Glossary.....	G-1
Executive Summary	ES-1
Introduction.....	ES-1
Project Description	ES-2
Overview	ES-2
Project Location	ES-2
Project Objectives	ES-3
Areas of Known Controversy/Issues Raised by Agencies and the Public	ES-3
Issues to be Resolved	ES-4
Summary of Project Impacts.....	ES-4
Summary of Project Alternatives	ES-5
Environmentally Superior Alternative	ES-7
Chapter 1 Introduction	1-1
1.1 Project Overview	1-1
1.2 Purpose of the California Environmental Quality Act and the Program Environmental Impact Report	1-1
1.3 Background.....	1-34
1.3.1 San Diego Unified Port District Act	1-34
1.3.2 California Coastal Act	1-45
1.3.3 Current Port Master Plan.....	1-56
1.4 District CEQA Documents Incorporated by Reference.....	1-56
1.4.1 Tenth Avenue Marine Terminal Redevelopment Plan, Final Environmental Impact Report, and Addenda to the Final Environmental Impact Report.....	1-67
1.4.2 North Embarcadero Port Master Plan Amendment Project Final Environmental Impact Report	1-68
1.5 Scope and Content of the Draft-Final Program Environmental Impact Report	1-78
1.5.1 Comments Received in Response to the Notice of Preparation and Areas of Controversy.....	1-89
1.6 Organization of the Draft-Final Program Environmental Report	1-1920
Chapter 2 Environmental Setting	2-1
2.1 Introduction.....	2-1
2.2 Existing Setting	2-1
2.2.1 Location.....	2-2
2.2.2 Surrounding Conditions	2-2
2.2.3 Existing Conditions.....	2-3

2.3	Cumulative Setting	2-17
2.3.1	Cumulative Methodology	2-17
2.3.2	Application of the Plan Method.....	2-19
Chapter 3	Project Description	3-1
3.1	Introduction.....	3-1
3.2	Project Background and Purpose	3-3
3.3	Project Objectives.....	3-4
3.4	Project Benefits	3-5
3.5	Proposed PMPU Description	3-7
3.5.1	Proposed Elements and Policies	3-7
3.5.2	Baywide Development Standards.....	3-22
3.5.3	Proposed Planning Districts	3-23
3.5.4	Plan Implementation and Development Conformance.....	3-106 <u>108</u>
3.6	Intended Uses of the Program Environmental Impact Report.....	3-106 <u>109</u>
3.6.1	Agencies Expected to Use this Program Environmental Impact Report	3-107 <u>109</u>
Chapter 4	Environmental Analysis	4-1
	Introduction.....	4-1
	Potential Environmental Impacts	4-1
	Format of the Environmental Analysis	4-2
4.1	Aesthetics and Visual Resources	4.1-1
4.1.1	Overview	4.1-1
4.1.2	Existing Conditions.....	4.1-5
4.1.3	Laws, Regulations, Plans, and Policies	4.1-30
4.1.4	Project Impact Analysis.....	4.1-31
4.1.5	Cumulative Impact Analysis	4.1-75
4.2	Air Quality and Health Risk.....	4.2-1
4.2.1	Overview	4.2-1
4.2.2	Existing Conditions.....	4.2-4
4.2.3	Laws, Regulations, Plans, and Policies	4.2-21
4.2.4	Project Impact Analysis.....	4.2-39 <u>44</u>
4.2.5	Cumulative Impact Analysis	4.2-90 <u>95</u>
4.3	Biological Resources	4.3-1
4.3.1	Overview	4.3-1
4.3.2	Existing Conditions.....	4.3-10
4.3.3	Laws, Regulations, Plans, and Policies	4.3-79
4.3.4	Project Impact Analysis.....	4.3-85 <u>87</u>
4.3.5	Cumulative Impact Analysis.....	4.3-142 <u>149</u>

4.4	Cultural Resources and Tribal Cultural Resources.....	4.4-1
4.4.1	Overview	4.4-1
4.4.2	Existing Conditions.....	4.4-4
4.4.3	Laws, Regulations, Plans, and Policies	4.4-3836
4.4.4	Project Impact Analysis.....	4.4-4442
4.4.5	Cumulative Impact Analysis.....	4.4-7473
4.5	Geology and Soils	4.5-1
4.5.1	Overview	4.5-1
4.5.2	Existing Conditions.....	4.5-2
4.5.3	Laws, Regulations, Plans, and Policies	4.5-30
4.5.4	Project Impact Analysis.....	4.5-40
4.5.5	Cumulative Impact Analysis.....	4.5-7374
4.6	Greenhouse Gas Emissions and Energy	4.6-1
4.6.1	Overview	4.6-1
4.6.2	Existing Conditions.....	4.6-3
4.6.3	Laws, Regulations, Plans, and Policies	4.6-11
4.6.4	Project Impact Analysis.....	4.6-2728
4.6.5	Cumulative Impact Analysis.....	4.6-7982
4.7	Hazards and Hazardous Materials.....	4.7-1
4.7.1	Overview	4.7-1
4.7.2	Existing Conditions.....	4.7-2
4.7.3	Laws, Regulations, Plans, and Policies	4.7-3635
4.7.4	Project Impact Analysis.....	4.7-4746
4.7.5	Cumulative Impact Analysis.....	4.7-9192
4.8	Hydrology and Water Quality.....	4.8-1
4.8.1	Overview	4.8-1
4.8.2	Existing Conditions.....	4.8-4
4.8.3	Laws, Regulations, Plans, and Policies	4.8-32
4.8.4	Project Impact Analysis.....	4.8-47
4.8.5	Cumulative Impact Analysis.....	4.8-9091
4.9	Land Use and Planning	4.9-1
4.9.1	Overview	4.9-1
4.9.2	Existing Conditions.....	4.9-1
4.9.3	Laws, Regulations, Plans, and Policies	4.9-5
4.9.4	Project Impact Analysis.....	4.9-11
4.9.5	Cumulative Impact Analysis.....	4.9-7173

4.10	Noise and Vibration	4.10-1
4.10.1	Overview	4.10-1
4.10.2	Noise Fundamentals	4.10-5
4.10.3	Groundborne Vibration Fundamentals.....	4.10-11
4.10.4	Existing Conditions.....	4.10-16 <u>15</u>
4.10.5	Laws, Regulations, Plans, and Policies	4.10-39
4.10.6	Project Impact Analysis.....	4.10-47
4.10.7	Cumulative Impact Analysis.....	4.10-86 <u>87</u>
4.11	Population and Housing	4.11-1
4.11.1	Overview	4.11-1
4.11.2	Existing Conditions.....	4.11-1
4.11.3	Laws, Regulations, Plans, and Policies	4.11-34
4.11.4	Project Impact Analysis.....	4.11-5
4.11.5	Cumulative Impact Analysis.....	4.11-11
4.12	Public Services and Recreation.....	4.12-1
4.12.1	Overview	4.12-1
4.12.2	Existing Conditions.....	4.12-5
4.12.3	Laws, Regulations, Plans, and Policies	4.12-14
4.12.4	Project Impact Analysis.....	4.12-20
4.12.5	Cumulative Impact Analysis.....	4.12-60 <u>61</u>
4.13	Sea Level Rise	4.13-1
4.13.1	Overview	4.13-1
4.13.2	Existing Conditions.....	4.13-1
4.13.3	Laws, Regulations, Plans, and Policies	4.13-4
4.13.4	Project Impact Analysis.....	4.13-9
4.13.5	Cumulative Impact Analysis.....	4.13-56 <u>58</u>
4.14	Transportation, Circulation, and Mobility.....	4.14-1
4.14.1	Overview	4.14-1
4.14.2	Existing Conditions.....	4.14-3
4.14.3	Laws, Regulations, Plans, and Policies	4.14-8
4.14.4	Project Impact Analysis.....	4.14-16 <u>17</u>
4.14.5	Cumulative Impact Analysis.....	4.14-87 <u>88</u>
4.15	Utilities and Service Systems.....	4.15-1
4.15.1	Overview	4.15-1
4.15.2	Existing Conditions.....	4.15-4
4.15.3	Laws, Regulations, Plans, and Policies	4.15-14
4.15.4	Project Impact Analysis.....	4.15-22

4.15.5	Cumulative Impact Analysis	4.15-51
Chapter 5	Additional Consequences of PMPU Implementation.....	5-1
5.1	Introduction.....	5-1
5.2	Significant Irreversible Environmental Changes.....	5-1
5.3	Growth-Inducing Impacts.....	5-2
5.3.1	Foster Economic Growth	5-2
5.3.2	Population Growth and Housing.....	5-3
5.3.3	Removal of Obstacles to Population Growth	5-4
5.4	Effects Found Not to Be Significant.....	5-4
5.4.1	Agriculture and Forestry Resources.....	5-4
5.4.2	Geology and Soils.....	5-5
5.4.3	Hazards and Hazardous Materials	5-6
5.4.4	Hydrology and Water Quality	5-6
5.4.5	Mineral Resources	5-7
5.4.6	Noise and Vibration	5-7
5.4.7	Population and Housing.....	5-8
5.4.8	Transportation, Circulation, and Parking.....	5-8
5.4.9	Wildfire	5-9
Chapter 6	Alternatives to the PMPU	6-1
6.1	Overview.....	6-1
6.2	Requirements for Alternatives Analysis	6-1
6.3	Selection of Alternatives	6-2
6.4	Alternatives Considered	6-10
6.4.1	Alternatives Considered but Rejected	6-10
6.5	Analysis of Alternatives	6-12
6.5.1	Analysis of Alternative 1 – No Project Alternative.....	6-12
6.5.2	Analysis of Alternative 2 – One-Third Reduced Growth Alternative	6-21
6.5.3	Analysis of Alternative 3 – One-Half Reduced Growth Alternative	6-30
6.5.4	Analysis of Alternative 4 – Harbor Island Centralized Commercial Recreation Alternative	6-40
6.5.5	Analysis of Alternative 5 – Recreation Open Space Alternative	6-51
6.5.6	Environmentally Superior Alternative	6-63
Chapter 7	List of Preparers and Agencies Consulted	7-1
7.1	San Diego Unified Port District—Lead Agency	7-1
7.1.1	Planning and Environment.....	7-1
7.1.2	Department Development Services.....	7-1
7.1.3	Government and Civic Relations.....	7-1

7.1.4	Harbor Police Department.....	7-2
7.1.5	Maritime Department.....	7-2
7.1.6	Office of the General Counsel.....	7-2
7.1.7	Engineering-Construction	7-2
7.2	Ascent Environmental—Final EIR Preparation	7-2
7.3	Ridgeline Environmental—Final EIR Preparation	7-3
7.4	ICF International—Draft EIR Preparation	7-3
7.4.1	EIR Management.....	7-3
7.4.2	Technical Staff.....	7-3
7.4.3	Publication Staff.....	7-3
7.5	Traffic Report.....	7-4
7.5.1	Intersecting Metrics	7-4
7.5.2	Chen Ryan Associates	7-4
7.6	Agencies, Organizations, and Persons Consulted	7-4
Chapter 8	References.....	8-1
8.1	Chapter 1, Introduction.....	8-1
8.2	Chapter 2, Environmental Setting	8-1
8.3	Chapter 3, Project Description	8-1
8.4	Chapter 4, Impact Analysis.....	8-2
8.4.1	Section 4.1, Aesthetics and Visual Resources	8-2
8.4.2	Section 4.2, Air Quality and Health Risk	8-2
8.4.3	Section 4.3, Biological Resources.....	8-6
8.4.4	Section 4.4, Cultural Resources and Tribal Cultural Resources	8-7
8.4.5	Section 4.5, Geology and Soils	8-1413
8.4.6	Section 4.6, Greenhouse Gas Emissions and Energy	8-14
8.4.7	Section 4.7, Hazards and Hazardous Materials	8-17
8.4.8	Section 4.8, Hydrology and Water Quality	8-23
8.4.9	Section 4.9, Land Use and Planning	8-28
8.4.10	Section 4.10, Noise and Vibration	8-28
8.4.11	Section 4.11, Population and Housing.....	8-29
8.4.12	Section 4.12, Public Services and Recreation	8-30
8.4.13	Section 4.13, Sea Level Rise	8-32
8.4.14	Section 4.14, Transportation, Circulation, and Mobility.....	8-33
8.4.15	Section 4.15, Utilities and Service Systems	8-33

List of Appendices

Appendix A	Notice of Preparation
Appendix B	Notice of Preparation Comment Letters
Appendix C	Air Quality/Greenhouse Gas Calculations
Appendix D	Port Master Plan Update Transportation Impact Study (TIS) Vehicle Miles Traveled – SB 743 Analysis prepared by Chen Ryan Associates, <u>August 2022</u> February 2020
Appendix E	Cultural (NAHC Correspondence)
Appendix F	Geology (EIR Level Geology and Soils Evaluation for the Integrated Planning Port Master Plan Update prepared by Ninyo & Moore)
Appendix G	Hazardous Materials Technical Study (Integrated Planning Port Master Plan Update, San Diego Unified Port District, San Diego, California prepared by Ninyo & Moore)
Appendix H	Noise Field Measurements Datasheets
Appendix I	Sea Level Rise (The District’s Sea Level Rise Vulnerability Assessment and Coastal Resiliency Report [AB 691 Report], prepared by the San Diego Unified Port District)
Appendix J	<u>CERP/MCAS Inconsistency Analyses</u>
Appendix K	<u>San Diego Unified Port District – Coastal Development Permit Regulations</u>
Appendix L	<u>D. Vigil, SDAPCD, July 25, 2022, Email</u>
Appendix M	<u>Port Master Plan Update Passing Vessel Study, prepared by GHD, Inc, May 2023</u>
Appendix N	<u>Final Draft Port Master Plan Update, December 2023</u>

Tables

Table	Page
ES-1	Project Impacts and Mitigation Measures ES-98
1-1	Summary of NOP Comments Received 1-810
1-2	Document Organization and CEQA Requirements..... 1-1920
2-1	Certified Port Master Plan Water and Land Use Designations 2-5
2-2	Additional Cumulative Plans and Programs 2-19
3-1	Water and Land Use Designation Consolidation..... 3-89
3-2	Proposed PMPU Water and Land Use Designation Descriptions1..... 3-13
3-3	Baywide Water and Land Use Designations..... 3-15
3-4	Baywide Development Projections 3-2425
3-5	Shelter Island Planning District Water and Land Use Designations (Certified PMP and Proposed PMPU) 3-26
3-6	Harbor Island Planning District Water and Land Use Designations 3-39
3-7	Embarcadero Planning District Water and Land Use Designations 3-5051
3-8	Subdistrict Land Use Options 3-5759
3-9	Working Waterfront Planning District Water and Land Use Designations 3-7275
3.10	South Bay Planning District Water and Land Use Designations..... 3-8284
3-11	Imperial Beach Oceanfront Planning District Water and Land Use Designations..... 3-8587
3-12	Silver Strand Planning District Water and Land Use Designations..... 3-9193
3-13	Coronado Bayfront Planning District Water and Land Use Designations 3-99101
3-14	List of Required Discretionary Actions 3-108110
4.1-1	Summary of Significant Aesthetics and Visual Resources Impacts and Mitigation Measures 4.1-1
4.2-1	Summary of Significant Air Quality and Health Risk Impacts and Mitigation Measures 4.2-1
4.2-2	Summary of Local Climate Conditions (Temperature and Precipitation) 4.2-56
4.2-3	Federal and State Attainment Status for San Diego County 4.2-67
4.2-4	Ambient Background Concentrations from Area Monitoring Stations..... 4.2-9
4.2-5	Health Effects Summary of the Major Criteria Air Pollutants 4.2-15

4.2-6	Estimate of SDAB Emissions by Source (tons per day)	4.2-17
4.2-7	Water and Land Uses and Emissions Sources by Planning District	4.2-18
4.2-8	Summary of Maritime Criteria Pollutant Emissions in the Proposed PMPU Area (tons per year)	4.2-19
4.2-9	Summary of Maritime Diesel Particulate Matter Pollutant Emissions by Planning District (pounds per year).....	4.2-20
4.2-10	Federal and State Ambient Air Quality Standards	4.2-23
4.2-11	Construction Water and Land Use Assumptions.....	4.2-4043
4.2-12	New Development Assumed for the Proposed PMPU at Full Buildout and in 2030	4.2-4245
4.2-13	Vehicle Miles Traveled Estimates with Implementation of the Proposed PMPU at Full Buildout and by 2030.....	4.2-4346
4.2-14	Summary of 2016 Maritime Criteria Pollutant Emissions for Commercial Fishing (tons per year)	4.2-4446
4.2-15	Change in Boating Slips Assumed at Full PMPU Buildout (2050) and by 2030	4.2-4547
4.2-16	Air Quality Thresholds	4.2-4951
4.2-17	Construction Emission Estimates Associated with All Development Through 2050—Unmitigated (pounds per day).....	4.2-6165
4.2-18	Estimated Net New Daily Emissions Baywide in 2030 Associated with PMPU Buildout—Unmitigated (pounds per day)	4.2-6569
4.2-19	Estimated Net New Daily Emissions Baywide in 2050 Associated with PMPU Buildout—Unmitigated (pounds per day)	4.2-6569
4.2-20	Estimated Net New Daily Emissions in 2030 Associated with PMPU Buildout— Unmitigated (pounds per day)	4.2-6770
4.2-21	Estimated Net New Daily Emissions in 2050 Associated with PMPU Buildout— Unmitigated (pounds per day)	4.2-6771
4.2-22	Construction Emission Estimates Associated with All Development—Mitigated (pounds per day)	4.2-7883
4.2-23	Estimated Net New Daily Emissions Baywide in 2030 Associated with PMPU Buildout—Mitigated (pounds per day)	4.2-7883
4.2-24	Estimated Net New Daily Emissions Baywide in 2050 Associated with PMPU Buildout—Mitigated (pounds per day)	4.2-7884
4.2-25	Estimated Net New Annual Diesel Particulate Matter Emissions Baywide Associated with PMPU Buildout—Unmitigated (pounds per year)	4.2-8287
4.2-26	Estimated Net New Annual Diesel Particulate Matter Emissions by Planning District—Unmitigated (pounds per year).....	4.2-8287

