3, PD8, PD9, and PD10, and increase in VMT/Employee in PD2 (**Impact-TRA-1** and **Impact-TRA-2**). **Impact-TRA-1** would still occur in PD3 under Option 1.

Employment VMT

Because employment-based land uses proposed under this option would be consistent with those analyzed above, the land use assumptions for Option 1 would be consistent with the findings outlined in Table 4.14-10. It should be noted that all of PD3 is located within 0.5 mile of a major transit stop. Therefore, pursuant to State CEQA Guidelines Section 15064.3(b)(1), the transportation-related impacts associated with the proposed employment land uses under Option 1 would be considered to have a less-than-significant transportation impact.

Retail, Restaurant, and Recreational VMT

Option 1 proposes to increase the Commercial Recreation land uses within PD3 by 1.5 acres compared to the analysis in Table 4.14-11. This increase in land uses would contribute to the impacts related to VMT for retail and recreational uses in PD3. Therefore, potential impacts related to VMT for these uses in PD3 would be significant (**Impact-TRA-1**). These assumed uses would be located within a TPA and therefore can be considered to have a less-than-significant impact. However, because these uses are associated with a net increase in VMT within the planning district, and may not be local-serving in nature, their impact is considered to be significant. Therefore, the transportation-related impacts associated with the proposed retail land uses under Option 1 are considered to be significant.

Transportation Projects VMT

Option 1 would include the same transportation infrastructure improvements as discussed above in the analysis for PD3, but would also include the closure of North Harbor Drive between G Street and Broadway.

Because the multi-use pedestrian and bicycle facilities and transit right-of-way improvements would provide additional multimodal transportation options and would promote alternatives to automobile use, they would be expected to result in fewer automobile trips and reduce VMT. Therefore, transportation improvements in PD3 would not induce travel, and the effect on the transportation system would be beneficial, helping to reduce transportation-related impacts.

However, the closure of Market Street between West Harbor Drive and Columbia Street would reduce delay at the Harbor Drive/Market Street intersection, resulting in reduced travel times along Harbor Drive. This reduction in travel time could incentivize travelers to take vehicular

trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Similarly, the proposed extension of A Street between Pacific Highway and North Harbor Drive would reduce vehicular demand along parallel roadways such as Ash Street and Broadway. The reduction in vehicular demand along these roadways would result in improved traffic operations along both corridors and could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Thus, implementation of ~~these~~this improvements could potentially induce travel based on route changes and newly generated trips, as described in Section 4.14.4.2. Because some of the roadway network changes included in the proposed PMPU for PD3 would potentially induce travel, there would be a significant impact (**Impact-TRA-3**). It should be noted that the total amount of induced VMT that may be associated with ~~these~~this improvements cannot be accurately quantified at this time because ~~they~~it would be made in conjunction with implementation of the proposed PMPU, and not in isolation. Additionally, the SANDAG Series 13 Transportation Forecast Model is only calibrated to calculate changes in VMT at a macro-level, and localized improvements at specific intersection locations or along single roadway segments cannot be accurately projected by the model. Finally, as noted in Section 4.14.4.2, the significance threshold for induced travel is no increase in overall VMT, meaning that if ~~these~~this improvements would incentivize any new vehicular trips or any increase in trip lengths, ~~they~~it would result in a significant impact. Therefore, because the impacts of ~~these~~this improvements cannot be accurately quantified at this time and the threshold does not allow any increase in VMT, to be conservative, it is assumed that ~~these~~this improvements would result in some increase in VMT, and the impact would be significant.

Accessibility Improvements

Planned improvements for PD3 under Option 1 would be the same as described in the above analysis for PD3. These planned improvements would encourage non-automobile use throughout PD3, and would reduce automobile trips and reduce VMT associated with the implementation of the PMPU (**Impact-TRA-1** and **Impact-TRA-2**). However, because it is not yet known when the mobility hubs and the circulator would be implemented in relation to the roadway improvements that may induce automobile travel in PD3, these accessibility improvements would not reduce potential VMT-related impacts to a less-than-significant level.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU would result in significant impacts related to the increase Total VMT associated with future development consistent with the

proposed PMPU in PD1, PD2, PD3, PD8, PD9, and PD10, and the increase in VMT/Employee in PD2 (**Impact-TRA-1** and **Impact-TRA-2**). **Impact-TRA-1** would still occur in PD3 under Option 2.

Employment VMT

Because employment-based land uses proposed under this option would be consistent with those analyzed above, the land use assumptions for Option 2 would be consistent with the findings outlined in Table 4.14-10. All of PD3 is located within 0.5 mile of a major transit stop. Therefore, pursuant to State CEQA Guidelines Section 15064.3(b)(1), the transportation-related impacts associated with the proposed employment land uses under Option 2 would be considered to have a less-than-significant transportation impact.

Retail, Restaurant, and Recreational VMT

As shown in Table 4.14-11, the total VMT in PD3, under the proposed PMPU, is expected to increase by 10,634 miles, which would exceed the applicable significance threshold for retail, restaurant, and recreational boat berthing uses of no net growth by approximately 2 percent. Even though Option 2 proposes to decrease the Commercial Recreation land uses within PD3 by 3.3 acres (3.5 percent), it is assumed that this decrease would only have a nominal effect on the total VMT generated within PD3, and thus would be consistent with the findings in Table 4.14-11. Therefore, potential impacts related to VMT for these uses in PD3 would be significant (**Impact-TRA-1**). These assumed uses would be located within a TPA and therefore can be considered to have a less-than-significant impact. However, because these uses were identified to be associated with a net increase in VMT within the planning district, and may not be local-serving in nature, their impact is considered to be significant. Therefore, the transportation-related impacts associated with the proposed retail land uses under Option 2 are considered to be significant.

Transportation Projects VMT

Option 2 would include the same transportation infrastructure improvements as discussed above in the analysis for PD3.

Because the multi-use pedestrian and bicycle facilities and transit right-of-way improvements would provide additional multimodal transportation options and would promote alternatives to automobile use, they would be expected to result in fewer automobile trips and reduce VMT. Therefore, transportation improvements in PD3 would not induce travel, and the effect on the transportation system would be beneficial, helping to reduce transportation-related impacts.

However, ~~the closure of Market Street between West Harbor Drive and Columbia Street would reduce delay at the Harbor Drive/Market Street intersection, resulting in reduced travel times along Harbor Drive. This reduction in travel time could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Similarly,~~ the proposed extension of A Street between Pacific Highway and North Harbor Drive would reduce vehicular demand along parallel roadways such as Ash Street and Broadway. The reduction in vehicular demand along these roadways would result in improved traffic operations along both corridors and could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Thus, implementation of ~~these~~ this improvements could potentially induce travel based on route changes and newly generated trips, as described in Section 4.14.4.2. Because some of the roadway network changes included in the proposed PMPU for PD3 would potentially induce

travel, there would be a significant impact (**Impact-TRA-3**). It should be noted that the total amount of induced VMT that may be associated with ~~these~~this improvements cannot be accurately quantified at this time because ~~they~~it will be made in conjunction with implementation of the proposed PMPU, and not in isolation. Additionally, the SANDAG Series 13 Transportation Forecast Model is only calibrated to calculate changes in VMT at a macro-level, and localized improvements at specific intersection locations or along single roadway segments cannot be accurately projected by the model. Finally, as noted in Section 4.14.4.2, the significance threshold for induced travel is no increase in overall VMT, meaning that if ~~these~~this improvements would incentivize any new vehicular trips or any increase in trip lengths, ~~they~~it would result in a significant impact. Therefore, because the impacts of ~~these~~this improvements cannot be accurately quantified at this time and the threshold does not allow any increase in VMT, to be conservative, it is assumed that ~~these~~this improvements would result in some increase in VMT, and impacts would be significant.

Accessibility Improvements

Planned improvements for PD3 in Option 2 would be the same as described in the above analysis for PD3. These planned improvements would encourage non-automobile use throughout PD3, and would reduce automobile trips and reduce VMT associated with the implementation of the PMPU (**Impact-TRA-1** and **Impact-TRA-2**). However, because it is not yet known when the mobility hubs and the circulator would be implemented in relation to the roadway improvements that may induce automobile travel in PD3, these accessibility improvements would not reduce potential VMT-related impacts to a less-than-significant level.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU would result in significant impacts related to the increase in Total VMT associated with future development consistent with the proposed PMPU in PD1, PD2, PD3, PD8, PD9, and PD10, and the increase in VMT/Employee in PD2 (**Impact-TRA-1** and **Impact-TRA-2**). **Impact-TRA-1** would still occur in PD3 under Option 3.

Employment VMT

Because employment-based land uses proposed under this option would be consistent with those analyzed above, the land use assumptions for Option 3 would be consistent with the findings outlined in Table 4.14-10. All of PD3 is located within 0.5 mile of a major transit stop. Therefore, pursuant to State CEQA Guidelines Section 15064.3(b)(1), the transportation-related impacts associated with the proposed employment land uses under Option 3 would be considered to have a less-than-significant transportation impact.

Retail, Restaurant, and Recreational VMT

As shown in Table 4.14-11, the total VMT in PD3, under the proposed PMPU, is expected to increase by 10,634 miles, which would exceed the applicable significance threshold for retail, restaurant, and recreational boat berthing uses of no net growth by approximately 2 percent. Option 3 proposes to increase the Commercial Recreation land uses within PD3 by 0.8 acre (0.9%) compared to the analysis in Table 4.14-11. This increase in Commercial Recreation land uses would contribute to the impacts related to VMT for the retail and recreational uses in PD3. Therefore, potential impacts related to VMT for these uses in PD3 would be significant (**Impact-TRA-1**). These assumed uses would be located within a TPA and therefore can be considered to have a less-than-significant impact. However, because these uses were identified to be associated with a net increase in VMT within the planning district, and may not be local serving in nature, their impact is considered to be significant. Therefore, the transportation-related impacts associated with the proposed retail land uses under Option 3 are considered to be significant.

Transportation Projects VMT

Option 3 would include the same transportation infrastructure improvements as discussed above in the analysis for PD3, but would also include the realignment of Harbor Drive from Hawthorne Street to B Street.

Because the multi-use pedestrian and bicycle facilities and transit right-of-way improvements would provide additional multimodal transportation options and would promote alternatives to automobile use, they would be expected to result in fewer automobile trips and reduce VMT. Therefore, transportation improvements in PD3 would not induce travel, and the effect on the transportation system would be beneficial, helping to reduce transportation-related impacts.

However, ~~the closure of Market Street between West Harbor Drive and Columbia Street would reduce delay at the Harbor Drive/Market Street intersection, resulting in reduced travel times along Harbor Drive. This reduction in travel time could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Similarly, the proposed extension of A Street between Pacific Highway and North Harbor Drive would reduce vehicular demand along parallel roadways such as Ash Street and Broadway. The reduction in vehicular demand along these roadways would result in improved traffic operations along both corridors and could incentivize travelers to take vehicular trips in lieu of other multimodal options, resulting in induced travel demands and the generation of additional VMT. Thus, implementation of these improvements could potentially induce travel based on route changes and newly generated trips, as described in Section 4.14.4.2. Because some of the roadway network changes included in the proposed PMPU for PD3 would potentially induce travel, there would be a significant impact (**Impact-TRA-3**). It should be noted that the total amount of induced VMT that may be associated with these improvements cannot be accurately quantified at this time because they it would be made in conjunction with implementation of the proposed PMPU, and not in isolation. Additionally, the SANDAG Series 13 Transportation Forecast Model is only calibrated to calculate changes in VMT at a macro-level, and localized improvements at specific intersection locations or along single roadway segments cannot be accurately projected by the model. Finally, as noted in Section 4.14.4.2, the significance threshold for induced travel is no increase in overall VMT, meaning that if these improvements would incentivize any new vehicular trips or any increase in trip lengths, they it would result in a significant impact. Therefore, because the impacts of these improvements cannot be accurately quantified at this time and the~~

threshold does not allow any increase in VMT, to be conservative, it is assumed that ~~these~~this improvements would result in some increase in VMT, and impacts would be significant.

Accessibility Improvements

Planned improvements for PD3 in Option 3 would be the same as described in the above analysis for PD3. These planned improvements would encourage non-automobile use throughout PD3, and would reduce automobile trips and reduce VMT associated with the implementation of the PMPU (**Impact-TRA-1** and **Impact-TRA-2**). However, because it is not yet known when the mobility hubs and the circulator would be implemented in relation to the roadway improvements that may induce automobile travel in PD3, these accessibility improvements would not reduce potential VMT-related impacts to a less-than-significant level.

Operation Impact Summary

Future development under the proposed PMPU would result in a net increase in VMT in PD1 PD2, PD3, PD8, PD9, and PD10 as a result of developing retail, restaurant, and recreational land uses in the future. This would result in a conflict with State CEQA Guidelines Section 15064.3, subdivision (b) and thus a significant impact related to the proposed PMPU (**Impact-TRA-1**). Potential significant impacts would occur as a result of implementation of the proposed PMPU. In PD2, the proposed PMPU's employment uses do not achieve a VMT reduction of 15 percent below the 2050 Regional Average. Therefore, the significant impact associated with the increase in employment-related VMT in PD2 would result in a significant impact for the proposed PMPU (**Impact-TRA-2**). Additionally, improvements to existing transportation infrastructure in PD2 and PD3 would increase VMT by making vehicle trips more attractive within these planning districts and thereby induce travel. This would result in a conflict with State CEQA Guidelines Section 15064.3, subdivision (b) and thus a significant impact related to the proposed PMPU (**Impact-TRA-3**).

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies listed in Section 4.14.4.3 would not result in impacts related to the increase in VMT that would conflict with or be inconsistent with State CEQA Guidelines Section 15064.3 subdivision (b). The proposed policies would support the development of multimodal infrastructure to encourage the use of all non-automobile transit options (pedestrian, bicycle, public transit routes), which would reduce automobile trips in the proposed PMPU area, and contribute to the reduction of VMT. For instance, a network of pathways and water-based transfer points will connect the waterfront (WLU Policy 3.1.1); the District will coordinate with transportation agencies to explore opportunities to expand accessible transit service to Tidelands (M Policy 1.1.9); ~~the District certain development will develop and comply with project-specific TDM guidelines and require development to comply with such guidelines,~~ with the intent to reduce dependence on single-occupancy vehicles and reduce vehicle miles traveled to, and from, and within Tidelands the proposed development site (M Policy 1.1.11); and the District will require the planning, designing, and implementation of a network of mobility hubs (Regional, Local Gateway, and Connector) that provide the opportunity for users to change from one mode of travel to another (M Policy 1.2.1).

Impact Determination and Mitigation

Implementation of the proposed PMPU would conflict with or be inconsistent with State CEQA Guidelines Section 15064.3, subdivision (b).

Significant Impacts

Impact-TRA-1: Increase in Total VMT Associated with Future Development Consistent with the Proposed PMPU. Future development under the proposed PMPU would result in a net increase in VMT in PD1, PD2, PD3, PD8, PD9, and PD10 as a result of developing retail, restaurant, and recreational land uses in the future. This would result in a conflict with State CEQA Guidelines Section 15064.3, subdivision (b).

Impact-TRA-2: Increase in VMT/Employee Associated with Future Development Consistent with the Proposed PMPU. Future development under the proposed PMPU would result in an average VMT per employee above the 2050 Regional Average within PD2. This would result in a conflict with State CEQA Guidelines Section 15064.3, subdivision (b).

Impact-TRA-3: Increase in VMT Due to Transportation Infrastructure Improvements Associated with the Proposed PMPU. Implementation of the proposed PMPU would include improvements to existing transportation infrastructure in PD2 and PD3, which would increase VMT by making vehicle trips more attractive within these planning districts and thereby inducing travel. This would result in a conflict with State CEQA Guidelines Section 15064.3, subdivision (b).

Mitigation Measures

For **Impact-TRA-1**, **Impact-TRA-2**, and **Impact-TRA-3**:

MM-TRA-1: Establish a Vehicle Miles Traveled (VMT) Infrastructure Mitigation Program. ~~Transportation Impact Fee Program.~~ Consistent with ECON Policy 1.2.6 of the proposed PMPU, prior to approval of the first future development project allowed under the proposed PMPU, To reduce vehicle miles traveled (VMT), within three years of the PMPU's certification, the District shall establish ~~an impact fee program and implement a VMT Infrastructure Mitigation Program that provides for the funding installation of transportation multi-modal infrastructure improvements that would reduce VMT, including both existing and future VMT, within the District. This program may include, but not be limited to, the following improvements:~~ mobility hubs; transit facilities; bicycle improvements; pedestrian improvements; Bayfront Circulator, hotel shuttle service, or comparable service; and/or other mobility-related infrastructure improvements and amenities, as specified in the proposed PMPU. The impact fee program will District may finance these improvements through one or more of the following methods:

- Transportation Impact Fees;
- District-Wide General In-Lieu Fee Program for Public Benefits (e.g., mobility improvements, and parks and recreational improvements);
- Private Investments;
- Public Investments;
- Private-Public Partnerships, based on a District-established schedule;
- Conditions of approval to CDPs for future development, related to funding VMT-reducing measures; or
- Other funding mechanisms (e.g., grant awards).

The VMT Infrastructure Mitigation Program shall impact fee program will identify needed improvements throughout the PMPU area consistent with Chapter 4, *Baywide Development Standards*, of the proposed PMPU and include guidelines to determine the proportionate fair-share contributions made by public and private project proponents, on a case-by-case basis, based on a project's contribution to VMT within the proposed PMPU area. ~~These improvements may be implemented through a combination of private investments, public investments, and private-public partnerships based on a schedule established by the District to minimize and offset VMT-related impacts on the transportation system from future PMPU-related development. The fee program shall be in place prior to approval of the first future development project associated with the proposed PMPU.~~

The VMT Infrastructure Mitigation Program shall be designed to achieve the performance criteria identified in Table 4.14-4. *Evaluation Criteria and Impact Thresholds by Proposed Planned Improvements*, of the Final PEIR and any District updates thereto.

~~MM-TRA-2: Contribute Fair Share Impact Fees.~~ During project specific environmental review for all future projects proposed consistent with the PMPU, the project proponent(s) shall prepare project-specific studies to identify the appropriate fees that will constitute a fair share contribution based on the impacts of individual projects in accordance with the fee program established under **~~MM-TRA-1~~**. Once the appropriate fees have been determined by the District, the project proponent shall pay its proportionate fair share contribution to the District prior to the issuance of a building permit. Payment into the fee program based upon pre-established formulas developed as part of **~~MM-TRA-1~~** will serve as mitigation for project-specific VMT-related impacts. Project proponents shall also contribute development impact fees to the applicable member cities that have jurisdiction over the issuance of building permits for future projects. This would include the City of San Diego (Municipal Code Section 142.0640), City of Imperial Beach (Municipal Code Section 15.48), and City of Coronado (Municipal Code Section 8.20). The project proponent shall pay the applicable development impact fee required by the local jurisdiction at the time required by the local jurisdiction.

MM-TRA-2: Project Level Analysis and Mitigation. Prior to the approval of a future project that generates more than 110 daily trips and is located outside of a Transit Priority Area, the project proponent shall identify the project-level VMT impacts using significance criteria identified in Table 4.14-4. *Evaluation Criteria and Impact Thresholds by Proposed Planned Improvements*, of the Final PEIR and any District updates thereto. In calculating "daily trips," the District may consider the ability of the project to offset other existing trips. Furthermore, the project proponent shall reduce project-induced VMT impacts either through participation in the District's VMT Infrastructure Mitigation Program (**MM-TRA-1**) or by implementation of VMT-reducing infrastructure that mitigates the project's VMT-related impacts to less than significant, and is consistent with the PMPU and the District's VMT Infrastructure Program (if already established at the time of mitigation). Development that is proposed prior to the establishment of the VMT Infrastructure Mitigation Program shall establish its own mitigation for project-specific VMT impacts to reduce the project-related VMT to 15 percent below the regional average (for future employment VMT generating uses [e.g., hotels] in PD2) or to no net increase in VMT (for future retail, restaurant, and recreational projects in PD2, PD3, PD8, PD9, or PD10). (This percentage reduction requirement may be modified in the future based on best available VMT-related information for the San Diego region, including but not limited to, VMT reduction targets identified as part of SANDAG's Regional Plan and future updates thereto [including the Sustainable Communities' Strategy] and any additional guidelines or amendments thereto

issued by the State). The VMT mitigation measures (participation in **MM-TRA-1** or construction of VMT reducing infrastructure) shall be subject to District review and approval, and implementation of such VMT measures shall occur prior to the issuance of the first certificate of occupancy. Future developments may be screened out from conducting a VMT impact analysis, and assumed to have a less than significant impact, if they are located within a TPA, are located in an area (Traffic Analysis Zone or Census Tract) where the base year VMT per Employee is below the current significance threshold, generate less than 110 daily trips, or will generate the same or less daily VMT than the previous land uses on the site.

MM-TRA-3: Implement a Transportation Demand Management Plan. Prior to the approval of a future development projects proposed in PD2, PD3, PD8, PD9, or PD10 that generates more than 110 daily trips and is located outside of a Transit Priority Area, the project proponent shall prepare and submit a Transportation Demand Management (TDM) Plan to the District for approval a TDM Plan as listed in the most recent Regional Transportation Plan prepared by SANDAG. In calculating “daily trips,” the District may consider the ability of the project to offset other existing trips. The TDM Plan shall include measures, to reduce project-related VMT. Measures may include such as ridesharing initiatives (e.g., carpooling), promoting alternative work schedules and telework, subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit. The project shall to reduce its projected VMT either to 15 percent below the regional average (for future employment VMT generating uses [e.g., hotels] in PD2) or to no net increase in VMT (for future retail, restaurant, and recreational projects in PD2, PD3, PD8, PD9, or PD10). (This percentage reduction requirement may be modified in the future based on best available VMT-related information for the San Diego region, including VMT reduction targets identified as part of SANDAG’s Regional Plan and future updates thereto [including the Sustainable Communities’ Strategy] and any additional guidelines or amendments thereto issued by the State). The TDM Plan will be subject to the District’s review and approval and no development shall proceed until the TDM Plan is deemed acceptable to the District. The project proponent shall implement the TDM Plan prior to and during project operations to ensure that the VMT performance standards stated in this measure are met throughout the operational life of the project.

Level of Significance After Mitigation

In order to reduce potential impacts related to the increase of Total VMT (**Impact-TRA-1**) and VMT/Employee (**Impact-TRA-2**), as well as increased VMT induced by certain transportation infrastructure improvements in PD2 and PD3 (**Impact-TRA-3**), **MM-TRA-1** requires the District to develop an impact fee program establish and implement a VMT infrastructure mitigation program; consistent with proposed PMPU ECON Policy 1.2.6, to fund that provides for the installation of transportation multi-modal infrastructure improvements that would reduce both existing and future VMT. **MM-TRA-1** requires this program to be established within three years of the PMPU’s certification prior to approval of the first future development project associated with the proposed PMPU. Once the impact VMT infrastructure mitigation program has been developed, project proponents would be required may to make a proportionate fair share contribution to participate in the District’s VMT infrastructure mitigation implemented impact fee program to develop and expand install VMT-reducing infrastructure, including, but not limited to, mobility hubs or provide VMT-reducing infrastructure to reduce project specific VMT impacts (**MM-TRA-2**). However, because the timing and exact location of infrastructure improvements have not been identified, and the funding

programs have not yet been implemented, it cannot be guaranteed that the necessary improvements would be implemented, prior to the operation of any new development under the proposed PMPU.

Implementation of a TDM Plan (**MM-TRA-3**) would also provide incentives to use alternative modes of transportation instead of individual vehicles, which would reduce VMT induced by development projects and improvements to transportation infrastructure. However, it is not possible to quantify the effectiveness of the recommended mitigation measures because the location, timing, and design of new development allowed under the proposed PMPU is unknown at this time. Additionally, future developments may be screened-out from implementing a transportation demand management plan, and assumed to have a less than significant impact, if they: 1) are within a TPA; 2) are within an area (Traffic Analysis Zone or Census Tract) where the base year VMT per Employee is below the current significance threshold; 3) generate less than 110 daily trips; or 4) will generate the same or less daily VMT than the previous land uses on the site.

Thus, after the incorporation of mitigation, **Impact-TRA-1**, **Impact-TRA-2**, and **Impact-TRA-3** would remain significant and unavoidable.

<i>Threshold 3: Substantially increase hazards due to a geometric design feature or incompatible uses?</i>

Impact Analysis

Impacts on transit circulation would occur if the proposed PMPU would substantially increase hazards due to a design feature or incompatible uses. Similarly, impacts related to pedestrian and bicycle circulation would occur if the proposed PMPU would substantially increase hazards due to a design feature. Impacts on the pedestrian and bicycle circulation system were considered through a review of the proposed water and land use scenarios and existing pedestrian and bicycle facilities within each planning district.

Impacts of Water and Land Uses

Future transportation improvement projects allowed under the proposed PMPU would result in physical improvements to existing pedestrian and bicycle facilities, as well as existing road right-of-way, to improve accessibility, encourage the use of public transit and multimodal facilities, and decrease conflict between vehicles, bicycles, and pedestrians. These improvements would occur in PD1, PD2, PD3, and PD4 (as described in Threshold 1), and would be constructed throughout the 30-year planning period of the proposed PMPU (i.e., 2050). The multimodal infrastructure improvements would create a safer environment for bicyclists and pedestrians within these three planning districts. Roadway improvements proposed in each of these planning districts are intended to improve efficiency of travel for vehicles and accommodate pedestrians, bicyclists, and/or the bayfront circulator or other public transit usage. These proposed transportation improvement projects have not yet been designed; however, each project would be designed in accordance with applicable standards, including the City of San Diego's *Street Design Manual* for roadway and bicycle improvement projects (given their location within the City of San Diego), and any applicable Baywide Development Standards identified in Chapter 4 of the proposed PMPU for pedestrian facility (e.g., promenade) projects. Final plans for transportation improvement projects would be subject to the review and approval by the City of San Diego's traffic engineer (for roadway and bicycle facility improvements) and/or the District (for pedestrian facility improvements) to ensure the proposed improvement would not result in hazardous design features.

In addition, mobility hubs are proposed in PD1, PD2, PD3, PD9, and PD10. Mobility hubs would provide access to multiple forms of transit, including both land-based transit (e.g., the District's Bayfront Circulator and/or MTS transit routes) and water-based transit (e.g., ferries or water taxis) and a direct connection to the various amenities within the proposed PMPU area. Mobility hubs would also provide safe and well-delineated pedestrian bicycle paths to nearby attractions and uses. The proposed PMPU does not identify the exact location and timing for development of mobility hubs, although potential locations of mobility hubs are provided within the specific planning district elements within Chapter 5 of the proposed PMPU. However, at the time of implementation, mobility hub plans must be designed in accordance with all applicable standards, depending on the types of transit connections proposed, including the California Building Code, City of San Diego's *Street Design Manual* (PD1, PD2, PD3), and the City of Coronado *Comprehensive Active Transportation Plan and Complete Streets Strategy* and Municipal Code Section 52.08 (PD9, PD10). Final plans for the mobility hubs would be subject to the review and approval by either the City of San Diego (PD1, PD2, PD3) or the City of Coronado traffic engineer (PD9, PD10), depending on the location of the mobility hub. Compliance with these existing requirements and planning processes would ensure impacts would be less than significant.

Future development under the proposed PMPU would result in new or expanded visitor-serving development including, but not limited to, hotels, retail shops, commercial recreational uses, marinas and associated amenities, restaurants, and parks. The construction of these future development projects could result in certain elements, such as driveways, access roads, barriers, parking lots, or other circulation-related features. However, all future development projects would be required to comply with the California Building Code, as adopted by the City of San Diego (Municipal Code Section 145.0101), the City of Imperial Beach (Municipal Code Section 15.06.010), and the City of Coronado (Municipal Code Section 70.20), which establish regulations for the safe construction and maintenance of buildings and structures. Future development projects would also have to comply with local jurisdictions regulations related to the design of public right-of-way including the City of San Diego *Street Design Manual*, City of Coronado Municipal Code Section 52.01, and City of Imperial Beach Municipal Code Section 12.04. Lastly, future development projects would also be required to comply with the Baywide Development Standards outlined in Chapter 4 of the proposed PMPU, as well as the subdistrict-specific development standards outlined in Chapters 5.1 to 5.10. The proposed PMPU development standards would establish development requirements for pathways, scenic vista areas, view corridor extensions, and structures for future development under the proposed PMPU. Compliance with these existing requirements and planning processes would ensure impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, one of three options within North Embarcadero could be selected by the Board if the proposed PMPU is approved. Each of these options would replace the water and land uses proposed within the same area of the proposed PMPU located along North Harbor Drive. Figures 3-5, 3-6, and 3-7 illustrate the locations. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, in compliance with existing requirements and planning processes, would result in less-than-significant impacts.

The closure of North Harbor Drive between G Street and Broadway and the development of the Waterfront Destination Park under Option 1 would be subject to review and approval by the City of San Diego's traffic engineer (for roadway and bicycle facility improvements) and/or the District (for pedestrian facility improvements) to ensure the proposed improvement would not result in hazardous design features. Furthermore, construction of these developments would comply with the California Building Code, as adopted by the City of San Diego (Municipal Code Section 145.0101), the City of San Diego *Street Design Manual*, and the Baywide Development Standards outlined in Chapter 4 of the proposed PMPU. Thus, Option 1 would result in less-than-significant impacts, and would not result in any additional or more severe impacts related to substantially increasing hazards due to a geometric design or incompatible use than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, in compliance with existing requirements and planning processes, would result in less-than-significant impacts.

Development of the expanded Lane Field Setback Park under Option 2 would be subject to review and approval by the City of San Diego's traffic engineer (for roadway and bicycle facility improvements) and/or the District (for pedestrian facility improvements) to ensure the proposed improvement would not result in hazardous design features. Furthermore, construction of these developments would comply with the California Building Code, as adopted by the City of San Diego (Municipal Code Section 145.0101), the City of San Diego *Street Design Manual*, and the Baywide Development Standards outlined in Chapter 4 of the proposed PMPU. Thus, Option 2 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to substantially increasing hazards due to a geometric design or incompatible use than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, in compliance with existing requirements and planning processes, would result in less-than-significant impacts.

The realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street and the development of additional park space under Option 3 would be subject to the review and approval by the City of San Diego's traffic engineer (for roadway and bicycle facility improvements) and/or the District (for pedestrian facility improvements) to ensure the proposed improvement would not result in hazardous design features. Furthermore, construction of these developments would comply with the California Building Code, as adopted by the City of San Diego (Municipal Code Section 145.0101), the City of San Diego *Street Design Manual*, and the Baywide Development Standards outlined in Chapter 4 of the proposed PMPU. Thus, Option 3 would result in less-than-significant impacts, and would not result in any additional or more severe impacts related to substantially increasing hazards due to a geometric design or incompatible use than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies listed in Section 4.14.4.3 would not result in impacts related to increased hazards due to geometric design features or incompatible uses. The proposed policies would minimize and reduce the potential for transportation-related hazards. For instance, the District will plan, design, and implement a comprehensive waterfront open space network that provides access to and throughout the public realm on Tidelands and enhances proximate connections to the water for the public and priority coastal uses (WLU Policy 3.1.2); the District will protect and, where feasible, expand waterside amenities (WLU Policy 3.1.5); and through CDPs issued by the District, permittees will plan, design, and implement improvements to the mobility network that provide opportunities for a variety of users to access the public realm (M Policy 1.1.12).

Impact Determination and Mitigation

Implementation of the proposed PMPU would not substantially increase hazards due to a geometric design feature or incompatible uses. Impacts would be less than significant, and no mitigation measures are required.

Threshold 4: Result in inadequate emergency access?

Impact Analysis

Impacts of Water and Land Uses

Construction

The proposed PMPU does not authorize construction of any specific development project, but it is reasonably foreseeable that future development projects consistent with the proposed water and land use designations, as well as the proposed policies and planning district standards, would be constructed throughout the life of the proposed PMPU until its buildout year of 2050. Construction of future development projects or transportation infrastructure improvements may require roadways to be partially or completely closed to traffic due to large equipment, material delivery, or work within the right-of-way. Road blockages could prevent emergency response vehicles from accessing existing development within the proposed PMPU planning area or surrounding areas, thereby resulting in inadequate emergency access.

If construction activities of future projects would encroach on public right-of-way within one of the adjacent cities, which could result in interference with emergency access, the project proponent must obtain a temporary encroachment and/or right-of-way permit from the appropriate jurisdiction(s) prior to commencing construction (see Section 4.14.3.3 for applicable local regulations). In the City of San Diego, Municipal Code Section 129.0702 requires a Public Right-of-Way Permit for Traffic Control for all public improvement projects, construction projects, and other work that encroaches into the public right-of-way, including sidewalks, as well as an accompanying traffic control plan. Future development within PD1, PD2, PD3, and PD4 would be subject to this requirement. For future development in PD8, the City of Imperial Beach requires a Temporary Encroachment Permit for any work performed in any public right-of-way of the city (Municipal Code Section 12.04.020). Lastly, future development in PD9 and PD10 would be subject to City of Coronado Municipal Code Section 52.10, which requires a Right-of-Way Permit for all work on public property, such as repairs to sidewalks, curbs and gutters, driveway aprons, and parkways

(the area between the sidewalk and the curb); or to place equipment in the public right-of-way, such as a crane placed in the street to transport materials to a second story. Section 52.10.060 includes specific requirements for traffic control around the work site (see Section 4.14.3.3 above for more details). In some cases, the approval of these permits requires the preparation and implementation of a traffic control plan for the management of traffic during the period in which the construction activities encroach into the right-of-way. This would also include sidewalks or bike routes if any of these facilities are affected by the encroachment. Compliance with these existing regulatory requirements would ensure that construction of future PMPU-related development would not result in inadequate emergency access. Therefore, impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, one of three options within the North Embarcadero Subdistrict could be selected by the Board, if the proposed PMPU is approved. Each of these options shows alternative project components from that of the proposed PMPU, as illustrated in Figures 3-5, 3-6, and 3-7. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would comply with local regulations, which would ensure a less-than-significant impact related to inadequate emergency access.

If construction activities associated with the new Waterfront Destination Park under Option 1 would encroach on public right-of-way that could result in interference with emergency access, the project proponent must obtain a temporary encroachment and/or right-of-way permit from the City of San Diego prior to commencing construction (see Section 4.14.3.3 for applicable local regulations) to ensure that emergency access will be maintained. Therefore, construction associated with Option 1 would result in less-than-significant impacts, and would not result in any additional or more severe impacts associated with inadequate emergency access than buildout of PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would comply with local regulations, which would ensure a less-than-significant impact related to inadequate emergency access.

If construction activities associated with the expanded Lane Field Setback Park under Option 2 would encroach on public right-of-way that could result in interference with emergency access, the project proponent must obtain a temporary encroachment and/or right-of-way permit from the City of San Diego prior to commencing construction (see Section 4.14.3.3 for applicable local regulations) to ensure that emergency access will be maintained. Therefore, construction associated with Option 2 would result in less-than-significant impacts, and would not result in any additional or more severe impacts associated with inadequate emergency access than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would comply with local regulations, which would ensure a less-than-significant impact related to inadequate emergency access.

If construction activities associated with the new park space that could be developed under Option 3 would encroach on public right-of-way that could result in interference with emergency access, the project proponent must obtain a temporary encroachment and/or right-of-way permit from the City of San Diego prior to commencing construction (see Section 4.14.3.3 for applicable local regulations) to ensure that emergency access will be maintained. Therefore, construction associated with Option 3 would result in less-than-significant impacts, and would not result in any additional or more severe impacts related to inadequate emergency access than buildout of the proposed PMPU without Option 3.

Operation

The proposed PMPU would allow for the development of transportation infrastructure projects in PD1, PD2, PD3, PD4, PD8, PD9, and PD10 that would physically alter the existing roadway network. Transportation infrastructure improvements may include narrowing or widening roadways; adding bike paths and/or bike lanes to road rights-of-way; and/or closing, opening, or connecting existing roadways. For example, potential improvements identified in the proposed PMPU for PD3 include the closure of Market Street between Harbor Drive and Columbia Street, which could alter existing emergency access routes. Alternatively, other potential transportation improvements proposed in PD3 include the extension of A Street to Harbor Drive, which could improve emergency access by providing a continuous connection linking Harbor Drive and Pacific Highway. In addition, mobility hubs are proposed in PD1, PD2, PD3, PD9, and PD10 to provide connections between local and regional transit and the proposed PMPU area. These improvements may alter existing circulation patterns or points of emergency vehicle access within the planning districts. Mobility hubs vary in size and function, and could include components such as parking structures, bike and pedestrian pathways, and other forms of transit connection.

In addition, future development under the proposed PMPU would result in new or expanded visitor-serving development including, but not limited to, hotels, retail shops, commercial recreational uses, marinas and associated amenities, restaurants, and parks. The construction of these future development projects could result in certain elements, such as driveways, access roads, barriers, parking lot, or other circulation-related feature, that could potentially affect emergency access. However, all future development projects that could occur under the proposed PMPU would be subject to review by the applicable city's fire department, which reviews projects for sufficient emergency access for fire trucks and other emergency vehicles. All future development projects under the proposed PMPU would also be reviewed for certain elements such as width of egress/ingress to ensure the driveways and other access points would be properly sized to allow emergency vehicle access and turn-around, if necessary. In addition, transportation infrastructure improvements, including mobility hubs, would be constructed in compliance with all applicable standards, including the California Building Code, the City of San Diego's *Street Design Manual*, and applicable requirements of the City of Coronado. Therefore, compliance with the applicable regulations and review requirements would ensure that future development under the proposed PMPU would not result in inadequate emergency access.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, one of three options within North Embarcadero could be selected by the Board if the proposed PMPU is approved. Each of these options would replace the water and land uses proposed within the same area of the proposed PMPU located along North Harbor Drive. Figures 3-5, 3-6, and 3-7 illustrate the locations. Operational impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU would comply with local regulations, which would ensure a less-than-significant impact related to inadequate emergency access.

The closure of North Harbor Drive and the operation of the new Waterfront Destination Park that could occur under Option 1 would be subject to review by the City of San Diego's Fire Department, which reviews projects for sufficient emergency access for fire trucks and other emergency vehicles. These projects would also be reviewed to ensure the driveways and other access points would be properly sized to allow emergency vehicle access and turn-around, if necessary. Option 1 would be constructed in compliance with all applicable standards, including the California Building Code and the City of San Diego's *Street Design Manual*. Therefore, compliance with the applicable regulations and review requirements would ensure implementation of Option 1 would not result in inadequate emergency access, and would not result in any additional or more severe impacts related to inadequate emergency access than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU would comply with local regulations, which would ensure a less-than-significant impact related to inadequate emergency access.

The expansion of Lane Field Setback Park that could occur under Option 2 would be subject to review by the City of San Diego Fire Department, which reviews projects for sufficient emergency access for fire trucks and other emergency vehicles, and would be reviewed to ensure the driveways and other access points would be properly sized to allow emergency vehicle access and turn-around, if necessary. In addition, Option 2 would be constructed in compliance with all applicable standards, including the California Building Code and the City of San Diego's *Street Design Manual*. Therefore, compliance with the applicable regulations and review requirements would ensure implementation of Option 2 would not result in inadequate emergency access, and would not result in any additional or more severe impacts related to inadequate emergency access than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU would comply with local regulations, which would ensure a less-than-significant impact related to inadequate emergency access.

The realignment of North Harbor Drive and development of a new park space that could occur under Option 3 would be subject to review by the City of San Diego Fire Department, which reviews projects for sufficient emergency access for fire trucks and other emergency vehicles and would also be reviewed to ensure the driveways and other access points would be properly sized to allow emergency vehicle access and turn-around, if necessary. In addition, Option 3 would be constructed in compliance with all applicable standards, including the California Building Code and the City of San Diego's *Street Design Manual*. Therefore, compliance with the applicable regulations and review requirements would ensure implementation of Option 3 would not result in inadequate emergency access and would not result in any additional or more severe impacts associated in inadequate emergency access than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies listed in Section 4.14.4.3 would not result in impacts related to inadequate emergency access. The proposed policies would minimize and reduce the potential for impacts related to adequate emergency access. For instance, the District will coordinate with agencies that have transportation authority and with adjacent jurisdictions and permittees, to plan shared mobility infrastructure in support of the safe movement of people and/or goods (M Policy 1.1.8); the District will engage with the U.S. military, local, regional, and State agencies with transportation authority to identify and document the transportation facilities located on Tidelands that either are part of the STRAHNET or provide a critical connection to strategic facilities located on or adjacent to Tidelands, ensure that the critical components of the District's transportation network are available and maintained to meet the goals and standards of the STRAHNET, and ensure that the identified critical transportation facilities located on Tidelands are clear of permanent obstructions that would prohibit or slow the movement of military use when needed for Department of Defense activities (M Policy 3.1.1); the District will engage with the U.S. military to identify and ensure the effectiveness of critical assets for military use, such as marine terminals, rail facilities, and docks and piers, that may be needed in times of emergency while allowing day-to-day access to strategic assets (M Policy 3.2.1); the District will plan and maintain its transportation network so that it has the capacity to evacuate operations located on terminals in a manner and timeframe consistent with the U.S. military's needs consistent with requirements under the Strategic Port designation (M Policy 3.2.2); and the District will coordinate with regional transportation agencies to design shared infrastructure that meets emergency needs, including evacuation, such as evacuation for post-seismic events and tsunamis (SR Policy 1.1.3).

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in inadequate emergency access. Impacts would be less than significant, and no mitigation is required.

4.14.5 Cumulative Impact Analysis

A significant cumulative impact on transportation, circulation, and mobility would occur if the future development allowed under the proposed PMPU were to make a cumulatively considerable contribution to a conflict with an applicable program, plan, ordinance, or policy addressing the circulation system; conflict with or be inconsistent with State CEQA Guidelines Section 15064.3,

subdivision (b); substantially increase hazards due to a geometric design feature or incompatible uses; or result in inadequate emergency access. These issues are evaluated within the context of past, present, and probable future projects.

A significant cumulative impact would generally occur if a proposed development project, when combined with past, present, or probable future plans or projects, would conflict with an applicable program, plan, ordinance, or policy addressing the circulation system. For this analysis, these programs, plans, ordinances, or policies are described in Section 4.14.3, *Laws, Regulations, Plans, and Policies*.

Based on the changes to the State CEQA Guidelines initiated by the passage of SB 743, a project's impact on transportation is measured by the number of VMT that would be generated. As discussed under OPR's Technical Advisory, "metrics such as VMT per capita or VMT per employee, i.e., metrics framed in terms of efficiency (as recommended below for use on residential and office projects), cannot be summed because they employ a denominator. A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa" (OPR 2018:6). Consequently, please see the analysis above for discussion of combined project specific and cumulative analysis. Therefore, the methodology for determining a project's contribution to the cumulative VMT impact is the same as that for direct VMT impacts (see Section 4.14.4.2, *Thresholds of Significance*). Consistent with the methodology in Section 4.14.4.1, a significant cumulative impact associated with a conflict or inconsistency with State CEQA Guidelines Section 15064.3, subdivision (b) (induced VMT) would occur if future development allowed under the proposed PMPU would not be able to achieve a 15 percent reduction in per employee VMT below the 2050 Regional Average, or would result in an increase in total planning district VMT, depending on the land use type. Failure to meet these thresholds would result in a cumulative impact due to the resulting secondary impacts on the physical environment associated with VMT, including GHG emissions and decreased air quality.

A significant cumulative transportation, circulation, and mobility impact would occur if the proposed PMPU, when combined with past, present, and probable future projects, would substantially increase hazards from geometric design features (e.g., sharp roadway angles or short site distances) or incompatible uses (e.g., tall buildings that encroach into nearby airport airspace).

Finally, a significant cumulative transportation, circulation, and mobility impact would occur if the proposed PMPU, when combined with past, present, and probable future projects, would result in inadequate emergency access that could affect emergency response to a certain project area.

4.14.5.1 Geographic Scope

The geographic scope of analysis for cumulative impacts related to VMT includes the San Diego Region, based on the OPR Technical Advisory. The geographic scope for the analysis of the impacts related to a program, plan, ordinance, or policy addressing the circulation system, substantially increasing hazards due to geometric features or incompatible uses, and inadequate emergency access, would be different than the geographic scope for the VMT analysis, which would include all past, present, and probable future projects that would have the potential to affect the same transit, roadway, bicycle, and pedestrian facilities within the proposed PMPU area and the interconnected circulation system of the adjacent cities.