4.2-27	Modeled CO Concentrations (parts per million)	4.2- 83 88
4.3-1	Summary of Significant Biological Resources Impacts and Mitigation Measures.....	4.3-1
4.3-2	Site Reconnaissance Species Observed within the Planning Districts	4.3-33
4.3-3	Sensitive Plant Species with Potential to Occur Within the Proposed PMPU Planning Area	4.3-55
4.3-4	Sensitive Wildlife Species with Potential to Occur Within the Proposed PMPU Area	4.3-63
4.3-5	Southern California Bight Aerial Marine Mammal Survey Results (2008–2013)	4.3-74
4.3-6	Fish Impact Criteria	4.3-88
4.3-7	Adopted Underwater Acoustic Criteria for Marine Mammals.....	4.3-89
4.3-8	Definition of Marine Mammal Hearing Group.....	4.3-89
4.3-9	Adopted Underwater Acoustic Criteria for Green Sea Turtles.....	4.3-90
4.4-1	Summary of Significant Cultural Resources and Tribal Cultural Resources Impacts and Mitigation Measures	4.4-1
4.4-2	Previously Identified Archaeological Resources Within Planning District 2: Harbor Island	4.4- 22 21
4.4-3	Previously Identified Archaeological Resources Within Planning District 3: Embarcadero	4.4- 23 22
4.4-4	Previously Identified Archaeological Resources Within Planning District 4: Working Waterfront	4.4- 24 22
4.4-5	Previously Identified Archaeological Resources Within Planning District 8: Imperial Beach Oceanfront	4.4- 24 23
4.4-6	Previously Identified Archaeological Resources Within Planning District 9: Silver Strand	4.4- 24 23
4.4-7	Previously Identified Archaeological Resources Within Planning District 10: Coronado Bayfront	4.4- 25 23
4.4-8	Historic Shoreline Data for Landward and Seaward Acreage, and Total Acreage of Each Planning District Within the Study Area	4.4- 28 27
4.4-9	Previously Identified Built Environment Resources Within Planning District 1: Shelter Island	4.4- 31 30
4.4-10	Previously Identified Built Environment Resources Within Planning District 2: Harbor Island	4.4- 32 31
4.4-11	Previously Identified Built Environment Resources Within Planning District 3: Embarcadero	4.4- 33 32

4.4-12	Previously Identified Built Environment Resources Within Planning District 4: Working Waterfront	4.4- 34 <u>33</u>
4.4-13	Previously Identified Built Environment Resources Within Planning District 7: South Bay.....	4.4- 36 <u>34</u>
4.4-14	Previously Identified Built Environment Resources Within Planning District 10: Coronado Bayfront	4.4- 37 <u>35</u>
4.5-1	Summary of Significant Geology and Soils Impacts and Mitigation Measures	4.5-1
4.5-2	Planning District Geologic Setting	4.5-12
4.5-3	Soil Series Characteristics	4.5- 25 <u>27</u>
4.5-4	Geologic Formations and Paleontological Sensitivity by Planning District	4.5-29
4.6-1	Summary of Significant Greenhouse Gas Emission Impacts and Mitigation Measures	4.6-1
4.6-2	Global Warming Potentials of Key GHGs.....	4.6-5
4.6-3	Global, National, State, and Regional GHG Emissions Inventories	4.6-6
4.6-4	Comparison of Recalibrated 2006 Baseline and Calendar Year 2016 Emissions (MTCO ₂ e per year)	4.6-7
4.6-5	Water and Land Uses and Emission Sources by Planning District.....	4.6- 98
4.6-6	SDG&E and the State of California Power Mix in 2020 (percent)	4.6-10
4.6-7	Electricity and Natural Gas Consumption in the SDG&E Service Area in 2019	4.6-11
4.6-8	Applicable Mobile Source Strategy Concepts	4.6- 15 <u>16</u>
4.6-9	Annual Energy Generation Rates	4.6- 32 <u>33</u>
4.6-10	Construction Emission Estimates Associated with All Development– Unmitigated (total metric tons for all construction)	4.6- 41 <u>43</u>
4.6-11	Unmitigated Operational Emissions Associated with New Development under the PMPU Buildout (MTCO ₂ e per year)	4.6- 42 <u>44</u>
4.6-12	Mitigated Operational Emissions Associated with New Development Under the PMPU Buildout (MTCO ₂ e per year)	4.6- 49 <u>52</u>
4.6-13	Project Consistency with Relevant District CAP Measures	4.6- 51 <u>53</u>
4.6-14	PMPU Consistency with Selected 2017 Scoping Plan Policies	4.6- 56 <u>59</u>
4.6-15	Estimated Construction Energy Consumption by Source	4.6- 67 <u>71</u>
4.6-16	Estimated Energy Consumption During Operations Prior to Mitigation (million BTUs/year)	4.6- 69 <u>72</u>
4.6-17	Proposed Project Comparison to State CEQA Guidelines Appendix F	4.6- 71 <u>74</u>

4.6-18	Proposed Project Consistency with State and Local Energy Plans and Regulations	4.6- 75 <u>79</u>
4.7-1	Summary of Significant Hazards and Hazardous Materials Impacts and Mitigation Measures	4.7-1
4.7-2	Schools in the Vicinity of the Planning Districts	4.7- 25 <u>24</u>
4.7-3	Airport Land Use Plan Overlay Zones	4.7- 34 <u>33</u>
4.8-1	Summary of Significant Hydrology and Water Quality Impacts and Mitigation Measures	4.8-1
4.8-2	Planning Districts Hydrologic Units and Water Bodies	4.8-18
4.8-3	Beneficial Uses for Surface Waters or Water Bodies with the Potential to Be Affected by the PMPU	4.8-22
4.8-4	303(d)-Listed Impairments for Water Bodies Within the Planning Districts.....	4.8-27
4.8-5	Dischargers Subject to the Boatyard General Permit within PMPU Area	4.8-47
4.9-1	Project Consistency with Relevant Goals, Objectives, and Policies	4.9- 35 <u>36</u>
4.10-1	Summary of Significant Noise and Vibration Impacts and Mitigation Measures	4.10-1
4.10-2	Typical Noise Levels in the Environment.....	4.10-7
4.10-3	Summary of Measured Ambient Noise Levels	4.10-29
4.10-4	Summary of Barrio Logan Nighttime Noise Levels, 12:00 a.m. to 6:00 a.m.....	4.10-31
4.10-5	Existing Modeled Traffic Noise Levels	4.10-32
4.10-6	Caltrans Guideline Vibration Damage Criteria	4.10-40
4.10-7	Caltrans Guideline Vibration Annoyance Criteria	4.10-40
4.10-8	County of San Diego Noise Limits.....	4.10-41
4.10-9	City of San Diego General Plan Land Use – Noise Compatibility Guidelines	4.10-42
4.10-10	City of San Diego Noise Limits	4.10-43
4.10-11	City of Imperial Beach Land Use Compatibility Guidelines for Development.....	4.10-45
4.10-12	City of Coronado Noise Sensitivity of Land Use	4.10-46
4.10-13	City of Coronado Noise Limits	4.10-46
4.10-14	Representative Construction Scenarios	4.10-50
4.10-15	Construction Equipment Reference Vibration Levels	4.10-51
4.10-16	City of San Diego Traffic Noise Significance Thresholds.....	4.10-52
4.10-17	Summary of Construction Noise Thresholds by City	4.10-56
4.10-18	Construction Noise Levels from Representative Construction Scenarios.....	4.10-56

4.10-19	Distances Required to Reduce Construction Noise Levels to 75 dBA Leq.....	4.10-57
4.10-20	Existing and Future Traffic Noise Levels.....	4.10-61
4.10-21	Proposed Mobility Hubs by Planning District.....	4.10-64
4.10-22	Distances to Potential Vibration Damage from Program Construction.....	4.10- 76 <u>77</u>
4.10-23	Distances to Potential Human Effects from Program Construction Vibration.....	4.10- 81 <u>82</u>
4.11-1	Existing and Projected Population by Jurisdiction	4.11-2
4.11-2	Existing and Projected Employment by Jurisdiction	4.11-3
4.11-3	Estimated Baywide Employment with Implementation of the Proposed PMPU.....	4.11-9
4.12-1	Summary of Significant Public Services and Recreation Impacts and Mitigation Measures.....	4.12-1
4.12-2	SDFD Fire Stations Serving PMPU Planning Districts.....	4.12-7
4.12-3	Schools in the Vicinity of the Planning Districts	4.12- 10 <u>11</u>
4.13-1	San Diego Bay Probabilistic Sea Level Rise Projections in Feet (with Meters in Parentheses) Above 1991–2009 Mean Sea Level Baseline.....	4.13-4
4.13-2	Alignment of San Diego Bay Sea Level Rise Projections with the CoSMoS Mapping	4.13- 11 <u>10</u>
4.13-3	Acreage Potentially Exposed to Sea Level Rise Scenarios Under Average Daily Conditions (i.e., with no storm event).....	4.13- 18 <u>19</u>
4.13-4	Acreage Potentially Exposed to Sea Level Rise Scenarios During a 100-Year Storm	4.13- 28 <u>29</u>
4.13-5	PMPU Consistency with California Coastal Commission 2018 Sea Level Rise LCP Guidance.....	4.13- 44 <u>45</u>
4.13-6	PMPU Consistency with California Coastal Commission Sea Level Rise Adaptation Strategy Goals.....	4.13- 45 <u>46</u>
4.13-7	PMPU Consistency with California Coastal Commission Sea Level Rise CDP Guidance.....	4.13- 52 <u>54</u>
4.14-1	Summary of Significant Transportation Impacts and Mitigation Measures	4.14-1
4.14-2	Local Roadways	4.14-4
4.14-3	Mobility Hub Requirements	4.14-35
4.14-4	Evaluation Criteria and Impact Thresholds by Proposed Planned Improvements.....	4.14-55
4.14-5	Planning District 1 (Shelter Island) Projected Future Development	4.14- 59 <u>60</u>
4.14-6	Planning District 2 (Harbor Island) Projected Future Development	4.14-61

4.14-7	Planning District 2 (Harbor Island) VMT Efficiency Metrics for Impact Analysis of Employment Uses.....	4.14-61
4.14-8	Planning District 2 (Harbor Island) Total VMT for Impact Analysis of Retail, Restaurant, and Recreational Uses	4.14-62
4.14-9	Planning District 3 (Embarcadero) Projected Future Development1.....	4.14-63
4.14-10	Planning District 3 (Embarcadero) VMT Efficiency Metrics for Impact Analysis of Employment Uses.....	4.14-64
4.14-11	Planning District 3 (Embarcadero) Total VMT for Impact Analysis of Retail Uses	4.14-65
4.14-12	Planning District 4 (Working Waterfront) Projected Future Development	4.14-67
4.14-13	Planning District 4 (Working Waterfront) VMT Efficiency Metrics for Impact Analysis of Employment Uses	4.14-67
4.14-14	Planning District 8 (Imperial Beach Oceanfront) Projected Future Development.....	4.14-68
4.14-15	Planning District 8 (Imperial Beach Oceanfront) Total Regional VMT for Impact Analysis of Retail Uses.....	4.14-69
4.14-16	Planning District 9 (Silver Strand) Projected Future Development.....	4.14-70
4.14-17	Planning District 10 (Coronado Bayfront) Project Future Development	4.14-71
4.15-1	Summary of Significant Utilities and Service Systems Impacts and Mitigation Measures	4.15-1
4.15-2	Utility Service Providers	4.15-4
4.15-3	SDCWA Normal, Single-, and Multiple-Dry Year Water Supply and Demand (2020–2045) (AFY)	4.15-7
4.15-4	City of San Diego PUD Normal, Single-, and Multiple-Dry Year Water Supply and Demand (2025–2045) (AFY)	4.15-9
4.15-5	Sweetwater Authority Normal, Single-, and Multiple-Dry Year Water Supply and Demand (2025–2045) (AFY)	4.15-11
4.15-6	Active San Diego County Municipal Solid Waste Landfills	4.15-12
4.15-7	Wastewater, Water, and Solid Waste Generation Rates1	4.15-22
4.15-8	Existing and Proposed Utility and Solid Waste Consumption	4.15-22
6-1	Summary of Significant Effects of the Proposed PMPU	6-3
6-2	2050 Buildout Assumptions for Each Alternative (Net New)	6-11
6-3	Summary Impact Comparison of Proposed PMPU Alternatives	6-64

4.14-5	Proposed Transportation Facilities in Planning District 8: Imperial Beach Oceanfront	4.14-29
4.14-6	Proposed Transportation Facilities in Planning District 69: Silver Strand	4.14-31
4.14-7	Proposed Transportation Facilities in Planning District 10: Coronado Bayfront.....	4.14-33
6-1	Harbor Island Centralized Commercial Recreation Alternative	6-41
6-2	Recreation Open Space Alternative	6-53

Acronyms and Abbreviations

μPa	microPascals
μg/cm ₃	micrograms of lead per cubic meter
2016 SIP	2016 Plan for Attaining the National Ozone Standards
2020 SIP	2020 Plan for Attaining the National Ozone Standards
AB	Assembly Bill
AB 2588	Air Toxics Hot Spots Information and Assessment Act of 1987
AB 691 Report	Sea Level Rise Vulnerability Assessment and Coastal Resiliency Report
ABM	Activity Based Model
ACC	Advanced Clean Cars
ACM	asbestos-containing material
ADA	Americans with Disabilities Act
ADP	Airport Development Plan
ADT	average daily traffic
AFY	acre-feet per year
AGR	agricultural supply
AIA	Airport Influence Area
AICUZ	Air Installations Compatible Use Zones
Airport Authority	San Diego County Regional Airport Authority
Airport Committee	Airport Authority initiated the Harbor Drive Mobility Committee
Alquist-Priolo	Alquist-Priolo Earthquake Fault Zoning Act
ALUC	Airport Land-Use Commission
ALUCP	Airport Land Use Compatibility Plan
AQIA	Air Quality Impact Analysis
AR4	IPCC Fourth Assessment Report
ARA	Archaeological Resources Assessment
ARB	California Air Resources Board
ASCE	American Society of Civil Engineers
AST	aboveground storage tank
ATCM	airborne toxic control measure
ATP	Active Transportation Plan
BACT	best available control technology
BAE Systems	BAE Systems San Diego Ship Repair Facility
Basin 9-033	Coastal Plain of San Diego Basin
Basin Plan	Water Quality Control Plan for the San Diego Basin
BAU	business-as-usual
Bay	San Diego Bay
BMP	best management practice
Board	District Board of Port Commissioners
bp	before present
BPC	<u>District</u> Board of Port Commissioners
BTU	British thermal units
C&D	Construction and Demolition

CAA	Clean Air Act
CAAQS	California Ambient Air Quality Standards
CAC	County Administration Center
CAFÉ	Corporate Average Fuel Economy Standards
Cal/EPA	California Environmental Protection Agency
Cal/OSHA	California Division of Occupational Safety and Health
Cal-Am	California American Water Company
CalEEMod	California Emissions Estimator Model
CalEnviroScreen	California Communities Environmental Health Screening Tool
CalEPA	California Environmental Protection Agency
CalGreen	California Green Building Standards Code
Caltrans	California Department of Transportation
CAO	Cleanup and Abatement Order
CAP	Climate Action Plan
CAPP	Community Air Protection Program
CARB	California Air Resources Board
CBC	California Building Code
CCA	California Coastal Act
<u>CCPDO</u>	<u>City Center Planned District Ordinance (City of San Diego)</u>
CCC	California Coastal Commission
CCR	California Code of Regulations
CDFA	California Department of Food and Agriculture
CDFW	California Department of Fish and Wildlife
CDO	Cease and Desist Order
CDP	Coastal Development Permit
CEC	California Energy Commission
CEIDARS	California Emission Inventory Development and Reporting System
CEMP	California Eelgrass Mitigation Policy
CEPAM	California Emission Projection Analysis Model
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response Compensation and Liability Act
CERP	Community Emissions Reduction Program
CERP	Community Emissions Reduction Plan
CESA	California Endangered Species Act
CESPT	Comisión Estatal de Servicios Públicos de Tijuana
CFD	Coronado Fire Department and Lifeguard Services
CFL	compact fluorescent lamp
CFR	Code of Federal Regulations
CH ₄	methane
CHC	Commercial Harbor Craft
CHE	cargo handling equipment
CHP	California Highway Patrol
CHRIS	California Historical Resource Information System
City	City of San Diego
CMP	Congestion Management Program
CNDDb	California Natural Diversity Database

CNEL	Community Noise Equivalent Level
CNPS	California Native Plant Society
CNRA	California Natural Resources Agency
CO	carbon monoxide
CO ₂	carbon dioxide
CO ₂ e	carbon dioxide equivalent
Coalition	San Diego Navy Broadway Complex Coalition
COCs	constituents of concern
COD	chemical oxygen demand
Continental Maritime Shipyard IO	Continental Maritime ship repair facility
CoSMoS	Coastal Storm Modeling System
CPD	City of Coronado Police Department
CPUC	California Public Utilities Commission
CRHR	California Register of Historical Resources
CRPR	California Rare Plant Rank
CSLC	California State Lands Commission
CST	Cruise Ship Terminal
CTR	California Toxics Rule
CUPA	Certified Unified Program Agency
CVBMP	Chula Vista Bayfront Master Plan
CWA	Civil Works Administration
CWA	Clean Water Act
CY	Calendar Year
<u>dB</u>	<u>decibel</u>
<u>DCP</u>	<u>Downtown Community Plan (City of San Diego)</u>
DDT	dichlorodiphenyltrichloroethane
DEH	Department of Environmental Health
Dewatering General Permit	General Waste Discharge Requirements for Groundwater Extraction Discharges to Surface Waters Within the San Diego Region
District	San Diego Unified Port District
District Tidelands	District lands, tidelands, and submerged lands
District's	San Diego Unified Port District's
DMP	Dredging Management Program
DMP	Dredging Management Plan
DOT	Department of Transportation
DPM	diesel particulate matter
DPR	Department of Parks and Recreation
DPS	distinct population segments
Draft Plan	Draft California 2030 Natural and Working Lands Climate Change Implementation Plan
DSVs	Deep Submergence Vehicles
DTSC	Department of Toxic Substances Control
DWR	Department of Water Resources
EAC	Environmental Advisory Committee
ECA	Emission Control Area

ECO	Ecology Element (PMPU)
ECON	Economics Element (PMPU)
EDD	Employment Development Department
EDF	Environmental Defense Fund
EDR	Environmental Database Resource, Inc.
EFH	essential fish habitat
EJ	Environmental Justice Element (PMPU)
EIR	Environmental Impact Report
ELAP	Environmental Laboratory Accreditation Program
EMPN	Embarcadero Marina Park North
EMPS	Embarcadero Marina Park South
EMS	Emergency Medical Services
EO	Executive Order
EPA	U.S. Environmental Protection Agency
EPCRA	Emergency Planning and Community Right-to-Know Act
ESA	Environmental Site Assessment
ESA	Endangered Species Act
EV	electric vehicle
FAA	Federal Aviation Administration
FAR	Floor Area Ratio
FEMA	Federal Emergency Management Agency
FHWA	Federal Highway Administration
FIRMs	Flood Insurance Rate Maps
FR	Federal Register
FRS	fast response squad
FTA	Federal Transit Administration
FUDS	Formerly Used Defense Sites
g/L	75 grams per liter
GDLFP	General Dynamics Lindberg Field Plant
GHG	greenhouse gas
GIS	geographic information system
gpd	gallons per day
gpm	gallons per minute
GVWR	Gross Vehicle Weight Rating
HABS	Historic American Buildings Survey
HAER	Historic American Engineering Record
HALS	Historic American Landscapes Survey
HAPC	Habitat Area of Particular Concern
HAPs	hazardous air pollutants
HC	hydrocarbons
HDTF	Harbor Drive Test Facility
Health and Safety Plan	Health and Safety Plan for Dredging Activities
HFCs	hydrofluorocarbons
HMD	Hazardous Materials Division
HMTS	hazardous materials technical study
HOV	High-Occupancy Vehicle

hp	horsepower
HPAHs	high-molecular-weight PAHs
HPD	Harbor Police Department
HUs	hydrologic units
Hz	Hertz
I	Interstate
IAS	Institute of Aeronautical Sciences
IBFD	Imperial Beach Fire Department
IBWC	International Boundary and Water Commission
IES/IDA	Illuminating Engineering Society and International Dark Sky Association
IIPP	Injury Illness Prevention Program
IMO	International Maritime Organization
in/s	inches per second
in/s ²	inches per second squared
IND	industrial service supply
Industrial General Permit	General Permit for Stormwater Discharges Associated with Industrial Activities
INRMP	Integrated Natural Resources Management Plan
IOs	Investigative Orders
IPAC	Information, Planning, and Consultation System
IPCC	Intergovernmental Panel on Climate Change
IS&E Order	Imminent or Substantial Endangerment Determination and Remedial Action Order
ITC	Intermodal Transit Center
JHOC	Joint Harbor Operations Center
JPA	Joint Powers Authority
JRMP	Jurisdictional Runoff Management Plan
kg/yr	kilograms per year
kHz	kilohertz
kW	kilowatts
kWh	kilowatt hour
LBP	lead-based paint
LCFS	Low Carbon Fuel Standard
LCPS	Local Coastal Plans
LDS	Land Disposal Sites
LEA	Local Enforcement Agency
LED	light-emitting diode
LEED	Leadership in Energy and Environmental Design
L _{eq}	equivalent sound level
LHCE	Laurel Hawthorn Central Embayment
LHE	Laurel Hawthorn Embayment
LID	low-impact development
L _{max}	Maximum Sound Level
L _{min}	Minimum Sound Level
LOS	level of service
LPAHs	low-molecular-weight PAHs

LRMOSP	Long-Term Resource Management Options Strategic Plan
LT	long-term
LUST	leaking underground storage tank
LV	Vibration Velocity Level
L _{xx}	Percentile-Exceeded Sound Level
M	Mobility Element (PMPU)
M&I	Municipal and Industrial
m ₂	square meter
MARPOL	International Convention for the Prevention of Pollution from Ships
MBTA	Migratory Bird Treaty Act
MCAS	Maritime Clean Air Strategy
mg/L	milligrams per liter
mgd	million gallons per day
MICR	maximum incremental cancer risk
MLLW	mean lower-low water
MLO	Model Lighting Ordinance
mm	millimeters
MMPA	Marine Mammal Protection Act
MMRP	Mitigation Monitoring and Reporting Program
MMs	mitigation measures
MMT	million metric tons
MOU	Memorandum of Understanding
MPC	maximum practical capacity
mpg	miles per gallon
mph	miles per hour
MSL	mean sea level
MT	metric tons
MTS	Metropolitan Transit System
MUN	municipal and domestic supply
MUTCD	Manual on Uniform Traffic Control Devices
MWD	Metropolitan Water District
MWh	megawatt-hour
N ₂ O	nitrous oxide
NAAQS	national ambient air quality standards
NAHC	Native American Heritage Commission
NAS	Naval Air Station
NASSCO	National Steel & Shipbuilding Company
NAVAIDS	navigational aids
NCCP	Natural Communities Conservation Plan
NCMT	National City Marine Terminal
NCTD	North County Transit District
NCWRP	North City Water Reclamation Plant
NESHAPs	National Emission Standards for Hazardous Air Pollutants
NEVP	North Embarcadero Visionary Plan
NGOs	nongovernmental organizations
NHTSA	National Highway Traffic Safety <u>Administration</u>

NIMS	National Incident Management System
NMFS	National Marine Fisheries Service
NO	nitric oxide
NO ₂	Nitrogen Dioxide
NOAA	National Oceanic and Atmospheric Administration
NOLF	Naval Outlying Landing Field
NOLF-IB	Naval Outlying Landing Field-Imperial Beach
NOP	Notice of Preparation
NO _x	nitrogen oxides
NPDES	National Pollutant Discharge Elimination System
NPS	National Parks Service's
NRHP	National Register of Historic Places
NSR	New Source Review
NTR	National Toxics Rule
NWR	National Wildlife Refuge
O ₃	ozone
OEHHA	Office of Environmental Health Hazard Assessment
OGV	Ocean-Going Vessel
OGVs	ocean going vessels
OPR	Office of Planning and Research
OSHA	Occupational Safety and Health Administration
PAH	polycyclic aromatic hydrocarbons
PAHs	polycyclic aromatic hydrocarbons
Pb	Lead
PCBs	polychlorinated biphenyls
PCTs	polychlorinated terphenyls
PD	planning district
PDPs	Priority Development Projects
PDs	planning districts
PEIR	Program Environmental Impact Report
PFCs	perfluorinated carbons
PLWTP	Point Loma Wastewater Treatment Plant
PM	particulate matter
PM ₁₀	Respirable Particulate Matter
PM _{2.5}	particulate matter less than or equal to 2.5 microns in diameter
PMP	Port Master Plan
PMPA	Port Master Plan Amendment
PMPU	Port Master Plan Update
Port Act	San Diego Unified Port District Act
Portside Community	Community of Portside Environmental Justice Neighborhoods
ppb	parts per billion
ppm	parts per million
PPV	Peak Particle Velocity
PRC	Public Resource Code
psi	pounds per square inch
PUD	Public Utilities Department's

RAQS	Regional Air Quality Strategy
RCNM	Roadway Construction Noise Model
RCPs	Representative Concentration Pathways
RCRA	Resource Conservation and Recovery Act of 1976
Regional Bike Plan	Riding to 2050, the San Diego Regional Bike Plan
Regional Plan	<i>San Diego Forward: The Regional Plan</i>
RES	Regional Energy Strategy
RHMP	Regional Harbor Monitoring Program
RMI	Rohr Marine Incorporated
rms	root-mean-square
RoRo	roll-on/roll-off
ROW	Right(s)-of-Way
RPS	Renewables Portfolio Standard
RTCIP	Regional Transportation Congestion Improvement Plan
RTP	Regional Transportation Plan
RWQCB	Regional Water Quality Control Board
SAFE	Safer Affordable Fuel-Efficient
SAM	Site Assessment and Mitigation
SANDAG	San Diego Association of Governments
SAP	Sampling Analysis Plan
SB	Senate Bill
SBIWTP	South Bay International Wastewater Treatment Plant
SBWRP	South Bay Water Reclamation Plant
SCAB	South Coast Air Basin
SCAQMD	South Coast Air Quality Management District
SCCWRP	Southern California Coastal Water Research Project
SCH	State Clearinghouse and Planning Unit
SCIC	South Coastal Information Center
SCP	Site Cleanup Program
SCS	Sustainable Communities Strategy
SD&A	San Diego and Arizona
SD&AE	San Diego and Arizona Eastern
SDAB	San Diego Air Basin
SDAPCD	San Diego Air Pollution Control District
SDC	Seismic Design Category
SDCC	San Diego Convention Center
SDCOE	San Diego County Office of Education
SDCRAA	San Diego County Regional Airport Authority
SDFD	San Diego's Fire-Rescue Department
SDG&E	San Diego Gas & Electric
SDIA	San Diego International Airport
SDPD	City of San Diego Police Department
SDRC	San Diego Rowing Club
SDUSD	San Diego Unified School District
SEMS	Superfund Enterprise Management System
SEMS	Standardized Emergency Management System

SEP	State Energy Plan
SERC	State Emergency Response Commission
SF6	sulfur hexafluoride
SFHA	special flood hazard area
SHPO	State Historic Preservation Officer
SIC	standard industrial codes
SIP	State Implementation Plan
SJVAPCD	San Joaquin Valley Air Pollution Control District
SLCP	Short-Lived Climate Pollutant
SLIC	Spills, Leaks, Investigation and Cleanup
SLM	sound level meters
SLR	sea-level rise
SLR	sea level rise
SLT	screening-level threshold
STC	Sound transmission Class
SO ₂	Sulfur Dioxide
SOI	Secretary of the Interior's
Solar	Solar Turbines
SOPs	standard operating procedures
<u>SOV</u>	<u>Single-Occupancy Vehicle</u>
SO _x	sulfur oxide
SPAWAR	Space and Naval Warfare Systems
SPCC	Spill Prevention Control and Countermeasure
SPL	sound pressure level
<u>SR</u>	<u>Safety and Resiliency Element (PMPU)</u>
SR-	State Route
SSMP	Sewer System Management Plan
SSOs	Sanitary Sewer Overflows
ST	short-term
STC	Sustainable Terminal Capacity <u>(TAMT Redevelopment Plan)</u>
STRAHNET	Strategic Highway Network
SUHSD	Sweetwater Union High School District
Sustainable Freight Action Plan or Action Plan	Sustainable Freight Action Plan
SVOCs	semi-volatile organic compounds
SWCSs	stormwater control systems
Sweetwater	Sweetwater Authority's
SWPPP	Storm Water Pollution Prevention Plan
SWQMP	Storm Water Quality Management Plan
SWRCB	State Water Resources Control Board
TAC	toxic air contaminant
TAMT	Tenth Avenue Marine Terminal
TAZ	Transportation Analysis Zone
TBT	tributyltin
TCRs	tribal cultural resources

TDM	Transportation Demand Management
TDS	Total Dissolved Solids
TDY	Teledyne Ryan
Technical Advisory	Technical Advisory on Evaluating Transportation Impacts in CEQA
TIA	Transportation Impact Analysis
Tidelands	District lands, tidelands, and submerged lands
TIS	Traffic Impact Study
TIS	Transportation Impact Study
TMA	transportation management area
TMDL	total maximum daily load
TPA	Transit Priority Area
TPH	total petroleum hydrocarbons
TSS	Threshold Siting Surface
UP	Union Pacific Railroad
US&R	urban search and rescue
USACE	U.S. Army Corps of Engineers
USC	United States Code
USCG	U.S. Coast Guard
USDA	U.S. Department of Agriculture
USEPA	United States Environmental Protection Agency
USFWS	U.S. Fish and Wildlife Service
USGS	U.S. Geological Survey
USIBWC	United States Section of the International Boundary and Water Commission
UST	underground storage tank
UWMP	Urban Water Management Plan
UWMPA	Urban Water Management Planning Act
VAP	Voluntary Action Program
VAP	Voluntary Assistance Program
VHFHSZs	very high fire hazard severity zones
VTM	vehicle miles traveled
VOC	volatile organic compound
VSR	vessel speed reduction
Water Authority	San Diego County Water Authority
WDRs	Waste Discharge Requirements
WERs	water effect ratios
WHO	World Health Organization
WLU	Water and Land Use Element (PMPU)
WML	West Miramar Landfill
WoS	waters of the state
<u>WoUS</u>	<u>waters of the United States</u>
WPA	Works Progress Administration
WQIP	Water Quality Improvement Plan
<u>WSA</u>	<u>Water Supply Assessment</u>
WSCP	Water Shortage Contingency Plan
ZEV	zero-emission vehicle
ZNE	Zero Net Energy

Port Master Plan Glossary

Term	Definition
Accessory Use	A use of land or building, or portion thereof, that is customarily incidental to, related to, or clearly subordinate to a primary use or secondary use of the land or building located on the same premises. Accessory uses are distinguished from secondary uses in that an accessory use has a relationship to a primary or secondary use, whereas a secondary use may be independent of and have little to no relation to a primary use.
Accessway	A route by water or land that provides access to or through a destination. Examples of accessways include, but are not limited to, roadways, rail, pathways, bikeways, and navigation corridors. Refer to Figure 3.2.2 Accessway Hierarchy in (Chapter 3.2, Mobility Element).
Accommodate	To have or provide.
Accommodating	Supporting or sustaining.
Achieve	To carry out and meet stated policy or action.
Activating Feature	Attract visitors to, and extend users stay on Tidelands. May involve temporary or permanent activities and/or structures or amenities. Activating commercial features host small-scale commercial enterprises and serve visitors and the community. These features include, but are not limited to, carts, kiosks, stands, and pavilions for food service, retail, or other small-scale commercial, leisure or hospitality activities. Activating non-commercial features are structures or amenities designed for enhancing the public's use or enjoyment of open space. These features include, but are not limited to, furnishings or structures that offer shade or host interactive activities such as performance, entertainment, education, games, play, exercise, or similar activities. Shade structures are not considered an activating feature.
Activation Plan	An activation plan provides a framework and guidance for planning and programming of recreation open space for diverse human activity. The focus of place activation is on ensuring the needs of all potential users are met.
Active Uses	A use that involves participation, movement, or engagement in an activity.
Adaptation	Adjustment in natural or human systems to a new or changing environment. For example, adaptation to climate change refers to adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities.
Address	To direct the efforts or attention.
Adhere	To act based on rules or agreements that are upheld.
Adjacent Jurisdictions	Local, state, or federal agencies or municipalities whose jurisdictional boundaries are located adjacent to the District.
Allow	To give permission to have or do something.
Amenity	Facilities or furnishings that provide comfort, convenience, or enjoyment.
Amenity Zone	An area intended to improve comfort, convenience, or enjoyment, by providing a variety of facilities or street furnishings, such as pedestrian seating, trash receptacles, and signage.