4.14.5.2 Cumulative Effects of Past, Present, and Probable Future Projects

Conflict with a Program, Plan, Ordinance, or Policy Addressing the Circulation System

A significant cumulative impact on roadway, pedestrian, bicycle, and transit facilities would generally occur if past, present, and probable future projects would conflict with an applicable program, plan, ordinance, or policy addressing these transportation facilities. Past projects such as general plans and community plans, for which the complete buildout covers many years, have been required to demonstrate consistency with all applicable programs, plans, ordinances, or policies addressing the circulation system at the time of their adoption. It should be noted that past projects were analyzed by evaluating the project's potential impact on roadway congestion, or level of service, until July 1, 2020, when State CEQA Guidelines Section 15064.3 went into effect, which established VMT as the appropriate methodology for transportation analysis. Therefore, projects after July 1, 2020 are analyzed using VMT methodology. Present and probable future projects would also be required to demonstrate consistency with applicable programs, plans, ordinances, and policies addressing the transportation facilities within its project boundaries. However, it is possible the past, present or probable future projects would propose a component that would be inconsistent with a policy or plan addressing the circulation system, such as the removal of a bikeway, that could result in an impact. Because plans and policies are not enforced in the same way laws or ordinances adopted by cities and jurisdictions are enforced, a conflict with a plan or policy could occur as part of a future project, and would result in a significant impact. Therefore, cumulative effects from past, present, and probable future projects would be significant.

Conflict or Be Inconsistent with State CEQA Guidelines Section 15064.3, Subdivision (b)

Past, present, and probable future projects have been described in Table 2-2 in Chapter 2, *Environmental Setting*. The VMT analysis is cumulative in nature. Past projects would have been approved prior to the passage of SB 743, and therefore would not have been required to analyze and mitigate for VMT-related impacts. Cumulative present and probable future projects would be required to comply with SB 743. Although compliance is required, it is not guaranteed each present and probable future project would be able to make a less-than-significant impact determination regarding a 15 percent reduction below regional average VMT. Mitigation may reduce VMT for a project, but still may not reduce potential impacts to a less-than-significant level. Projects that cannot reach the VMT reduction goal of 15 percent below the regional average would contribute to increased VMT in the region, which would contribute to the prevention of the region reaching the established GHG reduction targets. Therefore, cumulative projects in the region could result in significant cumulative impacts related to a conflict or inconsistency with State CEQA Guidelines Section 15064.3(b).

Substantially Increase Hazards Because of a Geometric Design Feature or Incompatible Uses

Design plans for the development associated with all regionally significant plans and programs in the cumulative study area (listed in Table 2-2) would be required to undergo review and approval by the relevant city's traffic engineer (Chula Vista, Coronado, Imperial Beach, National City, or San Diego) to ensure the development would be consistent with the most recent design and safety

standards. This would include adjacent cumulative projects such as the Chula Vista Bayfront Master Plan, Midway-Pacific Highway Community Plan Update, and National City Bayfront Projects and Plan Amendments. Therefore, cumulative projects would not result in a significant cumulative impact related to increased hazards due to geometric features or incompatible uses.

Result in Inadequate Emergency Access

Development of the present and probable future projects listed in Table 2-2 may result in the closure of roadway lanes and/or whole roadways during construction, due to equipment, material delivery, or construction activities occurring within the road right-of-way. Cumulative projects that are directly adjacent to the proposed PMPU area, such as the Chula Vista Bayfront Master Plan and National City Bayfront Projects and Plan Amendments, could cumulatively have the potential to interfere with the same roadways or road systems. However, future development that would impact the public roadways and potentially interfere with emergency access would be required to implement traffic control measures in compliance with local regulations and as part of the permitting process. As such, cumulative impacts from past, present, and probable future projects would not be significant.

4.14.5.3 Project Contribution

Conflict with a Program, Plan, Ordinance, or Policy Addressing the Circulation System

The proposed PMPU would not result in a cumulatively considerable contribution to a significant cumulative impact related to conflict with programs, plans, ordinances, or policies associated with the circulation system because the planned improvements and policies would not conflict with regional and local transportation plans. Additionally, policies proposed as part of the proposed PMPU would ensure the District would coordinate with regional agencies with transit authority, as well as adjacent jurisdictions for the expansion or development of transit facilities. Therefore, the proposed PMPU would not make a cumulatively considerable contribution to a significant cumulative impact.

Conflict or Be Inconsistent with State CEQA Guidelines Section 15064.3, Subdivision (b)

As noted above, VMT analysis is cumulative by nature; the significance of a potential impact is determined based on the project's individual VMT contribution to cumulative regional VMT impacts. The VMT generated by the proposed PMPU is analyzed by determining if the proposed uses would either result in employment-based VMT (e.g., hotels) that does not achieve a VMT reduction of 15 percent below the 2050 Regional Average or results in a net increase in VMT for retail, restaurant, or recreational uses. If the proposed use would not reduce employee VMT by 15 percent below the 2050 Regional Average VMT per employee, or would result in a net increase in total planning district VMT, it would result in a significant impact. Consequently, the VMT-related impacts identified above in Section 4.14.4.4, *Project Impacts and Mitigation Measures*, are naturally cumulative in nature.

The total VMT associated with buildout of PD1, PD2, PD3, PD8, PD9, and PD10 is expected to increase with the proposed PMPU. Therefore, impacts related to VMT for retail, restaurant, and recreational uses would result in a cumulatively considerable contribution to a significant cumulative impact (**Impact-C-TRA-1**).

The future buildout of the proposed water and land uses in PD2 as part of the proposed PMPU, includes uses that would result in increased VMT. The proposed PMPU's employment uses do not achieve a VMT reduction of 15 percent below the 2050 Regional Average significance threshold. Therefore, the increase in employment in PD2 associated with the proposed PMPU would result in a cumulatively considerable contribution to a significant cumulative impact (**Impact-C-TRA-2**).

Because proposed roadway network changes in PD2 and PD3 would increase VMT and thereby induce travel, the full buildout of the proposed PMPU would result in a cumulatively considerable contribution to a significant cumulative impact related to an increase in VMT due to infrastructure improvements (**Impact-C-TRA-3**).

Substantially Increase Hazards Because of a Geometric Design Feature or Incompatible Uses

Future development associated with the proposed PMPU would be subject to review and approval of all design plans by the traffic engineer of the city in which the development would occur, similar to the process for the cumulative present and probable future cumulative projects. The review and approval by the applicable traffic engineer would ensure the development projects would not result in unsafe geometric design features or incompatible uses that would create hazards or exacerbate existing hazards within the circulation system. Therefore, implementation of the proposed PMPU would not make a cumulatively considerable contribution to a significant cumulative impact.

Result in Inadequate Emergency Access

Future development associated with the proposed PMPU would likely result in the closure of roadway lanes during construction, due to equipment, material delivery, or construction activities occurring within the road right-of-way. Blocked roadways could prevent the access of emergency vehicles to the proposed PMPU area or surrounding vicinity. However, construction of future development under the proposed PMPU would be required to comply with existing regulatory requirements of the applicable adjacent city, which require temporary encroachment and/or right-of-way permits for any construction activities that would extend into public right-of-way. In some cases, the approval of these permits includes the preparation and implementation of a traffic control plan for the management of traffic during the period in which construction activities would encroach into the right-of-way. This would also include sidewalks or bike routes if any of these facilities are affected by the encroachment. Compliance with these existing regulatory requirements would ensure that construction of future PMPU-related development would not result in inadequate emergency access. Therefore, the proposed PMPU would not make a cumulatively considerable contribution to a significant cumulative impact related to emergency access.

4.14.5.4 Cumulative Impact Determination and Mitigation

Significant Impacts

Implementation of the proposed PMPU would result in a cumulatively considerable contribution to cumulative transportation and mobility impacts (**Impact-C-TRA-1** through **Impact-C-TRA-3**).

Mitigation Measures

For **Impact-C-TRA-1**, **Impact-C-TRA-2**, and **Impact-C-TRA-3**:

Implement **MM-TRA-1: Establish a Transportation Impact Fee Program**, as specified under Threshold 2.

Implement **MM-TRA-2: Contribute Fair Share Impact Fees**, as specified under Threshold 2.

Implement **MM-TRA-3: Implement a Transportation Demand Management Plan**, as under specified Threshold 2.

Level of Significance After Mitigation

Because the location and timing of the future development of the proposed PMPU buildout is unknown at the time of this analysis, and the timing and location of VMT-reducing ~~transportation~~ multi-modal infrastructure improvements that would be ~~funded by~~ installed through **MM-TRA-1** and **MM-TRA-2** are also unknown, the potential reduction of the significance of the impact cannot be determined. Implementation of a TDM Plan (**MM-TRA-3**) would also provide incentives to use alternative modes of transportation instead of individual vehicles, which would reduce VMT induced by development projects and improvements to transportation infrastructure. However, it is not possible to quantify the effectiveness of the recommended mitigation measures because the location, timing, and design of new development allowed under the proposed PMPU is unknown at this time. Therefore, the project would result in a cumulatively considerable contribution to the significant cumulative VMT-related impact. **Impact-C-TRA-1, Impact-C-TRA-2, and Impact-C-TRA-3** would be cumulatively considerable and unavoidable.

This page was intentionally left blank.

4.15.1 Overview

This section describes the existing utility systems that serve the proposed Port Master Plan Update (PMPU) area, as well as the regulations that govern their use, supply, distribution, and performance. This section also discusses the proposed PMPU's potential to exceed the existing or planned infrastructure and treatment capacities for utilities and service systems.

Impacts on utilities and service systems would be significant if the proposed PMPU were to (1) require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects; (2) have insufficient water supplies available to serve the proposed PMPU and reasonably foreseeable future development during normal, dry and multiple dry years; (3) result in a determination by the wastewater treatment provider which serves or may serve the PMPU area that it does not have adequate capacity to serve the projected demand in addition to the provider's existing commitments; (4) generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; and (5) not comply with Federal, state, and local management and reduction statutes and regulations related to solid waste. Potential impacts associated with energy use are addressed in Section 4.6, *Greenhouse Gas Emissions and Energy*.

Table 4.15-1. Summary of Significant Utilities and Service Systems Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-UTIL-1: Utility-Related Land Disturbance	All planning districts	MM-BIO-2, MM-BIO-5, MM-BIO-8, and MM-BIO-9 , as described in Section 4.3, <i>Biological Resources</i> MM-CUL-1 through MM-CUL-3 , as described in Section 4.4, <i>Cultural Resources and Tribal Cultural Resources</i> MM-GEO-1 , as described in Section	Significant and Unavoidable	Mitigation measures would not reduce all ground-disturbing impacts to a level below significance, including impacts on cultural resources and water quality; therefore, Impact-UTIL-1 would be significant and unavoidable.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
		4.5, <i>Geology and Soils</i> MM-HAZ-1 and MM-HAZ-2 , as described in Section 4.7, <i>Hazards and Hazardous Materials</i> MM-WQ-1 through MM-WQ-7 , as described in Section 4.8, <i>Hydrology and Water Quality</i> .		
Impact-UTIL-2: Insufficient Water Supplies Available to Serve the proposed PMPU During Operation of Future Development	All planning districts	MM-UTIL-1: Update the UWMP with New Growth Projections MM-UTIL-2: Prepare a Water Demand Analysis to Determine if Sufficient Water Supplies are Available MM-UTIL-3: Implement Water Conservation Measures	Less than Significant	MM-UTIL-1 would ensure that future growth occurring under the proposed PMPU is accounted for in the next UWMP updates; MM-UTIL-2 would ensure adequate water supplies are available prior to site-specific development; MM-UTIL-3 would require implementation of water-efficient design measures
Impact-C-UTIL-1: Potential to Result in a Cumulatively Considerable Adverse Impact Related to the Requirement for New or Expanded Utilities	All planning districts	MM-BIO-2, MM-BIO-5, MM-BIO-8, and MM-BIO-9 MM-CUL-1 through MM-CUL-3 MM-GEO-1 MM-HAZ-1 and MM-HAZ-2 MM-WQ-1 through MM-WQ-7	Significant and Unavoidable	Mitigation measures would not reduce all ground-disturbing impacts to a level below significance, including impacts on cultural resources and water quality; therefore, this impact would be significant and unavoidable.
Impact-C-UTIL-2: Potential to Result in Cumulatively Considerable Insufficient Water Supplies During Operation	All planning districts	MM-UTIL-1, MM-UTIL-2, and MM-UTIL-3	Less than Significant	MM-UTIL-1 would ensure that future growth occurring under the proposed PMPU is accounted for in the next UWMP updates, and MM-UTIL-2 would ensure adequate water supplies are available prior to site-specific development. MM-

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
				UTIL-3 would require water conservation measures for future development.
Impact-C-UTIL-3: Potential to Result in Cumulatively Considerable Adverse Impacts Related to Exceeding Capacity at Existing Landfills During Construction	All planning districts	MM-C-UTIL-1: Update the Five-Year Review Report with New Growth Projections MM-C-UTIL-2: Conduct Site-Specific Environmental Review to Assess Landfill Capacity and Implement Measures to Reduce Solid Waste	Less than Significant	MM-C-UTIL-1 would ensure that future growth occurring under the proposed PMPU is accounted for in the next Five-Year Review Report updates, which would ensure that growth occurring under the proposed PMPU is accounted for in landfill capacity planning; in the interim, MM-C-UTIL-2 requires that adequate landfill capacity exist before the District approves site-specific development, which would reduce impacts to less than significant.
Impact-C-UTIL-4: Potential to Result in Cumulatively Considerable Adverse Impacts Related to Exceeding Capacity at Existing Landfills During Operation	All planning districts	MM-C-UTIL-1 and MM-C-UTIL-2	Less than Significant	MM-C-UTIL-1 would ensure that future growth occurring under the proposed PMPU is accounted for in the next Five-Year Review Report updates, which would ensure that growth occurring under the proposed PMPU is accounted for in landfill capacity planning; in the interim, MM-C-UTIL-2 requires that adequate landfill capacity exist before the District approves site-specific development, which would reduce impacts to less than significant.

4.15.2 Existing Conditions

The utility providers that service the proposed PMPU area are listed in Table 4.15-2. Each utility provider and information about the utilities provided is described in further detail below.

Table 4.15-2. Utility Service Providers

Utility Service	Provider ¹
Wastewater	Metropolitan Sewerage System (City of San Diego Public Utilities Department)
Water	City of San Diego Public Utilities Department; Sweetwater Authority; California-American Water Company
Stormwater	San Diego Unified Port District; City of San Diego Storm Water Department; City of Imperial Beach Stormwater Department; City of Coronado Stormwater Department
Solid Waste	Various Franchise Waste Haulers ² / Miramar, Sycamore, Otay, and Borrego Landfills
Electricity and Natural Gas	San Diego Gas and Electric (SDG&E)
Telecommunications	Various Providers, such as AT&T, T-Mobile, Verizon, Sprint, etc.

¹ Utility providers listed here are limited to the proposed PMPU area, which does not include PD5, PD6, and a portion of PD7 (Pond 20).

² A list of current franchise waste haulers as of the time of this PEIR's preparation is available on the City of San Diego's website: <https://www.sandiego.gov/sites/default/files/esd-franchised-hauler-list.pdf>.

4.15.2.1 Wastewater

The Cities of Coronado, Imperial Beach, and San Diego all operate and maintain the sanitary sewer systems within their respective jurisdictions. However, the Metropolitan Sewerage System, which is owned and operated by the City of San Diego's Public Utilities Department's (PUD) Wastewater Branch, provides wastewater treatment service to all of the planning districts (PDs). The Metropolitan Sewerage System serves the City of San Diego's water customers as well as 12 cities and agencies with a service area of approximately 450 square miles and service population of approximately 2.2 million (PUD 2021). The Metropolitan Wastewater Joint Powers Authority (JPA) serves as an advisory body on the operation of the Metropolitan Sewerage System. Joint Powers Authority member agencies include the cities of Chula Vista, Coronado, Del Mar, El Cajon, Imperial Beach, La Mesa, National City and Poway; the Lemon Grove Sanitation District; the Padre Dam Municipal and Otay Water Districts; and the County of San Diego (on behalf of the Winter Gardens Sewer Maintenance District, and the Alpine, Lakeside and Spring Valley Sanitation Districts). Collectively, the wastewater collection and treatment system is known as the Metropolitan Sewerage System.

The Metropolitan Sewerage System collects, treats, and disposes of approximately 552 acre-feet per day (180 million gallons per day [mgd]) of wastewater and has existing wastewater treatment capacity to handle 285 mgd (PUD 2020).

Three treatment plants treat wastewater generated in the Metro System, including the North City Water Reclamation Plant (NCWRP), South Bay Water Reclamation Plant (SBWRP), and the Point Loma Wastewater Treatment Plant (PLWTP). The total measured wastewater collected from the wastewater service area in 2020 was 189,531 acre-feet per year (AFY) (61,758 mgd), (PUD 2020).

The PLWTP and SBWRP both treat the wastewater generated within the proposed PMPU area with the wastewater discharge being regulated by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0107409.

NCWRP has a 30 mgd capacity (33,627 AFY) and in 2020 the measured wastewater flows collected were 18,208 AFY. Secondary treated water that is not recycled is discharged to the sewer system, where it is mixed with untreated flows and conveyed to PLWTP for treatment and discharge. Solids are conveyed to the City of San Diego's Metropolitan Biosolids Center for further treatment. Approximately 80 percent of the 2020 recycled water produced, or 8,300 AFY, was used within the water service area. The remainder of the recycled water was sold to other agencies.

The PLWTP facility, which provides wastewater treatment for PD1, PD2, PD3, PD4, PD9 and PD10, is located on top of the bluffs at the end of Point Loma. The PLWTP has a daily treatment capacity of approximately 737 acre-feet per day (240 mgd) and a daily peak wet weather capacity of approximately 1,326 acre-feet per day (432 mgd), and treats approximately 537 acre-feet per day (175 mgd) of wastewater. In 2020, the measured wastewater collected was 164,000 AFY (PUD 2020). Wastewater at the PLWTP is treated to an advanced primary level, at which point it is discharged into the Pacific Ocean through a 4.5-mile-long ocean outfall.

The SBWRP, which treats wastewater for PD7 and PD8, is within the Tijuana River Valley near the international border and primarily serves areas close to the SBWRP and the Otay Water District. The SBWRP's total treatment capacity is 17,000 AFY (15 mgd). In 2020, the measured wastewater flows collected were 7,323 AFY. Secondary treated wastewater is discharged to the 3.5-mile South Bay Ocean Outfall, while solids are conveyed to the PLWTP for treatment.

4.15.2.2 Water Supply

There are three main water purveyors that serve the proposed PMPU area: the San Diego County Water Authority, City of San Diego Public Utilities Department, and Sweetwater Authority. Each water supplier prepares a distinct Urban Water Management Plan (UWMP). The UWMPs discussed below were prepared in 2015 or 2020, or are in the process of being updated. The information below primarily summarizes information from the adopted 2015 and 2020 UWMPs.

On May 10, 2021, the Governor of California declared a state of emergency related to drought conditions in California. As outlined in Section 4.15.3, *Laws, Regulations, Plans, and Policies*, below, this initiated temporary drought contingency measures for water suppliers and public agencies (State of California 2021).

San Diego County Water Authority

The following information is summarized from the San Diego County Water Authority's (Water Authority) 2015 and 2020 UWMPs (the 2020 UWMP was approved on June 24, 2021), which are incorporated herein by reference. The 2015 and 2020 UWMPs provide more detailed discussion of Water Sources and Supplies, Water Quality, Reliability Planning, Conservation Measures, Contingency Planning, and Water Recycling.¹ SDCWA also maintains a Water Shortage and Drought

¹ SDCWA's 2015 UWMP is available at: <https://www.sdcwa.org/wp-content/uploads/2020/12/UWMP2015.pdf>; SDCWA's 2020 UWMP is available at: <https://www.sdcwa.org/wp-content/uploads/2021/06/SDCWA-2020-UWMP.pdf>.

Response Plan (update approved on June 24, 2021) and Drought Response Ordinance for adoption by local agencies.² This drought response ordinance includes use of non-potable water for construction purposes, including dust suppression.

The Water Authority was established to supply imported water to San Diego County for wholesale distribution to its member agencies. The Water Authority is now the predominant water provider in the county and supplies 75 to 95 percent of the region's water. The Water Authority's service area serves approximately 3.3 million people in 2020, which is projected to increase to roughly 3.8 million people by 2045. The County of San Diego is expected to develop an additional 130,000 acres between 2020 and 2050, with the majority (125,000 acres) of development dedicated to residential land uses. These regional growth projections are based on the latest San Diego Association of Governments (SANDAG) Regional Growth Forecasts. The Water Authority's 24 member agencies purchase water for retail distribution within their respective service areas. Imported water supplies consist of water purchases from the Metropolitan Water District (MWD), core water transfers from the Imperial Irrigation District and canal lining projects, and as-needed spot water transfers to offset reduced supplies from MWD. These imported water supplies are delivered to the member agencies through a system of large-diameter pipelines, pumping stations, and reservoirs. The SDCWA also relies on desalinated ocean water produced at the Carlsbad Desalination Plant, which is in commercial operation and is capable of producing up to 56,000 AFY.

The Water Authority classifies water demand within its service area into two categories: (1) Municipal and Industrial (M&I) and (2) Agricultural. The M&I classification includes residential demand and water used for commercial, industrial, and institutional purposes. The Water Authority utilizes an econometric model to develop its long-range M&I demand forecasts, which is based on the U.S. Army Corps of Engineers' Municipal and Industrial Needs model and the SANDAG official growth forecasts. Agricultural demand projections are based on coordination between the Water Authority, its member agencies, SANDAG, County of San Diego Agricultural Weights and Measures, and the California Avocado Commission.

The Water Authority's 2020 UWMP includes water use associated with accelerated forecasted growth in residential housing development, which was identified in SANDAG's 2050 Regional Growth Forecast and based on adopted general plans of local jurisdictions. It should be noted that because the proposed PMPU was not an adopted plan at the time the water demand forecasts were developed, water demand associated with the proposed PMPU was not accounted for in the 2020 UWMP. Table 4.15-3 shows the Water Authority's existing and projected water demand and estimated supply between 2025 and 2045 under normal and dry year weather conditions. Water supply values account for both Water Authority and member agency supplies, as well as projected supplies from MWD necessary to meet the projected demand.

² The SDCWA Water Shortage and Drought Response Plan is available at: <https://www.sdcwa.org/wp-content/uploads/2021/03/SDCWA-WSCP-05272021.pdf>. The SDCWA Drought Ordinance is available at: https://www.sdcwa.org/wp-content/uploads/2020/12/droughtordinance_03272008.pdf.

Table 4.15-3. SDCWA Normal, Single-, and Multiple-Dry Year Water Supply and Demand (2020–2045) (AFY)

	2025	2030	2035	2040	2045
Normal Year					
Supply	555,758	578,244	598,474	614,235	630,771
Demand	555,758	578,244	598,474	614,235	630,771
Difference	0	0	0	0	0
Single-Year Dry					
Supply ²	791,422	815,574	875,491	876,054	876,601
Demand	596,965	618,879	639,310	655,054	671,320
Difference	194,457	196,695	236,181	221,000	205,281
Multiple-Year Dry (First Year)					
Supply	818,340	791,468	771,887	748,658	765,519
Demand	580,626	586,432	592,296	598,219	604,201
Difference	237,714	205,036	179,591	150,439	161,318
Multiple-Year Dry (Second Year)					
Supply	877,285	847,729	828,858	806,339	789,676
Demand	602,935	608,964	615,054	621,204	627,416
Difference	274,350	238,765	213,804	185,135	162,260
Multiple-Year Dry (Third Year)					
Supply	880,590	850,313	830,755	807,549	849,559

Source: Water Authority 2020, Tables 9-1 through 9-7.

¹ The demand accounts for water efficiency savings.² Includes total projected core supplies with utilization of carryover storage supplies.

As shown in Table 4.15-3, if MWD, Water Authority, and member agency supplies are maintained, and water conservation measures are implemented, no shortages are anticipated through 2045 in a normal year or in single-year and multiple-year dry scenarios. In single- and multiple-year dry scenarios, additional regional shortage management measures, consistent with the Water Authority's Water Shortage and Drought Response Plan, would require conservation measures (Water Authority 2020). By 2045, the Water Authority's total normal water demands are projected to reach 630,771 AFY (including future conservation, demand associated with projected near-term annexations, and accelerated forecasted growth), which represents a 36 percent increase from the fiscal year 2020 demand.

City of San Diego Public Utilities Department

The PUD serves more than 1.39 million people, delivering more than 156 mgd or 175,000 AFY of water throughout an approximately 404-square-mile service area (PUD 2020). For the proposed PMPU area, the City of San Diego PUD's Water Branch provides direct water service to planning districts within the City of San Diego, including PD1, PD2, PD3, and PD4. Additionally, the City of San Diego sells wholesale treated water to California American Water Company (Cal-Am), which provides water to the cities of Coronado (PD9 and PD10) and Imperial Beach (PD8), as well as a small portion of residents within the South Bay (PD7).

The City of San Diego's water system is made up of nine reservoirs that capture runoff from rainfall within local water sheds, three water treatment plants, and a small supply of local groundwater. To offset potable water demands, PUD owns and operates two water reclamation plants and a recycled water distribution system that delivers recycled water for non-potable water uses. In addition, the PUD maintains and operates more than 3,000 miles of water lines, 49 water pump stations, approximately 131 hydraulic pressure zones, and more than 200 mgd of potable water storage capacity in 29 elevated tanks, and concrete and steel reservoirs (PUD 2020). The City of San Diego's nine reservoirs have a combined capacity of 549,007 acre-feet. The City of San Diego relies heavily on purchased water from the Water Authority. From 2016 to 2020, imported water represented 89 percent of the City of San Diego's overall water (PUD 2020).

Future water demand and supply projections are required to be updated every 5 years with the adoption of a UWMP. The City of San Diego recently updated its UWMP to project water supply and demand through 2045. The 2020 UWMP was released for public review in March 2021, and was adopted at a public hearing of the City Council during one of its regularly scheduled public hearings on May 18, 2021. The City's 2020 UWMP is hereby incorporated by reference.³ Total retail area consumptive water demands decreased by 13 percent between 2015 and 2020, reflecting the City's conservation efforts as well as the more recent changes from the COVID-19 pandemic beginning March 2020. The 2020 UWMP projects that water demand for 2035 will be 217,156 AFY as opposed to the 273,748 AFY projected in the 2015 UWMP (PUD 2020). Estimated demand for 2045 will be 228,065 AFY. As noted, because the proposed PMPU was not an adopted plan at the time the water demand forecasts were developed, water demand associated with the proposed PMPU was not accounted for in the 2020 UWMP.

The City of San Diego's 2020 UWMP projects the estimated demand of potable water resources until the year 2045 based on coordination with various agencies, including the Water Authority, which provided imported water availability and regional water demands and conservation, and SANDAG, which provided the most recent SANDAG demographic projections for the City of San Diego. Table 4.15-4 shows the City of San Diego's existing and projected water demand and estimated supply between 2025 and 2045 under normal and dry year weather conditions. As shown, it is anticipated that future demand would be met by the supply in each 5-year increment through 2045. These water supply and demand projections are reevaluated for the reasonably foreseeable future (i.e., 20-year planning period) as part of the UWMP update process. In addition, the City's UWMP notes that reliance on water purchased from the SDCWA is anticipated to be significantly reduced with completion of the Pure Water project, which will become a source of drought-proof recycled water through an advanced water purification technology. As discussed in the UWMP, "the Pure Water San Diego Program is a 20-

³ SDCWA 2020 UWMP is available at: [Urban Water Management Plan \(sdcwa.org\)](https://www.sdcwa.org/) The City of San Diego's 2020 UWMP is available at: https://www.sandiego.gov/sites/default/files/city_of_san_diego_2020_uwmp_final_6_29_2021_send.pdf

year (2015–2035) multi-phased water and wastewater capital improvement initiative that is expected to create 83 mgd of locally controlled water upon full implementation in 2035. The...Program will divert treated water from the PLWTP ocean outfall and recycle a valuable and limited resource that is currently discharged to the ocean. Phase 1 is expected to be online by March 2025. Production is expected to be a staged ramp-up in flow with 30 mgd produced by the end of Calendar Year (CY) 2025. This will allow the City to reduce the amount of water it purchases in FY 2025 and beyond.”

The SDCWA 2020 UWMP identifies a significant projected increase in potable reuse as a result of Pure Water San Diego, Pure Water Oceanside, and the East County Advanced Water Purification Program. In 2020, the City of Oceanside began construction to expand its existing recycled water system and develop an advanced water purification project. Pure Water Oceanside will purify recycled water from the San Luis Rey Water Reclamation Facility through advanced treatment to create a new local and high-quality drinking water for the City, which will provide more than 30 percent of the City of Oceanside’s water supply. The East County Advanced Water Purification Program is a multi-phased surface water augmentation project that will purify East San Diego County’s recycled water to produce a new local and sustainable drinking water supply. It is scheduled to begin distributing water in 2025 and is expected to meet 30 percent of East County’s current drinking water demands. Additionally, the City of Escondido’s Advanced Water Treatment for Agriculture project, funded under Proposition 84, will construct a new microfiltration/reverse osmosis advanced treatment facility with a total production capacity of 3,280 AFY upon completion in 2021. Water treated at the microfiltration/reverse osmosis facility will be blended with tertiary treated water from an existing recycled water plant and distributed to agricultural customers in the northern and eastern areas of Escondido. The City of Escondido and Marine Corps Base Camp Pendleton have identified additional planned projects that are projected to yield an additional 4,300 AFY by 2025.

Table 4.15-4. City of San Diego PUD Normal, Single-, and Multiple-Dry Year Water Supply and Demand (2025–2045) (AFY)

Sweetwater Authority

Sweetwater Authority's (Sweetwater) water system provides water service to the cities of Chula Vista and National City, as well as the unincorporated community of Bonita within San Diego County. Sweetwater serves approximately 188,000 people, and has a service area covering 36.5 miles with approximately 33,000 service connections (Sweetwater Authority 2016). Within the proposed PMPU area, Sweetwater provides water to a portion of PD7. Sweetwater obtains its water supply through agreements with the Water Authority and the Richard A. Reynolds Desalination Facility, as well as through appropriated sources such as surface runoff from the Sweetwater River watershed and the National City well field. In addition, Sweetwater's system has emergency water connections with Otay Water District, the City of San Diego, and Cal-Am.

Sweetwater owns and operates two surface water reservoirs within the Sweetwater River watershed: Loveland Reservoir and Sweetwater Reservoir. Loveland Reservoir has an approximate capacity of 25,387 acre-feet, while Sweetwater Reservoir has an approximate capacity of 28,079 acre-feet. Sweetwater also operates the Robert A. Perdue Water Treatment Plant, which has a treatment capacity of 30 mgd and is capable of treating surface runoff stored at Sweetwater Reservoir or imported raw water from the Water Authority. The plant has a 10-million-gallon reservoir that serves as clearwell storage and as the point of delivery into the distribution system. Other sources of potable water include the National City wells, which produce potable groundwater, and the Richard A. Reynolds Desalination Facility, which produces drinking water from brackish groundwater. The National City wells consist of three wells that produce approximately 2,100 acre-feet of groundwater in a normal water year. The desalination facility treats brackish groundwater using reverse osmosis technology and was originally designed to produce 4 mgd of drinking water; however, the facility was expanded in 2017 to produce 10 mgd of drinking water (Sweetwater Authority 2018). Sweetwater's water system also includes 20 storage tanks with a combined storage capacity of approximately 43.5 million gallons of treated water and 23 pump stations with a total pumping capacity of approximately 36,000 gallons per minute.

As mentioned, future water demand and supply projections are required to be updated every 5 years with the adoption of a UWMP. In April 2021, Sweetwater issued a draft 2020 UWMP (Sweetwater 2021a). As such, Table 4.15-5 shows Sweetwater's existing and projected water demand and estimated supply between 2025 and 2045 under normal and dry year weather

conditions as indicated in Sweetwater’s Draft 2020 UWMP, which is hereby incorporated by reference.⁴ As shown, it is anticipated that future demand would be met by the supply in each 5-year increment through 2045. Similar to the City of San Diego, Sweetwater’s UWMP is updated every 5 years, at which time the projected supply and demand of potable water resources is reevaluated for the reasonably foreseeable future (i.e., 20-year planning period). On June 9, 2021, the Sweetwater Board adopted a new Water Shortage Contingency Plan (WSCP), an Addendum to the 2015 UWMP, the 2020 UWMP, and an Amendment to the Drought Response Plan (Sweetwater 2021b), which are incorporated herein by reference.

4.15.2.3 Storm Drainage

Stormwater within PD1, PD2, PD3, PD4, PD9, and PD10 is collected by a system of inlets that are not controlled by the San Diego Unified Port District (District), before flowing through conveyance structures and discharging into San Diego Bay via outfall structures, many of which are subject to tidal inundation. There are no developed lands within PD7, and storm drain inlets, if present, would be limited to roadway drainage associated with Silver Strand Boulevard; likely discharging as sheet flow into the Bay. Stormwater within PD8 is collected by a system of inlets before flowing through

⁴ Sweetwater Authority’s Draft 2020 UWMP is available at:
<https://www.sweetwater.org/DocumentCenter/View/2326/2020-Urban-Water-Management-Plan-Draft>.

conveyance structures and discharging into the Pacific Ocean via outfall structures, which are subject to tidal inundation. Existing drainage features present within these planning districts are displayed on Figures 4.8-1 through 4.8-4 and Figures 4.8-7 and 4.8-8 of Section 4.8, *Hydrology and Water Quality*, of this Program Environmental Impact Report (PEIR).

4.15.2.4 Solid Waste

San Diego County has four active landfills that accept solid waste: Miramar, Sycamore, Otay Annex, and Borrego Springs landfills. Table 4.15-6 shows the landfills' permitted remaining capacities and estimated remaining lifespans. Remaining landfill capacities are based on design limits specific to each landfill site. Site capacity and the maximum daily permitted rate of disposal specific to each site determine the estimated closure dates.

Table 4.15-6. Active San Diego County Municipal Solid Waste Landfills

Solid Waste Facility	Permitted Remaining Capacity (cubic yards)	Maximum Permitted Capacity (cubic yards)	Estimate of Remaining Site Life
Miramar Landfill	13,327,508	97,354,735	2031
Sycamore Canyon Landfill	110,000,000	147,908,000	2054
Otay Annex Landfill	21,194,008	61,154,000	2030
Borrego Landfill	111,504	476,098	2046
Total Capacity	144,633,020	306,892,833	--

Source: San Diego County 2017.

The remaining capacity at the Miramar Landfill is approximately 13,327,508 cubic yards of solid waste, and the landfill is projected to reach full capacity in 2031. Other large municipal landfills within the county include Sycamore Canyon, with a remaining capacity of approximately 110,000,000 cubic yards; Otay Annex Landfill, with a remaining capacity of 21,194,008 cubic yards; and Borrego Landfill, with a remaining capacity of 114,504 cubic yards. Solid waste collection would be rerouted to any of these landfills once Miramar Landfill is closed.

California Assembly Bill (AB) 939 requires that local county agencies prepare and implement Integrated Waste Management Plans, which must include a Siting Element (California Legislative Information 2020). The Siting Element must include a projection of the amount of disposal capacity that will be needed to accommodate the solid waste generated within the local jurisdiction for a 15-year period. The San Diego County Integrated Waste Management Plan Countywide Summary Plan contains the Countywide Siting Element, which outlines a combination of strategies including existing, proposed, and tentative landfills or expansions, increased diversion efforts, and out-of-county transport of solid waste, to serve all jurisdictions in the county for at least 15-years of disposal capacity (San Diego County 2005). The August 2017 Five-Year Review Report, approved by CalRecycle in 2018, updated the planning for 15 years of county-wide landfill disposal capacity (CalRecycle 2018). The Five-Year Review Report provides estimates for available landfill capacity within San Diego County for the State-mandated 15-year period, with the last permitted public landfill in the county, Sycamore Canyon Landfill, projected to close in 2054 (Las Pulgas Landfill is projected to remain open until 2059; however, this site is located in Camp Pendleton and is for military solid waste disposal only). In their Integrated Waste Management Plan Five Year Review, the County documents local disposal trends and landfill capacity, and assesses whether sufficient

capacity exists to accommodate disposal for the next 15 years. Based on the disposal trends in the most recent report, the County concluded that the remaining landfill system capacity is sufficient to accommodate solid waste disposal for more than 15 years, and when other variables are considered, including planned expansions and increased permitted daily waste capacity at Sycamore Canyon, the County anticipated sufficient landfill capacity through 2052 (San Diego County 2017).

In an effort to develop and evaluate options for managing solid waste disposal needs in San Diego through the year 2045, the City of San Diego initiated the Long-Term Resource Management Options Strategic Plan (LRMOSP) in 2007. Phase II of the LRMOSP concluded that maximizing the capacity at Miramar Landfill and extending its useful life by approximately 24 additional years would provide revenue streams for the longest period of time (BAS Team 2012, City of San Diego ESD 2012). The implementation phase, Phase III of the LRMOSP, will evaluate which of the system configurations or derivative of the configurations identified within Phase II of the LRMOSP will be pursued. Most recently, the City of San Diego Solid Waste Local Enforcement Agency (LEA) requested a Solid Waste Facility Permit Revision to increase the permitted height of the existing active portion of West Miramar Landfill (WML) 238-acre Phase II from 485 feet mean sea level (MSL) to 510 feet MSL which would extend the life of the landfill by approximately 8–10 years (City of San Diego 2019).

4.15.2.5 Electricity and Natural Gas

San Diego County is served by San Diego Gas and Electric (SDG&E), which provides electricity and natural gas to over 3.6 million customers (i.e., 1.4 million accounts) in the county and portions of southern Orange County. The utility has a diverse power production portfolio, composed of a variety of renewable and non-renewable sources. In addition, in February 2019, the City of San Diego decided to pursue Community Choice Aggregation/Energy in order to achieve 100 percent renewable energy by 2035, and created a joint-powers entity with cities across the region to pool resources in creating a more efficient Community Choice program, which would allow customers a choice of electricity power (City of San Diego Sustainability Department 2021). Energy production typically varies by season and by year. Regional electricity loads also tend to be higher in the summer because the higher summer temperatures drive increased demand for air-conditioning. In contrast, natural gas loads are higher in the winter because the colder temperatures drive increased demand for natural gas heating. See Table 4.6-7 in Section 4.6 for a summary of electricity and natural gas use within SDG&E service area.

4.15.2.6 Telecommunications

Telecommunication services are those that offer voice and data services over a large area, including phone services (landlines and/or wireless services), internet (dial-up, fiber optics, broadband), television (cable, etc.), and computer networking. As defined by Federal Standard 1037C, telecommunication facilities include the following:

- Any fixed, mobile, or transportable structure, including all installed electrical and electronic wiring, cabling, and equipment and all supporting structures, such as utility, ground network, and electrical supporting structures.
- A network-provided service to users or the network operating administration; a transmission pathway and associated equipment.
- A real property entity consisting of one or more of the following: a building, a structure, a utility system, pavement, and underlying land.

Generally, telecommunication facilities are constructed and maintained by private companies within public rights-of-way or easements on private property. While the specific type of telecommunication facilities available within any given area may vary, the proposed PMPU area is currently comprehensively served by telecommunication services, including landline/wireless telephone services, internet, television, and computer networking. Generally, District tenants contract with private providers for these services and do not construct or maintain their own telecommunication facilities.

In addition, the District is in the process of developing regulations for wireless communication facilities, including standards for managing, processing, and acting upon requests for the placement and modification of wireless communication facilities on District Tidelands.

4.15.3 Laws, Regulations, Plans, and Policies

4.15.3.1 Federal

There are no Federal laws, regulations, or plans related to utilities and service systems.

4.15.3.2 State

Water

California Water Code

Sections 10610–10656 (Urban Water Management Planning Act)

In 1983, the California Legislature enacted the Urban Water Management Planning Act (UWMPA) (California Water Code Sections 10610–10656). The UWMPA states that every urban water supplier that provides water to 3,000 or more urban connections, or that provides more than 3,000 acre-feet of water annually, should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry years. This effort includes the adoption of a UWMP by every urban water supplier and an update of the plan every 5 years on or before December 31 of every year ending in a five or zero. The UWMPA has been amended several times since 1983, with the most recent amendment occurring with Senate Bill (SB) 318 in 2004. With the passage of SB 610 in 2001, additional information is required to be included as part of an urban water management plan if groundwater is identified as a source of water available to the supplier. An urban water supplier is required to include in the plan a description of all water supply projects and programs that may be undertaken to meet total projected water use. The UWMPA and SB 610 are interrelated; the UWMP is typically relied upon to meet the requirements of SB 610.

2019 California Green Building Standards Code, Title 24, Part 11, Chapter 5

Chapter 5 of the 2019 California Green Building Standards Code specifies water efficiency requirements for non-residential development. Specific requirements are provided for plumbing within the interior of non-residential buildings as well as the use of recycled water for landscaping where recycled water is available and supplied by the municipality.

The Water Conservation Act of 2009 (Senate Bill X7 7 (2009))

Requirements per State law (SB-X7 7) mandate reduction of per capita water use and agricultural water use throughout the State by 20 percent by 2020.

State Updated Model Landscape Ordinance (Assembly Bill 1881 [2006])

The updated Model Landscape Ordinance requires cities and counties to adopt landscape water conservation ordinances. Section 142.0401 of the San Diego Municipal Code establishes landscaping standards across the City, which are implemented through the landscape standards identified in the Land Development Code. The standards require the installation of water-efficient and/or drought tolerant landscape materials for the types of projects identified in Table 142-04A of the Municipal Code.

Solid Waste

California Integrated Waste Management Act

In response to reduced landfill capacity, the State of California passed the California Integrated Waste Management Act in 1989. This legislation (generally known by the name of its enacting bill, AB 939) requires cities and counties to reduce the amount of solid waste entering existing landfills through recycling, reuse, and waste prevention efforts. The purpose of AB 939 is to “reduce, recycle, and re-use solid waste generated in the state to the maximum extent feasible.” AB 939 requires jurisdictions to utilize “integrated waste management”—a variety of waste management practices to safely and effectively handle the municipal solid waste stream with the least adverse impact on human health and the environment.

When first enacted, AB 939 required every city and county in the state to prepare a Source Reduction and Recycling Element in its Solid Waste Management Plan to identify how each jurisdiction planned to meet mandatory State waste diversion goals of 25 percent by the year 1995 and 50 percent by the year 2000. AB 939 also established the California Integrated Waste Management Board, the State agency designated to oversee, manage, and track California’s solid waste generation each year. In order to further the goals of AB 939, statewide strategies to achieve a statewide goal of diverting 75 percent of solid waste from landfills by 2020 were established with the adoption of AB 341 in May 2012. As stated in the legislative text of AB 341, it is the policy goal of the State that not less than 75 percent of solid waste generated be source reduced, recycled, or composted by the year 2020, and annually thereafter (PRC Section 41780.01(a)). The 75 percent diversion goal does not apply to individual jurisdictions or development projects (CalRecycle 2020). AB 341 also establishes the statewide mandatory commercial recycling program which requires businesses that generate 4 cubic yards or more of commercial solid waste per week, or multi-family residential dwellings of five units or more must implement recycling practices during operation to help the State achieve the statewide diversion goal of 75 percent.

Electricity and Natural Gas

California Code of Regulations, Title 20 and Title 24(2019)

Updated every 3 years through a rigorous stakeholder process, Title 24 of the California Code of Regulations (CCR) requires California homes and businesses to meet strong energy efficiency measures, thereby lowering their energy use. Title 24 contains numerous subparts, including Part 1 (Administrative Code), Part 2 (Building Code), Part 3 (Electrical Code), Part 4 (Mechanical Code), Part 5 (Plumbing Code),

Part 6 (Energy Code), Part 8 (Historical Building Code), Part 9 (Fire Code), Part 10 (Existing Building Code), Part 11 (Green Building Standards Code), and Part 12 (Referenced Standards Code).

New buildings constructed in California must comply with the standards contained in CCR Title 20, Energy Building Regulations, and Title 24, Energy Conservation Standards. Title 20 contains standards ranging from power plant procedures and siting to energy efficiency standards for appliances to ensuring reliable energy sources are provided and diversified through energy efficiency and renewable energy resources.