Term	Definition
Anchorage Area	Space for vessels to anchor with sufficient area for natural movement during mooring and with sufficient access to navigable waters.
Appealable	Section 30715 in Chapter 8 of the Coastal Act provides a list of categories of development that may be appealed by the CCC. Development that is considered within one of these category types is referred to as “appealable,” and development that is not considered one of these category types is referred to as “non-appealable.” Refer to WLU Goal 1 (Chapter 3.1, Water and Land Use Element) for more information on development types and categories.
Aquaculture	Aquaculture, also known as fish, shellfish, or algae/seaweed farming, refers to the propagation, cultivation, maintenance, and harvesting of marine plants and animals in all types of water environments including ponds, rivers, lakes, the ocean and man-made “closed” systems on land. Aquaculture includes the production of food fish, sport fish, bait fish, ornamental fish, crustaceans, mollusks, algae, sea vegetables and other marine plant species, and fish eggs for the aquarium trade and in a range of food, pharmaceutical, nutritional or biotechnology products. Aquaculture is a priority coastal-dependent use, as described in the Coastal Act. Aquaculture may include the production of seafood from hatchery fish and shellfish which are grown to market size in ponds, tanks, cages, or raceways. Stock restoration or “enhancement” is a form of aquaculture in which hatchery fish and shellfish are released into the wild to rebuild wild populations or the creation of habitats to support native populations, such as oyster reefs. Fish laboratories and testing, as well as fish offloading/transshipment are also important aspects of aquaculture.
Artifacts	Objects or items characteristic of, or resulting from, a particular human institution, period, trend, or individual and may be prehistoric or historic.
Assess	To consider in order to make a judgement about.
Assessment District	Areas organized for the purpose of aiding in the development or improvement allowing for the collection of special assessments to finance public improvements.
Attractions	Places whose main purpose is to allow public access for entertainment, interest, or education. May include heritage, amusement/entertainment, recreation, or commercial. Activating features are similar to attractions, but with a size threshold for structures.
Avoid	To act in order to prevent something from occurring.
Barge	A large, flat-bottomed boat used to carry cargo from a port to shallow-draft waterways.
Basin	The catchment area of an abiotic compartment of Earth, usually associated with the hydrosphere or atmosphere (e.g. river basin or air basin).
Bayfront	An area of land adjacent to San Diego Bay.
Bayshore Bikeway	A regional corridor for use by cyclists that is planned to extend 24 miles around San Diego Bay, providing a physical and scenic connection to major bayfront employers, as well as tourist and recreational destinations. The SANDAG Bayshore Bikeway Plan provides guidance for the multi-agency and multi-jurisdictional effort.
Baywide Circulator	This is a mobility concept advanced in this Plan. It is anticipated that the summer shuttle will be upgraded to provide year-round service (aka bayfront circulator) and operate along Harbor Drive, establishing connections between Shelter Island and the San Diego Convention Center.

Term	Definition
	This Plan is agnostic to specific technology, so that it can include multiple forms of transportation technology (e.g., bus, automated people mover, fixed guideways, etc.).
Beneficial Use [Water]	Pursuant to the Porter-Cologne Water Quality Control Act, designations assigned to water bodies of the state that may be protected against quality degradation. In the San Diego Region, Beneficial Water Uses, including water quality objectives and implementation plans to protect those uses, are established by the California Water Quality Control Board, San Diego Region's Water Quality Control Plan for the San Diego Basin (Basin Plan). In the Pacific Ocean, Beneficial Water Uses include: contact water recreation; non-contact water recreation; wildlife habitat; industrial service supply; navigation; commercial and sportfishing; preservation of biological habitats of special significance; rare, threatened, or endangered species; marine habitat; migration of aquatic organisms; spawning, reproduction, and/or early development; shellfish harvesting; and aquaculture. In San Diego Bay, Beneficial Water Uses include: contact water recreation; non-contact water recreation; wildlife habitat; industrial service supply; navigation; commercial and sport fishing; preservation of biological habitats of special significance; rare, threatened, or endangered species; estuarine habitat; marine habitat; migration of aquatic organisms; spawning, reproduction, and/or early development; and shellfish harvesting.
Berth	The place primarily for a ship or boat when at anchor, a slip, or dock. A berth may also serve as a place for a barge, dry dock, or floating upweller system.
Best Available Science	The informational, scientific standard followed for decision making for an applicable process for a specific discipline.
Best Management Practices	A best practice is a method or technique that has been generally accepted as superior to any alternatives, because it produces results that are superior to those achieved by other means or because it has become a standard way of doing things, e.g., a standard way of complying with legal or ethical requirements.
Bike Lanes	A type of dedicated bike facility. Bike lanes are one-way facilities located on either side of a roadway. They provide a striped lane designated for the exclusive or shared <u>semi-exclusive use of bicycles. These are commonly referred to as Class II Bike Lanes.</u>
Bikeway	Right-of-way and/or a transportation facility that is dedicated to bicycles or nonmotorized micro-mobility vehicles.
Biodiversity	The number and variety of species found within a specified geographic region. The variability among living organisms on the earth, including the variability within and between species and within and between ecosystems.
Biologically Engineered	Application of engineering principles to analyze and design biological systems and technologies.
Blue Economy	The sustainable use of ocean resources for economic growth, improved livelihoods, and jobs while preserving the health of the ocean.
Boat (Yacht) Brokerage	A business representing yacht or boat sellers and/or buyers during sale or purchase of the boat, parts, and/or equipment.
Boat Launch Ramp	A developed slope between the shore and the water by which vessels or boats can be moved to and from the water.

Term	Definition
Build	To construct, assemble, erect, convert, enlarge, reconstruct, or structurally alter a building or structure.
Building Base	The lower portion of a building located immediately above grade.
California Coastal Plan	As defined in the Coastal Act, Section 30102: “Coastal plan” means the California Coastal Zone Conservation Plan prepared and adopted by the California Coastal Zone Conservation Commission and submitted to the Governor and the Legislature on December 1, 1975, pursuant to the California Coastal Zone Conservation Act of 1972 (commencing with Section 27000). For background on this coastal plan, prior to the passage of the California Coastal Act in 1976, the State of California adopted a Coastal Initiative (Proposition 20) in 1972 that established temporary regional coastal commissions and one statewide commission. These commissions were tasked with preparing a coastal plan with coastal policy and planning recommendations for the State. The California Coastal Zone Conservation Plan was completed in 1975 and many of these recommendations were brought forward into the California Coastal Act, including the establishment of the California Coastal Commission. Part IV of the 1975 Coastal Plan provided specific policy recommendations to each region, with accompanying maps, identifying various landmarks and coastal resources. These maps are referred to in Chapter 8 (titled “Ports”) of the Coastal Act for identifying wetland, estuary, or existing recreation areas in the coastal zone.”
Cantilevered Promenade	A pathway along the water’s edge designed to project over the water, allowing for enhanced access and enjoyment of Tidelands.
Carbon Neutrality	Carbon neutrality means annual zero net anthropogenic (human caused or influenced) carbon dioxide emissions.
Catastrophic Event	Tornadoes, hurricanes, earthquakes, tsunamis, unintentional fire, flooding, other acts of nature, terrorism, unintentional hazardous accidents, and other unintentional human-made incidents that severely damage or destroy structures, infrastructure, roads, or other components of the built environment that make such development or any portion thereof or not occupiable or usable for its intended purpose. Economic or fiscal conditions or market fluctuations shall not constitute a catastrophic event.
Clean Transportation and Sustainable Freight Strategies	Strategies fostering improving freight efficiency, transition to zero-emission vehicles and technologies, and increasing the competitiveness of freight systems.
Climate	The meteorological conditions, including temperature, precipitation, and wind, that characteristically prevail in a region.
Climate Change	A change in the state of the climate that can be identified (e.g., by using statistical tests) by changes in the mean and/or the variability of its properties and that persists for an extended period, typically decades or longer.
Coastal Act Approval	A CDP or Coastal Act exclusion issued by the District or alternatively issued by the CCC for an appealed Coastal Act approval.
Coastal-Dependent Development or Use	Any development or use which requires a site on, or adjacent to, the sea (or Bay) to be able to function at all. (Coastal Act Section 30101).
Coastal Development Permit	A permit for any development within the Coastal Zone that is required pursuant to subdivision (a) of Section 30600 of the Coastal Act and as applicable to ports pursuant to Chapter 8 of the Coastal Act.

Term	Definition
Coastal-Enhancing Development or Use	Any development or use that is not inherently or physically dependent on access to the water but may benefit or be more attractive by virtue of being in proximity to water. Uses draw from the coastal dependent and coastal related use activities as well as from other activities. Coastal-enhancing uses, while not a formal Coastal Act category, are a use category that has been carried forward in the Plan since it was originally certified by the CCC in 1981. Examples include restaurants, hotels and public recreation areas providing facilities for golf, field sports, and passive recreation.
Coastal Flooding	Flooding resulting from a coastal process—such as waves, tides, storm surge, or heavy rainfall from coastal storms.
Coastal Habitat	Habitats above spring high tide limit (or above mean water level in non-tidal waters) occupying coastal features and characterized by their proximity to the water.
Coastal Hazard	Natural hazards that adversely impact the coastline, including but not limited to coastal erosion, coastal flooding, extreme monthly tidal inundation, sea level rise, wave run-up.
Coastal Hazard Area	An area of special flood hazard extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storms or seismic sources.
Coastal-Related Development or Use	Any development or use that is dependent on a coastal-dependent development or use (Coastal Act Section 30101.3).
Coastal Zone	Land and water area of the State of California from the Oregon border to the border of the Republic of Mexico, specified on the maps identified and set forth in Section 17 of that chapter of the Statutes of the 1975-76 Regular Session enacting this division, extending seaward to the state's outer limit of jurisdiction, including all offshore islands, and extending inland generally 1,000 yards from the mean high tide line of the sea. In significant coastal estuarine, habitat, and recreational areas it extends inland to the first major ridgeline paralleling the sea or five miles from the mean high tide line of the sea, whichever is less, and in developed urban areas of the zone generally extends inland less than 1,000 yards. The coastal zone does not include the area of jurisdiction of the San Francisco Bay Conservation and Development Commission, established pursuant to Title 7.2 (commencing with Section 66600 of the Government Code, nor any contiguous thereto, including any river, stream, tributary, creek, or flood control or drainage channel flowing into such area (Coastal Act Section 30103).
Co-Benefit	The positive effects that a policy or measure aimed at one objective might have on other objectives, thereby increasing the total benefits (for the public or the environment).
Collaborate	To partner in aspects of a decision including the development of alternatives and the identification of a preferred solution.
Commerce	Activities and procedures involved in buying and selling goods or services.
Commercial Fishing	Fishing duly authorized under applicable state and federal laws or regulations, in which fish, or other seafood, wild harvested, either in whole or in part, are intended to enter commerce or enter commerce through sale, barter, or trade.
Commercially Operated Passenger Vessels	Vessels that carry multiple paying passengers for bay- and/or ocean-related activities.

Term	Definition
Conservation	The protection and management of natural resources that best reflect environmental stewardship for present and future generations.
Connection Points	Facilitate the transition from one mobility mode to another, including between water and land mobility modes.
Conservation Areas	Geographic locations or extents designated or dedicated to the act of conserving.
Conserve	To protect from loss, harm, and/or wastefulness.
Consider	To look at carefully or to think about in order to understand or decide.
Consultation	Solicitation and consideration of an agency's comments, suggestions, or input. (Consultation is not synonymous with "agreement" regarding an agency's comments or suggestions.)
Contribute	To give support or money for a common purpose or fund.
Coordination	More than just consultation and involves some level of cooperation. Taking a stakeholder's recommendations into account and incorporating (where possible) to avoid or reduce conflicts.
Courtyard	An open area of ground which is mostly surrounded by buildings or walls.
Create	To be the cause of establishment or to cause something to come into existence.
Criteria Air Pollutant	Six common air pollutants regulated by the U.S. Environmental Protection Agency per the Clean Air Act: carbon monoxide, lead, nitrogen dioxide, ozone, particulate matter, and sulfur dioxide.
Cultural History	The history of a culture or cultural area.
Cultural Use	Programming, production, presentation, and exhibition of any of the arts and cultural disciplines.
Curbside Management	Programmed organization and the physical treatment of dedicated stretches of curb lengths, designed to better manage and optimize the operations for a variety of users and mobility types who all require the use of the same curb space, ultimately utilizing space more efficiently or dedicating space to other uses other than single-occupancy vehicle parking.
Cycle Track	A bikeway for the exclusive use of bicycles, along a roadway that provides vertical and horizontal separation from vehicular traffic. Cycle tracks have different forms, but all share common elements—they provide space that is intended to be exclusively or primarily used for bicycles, and are separated from vehicular travel lanes. In situations where on-street parking is allowed cycle tracks are located to the curbside of the parking (in contrast to bike lanes).
Dedicated Bike Area	Right-of-way and/or a transportation facility that is solely dedicated to bicycles. Dedicated bike facilities include bike lanes and cycle tracks.
Dedicated Lanes	Travel lanes or right-of-way within the roadway that are solely dedicated for a specific mode. For example, a dedicated transit lane would be solely dedicated for the use of public transit vehicles, including, but not limited to, buses, street cars, and trolleys.
Deep-Water Berth	A place with sufficient depth of water for the access and usage of very large and heavily loaded ships to loading and unload.
Deep-Water Dependent	Any development or use which requires a site on, or adjacent to, deep water to be able to function at all.
Demolition	The razing, removal, deconstruction, salvaging, or wrecking of portions or all the exterior of a structure or building by hand, with heavy equipment,

Term	Definition
	by explosives or other means where a demolition permit or similar permit is required.
Design	To create, fashion, execute, or construct according to plan.
Destination	The place toward which someone or something is going or a place of arrival.
Develop	To grow or cause to become more physically active, advanced, or changed.
Development	On land, in or under water connected to submerged lands, the placement or erection of any solid material or structure; discharge or disposal of any dredged material or of any gaseous, liquid, solid, or thermal waste; grading, removing, dredging, mining, or extraction of any materials; change in the density or intensity of use of land, and any other division of land, including lot splits, except where the land division is brought about in connection with the purchase of such land by a public agency for public recreational use; change in the intensity of use of water, or of access thereto; construction, reconstruction, demolition, or modification of the size of any structure, including any facility of any private, public, or municipal utility; and the removal or harvesting of major vegetation other than for agricultural purposes, kelp harvesting, and timber operations which are in accordance with a timber harvesting plan submitted pursuant to the provisions of the Z'berg-Nejedly Forest Practice Act of 1973 (commencing with Section 4511) [California Coastal Act 30106].
Development Setback	A setback from the landside edge of a promenade (or similar pathway) and the building face.
Development Site	An individual lease premises or as determined by the District, collectively, individual lease premises or portions of land and/or water that functions collectively as one experience or development.
Development Standards	Specific requirements for structures, facilities, and buildings. These may include but is not limited to criteria such as minimum and maximum widths, heights, square footages, and setbacks.
Disadvantaged Community	Pursuant to SB 1000 (Levy, 2016), the definition of “disadvantaged communities is: an area identified by the California Environmental Protection Agency pursuant to Section 39711 of the Health and Safety Code or an area that is a low-income area that is disproportionately affected by environmental pollution and other hazards that can lead to negative health effects, exposure, or environmental degradation. This Plan encompasses not only the definitions contemplated by SB 1000, but also to include other low-income and minority populations, that are disproportionately burdened by or less able to prevent, respond, and recover from adverse environmental impacts. Refer to Section 3.5.2 (Chapter 3.5, Environmental Justice Element) for more information.
Disaster	Severe alterations in the normal functioning of a community or a society due to hazardous physical events interacting with vulnerable social conditions, leading to widespread adverse human, material, economic or environmental effects that require immediate emergency response to satisfy critical human needs and that may require external support for recovery.
Disaster Mitigation	Processes for designing, implementing, and evaluating strategies, policies, and measures to improve the understanding of disaster risk, foster disaster risk reduction and transfer, and promote continuous improvement in disaster preparedness, response, and recovery practices, with the explicit