Energy Conservation Standards for new residential and nonresidential buildings were adopted by the California Energy Resources Conservation and Development Commission in June 1977. The most recent update was the 2019 Building Energy Efficiency Standards, which were adopted in May 2018 and took effect on January 1, 2020 (Part 6, Title 24). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. The 2016 Standards improve upon the previous 2013 Standards for new construction of, and additions and alterations to, residential and nonresidential buildings. Under the 2016 Standards, residential buildings are generally 28 percent more efficient than the 2013 Standards, and nonresidential buildings are generally 5 percent more energy efficient than the 2013 Standards as a result of better windows, insulation, lighting, ventilation systems, and other features (CEC 2015). Under the 2019 Standards, nonresidential buildings will be 30 percent more energy-efficient compared to the 2016 Standards. Part 6 also provides for the installation of cool roofs in Sections 140.3(a)(1), 141.0(b)(2)(B), and 141.0(b)(3).

On July 17, 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11, Title 24) (CalGreen) was adopted as part of the California Building Standards Code (24 CCR) and applies to the planning, design, operation, construction, use, and occupancy of every newly constructed building or structure, unless otherwise indicated in the code, throughout the state. The current version of CalGreen (2019) became effective on January 1, 2020.

Part 11 establishes voluntary standards that became mandatory in the 2010 edition of the code, including planning and design for sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants. In addition, Section 5.408 of CalGreen requires that a minimum of 65 percent of all non-hazardous construction and demolition waste be recycled and/or salvaged for reuse. This specific requirement applies to non-residential construction projects.

4.15.3.3 Local

All Utilities

San Diego Unified Port District Climate Action Plan

The District adopted a Climate Action Plan (CAP) in December 2013. The CAP includes an inventory of existing (2006) and projected greenhouse gas (GHG) emissions in 2020, 2035, and 2050 and identifies the District's GHG reduction goals and measures to be implemented to support meeting the statewide reduction goals set forth in AB 32 (1990 levels by 2020), as described in Section 4.6, *Greenhouse Gas Emissions and Climate Change*. To achieve the requisite reductions, the CAP includes various reduction measures related to transportation and land use, alternative energy generation,

energy conservation, waste reduction and recycling, and water conservation and recycling.

Green Port Program and Green Port Policy (BPC Policy No. 736)

The District's Board of Commissioners adopted the Green Port Policy in 2007. This policy establishes guiding principles to achieve long-term environmental, societal, and economic benefits through resource conservation, waste reduction, and pollution prevention. The policy provides the overall framework for the Green Port Program. The Green Port Program is an umbrella program designed to achieve the District's environmental sustainability goals in six key areas: water, energy, air, waste management, sustainable development, and sustainable business practices. It was established in early 2008 to achieve the objectives outlined in the District's Green Port Policy.

Policy objectives include the following.

- Minimize, to the extent practicable, environmental impacts directly attributable to operations on San Diego Bay and the tidelands.
- Strengthen the District's financial position by maximizing the long-term benefits of energy and resource conservation.
- Prevent pollution and improve personal, community, and environmental health.
- When possible, exceed applicable environmental laws, regulations, and other industry standards.
- Ensure a balance of environmental, social, and economic concerns are considered during planning, development, and operational decisions.
- Define and establish performance-driven environmental sustainability objectives, targets, and programs.
- Monitor key environmental indicators and consistently improve performance.
- Foster socially and environmentally responsible behavior through communications with employees, tenants, stakeholders, and the community.
- Collaborate with tenants to develop an integrated, measurable, Bay-wide environmental sustainability effort.

At present, the Green Port Program primarily focuses on things the District can do to be more environmentally sustainable, such as using less water and being more energy efficient in its own operations. In the future, the District will work with its tenants (businesses that lease bayfront land from the District), local environmental groups, and others around San Diego Bay to identify ways they can support the Green Port Program.

Wastewater

City of San Diego Sewer Design Guide

When planning and designing wastewater facilities, the City Wastewater Branch follows the guidance and design policies of the *Sewer Design Guide* (2004), which summarizes and outlines relevant policies, applicable codes, and engineering and operational practices and procedures necessary to establish a safe and efficient wastewater collection system. This document provides

guidance for the City of San Diego to design and maintain sewer facilities such as pump stations, gravity sewers, force mains, and associated wastewater appurtenances.

City of Coronado Sewer System Management Plan

The City of Coronado's Sewer System Management Plan (SSMP) was prepared in compliance with the requirements of the State Water Resources Control Board (SWRCB), Order 2006-0003 DWQ, Statewide General Waste Discharge Requirements (WDRs) for Sanitary Sewer Systems (2009). The goal of the WDRs is to provide a consistent statewide approach for reducing Sanitary Sewer Overflows (SSOs). The City of Coronado's ultimate goals include operating and maintaining all portions of their sanitary sewer system to minimize the potential for SSOs and to quickly and effectively mitigate the impacts associated with an SSO if it were to occur so as to protect life, environment, and property while adhering to regulatory requirements. To achieve these goals, the SSMP includes methods for ensuring that adequate capacity to convey the peak wastewater flows is provided and that comprehensive procedures are established to meet all applicable regulatory notification and reporting requirements.

Water

San Diego County Water Authority's 2020 Urban Water Management Plan

The California Urban Water Management Planning Act requires that each urban water supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually must prepare, update, and adopt a UWMP at least once every 5 years. This law applies to the San Diego County Water Authority. The intent of an UWMP is to present information on water supply, water usage, recycled water, and water use efficiency programs in a respective water district's service area. A UWMP also serves as a resource for planners and policy makers over a 25-year timeframe. The San Diego County Water Authority updates its demand forecasts and supply needs based on the most recent SANDAG forecast approximately every five years. The most current supply and demand projections are contained in the 2020 UWMP, an update to the 2015 UWMP, which was adopted on May 27, 2021, and were submitted to the State prior to July 1, 2021. The 2020 UWMP states that all future water demands will have available water supplies for the predicted service areas during a normal and single and multiple dry year scenarios through 2045.

City of San Diego's 2020 Urban Water Management Plan

The California Urban Water Management Planning Act requires that each urban water supplier providing water for municipal purposes to more than 3,000 customers, or supplying more than 3,000 acre-feet of water annually, must prepare, update, and adopt a UWMP at least once every five years. This law applies to the City of San Diego, which is a member agency of the San Diego County Water Authority. The City of San Diego prepared the 2020 UWMP to meet the State's requirements under the California Water Code and comply with the California Urban Water Management Planning Act. The plan provides information on the city's current and future water demands and supplies, discusses the water resources challenges that the city faces, and summarizes the major water resources initiatives that the City of San Diego has proactively taken to ensure a safe, reliable water supply for its water customers. Specifically, the 2020 UWMP details the city's water system, water demands, sources of water supplies, water conservation efforts, climate change impacts, energy intensity, water shortage contingency planning, and projected water supply reliability during

normal, dry, and multiple-year drought conditions. Availability of imported water and regional water demands and conservation were coordinated with the San Diego County Water Authority, the wholesale water provider for the city. To prepare the City of San Diego's water demand forecast, coordination with SANDAG was necessary to obtain the most recent demographic projections for the city (2050 Regional Growth Forecast Update Series 14). The 2020 UWMP is an update to the 2015 UWMP. The Draft 2020 UWMP was released for public review from March 1, 2021, through April 5, 2021, and was adopted by the San Diego City Council in June 2021.

Sweetwater Authority's Draft 2020 Urban Water Management Plan

Sweetwater prepares an UWMP every 5 years and prepared a Draft 2020 UWMP to meet the State's requirements under the California Water Code and comply with the California Urban Water Management Planning Act. Sweetwater's UWMP is intended to ensure that sufficient water supplies are available to meet existing and future water demands within its service area. Preparation of the Draft 2020 UWMP involved coordination with various agencies and municipalities, including the San Diego County Water Authority, City of Chula Vista, City of National City, and the County of San Diego. Each of these jurisdictions have land use authority within Sweetwater's service area, and thus establish land use and housing growth policies that have an impact on Sweetwater's water use projections. Additionally, Sweetwater also coordinated with the City of San Diego on water supplies. On June 9, 2021, the Sweetwater Board adopted a new Water Shortage Contingency Plan (WSCP), an Addendum to the 2015 UWMP, the 2020 UWMP, and an Amendment to the Drought Response Plan.

Stormwater

Jurisdictional Runoff Management Program

Under the Municipal Stormwater Permit, each jurisdiction is required to have a Jurisdictional Runoff Management Program (JRMP), which includes a component that addresses issues related to construction activities and a component that addresses issues related to existing development, and that requires co-permittees to establish adequate enforcement authority, develop education/outreach, and conduct monitoring. In addition, each co-permittee prepares and submits an annual report that describes program implementation and strategies to reduce the discharge of pollutants of concern to the Municipal Separate Storm Sewer Systems (MS4) Permit and receiving waters to the maximum extent practicable.

The District's JRMP has been developed to meet the conditions of the Municipal Stormwater Permit and to assist the District in achieving the goals identified in the Water Quality Improvement Project (WQIP). District-specific WQIP-based strategies have been incorporated into the JRMP. The JRMP's focus is on controlling stormwater discharges to the MS4, with the overall goal of achieving improvements in receiving water quality. The District has developed a list of Best Management Practices (BMPs) that are applicable to all persons, activities, and operations occurring on District Tidelands, and the JRMP utilizes District-specific jurisdictional activities and watershed-based strategies. Enforcement of the JRMP helps to prevent stormwater pollutants from entering local storm drains and, ultimately, San Diego Bay.

Jurisdictional Runoff Management Program BMP Standards

Best Management Practices Design Manual

As part of the District's JRMP, a *BMP Design Manual*⁵ was developed to provide guidelines for incorporating permanent post-construction BMPs into new and redevelopment projects. The *BMP Design Manual* identifies the required source-control and site-design BMPs to eliminate or reduce pollutants in stormwater runoff for all projects. For Priority Development Projects (PDPs), the *BMP Design Manual* also describes pollutant-control BMPs that must be incorporated into the site design and, where applicable, addresses potential hydromodification impacts from changes in flow and sediment supply. The *BMP Design Manual* is applicable for both tenant- and District-sponsored major maintenance or capital improvement projects, as required by the Municipal Stormwater Permit. Project proponents must submit a Storm Water Quality Management Plan (SWQMP) accurately describing how the project will meet source control site design and pollutant control BMP requirements. District staff provide technical review of and approve SWQMP documents and drainage design plans to ensure that pollutant control BMP requirements are met. The SWQMP is evaluated for compliance with the Municipal Stormwater Permit and with design criteria outlined in the District's *BMP Design Manual*. Once the approval process is complete, the project is able to commence and routine inspections are conducted throughout the duration of project construction.

Solid Waste

San Diego City Council Policy 900-16

Although the proposed PMPU area is within the District's jurisdiction, solid waste is collected and processed by the City of San Diego's franchised waste haulers. Consequently, City of San Diego policies would apply to the collection and processing of solid waste generated by future development associated with the proposed PMPU.

Construction waste makes up approximately 35 percent of the waste entering the Miramar Landfill. A majority of this waste comprises recyclable or reusable materials. In 2004, San Diego's Mayor and City Council enacted Council Policy 900-16, Construction & Demolition Material Recycling, expressing the City's commitment to recycling construction and demolition waste as an integral part of the City's comprehensive solid waste management strategy. The policy outlines the following principles for private industry.

1. Businesses, organizations, and contractors are encouraged to facilitate as much waste diversion from landfills as possible through recycling, waste reduction, and reuse.
2. Demolition, construction, and renovation project proponents should evaluate the potential for maximizing waste diversion through recycling, waste reduction, and reuse. Diversion plans should be adequately communicated with all contractors and subcontractors.
3. Diversion goals should be 100 percent diversion of inert materials (concrete, rock, asphalt, dirt, etc.) and at least 50 percent diversion of all remaining materials by weight if mixed C&D [Construction and Demolition] recycling facilities are available, or as much as feasible through source separation of recyclable materials if a mixed C&D facility is not available.

⁵ The *BMP Design Manual* and appendices are available online at: <https://www.portofsandiego.org/stormwater-management>.

4. Businesses, organizations, and contractors should purchase products made from recycled materials to the maximum extent possible.

City of San Diego Construction and Demolition Debris Deposit Ordinance

On July 1, 2008, the Construction and Demolition (C&D) Debris Deposit Ordinance took effect. The ordinance requires that the majority of construction, demolition, and remodeling projects requiring building, combination, and demolition permits pay a refundable C&D Debris Recycling Deposit and divert at least 65 percent of their debris by recycling, reusing, or donating usable materials. The ordinance is designed to keep construction and demolition materials out of local landfills and ensure they get recycled.

San Diego County Integrated Waste Management Plan

The San Diego County Integrated Waste Management Plan was adopted in January 2005 to meet the requirements of the California Integrated Waste Management Act (i.e., AB 939). The plan includes goals and policies as well as a summary of integrated waste management issues in San Diego County. It summarizes waste management programs that local jurisdictions are using to meet the 50 percent waste reduction mandate. It also suggests steps needed to cooperatively implement and administer specific programs regionally or countywide. The plan consists of a Countywide Siting Element, a Countywide Summary Plan, and three elements from each jurisdiction:

- Source Reduction and Recycling Element, which analyzes the local waste stream, and presents diversion programs and funding.
- Household Hazardous Waste Element, which includes programs to encourage safe management of household toxic waste and provide framework for recycling, treatment, and proper disposal.
- Non-Disposal Facility Element, which lists existing and planned facilities.

Long-Term Resource Management Options Strategic Plan

The LRMOSP is a planning process initiated by the City of San Diego in 2007 to develop and evaluate options for managing solid waste disposal needs in San Diego through the year 2045. Miramar Landfill, the City of San Diego's only landfill, is anticipated to close under current conditions and projections in 2030. The LRMOSP assesses the City of San Diego's current disposal system capabilities, projects future solid waste management demands, and presents long-term options for consideration by City staff and elected officials.

The LRMOSP is a three-phase process. Phase I consisted of a system analysis, regional demand and capacity analysis, and identification and screening of options. Phase II provides a review of the existing diversion programs and disposal system, and an update of future disposal demands; evaluates options to meet disposal demand after diversion programs; identifies potential system configurations; evaluates potential City of San Diego roles in future solid waste management systems; provides a financial analysis for maintaining the status quo or implementing various system configurations; identifies potential revenue opportunities; and provides implementation strategies for each of the five identified system configurations. Phase III will recommend a specific strategy and configuration system, including a detailed implementation plan.

4.15.4 Project Impact Analysis

4.15.4.1 Methodology

The analysis of impacts associated with utilities (wastewater, water, stormwater, solid waste, natural gas, electricity, and telecommunications) as a result of implementation of the proposed PMPU generally includes a comparison of the demand generated by buildout of the future development under the proposed PMPU against existing supply and storage capacities. A significant impact would occur if new or expanded facilities would be required as a result of the proposed PMPU's implementation. Utility use estimates are based on CalEEMod default generation rates for utilities, including water, wastewater, solid waste, natural gas, and electricity (Appendix C), which provide estimates for existing and proposed demand for water and energy use as well as wastewater and solid waste generation. Please see Section 4.6 for a detailed description of the methodology for utility demand estimates. Table 4.15-7 provides the generation rates for water, wastewater, and solid waste by land use. Increased demand on telecommunication facilities were qualitatively assessed.

Table 4.15-7. Wastewater, Water, and Solid Waste Generation Rates¹

Use	Wastewater (acre-feet per year)	Water (acre-feet per year)	Electricity (kWh) ²	Natural Gas (therm)	Solid Waste (cubic yards per year)	Unit
Hotel	0.08	0.09	18,063	151	2.0	Per room
Retail/ Restaurant	0.93	0.99	37,820	9,685	44.1	Per tsf ²
Meeting Space	0.55	0.88	15,150	321	3.4	Per tsf

Source: Appendix C.

¹ Generation rates are based on CalEEMod defaults for hotel, restaurant, and retail uses.

² tsf = thousand square feet

Any need for physical improvements to the existing infrastructure and the potential impacts from these improvements are evaluated within this section and the other applicable resource sections of this PEIR. A summary of the existing and proposed utility consumption within the proposed PMPU area for water, wastewater, and solid waste is provided in Table 4.15-8.

Table 4.15-8. Existing and Proposed Utility and Solid Waste Consumption

Utility	Existing (2016)	Demand of Proposed PMPU (net new) (2050)	Total - Existing plus PMPU (2050)
Water (acre-feet/year)	9,609	104	9,712
Wastewater (acre-feet/year)	8,774	86	8,860
Solid Waste (cubic yards/year)	81,486	1,755	83,241
Electricity (kWh/year)	333,873,577,333	88,647,100	333,962,224,433
Natural Gas (therm/year)	43,806,618	3,988,639	47,795,257

Source: Appendix C.

4.15.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of impacts associated with utilities and service systems resulting from the implementation of the proposed PMPU. The determination of whether a utilities and service systems impact would be significant is based on the professional judgment of the District as Lead Agency and is based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following:

1. Require or result in the relocation or construction of new or expanded water, or wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities or expansion of existing facilities, the construction or relocation of which could cause significant environmental effects;
2. Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years;
3. Result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments;
4. Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or
5. Not comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

4.15.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to avoid or reduce impacts associated with utilities and service systems, and are considered in the impact analysis that follows.

SR Policy 3.1.3 Permittees of development shall deploy renewable energy technology to improve energy reliability and economic resilience, where feasible.

SR Policy 3.1.5 The District shall continue to coordinate with Tidelands' tenants and adjacent local businesses to reduce resource consumption and promote sustainable operations.

SR Policy 3.1.6 The District shall promote the innovative use of "green" design for new or retrofitted Tidelands' buildings, structures, and facilities.

SR Policy 3.1.7 Development shall include water conservation strategies to save water and energy on-site, where feasible.

ECO Policy 1.1.8 Development shall integrate drought-tolerant species native to the San Diego County coastal zone as a part of landscaped areas.

ECON Policy 1.2.4 The District shall explore the creation of, and allow for the use of, different financing mechanisms to help fund the building of new infrastructure or improvement to existing infrastructure, including multimodal transportation facilities, water and stormwater systems, information and communication systems, and public space.

ECON Policy 2.3.2 The District and permittees shall coordinate the investment in improvements to marine terminal and maritime industrial operations that improve functionality and efficiency through modernization of terminal infrastructure and equipment, including electrification that supports optimization of cargo movement and reduces emissions.

4.15.4.4 Project Impacts and Mitigation Measures

Threshold 1: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant effects?

Impact Analysis

Impacts of Water and Land Uses

Construction

Chapter 3, *Project Description*, provides a complete list of the allowable uses within PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10 and details the development projections that could occur in these planning districts by 2050, the planning horizon for the proposed PMPU. Construction activities for future PMPU-related development would involve the temporary use of the utilities discussed below and would be spread over the PMPU's approximately 30-year planning horizon. As such, the demand for construction-related utilities associated with future development under the proposed PMPU would be dispersed over an approximately 30-year period.

Water Facilities

Water would be required during construction of future development under the proposed PMPU for activities such as dust suppression—including during demolition—light washing of equipment and tools consistent with water quality regulations, and for drinking water for construction workers. Water usage during construction would be temporary, and it is possible that recycled water or other soil stabilizers could be used for dust suppression, equipment washing, etc. In 2020, PUD provided 8,195 AFY of non-potable recycled water within the City of San Diego and 4,232 AFY to three wholesale customers. The use of recycled water during future construction activities would reduce the quantity of potable water that would otherwise be required. SDCWA's Water Shortage and Drought Response Plan and Drought Response Ordinance includes use of non-potable water for construction purposes. Agencies in San Diego County use recycled water provided by SDCWA to control dust at construction sites. As described in Chapter 2, *Environmental Setting*, most of the planning districts are within urbanized areas and are largely developed. Because there is little vacant land in the proposed PMPU area, the majority of future improvements associated with the proposed PMPU would occur as infill development or the redevelopment of existing uses. As such, construction demand for water would be offset by the cessation of existing uses during construction. Moreover, construction water usage would not require or result in the relocation or construction of new or expanded water facilities, as new or expanded existing water facilities are typically intended to serve permanent uses and operations rather than temporary water consumptive activities associated with construction. As such, demand for water during construction activities would not result in impacts from new or expanded water facilities, and, therefore, impacts would be less than significant.

Wastewater Facilities

As discussed under Section 4.15.2.1, *Wastewater*, the PLWTP and SBWRP currently meet the wastewater discharge requirements of NPDES Permit No. CA0107409. Wastewater treatment requirements for wastewater generated during construction of future development under the proposed PMPU would be based on all applicable State and Federal regulations and policies including the NPDES Permit, and would include limitations on effluent discharge and receiving water. In general, effluent discharge requirements include specifications for adequate disinfection treatment and limitations on radioactivity, pollutant concentrations, sediments, pH, temperature, and toxicity.

Construction of future development under the proposed PMPU would temporarily require construction workers within the proposed PMPU area. During construction, it is anticipated that portable temporary restroom facilities would be brought to the site for construction workers. Wastewater generated at the portable restroom facilities would be hauled away and the waste would be disposed of at an appropriate facility in accordance with 17 CCR 8007, which requires the contents of portable toilets to be disposed of by draining or pumping into a sanitary sewer, an approved septic tank of sufficient capacity to handle the wastes, a suitably sized and constructed holding tank, approved by the local health department, or by any other method approved by the local health department. No wastewater treatment facilities, infrastructure improvements, or other expansions would be required as a result of construction of future development associated with implementation of the proposed PMPU. Therefore, construction impacts would be less than significant.

Stormwater Drainage Facilities

Stormwater drainage facilities (i.e., storm drains) may be temporarily modified during the construction of future development projects allowed under the proposed PMPU. Construction activities proposed consistent with the proposed PMPU that would disturb more than 1 acre of land would be required to comply with the Construction General Permit, which would require development and implementation of a SWPPP by a Qualified SWPPP Developer (as described in Section 4.8.3.2 in Section 4.8). The SWPPP would identify the construction BMPs to be implemented in order to protect stormwater runoff and would include a monitoring plan for measuring BMP effectiveness. BMPs are required to be inspected regularly by a Qualified SWPPP Practitioner. The Qualified SWPPP Practitioner monitors the construction activities to ensure the BMPs listed in the SWPPP are implemented and performing as anticipated. For projects under 1 acre of land, PMPU-related construction activities would still need to comply with the District's JRMP, which requires preparation of a Construction BMP Plan. The Construction BMP Plan requires the same construction BMPs as a SWPPP, but does not include as many post-construction BMPs. Projects that would disturb less than 1 acre, but more than 100 square feet, would need to prepare and implement a Construction BMP Plan. Implementation of the SWPPP or Construction BMP Plan would include several BMPs, described in Section 4.8, which would slow onsite runoff and ensure that the available capacity of the existing stormwater facilities would be sufficient for anticipated increases in BMP-treated runoff water. As a result, construction of future development under the proposed PMPU would not result in significant impacts from the relocation or construction of new or expanded stormwater drainage facilities. Construction impacts would be less than significant.

Electricity and Natural Gas Facilities

Because of the urbanized nature of the proposed PMPU area, it is not anticipated that new or expanded electricity and natural gas facilities, which are owned and operated by SDG&E, would be required for construction activities associated with future PMPU-related development. As detailed in Section 4.6,

construction associated with buildout of the proposed PMPU would require approximately 1,967,096 million BTUs of energy. Generally, construction activities do not involve the use of natural gas. Natural gas would not be supplied to support construction activities of future development because there would be no demand generated by construction. Additionally, electric construction tools that would be used during construction of future development would be powered by diesel-operated generators at a project site rather than by electricity from the power grid (except in rare circumstances). In the event that electricity is required for future construction activities, SDG&E would continue to provide service to the proposed PMPU area, and construction activities for future development would not require or result in the relocation or construction of new or expanded electricity and natural gas facilities, the construction of which would cause significant effects. Construction impacts associated with electricity and natural gas facilities would be less than significant.

Telecommunications Facilities

Because of the urbanized nature of the proposed PMPU area, it is not anticipated that new or expanded telecommunication facilities would be required for construction activities associated with future PMPU-related development. These providers would continue to serve the proposed PMPU area, and construction activities for future development would not require or result in the relocation or construction of new or expanded facilities, the construction of which would cause significant effects. Construction impacts associated with telecommunication infrastructure would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to expansion of utilities.

Construction activities associated with the new Waterfront Destination Park under Option 1 would generally involve the same types of construction activities described above, including grading activities and the use of heavy construction equipment and would require the use of utilities during construction, including water, wastewater, storm drains, electricity and natural gas, and telecommunications. However, construction activities under Option 1 would not require or result in the relocation or construction of new or expanded facilities, and impacts would be less than significant. Therefore, construction activities occurring under Option 1 would not result in any additional or more severe impacts related to extension of utilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to expansion of utilities.

Construction activities associated with the expanded Lane Field Setback Park under Option 2 would generally involve the same types of construction activities described above, including grading activities and the use of heavy construction equipment and would require the use of utilities during construction, including water, wastewater, storm drains, electricity and natural gas, and telecommunications. However, construction activities under Option 2 would not require or result in the relocation or construction of new or expanded facilities, and impacts would be less than significant. Therefore, construction activities occurring under Option 2 would not result in any additional or more severe impacts related to extension of utilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to expansion of utilities.

Construction activities associated with the new park space that could be developed under Option 3 would generally involve the same types of construction activities described above, including grading activities and the use of heavy construction equipment and would require the use of utilities during construction, including water, wastewater, storm drains, electricity and natural gas, and telecommunications. However, construction activities under Option 3 would not require or result in the relocation or construction of new or expanded facilities, and impacts would be less than significant. Therefore, construction activities occurring under Option 3 would not result in any additional or more severe impacts related to extension of utilities than buildout of the proposed PMPU without Option 3.

Operation

As described in Chapter 3, implementation of the proposed PMPU could result in the development of commercial recreation facilities within the proposed PMPU area, including within PD2, PD3, and PD8 where hotels, retail, and other commercial and visitor-serving development are planned. Planning District 4 would primarily comprise marine terminal and marine industrial operations. Planning District 7 is predominately natural habitat, and operations within PD7 would generally consist of restoration and habitat mitigation banking. Future development in PD1, PD9, and PD10 would generally be limited to new recreational boat berthing slips and anchorages, and replacement in-kind or renovations of existing uses. Therefore, these improvements would not result in a substantial increase in water demand or in any increase in impervious surfaces compared to existing conditions. The proposed PMPU would also result in alterations to the circulation system, to provide infrastructure for transit opportunities, and pedestrians and bicyclists with improved travel routes, and to establish mobility hubs to meet the needs of the visitors to the proposed PMPU area. Implementation of the proposed PMPU would also result in in-water development, which would include dock maintenance, vessel slip reconfiguration and enhancement in the water basin, modification of marina capacity, enhancement or modifications to the existing anchorage area supporting transient vessel berthing, and the addition of aquaculture within the proposed PMPU area. Proposed primary water uses would include anchorage, commercial fishing berthing, marine services berthing, navigation corridor, open bay/water, recreational berthing, and sportfishing

berthing. Allowable land uses would include commercial fishing, commercial recreation, institutional/roadway, marine sales and services, recreation open space, and sportfishing.

Water Facilities

The operation of future development consistent with the proposed PMPU would introduce new employees, visitors, and hotel guests to the proposed PMPU area, which would increase demand on existing water facilities that would serve future development under the PMPU. Note that this analysis focuses on the physical impacts of constructing any new or expanded water conveyance and treatment facilities needed to serve future development under the proposed PMPU. A detailed analysis of impacts of the proposed PMPU on water supply is provided below in Threshold 2.

Water demand would increase as a result of future development within the proposed PMPU area, and notably in PD2, PD3, and PD8 where future development may include hotels, retail, restaurants, and other commercial and visitor-serving development. As explained in Section 4.15.4.1, *Methodology*, and indicated in Table 4.15-8, implementation of the proposed PMPU could result in an increased demand for water of an additional 34 million gallons-per-year (approximately 104 AFY). To accommodate the additional water demand, new or expanded water conveyance infrastructure (i.e., new, upgraded, relocated, or expanded water lines into specific future project sites) may need to be installed by future development projects. Because the proposed PMPU area is largely urbanized, it is not anticipated that future development under the proposed PMPU, which would largely involve redevelopment of existing sites, would require the installation of water conveyance facilities into currently undeveloped areas. Beyond future development-specific water infrastructure upgrades, no water facility projects are planned as part of the proposed PMPU. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with the installation of new or expanded water pipelines to serve specific future development are generally known, and impacts associated with ground-disturbing activities would potentially occur. The impacts of ground disturbing activities are analyzed within this PEIR, including in Sections 4.3, *Biological Resources*, 4.4, *Cultural Resources and Tribal Cultural Resources*, 4.5, *Geology and Soils*, 4.7, *Hazards and Hazardous Materials*, and 4.8, *Hydrology and Water Quality*. Based on the determinations within these sections, land disturbance associated with installing water conveyance facilities would also have the potential to result in a significant impact (**Impact-UTIL-1**).

Wastewater Facilities

Operation of future development associated with implementation of the proposed PMPU would generate wastewater. During operation, wastewater generation within the proposed PMPU area is expected to increase approximately 28 million gallons per year (86 AFY) over existing conditions.

Because the proposed PMPU area is largely urbanized, it is not anticipated that future development under the PMPU, which would largely involve redevelopment of existing sites, would require the installation of new wastewater facilities into currently undeveloped areas. However, to accommodate the wastewater demand of future development, connections to existing wastewater conveyance lines would likely be required. Connection to the existing wastewater treatment system would adhere to all requirements of the adjacent city, including any applicable sewer design guidelines (see Section 4.15.3). While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded wastewater conveyance facilities to serve specific future projects are generally known, and impacts associated with ground-disturbing activities would potentially

occur. The impacts of ground disturbing activities are analyzed within this PEIR, including in Sections 4.3, 4.4, 4.5, 4.7, and 4.8. Based on the determinations within these sections, land disturbance associated with installing wastewater conveyance facilities would also have the potential to result in a significant impact (**Impact-UTIL-1**).

Stormwater Drainage Facilities

Most of the planning districts are largely built out (PD3) or would undergo little to no additional development (e.g., PD1, PD4, PD7, PD8, PD9, PD10). As such, the proposed PMPU would not be expected to result in a substantial increase in impervious surfaces compared to existing conditions in those planning areas. Planning District 2 would potentially see some additional impervious surfaces installed, but generally much of PD2, in the areas where development may occur, consists of impervious surfaces, including parking lots, internal roads, and several buildings that are shorter in height than what may be developed under the proposed PMPU. As such, because the proposed PMPU area is largely urbanized, it is not anticipated that future development under the proposed PMPU, which would largely involve redevelopment of existing sites, would require the installation of new stormwater drainage facilities into currently undeveloped areas. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded stormwater facilities to serve specific future development are generally known, and impacts associated with ground-disturbing activities would potentially occur. The impacts of ground-disturbing activities are analyzed within this PEIR, including in Sections 4.3, 4.4, 4.5, 4.7, and 4.8. Based on the determinations within these sections, land disturbance associated with installing stormwater drainage facilities would also have the potential to result in a significant impact (**Impact-UTIL-1**).

Electricity and Natural Gas Facilities

Electricity and natural gas in the proposed PMPU area are provided by SDG&E, which offers electricity and natural gas to approximately 3.4 million people within its approximately 4,100-square-mile service area in San Diego and Orange Counties. Future development under the proposed PMPU would increase demand for electricity by 88,647,100 kWh per year and would increase demand for natural gas by 3,988,639 therm per year and would require new connections to existing electricity and natural gas facilities within the proposed PMPU area. Because the proposed PMPU area is largely urbanized, it is not anticipated that future development under the PMPU, which would largely involve redevelopment of existing sites, would require the installation of new electricity and natural gas facilities into currently undeveloped areas. Future development under the proposed PMPU could potentially result in an increase in electricity or natural gas demand that could require upgrades to on- or offsite electrical or natural gas facilities to accommodate operation of individual future development projects. As detailed in Section 4.6, operation associated with buildout of the proposed PMPU would require approximately 186,369 million BTUs of energy, which could require the installation of new or expanded electricity and natural gas facilities. Some of this demand could be met with the use of renewable energy under the City's Community Choice Aggregation/Energy program; however, even with the use of renewable energy, new electricity and natural gas facilities may be required to accommodate buildout of the proposed PMPU. As described in Section 4.15.3 above, new offsite electricity and natural gas facilities would typically need to be permitted by the California Energy Commission or California Public Utilities Commission. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded electricity and natural gas facilities to serve specific future development are generally known, and impacts associated with ground-disturbing

activities would potentially occur. The impacts of ground-disturbing activities are analyzed within this PEIR, including in Sections 4.3, 4.4, 4.5, 4.7, and 4.8. Based on the determinations within these sections, land disturbance associated with installing electricity and natural gas facilities would also have the potential to result in a significant impact (**Impact-UTIL-1**).

Telecommunications Facilities

Telephone, cellular, video/cable, DSL, and broadband services are available from a variety of privately owned providers, such as AT&T and Cox, for customers within the proposed PMPU area. Because the proposed PMPU area is within a highly urbanized setting, it is not anticipated that future development under the proposed PMPU, which would largely involve redevelopment of existing sites, would extend into undeveloped areas not currently served by telecommunication facilities. As such, the proposed PMPU area is comprehensively served by telecommunication facilities and it is not anticipated that new or expanded telecommunication facilities would be required to serve future PMPU-related development. However, depending on the specific use, location, or scale of future development allowed under the proposed PMPU, it is possible that some future development may require the installation of new telecommunication facilities or improvements to existing facilities, which could result in physical environmental impacts. As noted above, relocation or construction of new or expanded telecommunication facilities would need to be permitted by the adjacent city in which it is located. As described in Chapter 3, the vast majority of development that may occur under the proposed PMPU is located in PD2 and PD3, both of which are within the City of San Diego's service area. Future siting of telecommunications infrastructure within the City of San Diego would be in accordance with the Diego Municipal Code Section 141.0420, which regulates wireless communications facilities, as well as the City's Wireless Communications Facilities Guidelines. Similarly, any future telecommunications facilities within the City of Imperial Beach would be required to comply with Imperial Beach Municipal Code Chapter 19.90, while any new facilities within the City of Coronado would be required to comply with Coronado Municipal Code Chapter 52.40. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded telecommunication facilities to serve specific future development are generally known, and impacts associated with ground-disturbing activities would potentially occur. The impacts of ground disturbing activities are analyzed within this PEIR, including in Sections 4.3, 4.4, 4.5, 4.7, and 4.8. Based on the determinations within these sections related, land disturbance associated with installing telecommunication facilities would also have the potential to result in a significant impact (**Impact-UTIL-1**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to expansion of utilities (**Impact-UTIL-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with a new Waterfront Destination Park under Option 1 may require water and wastewater treatment for irrigation and water features, as well as possible restroom facilities. Electricity may also be required for security lighting and irrigation/water feature controls. As such, Option 1 would require minimal, if any, expanded water, wastewater treatment or stormwater drainage, electrical power, natural gas, or telecommunications facilities. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to utilities than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to expansion of utilities (**Impact-UTIL-1**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with the expanded Lane Field Setback Park under Option 2 may require water and wastewater treatment for irrigation and water features, as well as possible restroom facilities. Electricity may also be required for security lighting and irrigation/water feature controls. As such, Option 2 would require minimal, if any, expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to utilities than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to expansion of utilities (**Impact-UTIL-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with new park space that could be developed under Option 3 may require water and wastewater treatment for irrigation and water features, as well as possible restroom facilities. Electricity may also be required for security lighting and irrigation/water feature controls. As such, Option 3 would require minimal, if any, expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities. Therefore, operations under Option 3 would not result in any additional or more severe impacts related to utilities than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant effects. The proposed PMPU policies would help to

minimize adverse effects on utilities through promoting conservation, reduction, and planned capital improvements. For instance, SR Policy 3.1.7 promotes implementation of water conservation strategies. In addition, ECON Policy 1.2.4 promotes creation of financing mechanisms to fund the building of infrastructure improvements, which would help ensure the provision of adequate water, stormwater, and communications infrastructure.

Impact Determination and Mitigation

Implementation of the proposed PMPU may require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant effects.

Significant Impacts

Impact-UTIL-1: Utility-Related Land Disturbance. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded utility facilities to serve specific future development are generally known, and significant impacts associated with ground-disturbing activities would potentially occur. The impacts of ground-disturbing activities are analyzed within this PEIR, including in Sections 4.3, 4.4, 4.5, 4.7, and 4.8. Based on the determinations within these sections, land disturbance associated with installing utility facilities would also have the potential to result in a significant impact on these resources.

Mitigation Measures

For **Impact-UTIL-1**:

Implement **MM-BIO-2**, **MM-BIO-5**, **MM-BIO-8**, and **MM-BIO-9**, as described in Section 4.3, *Biological Resources*

Implement **MM-CUL-1** through **MM-CUL-3**, as described in Section 4.4, *Cultural Resources and Tribal Cultural Resources*

Implement **MM-GEO-1**, as described in Section 4.5, *Geology and Soils*

Implement **MM-HAZ-1** and **MM-HAZ-2**, as described in Section 4.7, *Hazards and Hazardous Materials*

Implement **MM-WQ-1** through **MM-WQ-7**, as described in Section 4.8, *Hydrology and Water Quality*.

Level of Significance After Mitigation

Implementation of **MM-BIO-2**, **MM-BIO-5**, **MM-BIO-8**, **MM-BIO-9**, **MM-CUL-1** through **MM-CUL-3**, **MM-GEO-1**, **MM-HAZ-1** and **MM-HAZ-2**, and **MM-WQ-1** through **MM-WQ-7** would reduce impacts from ground-disturbing activities that could result from construction activities associated with new or expanded utilities. Specifically, **MM-BIO-2**, **MM-BIO-5**, **MM-BIO-8**, and **MM-BIO-9** would reduce impacts on biological resources to less than significant, **MM-GEO-1** would reduce impacts on paleontological resources to less than significant, and **MM-HAZ-1** and **MM-HAZ-2** would reduce impacts related to hazardous materials to less than significant. However, because these mitigation

measures would not reduce all ground-disturbing impacts on cultural resources and water quality to less than significant, **Impact-UTIL-1** would be significant and unavoidable.

Threshold 2: Have sufficient water supplies available to serve the proposed PMPU and reasonably foreseeable future development during normal, dry, and multiple dry years?

Impact Analysis

Construction

Water would be required during future construction activities for such uses as dust suppression from grading and demolition, mixing of concrete and other construction materials, and cleaning equipment and tools. Water usage during construction would be temporary and the City of San Diego's recycled water is treated to a Title 22 disinfected tertiary level quality, which is suitable for construction purposes. The City administers a Recycled Water Tanker Truck Program that allows water tanker trucks used for construction purposes, such as dust suppression, to fill up at an approved City facility. Currently there are fill stations at 3245 Monument Road in South Bay and 10151 Meanley Drive in Scripps Ranch, with a third available soon at 4949 Eastgate Mall in North City (City of San Diego 2021). As discussed in the 2020 UWMP, PUD provided 8,185 AFY of non-potable recycled water to customers within the City of San Diego in 2015, and increased that amount to 10,393 AFY of non-potable recycled water within the City of San Diego in 2020. It is estimated that 13,773 AFY will be available by 2025. Moreover, the City has taken several steps to increase production of recycled potable water, which includes the Pure Water Phase I and Phase II projects. Potable recycled water is anticipated to increase supply from an estimated 16,800 AFY in 2025 to 33,600 AFY in 2030 to 92,960 AFY in 2035 through 2045 (PUD 2021).

In addition, because most of the development under the proposed PMPU would be infill development, future redevelopment projects would potentially decrease existing water use at the site during construction because operations of the previous use would cease. Furthermore, construction activities for future development associated with the proposed PMPU would not occur all at once, but rather would occur throughout the PMPU's planning horizon (i.e., 2050). As such, the water demand from construction of PMPU-related development would be dispersed over an approximately 30-year period. Therefore, with the continued increase in recycled water supplies forecasted and the availability of recycled water to construction water tankers, water supply for construction activities would continue to be available through the proposed PMPU planning horizon. Impacts on water supply from the construction of future development projects would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses.

Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would not result in a significant impact related to water supply. This less-than-significant impact would also occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with Option 1 would be similar as those described in the analysis above, which would increase demand on water. Construction activities for future development under Option 1, including construction of a new Waterfront Destination Park and the closure of a portion of North Harbor Drive, would require water use for dust suppression from grading and demolition, mixing of concrete and other construction materials, and cleaning equipment and tools. Given the potential size of the project site for the new Waterfront Destination Park and relatively limited construction duration, this would not result in a substantial demand for water. Therefore, construction activities under Option 1 would not result in any additional or more severe impacts related to water supply than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would not result in a significant impact related to water supply. This less-than-significant impact would also occur within PD3 under Option 2 as a result of same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with Option 2 would be similar as those described in the analysis above, which would increase demand on water. Construction activities for the Lane Field Setback Park under Option 2, would require water use for dust suppression from grading and demolition, mixing of concrete and other construction materials, and cleaning equipment and tools. Given the size of the project site for the Lane Field Setback Park and relatively limited construction duration, this would not result in a substantial demand for water. Therefore, construction activities under Option 2 would not result in any additional or more severe impacts related to water supply than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would not result in a significant impact related to water supply. This less-than-significant impact would also occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction activities associated with new park space under Option 3 would be similar as those described in the analysis above, which would increase demand on water. Construction activities for Option 3 would require water use for dust suppression from grading and demolition, mixing of concrete and other construction materials, and cleaning equipment and tools. Given the size of the project site for the new park under Option 3, the relatively limited construction duration, and the continued increase in recycled water supplies anticipated by the City of San Diego, this would not result in a substantial demand for water. Therefore, construction activities under

Option 3 would not result in any additional or more severe impacts related to water supply than buildout of the proposed PMPU without Option 3.

Operation

Chapter 3 identifies the increase in future development under the PMPU that could occur in PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10 by 2050, and water demand associated with potential future development is presented in Table 4.15-8. Using CalEEMod default rates for water demand, additional water demand associated with operation of future development under the proposed PMPU is estimated to increase by approximately 104 AFY over an existing (2016) demand of 9,609 AFY, for a total demand (existing plus proposed) of approximately 9,712 AFY by the year 2050 (see Table 4.15-8). This water demand would not occur all at once; rather, the demand would increase over the planning horizon of the proposed PMPU as development projects are proposed, constructed, and become operational. The majority of this demand would be generated by future development of new commercial recreation facilities within PD2 and PD3, including hotels, retail, and other commercial and visitor-serving development.

PD1, PD9, and PD10 would generally involve minimal increases in recreational berthing space and renovations or in-kind replacement of existing buildings and would not result in substantial increase in water demand, and the 18,000 square feet of potential retail space in PD8 would only account for a minor increase in water demand (using the generation rates in Table 4.15-7, this use would account for approximately 13 AFY of the overall PMPU water demand of 104 AFY). In addition, because PD4 is almost entirely built out or, in the case of the Tenth Avenue Marine Terminal (TAMT), currently has a modernization plan to increase throughput to the maximum sustainable capacity and has established mitigation measures in the certified TAMT EIR, the proposed PMPU would not result in a substantial increase in water demand in PD4. Uses within PD7 such as habitat conservation, restoration, and mitigation banking would not result in development that would have the potential to substantially increase water demand. As such, water demand associated with PD7 is not anticipated to substantially affect water supplies from Sweetwater Authority. In addition, development within PD9 and PD10, which are served by Cal Am, would be minimal and would not increase water demand beyond available supplies.

In terms of accounting for the proposed PMPU, water demand projections in the City of San Diego's 2020 UWMP were based on SANDAG's latest growth forecasts, which anticipate future growth through 2050 based on existing local jurisdiction's long-range land use plans. The increase in water demand generated by implementation of the proposed PMPU (104 AFY) would represent an increase in the City of San Diego's total projected 2045 normal year water demand of 228,065 AFY and the projected fifth-year multiple-dry year demand of 233,538 AFY (PUD 2021). However, the City's 2020 UWMP was based on SANDAG's Series 14 growth forecasts, which did not account for the growth anticipated under the proposed PMPU because the PMPU was not an adopted plan at the time the forecasts were developed (PUD 2021). Therefore, it is not certain that PUD's supply through 2045 could meet the additional demand of 104 AFY that could occur under the proposed PMPU. In addition, because the proposed PMPU planning horizon extends to 2050, it is currently unknown whether there would be sufficient water supplies available after 2045. As part of the normal water supply planning process, the proposed PMPU buildout scenario would be included in a future cycle update of the UWMP, which occurs every 5 years. However, until the proposed PMPU's water demand is included in the UWMP, the additional future water supply required to meet the proposed PMPU's demand is not assured, and it is possible that the PMPU's increase in water demand could exceed the water supplies available from existing entitlements and resources (**Impact-UTIL-2**).

Future development would need to install water conservation measures required by the 2019 California Green Building Standards Code, Title 24, Part 11, Chapter 5 (Non-Residential Mandatory Measures), including the use of toilets that do not exceed 1.28 gallons per flush, urinals that do not exceed 0.125 gallons (wall mounted) or 0.5 gallon (floor mounted) per flush, showerheads that do not exceed 1.8 gallons per minute at 80 pounds per square inch (psi), lavatory faucets that do not exceed 0.5 gallon per minute at 60 psi, and commercial kitchen faucets that do not exceed 1.8 gallons per minute at 60 psi. Outdoor water use must be recycled for all new non-residential developments where disinfected tertiary recycled water is available from the municipal source. Moreover, with the signing of Executive Order B-29-15, 23 CCR Division 2, Chapter 2.7 (Model Water Efficient Landscape Ordinance) established that landscaping must meet specific water efficiency metrics. Implementation of water conservation measures required by the California Green Building Standards Code would reduce the proposed PMPU's demand on potable water supplies.

Beyond the water use requirements of the Green Building Code and the Water Code, proposed PMPU policies such as SR Policy 3.1.3, SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 promote the reduction of resource consumption and sustainable operations, the use of "green" design, and require future development to implement water conservation strategies. Strategies could include use of water-wise landscaping, separate metering for irrigation and cooling towers, and use of water efficient plumbing, such as modern flush valves, aerators on faucets, or touch free faucets.

However, these policies alone would not fully reduce impacts because it is not known at this time the extent to which future development would be able to implement water conservation strategies. Additionally, if water conservation proves inadequate, the member cities or water suppliers would be forced to calibrate demand to supply by depriving users of water, essentially forcing them to conserve. Therefore, during the course of the buildout of the proposed PMPU there may not be sufficient water supplies available to serve future development during normal, dry, and multiple dry years, and the impact would be significant without mitigation (**Impact-UTIL-2**). Water use would be reduced through water conservation measures and the implementation of proposed PMPU policies such as SR Policy 3.1.7, which promotes implementation of water conservation strategies. In addition, implementation of **MM-UTIL-1** through **MM-UTIL-4** would reduce this impact to a level below significant by ensuring that the anticipated growth that could occur under the proposed PMPU would be accounted for in the next round of UWMP updates, and by requiring future project proponents to demonstrate that sufficient water supplies are available prior to project approval. In the event that sufficient water supply is not available, **MM-UTIL-2** would prohibit such development from being approved.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to water supply (**Impact-UTIL-2**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with a new Waterfront Destination Park under Option 1 could require water for irrigation, water features, or restroom facilities and additional water to accommodate the small increase in Commercial Recreational uses and may require slightly more water than existing uses. However, this water demand would likely be reduced compared to the water demand that would be generated under the proposed PMPU within the Option 1 boundaries. As discussed above, SR Policy 3.1.3 SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 promote the reduction of resource consumption and sustainable operations, and the use of “green” design, and implementation of water conservation strategies. As such, it is anticipated that water demand under this option would be minimal and would not exceed available supplies. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to water supply than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to water supply (**Impact-UTIL-2**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with the expanded Lane Field Setback Park under Option 2 could require water for irrigation, water features, or restroom facilities and may require a similar or slightly less use of water than existing conditions. In addition, this water demand would likely be reduced compared to the water demand that would be generated under the proposed PMPU within the Option 2 boundaries. As discussed above, SR Policy 3.1.3 SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 promote the reduction of resource consumption and sustainable operations, and the use of “green” design, and implementation of water conservation strategies. As such, it is anticipated that water demand under this option would be minimal and would not exceed available supplies. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to water supply than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to water supply (**Impact-UTIL-2**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with additional park space under Option 3 could require water for irrigation, water features, or restroom facilities and may require a similar or slightly less use of water than existing conditions. In addition, this water demand would likely be reduced compared to the water demand that would be generated under the proposed PMPU within the Option 3 boundaries. As discussed above, SR Policy 3.1.3 SR Policy 3.1.5, SR Policy 3.1.6, and SR Policy 3.1.7 promote the reduction of resource consumption and sustainable operations, and the use of “green” design, and implementation of water conservation strategies. As such, it is anticipated that water

demand under this option would be minimal and would not exceed available supplies. Therefore, operations under Option 3 would not result in any additional or more severe impacts related to water supply than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to having insufficient water supplies available to serve the proposed PMPU and future development during normal, dry, and multiple dry years. Rather, the proposed PMPU policies would help to minimize adverse effects related to water supply by promoting conservation, reduction, and planned capital improvements. For instance, SR Policy 3.1.7 promotes implementation of water conservation strategies, which would not result in adverse physical impacts, but would be beneficial to existing water supplies.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not have sufficient water supplies available to serve the proposed PMPU and future development during normal, dry, and multiple dry years.

Significant Impacts

Impact-UTIL-2: Insufficient Water Supplies Available to Serve the Proposed PMPU During Operation of Future Development. Due to the significant increase in water demand as a result of implementation of the proposed PMPU, sufficient water supplies may not be available to serve future development under the proposed PMPU during normal, dry, and multiple dry years. Therefore, given the increase in water demand, which is necessary for operation of future development allowed under the proposed PMPU, potential impacts are considered significant.

Mitigation Measures

For **Impact-UTIL-2**:

MM-UTIL-1: Update the UWMP with New Growth Projections. Within 6 months of California Coastal Commission certification of the proposed PMPU, the District shall provide SANDAG with amended growth assumptions and changes to water and land use designations associated with the proposed PMPU. The District shall coordinate with SANDAG and the City of San Diego to ensure the UWMPs are updated as part of the upcoming revision cycle to reflect the updated growth assumptions of the proposed PMPU. Until the UWMP is updated to account for projects proposed under a certified PMPU, the District shall implement **MM-UTIL-2** to ensure sufficient water supply exists for individual projects.

MM-UTIL-2: Prepare a Water Demand Analysis to Determine if Sufficient Water Supplies are Available. Prior to District's approval of any future development project that would equate to a water demand project, as defined by State CEQA Guidelines Section 15155, and before the successful update to the applicable UWMP(s) required under **MM-UTIL-1**, the District shall require the project proponent to prepare a water demand analysis.

In the event that project demand exceeds available supplies after incorporation of all feasible water-efficient measures, the project proponent shall be required to demonstrate how and where additional supply to meet the project's demand will be secured, as well as analyzing the

potential impacts of acquiring water from a new water source; or the project shall be redesigned to further reduce the demand for water to be within the available supplies. The District shall not approve any future development proposal unless the project proponent can demonstrate that the project's water supply demands will be met.

MM-UTIL-3: Implement Water Conservation Measures. The project proponent shall incorporate and implement water-efficient design measures into project design. Water-efficient design measures shall at a minimum, include:

- Implement indoor water reduction measures, including high-efficiency toilets, high-efficiency urinals, low-flow faucets, and low-flow showers (as applicable).
- Install only drought-tolerant landscaping, per PMPU ECO Policy 1.1.8, and perform any landscaping watering through a drip system or low-flow irrigation devices.
- Install cisterns above or below ground that collect and store runoff from rooftops and other impervious surfaces.
- Install water-efficient water coolers and equipment and monitor cooling tower and boiler water chemistry to minimize mineral buildup in the system and maximize the number of times water can be recycled through the system.
- Limit the use of turf.
- Educate employees on water conservation measures on an annual basis and post water conservation stickers, signs, and posters in bathrooms, kitchens, cafeterias, conference rooms, and other places where employees congregate.
- Reduce indoor water consumption by 20 percent lower than baseline buildings through the use of low-flow fixtures in all bathrooms (see also **MM-AQ-9**) (baseline water consumption for buildings is defined by LEED as indoor water use after meeting Energy Policy Act of 1992 fixture performance requirements).

Level of Significance After Mitigation

Implementation of **MM-UTIL-1** would ensure that the proposed PMPU's potential growth would be incorporated into the next SANDAG growth projections and that the water demand that could occur under the proposed PMPU would be incorporated into the next updates to the UWMP(s), which would ensure that sufficient supply exists through the horizon year of the proposed PMPU.

Implementation of **MM-UTIL-2** and **MM-UTIL-3** would require future project proponents to demonstrate that sufficient water supplies are available prior to project approval and to implement necessary water conservation measures, respectively. In the event that sufficient water supply is not available, **MM-UTIL-2** would prohibit such development from being approved. Therefore, construction and operational impacts would be less than significant after mitigation.

Threshold 3: Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the proposed PMPU's projected demand in addition to the provider's existing commitments?

Impact Analysis

Construction

Future development associated with the proposed PMPU would potentially include the construction of a variety of types of development, including new hotels and lower cost accommodations, restaurants and entertainment venues, park space and promenades, retail, development would occur periodically throughout the PMPU's 30-year planning horizon and would potentially involve excavation, grading, filling and compaction, utility installation, and construction of aboveground facilities and buildings. Onsite construction workers would potentially generate wastewater during construction of future development projects. However, the wastewater use would not affect onsite facilities or facilities within the proposed PMPU area because portable temporary restroom facilities would be brought to the development sites for construction workers, as is typical of construction sites. Wastewater generated at the portable restroom facilities would be hauled away to an authorized treatment facility, such as PLWPT or SBWRP, in accordance with 17 CCR 8007, which requires the contents of portable toilets to be disposed of by draining or pumping into a sanitary sewer, an approved septic tank of sufficient capacity to handle the wastes, a suitably sized and constructed holding tank, approved by the local health department, or by any other method approved by the local health department. Similar to water use, because most of the future development occurring under the proposed PMPU would be infill development, wastewater generation at a site would be substantially reduced during construction. Consequently, construction activities associated with future development are not anticipated to generate significant amounts of wastewater. Therefore, construction activities would not result in an inadequate capacity to serve the proposed PMPU's projected construction-related wastewater demand, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU would result in a less-than-significant impact related to wastewater.

Construction activities associated with Option 1 would be same as those described in the analysis above and would result in increased demand on wastewater treatment from construction workers. However, the wastewater use would not affect onsite facilities or facilities within the proposed PMPU area because portable temporary restroom facilities would be brought to the development sites for construction workers, as is typical of construction sites. Wastewater generated at the portable restroom facilities would be hauled away to an authorized treatment facility, such as PLWPT or SBWRP, in accordance with the regulations described above. As such, construction activities associated with future development under Option 1 are not anticipated to generate significant amounts of wastewater, and impacts would be less than significant. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to wastewater than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU would result in a less-than-significant impact related to wastewater.

Construction activities associated with Option 2 would be same as those described in the analysis above and would result in increased demand on wastewater treatment from construction workers. However, the wastewater use would not affect onsite facilities or facilities within the proposed PMPU area because portable temporary restroom facilities would be brought to the development sites for construction workers, as is typical of construction sites. Wastewater generated at the portable restroom facilities would be hauled away to an authorized treatment facility, such as PLWPT or SBWRP, in accordance with the regulations described above. As such, construction activities associated with future development under Option 2 are not anticipated to generate significant amounts of wastewater, and impacts would be less than significant. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to wastewater than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU would result in a less-than-significant impact related to wastewater.

Construction activities associated with Option 3 would be same as those described in the analysis above and would result in increased demand on wastewater treatment from construction workers. However, the wastewater use would not affect onsite facilities or facilities within the proposed PMPU area because portable temporary restroom facilities would be brought to the development sites for construction workers, as is typical of construction sites. Wastewater generated at the portable restroom facilities would be hauled away to an authorized treatment facility, such as PLWPT or SBWRP, in accordance with the regulations described above. As such, construction activities associated with future development under Option 3 are not anticipated to generate significant amounts of wastewater, and impacts would be less than significant. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to wastewater than buildout of the proposed PMPU without Option 3.

Operation

Operation of future PMPU-related development would increase wastewater generation within the proposed PMPU area compared to existing conditions. Implementation of the proposed PMPU would

result in an additional 86 AFY (0.24 acre-feet per day) of wastewater from the introduction of new hotel guests, retail and restaurant visitors, permanent employees, and recreational waterfront visitors (approximately 0.077 mgd). The PLWTP, which serves PD1, PD2, PD3, PD4, PD9, and PD10, has a daily wastewater treatment capacity of 737 acre-feet (240 mgd) and a daily peak wet weather capacity of approximately 1,326 acre-feet (432 mgd), and treats approximately 537 acre-feet (175 mgd) of wastewater per day. Based on the above, the PLWTP has a remaining capacity of 200 acre-feet per day (65 mgd). Therefore, the proposed PMPU's increased wastewater demand of 86 AFY (0.24 mgd) could be accommodated by the remaining capacity at the PLWTP.

The SBWRP, which serves PD7 and PD8, has a total treatment capacity of 17,000 AFY (15 mgd). While wastewater was not estimated separately for each PD, improvements associated with the proposed water and land uses at PD7, such as habitat conservation, restoration, and mitigation banking, would not generate wastewater, and PD8 would only potentially include an additional 18,000 square feet of retail space, which would produce a minimal amount of wastewater. Using the generation rates in Table 4.15-8, PD8 could result in a maximum additional generation of 12.24 AFY (0.011 mgd) of wastewater, which would fall within the treatment capacity of the SBWRP.

Based on the above, the existing wastewater treatment capacity of the PLWTP and SBWRP would be sufficient to accommodate the proposed PMPU. Therefore, implementation of the proposed PMPU would not result in the need to expand the capacity of the PLWTP or the SBWRP, and the proposed PMPU would have a less-than-significant impact on wastewater capacity.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to wastewater. This less-than-significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with a new Waterfront Destination Park under Option 1 could include generation of wastewater related to restroom facilities for the park or associated with the increased Commercial Recreational uses. However, the small amount of wastewater generated under Option 1 would not result in a substantial difference in the wastewater generation estimated in Table 4.15-8 above, and would likely be reduced compared to the wastewater that would be generated under the proposed PMPU within the Option 1 boundaries. Therefore, operations under Option 1 would result in less-than-significant impacts related to wastewater.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to wastewater. This less-than-significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with the expanded Lane Field Setback Park under Option 2 could include generation of wastewater related to restroom facilities for the park. However, the small amount of wastewater generated under Option 2 would not result in a substantial difference in the wastewater generation estimated in Table 4.15-8 above, and would likely be reduced compared to the wastewater that would be generated under the proposed PMPU within the Option 2 boundaries. Therefore, operations under Option 2 would result in less-than-significant impacts related to wastewater.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to wastewater. This less-than-significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with the new park space that could be developed under Option 3 could include generation of wastewater related to restroom facilities for the park. However, the small amount of wastewater generated under Option 3 would not result in a substantial difference in the wastewater generation estimated in Table 4.15-8 above, and would likely be reduced compared to the wastewater that would be generated under the proposed PMPU within the Option 3 boundaries. Therefore, operations under Option 3 would result in less-than-significant impacts related to wastewater.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to inadequate wastewater capacity to serve the proposed PMPU's projected demand in addition to the provider's existing commitments. Instead, policies focus on sustainable solutions related to utilities and promote the establishment of financing mechanisms to fund the building of new, or improvements to existing, infrastructure.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in a determination by the wastewater treatment provider that it does not have adequate capacity to serve the proposed PMPU's projected demand in addition to the provider's existing commitments. Impacts would be less than significant.

Threshold 4: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goal?

Impact Analysis

Construction

If the proposed PMPU is approved and implemented, it is reasonably foreseeable that future development would be constructed between the proposed PMPU's approval and its planning horizon of 2050. Most of the potential increase in future hotel, restaurant and retail development under the PMPU would occur in PD2 and PD3. Construction and demolition activities associated with PMPU would occur over a mid- to long-term period and have the potential to generate solid waste, including wood, cardboard, metals, plastics, concrete, and other building materials. Specific development proposals are not available at this programmatic level, and, as such, specific amounts of construction and demolition debris are not yet known. However, construction of future development under the proposed PMPU would be required to comply with applicable waste diversion requirements. These include the City of San Diego's C&D Debris Deposit Ordinance for future development within the City of San Diego's service area, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. Future development within the cities of Coronado and Imperial Beach, which do not have ordinances for construction and demolition debris recycling, would be required to comply with the construction material diversion requirements of CalGreen. Section 5.408 of CalGreen similarly requires that a minimum of 65 percent of all non-hazardous construction and demolition waste for non-residential projects be recycled and/or salvaged for reuse. Compliance with these regulations would reduce the amount of solid waste that would be disposed of in landfills from future construction activities. Moreover, the County's Five-Year Review Report of the Countywide Integrated Waste Management Plan indicates sufficient landfill capacity to accommodate solid waste disposal through 2052. Therefore, because a majority of any future construction-related waste would be recycled or salvaged for reuse per existing local and state regulations (i.e., compliance is mandatory) and the available landfill capacity would exist through the life of the PMPU, the proposed PMPU would not exceed the remaining capacity of the existing landfills, and new or expanded landfills would not be required as a direct result of the construction waste generated from future development associated with the PMPU.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to solid waste.

Construction of Recreation Open Space and Commercial Recreation uses under Option 1 would be required to comply the City of San Diego's C&D Debris Deposit Ordinance for future development within the City of San Diego, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. With these diversion requirements, Option 1 would not generate substantial construction-related solid waste. Therefore, construction activities occurring under Option 1 would not result in any additional or more severe impacts related to solid waste than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to solid waste.

Construction activities associated with the expanded Lane Field Setback Park under Option 2 would be required to comply the City of San Diego's C&D Debris Deposit Ordinance for future development within the City of San Diego, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. With these diversion requirements, Option 2 would not generate substantial construction-related solid waste. Therefore, construction activities occurring under Option 2 would not result in any additional or more severe impacts related to solid waste than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to solid waste.

Construction activities associated with new park space that could be developed under Option 3 would be required to comply the City of San Diego's C&D Debris Deposit Ordinance for future development within the City of San Diego, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. With these diversion requirements, Option 3 would not generate substantial construction-related solid waste. Therefore, construction activities occurring under Option 3 would not result in any additional or more severe impacts related to solid waste than buildout of the proposed PMPU without Option 3.

Operation

Implementation of the proposed PMPU would increase operational activities in most of the planning districts because it would allow for the expansion of existing uses, as well as the establishment of new commercial, maritime, and recreational land uses. The increase in water and land uses and associated development would result in the generation of solid waste.

As described in Section 4.15.2.4 *Solid Waste*, there are four active landfills in San Diego County that accept solid waste. Table 4.15-6 provides the landfills' permitted remaining capacities and estimated

remaining lifespans. Solid waste disposal needs would be served by various franchise waste haulers and be transported to the Miramar, Sycamore, Otay and/or Borrego Landfills. Miramar Landfill is projected to reach capacity in 2031 and Sycamore Canyon is anticipated to reach capacity in 2052. The Otay Landfill is projected to reach full capacity in 2030, and Borrego Landfill is anticipated to reach capacity in 2046. Total remaining capacity at these four landfills equals approximately 144,633,020 cubic yards. As noted above, the Five-Year Review Report indicates, given several different possible scenarios, the County of San Diego has sufficient landfill capacity to accommodate disposal through 2052.

Once operational, full buildout of the proposed PMPU would result in a generation of an additional approximately 1,755 cubic yards of solid waste per year (see Table 4.15-8). Miramar Landfill is closest to a majority of the proposed PMPU area and therefore would serve most future PMPU-related development. Miramar Landfill is currently projected to close in 2031. In the event that Miramar Landfill's capacity is reached, solid waste would be routed to Sycamore Canyon Landfill, which as indicated in the County's Five-Year Review Report has sufficient capacity to meet solid waste demand through 2052 given existing disposal trends and if planned expansions of that landfill occur. Therefore, solid waste generated under the proposed PMPU would not exceed the remaining capacity of this landfill and impacts are less-than-significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to solid waste.

Operational activities associated with a new Waterfront Destination Park under Option 1 would result in the generation of solid waste, but the difference in uses that could occur under Option 1 would not result in a substantial difference in the amount of solid waste generated under the proposed PMPU as indicated in Table 4.15-8, and would likely be reduced compared to the solid waste that would be generated under the proposed PMPU within the Option 1 boundaries. Therefore, operations under Option 1 would result in less-than-significant impacts related to solid waste.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to solid waste.

Operational activities associated with the expanded Lane Field Setback Park under Option 2 would result in the generation of solid waste, but the difference in uses that could occur under

Option 2 would not result in a substantial difference in the amount of solid waste generated under the proposed PMPU as indicated in Table 4.15-8, and would likely be reduced compared to the solid waste that would be generated under the proposed PMPU within the Option 2 boundaries. Therefore, operations under Option 2 would result in less-than-significant impacts related to solid waste.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to solid waste.

Operational activities associated with new park space that could be developed under Option 3 would result in the generation of solid waste, but the difference in uses that could occur under Option 3 would not result in a substantial difference in the amount of solid waste generated under the proposed PMPU as indicated in Table 4.15-8, and would likely be reduced compared to the solid waste that would be generated under the proposed PMPU within the Option 3 boundaries. Therefore, operations under Option 3 would result in less-than-significant impacts related to solid waste.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to the generation of solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goal.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goal. Impacts would be less than significant.

<i>Threshold 5: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?</i>
--

Impact Analysis

State and local management and reduction statutes and regulations related to solid waste include AB 939, AB 341, and the San Diego City Council Policy 900-16 and the City of San Diego C&D Debris Deposit Ordinance. AB 939 requires jurisdictions to utilize “integrated waste management,” and established mandatory State waste diversion goals of 25 percent by the year 1995 and 50 percent by the year 2000, and, with the adoption of AB 341 in May 2012, 75 percent of solid waste from landfills by 2020. AB 341 also establishes the statewide mandatory commercial recycling program, which requires businesses that generate 4 cubic yards or more of commercial solid waste per week, or multi-family residential dwellings of five units or more, to implement recycling practices during operation to help the State achieve the statewide diversion goal of 75 percent.

San Diego City Council Policy 900-16 and the City of San Diego C&D Debris Deposit Ordinance establish diversion goals for waste generated from construction and demolition activities.

Construction

During construction activities for future development associated with the proposed PMPU, construction and demolition debris would be recycled at local recycling facilities in accordance with the City of San Diego's C&D Debris Deposit Ordinance and the City of San Diego's Council Policy 900--16, Construction & Demolition Material Recycling (for future development within the City of San Diego), and/or CalGreen. The City of San Diego's C&D Debris Deposit Ordinance mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. Council Policy 900-16 encourages businesses, organizations, and contractors to divert waste through recycling, reduction, or reuse; project proponents should divert as much waste as possible during demolition, construction, and renovation projects; diversion goals for inert materials (concrete, rock, asphalt, dirt, etc.) should be 100 percent; and businesses, organizations, and contractors should purchase products made from recycled materials to the extent feasible. Section 5.408 of CalGreen similarly requires that a minimum of 65 percent of all non-hazardous construction and demolition waste for non-residential projects be recycled and/or salvaged for reuse. Materials that are not recyclable would be taken to Miramar Landfill, which is the closest landfill to the proposed PMPU area. Therefore, because a substantial majority of the construction and demolition materials would be recycled or reused instead of being disposed of in a local landfill, construction activities for future development associated with the proposed PMPU would comply with Federal, State, and local management and reduction statutes and regulations related to solid waste. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to compliance with solid waste management and reduction statute and regulations.

Construction activities under Option 1 would be required to comply with the City of San Diego's C&D Debris Deposit Ordinance and City of San Diego's Council Policy 900-16, Construction & Demolition Material Recycling for future development within the City of San Diego and with Section 5.408 of CalGreen, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. Because a substantial majority of the construction and demolition materials would be recycled or reused instead of being disposed of in a local landfill, construction activities for future development associated with

Option 1 would comply with Federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, construction activities under Option 1 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to compliance with solid waste management and reduction statutes and regulations than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to compliance with solid waste management and reduction statute and regulations.

Construction activities under Option 2 would comply with the City of San Diego's C&D Debris Deposit Ordinance City of San Diego's Council Policy 900-16, Construction & Demolition Material Recycling for future development within the City of San Diego and with Section 5.408 of CalGreen, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. Because a substantial majority of the construction and demolition materials would be recycled or reused instead of being disposed of in a local landfill, construction activities for future development associated with Option 2 would comply with Federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, construction activities under Option 2 would result in a less-than-significant impact and would not result in any additional or more severe impacts related to compliance with solid waste management and reduction statutes and regulations than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction activities occurring under the proposed PMPU, including within PD3, would result in a less-than-significant impact related to compliance with solid waste management and reduction statute and regulations.

Construction activities under Option 3 would comply with the City of San Diego's C&D Debris Deposit Ordinance City of San Diego's Council Policy 900-16, Construction & Demolition Material Recycling for future development within the City of San Diego and with Section 5.408 of CalGreen, which mandates that projects requiring building and demolition permits pay a refundable waste diversion deposit and divert at least 65 percent of their debris from landfills by recycling, reusing, or donating usable materials. Because a substantial majority of the construction and demolition materials would be recycled or reused instead of being disposed of in a local landfill, construction activities for future development associated with Option 3 would comply with Federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, construction activities under Option 3 result in a less-than-significant impact and would not result in any additional or more severe impacts related to compliance with solid waste management and reduction statutes and regulations than buildout of the proposed PMPU without Option 3.

Operation

Operation of future development under the proposed PMPU would be required to comply with applicable solid waste regulations. As noted in Section 4.15.3, AB 939 established a solid waste

diversion requirement of 50 percent by the year 2000 for all cities and counties in the State. In addition, AB 341 was enacted to further the goals of AB 939 and established a statewide goal of diverting at least 75 percent of solid waste from landfills. Future development that would generate 4 cubic yards or more of commercial solid waste per week would be required to implement recycling practices during operation in compliance with the mandatory commercial recycling program established by AB 341. Therefore, operation of the proposed PMPU would comply with State and local management and reduction statutes and regulations related to solid waste, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to compliance with solid waste management and reduction statute and regulations.

Operation of future commercial development under Option 1 that generates 4 cubic yards or more solid waste per week would comply with the mandatory recycling program established by AB 341, and operation of Option 1 would comply with State and local management and reduction statutes and regulations related to solid waste. Therefore, operations under Option 1 would be less than significant and would not result in any additional or more severe impacts related to compliance with solid waste management and reduction statutes and regulations than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to compliance with solid waste management and reduction statute and regulations.

Operation of future commercial development under Option 2 that generates 4 cubic yards or more solid waste per week would comply with the mandatory recycling program established by AB 341, and operation of Option 2 would comply with State and local management and reduction statutes and regulations related to solid waste. Therefore, operations under Option 2 would be less than significant and would not result in any additional or more severe impacts related to compliance with solid waste management and reduction statutes and regulations than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to compliance with solid waste management and reduction statute and regulations.

Operation of future commercial development under Option 3 that generates 4 cubic yards or more solid waste per week would comply with the mandatory recycling program established by AB 341, and operation of Option 3 would comply with State and local management and reduction statutes and regulations related to solid waste. Therefore, operations under Option 3 would be less than significant and would not result in any additional or more severe impacts related to compliance with solid waste management and reduction statutes and regulations than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to potential conflict with State and local management and reduction statutes and regulations related to solid waste.

Impact Determination and Mitigation

Implementation of the proposed PMPU would comply with State and local management and reduction statutes and regulations related to solid waste. Impacts would be less than significant.

4.15.5 Cumulative Impact Analysis

Cumulative impacts on utilities and service systems may occur when projects combine to increase demand such that additional services must be provided or additional facilities constructed. This usually would result from the incremental addition of people permanently occupying an area or the incremental construction of new or larger buildings requiring the provision of new or expanded utilities and service systems to meet the new permanent demand.

4.15.5.1 Geographic Scope

The geographic scope of cumulative impacts for utilities and service systems is based on the Plan Method. The cumulative setting for utilities and service systems includes all of the plans and programs listed in Table 2-2 as well as the growth assumptions provided in regional planning documents such as a UWMP, which are based on the latest SANDAG growth forecasts that anticipate future growth through 2050 based on local jurisdiction's existing general plans. As such, the geographic scope for the cumulative analysis for water, wastewater, telecommunications, and solid waste is San Diego County. The geographic scope for cumulative impacts for electricity and natural gas includes the SDG&E service area, which is the entire County, and surrounding vicinity.

4.15.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

As discussed in Section 4.15.2, *Existing Conditions*, water service in the proposed PMPU area is provided by the City of San Diego PUD Water Branch, which is a member agency of the San Diego County Water Authority, the wholesale water provider for the San Diego Region. In addition, Sweetwater Authority's water system provides water service to the cities of Chula Vista and National City, as well as the unincorporated community of Bonita within San Diego County. Wastewater services are provided by the Metropolitan Sewerage System with three treatment plants treating wastewater generated in the proposed PMPU area: NCWRP, SBWRP, and PLWTP.

Based on SANDAG's projections and the most recent U.S. Census, the San Diego regional population is forecast to increase from 3,095,313 persons in 2010 (U.S. Census Bureau 2010) to 4,068,759 persons in 2050 (SANDAG 2013)—an increase of 31.5 percent. Given the potential for the density and intensity of development within the geographic scope to increase under the updated regional and community plans identified in Table 2-2, as well as projected growth within the San Diego region, it is possible that demand on utilities would increase such that new or expanded utilities and service systems may be required, insufficient water supplies may be available, wastewater treatment capacity could be exceeded, or landfill capacity could be exceeded. Therefore, impacts of past, present, and future plans and programs on utilities and service systems would be cumulatively significant.

4.15.5.3 Project Contribution

PMPU impacts, including Options 1, 2, or 3, associated with the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities are anticipated to be significant and unavoidable under the proposed PMPU (**Impact-UTIL-1** even after implementation of **MM-BIO-2**, **MM-BIO-5**, **MM-BIO-8**, **MM-BIO-9**, **MM-CUL-1** through **MM-CUL-3**, **MM-GEO-1**, **MM-HAZ-1** and **MM-HAZ-2**, and **MM-WQ-1** through **MM-WQ-7**). Although implementation of mitigation measures identified in Sections 4.3, 4.4, 4.5, 4.7, and 4.8 would reduce impacts related to ground-disturbing activities that would result from construction of new or expanded utilities, it would not guarantee that impacts associated with the installation of new, upgraded, or expanded utilities facilities could be mitigated to less-than-significant levels as discussed under Sections 4.4 and 4.8. When combined with the significant cumulative impacts from past, present, and probable future projects, the project's contribution to the need for sufficient utilities facilities, the construction of which may have a significant impact on the environment, would be cumulatively considerable (**Impact-C-UTIL-1**).

During the course of the buildout of the proposed PMPU, including Options 1, 2, or 3, there may not be sufficient water supplies available to serve future development during normal, dry, and multiple dry years, which, when combined with the water demands of past, present, and probable future projects, would result in a cumulatively considerable impact under operational conditions prior to mitigation (**Impact-C-UTIL-2**). Implementation of **MM-UTIL-2** and **MM-UTIL-3** would ensure that future updates of the UWMP(s) account for the growth and associated future water demand that would occur under the proposed PMPU and, in the interim, would require future project proponents to adopt all feasible mitigation measures and to demonstrate that sufficient water supplies are available prior to project approval. In the event that sufficient water supply is not available, **MM-UTIL-3** would prohibit such development from being approved. Therefore, project-related impacts

would be less than significant, and the proposed PMPU's contribution to water supply impacts would be considered less-than-cumulatively considerable after mitigation.

Implementation of the proposed PMPU, including Options 1, 2, or 3, would not result in a determination by the wastewater treatment provider that it does not have adequate capacity to serve the proposed PMPU's projected demand in addition to the provider's existing commitments and, when combined with the wastewater treatment demands of past, present, and probable future projects, would not contribute to a cumulatively considerable impact. Therefore, future development under the proposed PMPU would not contribute to insufficient wastewater treatment capacity under cumulative conditions, and the proposed PMPU's contribution to wastewater impacts would be considered less-than-cumulatively considerable.

As discussed in Section 4.15.3 above, operation of the proposed PMPU would generate 1,755 cubic yards of disposable solid waste per year. Miramar Landfill is closest to the proposed PMPU area. AB 939 requires that local county agencies must prepare and implement Integrated Waste Management Plans, which must include a Siting Element. The Siting Element is required to include a projection of the amount of disposal capacity that will be needed to accommodate the solid waste generated within the local jurisdiction for a 15-year period. Due to compliance with AB 939, solid waste facility capacity must be assessed to ensure landfills could sufficiently accommodate solid waste generated in the region. However, the additional solid waste generated from buildout of the proposed PMPU under construction and operational conditions may exceed existing landfill capacity when combined with solid waste generated by past, present, and probable future projects. This impact would be cumulatively considerable prior to mitigation (**Impact-C-UTIL-3** and **Impact-C-UTIL-4**). Implementation of **MM-C-UTIL-1** and **MM-C-UTIL-2** would ensure that future updates of the Five-Year Review Report account for the growth and associated future solid waste demand that would occur under the proposed PMPU and, in the interim, would require future development to conduct project-level analysis to ensure that adequate landfill capacity exists to serve the project. **MM-C-UTIL-1** requires demonstration of sufficient landfill capacity prior to the District's approval of the project. In the event that sufficient landfill capacity is not available, **MM-C-UTIL-2** would prohibit such development from being approved. Therefore, implementation of the proposed PMPU would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Therefore, the proposed PMPU's contribution to solid waste impacts would be considered less-than-cumulatively considerable after mitigation.

4.15.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's incremental contribution to cumulative utilities impacts would be cumulatively considerable. Cumulatively considerable impacts include:

Impact-C-UTIL-1: Potential to Result in a Cumulatively Considerable Adverse Impact Related to the Requirement for New or Expanded Utilities. Operation of future development consistent with the proposed PMPU could increase demand on utilities serving the proposed PMPU area, including water, wastewater, stormwater, electricity, natural gas, and telecommunications, potentially requiring the relocation or construction of new or expanded utilities to serve future development and uses. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded utility facilities to serve specific future development are generally known and significant impacts associated with ground-disturbing activities would potentially occur. In

combination with other operational activity in or adjacent to the proposed PMPU area, construction of these facilities could result in cumulatively considerable physical impacts on the environment.

Impact-C-UTIL-2: Potential to Result in Cumulatively Considerable Insufficient Water Supplies During Operation. Due to the significant increase in water demand as a result of implementation of the proposed PMPU, sufficient water supplies may not be available to serve future development under the proposed PMPU during normal, dry, and multiple dry years. Therefore, in combination with the operation of other future development in or adjacent to the proposed PMPU area, given the increase in water demand, which is necessary for operation of future development, this would result in a cumulatively considerable impact related to water supplies.

Impact-C-UTIL-3: Potential to Result in Cumulatively Considerable Adverse Impacts Related to Exceeding Capacity at Existing Landfills During Construction. Construction activities associated with future development under the proposed PMPU could produce substantial quantities of demolition debris, the disposal of which could exceed existing landfill capacity, in combination with other construction activity in or adjacent to the proposed PMPU area. This would result in a cumulatively considerable impact related to capacity at existing landfills.

Impact-C-UTIL-4: Potential to Result in Cumulatively Considerable Adverse Impacts Related to Exceeding Capacity at Existing Landfills During Operation. Operation associated with future development under the proposed PMPU could result in a substantial increase in solid waste, the disposal of which could exceed existing landfill capacity, in combination with other operational activity in or adjacent to the proposed PMPU area. This would result in a cumulatively considerable impact related to capacity at existing landfills.

Mitigation Measures

For **Impact-C-UTIL-1:**

Implement **MM-BIO-2, MM-BIO-5, MM-BIO-8, MM-BIO-9, MM-CUL-1 through MM-CUL-3, MM-GEO-1, MM-HAZ-1, MM-HAZ-2, and MM-WQ-1 through MM-WQ-7**, as described under Threshold 1 above.

For **Impact-C-UTIL-2:**

Implement **MM-UTIL-1, MM-UTIL-2, and MM-UTIL-3**, as described under Threshold 1 above.

For **Impact-C-UTIL-3 and Impact-C-UTIL-4:**

MM-C-UTIL-1: Update the Five-Year Review Report with New Growth Projections. Within 6 months of the ~~California Coastal Commission's~~ full certification and approval of the proposed PMPU, the District shall provide the County of San Diego with amended growth assumptions and changes to water and land use designations associated with the proposed PMPU. The District shall coordinate with County of San Diego Local Enforcement Agency to ensure the Five-Year Review Report is updated as part of the next soonest revision cycle to reflect the updated growth assumptions of the proposed PMPU. Until the Five-Year Review Report is updated to account for projects proposed under a certified PMPU, the District shall implement **MM-C-UTIL-2** to ensure sufficient landfill capacity exists for individual projects.

MM-C-UTIL-2: Conduct Site-Specific Environmental Review to Assess Landfill Capacity and Implement Measures to Reduce Solid Waste. Prior to implementation of **MM-C-UTIL-1**, and prior to approval of a future project, the District shall assess the capacity of existing landfills serving the project site during construction and operation. Project proponents shall incorporate measures that reduce a project's solid waste, including, but not limited to, compliance with the City of San Diego's Recycling Ordinance, which requires 50 percent of solid waste to be recycled, and the City of San Diego's Construction and Demolition Debris Deposit Ordinance, which would require 65 percent of all construction and demolition debris be recycled. In addition, the District shall encourage project proponents to use recycled, regional, and rapidly renewable materials during construction. The District shall not approve ~~any a future project development proposals~~ unless the project proponent can demonstrate sufficient landfill capacity is available to meet the project's solid waste demands.

Level of Significance After Mitigation

As discussed above, implementation of **MM-BIO-2**, **MM-BIO-5**, **MM-BIO-8**, **MM-BIO-9**, **MM-CUL-1** through **MM-CUL-3**, **MM-GEO-1**, **MM-HAZ-1**, **MM-HAZ-2**, and **MM-WQ-1** through **MM-WQ-7** would reduce impacts from ground-disturbing activities that could result from construction activities associated with new or expanded utilities. However, because these mitigation measures would not reduce all ground-disturbing impacts to a level below significance, including impacts on cultural resources and water quality, **Impact-C-UTIL-1** would be cumulatively considerable and unavoidable.

Implementation of **MM-UTIL-1** and **MM-C-UTIL-1** would require the District to coordinate with the appropriate agencies to ensure that growth under the proposed PMPU would be accounted for during the next UWMP and Five-Year Review Report updates, and, in the interim, **MM-UTIL-2** and **MM-C-UTIL-2** would require project-specific analyses to determine if future development occurring under the proposed PMPU would exceed available water supplies or landfill capacity, respectively. **MM-UTIL-3** would implement water conserving design features to reduce the water demand of future development projects. Because these mitigation measures would require implementation of strategies for water conservation and solid waste reduction, they would reduce the demand of future development on these utilities. In addition, these mitigation measures stipulate that, if it cannot be demonstrated that sufficient water supplies or landfill capacity exist to serve a project, the District cannot approve that project. Therefore, these measures would reduce impacts related to water supply and landfill capacity to less-than-significant levels, which would reduce the proposed PMPU's contribution to **Impact-C-UTIL-2**, **Impact-C-UTIL-3**, and **Impact-C-UTIL-4** to less than cumulatively considerable.

Chapter 5

Additional Consequences of PMPU Implementation

5.1 Introduction

This chapter addresses the potential additional consequences associated with the proposed Port Master Plan Update (PMPU), as required pursuant to California Environmental Quality Act (CEQA) Guidelines Sections 15126, 15126.2¹ (b), (c), (d), (e), and 15128. Specifically, this chapter (1) identifies any significant irreversible changes to the environment that would result from PMPU implementation; (2) discusses growth-inducing impacts of the proposed PMPU, which pertain to ways in which the PMPU could promote either direct or indirect growth; and (3) describes the proposed PMPU's environmental effects that were determined not to be significant during the initial environmental review process.

5.2 Significant Irreversible Environmental Changes

The PMPU would involve adoption of a plan and, therefore, pursuant to State CEQA Guidelines Section 15127, the Program Environmental Impact Report (PEIR) is required to comply with State CEQA Guidelines Section 15126.2(d). Section 15126.2(d) requires that the PEIR identify any significant irreversible environmental changes resulting from implementation of the PMPU.

The PMPU consists of a comprehensive update to the current Port Master Plan (PMP), which will implement the 30-year planning vision of the San Diego Unified Port District (District). The PMPU does not propose any specific development project; however, future development activities allowed under the proposed PMPU would result in significant irreversible environmental changes. The demolition of existing waterside and landside uses, such as piers, docks, structures, and buildings, to accommodate future PMPU-related development would be an irreversible change. Implementation of the PMPU would also require a permanent commitment of non-renewable natural resources primarily from the direct consumption of fossil fuels. These fossil fuels would be consumed during both construction and operation of future PMPU-related projects in the form of diesel and gasoline used in construction equipment, commute vehicles, trucks, and vessels. Electricity would also be consumed during construction and operation of future projects from power tools, electric equipment, and lighting, although not all electricity would be from non-renewable sources. The portion generated from fossil fuels such as natural gas, however, would be irretrievable and irreversible. The materials that would be used during construction and operational activities associated with future PMPU-related projects would be unavailable for other uses.

¹ The requirements of State CEQA Guidelines Section 15126.2(a) and (c) are met in Chapter 4, *Environmental Analysis*, under each resource discussion. Additionally, the requirements of State CEQA Guidelines Section 15126.2(b) are met in Section 4.15, *Utilities and Service Systems*.

5.3 Growth-Inducing Impacts

State CEQA Guidelines Section 15126.2(e) requires that an EIR discuss the ways in which a proposed project could directly or indirectly foster economic development, population growth, or additional housing, and how that growth would affect the surrounding environment. Direct growth inducement would result if a project, for example, involved construction of new housing. Indirect growth might occur if a project were to establish substantial new permanent employment opportunities that would stimulate the need for additional housing, utilities, and public services.

Similarly, a project would indirectly induce growth if it would remove an obstacle to additional development, such as removing a constraint on a required public service or utility. A project proposing to expand water supply capabilities in an area where limited water supply has historically restrained growth would be considered growth-inducing.

This section discusses the characteristics and consequences of the proposed PMPU that may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. However, the following analysis does not assume that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment (State CEQA Guidelines 15126.2(e)). Rather, Chapter 4, *Environmental Analysis*, analyzes the potential adverse impacts on resources resulting from the PMPU, including any that would be caused by cumulative conditions. A detailed discussion of growth-inducing impacts is included in Section 4.11, *Population and Housing*, under Section 4.11.4.4.

5.3.1 Foster Economic Growth

One criterion by which growth inducement can be measured involves economic growth. Economic growth considerations range from a demand for temporary and permanent employees, to an increase in the overall revenue base for an area, to a new demand for supporting services such as retail, restaurant, and entertainment uses.²

The PMPU would foster growth through three primary means: (1) the creation of new jobs, (2) an increase in business and tax revenues, and (3) an increase in the demand for supporting services.

5.3.1.1 Economic Growth through New Jobs

Employment opportunities in the PMPU area include jobs in hospitality, retail, industrial, and commercial industries. Commercial recreation-oriented businesses provide full- and part-time employment opportunities in construction, warehousing, trucking, custodial, and personal services, all of which contribute to the economic base of the region (District 2017). Industrial uses at the Port support cargo and goods movement, ship building and repair, and other similar maritime-related industries and businesses. The PMPU would provide objectives and policies, including designating allowable water and land uses on District Tidelands. As such, the construction of future commercial visitor-serving uses within the PMPU area, such as hotels, restaurants, and retail, is reasonably foreseeable. Economic growth could occur as these new visitor-serving businesses are established or existing businesses expand, creating new sources of employment. As discussed in Section 4.11, buildout of the PMPU would generate approximately 10,400 new jobs. Additionally, the PMPU

² Residential uses are not allowed on District Tidelands per the San Diego Unified Port District Act.

includes several goals, objectives, and policies within the Economics Element that promote economic and employment growth within the Port.

As such, the PMPU would create new employment opportunities and ultimately would contribute to economic growth of the San Diego region.

5.3.1.2 Economic Growth through Increased Business and Tax Revenues

Buildout of the PMPU would result in new and/or expanded visitor-serving and commercial recreation-oriented businesses within the Port. These uses are expected to attract patrons that would spur economic growth in the form of increased revenue and a demand for related services (e.g., hotel rooms, restaurants, and retail) in the Port and greater San Diego area. As such, development of future water and land uses associated with the PMPU would result in an increase in business and local sales tax. In addition, increases in maritime activity at the waterfront terminals would generate additional funds from tariffs and leases. This increase in yearly revenue could spur additional growth in other areas because it would provide the District and its member cities with additional funds on a yearly basis. Therefore, the PMPU would stimulate economic growth through increased business and tax revenues.