Term	Definition
	purpose of increasing human security, well-being, quality of life, and sustainable development.
Displacement	To remove and move a use or structure from its place or position.
District Tidelands or Tidelands	The District's territory or jurisdiction as defined the San Diego Unified Port District Act, Section 5: (a) The area within the district shall include all of the corporate area of each of the cities of San Diego, Chula Vista, Coronado, National City, and Imperial Beach which establish the district as provided in this act, and any unincorporated territory in the County of San Diego contiguous thereto, which is economically linked to the development and operation of San Diego Bay, included in the district by the board of supervisors of the county as provided in this act. The regulatory, taxing, and police power jurisdiction of the district, as otherwise provided for in this act, shall apply to the above-described area. (b) In addition to the powers and authority describe in subdivision (a), the district shall exercise its land management authority and powers over the following areas: (1) The tidelands and submerged lands granted to the district pursuant to this act of any other act of the Legislature. (2) Any other lands conveyed to the district by any city of the County of San Diego or acquired by the district in furtherance of the district's powers and purposes as provided in Section 87 [of the San Diego Unified Port District Act]. Additionally, after acquired tidelands and exchanged lands are considered District Tidelands.
Dock	A platform extending from a shoreside facility over water, used to secure, protect, and provide access to a boat or ship.
Dock and Dine	Temporary berthing at a dock or pier to patronize an adjacent or adjoining restaurant
Docking	The act of securing a ship, boat, or barge to a dock.
Drought-tolerant	The ability of a plant to live, grow, and reproduce satisfactorily with limited water supply in the context of existing plant climate for an area/region.
Dry Bulk	A commodity type that includes, but is not limited to, minerals, fertilizing materials, sand and gravel, and cement, which is transported in large quantities.
Dry Dock	A narrow basin or vessel that can be flooded to allow a boat or ship to be floated in, then drained to allow that boat or ship to come to rest on a dry platform.
Dry Dock Service	Activity that may occur in or out of water and include, but are not limited to, vessel building, dockside facilities maintenance, and repair services. Activities associated with this use involve lifting vessels out of the water for inspection, maintenance, and repair, as well as undocking after completion of work.
Easement	An easement is a real estate ownership right granted to a third-party individual or entity to make a limited use of the land of another.
Ecological Buffer	An upland, wetland, and/or riparian area that protects and/or enhances biological resource functions associated with wetlands, rivers, streams, lakes, marine, and estuarine systems from disturbances associated with adjacent land uses (33 Code of Federal Regulations 332.2)
Ecology	The relationship between plants, animals, people, and their environment, and the balance of these elements within the ecosystem.
Ecoregion	Ecoregions are areas where ecosystems (and the type, quality, and quantity of environmental resources) are generally similar. Designed to serve as a spatial framework for the research, assessment, and monitoring of

Term	Definition
	ecosystems and ecosystem components, ecoregions denote areas of similarity in the mosaic of biotic, abiotic, terrestrial, and aquatic ecosystem components with humans being considered as part of the biota.
Ecosystem	A unit of land or water comprising populations of organisms (including humans) considered together with their physical environment and the interacting processes between them.
Ecosystem Service	Ecological processes or functions having monetary or non-monetary value to individuals, the environment, or society at large. These are frequently classified as (1) supporting services such as productivity or biodiversity maintenance, (2) provisioning services such as food or fiber, (3) regulating services such as climate regulation or carbon sequestration, and (4) cultural services such as tourism or spiritual and aesthetic appreciation.
Eco-Tourism	Travel to areas of natural or ecological interest for the purpose of observing wildlife and learning about the environment.
Educate	To teach something over a set time period, so that knowledge and understanding is acquired by others.
Effective Date	As to the Port Master Plan Update, once the process codified in 14 California Code of Regulations 13632, subsection (e), as may be amended, is completed
Emergency	A sudden, urgent, usually unexpected occurrence or occasion requiring immediate action.
Emerging market	An economy structured on new technology, standards, increasing access, and revised regulations.
Enable	To make possible or allow for something to occur.
Encourage	To stimulate something/someone by approval or help.
Encroachment	Any obstruction or protrusion into a right of way or adjacent property, whether on the land or above it.
Engage	To take part or participate; or to involve a person's attention intensely.
Enhance	To improve or increase in quality or value.
Ensure	To make certain.
Environmental Justice	Environmental justice means the fair treatment and meaningful involvement of all people regardless of race, color, national origin, culture, education, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Refer to Chapter 3.5, Environmental Justice Element for more information.
Environmental Sensitive Area	Any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments.
Establish	To begin or create something such as a program, activity, or use.
Estuary	Partially enclosed body of water where river/fresh and ocean/salt/tidal waters mix.
Evaluate	To find or judge the quality or value of something.
Existing Development Site	A development site that is present as of the date of certification of this Plan (amended XXXX).
Expand	To increase in extent, size, or scope.
Explore	To examine or investigate systematically.

Term	Definition
Extreme Monthly Tidal Inundation	Inundation experienced during monthly highest high tide.
Facility	Buildings, structures, pieces of equipment, or other physical systems.
Fair share (in terms of cost sharing)	Equitable distribution of costs amongst entities necessitating or benefiting from the improvements incurring those costs.
Fault Line setback	Distance established between a known fault line and where habitable structures may be built.
Feasible	Capable of being accomplished in a successful manner within a reasonable period of time, considering economic, environmental, social, and technological factors.
Fill	Earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon, placed in a submerged area.
Finished Grade	The final elevation and contour of the ground after cutting or filling and conforming to the proposed design.
Fish Laboratory and Testing	Facility containing laboratory testing equipment in support of marine research to ensure the health of marine species.
Fishery	The industry or occupation devoted to the catching, processing, or selling of fish, shellfish, or other marine or aquatic animals.
Floating Upweller System	Mechanical, water-based, floating structure that relies upon upwelling.
Freight	Goods, excluding passengers, carried by a vessel or vehicle, especially by a commercial carrier; cargo.
Freight Hub	Major airport, seaport, or other type of intermodal facility developed to exchange freight between different vessels or modes of transport.
Garden Space	A garden space is a non-programmed outdoor area that is primarily soft surfaced with ample seating and extensive planted areas. Garden spaces are intimate, nonprogrammed spaces intended as respite from more heavily programmed open spaces located throughout the waterfront.
Gateway/Entry Gateway	[A]n entrance corridor that heralds the approach of a new landscape and defines the arrival point as a destination.
General Use-Travel Lanes	<u>General travel lanes available for use by vehicular traffic without any restrictions or tolls. Portion of roadway for the movement of vehicles exclusive of shoulders, berms, sidewalks, and parking areas.</u>
Goal	A goal is a broad statement that guides action, in accordance with the District's vision for the Tidelands.
Golf Course	The grounds where the game of golf is played.
Greenhouse Gas (GHG)	Gaseous constituents of the atmosphere, both natural and anthropogenic, that absorb and emit radiation at specific wavelengths within the spectrum of terrestrial radiation emitted by the Earth's surface, the atmosphere itself and by clouds.
Green Infrastructure	The range of measures that use plant or soil systems, permeable pavement or other permeable surfaces or substrates, stormwater harvest and reuse, or landscaping to store, infiltrate, or evapotranspire stormwater and reduce flows to sewer systems or to surface waters.
Habitat	The place or environment where a plant or animal naturally or normally lives and grows.
Habitat Enhancement	Areas where activities are conducted within existing natural habitats to achieve specific management objectives or provide conditions which

Term	Definition
	previously did not exist, and which increase or improve one or more ecosystem functions.
Habitat Replacement	An approach to manipulating habitat conditions in which a habitat is converted from one type to another in order to mimic a desirable natural habitat present at another location.
Habitat Restoration	Returning certain habitats to their former historical condition.
Hand-Launched Non-Motorized Watercraft	Watercraft that does not have or utilize a motor to travel along the water. This type of watercraft does not require the use or assistance of vehicle or additional equipment when being launched into the water from the land.
Hazard	The potential occurrence of a natural or human-induced physical event or trend that may cause loss of life, injury, or other health impacts, as well as damage and loss to property, infrastructure, service provision, ecosystems, and environmental resources.
Height	The distance from the base of something to the top, measured from the ground up.
Identify	To discover, prove, or recognize as being a certain person, cause, or thing, often through an analytical process.
Impact	The effect of any direct man-made or natural actions or indirect repercussion of man-made or natural actions on existing physical, social, or economic conditions and communities.
Implement	To carry into effect; or to enact a document of steps or a scheme of action to ensure attainment of identified planning, development, environmental quality, or other standards within a specific time period.
Include	To add as part of the whole.
Increase	To make or become greater in size, degree, or frequency.
Indigenous	Produced, growing, living, or occurring natively or naturally in a region or environment.
Integrate	To add or bring parts together
Integrated Planning	A multi-faceted, collaborative planning process considering economic, social, and cultural opportunities
Intensification (as in increased density or intensity)	The development of a property, site or area at a higher density than currently exists, through development, redevelopment, infill and expansion or conversion of existing buildings.
Intertidal	The area along the shore that is intermittently submerged and exposed due to tidal flows, which change daily and seasonally due to the gravitational pull of the moon and the sun.
Invasive Species	Any kind of living organism that is not native to an ecosystem and causes harm.
Invest	To devote time, effort, or resources to a project, process, or initiative considered to useful or likely to succeed.
Involve	To work directly with the stakeholders throughout a process to ensure that concerns and aspirations are consistently understood and considered.
Kiosk	A small building or structure from which people can buy items, goods, or services.
Landward	Towards land (away from water).
Land Use Type	A type of development or activity occurring on the land within a specified land use designation.

Term	Definition
Lease	A written agreement by and between the District and a third-party for use of District Tidelands or other granted lands or water that complies with all applicable regulations and laws. For avoidance of doubt, leases include, but are not limited to ground leases, leases, Tideland Use and Occupancy Permit, Right of Entry Permit, or any subleases requiring District consent.
Lessee	The third-party or entity that has legally entered a lease with the District.
License Agreement	A written agreement by and between the District and a third-party that gives the third-party permission to use Tidelands but does not grant the third-party any real property interest in Tidelands. A license agreement may be revocable or irrevocable.
Leverage	To utilize resources or other means of ability to influence situations or people to accomplish some purpose
Linkage	The connection of two (or more) things.
Liquid Bulk Handling (receipt and distribution)	The physical transfer and storage of liquid bulk from vessels to vessels or freight to vessel through pipelines. This may also include bunkering and storage.
Listed Species	A species designated as candidate, threatened, or endangered pursuant to the California Endangered Species Act and/or listed as threatened or endangered under the Federal Endangered Species Act.
Living Shorelines	Constructed features that can be incorporated into shoreline protection that may mimic natural features of a shoreline to provide specific adaptation or ecological services, such as but not limited to, protection, dissipation of wave energy, and biological enhancements.
Locate	To designate the site of.
Logistics and Supply Chain Support Services	Processing, administration, maintenance, or repair facilities supporting cruise terminal or cargo terminal operations of transporting cargo and people.
Long-Term Leases	A lease with term of five years or more in duration.
Lower Cost Visitor and Recreational Facilities	Facilities that are intrinsically lower cost or no cost, which may include, but are not limited to: public recreational opportunities such as active and passive parks, open space, gardens, promenades, walkways, and bikeways/bike paths; wayfinding signage, seating, bicycle racks and other enhancements to public access areas; free or lower-cost public events or tours; public art, museums or exhibits; public viewing areas or piers; free or lower cost transportation, including shuttles, van pools, water taxis and bicycle racks; public fishing piers or floating docks; low cost or free moorings or boat slips; dock and dine piers; parking facilities/spaces that are free or lower cost; overnight accommodations with kitchenettes, free wi-fi, free or reduced cost breakfast, and free parking; campgrounds, yurts, or tent campsites that are intrinsically lower cost.
Maintain	To keep in functional and operating condition by regularly checking it and repairing it when necessary.
Major Development	Cumulative modification or cumulative replacement of 50 percent or more of a single major structural component of an existing development; or Cumulative modification or cumulative replacement of 50 percent or more of the sum total of all major structural components of a single existing development or multiple existing developments on an existing development site; or Issuance of a term extension or cumulative term extensions, after the effective date of the Port Master Plan Amendment,

Term	Definition
	that equal to fifteen (15) years or more; or Granting of a new lease of more than ten (10) years; or Issuance of a new Coastal Development Permit for new development.
Major Structural Component(s)	The foundation, floor framing, exterior wall framing and roof framing of a structure. Exterior siding, doors, window glazing, roofing materials, decks, chimneys, and interior elements including but not limited to interior walls and sheetrock, insulation, fixtures, and mechanical, electrical and plumbing elements are not considered major structural components.
Marine Research	Any study, whether fundamental or applied, intended to increase knowledge about the marine environment, including its resources or living organisms through scientific-based activity.
Marine Technology	Any technology, system, or platform that: <ul style="list-style-type: none"> • is designed for use or application above, on, or below the sea surface or that is otherwise applicable to maritime operational needs, including such a technology, system, or platform that provides continuous or persistent coverage; and • supports or facilitates: <ul style="list-style-type: none"> • maritime domain awareness, including: • surveillance and monitoring; • observation, measurement, and modeling; or • information technology and communications; • search and rescue; • emergency response; • marine inspections and investigations; or • protection and conservation of the marine environment.
Maximize	To increase to the maximum or to raise to the highest possible amount of degree.
Merchant Marine	United States civilian mariners and merchant vessels that engage in commerce or goods transportation and services in and out of United States' navigable waters. In times of war, the United States Merchant Marine can be called upon to deliver military personnel and material for the military.
Micromobility	Personal transportation using any vehicles whose gross weight is less than 500kg.
Mid-Block Pedestrian Crossing	A pedestrian roadway crossing that is not adjacent to, or aligned, with a controlled intersection. May or may not be aligned with a walkway.
Minimize	To reduce to a minimum or to decrease to the least possible amount.
Minor Development	All other development that is not major development (See Major Development).
Mitigation Banking	A wetland, stream, or other marine or coastal resource area that has been restored, created, enhanced, or (in certain circumstances) preserved for providing compensation for unavoidable impacts to marine or coastal resources permitted under Section 404 of the Clean Water Act or a similar state or local wetland regulation. A mitigation bank may be created when a government agency, corporation, nonprofit organization, or other entity undertakes these activities under a formal agreement with a regulatory agency.
Mobile Fueling Systems	Fueling apparatus that can re-locate to areas of need for fueling purposes for both land vehicles and water vessels.

Term	Definition
Industrial and Deep Water Berthing (This should be deleted)	Water areas primarily dedicated to ship berthing directly adjacent to berths. This designation supports the Marine Terminal, Visitor-Serving Marine Terminal, and Maritime Services and Industrial land use designations, with functional dependencies on direct access to, or association with, deep-water berthing and allows other supporting primary and secondary water uses or facilities.
Mobility Hub	A connection point in which visitors and workers are provided the opportunity to change from one mode of travel to another, as necessary, to reach their destination. A mobility hub includes, but is not limited to, landside modes such as personal auto; transit; rideshare; biking; walking; micro-mobility options; as well as waterside modes such as transient docking and water-based transfer points that support a water-based transit network, such as water taxis and/or ferries.
Modification (or Replacement) of Structural Component Cumulative Threshold to be Major Development (See Major Development)	<p>Exterior Wall Modification or Replacement. An exterior wall is considered to be modified 50 percent or more when any of the following occur:</p> <ul style="list-style-type: none"> • Exterior cladding and/or framing systems are altered in a manner that requires removal and/or replacement of 50 percent or more of the elements of those cladding and framing systems, normally considered as linear length of wall; or • Reinforcement is needed for any remaining portions of the wall to provide structural support in excess of 50 percent of existing support elements (e.g., addition of 50 percent or more of beams, shear walls, or studs whether alone or alongside the existing/retained elements, etc.). • Floor or Roof Structure Modification or Replacement. A floor or roof structure is considered to be modified 50 percent or more when any of the following occur: • The roof or floor framing is altered in a manner that requires removal and/or replacement of structural elements (e.g., trusses, joists, shear components, rafters, roof/floor structural surface (e.g., plywood), etc.) supporting 50 percent or more of the square footage of the roof or floor; or • The roof or floor structural framing system requires additional reinforcement to any remaining portions of the roof or floor system to provide structural support (e.g., addition of 50 percent or more of beams, joists, shear components, rafters, roof/floor structural surface (e.g., plywood), etc., whether alone or alongside existing/retained system elements). • Foundation Modification or Replacement. A foundation is considered to be modified 50 percent or more when any work is done on any of the following: <ul style="list-style-type: none"> • 50 percent or more of the horizontal surface area of a slab foundation; • 50 percent or more of the floor area of a structure supported by a pier/post and/or caisson/grade beam foundation; or • 50 percent or more of a perimeter foundation.
Modify	To change or alter.
Mooring	A place where a boat can be tied so that it cannot move away, or the object it is tied to.
Motorized Mobility Device	An electric personal assistive vehicle
Multi-Modal	Characterized by several modes of activity or transportation.
Multi-Use	Intended or suitable for more than one use.