5.3.1.3 Economic Growth through Increased Demand for Supporting Services

As mentioned, new and/or expanded businesses resulting from buildout of the PMPU are expected to attract patrons that would spur economic growth in the form of increased demand for supporting services such as hotels, restaurants, and retail. Additionally, the PMPU includes policies that promote economic growth within the Port, such as the following:

ECON Policy 2.3.14 The District shall promote and support the commercial fishing industry and its longevity as a priority coastal-dependent use and economic contributor to Tidelands, the region, and California through such efforts as joint public-private marketing, fishing-related festivals, and other fishing events and activities.

ECON Policy 2.4.4 The District shall promote and support a diversified hotel portfolio and corresponding elements of the hospitality industry and encourage their expansion.

ECON Policy 2.5.1 The District shall promote established and emerging coastal-dependent commercial and industrial sectors throughout Tidelands and may choose to promote through joint marketing campaigns and participation in conferences or other business development programs.

Therefore, the PMPU would stimulate additional economic growth as a result of the increase in demand for supporting services.

5.3.2 Population Growth and Housing

The Public Trust Doctrine restricts the type of land uses allowed on public lands, including District Tidelands. Under the Public Trust Doctrine, residential uses are prohibited on District property. As such, the PMPU would not allow for the construction of housing within the District. The PMPU would, however, result in the creation of both temporary and permanent employment opportunities

to support the construction and operation of future development associated with the PMPU. Consequently, while the PMPU would not result in the direct construction of additional housing, it may result in the indirect construction of housing outside of District's jurisdiction. Therefore, the PMPU may indirectly stimulate the construction of some housing due to the increase in permanent jobs.

5.3.3 Removal of Obstacles to Population Growth

As stated above, a project would indirectly induce growth if it would remove a constraint on a required public service or utility. A project would also indirectly induce growth if it would establish a precedent-setting action (e.g., an innovation, a change in zoning, a general plan amendment approval). The PMPU consists of a comprehensive update to the current PMP to guide land and water uses, as well as future development on District Tidelands. While the PMPU does not propose any physical development, including infrastructure improvements, it would facilitate future growth and development within the Port that could require infrastructure upgrades and result in the removal of obstacles to growth.

5.4 Effects Found Not to Be Significant

Pursuant to State CEQA Guidelines Section 15063, the District prepared an Initial Study that determined that one or more effects related to agriculture and forestry resources; geology and soils; hazards and hazardous materials; hydrology and water quality; mineral resources; noise and vibration; population and housing; transportation, circulation, and parking; and wildfire would not be significant. In accordance with State CEQA Guidelines Section 15128, a brief explanation indicating the reasons that the effects on these resources would not be significant is provided under each subheading below.

5.4.1 Agriculture and Forestry Resources

5.4.1.1 Conversion of Important Farmland

The PMPU area is entirely urbanized and there are no farmlands or agricultural resources. According to the Farmland Mapping and Monitoring Program of the California Department of Conservation (DOC 2017), the landside portion of the PMPU area is classified as Urban and Built-Up Land and does not contain any Prime Farmland or Farmland of Statewide Importance. As such, there is no potential for future activities associated with the PMPU to convert agricultural resources to nonagricultural uses. No impact would occur.

5.4.1.2 Agricultural Zoning or Williamson Act Contracts

The PMPU area is entirely urbanized and there are no farmlands or agricultural resources. The landside portion of the PMPU area is classified as Urban and Built-Up Land, and there are no parcels within the PMPU area zoned for agricultural use or under Williamson Act contract (DOC 2013). Therefore, the PMPU would not conflict with existing zoning for agricultural use or a Williamson Act contract, and no impact would occur.

5.4.1.3 Conflicts with Forestland Zoning, Timberland Zoning, or Timberland Production

The PMPU area is entirely urbanized and does not support any forestry uses. No land that has been zoned as forest land or timberland exists within the boundaries of the PMPU area. Therefore, future activities associated with the PMPU would not conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production. No impact would occur.

5.4.1.4 Loss or Conversion of Forestland

The PMPU area does not contain any forest lands as defined in Public Resources Code Section 12220(g). California's Forests and Rangelands: 2010 Assessment, completed as part of the California Department of Forestry and Fire Protection Fire Resource Assessment Program, provides an assessment of the State's inventory of forest land and identifies lands within the PMPU area as Urban (CAL FIRE 2010). Therefore, the PMPU would not result in a loss of forestland or the conversion of forestland to other uses. No impact would occur.

5.4.1.5 Other Changes Resulting in Conversion of Farmland or Forestland

No agricultural land, forestland, or timberland exists within or near the PMPU area. Future activities associated with the PMPU would not result in the conversion of important farmland or other agricultural resources to a non-agricultural use or from forestland to non-forest use because the PMPU area is developed land that is used for commercial and recreational purposes in accordance with the Public Trust Doctrine. Therefore, the PMPU would not involve a change to the existing environment that, because of its location or nature, would result in the conversion of Farmland to non-agricultural use or Forestland to non-forest use, and no impact would occur.

5.4.2 Geology and Soils

5.4.2.1 Landslides

Landslide activity generally occurs in areas that lack vegetation and have steep slopes. The PMPU area primarily consists of fill areas that are flat. According to the California Geological Survey (2011), the PMPU area has a low potential for landslides to occur. According to the City of San Diego Seismic Safety Study (2008a), there are two areas within Point Loma where historic landslides have occurred; however, these areas are not located within or adjacent to the PMPU area. Therefore, no portion of the PMPU area would be susceptible to landslides, nor would future activities associated with the PMPU exacerbate the potential for landslides to occur. No impact would occur.

5.4.2.2 Septic Tanks or Alternative Wastewater Disposal Systems

The entire PMPU area is urbanized and has sewer service. No septic tanks or alternative wastewater disposal systems would be required for any future projects associated with the PMPU. Therefore, no impact would occur.

5.4.3 Hazards and Hazardous Materials

5.4.3.1 Private Airstrips

The PMPU area is not located within the vicinity of a private airstrip.³ Therefore, future activities associated with the PMPU would not result in any safety hazards related to private airstrips for people working in the PMPU area. No impact would occur.

5.4.3.2 Wildland Fire Hazards

State law requires that all local jurisdictions identify very high fire hazard severity zones (VHFHSZs) within their areas of responsibility (California Government Code, Section 51175–51189). Inclusion within these zones is based on vegetation density, slope severity, and other relevant factors that contribute to fire severity. According to the VHFHSZ Maps (CAL FIRE 2009), the PMPU area is entirely within a “non-VHFSZ.” The PMPU area is located in and around San Diego Bay and is primarily developed. There are no wildlands or heavily vegetated areas near the PMPU area; therefore, subsequent projects implemented under the PMPU would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires, nor would they exacerbate the potential for wildland fires to occur. No impacts would occur.

5.4.4 Hydrology and Water Quality

5.4.4.1 100-Year Flood Hazard Areas (Placement of Housing)

The PMPU area includes several portions of the 100-year floodplain, as designated on Flood Insurance Rate Maps (Federal Emergency Management Agency 2012). However, pursuant to the San Diego Unified Port District Act (Port Act) and Public Trust Doctrine, no housing is allowed within the PMPU area. Therefore, the PMPU would not place housing within a 100-year flood hazard area, and no impact would occur.

5.4.4.2 Dam or Levee Failure

Dam failures are rated as a low-probability, high-loss event. Only two major dam failures have been recorded in San Diego County. These occurred in 1916 and were caused by a flood event (County of San Diego 2010). A portion of the PMPU area is located within a mapped dam inundation zone (California Office of Emergency Services 2003). The majority of the southernmost portion of the Bay, which encompasses the South Bay Planning District, would be subject to inundation if the Upper and Lower Otay Dams were to fail.⁴

The following information is based on geographic information system (GIS) data from the San Diego County Office of Emergency Services (2015). The Upper and Lower Otay Dams are approximately 10 miles to the east of the PMPU area, and inundation is projected to occur in the PMPU area within approximately 33 minutes if the dams were to fail. The City of San Diego operates the Upper and

³ While not a private airstrip or public airport, Naval Air Station North Island is considered in Chapter 4, *Environmental Analysis*, under “public airports” to reduce redundancy in the analysis.

⁴ A portion of the National City Bayfront Planning District near Civic Center Drive and the Chula Vista Bayfront Planning District are located within a mapped dam inundation zone (California Office of Emergency Services 2003). However, neither of these are part of the proposed PMPU.

Lower Otay Reservoirs. The reservoirs have spilled over on a few occasions in the past 10 years, but no downstream flooding has occurred (KPBS 2017).

However, as the dams are not within the vicinity of the PMPU area, there are no uses that could be proposed under the PMPU that would be expected to interfere with the dams or otherwise contribute to the potential failure of the dam. Therefore, the PMPU would not cause or otherwise exacerbate the failure of a dam or levee that could expose people or structures to a significant risk of loss, injury, or death involving flooding. Impacts would be less than significant.

5.4.5 Mineral Resources

5.4.5.1 Loss of Regional or State Valued Mineral Resources

The Surface Mining and Reclamation Act of 1975 required the State Geologist to initiate mineral land classification to help identify and protect mineral resources in areas within the state. In accordance with guidelines established by the State Mining and Geology Board, mineral deposits in western San Diego County have been classified into Mineral Resource Zones. The PMPU area does not contain aggregate resources and is not located in a zone that contains important resources, as shown in Figure CE-6 of the Conservation Element of the City of San Diego General Plan (City of San Diego 2008b). The PMPU area is not designated or zoned as land with available mineral resources.

Per the Conservation Element of the City of San Diego General Plan, however, the South San Diego Bay Unit of the San Diego National Wildlife Refuge supports salt production (South Bay Planning District). A commercial salt facility consisting of a series of diked ponds operates in the refuge, which concentrates and precipitates salts from the bay waters. While these salt ponds are a locally unique industry, they do not comprise a large share of the salt production market (City of San Diego 2008b). Additionally, the PMPU does not propose any changes to the South Bay Planning District that would affect the existing operations at the salt ponds. Therefore, the PMPU would not result in the loss of known mineral resources of value to the region or state. No impact would occur.

5.4.5.2 Loss of Locally Important Mineral Resources

The PMPU area is not designated for mineral extraction. The PMPU area and surrounding area do not contain locally important mineral resources. While the South Bay Planning District contains a locally unique commercial salt operation, the facility does not comprise a large share of the salt production market. Additionally, the PMPU does not propose any changes to the South Bay Planning District that would affect the existing operations at the salt ponds. Therefore, the PMPU would not result in the loss of availability of a locally important mineral resource recovery site. No impact would occur.

5.4.6 Noise and Vibration

5.4.6.1 Private Airstrips

The PMPU area is not located within the vicinity of a private airstrip. Therefore, future activities associated with the PMPU would not expose people working in the PMPU area to excessive noise from private airstrips. No impact would occur.

5.4.7 Population and Housing

5.4.7.1 Displacement of Housing

There are no residential uses or housing units present within the PMPU area. Under the Public Trust Doctrine, the types of land uses allowed on public lands are restricted, including those within the District's jurisdiction. The Public Trust Doctrine limits the uses of sovereign lands to waterborne commerce, navigation, fisheries, open space, water-oriented recreation, ecological habitat protection, or other recognized public trust purposes. Therefore, because residential uses are not an allowable use on public lands in accordance with the Public Trust Doctrine, future activities associated with the PMPU would not result in the displacement or loss of existing residential units, and no replacement housing would be necessary. Consequently, no impact would occur.

5.4.7.2 Displacement of People

As mentioned, the PMPU area does not contain any residential uses, as the Public Trust Doctrine restricts the types of uses on public lands to waterborne commerce, navigation, fisheries, open space, water-oriented recreation, ecological habitat protection, or other recognized public trust purposes. Therefore, because no residential uses are located within the PMPU area, future activities associated with the PMPU would not result in the displacement of people, necessitating the construction of replacement housing elsewhere. Consequently, no impact would occur.

5.4.8 Transportation, Circulation, and Parking

5.4.8.1 Congestion Management Programs

Federal Highway Administration 23 Code of Federal Regulations (CFR) 450.320 requires that each transportation management area (TMA) address congestion management through a process involving an analysis of multimodal metropolitan wide strategies that are cooperatively developed to foster safety and integrated management of new and existing transportation facilities eligible for federal funding. The San Diego Association of Governments (SANDAG) has been designated as the TMA for the San Diego region. San Diego Forward: The Regional Plan, the region's long-range transportation plan and sustainable communities strategy, meets the requirements of 23 CFR 450.320 by incorporating the following federal congestion management process: performance monitoring and measurement of the regional transportation system, multimodal alternatives and non-single occupancy vehicle analysis, land use impact analysis, the provision of congestion management tools, and integration with the Regional Transportation Improvement Program process.

California State Proposition 111, passed by voters in 1990, established a requirement that urbanized areas prepare and regularly update a Congestion Management Program (CMP). The requirements within the State CMP were developed to monitor the performance of the transportation system, develop programs to address near-term and long-term congestion, and better integrate transportation and land use planning. SANDAG provided regular updates for the state CMP from 1991 through 2008. In October 2009, the San Diego region elected to be exempt from the State CMP and, since this decision, SANDAG has been abiding by 23 CFR 450.320 to ensure the region's continued compliance with the Federal congestion management process. Therefore, the PMPU would have no impact on an applicable CMP.

5.4.9 Wildfire

5.4.9.1 Emergency Response and Evacuation Plans

According to the VHFHSZ Maps (CAL FIRE 2009), the PMPU area is entirely within a “non-VHFSZ” under local responsibility. The PMPU area is located in and around San Diego Bay and is primarily developed. Therefore, because the PMPU area is not within an area susceptible to wildfires, subsequent projects implemented under the PMPU would not substantially interfere with an adopted emergency response or evacuation plan for wildfires. No impact would occur.

5.4.9.2 Pollutant Concentrations

As mentioned, the PMPU area is entirely within a “non-VHFSZ” under local responsibility. The PMPU area is located in and around San Diego Bay and is primarily developed. There are no wildlands or heavily vegetated areas near the PMPU area; therefore, subsequent projects implemented under the PMPU would not exacerbate the potential for wildfires to occur that could expose project occupants to pollutant concentrations from wildfire or the uncontrolled spread of wildfire. No impact would occur.

5.4.9.3 Infrastructure and Wildfire Risk

While the PMPU does not propose any physical development, including infrastructure improvements, it would facilitate future growth and development within the Port that could require new infrastructure. However, the PMPU area is entirely within a “non-VHFSZ” under local responsibility, and no wildlands or heavily vegetated areas are present within the PMPU area. Therefore, because the PMPU area is not within an area susceptible to wildfires, any infrastructure improvements to serve subsequent projects implemented under the PMPU would not have the potential to exacerbate wildfire risk. No impact would occur.

5.4.9.4 Post-Wildfire Hazards

As mentioned, the PMPU area is entirely within a “non-VHFSZ” under local responsibility and is not characterized as an area susceptible to wildfires. As such, buildout of the PMPU would not expose people or structures to significant post-wildfire risks, including downslope or downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. Therefore, no impact would occur.

This page was intentionally left blank.

6.1 Overview

This chapter describes and analyzes a range of reasonable alternatives that could feasibly attain most of the basic project objectives while avoiding or substantially lessening one or more of the significant effects of the proposed Port Master Plan Update (PMPU). The primary purpose of this chapter is to ensure that the comparative analysis provides sufficient detail to foster informed decision-making and public participation in the environmental process.

Five alternatives to the proposed PMPU are analyzed in this chapter and discussed in terms of their characteristics relative to the proposed PMPU.

- Alternative 1 – No Project Alternative
- Alternative 2 – One-Third Reduced Growth Alternative
- Alternative 3 – One-Half Reduced Growth Alternative
- Alternative 4 – Harbor Island Centralized Commercial Recreation Alternative
- Alternative 5 – Recreation Open Space Alternative

Based on the analysis below, Alternative 3, the One-Half Reduced Growth Alternative, would be the environmentally superior alternative.

6.2 Requirements for Alternatives Analysis

The California Environmental Quality Act (CEQA) Guidelines require that an environmental impact report (EIR) present a range of reasonable alternatives to a project, or to the location of a project, that could feasibly attain a majority of the basic project objectives, and that would avoid or substantially lessen one or more significant environmental impacts of the project. The range of alternatives required in an EIR is governed by a “rule of reason” that requires an EIR to set forth only those alternatives necessary to permit a reasoned choice. An EIR need not consider every conceivable alternative to a project. Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the basic project objectives, are not feasible, or do not avoid or substantially lessen any significant environmental effects (State CEQA Guidelines, Section 15126.6(c)).

In addition to the requirements described above, CEQA requires the evaluation of a No Project Alternative, which analyzes the environmental effects that would occur if the project did not proceed (State CEQA Guidelines Section 15126.6(e)). Moreover, the EIR is required to identify the environmentally superior alternative. If the environmentally superior alternative is the No Project Alternative, the EIR must also identify an environmentally superior alternative among the other alternatives (State CEQA Guidelines Section 15126.6(e)(2)).

6.3 Selection of Alternatives

In developing alternatives that meet the requirements of CEQA, the starting point is the project's objectives. The following objectives have been identified for the proposed PMPU.

1. Create an integrated vision for the District that governs the use, design, and improvement of public trust lands in accordance with Section 30711 of the California Coastal Act (CCA), the Public Trust Doctrine, and the San Diego Unified Port District Act (Port Act).
2. Within the PMPU area, create standards for new development, which serve to: 1) enhance and blend development with the surrounding character; 2) provide a balanced and diverse range of complementary uses; and 3) provide enough activation year-round and during the day-time for visitors to minimize the seasonally-related downtimes of uses on Tidelands.
3. Streamline the project review and entitlement process for implementation of the Port Master Plan.
4. Allow for an intensity and diversity of development that provides on-going and sustainable revenues to the District to ensure the longevity of the District's operations and its ability to fulfill its legislative responsibilities; balance the future needs of the maritime industry, tourism, water and land recreation; and reinvestment in critical infrastructure and maintenance of waterfront amenities and facilities as required by the Port Act and Public Trust Doctrine.
5. Provide an interconnected mobility network that encourages a range of travel modes, including the expansion of water- and land-based transit opportunities to support the movement of people, goods, and military operations.
6. Enliven the public realm by providing and maintaining recreation open space opportunities, through the creation and maintenance of: 1) public accessways; 2) physical and visual access to the water; and 3) an interconnected open space network.
7. Provide opportunities for creating a vibrant waterfront destination with a range of attractions for visitors, while protecting and restoring the environment through the proactive management of sensitive biological resources and ensuring coastal access around San Diego Bay.

CEQA also requires that alternatives be potentially feasible and could feasibly accomplish most of the basic objectives of the project. Feasible is defined in CEQA as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors" (Public Resources Code Section 21061.1). The State CEQA Guidelines indicate that factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, other plans or regulatory limitations, jurisdictional boundaries and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (State CEQA Guidelines Section 15126.6).

Finally, the alternatives should also avoid or substantially lessen one or more significant environmental impacts that would occur under the proposed project. Table 6-1 summarizes the proposed PMPU's significant impacts, which have been identified to assist with focusing the analysis of alternatives in Section 6.5. Unless otherwise indicated, impacts identified for the proposed PMPU would also occur under Options 1, 2, and 3.

Table 6-1. Summary of Significant Effects of the Proposed PMPU

Resource Impact	Significant and Unavoidable	Less than Significant with Mitigation
Section 4.1, Aesthetics and Visual Resources		
Impact-AES-1: Potential to Interfere with Designated Scenic Vista Areas or View Corridors During Construction Associated with Implementation of the Proposed PMPU	X	
Impact-AES-2: Potential to Result in Substantial Degradation of Visual Character and Quality During Construction Associated with Implementation of the Proposed PMPU.	X	
Impact-AES-3: New Permanent Source of Glare Generated by Potential High-Rise Development		X
Impact-C-AES-1: Potential to Result in Cumulatively Considerable Adverse Impacts on Scenic Vista Areas or View Corridors During Construction	X	
Impact-C-AES-2: Potential to Result in Cumulatively Considerable Substantial Degradation of Visual Character and Quality During Construction	X	
Impact-C-AES-3: Potential to Result in a Cumulatively Considerable New Permanent Source of Glare Generated by Potential High-Rise Development		X
Section 4.2, Air Quality and Health Risk		
Impact-AQ-1: New Land Use Designations Not Accounted for in the RAQS and SIP		X
Impact-AQ-2: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction		X
Impact-AQ-3: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations	X	
Impact-AQ-4: Health Effects During PMPU Buildout Construction from ROG and NOX		X
Impact-AQ-5: Health Effects During PMPU Buildout Operations from ROG, NOX, and CO	X	
Impact-C-AQ-1: New Land Use Designations Not Accounted for in the RAQS and SIP		X
Impact-C-AQ-2: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction		X
Impact-C-AQ-3: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations	X	
Impact-C-AQ-4: Health Effects During PMPU Buildout Construction from ROG and NO _x Emissions		X
Impact-C-AQ-5 Health Effects During PMPU Buildout Operations from ROG, NO _x , and CO	X	

Resource Impact	Significant and Unavoidable	Less than Significant with Mitigation
Section 4.3, Biological Resources		
Impact-BIO-1: In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species such as California Least Tern and California Brown Pelican		X
Impact-BIO-2: Construction Noise Impacts on Nesting Behavior of Marine Dependent Species Protected under the Migratory Bird Treaty Act and California Fish and Game Code		X
Impact-BIO-3: In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fishes		X
Impact-BIO-4: Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity		X
Impact-BIO-5: Potential Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code		X
Impact-BIO-6: Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment		X
Impact-BIO-7: Permanent and Long-Term Overwater Coverage from Introduction of New Structures		X
Impact-BIO-8: Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in their Nesting Habitats		X
Impact-BIO-9: Bird Strikes Resulting from Use of Reflective Materials		X
Impact-BIO-10: Temporary Water Quality and Sedimentation Impacts to Eelgrass Beds During Project Construction		X
Impact-BIO-11: Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures		X
Impact-BIO-12: Direct Loss of Eelgrass from Dredging Activities		X
Impact-BIO-13: Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters		X
Impact-BIO-14: Reduction in the Ecological Value of Benthic Communities from Increased Depths Created by Dredging Activities		
Impact-BIO-15: Potential for Future Projects to Result in a Conflict with the Integrated Natural Resources Management Plan		X
Impact-BIO-C-1: Cumulative Impacts of In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species such as California Least Tern and California Brown Pelican		X

Resource Impact	Significant and Unavoidable	Less than Significant with Mitigation
Impact-C-BIO-2: Cumulative Impacts of Construction Noise Impacts on Nesting Behavior of Marine Dependent Species Protected under the Migratory Bird Treaty Act and California Fish and Game Code		X
Impact-C-BIO-3: Cumulative In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fishes		X
Impact-C-BIO-4: Cumulative Impacts of Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity		X
Impact-C-BIO-5: Cumulative Impacts of Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code		X
Impact-C-BIO-6: Cumulative Impacts of Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment.		X
Impact-C-BIO-7: Cumulative Impacts of Permanent and Long-Term Overwater Coverage from Introduction of New Structures		X
Impact-C-BIO-8: Cumulative Impacts of Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in their Nesting Habitats		X
Impact-C-BIO-9: Cumulative Impacts of Bird Strikes Resulting from Use of Reflective Materials.		X
Impact-C-BIO-10: Cumulative Impacts of Temporary Water Quality and Sedimentation Impacts to Eelgrass Beds During Project Construction		X
Impact-C-BIO-11: Cumulative Impacts of Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures		X

6.4 Alternatives Considered

A total of six alternatives were initially considered for evaluation. Based on the criteria described in Section 6.3, *Selection of Alternatives*, in addition to evaluating a No Project Alternative, four other alternatives were selected for detailed analysis that are capable of meeting most of the basic project objectives. The alternative that was considered, but rejected, was an alternate location alternative. Alternatives that were carried forward and analyzed in Section 6.5 below include modifications of various components of the proposed PMPU that would help reduce environmental impacts. Table 6-2 summarizes the buildout scenarios for the five alternatives that were carried forward and analyzed in this Program EIR (PEIR).

6.4.1 Alternatives Considered but Rejected

6.4.1.1 Alternate Location Alternative

The District is statutorily charged with overseeing the Tidelands and submerged lands within the Port of San Diego. The Port Act (Appendix 1 of the California Harbor and Navigation Code) was adopted in 1962. Through the Port Act, the State of California delegated its authority to the District to own, manage, and control certain tidelands and submerged waters. Specifically, the District was established for the development, operation, maintenance, control, regulation, and management of the Tidelands and lands underlying the inland navigable waters of San Diego Bay.

The proposed PMPU involves an extensive update to the existing Port Master Plan and provides the official goals and planning policies, as well as permissible land and water uses, for development and conservation of the Tidelands. The District does not have jurisdiction over water or land areas outside of the Tidelands. Consequently, such an alternative would result in the District violating its statutory obligations to oversee the Port of San Diego therefore, no other location is available for implementation of the proposed PMPU and an Alternate Location Alternative was rejected from further consideration as being legally infeasible. Furthermore, such an alternative would not reduce or avoid impacts, and would simply redistribute impacts to another location.

Table 6-2. 2050 Buildout Assumptions for Each Alternative (Net New)

Land Uses	Proposed PMPU (Potential Net Increase over Certified PMP Development)	Alternative 1: No Project (Authorized by Certified PMP)	Alternative 2: One- Third Reduced Growth	Alternative 3: One-Half Reduced Growth	Alternative 4: Harbor Island Centralized Commercial Recreation Alternative	Alternative 5: Recreation Open Space
Retail/ Restaurant sf	340,000	22,500	227,800	170,000	340,000	340,000
Hotel Rooms	3,910	1,000	2,620	1,955	3,910	3,910
Hotel Meeting Space	162,000	No Change	108,000	81,000	162,000	162,000
Recreational Boat Slips	485	50	325	243	485	485
Convention Center sf	180,000	960,000	120,000	90,000	180,000	180,000
Recreation Open Space (acres)	14.03	No Change	>14.03	>14.03	14.37	16.03

sf = square feet

6.5 Analysis of Alternatives

This section discusses each of the project alternatives and determines whether each alternative would avoid or substantially reduce any of the significant impacts of the proposed PMPU. This section also identifies any additional impacts resulting from the alternatives that would not result from the proposed PMPU. A summary comparison of the impacts of the proposed PMPU and the alternatives under consideration is included as Table 6-3 at the end of this chapter.

6.5.1 Analysis of Alternative 1 – No Project Alternative

The No Project Alternative is required by CEQA and would continue implementation of the existing PMP. Pursuant to State CEQA Guidelines Section 15126.6(e), the No Project Alternative considers the existing conditions and what would be reasonably expected to occur in the foreseeable future as entitled uses if the proposed PMPU was not approved, based on current plans and consistent with available infrastructure and community services. The remaining, entitled appealable projects identified in the proposed PMPU provide tables for each existing precise plan that assumed to be developed under this alternative. Development projections under this alternative are identified in Table 6-2 and would include up to 22,500 square feet of additional retail/restaurant space, 1,000 hotels rooms, 50 additional recreational boat slips, and 960,000 square feet of additional convention center space. In addition, the Tenth Avenue Marine Terminal (TAMT) would continue to implement the improvements consistent with the Tenth Avenue Marine Terminal Redevelopment Plan (see Chapter 3, *Project Description*, for a more detailed discussion on the TAMT Redevelopment Plan).

6.5.1.1 Aesthetics and Visual Resources

The No Project Alternative would take place within the same area and planning districts (PDs) as the proposed PMPU. This alternative would involve less development intensity than the proposed PMPU within PD2 and PD3, and would largely involve infill development within those planning districts. However, under this alternative, the baywide development standards that establish requirements for protecting scenic vista areas and view-corridor extensions and the Baywide and planning/subdistrict-specific standards that establish requirements related to building height, setback, and stepbacks in order to protect views and visual character of a site and its surroundings would not be implemented. While the existing PMP contains some policies related to protection of scenic vistas, these policies are not as specific or well-defined as the proposed policies and development standards that are in the proposed PMPU. Construction activities under this alternative could involve the use of equipment that could intrude into and temporarily block scenic vistas or view-corridor extensions, which would require the implementation of mitigation measures similar to those identified for the proposed PMPU. In addition, new buildings developed under this alternative could result in the permanent intrusion into or blockage of scenic vistas. Furthermore, like the proposed PMPU, this alternative could also introduce new sources of glare from the introduction of new and taller buildings that use glass curtainwall siding. Implementation of mitigation measures that are similar to those identified for the proposed PMPU would be required, which establish low-reflectivity standards to ensure that these glare impacts are reduced to less-than-significant levels.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant aesthetic impacts related to glare, but would result in significant and unavoidable impacts related to the potential to interfere with designated scenic vistas or view corridors during construction and the potential to result in substantial degradation of visual character and quality during construction. While the No Project Alternative would result in less development than the proposed PMPU and would result in fewer changes to the existing aesthetics of the proposed PMPU area overall, because the existing PMP does not contain the policies and development standards that would protect scenic vistas and visual character, the potential exists for this alternative to result in significant and unavoidable impacts related to aesthetic resources. Therefore, impacts related to aesthetics and visual resources would be greater for impacts on scenic vistas but reduced for visual character compared to the proposed PMPU. Overall, impacts would be similar.

6.5.1.2 Air Quality and Health Risk

This alternative would be consistent with the currently adopted PMP, which would have been accounted for in the San Diego Association of Governments' (SANDAG's) regional growth assumptions. Therefore, this alternative would be consistent with the Regional Air Quality Standards (RAQS) and State Implementation Plan (SIP), and impacts would be less than significant related to consistency with the applicable air quality plans (**Impact-AQ-1**). In addition, the No Project Alternative would result in less development than would occur under the proposed PMPU; however, it is still possible that construction emissions could exceed thresholds related to reactive organic gas (ROG) and nitrogen oxide (NO_x) emissions, especially given the amount of hotel and convention center space that would occur under the No Project Alternative (**Impact-AQ-2**). In addition, it is possible that operational impacts could exceed thresholds related to ROG and NO_x, which would result in similar impacts as the proposed PMPU related to a cumulatively considerable net increase of criteria pollutants for which the region is nonattainment (**Impact-AQ-3**). This impact related to construction and operational criteria pollutants would remain significant and unavoidable even after the implementation of mitigation (**MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-2** and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-3**). However, because this alternative would result in substantially less development overall, thereby reducing the duration and intensity of construction activity, this impact would be reduced compared to the proposed PMPU.

In addition, construction activities under this alternative could increase diesel particulate matter emissions over existing condition levels that could result in cancer or non-cancer health risks to sensitive receptors within and adjacent to the proposed PMPU area (**Impact-AQ-4**), and construction (**Impact-AQ-5**) and operational (**Impact-AQ-6**) activities under this alternative could also generate criteria pollutant emissions that exceed thresholds, which are set to protect public health. However, because the intensity of development occurring under this alternative would be reduced compared to the proposed PMPU, diesel particulate matter and criteria pollutant emissions would also be reduced. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable air quality impacts. Overall, because future development under this alternative would be substantially reduced, air quality and health risk impacts occurring under this alternative would be reduced compared to the proposed PMPU, but still would be significant and unavoidable.

6.5.1.3 Biological Resources

The No Project Alternative would result in construction and operational activities throughout the proposed PMPU area, which, similar to the proposed PMPU, would have the potential to adversely affect sensitive habitat or species or other biological resources. Specifically, landside and waterside improvements under this alternative could include activities such as the construction of new landside structures and the installation of recreational boat slips or aquaculture pens, the construction of which would result in construction noise or increased turbidity that could affect terrestrial and marine resources, and various avian species, and/or result in the loss of eelgrass beds. In addition, marine resources could be affected by operation of waterside improvements through increased overwater coverage, the discharge of harmful chemicals into waters, alteration of hydrodynamics, or increased recreational vessel activity. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts on biological resources with the implementation of mitigation. This alternative would result in similar impacts and would require similar mitigation measures as those identified for the proposed PMPU and would similarly result in less-than-significant impacts after implementation of mitigation. However, because of the reduced intensity of development, this alternative would result in reduced impacts on biological resources compared to the proposed PMPU.

6.5.1.4 Cultural Resources

The No Project Alternative would involve improvements within all planning districts within the proposed PMPU area, each of which contain one or more known historical resources and built resources that will reach the 50-year age benchmark for consideration as a potential historical resource under CEQA. For these reasons, construction activities associated with this alternative would have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource. In addition, construction activities associated with implementation of future development under this alternative would involve ground-disturbing activities in areas where known or unknown archaeological resources are present. These activities could damage or destroy these archaeological resources. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on cultural resources. Implementation of this alternative could also result in significant and unavoidable impacts; however, given that this alternative would result in less development than the proposed PMPU, impacts on cultural resources under this alternative would be reduced compared to the proposed PMPU.

6.5.1.5 Geology and Soils

While the No Project Alternative would reduce the total number of hotel rooms, retail/restaurant square footage, and recreational boat berthing slips compared to the proposed PMPU, development still would occur potentially within areas mapped with geologic hazards, including ground rupture, liquefaction, strong ground-shaking due to seismic activity, or expansive or unstable soils. In addition, the potential for soil erosion also exists during implementation of this alternative. However, as discussed in Section 4.5, *Geology and Soils*, regulations contained within the California Building Code (CBC), the adjacent cities' municipal codes, and the District's Stormwater Management and Discharge Control Ordinance would ensure that any structures developed under this alternative would identify and mitigate for any geologic hazards existing within, or affecting, any given project site or reduce the potential for soil erosion. Impacts related to geology and soils

would be less than significant under this alternative, but given that this alternative would result in less development than the proposed PMPU, impacts related to geology and soils under this alternative and would be similar although reduced compared to the proposed PMPU.

In addition, as noted in Section 4.5, PD1, PD3, PD4, PD8, PD9, and PD10 contain a geologic formation that has high paleontological sensitivity, and fossil resources have been uncovered in PD4 and PD10. Because this alternative potentially would involve future development in these planning districts and could involve excavation that exceeds 10 feet in depth and requires removal of 1,000 cubic yards or more, this alternative has the potential to adversely affect unique paleontological resources or sites and would require mitigation. Impacts on paleontological resources under this alternative would be less than significant with mitigation, which is the same conclusion as the proposed PMPU. However, because the amount of earthwork that would occur would be less under the No Project Alternative, impacts would be reduced relative to the proposed PMPU.

6.5.1.6 Greenhouse Gas Emissions and Energy

Sources of construction-related greenhouse gas (GHG) emissions are identified in Table 4.6-12, of Section 4.6, *Greenhouse Gas Emissions and Energy*, and sources of operational GHG emissions are identified in Table 4.6-13 of Section 4.6. GHG emissions during construction would result from equipment vehicles associated with building construction as well as equipment associated with waterside construction, which could involve numerous in-water and landside construction pieces, such as tugboats, pushboats, small support boats, and cranes. Operational emissions are generated from a variety of sources, including utility consumption (i.e., electricity, natural gas, water, and wastewater); on- and off-road vehicles; freight rail and other maritime sources; and recreational boating. The No Project Alternative would involve all of the various GHG emission sources for both construction and operational activities, but under a less intense development scenario.

As indicated in Table 6-1, implementation of the proposed PMPU would result in one significant and unavoidable GHG impact with the remaining impacts being reduced to less than significant with the incorporation of mitigation. Given the level of development that could occur under this alternative, including increased cargo throughput at TAMT provided under the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR or increase passenger throughput at the cruise terminal that may occur in the future if demand for cruises increases, it is still likely that this alternative would result in similar significant and unavoidable impacts related to GHG emissions as the proposed PMPU, including an increase in GHG emissions relative to existing conditions and exceeding reduction targets. In addition, prior to the implementation of mitigation, future development that could occur under this alternative may not be consistent with the Climate Action Plan (CAP) because it would not implement all of the applicable reduction measures. Similar to the proposed PMPU, mitigation measures would be required to ensure that this alternative implements all applicable reduction measures and reduces impacts to less-than-significant levels. However, because this alternative would result in less growth and an overall reduction in GHG emissions, GHG emission impacts associated with this alternative would be reduced compared to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant energy impacts with mitigation incorporated. Energy consumption would also increase compared to existing conditions under this alternative and would likely require similar mitigation measures as those identified for the proposed PMPU in order to reduce impacts related to the wasteful, inefficient, or unnecessary consumption of energy and consistency with applicable energy

use reduction plans to less-than-significant levels. Overall, because this alternative would result in less development than the proposed PMPU, energy consumption would be less. As such, energy impacts under this alternative would be less than significant after mitigation and would be reduced compared to the proposed PMPU.

6.5.1.7 Hazards and Hazardous Materials

The No Project Alternative would involve potential future development throughout the proposed PMPU area, with future development being concentrated in PD2 and PD3, and the potential exists to encounter existing known or undocumented contaminated material (i.e., soil, groundwater, or sediment) or other hazardous materials such as asbestos-containing materials, lead-based paint, polychlorinated biphenyls, or organochlorine pesticides during construction activities, which would be a significant impact that could create a hazard to the public or the environment. It is also possible that future development occurring under this alternative could be located on a site with an active or closed case listed in an environmental database for hazardous materials. Mitigation would reduce these impacts to less-than-significant levels.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to hazards and hazardous materials with the implementation of mitigation. Because impacts associated with hazardous materials tend to be localized and because this alternative would result in less development than would occur under the proposed PMPU, potential hazards and hazardous materials impacts resulting from this alternative would be less than significant with mitigation incorporated and would be reduced compared to the proposed PMPU.

6.5.1.8 Hydrology and Water Quality

As described under Section 4.8.3, *Laws, Regulations, Plans, and Policies*, in Section 4.8, *Hydrology and Water Quality*, there are numerous Federal, State, and local laws, regulations, and programs that govern water quality standards or waste discharge requirements that help ensure that surface- or groundwater quality is not degraded as a result of development projects. These laws, regulations, and programs would apply to any future development projects that are consistent with the water and land use designations and the policies of this alternative, and where these development projects propose actions that are governed by these laws, regulations, and programs. Potential landside construction activities occurring under this alternative would be required to comply with the San Diego Regional Water Quality Control Board (RWQCB) regulations for short-term dewatering, as well as the Construction General Permit for sites that would disturb more than 1 acre of land or the District's Jurisdictional Runoff Management Program (JRMP) for sites that would disturb less than 1 acre of land. Compliance with these regulations would ensure that landside construction activities under this alternative would result in less-than-significant impacts. However, this alternative would involve waterside construction activities as well, including the removal of existing pilings and piers, and construction of new pilings/piers, moorings, or floating docks, which could affect water quality due to disturbance of localized sediments and increased turbidity. While waterside construction activities would be required to comply with Clean Water Act Sections 401 and 404, there are areas where known contaminated sediments exist and bottom-disturbing activities may uncover these contaminated sediments. Therefore, this alternative has the potential to result in significant and unavoidable water quality impacts during in-water construction activities.

In addition, operational waterside activities occurring under this alternative, including increased numbers of recreational vessels, would increase the potential for additional vessels using antifoulant copper-based paint for vessel hulls to potentially contribute to existing copper impairments present within PD1, PD2, PD3, PD9, and PD10, and may worsen the existing condition and result in a significant and unavoidable impact. Furthermore, aquaculture could also occur under this alternative, which could result in water quality degradation due to dissolved nitrogen and phosphorus, turbidity, biological oxygen demand, and bacteria. Mitigation would reduce this impact to less than significant.

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on hydrology and water quality. While the No Project Alternative has the potential to result in significant impacts, including a significant and unavoidable impact related to copper impairments from increases in recreational boating, due to smaller scale of these uses occurring under this alternative, impacts would be reduced compared to the proposed PMPU.

6.5.1.9 Land Use and Planning

Future development allowed under the No Project Alternative would not extend into areas beyond the proposed PMPU area, nor result in water or land use designations not already proposed in the PMPU. This alternative would not result in new roadway alignments or other infrastructure that physically would divide an established community. In general, future development occurring under this alternative would be similar to what could occur under the proposed PMPU, but at a less intense scale. As such, this alternative would not have the potential to divide an established community, would not result in land use compatibility conflicts with adjacent communities, and would be consistent with plans, policies, and regulations adopted for the purposes of avoiding or mitigating environmental effects. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to land use and planning. Impacts under this alternative would also be less than significant and would be similar to, but lesser in scale than, the proposed PMPU.

6.5.1.10 Noise and Vibration

Construction activities occurring under this alternative could exceed noise thresholds at sensitive receptors and would result in similar significant impacts related to noise and vibration as the proposed PMPU. In addition, this alternative would involve similar land uses as the proposed PMPU and would also include other activities such as roadway improvements, operational impacts associated with increased traffic noise, ambient parking lot noise, or mechanical noise from operation of aquaculture facilities or ocean-related enterprise uses. However, because this alternative would result in less development overall, this alternative would result in fewer construction activities and less traffic. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on noise. Impacts under this alternative, while also potentially being significant and unavoidable, would be reduced compared to the proposed PMPU.

6.5.1.11 Population and Housing

The No Project Alternative would have the potential to increase the amount of retail/restaurant square footage, hotel rooms, convention center square footage, and other uses that would result in increased employment throughout the proposed PMPU area compared to existing conditions. As

discussed in Section 4.11, *Population and Housing*, employment growth anticipated under the proposed PMPU would be within the growth estimates projected by SANDAG and would not result in substantial unplanned population growth in the region. Because future development occurring under this alternative would be less than what could occur under the proposed PMPU, this alternative would also result in less employment growth than the proposed PMPU, and would also be within the anticipated employment projections for the region. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to unplanned population growth. Impacts related to substantial unplanned population growth under this alternative would be less than significant and would be reduced slightly compared to the proposed PMPU.

6.5.1.12 Public Services and Recreation

The No Project Alternative would result in less future development than the proposed PMPU; however, the increase in hotel rooms and retail/restaurant space, convention space, and recreational boat slips that could occur under this alternative would result in new visitors and employees to the Downtown San Diego area and San Diego Bay. Increased numbers of visitors and employees would increase demand on public services, including the member-city police and fire protection services and Harbor Police Department (HPD) resources. However, the HPD indicated that implementation of the proposed PMPU would not generate the need for new equipment and personnel. Therefore, these services would not require new or expanded facilities (Nichols pers. comm., Webber pers. comm.). Buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant. As such, impacts occurring under this alternative would be less than significant and would be reduced slightly compared to the proposed PMPU.

While there would be less development than for the proposed PMPU, the timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities, are all unknown at this time. Mitigation measures detailed in the proposed PMPU's Mitigation Monitoring and Reporting Program (MMRP) would be required where necessary (**MM-PS-1**); however, to effectively implement **MM-PS-1**, a specific location (including surrounding land uses), project timing, and project design specifications for a future expansion or construction of a new police facility must be known. However, because factors are not known at this time, it would be speculative to conclude that impacts would be less than significant. Moreover, because the location of the police facility may be outside of the District's jurisdiction, the District would have no authority in this case to require and enforce mitigation measures to lessen any significant impacts. Therefore, similar to the proposed PMPU, and for similar reasons; it is reasonably foreseeable that the future construction of any new or expanded police facilities potentially would result in significant and unavoidable environmental impacts. However, with less future development under this alternative, impacts on police facilities would be reduced slightly compared to the proposed PMPU.

In addition, similar to the proposed PMPU, new or expanded parks and recreational facilities could be developed under this alternative, which could result in similar impacts related to construction and operation of those parks and recreational facilities, even with implementation of mitigation measures. However, there would be fewer improvements related to parks and recreational facilities made under this alternative compared to the proposed PMPU. As such, impacts occurring under this

alternative would be significant and unavoidable but reduced as compared to those occurring under the proposed PMPU.

As indicated in Table 6-1, implementation of the PMPU would result in significant and unavoidable impacts on public services and recreation. Under this alternative, impacts would be significant and unavoidable and would be similar to the proposed PMPU. However, because this alternative would result in substantially less demand on existing public services and recreational resources than the PMPU, impacts would be reduced compared to the proposed PMPU.