Term	Definition
Multi-Use Pathway	An accessway intended or suitable for more than one mode (e.g., pedestrians and bicycles), such as walking, jogging, cycling, and wheelchair use.
Native Vegetation	Vegetation that is local or endemic to the area and which originated or was produced naturally in the region and not introduced directly or indirectly by humans.
Natural Resources	Land, fish, wildlife, biota, air, water, groundwater, drinking water supplies, and other such resources belonging to, managed by, held in trust by, appertaining to, or otherwise controlled by the United States, any state or local government, any foreign government, or any indigenous tribe.
Nature Trail	An unpaved <u>pathway (could be waterside or non-waterside) that provides a dedicated area for pedestrians</u> walkway .
Navigation	The science of locating the position and plotting the course of ships and aircraft.
Net Zero Carbon Emissions	Net zero carbon emissions is considered a synonym for carbon neutrality.
New Development	Development that occurred after the effective date of this Plan.
Nonconforming Development	A development that was lawfully established, improved or constructed prior to the adoption of certification of this Plan (amended XXXX), but that does not conform with goals, objectives, and policies of this Plan's Elements and the standards and requirements of the applicable Planning District where the development is located.
Nonconforming Use	A use of development, water, or land that was legally established and maintained prior to the adoption and certification of this Plan (amended XXXX) yet does not conform to the amended land and/or water use designation.
Non-Native Species	A species living outside its native distributional range.
Non-Port Administration Office	Establishments that may operate on Tidelands but are not directly related to District operations.
Non-Water Oriented	Uses or actions not principally utilized for water-oriented purposes.
Nurture	Encourage or help to develop (plans ideas, or people).
Objective	A statement of a desired end.
Occupant	The third-party or entity that legally occupies a space on Tidelands.
Offer	To present for consideration.
Open Space, Active	Unobstructed, usable outdoor spaces accessible to the public for the purpose of programmed recreational activities including small and large park events.
Open Space, Passive	Emphasis on the open space aspect of a park and which involves a low level of development, including picnic areas and trails. A generally undeveloped space not intended for programmed recreational activities or small and large park events.
Optimize	To obtain the most efficient or optimum use of
Orient	To position, align or set with reference to points of the compass or other specific directions
Oriented	To be principally devoted to. (See non-water-oriented retail)
Overnight Accommodations	Land or water areas allowing for temporary overnight accommodation rented to a person for less than 180 consecutive days. Examples of

Term	Definition
	overnight accommodations include, but are not limited to, hotels, hostels, and lower cost visitor facilities.
Parcel	A District-defined piece of real estate.
Park	Open space primarily for recreation and publicly accessible.
Parking District	Defined geographic area within which parking fees are collected and used for parking improvements within that area.
Parkway	Within a street right-of-way, area between the curb and sidewalk, intended for landscaping and tree planting.
Participate	To take part, be or become actively involved, or share in.
Partner	To join together on an effort or initiative.
Partnership	A relationship between two entities that share the responsibility for a project or service delivery.
Paseo	A pedestrian way or plaza located between two adjacent buildings.
Passageway	A long narrow space with walls or fences on both sides, that connects one place with another.
Pathway	A type of accessway solely dedicated for the use of pedestrians. Examples of pathways include, but are not limited to, sidewalks, walkways, and nature trails.
Pavilions	A permanent or temporary structure providing commercial recreational services, retail/restaurant services, concessions, or entertainment.
Pedestrian Scramble	Traffic signal phase that temporarily stops all vehicular traffic from entering an intersection to allow for pedestrians and cyclists to cross the intersection in all directions, including diagonally, at the same time.
Performance Venue	Any establishment (indoors or outdoors) where entertainment, either passive or active, is provided for the pleasure of the patrons, either independent or in conjunction with any other use. Such entertainment includes but is not limited to vocal and instrumental music, dancing, karaoke, comedy, and acting.
Permittee	Any person or entity that is issued a Coastal Act Approval or has applied for a Coastal Act Approval.
Pier	A fixed structure that extends over the water and used as a landing place for vessels. A pier can also be used for other non-landing activities such as, but not limited to, recreation and commercial uses.
Planning District	Identifiable and functional geographic units of the District's jurisdiction. Planning district boundaries conform closely to the boundaries of established municipal jurisdictions and/or census tracts.
Planned Improvements	Planned improvements provide enhanced coastal access to Tidelands, on land and between the water-land interface or define the thresholds for development for appealable projects consistent with the Coastal Act.
Platform	A fixed structure that extends over the water and functions as an extension of land over the water and is used exclusively for non-landing activities such as, but not limited to, recreation and commercial uses. Some platforms have built structures or may be leased. Like a deck, but a platform is always over water or riprap.
Plaza	An open space designed for public use and defined by surrounding buildings and/or streets.

Term	Definition
Policy	A policy is a rule or course of action that indicates how a District objective will be achieved.
Port Master Plan	Carries out the provisions Chapter 8 of the Coastal Act. Contains the proposed uses of land and water areas, where known; the projected design and location of port land areas, water areas, berthing, and navigation ways and systems intended to serve commercial traffic within the area of jurisdiction of the port governing body; and proposed projects listed as appealable.
Port Master Plan Amendment	Formal approved change to the certified Port Master Plan, such an Amendment itself requires certification by the CCC.
Port Master Plan Update	A Port Master Plan Amendment approved by the Board of Port Commissioners on (XXX), certified by the CCC on (XXX) and effective as of (XXXX) (see 14 California Code of Regulations Section 13632).
Portside Community	Communities downwind from industrialized, waterfront uses and activities and tend to have poor air quality. As of certification of this Plan (dated XXXX), Portside Communities included Barrio Logan, Logan Heights, Sherman Heights in the City of San Diego, and West National City.
Preserve	To maintain and protect.
Primary Use	The preferred and dominant use within a water or land use designation. The primary use(s) for which land or a building is or may be intended, occupied, maintained, arranged, or designed.
Prioritize	To designate or treat (something) as more important than other things.
Prohibit	To refuse to allow.
Project	The whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment, and that is any of the following: (1) an activity directly undertaken by any public agency including but not limited to public works construction and related activities clearing or grading of land, improvements to existing public structures, enactment and amendment of zoning ordinances, and the adoption and amendment of local General Plans or elements thereof pursuant to Government Code Sections 65100–65700; (2) an activity undertaken by a person or entity which is supported in whole or in part through public agency contacts, grants, subsidies, loans, or other forms of assistance from one or more public agencies; or (3) an activity involving the issuance to a person of a lease, permit, license, certificate, or other entitlement for use by one or more public agencies (CEQA Guidelines Section 15378). A Project is separate from the ‘Appealable Project List’ as defined by this document; see definition of ‘Appealable’.
Promenade	A public pathway adjacent to the water for leisurely strolling or bicycling.
Promote	To help bring about or further the growth or establishment of; or to further the popularity of by publicizing and advertising.
Protect	To defend from trouble, harm, or loss.
Provide	To make available.
Public Facility	Any area that is owned, leased, or otherwise operated, or funded by a governmental body or public entity, which may, include, but is not limited to, buildings, property, recreation areas, and roads.
Public Open Space	Unobstructed, usable outdoor spaces accessible to the public.

Term	Definition
Public Realm	Public realm is defined as the exterior space around and between structures and facilities that are publicly accessible. These areas support or facilitate social interaction and include active and passive uses. While public realm areas may include designated Recreation Open Space areas, they may also include areas within a developed site or leasehold assigned with other use designations, such as Commercial Recreation. Public realm also includes streets, sidewalks, and other accessways that facilitate public access.
Public Transit	A system of transport, in contrast to private transport, for passengers by group travel systems available for use by the general public, typically managed on a schedule, operated on established routes, and that charge a posted fee for each trip.
Public Trust Doctrine	Refers to a common law doctrine creating the legal right of the public to use certain lands and water.
Public-Private Partnership	A partnership between a government agency and private entity that share the responsibility for a project or service delivery.
Pursue	To proceed along, follow, or continue with to try to find or strive for an item or objective.
Rail	A permanent road having a line of rails fixed to ties and laid on a roadbed and providing a track for cars or equipment drawn by locomotives or propelled by self-contained motors.
Recognize	To acknowledge or to be aware of the existence of or significance of.
Reconfiguration	The arrangement or rearrangement of parts into a different form or combination.
Recreation	Activities of leisure.
Recreational Boat Service Facilities	Facilities that provide services to recreational boating necessary for the operation and maintenance of recreational boats or for the comfort of recreational boat users. Such facilities should be located and designed to not interfere with commercial fishing. Facilities may include, but are not limited to, pump outs stations, repairs, fueling, docks, restrooms, and boat launches.
Recreational Marina	Coastal water area designated and used exclusively for the mooring of recreational vessels including mooring slips and service facilities located on mooring slip docks.
Recreational Marina – Related Facilities	Ancillary and supportive uses and areas related to supporting recreational marinas.
Recreational Vehicle & Camping	Areas dedicated for the parking and/or placement of tents, recreational vehicles (i.e. campers, motorhomes, trailers), and motor vehicles for overnight accommodations.
Recreational Vessel	Vessels used for recreational use. Recreational vessels can be motorized or non-motorized. Motorized vessels include but are not limited to jet skis; fly boards; boats; or similar motorized vessels for recreational use. Non-motorized vessels include but are not limited to: kayaks; paddle boats; boards (paddle, stand-up, surf, or similar); or similar non-motorized vessels for recreational use.
Redevelopment	Development on an existing development site.
Regulate	To control, direct, or govern according to a rule, principle, or system.

Term	Definition
Remediation (Environmental Remediation)	The removal of pollution or contaminants from environmental media such as soil, groundwater, sediment, or surface water.
Remove	To move something from place or position occupied.
Replace	To provide a substitute or equivalent for what is existing.
Replace in-kind	To provide a substitute or equivalent.
Require	To ask or insist upon, as by right or authority.
Research	To conduct careful, systematic, patient study and investigation in some field of knowledge, undertaken to discover or establish facts or principles.
Resilience	The capacity of any entity – an individual, a community, an organization, or a natural system – to prepare for disruptions, to recover from shocks and stresses, and to adapt and grow from a disruptive experience.
Restaurant (full-service)	Establishments primarily engaged in providing food services to patrons who order and are served while seated (i.e., waiter/waitress service) and pay after eating.
Restaurant (limited-service)	Establishments primarily engaged in providing food services where patrons generally order or select items and pay before eating.
Retain	To keep in a fixed state or condition.
Retrofit	To change in design, construction, or equipment of an existing facility in order to incorporate later improvements or to bring it into compliance (or where that is not feasible, more nearly into compliance) with modern standards for such facilities.
Roadways	An accessway which allows and is intended to serve vehicular traffic. Examples of roadways include, but are not limited to, general lanes and dedicated lanes for transit or other mobility modes.
Salt Pond	A human-made feature along the coastline that allows for the drying and collection of salt.
Scenic Vista Area	An area of visual public access providing scenic views from publicly accessible points on Tidelands, as depicted on the Planning District Coastal Access: Views and Pathways figures.
Sea Level Rise	Sea level change, both globally and locally (relative sea level change) due to (1) a change in ocean volume as a result of a change in the mass of water in the ocean, (2) changes in ocean volume as a result of changes in ocean water density, (3) changes in the shape of the ocean basins and changes in the Earth's gravitational and rotational fields, and (4) local subsidence or uplift of the land.
Secondary Use	Complement primary use(s) identified within a water and land use designation but are not the preferred use and should not dominate any development site, or impede, interfere or create conflicts with the functionality of the higher priority primary use.
Sensitive Coastal Habitats	Areas that have: "sensitive resource values," meaning those fragile or unique natural resources, including flora and fauna, which are particularly susceptible to degradation resulting from surrounding development, the adverse effects of which have not been carefully evaluated, mitigated, or avoided. Examples include, but are not limited to, environmentally sensitive areas, as defined in CCA Section 30107.5, areas uniquely suited for scientific or educational purposes, and specific public recreation areas where the quality of the recreational experience is dependent on the character of the surrounding area. (California Coastal Act Section 30525)

Term	Definition
Sensitive Habitat	Land, water, and vegetation needed to maintain one or more sensitive species.
Sensitive Receptor	Areas where the occupants are more susceptible to the adverse effects of exposure to toxic chemicals, pesticides, noise, and other pollutants. A sensitive receptor includes, but is not limited to, hospitals, schools, daycare facilities, elderly housing, and convalescent facilities, but excludes overnight accommodations.
Setback	The minimum distance required to be maintained between two structures or between a structure and a leasehold line/premises or development area boundary.
Shade Structure	A built or natural structure, either permanent or transient, where the intended use is to provide relief from the sun.
Shared Parking	A parking facility that serves, or is utilized by, two or more developments or uses. An example of a shared parking facility is that shared parking spaces between entities could be utilized during different peak-hour times to result in overall reduction in the total number of required parking spaces.
Ship	A large vessel used for military, cargo, or passenger needs.
Ship Chandlery	A retail dealer specializing in supplies and/or equipment for ships.
Shoreline	Where the land and a body of water meet.
Shoreline Protective Devices	Revetments, breakwaters, groins, harbor channels, seawalls, cliff retaining walls, and other such construction that alters natural shoreline processes shall be permitted when required to serve coastal dependent uses or to protect existing structures or public beaches in danger from erosion, and when designed to eliminate or mitigate adverse impacts on local shoreline sand supply.” Upland adaptation strategies and “soft” or natural shoreline solutions, such as living shorelines, do not constitute shoreline protective devices. (California Coastal Act, Section 30235)
Short-term public docking	A location, typically a dock or a pier, that is made available to the public, by reservation and/or on a first come, first served basis, for short-term recreational boat berthing; not for the purposes of overnight berthing for recreational boaters and/or berthing of commercial vessels. A “Dock and Dine” facilities is the same as short-term public docking.
Sidewalk	A dedicated non-waterside pathway, providing that provides a dedicated area for pedestrians connectivity adjacent and parallel to a roadway.
Site	To locate or position (verb). The place where a structure or development was, is, or will be located (noun).
Special Allowances	Provide specific detail on allowable uses, conditions, or operations in specific locations on Tidelands. Special allowances are intended to address unique situations in either a planning district or subdistrict.
Spill Response Services	An establishment that provides the necessary services required to effectively respond to, contain, and clean up releases of hazardous chemicals and/or wastes.
Sportfishing	Fishing duly authorized under applicable state and federal laws or regulations in which passengers pay to fish on a licensed sportfishing vessel.
Standards	Establish requirements for the physical development of property.

Term	Definition
State Tidelands and Submerged Lands (or tidelands and submerged lands)	Pursuant to the Submerged Lands Act of 1953, these lands include: (1) all lands within the boundaries of each of the respective States which are covered by nontidal waters that were navigable under the laws of the United States at the time such State became a member of the Union, or acquired sovereignty over such lands and waters thereafter, up to the ordinary high water mark as heretofore or hereafter modified by accretion, erosion, and reliction; (2) all lands permanently or periodically covered by tidal waters up to but not above the line of mean high tide and seaward to a line three geographical miles distant from the coast line of each such State and to the boundary line of each such State where in any case such boundary as it existed at the time such State became a member of the Union, or as heretofore approved by Congress, extends seaward (or into the Gulf of Mexico) beyond three geographical miles, and (3) all filled in, made, or reclaimed lands which formerly were lands beneath navigable waters. These lands are managed by the California State Lands Commission or its grantees.
Stepback	An upper-story setback, a step-like recession in a building wall, used to reduce building bulk and scale, promote daylight, create pedestrian character, and/or reduce shadow.
Stewardship	An ethic that embodies the responsible planning and sustainable management of resources.
Storage	Dedicated structures or areas where materials or goods are kept until needed.
Strategic Highway Network (STRAHNET)	The STRAHNET is a 62,791-mile system of roads deemed necessary for emergency mobilization and the peacetime movement of heavy armor, fuel, ammunition, repair parts, food, and other commodities to support U.S. military operations. Even though the U.S. Department of Defense deploys heavy equipment primarily by rail, highways still play a critical role in times of need. STRAHNET Connectors (about 1,700 miles) are additional highway routes linking more than 200 important military installations and ports to STRAHNET. These routes typically are used when personnel and equipment are moved during a mobilization or deployment. Generally, these routes end at the port boundary or installation gate. Although installations may have multiple access/ egress routes, the STRAHNET Connector is generally the most direct and highest functional class roadway.
Structure	Includes, but is not limited to, any building, road, pipe, electrical power transmission and distribution line, communication facilities, renewable energy facilities, in-water improvements, or permanent placement or erection of any solid material on land or in the water, including without limitation building materials or landscaping.
Subdistrict	A division of a planning district.
Support	To carry or bear the weight of; To promote the interests or cause of.
Sustainable	Practices that meet the needs of present users without compromising the ability of future generations to meet their own needs, particularly with regard to use and waste of natural resources.
Technology Cluster	Broad and inclusive networks made up of public and private entities focused on industrial research, training, and technology transfer.
Terminal	A connection point for Industrial marine or cruise terminal operations.