6.5.1.13 Sea Level Rise

The No Project Alternative includes similar water and land use designations as those proposed in the PMPU, which could result in similar sea level rise (SLR) exposure scenarios identified in Tables 4.13-3 and 4.13-4 in Section 4.13, *Sea Level Rise*. Because this alternative could result in less development than the proposed PMPU, it would result in less development being exposed to SLR. Because SLR is a highly site-specific impact and, even within a single parcel, flood exposure can vary significantly and the exact location of future development consistent with this alternative is unknown, it is possible that this alternative could result in similar exposure as the proposed PMPU. However, this alternative would not include the same policies related to SLR that are proposed in the PMPU. These policies require, among other things, the District to prepare, and periodically update, an SLR adaptation plan (SR Policy 3.2.3) and permittees to submit site-specific hazards reports to the District that address anticipated coastal hazards over the anticipated life of the development (SR Policy 3.3.1). Other policies require permittees to site and design development to avoid impacts from coastal hazards from projected SLR considering the anticipated life of the development, and, if coastal hazards cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Additionally, to reduce the risks posed to neighboring properties and the natural environment from coastal protection devices, policies would require the prioritization of nature-based adaptation strategies, where feasible (SR Policy 3.3.4). If coastal protection devices are used, they must be designed to minimize adverse impacts on local sand supply, recreation, habitat, scenic views, beach width, and coastal fill, and impacts on coastal access and other Public Trust uses (SR Policy 3.3.10). SLR and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1.

While the existing PMP does not contain these policies, current District practice involves project-specific review to determine potential impacts related to SLR. In addition, the District has prepared a Sea Level Rise Vulnerability Assessment and Coastal Resiliency Report (District 2019) that includes an adaptation planning and strategy implementation chapter, which outlines recommendations for adaptation strategies, etc. Project-specific review and implementation of sea level rise adaptation strategies would ensure that future development occurring under this alternative would not exacerbate the potential for inundation due to projected SLR or storm surge. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to SLR. Impacts under this alternative would also be less than significant; however, given that this alternative would result in less development, impacts would be reduced slightly compared to the proposed PMPU.

6.5.1.14 Transportation, Circulation, and Mobility

Under the No Project Alternative, traffic related to employees and visitors for retail/restaurant and hotel rooms would be reduced compared to the proposed PMPU, which would reduce overall vehicle miles traveled (VMT) compared to the proposed PMPU, specifically in PD2 and PD3. However, because this alternative could result in up to 22,500 square feet of additional retail/restaurant uses, which would likely increase VMT related to those uses. It is probable that VMT generated by this alternative still would exceed the thresholds identified by land use in Table 4.14-5 in Section 4.13, *Transportation, Circulation, and Mobility*. Specifically, thresholds established for retail and restaurant uses would allow no increase in total planning district VMT. As such, this alternative likely still would result in significant and unavoidable impacts related to VMT.

Similar to the proposed PMPU, final plans for transportation improvement projects would be subject to the review and approval by the applicable city's traffic engineer (for roadway and bicycle facility improvements) and/or the District (for pedestrian facility improvements) to ensure that any improvement would not result in hazardous design features and would provide adequate emergency access. Impacts related to conflicts with plans and policies, hazardous design features, and adequate emergency access would be less than significant, similar to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on transportation, circulation, and mobility. This alternative would reduce VMT compared to the proposed PMPU, but would also result in significant and unavoidable impacts related to transportation, circulation, and mobility, and would be reduced slightly compared to the proposed PMPU.

6.5.1.15 Utilities and Service Systems

Future development under the No Project Alternative would increase demand on utilities throughout the proposed PMPU area. However, the projects listed in the existing PMP would have been taken into consideration by the public utility providers when planning for future demand on water supplies, and wastewater and landfill capacity. Because this demand has been accounted for, this alternative would not require new or expanded facilities to meet this demand. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on utilities and services systems. Based on the above, impacts on utilities would be less than significant and would be reduced compared to the proposed PMPU.

6.5.1.16 Summary of Impacts

The No Project Alternative would reduce impacts related to air quality and health risks, biological resources, cultural resources, geology and soils, GHG emissions, hazards and hazardous materials, hydrology and water quality, noise and vibration, population and housing, public services and recreation, SLR, transportation, circulation, and mobility, and utilities and service systems. The alternative would increase impacts related to scenic vistas, although impacts overall for aesthetics and visual resources would be similar. For land use and planning, impacts would be similar to the proposed PMPU.

6.5.2 Analysis of Alternative 2 – One-Third Reduced Growth Alternative

The One-Third Reduced Growth Alternative involves similar plan components as the proposed PMPU, but at an overall reduced scale. A reduction in the scale and magnitude of the proposed land and water uses is intended to reduce impacts on air quality and health risk, biological resources, GHG emissions, hydrology and water quality, noise, public services, transportation, and utilities. The One-Third Reduced Growth Alternative proposes a reduction in intensity of development by one-third for the following uses throughout the proposed PMPU area:

- **Retail and Restaurants:** This alternative would reduce the proposed PMPU's increased retail/restaurant uses from approximately 340,000 square feet to 227,800 square feet. Convention space would also be reduced from approximately 180,000 additional square feet to approximately 120,000 additional square feet. These reductions would be largely within the Harbor Island Planning District (PD2) and Embarcadero Planning District (PD3).
- **Hotel Rooms:** The One-Third Reduced Growth Alternative would reduce the proposed increase of approximately 3,910 hotel rooms to approximately 2,620 rooms. These reductions would be largely within PD2, with a reduction of approximately 248 rooms in PD3.
- **Recreational Boat Slips:** The One-Third Reduced Growth Alternative would reduce the proposed increase of approximately 485 recreational boat slips to approximately 325 recreational boat slips. These would be largely split between PD2 and PD3, with the majority in PD2, and a small number in the Silver Strand Planning District (PD9) and the Coronado Planning District (PD10).

While reducing the scale of development, this alternative could inversely increase recreation and open space throughout the proposed PMPU area to account for the reduced development intensity. The reductions in scale and intensity would also reduce the scale of the mobility hubs currently proposed in the proposed PMPU.

6.5.2.1 Aesthetics and Visual Resources

The One-Third Reduced Growth Alternative would take place within the same area and planning districts as the proposed PMPU. This alternative would involve less development intensity than the proposed PMPU within all planning districts (but largely within PD2 and PD3), and would primarily involve infill development. Under this alternative, the same baywide development standards would be implemented that establish requirements for protecting scenic vista areas and view-corridor extensions. In addition, this alternative would include both the Baywide and planning/subdistrict-specific standards that establish requirements related to building height, setback and stepbacks in order to protect views and visual character of a site and its surroundings. As such, this alternative would result in less-than-significant impacts on scenic vistas and visual character, similar to the proposed PMPU. However, construction activities could involve the use of equipment that could intrude into and temporarily block scenic vistas or view-corridor extensions (**Impact-AES-1** and **Impact-AES-2**), which would require the implementation of mitigation measures similar to those identified for the proposed PMPU (**MM-AES-1**). Furthermore, like the proposed PMPU, this alternative could also introduce new sources of glare from the introduction of new and taller buildings that use glass curtainwall siding (**Impact-AES-3**). Implementation of mitigation measures that are similar to those identified for the proposed PMPU would be required (**MM-AES-1**, **MM-AES-**

2, and **MM-AES-3**), which would attempt to avoid construction-related impacts on scenic vistas, shield construction activities at construction sites to avoid visual impacts, and establish low-reflectivity standards to reduce glare.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant aesthetic impacts related to glare, but would result in significant and unavoidable impacts related to the potential to interfere with designated scenic vistas or view corridors during construction and the potential to result in substantial degradation of visual character and quality during construction. However, because the One-Third Reduced Growth Alternative would result in less development than the proposed PMPU, there would be fewer changes to the existing aesthetics of the proposed PMPU area and fewer construction activities through the proposed PMPU's lifetime. Therefore, impacts related to aesthetics and visual resources would be reduced compared to the proposed PMPU.

6.5.2.2 Air Quality and Health Risk

This alternative would introduce a greater number of hotel rooms, retail/restaurant space, and recreational boat and commercial fishing slips than would occur under the existing PMP and, like the proposed PMPU, may not have been accounted for in SANDAG's regional growth assumptions. Therefore, similar to the proposed PMPU, this alternative would be inconsistent with the RAQS and SIP (**Impact-AQ-1**), which would be a significant impact prior to the implementation of mitigation. Furthermore, given the potential increased development that could occur under this alternative over the existing conditions, it is possible that construction emissions could exceed thresholds related to ROG and NO_x emissions (**Impact-AQ-2**), and operational impacts could exceed thresholds related to ROG, NO_x, and carbon monoxide (CO) emissions, which would result in similar impacts as the proposed PMPU related to a cumulatively considerable net increase of criteria pollutants for which the region is nonattainment (**Impact-AQ-3**). This impact would remain significant and unavoidable even after the implementation of mitigation (**MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-2** and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-3**). However, because this alternative would result in less development overall, this impact would be reduced compared to the proposed PMPU.

In addition, construction activities under this alternative could increase diesel particulate matter emissions over existing condition levels that could result in cancer or non-cancer health risks to sensitive receptors within and adjacent to the proposed PMPU area (**Impact-AQ-4**). In addition, construction (**Impact-AQ-5**) and operational (**Impact-AQ-6**) activities could also generate criteria pollutant emissions that exceed thresholds. **MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-4**, and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-5** and **Impact-AQ-6** would be implemented. However, because the intensity of development occurring under this alternative would be reduced compared to the proposed PMPU, diesel particulate matter, and criteria pollutant emissions would also be reduced. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable air quality impacts. Overall, because future development under this alternative would be reduced, air quality and health risk impacts occurring under this alternative would be reduced compared to the proposed PMPU, but still would be significant and unavoidable.

6.5.2.3 Biological Resources

The One-Third Reduced Growth Alternative would result in construction and operational activities throughout the proposed PMPU area, which, similar to the proposed PMPU, would have the

potential to adversely affect sensitive habitat or species or other biological resources. Specifically, landside and waterside improvements under this alternative could include activities such as the construction of new landside structures and the installation of recreational boat slips or aquaculture pens, the construction of which would result in construction noise or increased turbidity that could affect terrestrial and marine resources, and various avian species, and/or result in the loss of eelgrass beds. In addition, marine resources could be affected by operation of waterside improvements through increased overwater coverage, the entry of harmful chemicals into waters, alteration of hydrodynamics, or increased recreational vessel activity (**Impact-BIO-1** through **Impact-BIO-15**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts on biological resources with the implementation of mitigation (**MM-BIO-1** through **MM-BIO-11**). This alternative would result in similar impacts and would require similar mitigation measures as those identified for the proposed PMPU and would similarly result in less-than-significant impacts after implementation of mitigation. However, because of the reduced intensity of development, this alternative would result in reduced impacts on biological resources compared to the proposed PMPU.

6.5.2.4 Cultural Resources and Tribal Cultural Resources

The One-Third Reduced Growth Alternative would involve improvements within all planning districts, each of which contain one or more known historical resource and built resources that will reach the 50-year age benchmark for consideration as a potential historical resource under CEQA within the horizon year of the proposed PMPU. For these reasons, construction activities associated with this alternative would have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource (**Impact-CUL-1**). In addition, construction activities associated with implementation of future development under this alternative would involve ground-disturbing activities in areas where known or unknown archaeological resources are present (**Impact-CUL-2**). This alternative would also have the potential to result in significant impacts on tribal cultural resources due to future ground-disturbing activities (**Impact-CUL-3**). These activities could damage or destroy these archaeological resources. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on cultural resources even with the implementation of **MM-CUL-1** for **Impact-CUL-1**, **MM-CUL-2** for **Impact-CUL-2**, and **MM-CUL-2** and **MM-CUL-3** for **Impact-CUL-3**. Implementation of this alternative could result in significant and unavoidable impacts on cultural resources. However, because the amount of development would be reduced under this alternative, impacts would be reduced compared to the proposed PMPU.

6.5.2.5 Geology and Soils

Although the One-Third Reduced Growth Alternative would reduce the total number of hotel rooms, retail/restaurant square footage, convention center square footage, and recreational boat-berthing slips compared to the proposed PMPU, development potentially still would occur within areas mapped with geologic hazards, including ground rupture, liquefaction, strong ground-shaking due to seismic activity, or expansive or unstable soils. In addition, the potential for soil erosion also exists during implementation of this alternative. However, as discussed in Section 4.5, regulations contained within the California Building Code (CBC), the adjacent cities' municipal codes, and the District's Stormwater Management and Discharge Control Ordinance would ensure that any

structures developed under this alternative would identify and mitigate for any geologic hazards existing within, or affecting, any given project site or reduce the potential for soil erosion.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to geology and soils. Impacts related to geology and soils would also be less than significant under this alternative, but because the overall amount of development would be reduced, impacts would be reduced compared to the proposed PMPU.

In addition, as noted in Section 4.5, PD1, PD3, PD8, PD9, and PD10 contain a geologic formation that has high paleontological sensitivity, and fossil localities have been identified in PD4 and PD10. Because this alternative potentially would involve future development in several of these planning districts and could involve excavation that exceeds 10 feet in depth and requires removal of 1,000 cubic yards or more, this alternative has the potential to affect unique paleontological resources or sites adversely (**Impact-GEO-1**) and would require mitigation (**MM-GEO-1**). Impacts to paleontological resources under this alternative would be less than significant with mitigation, but because this alternative would result in less development than the proposed PMPU, impacts would be reduced compared to the proposed PMPU.

6.5.2.6 Greenhouse Gas Emissions and Energy

The One-Third Reduced Growth Alternative would involve all of the various GHG emission sources for both construction and operational activities associated with the proposed PMPU, but under a less-intense development scenario.

As indicated in Table 6-1, implementation of the proposed PMPU would result in one significant and unavoidable GHG impact (**Impact-GHG-1**), with the remaining impact (**Impact-GHG-2**) being reduced to less than significant with the incorporation of mitigation (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, and **MM-TRA-1** through **MM-TRA-3**). Given the magnitude of development that could occur under this alternative, it is still likely that it would result in similar significant and unavoidable impacts related to GHG as the proposed PMPU, including exceeding reduction targets (**Impact-GHG-1**). It should also be noted that under this alternative, the regional demand for hotel rooms would possibly be accommodated in locations that are less VMT-efficient, given the proposed PMPU area's proximity to local and regional transit options, as well as the airport and major visitor-serving attractions and amenities. Visitors staying in the proposed PMPU area would be more likely to walk or use public transit rather than drive from a more distant hotel, which would serve to reduce regional VMT and associated GHG emissions. In addition, many of the vehicle trips related to the hotel rooms proposed under the proposed PMPU would not be new trips to Downtown because they would simply be shifting trips from regional existing hotel rooms to the potential future net new PMPU hotel rooms because these would be located closer to visitors' ultimate destinations. In addition, prior to the implementation of mitigation, future development that could occur under this alternative may not be consistent with the CAP and statewide plans because it would not implement all of the applicable GHG reduction measures (**Impact-GHG-2**). Similar to the proposed PMPU, mitigation measures would be required to ensure that this alternative implements all applicable GHG reduction measures and reduce impacts to less-than-significant levels (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-13**, and **MM-TRA-1** through **MM-TRA-3**). However, because this alternative would result in less growth and an overall reduction in GHG emissions, GHG emission impacts associated with this alternative would be reduced compared to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant energy impacts with mitigation incorporated (**Impact-EN-1** and **Impact-EN-2**). Energy consumption would also increase compared to existing conditions under this alternative and likely would require similar mitigation measures as those identified for the proposed PMPU in Section 4.6 (**MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-AQ-9** through **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2** for **Impact-EN-1**, and **MM-AQ-9** through, **MM-AQ-12**, and **MM-GHG-2** for **Impact-EN-2**) in order to reduce impacts related to the wasteful, inefficient, or unnecessary consumption of energy and consistency with applicable energy-use reduction plans to less-than-significant levels. Overall, because this alternative would result in less development than the proposed PMPU, energy consumption would be less, and impacts would be reduced compared to the proposed PMPU.

6.5.2.7 Hazards and Hazardous Materials

The One-Third Reduced Growth Alternative would involve potential future development throughout the proposed PMPU area, primarily concentrated in PD2 and PD3, and the potential exists to encounter existing known or undocumented contaminated materials (i.e., soil, groundwater, or sediment) or other hazardous materials (e.g., asbestos-containing materials, lead-based paint, polychlorinated biphenyls, organochlorine pesticides) during construction activities, which would be a significant impact that could create a hazard to the public or the environment. It is also possible that future development occurring under this alternative could be located on a site with an active or closed case listed in an environmental database for hazardous materials (**Impact-HAZ-1** through **Impact-HAZ-4**). Mitigation would reduce these impacts to less-than-significant levels (**MM-HAZ-1** and **MM-HAZ-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to hazards and hazardous materials with the implementation of mitigation (**MM-HAZ-1** and **MM-HAZ-2**). Because impacts associated with hazardous materials tend to be localized, and this alternative could result in development at the same locations as those that would occur under the proposed PMPU, potential hazards and hazardous materials impacts resulting from this alternative would be less than significant with mitigation incorporated, but because of the reduced scale of development that would occur under this alternative, impacts would be reduced compared to the proposed PMPU.

6.5.2.8 Hydrology and Water Quality

As described under Section 4.8.3, *Laws, Regulations, Plans, and Policies*, in Section 4.8, *Hydrology and Water Quality*, numerous Federal, State, and local laws, regulations, and programs govern water quality standards or waste discharge requirements and help ensure that surface- or groundwater quality is not degraded as a result of development projects. These laws, regulations, and programs would apply to any future development projects that are consistent with the water and land use designations and policies of this alternative and where these development projects propose actions governed by these laws, regulations, and programs. Potential landside construction activities occurring under this alternative would be required to comply with the San Diego RWQCB regulations for short-term dewatering, as well as the Construction General Permit for sites that would disturb more than 1 acre of land or the District's JRMP for sites that would disturb less than 1 acre of land. Compliance with these regulations would ensure that landside construction activities under this alternative result in less-than-significant impacts. However, this alternative would involve waterside construction activities, as well, including the removal of existing pilings and piers

and construction of new pilings/piers, moorings, or floating docks, which could affect water quality due to disturbance of localized sediments and increased turbidity. Although waterside construction activities would be required to comply with Clean Water Act Sections 401 and 404, there are areas where known contaminated sediments exist, and bottom-disturbing activities may uncover these contaminated sediments. Therefore, this alternative has the potential to result in significant and unavoidable water quality impacts during in-water construction activities.

In addition, operational waterside activities occurring under this alternative, including increased numbers of recreational vessels, would increase the potential for additional vessels using antifoulant copper-based paint for vessel hulls potentially to contribute to existing copper impairments present within PD1, PD2, PD3, PD9, and PD10 and may worsen the existing condition and result in a significant and unavoidable impact (**Impact-WQ-2**). Furthermore, aquaculture could also occur under this alternative, which could result in water quality degradation due to dissolved nitrogen and phosphorus, turbidity, biological oxygen demand, and bacteria (**Impact-WQ-3**). Mitigation would reduce this impact to less than significant (**MM-WQ-9**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on hydrology and water quality. This alternative has a similar potential to result in significant and unavoidable impacts on hydrology and water quality, but because of the reduced scale of development that would occur under this alternative, these impacts would be reduced compared to the proposed PMPU.

6.5.2.9 Land Use and Planning

Future development allowed under the One-Third Reduced Growth Alternative would not extend into areas beyond the proposed PMPU area, nor result in water or land use designations not already proposed in the proposed PMPU. This alternative would not result in new roadway alignments or other infrastructure that physically would divide an established community. In general, future development occurring under this alternative would be similar to that which could occur under the proposed PMPU, but at a less-intense scale. As such, this alternative would not have the potential to divide an established community and would be consistent with plans, policies, and regulations adopted for the purposes of avoiding or mitigating environmental effects. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to land use and planning. Impacts under this alternative would also be less than significant and similar to, but lesser in scale than, the proposed PMPU.

6.5.2.10 Noise and Vibration

Construction activities occurring under this alternative could exceed noise thresholds at sensitive receptors and would result in similar significant impacts related to noise and vibration as the proposed PMPU (**Impact-NOI-1** and **Impact-NOI-2**). In addition, because this alternative involves the same land uses, roadway improvements, and implementation of other amenities (e.g., mobility hubs) as the proposed PMPU, operational impacts associated with increased traffic noise, ambient parking lot noise, or mechanical noise from operation of aquaculture facilities or marine technology uses would occur under this alternative (**Impact-NOI-3** through **Impact-NOI-10**). However, because this alternative would result in less development overall, it also would result in fewer construction activities and less traffic. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts related to noise and impacts under this

alternative; however, while still potentially being significant and unavoidable, these impacts would be reduced compared to the proposed PMPU.

6.5.2.11 Population and Housing

The One-Third Reduced Growth Alternative would have the potential to increase the amount of retail/restaurant square footage, hotel rooms, convention center square footage, and other uses that would result in increased employment throughout the proposed PMPU area compared to existing conditions. As discussed in Section 4.11, *Population and Housing*, employment growth anticipated under the proposed PMPU would be within the growth estimates projected by SANDAG and would not result in substantial unplanned population growth in the region. Because future development occurring under this alternative would be less than that which could occur under the proposed PMPU, this alternative would also result in less employment growth than the proposed PMPU, but would also be within the anticipated employment projections for the region. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to unplanned population growth. Impacts related to substantial unplanned population growth under this alternative would be less than significant and, due to the reduced scale of development that would occur under this alternative, impacts would be reduced slightly compared to the proposed PMPU.

6.5.2.12 Public Services and Recreation

The One-Third Reduced Growth Alternative would result in less future development than the proposed PMPU; however, the increase in hotel rooms and retail/restaurant space, convention space, and recreational boat slips that could occur under this alternative would result in a considerable increase of visitors and employees to the Downtown San Diego area and San Diego Bay. Larger numbers of visitors and employees would also increase demand on public services, including member-city police and fire protection services and HPD resources. However, the HPD indicated that any additional demand for new equipment and personnel due to implementation of the proposed PMPU would not require new or expanded facilities (Nichols pers. comm.; Webber pers. comm.). Therefore, buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for such, the construction of which could cause significant environmental impacts. Impacts would be less than significant. As such, impacts under this alternative would be less than significant and similar to the proposed PMPU.

Although there would be less development under this alternative than for the proposed PMPU, the timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities, other than HPD, are all unknown at this time. Mitigation measures detailed in the proposed PMPU's MMRP would be required where necessary (**MM-PS-1**); however, to effectively implement **MM-PS-1**, a specific location (including surrounding land uses), project timing, and project design specifications for a future expansion or construction of a new police facility must be known. Because these factors are not known at this time, it would be speculative to conclude that impacts would be less than significant, even with implementation of mitigation measure **MM-PS-1**. Moreover, because the police facility may be located outside of the District's jurisdiction, the District would have no authority in this case to require and enforce mitigation measures to lessen any significant impacts. Therefore, similar to the proposed PMPU, and for similar reasons, it is reasonably foreseeable that the future construction of any new or expanded police facilities under this alternative potentially would result in significant and unavoidable

environmental impacts. However, with less development under this alternative, impacts on police facilities would be reduced slightly compared to the proposed PMPU.

In addition, new or expanded park and recreational facilities could be developed under this alternative, which could result in similar impacts related to construction and operation of those parks and recreational facilities, even with implementation of mitigation measures. However, demand for new or expanded parks and recreational facilities would be less than what would occur under the proposed PMPU, and this alternative construction and operation of new or expanded parks and recreational facilities could still occur due to ground-breaking activities or operational impacts related to air and water quality. Implementation of the proposed PMPU would result significant and unavoidable impacts related to parks and recreation. Because this alternative would result in less overall new development of parks and recreational facilities, even though this alternative still would result in significant impacts related to parks and recreational resources, impacts would be reduced slightly compared to the proposed PMPU.

6.5.2.13 Sea Level Rise

The One-Third Reduced Growth Alternative would result in similar water and land use designations being applied throughout the proposed PMPU area, which could result in similar SLR exposure scenarios to those identified Tables 4.13-3 and 4.13-4 in Section 4.13, *Sea Level Rise*. Because this alternative could result in less development than the proposed PMPU, it potentially would result in less development being exposed to SLR. Because SLR is a highly site-specific impact, and flood exposure can vary significantly even within a single parcel, and because the exact location of future development consistent with this alternative is unknown, it is possible that this alternative could result in similar exposure as the proposed PMPU. However, this alternative would include the same policies related to SLR that are proposed in the proposed PMPU. These policies require, among other things, that the District prepare and periodically update an SLR adaptation plan (SR Policy 3.2.3) and that permittees submit site-specific hazards reports to the District that address anticipated coastal hazards over the projected life of the development (SR Policy 3.3.1). Other policies require permittees to site and design development to avoid impacts from coastal hazards from projected SLR, considering the anticipated life of the development, and, if coastal hazards cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Additionally, to reduce the risks posed to neighboring properties and the natural environment from coastal protection devices, policies would require the prioritization of nature-based adaptation strategies, where feasible (SR Policy 3.3.4). If coastal protection devices are used, they must be designed to minimize adverse impacts on local sand supply, recreation, habitat, scenic views, beach width, coastal fill, coastal access, and other Public Trust uses (SR Policy 3.3.10). SLR and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1. Specific design approaches would be reviewed by the District as specific development proposals are submitted for development review. Consistency with these policies would ensure that future development occurring under this alternative would not exacerbate the potential for inundation due to projected SLR or storm surge. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to SLR. Impacts related to this alternative would be less than significant; however, because this alternative would result in less development than the proposed PMPU, SLR impacts under this alternative would be reduced slightly compared to the proposed PMPU.

6.5.2.14 Transportation, Circulation, and Mobility

Under the One-Third Reduced Growth Alternative, traffic related to employees and visitors for retail/restaurant and hotel rooms would be reduced compared to the proposed PMPU, which would reduce overall VMT compared to the proposed PMPU, specifically in PD2 and PD3. However, given that the intensity of development under this alternative is still relatively large, it is possible that potential VMT generated by this alternative still would exceed the thresholds identified by land use in Table 4.14-3 in Section 4.13, *Transportation, Circulation, and Mobility*. Specifically, thresholds established for employment-based uses (e.g., hotels) require these uses to achieve a VMT reduction of 15 percent below the regional average, and retail and restaurant uses would allow no increase in total planning district VMT. As such, this alternative likely still would result in significant and unavoidable impacts related to VMT (**Impact-TRA-1** through **Impact-TRA-4**). However, as discussed above under GHG emissions, it should also be noted that under this alternative, the regional demand for hotel rooms possibly could be accommodated in places that are less VMT-efficient, given the proposed PMPU area's proximity to local and regional transit options, as well as the airport and major visitor-serving attractions and amenities. Visitors staying in the proposed PMPU area would be more likely to walk or use public transit, rather than drive from a more distant hotel, which would serve to reduce regional VMT and associated GHG emissions. In addition, many of the vehicle trips related to the hotel rooms proposed under the proposed PMPU would not be new trips to Downtown because they would simply be shifting trips from existing regional hotel rooms to the potential future net new PMPU hotel rooms, which would be located closer to visitors' ultimate destinations.

Similar to the proposed PMPU, this alternative would include physical improvements to the transportation infrastructure that would seek to increase the accessibility and connectivity of multi-modal infrastructure throughout the tidelands. These changes would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area. Furthermore, similar to the proposed PMPU, final plans for transportation improvement projects would be subject to the review and approval by the applicable city's traffic engineer (for roadway and bicycle facility improvements) or the District (for pedestrian facility improvements) to ensure that any improvement would not result in hazardous design features and would provide adequate emergency access. Impacts related to conflicts with plans and policies, hazardous design features, and adequate emergency access would be less than significant, similar to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on transportation, circulation, and mobility. Future development occurring under this alternative still could result in significant and unavoidable VMT impacts. Overall, however, because this alternative would result in less development and less total VMT, it also would result in slightly reduced transportation, circulation, and mobility impacts compared to the proposed PMPU.

6.5.2.15 Utilities and Service Systems

Future development under the One-Third Reduced Growth Alternative would increase demand on utilities throughout the proposed PMPU area because the remainder of the proposed PMPU potential future development could still occur. However, this demand would be reduced compared to the proposed PMPU, and future development that could occur under this alternative may require new or expanded utilities, the construction of which may result in significant and unavoidable

impacts related to ground-disturbance, even with mitigation (**Impact-UTIL-1**). In addition, given that potential buildout under this alternative could result in up to 2,620 new hotel rooms, as well as additional retail and restaurant space, convention space, and meeting space, all of which would increase demand on water supplies, water supplies may be insufficient to meet the increased demand generated under this alternative, similar to the proposed PMPU (**Impact-UTIL-2**). Also similar to the proposed PMPU, incorporation of this alternative into the next urban water management plan (UWMP) updates, preparation of a water demand analysis, and implementation of water conservation measures would be required for future development occurring under this alternative to ensure that sufficient water supplies exist before a project is approved, and impacts would be less than significant with mitigation (**MM-UTIL-1**, **MM-UTIL-2**, and **MM-UTIL-3**). Similar to the proposed PMPU, and although a regional issue, cumulative construction and operational activities under this alternative could generate solid waste that would exceed capacity at existing landfills (**Impact-C-UTIL-3** and **Impact-C-UTIL-4**). Similarly, site-specific environmental reviews for future development occurring under this alternative also would be required to coordinate the growth projections of this alternative with the Five-Year Review Report update and ensure that sufficient landfill capacity exists prior to project approval (**MM-C-UTIL-1** and **MM-C-UTIL-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on utilities and services systems as a result of utility-related land disturbance and a less-than-significant impact related to insufficient water or solid waste facilities after mitigation. Overall, because demand on utilities would be reduced under this alternative, impacts would also be reduced compared to the proposed PMPU, but still would be significant and unavoidable related to land disturbance.

6.5.2.16 Summary of Impacts

The One-Third Reduced Growth Alternative would reduce impacts related to aesthetics and visual resources, air quality and health risks, biological resources, GHG emissions, hydrology and water quality, noise and vibration, public services and recreation, traffic, circulation, and mobility, and utilities and service systems. Impacts related to land use and planning would be similar to the proposed PMPU.

6.5.3 Analysis of Alternative 3 – One-Half Reduced Growth Alternative

The One-Half Reduced Growth Alternative involves similar plan components as the proposed PMPU, but at an overall reduced scale. A reduction in the scale and magnitude of the proposed land and water uses is intended to reduce impacts on air quality and health risk, biological resources, GHG emissions, hydrology and water quality, noise, public services, transportation, and utilities. The One-Half Reduced Growth proposes a reduction in intensity of development by one-half for the following uses throughout the proposed PMPU area:

- **Retail and Restaurants:** This alternative would reduce the proposed PMPU's increased retail/restaurant uses from approximately 340,000 square feet to 170,000 square feet. Convention space also would be reduced from approximately 180,000 additional square feet to approximately 90,000 additional square feet. These reductions would be largely within the Harbor Island Planning District (PD2), with approximately 41,000 square feet in the Embarcadero Planning District (PD3).

- **Hotel Rooms:** The One-Half Reduced Growth Alternative would reduce the proposed increase of approximately 3,910 hotel rooms to approximately 1,955 rooms. These reductions would be largely within the Harbor Island Planning District (PD2), with a reduction of approximately 425 rooms in the Embarcadero Planning District (PD3).
- **Recreational Boat Slips:** The One-Half Reduced Growth Alternative would reduce the proposed increase of approximately 485 recreational boat slips to approximately 243 recreational boat slips. These would be largely split between the Harbor Island Planning District (PD2) and the Embarcadero Planning District (PD3), with the majority in PD2, and a small number in the Silver Strand Planning District (PD9) and the Coronado Planning District (PD10).

Although it reduces the scale of development, this alternative would increase recreation and open space inversely throughout the proposed PMPU area to account for the reduced development intensity. The reductions in scale and intensity would also reduce the scale of the mobility hubs currently proposed in the proposed PMPU.

6.5.3.1 Aesthetics and Visual Resources

The One-Half Reduced Growth Alternative would take place within the same area and planning districts as the proposed PMPU. This alternative would involve less development intensity than the proposed PMPU within all planning districts (but largely within PD2 and PD3) and would also involve infill development within the planning districts primarily. Under this alternative, the same baywide development standards would be implemented that establish requirements for protecting scenic vista areas and view-corridor extensions. In addition, this alternative would include both the baywide and planning/subdistrict-specific standards that establish requirements related to building height, setback, and stepbacks, in order to protect views and visual character of a site and its surroundings. As such, this alternative would result in less-than-significant impacts on scenic vistas and visual character, similar to the proposed PMPU. However, construction activities could involve the use of equipment that could intrude into and temporarily block scenic vistas or view-corridor extensions or adversely affect visual character (**Impact-AES-1** and **Impact-AES-2**), which would require the implementation of mitigation measures similar to those identified for the proposed PMPU (**MM-AES-1** and **MM-AES-2**). Furthermore, like the proposed PMPU, this alternative could also introduce new sources of glare from the development of new and taller buildings that use glass curtainwall siding (**Impact-AES-3**). Implementation of mitigation measures that are similar to those identified for the proposed PMPU would be required (**MM-AES-3**), establishing low-reflectivity standards to ensure that these glare impacts are reduced to less-than-significant levels.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant aesthetic impacts related to glare, but would result in significant and unavoidable impacts related to the potential to interfere with designated scenic vistas or view corridors during construction and the potential to result in substantial degradation of visual character and quality during construction. However, because the One-Half Reduced Growth Alternative would result in 50 percent less development than the proposed PMPU, there would be fewer changes to the existing aesthetics of the proposed PMPU area and fewer construction activities through the proposed PMPU's lifetime. Therefore, impacts related to aesthetics and visual resources would be reduced compared to the proposed PMPU.

6.5.3.2 Air Quality and Health Risk

This alternative would introduce a greater number of hotel rooms, retail/restaurant space, and recreational boat and commercial fishing slips than would occur under the existing PMP and, like the proposed PMPU, may not have been accounted for in SANDAG's regional growth assumptions. Therefore, similar to the proposed PMPU, this alternative would be inconsistent with the RAQS and SIP, which would be a significant impact prior to the implementation of mitigation (**Impact-AQ-1**). Furthermore, given the potential increased development that could occur under this alternative over the existing condition, it is possible that construction emissions could exceed thresholds related to ROG emissions (**Impact-AQ-2**), but may reduce NO_x emissions under the threshold. Operational impacts could still exceed thresholds related to ROG, NO_x, and CO emissions related to a cumulatively considerable net increase of criteria pollutants for which the region is nonattainment (**Impact-AQ-3**). This impact would remain significant and unavoidable even after the implementation of mitigation (**MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-2** and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-3**). However, because this alternative would result in 50 percent less development overall, this impact would be reduced compared to the proposed PMPU.

In addition, construction activities under this alternative could increase diesel particulate matter emissions over existing condition levels, which could result in cancer or non-cancer health risks to sensitive receptors within and adjacent to the proposed PMPU area (**Impact-AQ-4**). Construction (**Impact-AQ-5**) and operational (**Impact-AQ-6**) activities could also generate criteria pollutant emissions that exceed thresholds (**Impact-AQ-5**). **MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-4** and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-5** and **Impact-AQ-6** would be implemented. However, because the intensity of development occurring under this alternative would be reduced compared to the proposed PMPU, diesel particulate matter, PM₁₀, and PM_{2.5} emissions would also be reduced. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable air quality impacts. Overall, because future development under this alternative would be substantially reduced, air quality and health risk impacts occurring under this alternative would be reduced compared to the proposed PMPU, but would be significant and unavoidable.

6.5.3.3 Biological Resources

The One-Half Reduced Growth Alternative would result in construction and operational activities throughout the proposed PMPU area, which, similar to the proposed PMPU, would have the potential to affect sensitive habitat or species or other biological resources adversely. Specifically, landside and waterside improvements under this alternative would include activities such as the construction of new landside structures and the installation of recreational boat slips or aquaculture pens, the construction of which would result in construction noise or increased turbidity that could affect terrestrial and marine resources and various avian species and result in the loss of eelgrass beds. In addition, marine resources could be affected by operation of waterside improvements through increased overwater coverage, the entry of harmful chemicals into waters, alteration of hydrodynamics, or increased recreational vessel activity (**Impact-BIO-1** through **Impact-BIO-15**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts on biological resources with the implementation of mitigation (**MM-BIO-1** through **MM-BIO-11**). This alternative would result in similar impacts and require similar mitigation measures as those identified for the proposed PMPU and would similarly result in less-than-significant impacts after implementation of mitigation. However, because of the substantially

reduced intensity of development, this alternative would result in reduced impacts on biological resources compared to the proposed PMPU.

6.5.3.4 Cultural Resources and Tribal Cultural Resources

The One-Half Reduced Growth Alternative would involve improvements within all planning districts, each of which contain one more known historical resource and built resources that will reach the 50-year age benchmark for consideration as a potential historical resource under CEQA within the horizon year of the proposed PMPU. For these reasons, construction activities associated with this alternative would have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource (**Impact-CUL-1**). In addition, construction activities associated with implementation of future development under this alternative would involve ground-disturbing activities in areas where known or unknown archaeological resources are present (**Impact-CUL-2**). These activities could damage or destroy these archaeological resources. This alternative would also have the potential to result in significant impacts on tribal cultural resources due to future ground-disturbing activities (**Impact-CUL-3**). As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on cultural resources even with the implementation of **MM-CUL-1** for **Impact-CUL-1**, **MM-CUL-2** for **Impact-CUL-2**, and **MM-CUL-2** and **MM-CUL-3** for **Impact-CUL-3**. Implementation of this alternative could result in significant and unavoidable impacts on cultural resources; however, because this alternative would result in substantially less development than the proposed PMPU, impacts related to cultural resources would be similar, although reduced compared to the proposed PMPU.

6.5.3.5 Geology and Soils

Although the One-Half Reduced Growth Alternative would reduce the total number of hotel rooms, retail/restaurant square footage, convention center square footage, and recreational boat berthing slips compared to the proposed PMPU, development potentially still would occur within areas mapped with geologic hazards, including ground rupture, liquefaction, strong ground-shaking due to seismic activity, or expansive or unstable soils. In addition, the potential for soil erosion during implementation of this alternative also exists. However, as discussed in Section 4.5, regulations contained within the California Building Code (CBC), the adjacent cities' municipal codes, and the District's Stormwater Management and Discharge Control Ordinance would ensure that any structures developed under this alternative would identify and mitigate for any geologic hazards existing within, or affecting, any given project site or reduce the potential for soil erosion.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to geology and soils. These impacts would also be less than significant under this alternative, but because the overall amount of development would be reduced, impacts would be reduced compared to the proposed PMPU.

In addition, as noted in Section 4.5, PD1, PD3, PD8, PD9, and PD10 contain a geologic formation that has high paleontological sensitivity, and fossil localities have been identified in PD4 and PD10. Because this alternative potentially would involve future development in several of these planning districts and could involve excavation that exceeds 10 feet in depth and requires removal of 1,000 cubic yards or more, this alternative has the potential to adversely affect unique paleontological resources or sites (**Impact-GEO-1**) and would require mitigation (**MM-GEO-1**). As indicated in Table 6-1, the proposed PMPU would result in less-than-significant impacts with mitigation. Impacts to paleontological resources under this alternative would be less than significant with mitigation;

however, because this alternative would result in substantially less development than the proposed PMPU, impacts related to geology and soils would be reduced compared to the proposed PMPU.

6.5.3.6 Greenhouse Gas Emissions and Energy

The One-Half Reduced Growth Alternative would involve all of the various GHG emission sources for both construction and operational activities associated with the proposed PMPU, but under a substantially less intense development scenario.

As indicated in Table 6-1, implementation of the proposed PMPU would result in one significant and unavoidable GHG impact (**Impact-GHG-1**), with the remaining impact (**Impact-GHG-2**) reduced to less than significant with the incorporation of mitigation (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-13**, and **MM-TRA-1** through **MM-TRA-3**). Given the substantial reduction in development that would occur under this alternative, which would include associated reductions in construction activities, utility consumption, vehicular traffic, and solid waste generation, with the implementation of mitigation, this alternative could reduce GHG emissions relative to existing conditions and could fall below reduction targets, which would result in less-than-significant impacts related to GHG emissions. However, under this alternative, the regional demand for hotel rooms possibly could be accommodated in areas that are less VMT-efficient, given the proposed PMPU area's proximity to local and regional transit options, as well as the airport and major visitor-serving attractions and amenities. Visitors staying in the proposed PMPU area would be more likely to walk or use public transit, rather than drive from a more distant hotel, which would serve to reduce regional VMT and associated GHG emissions. In addition, many of the vehicle trips related to the proposed PMPU's potential future total hotel rooms would not be new trips to Downtown, because they would simply be shifting trips from other regional existing hotel rooms to the proposed PMPU's potential future total hotel rooms as these would be located closer to visitors' ultimate destinations. In addition, prior to the implementation of mitigation, future development that could occur under this alternative may not be consistent with the CAP and statewide plans because it would not implement all of the applicable GHG reduction measures (**Impact-GHG-2**). Similar to the proposed PMPU, mitigation measures would be required to ensure that this alternative implements all applicable GHG reduction measures and reduces impacts to less-than-significant levels (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-13**, and **MM-TRA-1** through **MM-TRA-3**). However, because this alternative would result in substantially less growth and an overall reduction in GHG emissions, GHG emission impacts associated with this alternative would be reduced compared to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant energy impacts with mitigation incorporated (**Impact-EN-1** and **Impact-EN-2**). Energy consumption would also increase compared to existing conditions under this alternative and would likely require similar mitigation measures as those identified for the proposed PMPU in Section 4.6 (**MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-AQ-9** through **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2** for **Impact-EN-1** and **MM-AQ-9** through **MM-AQ-12** and **MM-GHG-2** for **Impact-EN-2**) in order to reduce impacts related to the wasteful, inefficient, or unnecessary consumption of energy, and ensure consistency with applicable energy use reduction plans, to less-than-significant levels. Overall, because this alternative would result in substantially less development than the proposed PMPU, energy consumption would be less, and impacts would be reduced compared to the proposed PMPU.

6.5.3.7 Hazards and Hazardous Materials

The One-Half Reduced Growth Alternative would involve potential future development throughout the proposed PMPU area, with future development primarily concentrated in PD2 and PD3. Similar to the proposed PMPU, the potential exists to encounter existing known or undocumented contaminated materials (i.e., soil, groundwater, or sediment) or other hazardous materials (e.g., asbestos-containing materials, lead-based paint, polychlorinated biphenyls, organochlorine pesticides) during construction activities, which would be a significant impact that could create a hazard to the public or the environment. It is also possible that future development occurring under this alternative could be located on a site with an active or closed case listed in an environmental database for hazardous materials (**Impact-HAZ-1** through **Impact-HAZ-4**). Mitigation would reduce these impacts to less-than-significant levels (**MM-HAZ-1** and **MM-HAZ-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to hazards and hazardous materials with the implementation of mitigation (**MM-HAZ-1** and **MM-HAZ-2**). Because impacts associated with hazardous materials tend to be localized, and this alternative could result in development at the same locations as those that would occur under the proposed PMPU, potential hazards and hazardous materials impacts resulting from this alternative would be less than significant with mitigation incorporated; however, because this alternative would result in substantially less development than the proposed PMPU, impacts would be reduced compared to the proposed PMPU.

6.5.3.8 Hydrology and Water Quality

As described under Section 4.8.3 in Section 4.8, *Hydrology and Water Quality*, numerous Federal, State, and local laws, regulations, and programs govern water quality standards or waste discharge requirements and help ensure that surface- or groundwater quality is not degraded as a result of development projects. These laws, regulations, and programs would apply to any future development projects that are consistent with the water and land use designations and the policies of this alternative and where these development projects propose actions that are governed by these laws, regulations, and programs. Potential landside construction activities occurring under this alternative would be required to comply with the San Diego RWQCB regulations for short-term dewatering, as well as the Construction General Permit for sites that would disturb more than one acre of land or the District's JRMP for sites that would disturb less than 1 acre of land. Compliance with these regulations would ensure that landside construction activities under this alternative would result in less-than-significant impacts. However, this alternative would involve waterside construction activities, as well, including the removal of existing pilings and piers and construction of new pilings/piers, moorings, or floating docks, which could affect water quality due to disturbance of localized sediments and increased turbidity. Although waterside construction activities would be required to comply with Clean Water Act Sections 401 and 404, there are areas where known contaminated sediments exist, and bottom-disturbing activities may uncover these contaminated sediments; therefore, this alternative has the potential to result in significant and unavoidable impacts to water quality during in-water construction activities.