Term	Definition
Tidelands	<p>The District's territory or jurisdiction as defined by the San Diego Unified Port District Act, Section 5:</p> <ul style="list-style-type: none"> • The area within the district shall include all of the corporate area of each of the cities of San Diego, Chula Vista, Coronado, National City, and Imperial Beach which establish the district as provided in this act, and any unincorporated territory in the County of San Diego contiguous thereto, which is economically linked to the development and operation of San Diego Bay, included in the district by the board of supervisors of the county as provided in this act. The regulatory, taxing, and police power jurisdiction of the district, as otherwise provided for in this act, shall apply to the above-described area. • In addition to the powers and authority describe in subdivision (a), the district shall exercise its land management authority and powers over the following areas: • The tidelands and submerged lands granted to the district pursuant to this act of any other act of the Legislature. • Any other lands conveyed to the district by any city of the County of San Diego or acquired by the district in furtherance of the district's powers and purposes as provided in Section 87 [of the San Diego Unified Port District Act]. Additionally, after acquired tidelands and exchanged lands are considered District Tidelands.
Tidelands Border Community	Communities in the City of Imperial Beach, which tend to have poor water quality and suffer from transboundary environmental pollution in and around the Tijuana River Valley.
Tower	That portion of a building located above the base building, extending to the top of the building.
Tower Floor Plate	The amount of gross floor area located on a single floor in the tower of a building.
Toxic Air Contaminants	An air pollutant which may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health. (39655 California Health and Safety Code)
Transient Vessel Docking	Short-term boat docking which allows vessels access for dock and dine and passenger pick-up and loading.
Transit Facilities	Structures or location advancing public transit operations on and off the roadway system.
Transition Zone	A sequence of graduated land uses.
Transportation Network Companies	A mobility service provider offering prearranged transportation services for compensation to connect drivers using their personal vehicles with passengers.
Trust-consistent	Activities or uses that are compatible with the District's mandate and responsibilities to administer the Tidelands in trust. Includes administration activities undertaken by the District and associated facilities (offices) principally to conduct such administration as well as the beneficial uses of tidelands (commerce, environmental stewardship, fisheries, navigation, recreation,) and support thereof.
Underutilized Land	An undeveloped or underdeveloped parcel or development site not optimized for social, environmental, and economic potential.
Update	To bring into conformance or to improve with the current facts, methods, or ideas

Term	Definition
Upland Connecting Roadway	A landside accessway connecting Tidelands to and from adjacent jurisdictions.
Upwelling	An oceanographic phenomenon that involves wind-driven motion of dense, cooler, and usually nutrient-rich water towards the ocean surface, replacing the warmer, usually nutrient-depleted surface water.
Use	Development or activity that occurs on a site or in a building or facility.
Use Type	Any purpose for which a lot, building, or other structure or tract of land may be designated, arranged, intended, maintained, or occupied; or any activity, occupation, business, or operation carried on or intended to be carried on in a building or structure or on a tract of land.
Vessels	All types of ocean-going watercraft (personal and recreational), ships (military, cargo, and cruise), commercially operated passenger boats, and commercial fishing and sportfishing boats.
Viability	Ability to work as intended or to succeed.
View Corridor Extension	A scenic extension from a street, or other accessway, or a defined viewpoint, as depicted on the Planning District Coastal Access: Views and Pathways figures.
Visitor Overnight Accommodations (associated cost levels)	<p>Lower Cost. For hotels or motels, the average daily room rate of all economy hotels and motels in the San Diego County Coastal Zone that have room rates that are 25 percent below the Statewide average daily room rate or lower. Economy hotels and motels are AAA-rated one or two diamond hotels, or equivalent. Lower cost overnight accommodations shall also include campgrounds, hostels, and recreational vehicle parks, as these overnight accommodations are inherently lower cost.</p> <p>Moderate Cost. The average daily hotel or motel room rate in the San Diego County Coastal Zone that is between lower cost and higher cost.</p> <p>Higher Cost. The average daily hotel or motel room rate in the San Diego County Coastal Zone is 25 percent higher than the Statewide average daily room rate or greater.</p> <p>Refer to Goal 6 (Chapter 3.1, Water and Land Use Element) for more information.</p>
Visual Access	The unhindered, ability to have continuous views of scenic resources.
Visual Porosity	Visual porosity describes the amount of unobstructed visual access or continuous views a user has through a particular space to the waterfront. Visual obstructions that decrease visual porosity include any structures, utilities or infrastructure, furnishings, vegetation or other permanent or temporary features.
Walkways	A non-waterside pathway, not parallel to a roadway , that provides access from the nearest public road to the waterfront, also known as vertical access <u>or a vertical connection</u> . Walkways are primarily for pedestrians (non-exclusive use) and may also function as a multi-use pathway and/or include a designated multi-use pathway and may include a view corridor extension.
Water Feature	A point of interest with water as the defining focus.
Water Use Type	A type of development or activity occurring in or on the water within a specified water use designation.
Water-Based Transfer Point	A place for loading and offloading passengers and/or cargo. This may include piers, docks, and slips.

Term	Definition
Water-Based Transit	Transportation services available to the public (operated publicly or privately) picking up and offloading passengers at water-based transfer points.
Watercraft	Vessels used for personal and recreational use.
Waterfront Destination Park	A large, highly programmed recreation open space located at the water's edge. May include a single large flexible space that can be programmed for diverse temporary uses, events, or activities or a series of smaller spaces that can be combined into a single contiguous area for temporary uses, events, or activities.
Water-Oriented Retail	Shopping facilities principally devoted to the sale of commercial goods utilized for water-oriented purposes.
<u>Waterside Promenade or Promenade</u>	<u>A pathway along the waterfront designed to enhance access and enjoyment of District Tidelands. Waterside promenades are primarily for pedestrians (nonexclusive use) and may also function as a multi-use pathway and/or include a designated multi-use pathway.</u>
Waterways	A navigable body of water.
Wave run-up	The maximum vertical extent of wave action on a beach or structure, above the still water line.
Wayfinding	Signage, graphic representations, or other digital or technological tools that provide orientation to one's surroundings and help one navigate from place to place.
Wetlands	Lands which may be covered periodically or permanently with shallow water and include saltwater marshes, freshwater marshes, open or closed brackish water marshes, swamps, mudflats, and fens.
Window to the Bay	A designated stretch of waterfront, located generally between Ash Street and Date Street within the North Embarcadero Subdistrict, providing a continuous visual access of the Bay.
Yacht Club	A sport club specifically related to yachting.

Introduction

This chapter provides a summary of the Final Draft Program Environmental Impact Report (PEIR) prepared for the Port Master Plan Update (PMPU), prepared in compliance with the California Environmental Quality Act (CEQA). The San Diego Unified Port District (District) is the CEQA Lead Agency for the PEIR and, as such, has the primary responsibility for evaluating the environmental effects of the proposed PMPU and considering whether to approve or disapprove the proposed PMPU, in light of these effects.

As required by CEQA, this Final Draft EIR does the following: (1) describes the proposed PMPU, including its location, objectives, benefits, and features; (2) describes the existing conditions in the project area and nearby environs; (3) analyzes the direct, indirect, and cumulative adverse physical effects that would occur on the existing conditions should the proposed PMPU be implemented; (4) identifies feasible means of avoiding or substantially lessening the significant adverse effects; (5) provides a determination of significance for each impact, after mitigation is incorporated; and (6) evaluates a reasonable range of feasible alternatives to the proposed PMPU that would meet the basic project objectives and reduce a project-related significant impact.

This Executive Summary covers the following topics: (1) Project Description; (2) Areas of Controversy/Issues Raised by Agencies and the Public; (3) Significant Environmental Effects, with proposed mitigation measures and alternatives to reduce or avoid such effects; and (4) Issues to Be Resolved, including whether or how to mitigate significant environmental effects and the choice among alternatives to the proposed PMPU.

The Draft PEIR was available for public review for 63 days beginning on November 8, 2021 and ending on January 10, 2022. The San Diego Unified Port District (District) posted an electronic version of the Draft PEIR on the District's website. Hard copies were sent to the City of San Diego Central Library, Imperial Beach Library, and Coronado Public Library. A hard copy was also available for review at the District's Administration Building at 3165 Pacific Highway, San Diego, CA 92101. A Notice of Availability was posted with the County Clerk on November 8, 2021, posted on the District's website, and mailed to public agencies, organizations, and individuals that expressed interest in the project. An email containing the information from the NOA was sent by the District to members of the public that had registered to receive such updates. All requisite documents, including the Notice of Completion form, were sent to the State Clearinghouse (SCH) and the SCH posted the NOA on the Office of Planning Research's CEQAnet database.

The District received 162 comment letters on the Draft PEIR during the public review period from agencies, organizations, businesses, tenants and interested individuals. Many of the comments concern the policies, goals and objectives of the PMPU itself and raise policy issues, rather than environmental questions. Although CEQA does not require the District to provide responses to such comments, they are included in this chapter for consideration by the Board of Port Commissioners (Board) when it makes a decision whether or not to certify the Final PEIR and approve the PMPU.

Pursuant to State CEQA Guidelines section 15088, the District has provided written responses to comments raising environmental issues, which are contained within Volume 1, Chapter 2 of the Final PEIR. Topics in such comments included aesthetics and visual resources, air quality and health

risks, biological resources, cultural resources, geology and soils, greenhouse gas (GHG) emissions and climate change, hazards and hazardous materials, hydrology and water quality, land use and planning, public services and recreation, sea level rise, transportation, circulation and parking, and utilities and energy use.

Changes in the Final PEIR include additional clarifying information required to respond to comments received. No new or more severe significant impacts were identified during the course of the Final PEIR's preparation and no recirculation of the Draft PEIR is required.

Project Description

Overview

The District is undertaking a comprehensive update to its existing Port Master Plan (PMP). The PMPU provides the official goals and planning policies, as well as water and land uses, for development and conservation of the District lands, tidelands, and submerged lands (collectively, Tidelands or District Tidelands) that comprise the proposed PMPU area. With buildout expected to occur by 2050, the proposed PMPU will implement the approximately 30-year planning vision by identifying allowable water and land uses and providing policies that address the following six PMPU Elements:

- Water and Land Use
- Ecology
- Environmental Justice
- Mobility
- Safety and Resiliency
- Economics

Project Location

The District's jurisdiction is divided into ten planning districts (individually, PD, and collectively, PDs) that group Tideland properties into identifiable and functional units. Planning district boundaries conform closely to the boundaries of established municipal jurisdictions following logically grouped geographic areas and provide the detailed Planned Improvements, Development Standards, Special Allowances, and water and land use maps. The ten planning districts are as follows:

- PD1: Shelter Island
- PD2: Harbor Island
- PD3: Embarcadero
- PD4: Working Waterfront
- PD5: National City Bayfront (excluded from PMPU)
- PD6: Chula Vista Bayfront (excluded from PMPU)
- PD7: South Bay (Pond 20 is excluded from the proposed PMPU)
- PD8: Imperial Beach Oceanfront
- PD9: Silver Strand

- PD10: Coronado Bayfront

As discussed in Chapter 3, Project Description, the PMPU addresses eight of the District's ten planning districts, including PD1, PD2, PD3, PD4, PD8, PD9, PD10 and part of PD7. The PMPU excludes, and this PEIR does not analyze, PD5, PD6 and the Pond 20 portion of PD7 because the PMPU does not propose any changes in the existing conditions in those planning districts.

Project Objectives

State CEQA Guidelines Section 15124(b) requires an EIR to contain a statement of objectives that address the underlying purpose of the project, which may also show a project's benefits. The District has identified the following objectives for the proposed PMPU:

1. Create an integrated vision for the District that governs the use, design, and improvement of public trust lands in accordance with Section 30711 of the California Coastal Act (CCA), the Public Trust Doctrine, and the San Diego Unified Port District Act (Port Act).
2. Within the PMPU area, create standards for new development, which serve to: 1) enhance and blend development with the surrounding character; 2) provide a balanced and diverse range of complementary uses; and 3) provide enough activation year-round and during the day-time for visitors to minimize the seasonally-related downtimes of uses on Tidelands.
3. Streamline the project review and entitlement process for implementation of the Port Master Plan.
4. Allow for an intensity and diversity of development that provides on-going and sustainable revenues to the District to ensure the longevity of the District's operations and its ability to fulfill its legislative responsibilities; balance the future needs of the maritime industry, tourism, water and land recreation; and reinvestment in critical infrastructure and maintenance of waterfront amenities and facilities as required by the Port Act and Public Trust Doctrine.
5. Provide an interconnected mobility network that encourages a range of travel modes, including the expansion of water- and land-based transit opportunities to support the movement of people, goods, and military operations.
6. Enliven the public realm by providing and maintaining recreation open space opportunities, through the creation and maintenance of: 1) public accessways; 2) physical and visual access to the water; and 3) an interconnected open space network.
7. Provide opportunities for creating a vibrant waterfront destination with a range of attractions for visitors, while protecting and restoring the environment through the proactive management of sensitive biological resources and ensuring coastal access around San Diego Bay.

These project objectives support several benefits of the PMPU, which are discussed under Section 3.4, *Project Benefits*.

Areas of Known Controversy/Issues Raised by Agencies and the Public

Section 15123 of the State CEQA Guidelines requires the summary of an EIR to identify areas of controversy known to the Lead Agency, including issues raised by agencies and the public. On March

30, 2017, the District posted a Notice of Preparation (Clerk Document No. 66681) (NOP) with the County Clerk in accordance with Section 15082 of the State CEQA Guidelines. This NOP was mailed to public agencies, organizations, and other interested individuals to solicit their comments on the scope and content of the environmental analysis. The District also held a public scoping meeting on April 12, 2017, at the District's Administration Building at 3165 Pacific Highway, San Diego, CA, 92101. The NOP is included as Appendix A.

A total of 23 comment letters were received during the NOP public review period. The primary issues raised were related to aesthetics; air quality; biological resources; greenhouse gases (GHGs); geologic hazards and soils; hazards and hazardous materials; hydrology and water quality; land use and planning; noise and vibration; population and employment; public services and recreation; utilities; sea level rise and climate change; and transportation, mobility, and public access. A summary of all comments received is included in Table 1-2 of Chapter 1, *Introduction*, and all NOP comment letters are included in Appendix B of this PEIR.

Issues to be Resolved

Summary of Project Impacts

This ~~Final Draft~~ PEIR examines the potential environmental effects of the proposed PMPU, including information related to existing site conditions, analyses of the types and magnitude of individual and cumulative environmental impacts, and feasible mitigation measures that could reduce or avoid environmental impacts. In accordance with Appendix G of the State CEQA Guidelines, the potential environmental effects of the proposed PMPU were analyzed for the following areas.

- Aesthetics and Visual Resources
- Air Quality and Health Risk
- Biological Resources
- Cultural Resources
- Geologic Hazards and Soils
- Greenhouse Gas Emissions and Energy
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise and Vibration
- Population and Employment
- Public Services and Recreation
- Sea Level Rise and Climate Change
- Transportation, Mobility, and Public Access
- Utilities and Service Systems

Table ES-1, presented at the end of this chapter, provides a summary of the significant environmental impacts that could result from implementation of the proposed PMPU and feasible mitigation measures that would reduce or avoid the impacts. For each impact, Table ES-1 identifies the significance of the impact before mitigation, applicable mitigation measures, and the level of significance of the impact after the implementation of the mitigation measures.

There are no agricultural, forestry, mineral, or tribal cultural resources identified within the proposed PMPU area; therefore, the proposed PMPU would not have an adverse effect on any of these resources. In addition, there are no wildfire hazard designated areas within or adjacent to the proposed PMPU area; therefore, the proposed PMPU would not result in impacts related to wildfire. Chapter 5, *Additional Consequences of PMPU Implementation*, includes a brief analysis as to why

impacts on agricultural, forestry, mineral, and tribal cultural resources, as well as impacts related to wildfire would not be significant.

Summary of Project Alternatives

The following alternatives are analyzed in detail in Chapter 6, *Alternatives to the PMPU*. The objective of the alternatives analysis is to consider a reasonable range of potentially feasible alternatives that would achieve the fundamental objectives of the PMPU and would avoid or substantially lessen any of the PMPU's potential significant impacts. The alternatives to the proposed PMPU are summarized below.

Alternative 1 – No Project Alternative

The No Project Alternative is required by CEQA and results in the continued implementation of the existing PMP. Pursuant to State CEQA Guidelines Section 15126.6(e), the No Project Alternative considers the existing conditions and what would be reasonably expected to occur in the foreseeable future, if the proposed PMPU was not approved, based on current plans and consistent with available infrastructure and community services. The appealable projects identified in the project lists tables under each existing precise plan in the existing PMP are assumed to be developed under this alternative. Development projections under this alternative are identified in Table 6-2 and would include up to 22,500 square feet of additional retail and restaurant space, 1,000 hotels rooms, 50 additional recreational boat slips, and 960,000 square feet of additional convention center space. In addition, the Tenth Avenue Marine Terminal (TAMT) would continue to implement the improvements consistent with the Tenth Avenue Marine Terminal Redevelopment Plan¹ (.

Alternative 2 – One-Third Reduced Growth Alternative

The One-Third Reduced Growth Alternative involves similar plan components as the proposed PMPU, but at an overall reduced scale. A reduction in the scale and magnitude of the proposed water and land uses is intended to reduce impacts to air quality and health risk, biological resources, greenhouse gas emissions, hydrology and water quality, noise, public services, transportation, and utilities. The One-Third Reduced Growth Alternative proposes a reduction in intensity of development by one-third for the following uses throughout the proposed PMPU area:

- **Retail and Restaurants:** This alternative would reduce the proposed PMPU's increased retail/restaurant uses from approximately 340,000 square feet to 227,800 square feet. Convention space would also be reduced from approximately 180,000 additional square feet to approximately 120,000 additional square feet. These reductions would be largely within PD2 (Harbor Island Planning District) and PD3 (Embarcadero Planning District).
- **Hotel Rooms:** The One-Third Reduced Growth Alternative would reduce the proposed increase of approximately 3,910 hotel rooms to approximately 2,620 rooms. These reductions would be largely within PD2, with a reduction of approximately 248 rooms in PD3.
- **Recreational Boat Slips:** The One-Third Reduced Growth Alternative would reduce the proposed increase of approximately 485 recreational boat slips to approximately 325

¹ See Chapter 3, *Project Description*, for a more detailed discussion on the Tenth Avenue Marine Terminal Redevelopment Plan.

recreational boat slips. These would be largely spread among PDs 1-3, and PDs 9-10, with the majority of reductions found within PD2.