In addition, operational waterside activities occurring under this alternative, including increased numbers of recreational vessels, would increase the potential for additional vessels using antifoulant copper-based paint for vessel hulls potentially to contribute to existing copper impairments present within PD1, PD2, PD3, PD9, and PD10 and may worsen the existing condition and result in a significant and unavoidable impact (**Impact-WQ-2**). Furthermore, aquaculture could

also occur under this alternative, which could result in water quality degradation due to dissolved nitrogen and phosphorus, turbidity, biological oxygen demand, and bacteria (**Impact-WQ-3**). Mitigation would reduce this impact to less than significant (**MM-WQ-9**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on hydrology and water quality. This alternative has a similar potential to result in significant and unavoidable impacts on hydrology and water quality, but due to the substantially reduced scale of development that would occur under this alternative, these impacts would be reduced compared to the proposed PMPU.

6.5.3.9 Land Use and Planning

Future development allowed under the One-Half Reduced Growth Alternative would not extend into areas beyond the proposed PMPU area, nor result in water or land use designations not already proposed in the proposed PMPU. This alternative would not result in new roadway alignments or other infrastructure that physically would divide an established community. In general, future development occurring under this alternative would be similar to that which could occur under the proposed PMPU, but at a substantially less-intense scale. As such, this alternative would not have the potential to divide an established community and would be consistent with plans, policies, and regulations adopted for the purposes of avoiding or mitigating environmental effects. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to land use and planning. Impacts under this alternative would also be less than significant and similar to the proposed PMPU.

6.5.3.10 Noise and Vibration

Construction activities occurring under this alternative could exceed noise thresholds at sensitive receptors and would result in similar significant impacts related to noise and vibration as the proposed PMPU (**Impact-NOI-1** and **Impact-NOI-2**). In addition, because this alternative involves the same land uses, roadway improvements, and implementation of other amenities, such as mobility hubs, as the proposed PMPU, operational impacts associated with increased traffic noise, ambient parking lot noise, or mechanical noise from operation of aquaculture facilities or Marine Technology uses would occur under this alternative (**Impact-NOI-3** through **Impact-NOI-10**). However, because this alternative would result in substantially less development overall, this alternative would result in fewer construction activities and less traffic. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts related to noise and, therefore, impacts under this alternative, while still potentially being significant and unavoidable, would be reduced compared to the proposed PMPU.

6.5.3.11 Population and Housing

The One-Half Reduced Growth Alternative would have the potential to increase the amount of retail/restaurant square footage, hotel rooms, convention center square footage, and other uses that would result in increased employment throughout the proposed PMPU area compared to existing conditions. As discussed in Section 4.11, *Population and Housing*, employment growth anticipated under the proposed PMPU would be within the growth estimates projected by SANDAG and would not result in substantial unplanned population growth in the region. Because future development occurring under this alternative would be substantially less than that which could occur under the proposed PMPU, this alternative would also result in less employment growth than the proposed

PMPU and would also be within the anticipated employment projections for the region. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to unplanned population growth. Impacts related to substantial unplanned population growth under this alternative would be less than significant and slightly reduced compared to the proposed PMPU.

6.5.3.12 Public Services and Recreation

The One-Half Reduced Growth Alternative would result in substantially less development than the proposed PMPU; however, the increase in hotel rooms and retail/restaurant space, convention space, and recreational boat slips that could occur under this alternative would result in an increase in visitors and employees to the Downtown San Diego area and San Diego Bay. Larger numbers of visitors and employees would increase demand on public services, including member-city police and fire protection services and the HPD. However, the HPD indicated that no new or expanded facilities would be needed as a result of implementation of the proposed PMPU (Nichols pers. comm., Webber pers. comm.). Therefore, buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant. Further, given that this alternative would result in substantially less overall development and, as such, fewer visitors and employees than the proposed PMPU, the demand on public services could likely be met by the existing staff and equipment of the public service providers and likely would not require the construction of new or expansion of existing police and fire facilities. As such, impacts occurring under this alternative would be less than significant and reduced compared to the proposed PMPU.

Although there would be substantially less development under this alternative than for the proposed PMPU, the timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities other than HPD, are all unknown at this time. Mitigation measures detailed in the proposed PMPU's MMRP would be required where necessary (**MM-PS-1**); however, to effectively implement **MM-PS-1**, a specific location (including surrounding land uses), project timing, and project design specifications for a future expansion or construction of a new police facility must be known. Because these factors are not known at this time, it would be speculative to conclude that impacts would be less than significant, even with implementation of mitigation measure **MM-PS-1**. Moreover, because the police facility may be located outside of the District's jurisdiction, the District would have no authority in this case to require and enforce mitigation measures to lessen any significant impacts. Therefore, similar to the proposed PMPU and for similar reasons, it is reasonably foreseeable that the future construction of any new or expanded police facilities under this alternative potentially would result in significant and unavoidable environmental impacts. Because future development under this alternative would be reduced substantially compared to that which would occur under the proposed PMPU, impacts on police facilities would be reduced compared to the proposed PMPU.

In addition, similar to the proposed PMPU, new or expanded parks and recreational facilities could be developed under this alternative, which could result in similar impacts related to construction and operation of those parks and recreational facilities, even with implementation of mitigation measures. However, there would be fewer improvements related to parks and recreational facilities under this alternative compared to the proposed PMPU. As such, impacts occurring under this

alternative would be significant and unavoidable, but slightly reduced as compared to those occurring under the proposed PMPU.

6.5.3.13 Sea Level Rise

The One-Half Reduced Growth Alternative would result in similar water and land use designations being applied throughout the proposed PMPU area, which could result in similar SLR exposure scenarios identified Tables 4.13-3 and 4.13-4 in Section 4.13, *Sea Level Rise*. Because this alternative could result in substantially less development than the proposed PMPU, potentially it would result in less development being exposed to SLR. Because SLR is a highly site-specific impact, even within a single parcel, flood exposure can vary significantly, and the exact location of future development consistent with this alternative is unknown, it is possible that this alternative could result in similar exposure as the proposed PMPU. However, this alternative would include the same policies related to SLR that are outlined in the proposed PMPU. These policies require, among other things, that the District prepare, and periodically update, an SLR adaptation plan (SR Policy 3.2.3) and that permittees submit site-specific hazards reports to the District that address anticipated coastal hazards over the anticipated life of the development (SR Policy 3.3.1). Other policies require permittees to site and design development to avoid impacts from coastal hazards from projected SLR, considering the anticipated life of the development and, if coastal hazards cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Additionally, to reduce the risks posed to neighboring properties and the natural environment from coastal protection devices, policies would require the prioritization of nature-based adaptation strategies, where feasible (SR Policy 3.3.4). If coastal protection devices are used, they must be designed to minimize adverse impacts on local sand supply, recreation, habitat, scenic views, beach width, coastal fill, coastal access, and other Public Trust uses (SR Policy 3.3.10). SLR and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1. Specific design approaches would be reviewed by the District as specific development proposals are submitted for development review. Consistency with these policies would ensure that future development occurring under this alternative would not exacerbate the potential for inundation due to projected SLR or storm surge. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to SLR. SLR impacts related to this alternative would also be less than significant and slightly reduced compared to the proposed PMPU.

6.5.3.14 Transportation, Circulation, and Mobility

Under the One-Half Reduced Growth Alternative, traffic related to employees and visitors for retail/restaurant and hotel rooms would be reduced substantially compared to the proposed PMPU, which would reduce overall VMT compared to the proposed PMPU, specifically in PD2 and PD3. Potential VMT generated by this alternative may still exceed the thresholds identified by land use in Table 4.14-3 in Section 4.14, *Transportation, Circulation, and Mobility*. Specifically, thresholds established for employment-based uses (e.g., hotels) require these uses to achieve a VMT reduction of 15 percent below the regional average, and retail and restaurant uses would allow no increase in total planning district VMT. As such, this alternative likely still would result in significant and unavoidable impacts related to VMT (**Impact-TRA-1** through **Impact-TRA-3**). However, as discussed above under GHG emissions, it should also be noted that under this alternative, the regional demand for hotel rooms would possibly be accommodated in less VMT-efficient areas, given the proposed PMPU area’s proximity to local and regional transit options, as well as the

airport and major visitor-serving attractions and amenities. Visitors staying in the proposed PMPU area would be more likely to walk or use public transit, rather than drive from a more distant hotel, which would serve to reduce regional VMT and associated GHG emissions. In addition, many of the vehicle trips related to the hotel rooms proposed under the proposed PMPU would not be new trips to Downtown because they would simply be shifting trips from existing hotel rooms to the proposed hotel rooms, which would be located closer to visitors' ultimate destinations.

Similar to the proposed PMPU, this alternative would include physical improvements to the transportation infrastructure that seek to increase the accessibility and connectivity of multi-modal infrastructure throughout the tidelands. These changes would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area. Furthermore, similar to the proposed PMPU, final plans for transportation improvement projects would be subject to the review and approval by the applicable city's traffic engineer (for roadway and bicycle facility improvements) or the District (for pedestrian facility improvements) to ensure that any improvement would not result in hazardous design features and provide adequate emergency access. Impacts related to conflicts with plans and policies, hazardous design features, and adequate emergency access would be less than significant, similar to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on transportation, circulation, and mobility. Future development occurring under this alternative still could result in significant and unavoidable VMT impacts. Overall, however, because this alternative would result in substantially less development and less total VMT, it would result in slightly reduced transportation, circulation, and mobility impacts compared to the proposed PMPU.

6.5.3.15 Utilities and Service Systems

Future development under the One-Half Reduced Growth Alternative would increase demand on utilities throughout the proposed PMPU area. Although this demand would be reduced substantially compared to the proposed PMPU, future development that could occur under this alternative may require new or expanded utilities, the construction of which may result in significant and unavoidable impacts related to land-disturbing activities, even with mitigation (**Impact-UTIL-1**). In addition, given that potential buildout under this alternative could result in up to 1,955 new hotel rooms, as well as additional retail and restaurant space, convention space, and meeting space, all of which would increase demand on water supplies, water supplies may be insufficient to meet the increased demand generated under this alternative, similar to the proposed PMPU (**Impact-UTIL-2**). Similar to the proposed PMPU, incorporation of this alternative into the next UWMP updates, preparation of a water demand analysis, and implementation of water conservation measures would be required for future development occurring under this alternative to ensure that sufficient water supplies exist before a project is approved, and impacts would be less than significant with mitigation (**MM-UTIL-1** through **MM-UTIL-3**). Similar to the proposed PMPU, and although a regional issue, cumulative construction and operational activities could generate solid waste that would exceed capacity at existing landfills (**Impact-C-UTIL-3** and **Impact-C-UTIL-4**). Similarly, site-specific environmental reviews for future development occurring under this alternative would also be required to ensure that sufficient landfill capacity exists prior to project approval (**MM-C-UTIL-1** and **MM-C-UTIL-25**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on utilities and services systems as a result of utility-related land disturbance and a less-than-significant impact related to insufficient water and cumulative impacts related to solid waste facilities after mitigation. Overall, because demand on utilities would be reduced substantially under this alternative, impacts also would be reduced compared to the proposed PMPU, but still would be significant and unavoidable related to land disturbance.

6.5.3.16 Summary of Impacts

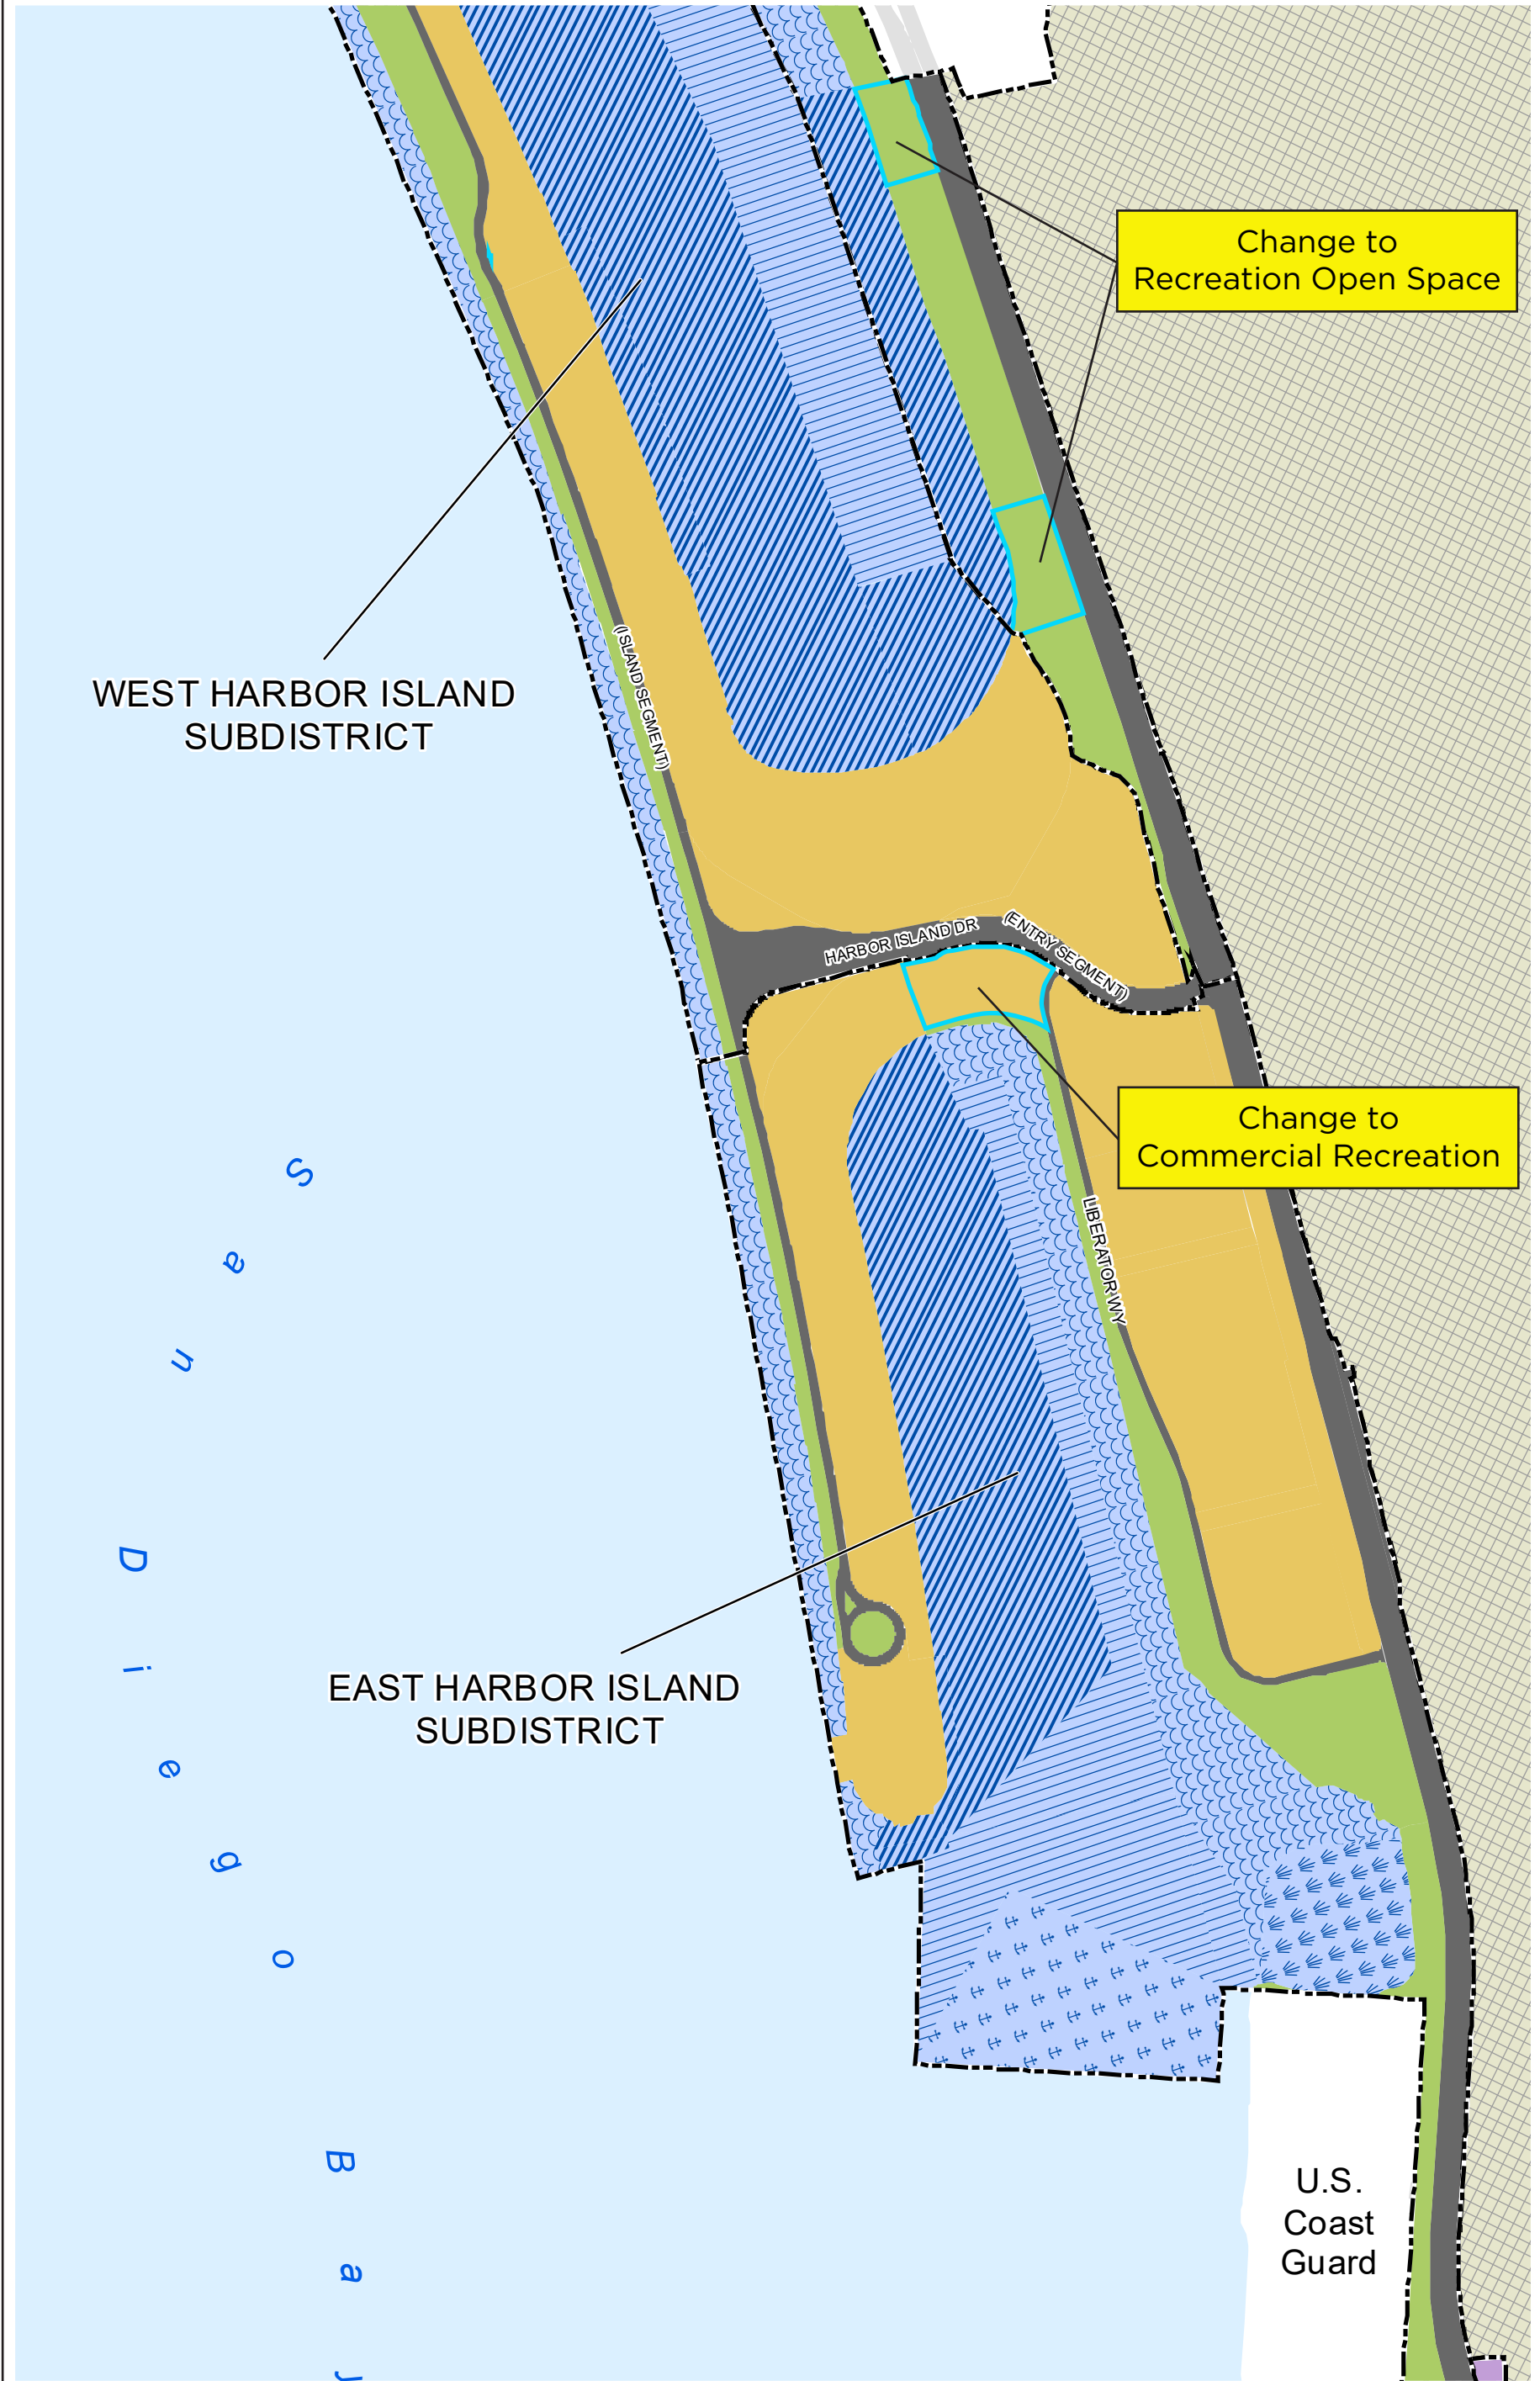

The One-Half Reduced Growth Alternative would substantially reduce impacts related to GHG emissions and public services and recreation. This alternative would reduce impacts related to aesthetics and visual resources, air quality and health risks, biological resources, hydrology and water quality, noise and vibration, traffic, circulation, and mobility, and utilities and service systems.

6.5.4 Analysis of Alternative 4 – Harbor Island Centralized Commercial Recreation Alternative

The Harbor Island Centralized Commercial Recreation Alternative was developed in response to stakeholder input. This alternative is located in the Harbor Island Planning District (PD2) and would include an increase in Recreation Open Space designated land use areas in the Spanish Landing Subdistrict and an increase in Commercial Recreation designated land use areas in the East Harbor Island Subdistrict (see Figure 6-1). Within the Spanish Landing Subdistrict, approximately 2.99 acres of land area proposed as Commercial Recreation in the PMPU instead would be assigned the Recreation Open Space land use designation. Within the East Harbor Island Subdistrict, approximately 2.65 acres of land designated Recreational Open Space instead would be assigned the Commercial Recreation land use designation.

This reallocation of land use designations would allow for the more centralized and contiguous placement of visitor-serving commercial development within the overall planning district, specifically in the East Harbor Island Subdistrict, which potentially would result in lowering total VMT due to proximity to existing and planned visitor-serving commercial development in the surrounding area. Additionally, the reallocation would allow for the preservation of existing park space in the Spanish Landing Subdistrict, which could accommodate the placement of activating features consistent with the Baywide Development Standards and allowances within ROS-designated spaces, as permitted in other subdistricts. This alternative would result in an overall net increase of 0.34 acre of Recreation Open Space areas within the East Harbor Island Planning District and establish continuous shoreline access for the public, while providing additional areas for visitors to recreate and experience the waterfront.

All other proposed water and land use designations and potential development intensities would remain the same as the proposed PMPU under this alternative (see Table 6-2).

This page was intentionally left blank.

6.5.4.1 Aesthetics and Visual Resources

The Harbor Island Centralized Commercial Recreation Alternative would take place within the same area and planning districts as the proposed PMPU. This alternative would involve similar development intensities as the proposed PMPU within the PMPU area. Under this alternative, the same baywide development standards would be implemented that establish requirements for protecting scenic vista areas and view-corridor extensions. In addition, this alternative would include both the baywide and planning/subdistrict-specific standards that establish requirements related to building height, setback, and setbacks, in order to protect views and visual character of a site and its surroundings. As such, this alternative would result in less-than-significant impacts on scenic vistas and visual character, similar to the proposed PMPU. However, construction activities could involve the use of equipment that could intrude into and temporarily block scenic vistas or view-corridor extensions or adversely affect visual character (**Impact-AES-1** and **Impact-AES-2**), which would require the implementation of mitigation measures similar to those identified for the proposed PMPU (**MM-AES-1** and **MM-AES-2**). Furthermore, like the proposed PMPU, this alternative could also introduce new sources of glare from the introduction of new and taller buildings that use glass curtainwall siding (**Impact-AES-3**). Implementation of mitigation measures that are similar to those identified for the proposed PMPU (**MM-AES-3**), which establish low-reflectivity standards to ensure that these glare impacts are reduced to less-than-significant levels, would be required.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant aesthetic impacts related to glare, but would result in significant and unavoidable impacts related to the potential to interfere with designated scenic vistas or view corridors during construction and the potential to result in substantial degradation of visual character and quality during construction. Because this alternative would involve the same overall development intensities as the PMPU, it still would result in a substantial amount of change to the existing aesthetics within the proposed PMPU area. As such, impacts related to aesthetics and visual resources would be similar to the proposed PMPU.

6.5.4.2 Air Quality and Health Risk

This alternative would introduce the same development intensities as the proposed PMPU and, like the proposed PMPU, may not have been accounted for in SANDAG's regional growth assumptions. Therefore, similar to the proposed PMPU, this alternative would be inconsistent with the RAQS and SIP, which would be a significant impact prior to the implementation of mitigation (**Impact-AQ-1**). Furthermore, given the potential increased development that could occur under this alternative over the existing condition, it is possible that construction emissions could exceed thresholds related to ROG and NO_x emissions (**Impact-AQ-2**). Operational impacts could still exceed thresholds related to ROG, NO_x, and CO emissions, which would result in similar impacts as the proposed PMPU related to a cumulatively considerable net increase of criteria pollutants for which the region is in nonattainment (**Impact-AQ-3**). This impact would remain significant and unavoidable, even after the implementation of mitigation (**MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-2** and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-3**). Because this alternative would result in the same overall development intensities, it would be similar compared to the proposed PMPU.

In addition, construction activities under this alternative could increase diesel particulate matter emissions over existing condition levels, which could result in cancer or non-cancer health risks to

sensitive receptors within and adjacent to the proposed PMPU area (**Impact-AQ-4**). Construction (**Impact-AQ-5**) and operational activities could also generate criteria pollutant emissions that exceed thresholds. **MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-4**, and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-5** and **Impact-AQ-6** would be implemented. Because the intensity of development occurring under this alternative would be the same as the proposed PMPU, diesel particulate matter and criteria pollutant emissions would be similar. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable air quality impacts, and air quality and health risk impacts occurring under this alternative still would be significant and unavoidable and would be similar compared to the proposed PMPU.

6.5.4.3 Biological Resources

The Harbor Island Centralized Commercial Recreation Alternative would result in construction and operational activities throughout the proposed PMPU area, which, similar to the proposed PMPU, would have the potential to affect sensitive habitat or species or other biological resources adversely. Specifically, landside and waterside improvements under this alternative would include activities such as the construction of new landside structures and the installation of recreational boat slips or aquaculture pens, the construction of which would result in construction noise or increased turbidity that could affect terrestrial and marine resources and various avian species or result in the loss of eelgrass beds. In addition, marine resources could be affected by operation of waterside improvements through increased overwater coverage, the entry of harmful chemicals into waters, alteration of hydrodynamics, or increased recreational vessel activity (**Impact-BIO-1** through **Impact-BIO-15**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts on biological resources with the implementation of mitigation (**MM-BIO-1** through **MM-BIO-11**). This alternative would result in similar impacts and require similar mitigation measures as those identified for the proposed PMPU and similarly would result in less-than-significant impacts after implementation of mitigation. Because of the similar intensity of development, this alternative would result in similar impacts on biological resources compared to the proposed PMPU.

6.5.4.4 Cultural Resources and Tribal Cultural Resources

The Harbor Island Centralized Commercial Recreation Alternative would involve improvements within all planning districts, each of which contain one more known historical resource and built resources that will reach the 50-year age benchmark for consideration as a potential historical resource under CEQA within the horizon year of the proposed PMPU. For these reasons, construction activities associated with this alternative would have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource (**Impact-CUL-1**). In addition, construction activities associated with implementation of future development under this alternative would involve ground-disturbing activities in areas where known or unknown archaeological resources are present (**Impact-CUL-2**). These activities could damage or destroy these archaeological resources. This alternative would also have the potential to result in significant impacts on tribal cultural resources from future ground-disturbing activities (**Impact-CUL-3**). As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on cultural resources, even with the implementation of **MM-CUL-1** for **Impact-CUL-1**, **MM-CUL-2** for **Impact-CUL-2**, and **MM-CUL-2** and **MM-CUL-3** for **Impact-CUL-3**.

Implementation of this alternative could result in significant and unavoidable impacts on cultural resources. Because this alternative would result in a similar level of overall development to the proposed PMPU, impacts would be similar compared to the proposed PMPU.

6.5.4.5 Geology and Soils

The Harbor Island Centralized Commercial Recreation Alternative would include a similar development scenario as the proposed PMPU, which still would potentially occur within areas mapped with geologic hazards, including ground rupture, liquefaction, strong ground-shaking due to seismic activity, or expansive or unstable soils. In addition, the potential for soil erosion also exists during implementation of this alternative. However, as discussed in Section 4.5, *Geology and Soils*, regulations contained within the CBC, the adjacent cities' municipal codes, and the District's Stormwater Management and Discharge Control Ordinance would ensure that any structures developed under this alternative would identify and mitigate for any geologic hazards existing within, or affecting, any given project site, or reduce the potential for soil erosion. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to geology and soils. Impacts related to geology and soils would be less than significant under this alternative and similar to the proposed PMPU.

In addition, as noted in Section 4.5, PD1, PD3, PD8, PD9, and PD10 contain a geologic formation that has high paleontological sensitivity, and fossil localities have been identified in PD4 and PD10. Because this alternative potentially would involve future development in several of these planning districts and could involve excavation that exceeds 10 feet in depth and requires removal of 1,000 cubic yards or more, this alternative has the potential to adversely affect unique paleontological resources or sites (**Impact-GEO-1**) and would require mitigation (**MM-GEO-1**). Impacts on paleontological resources under this alternative would be less than significant with mitigation and similar compared to the proposed PMPU.

6.5.4.6 Greenhouse Gas Emissions and Energy

The Harbor Island Centralized Commercial Recreation Alternative would involve all of the various GHG emission sources for both construction and operational activities associated with the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in one significant and unavoidable GHG impact (**Impact-GHG-1**), with the remaining impact (**Impact-GHG-2**) reduced to less than significant with the incorporation of mitigation (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-13** and **MM-TRA-1** through **MM-TRA-3**). Given the magnitude of development that could occur under this alternative, it is still likely that this alternative would result in similar significant and unavoidable impacts related to GHG as the proposed PMPU, including exceeding reduction targets (**Impact-GHG-1**). In addition, prior to the implementation of mitigation, future development that could occur under this alternative may not be consistent with the CAP and statewide plans because it would not implement all of the applicable GHG reduction measures (**Impact-GHG-2**). Similar to the proposed PMPU, mitigation measures would be required to ensure that this alternative implements all applicable GHG reduction measures and reduces impacts to less-than-significant levels (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-13**, and **MM-TRA-1** through **MM-TRA-3**). Because this alternative would result a similar level of development compared to the proposed PMPU, GHG impacts also would be similar.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant energy impacts with mitigation incorporated (**Impact-EN-1** and **Impact-EN-2**). Energy consumption would also increase compared to existing conditions under this alternative and likely would require similar mitigation measures as those identified for the proposed PMPU in Section 4.6 (**MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-AQ-9** through **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2** for **Impact-EN-1** and **MM-AQ-9** through **MM-AQ-12**, and **MM-GHG-2** for **Impact-EN-2**), in order to reduce impacts related to the wasteful, inefficient, or unnecessary consumption of energy and consistency with applicable energy use reduction plans to less-than-significant levels. Overall, energy impacts occurring under this alternative would be similar compared to the proposed PMPU, due to the overall similar development intensity that would occur under this alternative.

6.5.4.7 Hazards and Hazardous Materials

The Harbor Island Centralized Commercial Recreation Alternative would involve potential future development throughout the proposed PMPU area, with future development primarily concentrated in PD2 and PD3. Similar to the proposed PMPU, the potential exists to encounter existing known or undocumented contaminated materials (i.e., soil, groundwater, or sediment) or other hazardous materials (e.g., asbestos-containing materials, lead-based paint, polychlorinated biphenyls, organochlorine pesticides) during construction activities, which would be a significant impact that could create a hazard to the public or the environment. It is also possible that future development occurring under this alternative could be located on a site with an active or closed case listed in an environmental database for hazardous materials (**Impact-HAZ-1** through **Impact-HAZ-4**). Mitigation would reduce these impacts to less-than-significant levels (**MM-HAZ-1** and **MM-HAZ-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to hazards and hazardous materials with the implementation of mitigation (**MM-HAZ-1** and **MM-HAZ-2**). Because impacts associated with hazardous materials tend to be localized, and this alternative could result in development at the same locations as those that would occur under the proposed PMPU, potential hazards and hazardous materials impacts resulting from this alternative would be less than significant with mitigation incorporated and, because this alternative would result in similar levels of development as the proposed PMPU, impacts also would be similar compared to the proposed PMPU.

6.5.4.8 Hydrology and Water Quality

As described under Section 4.8.3, in Section 4.8, *Hydrology and Water Quality*, numerous Federal, State, and local laws, regulations, and programs govern water quality standards or waste discharge requirements and help ensure that surface- or groundwater quality is not degraded as a result of development projects. These laws, regulations, and programs would apply to any future development projects that are consistent with the water and land use designations and the policies of this alternative and where these development projects propose actions that are governed by these laws, regulations, and programs. Potential landside construction activities occurring under this alternative would be required to comply with the San Diego RWQCB regulations for short-term dewatering, as well as the Construction General Permit for sites that would disturb more than 1 acre of land or the District's JRMP for sites that would disturb less than 1 acre of land. Compliance with these regulations would ensure that landside construction activities under this alternative result in less-than-significant impacts. However, this alternative would involve waterside construction activities, as well, including the removal of existing pilings and piers and construction of new

pilings/piers, moorings, or floating docks, which could affect water quality due to disturbance of localized sediments and increased turbidity. Although waterside construction activities would be required to comply with Clean Water Act Sections 401 and 404, there are areas where known contaminated sediments exist and bottom-disturbing activities may uncover these contaminated sediments; therefore, this alternative has the potential to result in significant and unavoidable impacts on water quality during in-water construction activities.

In addition, operational waterside activities occurring under this alternative, including increased numbers of recreational vessels, would increase the potential for additional vessels using antifoulant copper-based paint for vessel hulls potentially to contribute to existing copper impairments present within PD1, PD2, PD3, PD9, and PD10 and may worsen the existing condition and result in a significant and unavoidable impact (**Impact-WQ-2**). Furthermore, aquaculture could also occur under this alternative, which could result in water quality degradation due to dissolved nitrogen and phosphorus, turbidity, biological oxygen demand, and bacteria (**Impact-WQ-3**). Mitigation would reduce this impact to less than significant (**MM-WQ-9**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on hydrology and water quality. The Harbor Island Centralized Commercial Recreation Alternative has the potential to result in significant impacts, including a significant and unavoidable impact related to copper impairments due to increased recreational boating, which would result in similar impacts compared to the proposed PMPU.

6.5.4.9 Land Use and Planning

Future development allowed under the Harbor Island Centralized Commercial Recreation Alternative would not extend into areas beyond the proposed PMPU area, nor result in water or land use designations not already proposed in the proposed PMPU. This alternative would not result in new roadway alignments or other infrastructure that physically would divide an established community. In general, future development occurring under this alternative would be similar to that which could occur under the proposed PMPU. As such, this alternative would not have the potential to divide an established community and would be consistent with plans, policies, and regulations adopted for the purposes of avoiding or mitigating environmental effects. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to land use and planning. Impacts under this alternative would also be less than significant and similar compared to the proposed PMPU.

6.5.4.10 Noise and Vibration

Construction activities occurring under this alternative could exceed noise thresholds at sensitive receptors and would result in similar significant impacts related to noise and vibration as would occur under the proposed PMPU (**Impact-NOI-1** and **Impact-NOI-2**). In addition, because this alternative involves the same land uses, roadway improvements, and implementation of other amenities, such as mobility hubs, as the proposed PMPU, operational impacts associated with increased traffic noise, ambient parking lot noise, or mechanical noise from operation of aquaculture facilities or marine technology uses would occur under this alternative (**Impact-NOI-3** through **Impact-NOI-10**). As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts related to noise and vibration, and impacts under this alternative potentially still would be significant and unavoidable. Because this alternative would

result in similar development intensities as the proposed PMPU, impacts would be similar to the proposed PMPU.

6.5.4.11 Population and Housing

The Harbor Island Centralized Commercial Recreation Alternative would have the potential to increase the amount of retail/restaurant square footage, hotel rooms, convention center square footage, and other uses that would result in increased employment throughout the proposed PMPU area compared to existing conditions. As discussed in Section 4.11, *Population and Housing*, employment growth anticipated under the proposed PMPU would be within the growth estimates projected by SANDAG and would not result in substantial unplanned population growth in the region. Because future retail and restaurant development occurring under this alternative would be similar to the proposed PMPU, this alternative would result in similar employment growth as the proposed PMPU, which would be within the anticipated employment projections for the region. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to unplanned population growth. Impacts related to substantial unplanned population growth under this alternative also would be less than significant. Because this alternative would result in a similar amount of development as the proposed PMPU, impacts would be similar compared to the proposed PMPU.

6.5.4.12 Public Services and Recreation

The Harbor Island Centralized Commercial Recreation Alternative would increase in hotel rooms and retail/restaurant space, convention space, and recreational boat slips, which would result in an increase in visitors and employees to the Downtown San Diego area and San Diego Bay. Increased numbers of visitors and employees would increase demand on public services, including member-city police and fire protection services and the HPD. However, the HPD indicated that no new or expanded facilities would be needed as a result of implementation of the proposed PMPU (Nichols pers. comm.; Webber pers. comm.). Therefore, buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant. Because this alternative would result in similar development intensities as the proposed PMPU, impacts would also be less than significant and similar to the proposed PMPU.

In addition, the timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities other than HPD, are all unknown at this time. Mitigation measures detailed in the proposed PMPU's MMRP would be required where necessary (**MM-PS-1**); however, to effectively implement **MM-PS-1**, a specific location (including surrounding land uses), project timing, and project design specifications for a future expansion or construction of a new police facility must be known. Because these factors are not known at this time, it would be speculative to conclude that impacts would be less than significant, even with implementation of mitigation measure **MM-PS-1**. Moreover, because the police facility may be located outside of the District's jurisdiction, the District would have no authority in this case to require and enforce mitigation measures to lessen any significant impacts. Therefore, similar to the proposed PMPU and for similar reasons, it is reasonably foreseeable that the future construction of any new or expanded police facilities under this alternative potentially would result in significant

and unavoidable environmental impacts. However, with less future development under this alternative, impacts on police facilities would be reduced slightly compared to the proposed PMPU.

This alternative would slightly increase the amount of recreation open space land available within PD2 and allow for greater preservation of this use within the Spanish Landing Subdistrict, which would be a beneficial impact. However, as with the proposed PMPU, the development of new or expanded parks and recreational facilities under this alternative could result in similar impacts related to construction and operation of those parks and recreational facilities, even with implementation of mitigation measures. As such, impacts occurring under this alternative would be significant and unavoidable and similar compared to those occurring under the proposed PMPU.

6.5.4.13 Sea Level Rise

The Harbor Island Centralized Commercial Recreation Alternative would result in similar water and land use designations being applied throughout the proposed PMPU area, which could result in similar SLR exposure scenarios identified Tables 4.13-3 and 4.13-4 in Section 4.13, *Sea Level Rise*. Because SLR is a highly site-specific impact, even within a single parcel, flood exposure can vary significantly, and the exact location of future development consistent with this alternative is unknown, it is possible that this alternative could result in similar exposure as the proposed PMPU. However, this alternative would include the same policies related to SLR that are proposed in the proposed PMPU. These policies require, among other things, that the District prepare, and periodically update, a SLR adaptation plan (SR Policy 3.2.3) and that permittees submit site-specific hazards reports to the District that address anticipated coastal hazards over the anticipated life of the development (SR Policy 3.3.1). Other policies require permittees to site and design development to avoid impacts from coastal hazards from projected SLR, considering the anticipated life of the development, and, if coastal hazards cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Additionally, to reduce the risks posed to neighboring properties and the natural environment from coastal protection devices, policies would require the prioritization of nature-based adaptation strategies, where feasible (SR Policy 3.3.4). If coastal protection devices are used, they must be designed to minimize adverse impacts on local sand supply, recreation, habitat, scenic views, beach width, coastal fill, coastal access, and other Public Trust uses (SR Policy 3.3.10). SLR and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1. Specific design approaches would be reviewed by the District as specific development proposals are submitted for development review. Consistency with these policies would ensure that future development occurring under this alternative would not exacerbate the potential for inundation due to projected SLR or storm surge. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to SLR. SLR impacts related to this alternative would also be less than significant; however, because this alternative would result in less overall development than the proposed PMPU, impacts would be similar, although reduced, compared to the proposed PMPU.

6.5.4.14 Transportation, Circulation, and Mobility

Under the Harbor Island Centralized Commercial Recreation Alternative, traffic related to employees and visitors would be similar compared to the proposed PMPU, and the potential VMT generated by this alternative would similarly exceed the thresholds identified by land use in Table 4.14-3 in Section 4.13, *Transportation, Circulation, and Mobility*. Specifically, thresholds established

for retail and restaurant uses would allow no increase in total planning district VMT. As such, this alternative would still result in significant and unavoidable impacts related to VMT because it still would generate an increase in total VMT, and all other significant VMT-related impacts identified for the proposed PMPU still would occur under this alternative (**Impact-TRA-1** through **Impact-TRA-3**). However, as compared to the proposed PMPU, the relocation of visitor-serving commercial designation from Spanish Landing to more a centralized and contiguous placement within the East Harbor Island Subdistrict potentially would result in lowering total VMT due to proximity to existing and planned visitor-serving commercial development in the East Harbor Island subdistrict. So although VMT thresholds still would be exceeded under this alternative, the relocation of visitor-serving commercial from a more isolated area on Spanish Landing to a more centralized location in East Harbor Island likely would result in a slightly lower VMT overall.

Similar to the proposed PMPU, this alternative would include physical improvements to the transportation infrastructure, which seek to increase the accessibility and connectivity of multi-modal infrastructure throughout the tidelands. These changes would be consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area. Furthermore, similar to the proposed PMPU, final plans for transportation improvement projects would be subject to the review and approval by the applicable city's traffic engineer (for roadway and bicycle facility improvements) or the District (for pedestrian facility improvements) to ensure that any improvement would not result in hazardous design features and provide adequate emergency access. Impacts related to conflicts with plans and policies, hazardous design features, and adequate emergency access would be less than significant, similar to the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on transportation, circulation, and mobility. Future development occurring under this alternative still would result in significant and unavoidable VMT impacts, although total VMT related to PD2 likely would be slightly lower under this alternative than the proposed PMPU. Overall, this alternative would result in slightly reduced transportation, circulation, and mobility impacts compared to the proposed PMPU.

6.5.4.15 Utilities and Service Systems

Future development under the Harbor Island Centralized Commercial Recreation Alternative would increase demand on utilities throughout the proposed PMPU area, and because the remainder of the proposed PMPU potential future development could still occur, and this alternative could result in a similar level of development, this demand would be similar to the proposed PMPU. Future development that could occur under this alternative may require new or expanded utilities, the construction of which may result in significant and unavoidable impacts related to ground-disturbance, even with mitigation (**Impact-UTIL-1**). In addition, given that potential buildout under this alternative could result in up to 3,910 new hotel rooms, a use that tends to consume a substantial amount of water, water supplies may be insufficient to meet the increased demand generated under this alternative, similar to the proposed PMPU (**Impact-UTIL-2**). Similar to the proposed PMPU, incorporation of this alternative into the next UWMP updates, preparation of a water demand analysis, and implementation of water conservation measures would be required for future development occurring under this alternative to ensure that sufficient water supplies exist before a project is approved, and impacts would be less than significant with mitigation (**MM-UTIL-1** through **MM-UTIL-3**). Similar to the proposed PMPU, cumulative construction and

operational activities could generate solid waste that would exceed capacity at existing landfills (**Impact-C-UTIL-3** and **Impact-C-UTIL-4**). Similarly, site-specific environmental reviews for future development occurring under this alternative also would be required to ensure that sufficient landfill capacity exists prior to project approval (**MM-C-UTIL-1** and **MM-C-UTIL-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on utilities and services systems as a result of utility-related land disturbance and a less-than-significant impact related to insufficient water, wastewater, or solid waste facilities after mitigation. Because this alternative would result in similar demand on water, wastewater, and solid waste facilities compared to PMPU, utility impacts occurring under this alternative still would be significant and unavoidable related to land disturbance and less than significant associated with demand for water and cumulative impacts related to solid waste facilities, and therefore would be similar compared to the proposed PMPU.

6.5.4.16 Summary of Impacts

Because buildout projections under the Harbor Island Centralized Commercial Recreation Alternative would involve the same development intensities, this alternative would result in similar impacts for all resources compared to the PMPU. However, by moving a portion of the visitor-serving commercial recreation land use designation to East Harbor Island subdistrict, where there is a greater density of similar land uses, VMT would likely be reduced by a small amount. Therefore, impacts on transportation, circulation, and mobility under this alternative would be reduced slightly compared to the proposed PMPU.

6.5.5 Analysis of Alternative 5 – Recreation Open Space Alternative

The Recreation Open Space Alternative was developed in response to stakeholder input. This alternative is located in the Embarcadero Planning District (PD3) and would include the closure to vehicular traffic of North Harbor Drive between Ash Street and Grape Street (i.e., directly adjacent and to the west of the County Administration Center); however, shuttle and emergency access, along with commercial loading access for visitor-serving uses situated along this portion of the Embarcadero, still would be allowed (see Figure 6-2). Vehicular traffic that currently utilizes this segment of North Harbor Drive would be rerouted to Pacific Highway. The closed segment of North Harbor Drive would be converted from Institutional/Roadway to Recreation Open Space and would slightly increase the total acreage of Recreation Open Space in the planning district (approximately 2 acres). The closure of this segment of North Harbor Drive would allow for the establishment of a “festival street,” providing contiguous park space from the County waterfront park on the east to the Embarcadero on the west. Types of activities that could occur under this alternative would be consistent with other Recreation Open Space areas within the tidelands, including, but not limited to, 5K runs/walks, parades, and film, food, and music festivals. All other proposed water and land use designations and potential development intensities would remain the same as the proposed PMPU under this alternative (see Table 6-2).

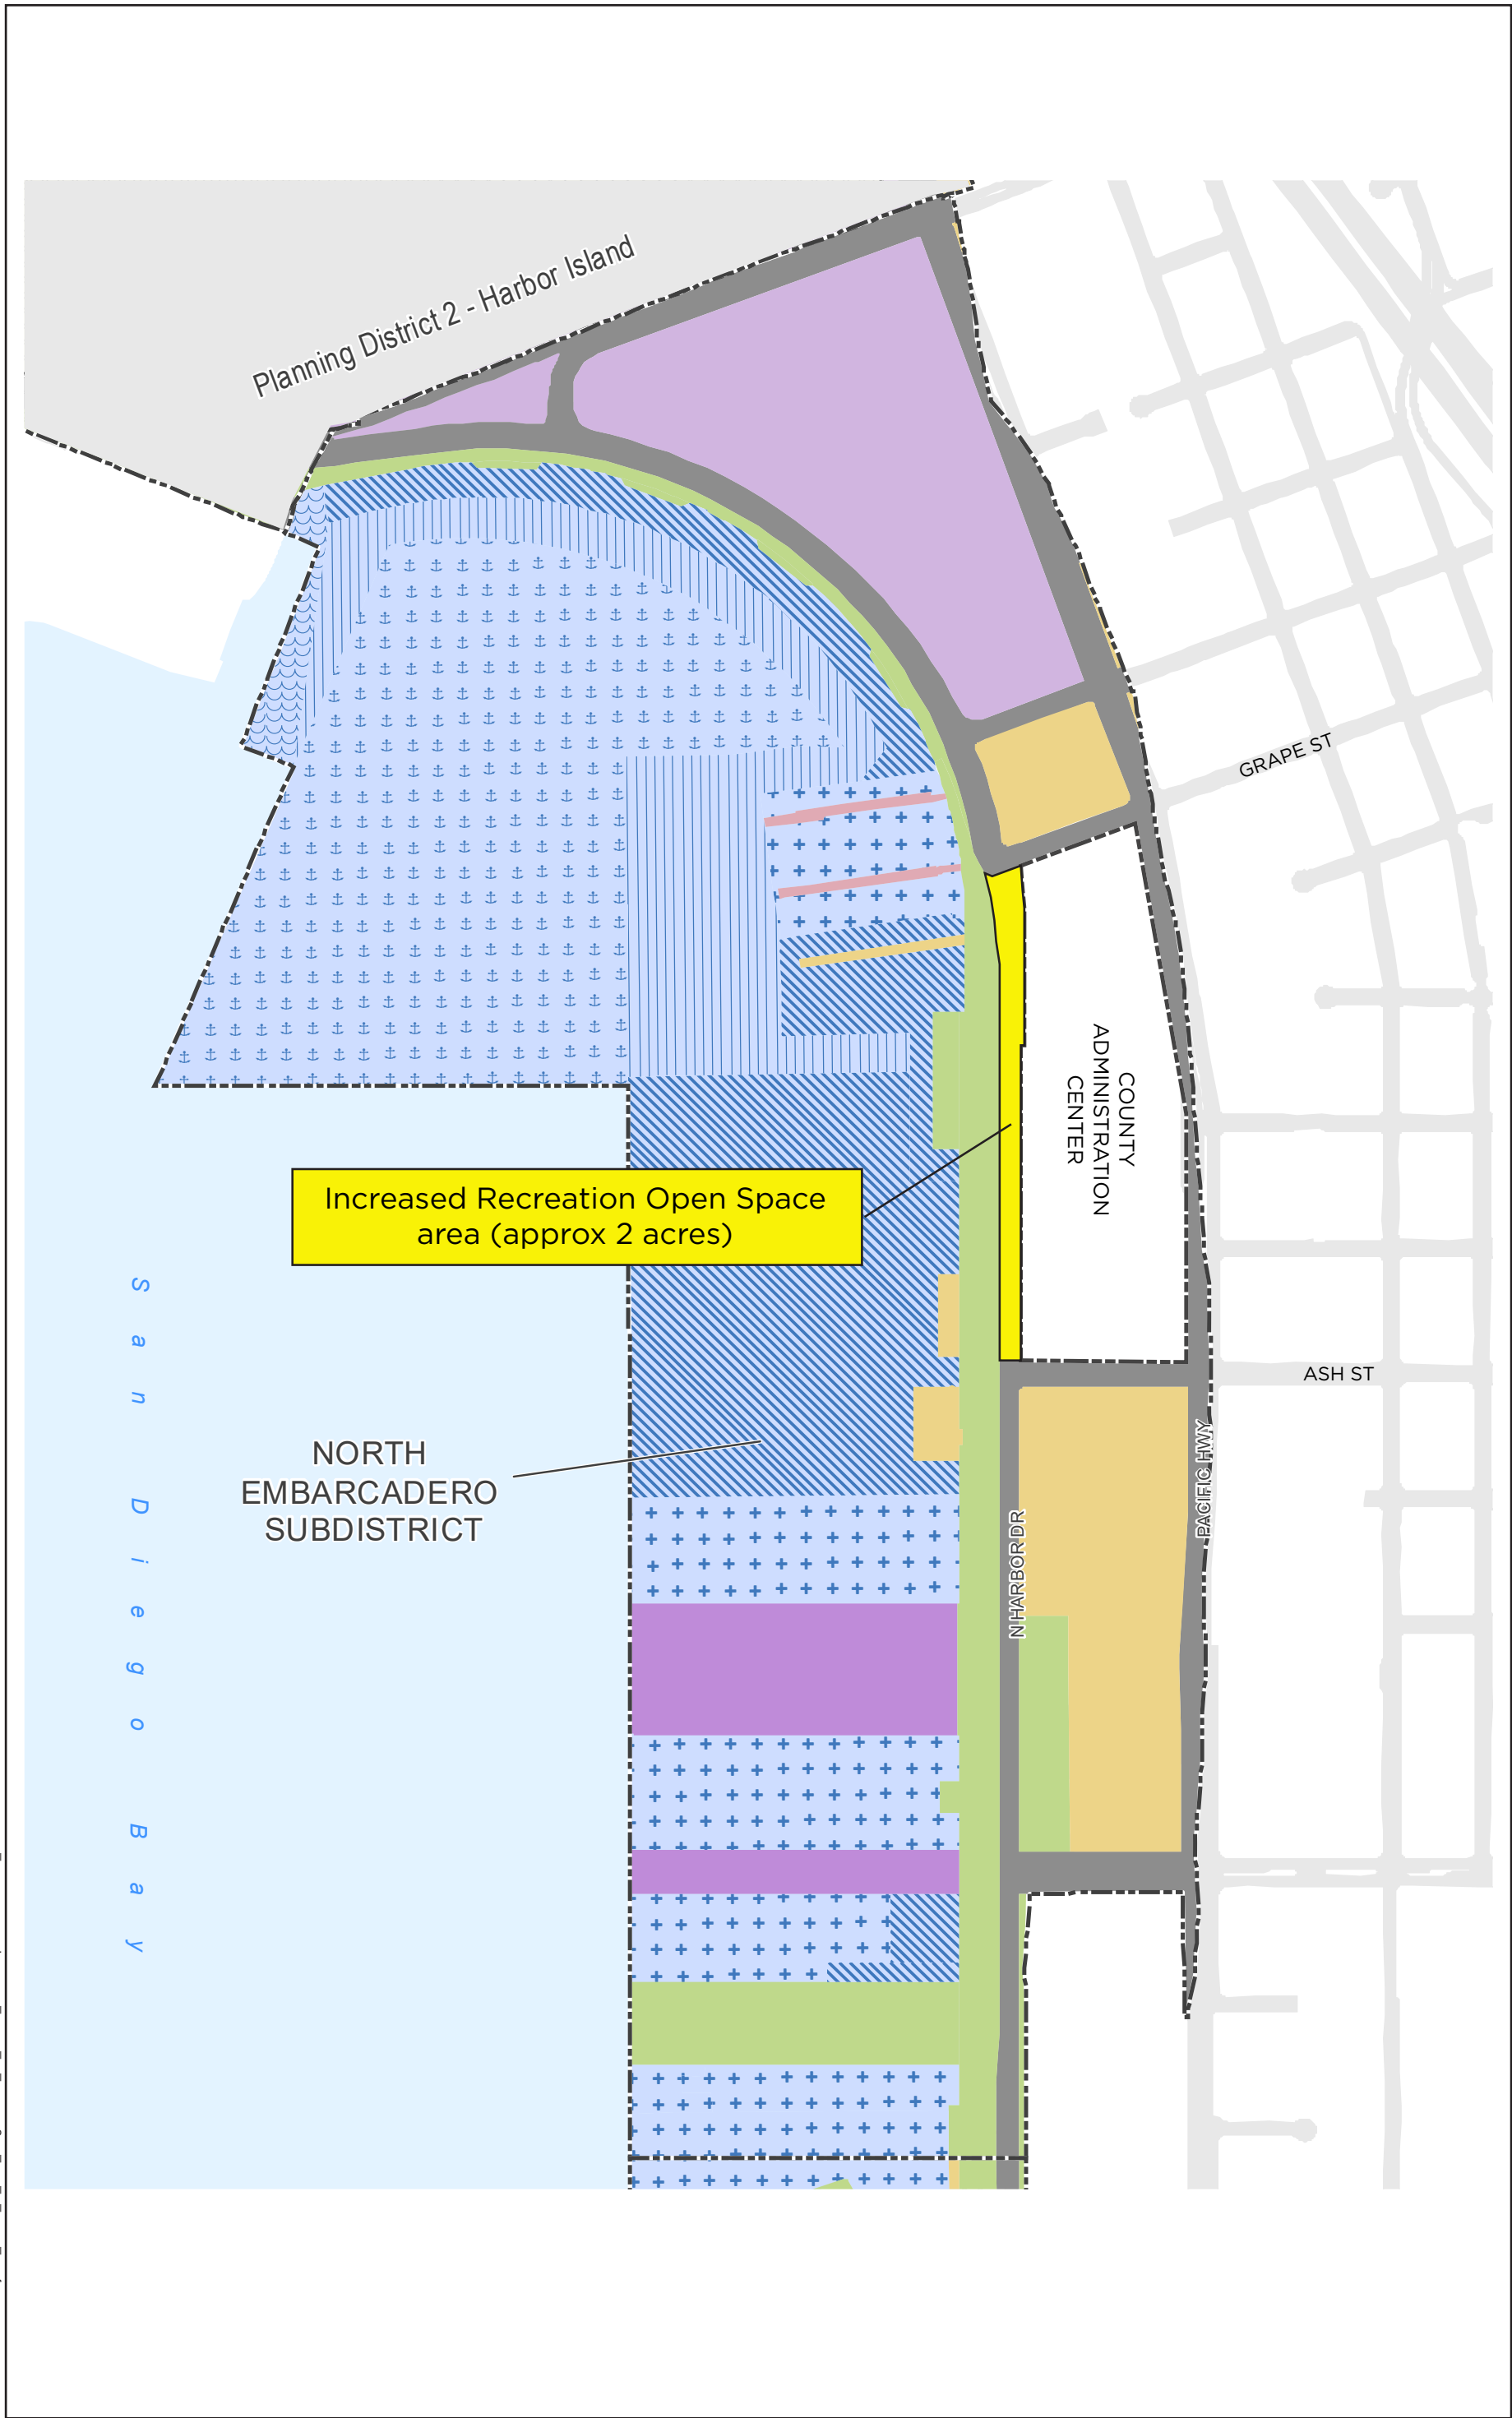

Figure 6-2
Recreation Open Space Alternative
Port Master Plan Update

This page was intentionally left blank.

6.5.5.1 Aesthetics and Visual Resources

The Recreation Open Space Alternative would take place within the same area and planning districts as the proposed PMPU and involve the same level of overall development as would occur under the proposed PMPU, but would involve the closure of North Harbor Drive between Ash Street and Grape Street to allow for the establishment of a festival street that provides contiguous park space from the County waterfront park on the east to the Embarcadero on the west. Under this alternative, the same baywide development standards would be implemented that establish requirements for protecting scenic vista areas and view-corridor extensions. In addition, this alternative would include both the baywide and planning/subdistrict-specific standards that establish requirements related to building height, setback, and stepbacks in order to protect views and visual character of a site and its surroundings. As such, this alternative would result in less-than-significant impacts on scenic vistas and visual character, similar to the proposed PMPU. In addition, construction activities could involve the use of equipment that could intrude into and temporarily block scenic vistas or view-corridor extensions (**Impact-AES-1** and **Impact-AES-2**), which would require the implementation of mitigation measures similar to those identified for the proposed PMPU (**MM-AES-1** and **MM-AES-2**). Furthermore, like the proposed PMPU, this alternative also could introduce new sources of glare from the introduction of new and taller buildings that use glass curtainwall siding (**Impact-AES-3**). Implementation of mitigation measures that are similar to those identified for the proposed PMPU (**MM-AES-3**), which establish low-reflectivity standards to ensure that these glare impacts are reduced to less-than-significant levels, would be required.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant aesthetic impacts related to glare, but would result in significant and unavoidable impacts related to the potential to interfere with designated scenic vistas or view corridors during construction and the potential to result in substantial degradation of visual character and quality during construction. Because the Recreation Open Space Alternative would result in the same amount of development as the proposed PMPU, this alternative would result in a similar potential to affect scenic vistas and view corridors adversely during construction activities and has a similar potential to introduce new sources of glare within the proposed PMPU area. Therefore, overall, impacts related to aesthetics and visual resources would be similar compared to the proposed PMPU.

6.5.5.2 Air Quality and Health Risk

This alternative would introduce a greater number of hotel rooms, retail/restaurant space, and recreational boat and commercial fishing slips than would occur under the existing PMP and, like the proposed PMPU, may not have been accounted for in SANDAG's regional growth assumptions. Therefore, similar to the proposed PMPU, this alternative would be inconsistent with the RAQS and SIP, which would be a significant impact prior to the implementation of mitigation (**Impact-AQ-1**). Furthermore, given the potential increased development that could occur under this alternative over the existing conditions, it is possible that construction emissions could exceed thresholds related to ROG and NO_x emissions (**Impact-AQ-2**). Operational impacts still could exceed thresholds related to ROG, NO_x, and CO emissions, which would result in similar impacts as the proposed PMPU related to a cumulatively considerable net increase of criteria pollutants for which the region is in nonattainment (**Impact-AQ-3**). This impact would remain significant and unavoidable even after the implementation of mitigation (**MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-2** and **MM-AQ-9**

through **MM-AQ-12** for **Impact-AQ-3**). However, because this alternative would result in similar development, this impact would be similar to the proposed PMPU.

In addition, construction activities under this alternative could increase diesel particulate matter emissions over existing condition levels, which could result in cancer or non-cancer health risks to sensitive receptors within and adjacent to the proposed PMPU area (**Impact-AQ-4**). Construction (**Impact-AQ-5**) and operational (**Impact-AQ-6**) activities could also generate criteria pollutant emissions that exceed thresholds. **MM-AQ-2** through **MM-AQ-8** for **Impact-AQ-4** and **MM-AQ-9** through **MM-AQ-12** for **Impact-AQ-5** and **Impact-AQ-6** would be implemented. However, because the intensity of development occurring under this alternative would be reduced compared to the proposed PMPU, diesel particulate matter and criteria pollutant emissions would also be reduced. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable air quality impacts. Overall, because this alternative would result in the same amount of future development as the proposed PMPU and would result in the same amount of traffic and other pollutant generators, air quality and health risk impacts occurring under this alternative would be similar compared to the proposed PMPU and would be significant and unavoidable.

6.5.5.3 Biological Resources

The Recreation Open Space Alternative would result in construction and operational activities throughout the proposed PMPU area, which, similar to the proposed PMPU, would have the potential to affect sensitive habitat or species or other biological resources adversely. Specifically, waterside improvements under this alternative would include activities such as the installation of recreational boat slips or aquaculture pens, the construction of which would result in construction noise or increased turbidity that could affect marine resources or various avian species or result in the loss of eelgrass beds. In addition, marine resources could be affected by operation of waterside improvements through overwater coverage, the entry of harmful chemicals into waters, alteration of hydrodynamics, or increased vessel activity (**Impact-BIO-1** through **Impact-BIO-15**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts on biological resources with the implementation of mitigation (**MM-BIO-1** through **MM-BIO-11**). This alternative would result in similar less-than-significant impacts and require similar mitigation measures as those identified for the proposed PMPU. This alternative would result in similar impacts on biological resources compared to the proposed PMPU.

6.5.5.4 Cultural Resources and Tribal Cultural Resources

The Recreation Open Space Alternative would involve improvements within all planning districts throughout the proposed PMPU area, which contain one more known historical resource and built resources that will reach the 50-year age benchmark for consideration as a potential historical resource under CEQA within the horizon year of the proposed PMPU. For these reasons, construction activities associated with this alternative would have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource (**Impact-CUL-1**). In addition, construction activities associated with implementation of future development under this alternative would involve ground-disturbing activities in areas where known or unknown archaeological resources are present (**Impact-CUL-2**). These activities could damage or destroy these archaeological resources. This alternative would also have the potential to result in significant impacts on tribal cultural resources due to future ground-disturbing activities (**Impact-CUL-3**). As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and

unavoidable impacts on cultural resources, even with the implementation of **MM-CUL-1** for **Impact-CUL-1**, **MM-CUL-2** for **Impact-CUL-2**, and **MM-CUL-2** and **MM-CUL-3** for **Impact-CUL-3**.

Implementation of this alternative could result in significant and unavoidable impacts on cultural resources, and impacts would be similar to the proposed PMPU.

6.5.5.5 Geology and Soils

The Recreation Open Space Alternative would include a similar development scenario as the proposed PMPU, which still potentially would occur within areas mapped with geologic hazards, including ground rupture, liquefaction, strong ground-shaking due to seismic activity, or expansive or unstable soils. In addition, the potential for soil erosion also exists during implementation of this alternative. However, as discussed in Section 4.5, *Geology and Soils*, regulations contained within the CBC, the adjacent cities' municipal codes, and the District's Stormwater Management and Discharge Control Ordinance would ensure that any structures developed under this alternative would identify and mitigate for any geologic hazards existing within, or affecting, any given project site or reduce the potential for soil erosion. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to geology and soils. Impacts related to geology and soils would be less than significant under this alternative, and impacts would be similar to the proposed PMPU.

In addition, as noted in Section 4.5, PD1, PD3, PD8, PD9, and PD10 contain a geologic formation that has high paleontological sensitivity, and fossil localities have been identified in PD4 and PD10. Because this alternative potentially would involve future development in several of these planning districts and could involve excavation that exceeds 10 feet in depth and requires removal of 1,000 cubic yards or more, this alternative has the potential to affect unique paleontological resources or sites (**Impact-GEO-1**) adversely and would require mitigation (**MM-GEO-1**). Impacts on paleontological resources under this alternative would be less than significant with mitigation, and impacts would be similar to the proposed PMPU.

6.5.5.6 Greenhouse Gas Emissions

The Recreation Open Space Alternative could result in the same level of development that could occur under the proposed PMPU and would involve all of the various GHG emission sources for both construction and operational activities associated with the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in one significant and unavoidable GHG impact (**Impact-GHG-1**), with the remaining impact (**Impact-GHG-2**) being reduced to less than significant with the incorporation of mitigation (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-12**, and **MM-TRA-1** through **MM-TRA-3**). Given the magnitude of development that could occur under this alternative, this alternative would result in similar significant and unavoidable impacts related to GHG emissions as the proposed PMPU, including exceeding reduction targets (**Impact-GHG-1**). In addition, prior to the implementation of mitigation, future development that could occur under this alternative may not be consistent with the CAP and statewide plans because it would not implement all of the applicable GHG reduction measures (**Impact-GHG-2**). Similar to the proposed PMPU, mitigation measures would be required to ensure that this alternative implements all applicable GHG reduction measures and reduces impacts to less-than-significant levels (**MM-GHG-1**, **MM-GHG-2**, **MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6** through **MM-AQ-13**, and **MM-TRA-1** through **MM-TRA-3**). As such, this alternative would result in similar GHG impacts as the proposed PMPU.

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant energy impacts with mitigation incorporated (**Impact-EN-1** and **Impact-EN-2**). Energy consumption would also increase compared to existing conditions under this alternative and likely would require similar mitigation measures as those identified for the proposed PMPU in Section 4.6 (**MM-AQ-2**, **MM-AQ-3**, **MM-AQ-6**, and **MM-AQ-9** through **MM-AQ-12**, **MM-GHG-1**, and **MM-GHG-2** for **Impact-EN-1** and **MM-AQ-9** through **MM-AQ-12**, and **MM-GHG-2** for **Impact-EN-2**), in order to reduce impacts related to the wasteful, inefficient, or unnecessary consumption of energy and consistency with applicable energy use reduction plans to less-than-significant levels. Overall, energy impacts occurring under this alternative would be similar to the proposed PMPU.

6.5.5.7 Hazards and Hazardous Materials

The Recreation Open Space Alternative would involve potential future development throughout the proposed PMPU area, with future development primarily concentrated in PD2 and PD3. Similar to the proposed PMPU, the potential exists to encounter existing known or undocumented contaminated materials (i.e., soil, groundwater, or sediment) or other hazardous materials (e.g., asbestos-containing materials, lead-based paint, polychlorinated biphenyls, organochlorine pesticides) during construction activities, which would be a significant impact that could create a hazard to the public or the environment (**Impact-HAZ-1** through **Impact-HAZ-3**). It is also possible that future development occurring under this alternative could be located on a site with an active or closed case listed in an environmental database for hazardous materials (**Impact-HAZ-4**). Mitigation would reduce these impacts to less than significant levels (**MM-HAZ-1** and **MM-HAZ-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to hazards and hazardous materials with the implementation of mitigation. Because impacts associated with hazardous materials tend to be localized, and because this alternative could result in development at the same locations as those that would occur under the proposed PMPU, potential hazards and hazardous materials impacts resulting from this alternative would be less than significant with mitigation incorporated and would be similar to the proposed PMPU.

6.5.5.8 Hydrology and Water Quality

As described under Section 4.8.3, in Section 4.8, *Hydrology and Water Quality*, there are numerous Federal, State, and local laws, regulations, and programs that govern water quality standards or waste discharge requirements and help ensure that surface- or groundwater quality is not degraded as a result of development projects. These laws, regulations, and programs would apply to any future development projects that are consistent with the water and land use designations and the policies of this alternative and where these development projects propose actions that are governed by these laws, regulations, and programs. Potential landside construction activities occurring under this alternative would be required to comply with the San Diego RWQCB regulations for short-term dewatering, as well as the Construction General Permit for sites that would disturb more than 1 acre of land or the District's JRMP for sites that would disturb less than 1 acre of land. Compliance with these regulations would ensure that landside construction activities under this alternative would result in less-than-significant impacts. However, this alternative would involve waterside construction activities, as well, including the removal of existing pilings and piers and construction of new pilings/piers, moorings, or floating docks, which could affect water quality due to disturbance of localized sediments and increased turbidity. Although waterside construction

activities would be required to comply with Clean Water Act Sections 401 and 404, there are areas where known contaminated sediments exist, and bottom-disturbing activities may uncover these contaminated sediments. Therefore, this alternative has the potential to result in significant and unavoidable water quality impacts during in-water construction activities (**Impact-WQ-1**).

In addition, operational waterside activities occurring under this alternative, including increased numbers of recreational vessels, would increase the potential for additional vessels using antifoulant copper-based paint for vessel hulls potentially to contribute to existing copper impairments present within PD1, PD2, PD3, PD9, and PD10 and may worsen the existing condition and result in a significant and unavoidable impact (**Impact-WQ-2**). Furthermore, aquaculture could also occur under this alternative, which could result in water quality degradation due to dissolved nitrogen and phosphorus, turbidity, biological oxygen demand, and bacteria (**Impact-WQ-3**). Mitigation would reduce this impact to less than significant (**MM-WQ-9**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on hydrology and water quality. Because the Recreation Open Space Alternative has the potential to result in significant and unavoidable impacts, these impacts would be similar to the proposed PMPU.

6.5.5.9 Land Use and Planning

Future development allowed under the Recreation Open Space Alternative would not extend into areas beyond the proposed PMPU area, nor result in water or land use designations not already proposed in the proposed PMPU. This alternative would not result in new roadways or other infrastructure that physically would divide an established community. Although this alternative would include the closure of North Harbor Drive between Ash Street and Grape Street, the extent of the roadway closure would not be so substantial such that it would be considered physically to divide an established community. In general, future development occurring under this alternative would be the same as that which could occur under the proposed PMPU. As such, this alternative would not have the potential to divide an established community and would be consistent with plans, policies, and regulations adopted for the purposes of avoiding or mitigating environmental effects. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to land use and planning. Impacts under this alternative would also be less than significant. Therefore, overall, impacts related to land use and planning would be similar compared to the proposed PMPU.

6.5.5.10 Noise and Vibration

Construction activities occurring under this alternative could exceed noise thresholds at sensitive receptors and result in similar significant impacts related to noise and vibration as the proposed PMPU (**Impact-NOI-1** and **Impact-NOI-2**). In addition, because this alternative involves the same land uses, roadway improvements, and implementation of other amenities, such as mobility hubs, as the proposed PMPU, operational impacts associated with increased traffic noise, ambient parking lot noise, or mechanical noise from operation of aquaculture facilities or ocean-related enterprise uses would occur under this alternative (**Impact-NOI-3** through **Impact-NOI-10**). As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts related to noise, and impacts under this alternative, which potentially still would be significant and unavoidable, would be similar compared to the proposed PMPU.

6.5.5.11 Population and Housing

The Recreation Open Space Alternative would have the potential to increase the amount of retail/restaurant square footage, hotel rooms, convention center square footage, and other uses that would result in increased employment throughout the proposed PMPU area compared to existing conditions. As discussed in Section 4.11, *Population and Housing*, employment growth anticipated under the proposed PMPU would be within the growth estimates projected by SANDAG and would not result in substantial unplanned population growth in the region. Because future development occurring under this alternative would be similar to that which could occur under the proposed PMPU, this alternative would also result in less employment growth than the proposed PMPU and be within the anticipated employment projections for the region. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to unplanned population growth. Impacts related to substantial unplanned population growth under this alternative would be less than significant, and impacts would be similar to the proposed PMPU.

6.5.5.12 Public Services and Recreation

The Recreation Open Space Alternative would result in the same level of development that would occur under the proposed PMPU and result in an increase in visitors and employees to the Downtown San Diego area and San Diego Bay. Increased numbers of visitors and employees would increase demand on public services, including member-city police and fire protection services and HPD resources, and could require construction of new or expansion of existing police facilities and cause an impact on the environment. However, the HPD indicated that any additional demand for new equipment and personnel due to implementation of the proposed PMPU would not require new or expanded facilities (Nichols pers. comm.; Webber pers. comm.). Therefore, buildout of the proposed PMPU would not require new or physically altered government facilities or result in the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts. Impacts would be less than significant. Because this alternative would result in similar levels of overall development compared to the proposed PMPU, impacts would also be less than significant, and impacts would be similar compared to the proposed PMPU.

Although there would be less development under this alternative than for the proposed PMPU, the timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities other than HPD, are all unknown at this time. Mitigation measures detailed in the proposed PMPU's MMRP would be required, where necessary (**MM-PS-1**); however, to implement **MM-PS-1** effectively, a specific location (including surrounding land uses), project timing, and project design specifications for a future expansion or construction of a new police facility must be known. Because these factors are not known at this time, it would be speculative to conclude that impacts would be less than significant, even with implementation of mitigation measure **MM-PS-1**. Moreover, because the police facility may be located outside of the District's jurisdiction, the District would have no authority in this case to require and enforce mitigation measures to lessen any significant impacts. Therefore, similar to the proposed PMPU, and for similar reasons, it is reasonably foreseeable that the future construction of any new or expanded police facilities under this alternative potentially would result in significant and unavoidable environmental impacts. Because this alternative would result in similar levels of overall development compared to the proposed PMPU, impacts would also be significant and unavoidable and similar compared to the proposed PMPU.

In addition, similar to the proposed PMPU, new or expanded parks and recreational facilities could be developed under this alternative, which could result in similar impacts related to construction and operation of those parks and recreational facilities, even with implementation of mitigation measures. As such, impacts occurring under this alternative would be significant and unavoidable and similar compared to those occurring under the proposed PMPU.

6.5.5.13 Sea Level Rise

The Recreation Open Space Alternative would result in similar water and land use designations being applied throughout the proposed PMPU area, which could result in similar SLR exposure scenarios identified Tables 4.13-3 and 4.13-4 in Section 4.13, *Sea Level Rise*. Because SLR is a highly site-specific impact, even within a single parcel, flood exposure can vary significantly, and the exact location of future development consistent with this alternative is unknown, it is possible that this alternative could result in similar exposure as the proposed PMPU. This alternative would include the same policies related to SLR that are proposed in the proposed PMPU. These policies require, among other things, that the District prepare, and periodically update, an SLR adaptation plan (SR Policy 3.2.3) and that permittees submit site-specific hazards reports to the District that address anticipated coastal hazards over the anticipated life of the development (SR Policy 3.3.1). Other policies require permittees to site and design development to avoid impacts from coastal hazards from projected SLR considering the anticipated life of the development and, if coastal hazards cannot be completely avoided, to plan, design, and implement adaptation strategies (see SR Policy 3.3.2). Additionally, to reduce the risks posed to neighboring properties and the natural environment from coastal protection devices, policies would require the prioritization of nature-based adaptation strategies, where feasible (SR Policy 3.3.4). If coastal protection devices are used, they must be designed to minimize adverse impacts on local sand supply, recreation, habitat, scenic views, beach width, coastal fill, coastal access, and other Public Trust uses (SR Policy 3.3.10). SLR and increased “storminess” due to climate change may increase wave uprush, which would be analyzed on an individual development basis, as required in SR Policy 3.3.1. Specific design approaches would be reviewed by the District as specific development proposals are submitted for development review. Consistency with these policies would ensure that future development occurring under this alternative would not exacerbate the potential for inundation due to projected SLR or storm surge. As indicated in Table 6-1, implementation of the proposed PMPU would result in less-than-significant impacts related to SLR. Under this alternative, impacts would also be less than significant, similar to the proposed PMPU.

6.5.5.14 Transportation, Circulation, and Mobility

Under the Recreation Open Space Alternative, a segment of North Harbor Drive would be closed to vehicular traffic in order to create a continuous recreational area between the County waterfront park and the Embarcadero. Traffic would have to be detoured around this roadway closure, which could create greater congestion on roadways where this traffic would be rerouted. In addition, traffic related to employees and visitors under this alternative would be similar to the proposed PMPU, and the potential VMT generated by this alternative would similarly exceed the thresholds identified by land use in Table 4.14-3 in Section 4.13, *Transportation, Circulation, and Mobility*. As such, this alternative would result in significant and unavoidable impacts related to VMT (**Impact-TRA-1** through **Impact-TRA-3**). Similar to the proposed PMPU, this alternative would include physical improvements to the transportation infrastructure, which seek to increase the accessibility and connectivity of multi-modal infrastructure throughout the tidelands. These changes would be

consistent with the goals and policies of the programs, plans, policies, or ordinances related to the circulation system applicable to the proposed PMPU area. Furthermore, similar to the proposed PMPU, final plans for transportation improvement projects would be subject to the review and approval by the applicable city's traffic engineer (for roadway and bicycle facility improvements) or the District (for pedestrian facility improvements) to ensure that any improvement would not result in hazardous design features and provide adequate emergency access. Impacts related to conflicts with plans and policies, hazardous design features, and adequate emergency access would be less than significant, similar to the proposed PMPU. As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on transportation, circulation, and mobility. Future development occurring under this alternative still could result in significant and unavoidable VMT impacts. Overall, this alternative would result in similar transportation, circulation, and mobility impacts compared to the proposed PMPU.

6.5.5.15 Utilities and Service Systems

Future development under the Recreation Open Space Alternative would increase demand on utilities throughout the proposed PMPU area and, because the remainder of the proposed PMPU potential future development still could occur and this alternative could result in a similar level of development, this demand would be similar to the proposed PMPU. Future development that could occur under this alternative may require new or expanded utilities, the construction of which may result in significant and unavoidable impacts related to ground disturbance, even with mitigation (**Impact-UTIL-1**). In addition, given that potential buildout under this alternative could result in up to 3,910 new hotel rooms, as well as additional retail and restaurant space, convention space, and meeting space, all of which would increase demand on water supplies, water supplies may be insufficient to meet the increased demand generated under this alternative, similar to the proposed PMPU (**Impact-UTIL-2**). Furthermore, because this alternative would replace existing roadway space with recreation space, which would use more water, this alternative could increase demand on water supplies compared to the proposed PMPU. Similar to the proposed PMPU, incorporation of this alternative into the next UWMP updates, preparation of a water demand analysis, and implementation of water conservation measures would be required for future development occurring under this alternative to ensure that sufficient water supplies exist before a project is approved, and impacts would be less than significant with mitigation (**MM-UTIL-1**, **MM-UTIL-2**, and **MM-UTIL-3**). Similar to the proposed PMPU, construction and operational activities could generate solid waste that would exceed capacity at existing landfills (**Impact-C-UTIL-3** and **Impact-C-UTIL-4**). Similarly, site-specific environmental reviews for future development occurring under this alternative also would be required to ensure that sufficient landfill capacity exists prior to project approval (**MM-C-UTIL-1** and **MM-C-UTIL-2**).

As indicated in Table 6-1, implementation of the proposed PMPU would result in significant and unavoidable impacts on utilities and services systems as a result of utility-related land disturbance and a less-than-significant impact related to insufficient water, wastewater, or solid waste facilities after mitigation. Because this alternative would result in similar demand on water, wastewater, and solid waste facilities compared to PMPU, utility impacts occurring under this alternative still would be significant and unavoidable related to land disturbance and less than significant associated with demand for water, wastewater, and solid waste facilities, and impacts would be similar compared to the proposed PMPU.

6.5.5.16 Summary of Impacts

The Recreation Open Space Alternative would result in similar impacts on the proposed PMPU.

6.5.6 Environmentally Superior Alternative

Pursuant to CEQA, EIRs are required to identify the environmentally superior alternative. As shown in Table 6-3, the One-Third Reduced Growth Alternative (Alternative 2) and the One-Half Reduced Growth Alternative (Alternative 3) reduce the same number of significant impacts. However, because Alternative 3 would result in less overall development than Alternative 2, this alternative is the environmentally superior alternative. As provided in the analysis above, there are different tradeoffs for each alternative, depending on the specific resource areas. Individuals and the decision-makers may weigh these resource areas differently.

Table 6-3. Summary Impact Comparison of Proposed PMPU Alternatives

Environmental Resource	PMPU Determination	No Project (Alternative 1)	One-Third Reduced Growth (Alternative 2)	One-Half Reduced Growth (Alternative 3)	Harbor Island Centralized Commercial Recreation Alternative (Alternative 4)	Recreation Open Space (Alternative 5)
Aesthetics and Visual Resources	Significant and Unavoidable	0	-2	-2	0	0
Air Quality and Health Risk	Significant and Unavoidable	-2	-2	-2	0	0
Biological Resources	Less than Significant w/Mitigation	-2	-2	-2	0	0
Cultural Resources and Tribal Cultural Resources	Significant and Unavoidable	-2	-2	-2	0	0
Geology and Soils	Less than Significant w/Mitigation	-2	-2	-2	0	0
Greenhouse Gas Emissions and Climate Change	Significant and Unavoidable	-2	-2	-2	0	0
Hazards and Hazardous Materials	Less than Significant w/Mitigation	-2	-2	-2	0	0
Hydrology and Water Quality	Significant and Unavoidable	-2	-2	-2	0	0
Land Use and Planning	Less than Significant	0	0	0	0	0
Noise and Vibration	Significant and Unavoidable	-2	-2	-2	0	0
Population and Housing	Less than Significant	-1	-1	1	0	0

Environmental Resource	PMPU Determination	No Project (Alternative 1)	One-Third Reduced Growth (Alternative 2)	One-Half Reduced Growth (Alternative 3)	Harbor Island Centralized Commercial Recreation Alternative (Alternative 4)	Recreation Open Space (Alternative 5)
Public Services and Recreation	Significant and Unavoidable	-1	-1	-1	0	0
Sea Level Rise	Less than Significant	-1	-1	-1	0	0
Transportation, Circulation, and Mobility	Significant and Unavoidable	-1	-1	-1	-1	0
Utilities and Service Systems	Significant and Unavoidable	-2	-2	-2	0	0
Total¹	--	-22	-24	-24	-1	0

-2= Reduced; -1= Slightly Reduced; 0 = Similar; +1 = Slightly Greater; +2 = Greater

¹ Lowest score is environmentally superior

Chapter 7

List of Preparers and Agencies Consulted

7.1 San Diego Unified Port District—Lead Agency

7.1.1 Planning and Environment

Jason H. Giffen	Vice President of Planning and Environment
Lesley Nishihira	Planning Director, Planning Department
Karen Holman	Director, Environmental Protection
Eileen Maher	Director, Environmental Conservation
Paula Sylvia	Program Director, Aquaculture & Blue Technology
Anna Buzaitis	Program Manager, Planning Department
Larry Hofreiter	Program Manager, Planning Department
Phil Gibbons	Program Manager, Planning Department
Paul Brown	Program Manager, Environmental Protection
George Liddle	Senior Environmental Specialist, Environmental Protection
Dennis Campbell	Senior Planner, Planning Department
Ashley Wright	Senior Planner, Planning Department
Maggie Weber	Senior Planner, Planning Department
Lily Tsukayama	Associate Planner, Planning Department
Amanda Russel	Sea Grant Fellow, Planning Department

7.1.2 Department Development Services

Wileen Manaois	Director
Peter Eichar	Senior Planner, Development Services Department

7.1.3 Government and Civic Relations

Aimee Heim	Program Director
Stephen Shafer	Principal, Economics and Policy

7.1.4 Harbor Police Department

Kirk Nichols	Assistant Chief
Magda Fernandez	Captain

7.1.5 Maritime Department

Joel Valenzuela	Assistant Vice President
Adam Deaton	Senior Trade Account Representative
Bruce Cummings	Marine Terminal Supervisor, Maritime Operations
Dan Valentine	Manager, Maritime Operations
Mark Taylor	Marine Terminal Superintendent, Maritime Operations
Kristine Zortman	Manager

7.1.6 Office of the General Counsel

Rebecca Harrington, Esq.	Senior Deputy General Counsel
John Carter, Esq.	Deputy General Counsel V
Michael Hogan, Esq.	Outside Counsel—Hogan Law APC
Margaret Sohagi, Esq.	Outside Counsel—Sohagi Law Group
Tyson Sohagi, Esq.	Outside Counsel—Sohagi Law Group

7.1.7 Engineering-Construction

Mark McIntire	Capital Project Manager II
---------------	----------------------------

7.2 Ascent Environmental—Final EIR Preparation

<u>Chris Mundhenk</u>	<u>Principal-In-Charge</u>
<u>Charlie Richmond</u>	<u>Senior Environmental Director, Technical Advisor/QA-QC</u>
Tristan Evert	Environmental Planner/Project Coordinator
<u>Matthew McFalls</u>	<u>Air Quality and Climate Change Manager</u>
<u>Alyssa Luna</u>	<u>GIS Specialist</u>
<u>Michele Mattei</u>	<u>Document Production Specialist</u>
<u>Gaiety Lane</u>	<u>Document Production Specialist</u>
<u>Riley Smith</u>	<u>Document Production Specialist</u>

7.3 Ridgeline Environmental—Final EIR Preparation

Charlie Richmond

Project Manager/QA&QC

7.4 ICF International—Draft EIR Preparation

7.4.1 EIR Management

Lance Unverzagt, AICP CEP

Project Manager

7.4.2 Technical Staff

Kelly Ross

Senior Environmental Planner

Kathie Washington

Senior Environmental Planner

Emily Seklecki

Environmental Planner

~~Matt McFalls~~

~~Senior Air Quality and Greenhouse Gas Specialist~~

Blake Barroso

Air Quality and Greenhouse Gas Specialist

Pierre Glaize

Air Quality and Greenhouse Gas Specialist

Brenda Dix

Director Climate Resilience (Sea Level Rise)

Jonathan Higginson, INCE-USA

Senior Noise Specialist

Jakob Rzeszutko

Noise Specialist

Tim Yates, Ph.D

Historian (Built Environment)

Karolina Chmiel, RPA

Archaeologist

Karen Crawford, MA, RPA

Cultural Resources (QA/QC)

Will Kohn

Senior Biologist

Shawn Johnston

Senior Biologist

Mario Barrera

Hazardous Materials Specialist

Dave Duncan

GIS Specialist

Brad Stein

GIS Specialist

Soraya Swiontek

GIS Specialist

7.4.3 Publication Staff

Ken Cherry

Lead Editor

Liz Irvin

Support Editor

Saadia Byram

Support Editor

Jenelle Mountain-Castro

Publication Specialist, Production

7.5 Traffic Report

7.5.1 Intersecting Metrics

Stephen Cook, P.E.

Project Manager/Sr. Engineer

7.5.2 Chen Ryan Associates

Jonathan Sanchez

Engineer

Aleksandar Jovanovic