While reducing the scale of development, this alternative would inversely increase recreation and open space throughout the proposed PMPU area to account for the reduced development intensity. The reductions in scale and intensity would also reduce the scale of the mobility hubs currently proposed in the PMPU.

Alternative 3 – One-Half Reduced Growth Alternative

The One-Half Reduced Growth Alternative involves similar plan components as the proposed PMPU, but at an overall reduced scale. A reduction in the scale and magnitude of the proposed land and water uses is intended to reduce impacts to air quality and health risk, biological resources, greenhouse gas emissions, hydrology and water quality, noise, public services, transportation, and utilities. The One-Half Reduced Growth proposes a reduction in intensity of development by one-half for the following uses throughout the proposed PMPU area:

- **Retail and Restaurants:** This alternative would reduce the proposed PMPU's increased retail/restaurant uses from approximately 340,000 square feet to 170,000 square feet. Convention space would also be reduced from approximately 180,000 additional square feet to approximately 90,000 additional square feet. These reductions would be largely within PD2 with approximately 41,000 square feet in PD3.
- **Hotel Rooms:** The One-Half Reduced Growth Alternative would reduce the proposed increase of approximately 3,910 hotel rooms to approximately 1,955 rooms. These reductions would be largely within PD2, with a reduction of approximately 425 rooms in PD3.
- **Recreational Boat Slips:** The One-Third Reduced Growth Alternative would reduce the proposed increase of approximately 485 recreational boat slips to approximately 325 recreational boat slips. These would be largely spread among PDs 1-3, and PDs 9-10, with the majority of reductions found within PD2.

While reducing the scale of development, this alternative would inversely increase recreation and open space throughout, the PMPU area, to account for the reduced development intensity. The reductions in scale and intensity would also reduce the scale of the mobility hubs currently proposed in the proposed PMPU.

Alternative 4 – Harbor Island Centralized Commercial Recreation Alternative

The Harbor Island Centralized Commercial Recreation Alternative was developed in response to stakeholder input. This alternative is located in the Harbor Island Planning District (PD2) and would include an increase in Recreation Open Space designated land use areas in the Spanish Landing Subdistrict and an increase in Commercial Recreation designated land use areas in the East Harbor Island Subdistrict (see Figure 6-1). Within the Spanish Landing Subdistrict, approximately 2.99 acres of land area proposed as Commercial Recreation in the PMPU would instead be assigned the Recreation Open Space land use designation. Within the East Harbor Island Subdistrict, approximately 2.65 acres of land designated Recreational Open Space would instead be assigned the Commercial Recreation land use designation.

This reallocation of land use designations would allow for the more centralized and contiguous placement of visitor-serving commercial development within the overall planning district,

specifically in the East Harbor Island Subdistrict, which would potentially result in lowering total VMT due to proximity to existing and planned visitor-serving commercial development in the surrounding area. Additionally, the reallocation would allow for the preservation of existing park space in the Spanish Landing Subdistrict, which could accommodate the placement of activating features consistent with the Baywide Development Standards and allowances within Recreation Open Space designated spaces as permitted in other subdistricts. This alternative would result in an overall net increase of 0.34 acre of Recreation Open Space areas within the East Harbor Island Planning District and would establish continuous shoreline access for the public while providing additional areas for visitors to recreate and experience the waterfront.

All other proposed water and land use designations and potential development intensities would remain the same as the proposed PMPU under this alternative.

Alternative 5 – Recreation Open Space Alternative

The Recreation Open Space Alternative was developed in response to stakeholder input. This alternative is located in PD3 and would include the closure of North Harbor Drive between Ash Street and Grape Street (i.e., directly adjacent and to the west of the County Administration Center) to vehicular traffic; however, shuttle and emergency access, along with commercial loading access for visitor-serving uses situated along this portion of the Embarcadero, would still be allowed. Vehicular traffic that currently utilizes this segment of North Harbor Drive would be rerouted to Pacific Highway. The closed segment of North Harbor Drive would be converted from Institutional/Roadway to Recreation Open Space and would slightly increase the total acreage of Recreation Open Space in the planning district. The closure of this segment of North Harbor Drive would allow for the establishment of a “festival street”, providing contiguous park space from the County waterfront park on the east to the embarcadero on the west. Types of activities that could occur under this alternative would be consistent with other Recreation Open Space areas within the Tidelands, including, but not limited to, 5K runs/walks, parades, film, food, and music festivals. All other proposed water and land use designations and potential development intensities would remain the same as the proposed PMPU under this alternative.

Environmentally Superior Alternative

Pursuant to CEQA, an EIR is required to identify the environmentally superior alternative. As shown in Table 6-3, the One-Third Reduced Growth Alternative (Alternative 2) and the One-Half Reduced Growth Alternative (Alternative 3) reduce the same number of significant impacts. However, because Alternative 3 would result in less overall development than Alternative 2, this alternative is the environmentally superior alternative. As provided in the analysis above, there are different tradeoffs for each alternative, depending upon the specific resource areas. Individuals and the decision-makers may weigh these resource areas differently.

Table ES-1. Project Impacts and Mitigation Measures

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.1 Aesthetics and Visual Resources			
Project Impacts			
Impact-AES-1: Potential to Interfere with Designated Scenic Vista Areas or View Corridors During Construction Associated with Implementation of the Proposed PMPU. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment, that could intrude into a designated scenic vista area or view corridor extension, which would temporarily interfere with the views provided by scenic vista areas or view corridor extensions, or prevent access to the scenic vista areas or view corridor extensions, which could have a substantial adverse effect on a designated scenic vista. Impacts are considered significant.	PS	MM-AES-1: Plan Construction Schedule and Storage/Staging to Avoid Scenic Vista Areas and View Corridor Extensions. Prior to District approval of a future development project, the project proponent shall provide the District with the project's construction schedule, including the phasing of the construction, the type of construction equipment to be used, and the duration and location of the use of the construction equipment. The District shall review the construction schedule and may require the proponent to alter the schedule to prevent extended interference with views from designated scenic vista areas or view corridor extensions. The project proponent shall locate construction equipment away from designated scenic vista areas or view corridor extensions when not in use or during staging to minimize potential impacts on views. The District shall review and approve the construction schedule and staging locations prior to project approval.	SU
Impact-AES-2: Potential to Result in Substantial Degradation of Visual Character and Quality During Construction Associated with Implementation of the Proposed PMPU. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment for extended periods of time, which could result in temporary substantial degradation of the visual character or quality of a site. Impacts are considered significant.	PS	MM-AES-2: Install Construction Fencing. <u>Prior to the start of construction activities,</u> the project proponent shall be required to install construction-screening fencing around the entire perimeter of the project site to shield construction activities from sight. Construction screening shall include, at a minimum, installation of 8-foot-tall fencing for the duration of the construction period that is covered with view-blocking materials, such as tarp or mesh in a color that blends in with the existing environment such as a shade of green or blue, depending on the location. The District's Development Services Department shall confirm such fencing is	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-AES-3: New Permanent Source of Glare Generated by Potential High-Rise Development. New high-rise buildings constructed during implementation of the proposed PMPU could be designed using curtainwall façades that would use architectural finishes and materials that would increase the amount of glare produced at future project sites, which would represent a significant new source of substantial glare at the project site compared to existing conditions that would potentially affect daytime views in the area.	PS	<p>depicted on the project's demolition and construction plans.</p> <p>MM-AES-3: Incorporate the Use of Reduced Glare Building Materials. The project proponent for any of a future high-rise towers (over 75 feet or 7 stories) developed under the proposed PMPU shall incorporate non-reflective exterior building materials in their design, and any glass incorporated into the façade of the building shall either be of low reflectivity or accompanied by a non-glare coating. Glass and other material shall have a light reflectivity factor no more than 30% and no more than 50% of the building surface shall be made of reflective materials, to be consistent with the standards established in the City of San Diego Municipal Code §142.0730 Glare Regulations and any future amendments. Prior to issuance of a building permit for future high-rise hotel towers, the District shall confirm such non-reflective materials and low reflectivity or non-glare coating are depicted on the appropriate building plans. Building plans and materials shall be consistent with specific design strategies as described in Section 4.3, <i>Biological Resources</i>, under MM-BIO-9, Implement Bird Strikes Reduction Measures on New Structures, to avoid or reduce potential for bird strikes.</p>	LTS
Impact-C-AES-1: Potential to Result in a Cumulatively Considerable Contribution to Adverse Impacts on Scenic Vista Areas or View Corridors During Construction. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment, that could intrude into a designated scenic vista area or view corridor extension, which could entirely block or interfere with the views provided by	PS	Implement MM-AES-1 , as described above.	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
scenic vista areas or view corridors, or prevent access to the scenic vista areas or view corridors. In combination with other construction activity in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable <u>contribution to a significant cumulative</u> impact on scenic vista areas or view corridors.			
Impact-C-AES-2: Potential to Result in a Cumulatively Considerable <u>Contribution to Substantial Degradation of Visual Character and Quality During Construction.</u> Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment for extended periods of time, which could result in temporary substantial degradation of the visual character or quality of a site. In combination with other construction activity in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable <u>contribution to a significant cumulative</u> impact on visual quality and character.	PS	Implement MM-AES-2 , as described above.	SU
Impact-C-AES-3: Potential to Result in a Cumulatively Considerable <u>Contribution to New Permanent Source of Glare Generated by Potential High-Rise Development.</u> New high-rise buildings constructed during implementation of the proposed PMPU could be designed using curtainwall façades that would use architectural finishes and materials that would increase the amount of glare produced at future project sites, which would represent a significant new source of substantial glare that could potentially affect daytime views in the area. In combination with other high-rise buildings in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable <u>contribution to a significant cumulative</u> impact related to glare.	PS	Implement MM-AES-3 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.2 Air Quality and Health Risk			
Project Impacts			
Impact-AQ-1: New Land Use Designations Not Accounted for in the RAQS and SIP. The proposed PMPU would redesignate various water and land uses that could increase activity within the Tidelands. As these land use changes were not known at the time the RAQS and SIP were last updated, this would result in a conflict with the applicable State and regional air quality plans because the proposed land uses and the intensities proposed are not included in RAQS and SIP growth projections.	PS	MM-AQ-1: Update the RAQS and SIP with New Growth Projections. Within 6 months <u>thirty days</u> of <u>certification approval</u> of the proposed PMPU, the District shall provide SANDAG with amended growth assumptions and changes to water and land use designations associated with the proposed PMPU. The District shall coordinate with SANDAG and the SDAPCD to ensure the RAQS and SIP are updated as part of the next soonest revision cycle to reflect the updated growth assumptions of the proposed PMPU.	LTS
Impact-AQ-2: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction. Project emissions during construction activities, before mitigation, would exceed thresholds for ROG, NO _x , and CO. Specific construction details (such as project design, location, timing, phasing, and overlapping of possible construction projects that would be implemented over the life of the proposed PMPU) are not known at this time, but the emissions analysis demonstrates the potential for construction emissions to exceed thresholds. As a result, the proposed PMPU would have a significant impact on air quality because future development allowed under the proposed PMPU may result in a cumulatively considerable net increase in criteria pollutants for which the proposed PMPU region is in nonattainment under Federal or State regulations.	PS	MM-AQ-2: Implement Best Management Practices During Construction of all Future PMPU-Consistent Projects. A project proponent shall implement, or require implementation by its construction contractor(s), the following measures during construction and project operations, subject to verification by the District. <ul style="list-style-type: none"> • All The project proponents shall limit all construction equipment, drayage, and delivery truck idling times by shutting down equipment, when not in use, and reducing the maximum idling time to less than 3 minutes. The project proponent shall install clear signage regarding the limitation on idling time at the delivery driveway and loading areas, if applicable; and shall submit annual reports of violators to the District. This measure shall be enforced by the <u>on-site construction supervisor, hotel, restaurant, and marina supervisors; and</u> <u>Violations shall be reported to the District and</u> project proponents with <u>more than one or more violations may at the discretion of California Air Resources Board,</u> shall be subject to penalties pursuant to California airborne toxics control measure 13 CCR 2485. The project proponent 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>shall submit evidence of the use of diesel emission reduction measures to the District's Planning and Green Port Department through annual reporting, with the first report due 1 year from the date of project completion and each subsequent report due exactly 1 year thereafter until construction is completed, noting all violations with relevant identifying information of the vehicles and drivers in violation of these measures.</p> <ul style="list-style-type: none"> The project proponent shall verify that all construction equipment <u>used on-site</u> is maintained and properly tuned in accordance with manufacturers' specifications. Prior to the commencement of construction and operations activities using diesel-powered vehicles or equipment, the project proponent shall verify that all vehicles and equipment have been checked by a certified mechanic <u>or mechanic experienced with such equipment</u>, and determined to be running in proper condition prior to admittance onto the <u>project site delivery driveway and loading areas</u>. The project proponent shall submit a report by the certified mechanic <u>or mechanic experienced with such equipment</u>, of the condition of the construction vehicles and equipment to the District's Planning and Green Port Department during the operation phase prior to commencement of their use. <u>The project proponent shall submit evidence of the use of diesel emission reduction measures, including truck idling time violations, to the District through regular reporting, with the first report due thirty days from the date of commencement of construction and each subsequent report due exactly 30 days thereafter, until construction is completed, noting all violations with relevant identifying information of the vehicles and drivers in violation of these measures.</u> 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>MM-AQ-3: Implement Diesel Emission-Reduction Measures During Construction of All Future PMPU-Consistent Projects. To reduce ROG and CO emissions during construction of future development under the proposed PMPU, the project proponent shall implement or require implementation by its construction contractor(s) the following measures during construction of the project, and shall provide verification to the District, prior to the issuance of a building permit commencement of construction future activities. Prior to the commencement of construction activities, for any discretionary project — where the definition of discretionary project meets the definition of the State CEQA Guidelines, and such project is allowed by the PMPU water and land use designations, such as new hotel rooms, restaurant/retail square footage, or boat slips — the project proponent for that project shall submit a list of equipment to be used and the equipment's specifications (model year, engine tier, horsepower) to the District's Development Services Department to ensure the construction equipment list is consistent with the following requirements. <u>No changes shall be made to the list of equipment without the District's prior approval. Within 30 days after the completion of</u> After construction, the project proponent/operator and/or its contractor(s) shall provide written evidence <u>to the District</u> that the construction was consistent with the following requirements.</p> <ul style="list-style-type: none"> • For all construction activities, equip all off-road diesel equipment engines over 25 horsepower with EPA Tier 4 or cleaner engines unless Tier 4 construction equipment is not <u>commercially</u> available (<u>defined below</u>) within 50-100 miles of the project site. The project proponent shall submit written evidence to the District prior to commencement of construction 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>activities that Tier 4 or cleaner equipment shall be used, or that Tier 4 or cleaner equipment is not available for use during the entire duration of that project's construction period beyond 2025. <u>The provided evidence shall include details of the project proponent's effort to secure Tier 4 or cleaner equipment, including suppliers contacted and their responses, subject to the District's concurrence.</u></p> <ul style="list-style-type: none"> • Use renewable diesel fuel in all heavy-duty off-road diesel-fueled equipment. Renewable diesel <u>fuel</u> must meet the most recent ASTM D975 specification for Ultra Low Sulfur Diesel and have a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum diesel fuels sold in California. • Use zero or near-zero emissions equipment in lieu of diesel- or gasoline-powered equipment where such zero or near-zero equipment is commercially available within 50 miles of the project site. <u>Commercially available means available within 100 miles, for purchase or lease by the project proponent or any contractors that may be retained by the project proponent.</u> • Use diesel particulate filters (or the equivalent) if permitted under manufacturer's guidelines for on-road and off-road diesel equipment. <p>MM-AQ-4: Implement Fugitive Dust Control During Construction of All PMPU-Consistent Projects.</p> <p>During construction of any discretionary future project, —where the definition of discretionary project meets the definition of the State CEQA Guidelines, and such project is allowed by the PMPU water and land use designations, such as new hotel rooms, restaurant/retail square footage, or boat slips— the project proponent shall implement the following dust control measures that go beyond SDAPCD Rule 55. The</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>project proponent shall submit evidence of <u>its compliance with the following the use of</u> fugitive dust reduction measures to the District, <u>within 90 days after the completion of construction.</u></p> <ul style="list-style-type: none"> • Water the grading areas, if any, at a minimum of three times daily to minimize fugitive dust. • Stabilize graded areas, if any, immediately after grading, to minimize fugitive dust. • Apply chemical stabilizer or pave the last 100 feet of internal travel path within the construction site prior to public road entry. • Install wheel washers adjacent to a paved apron prior to vehicle entry on public roads. • Remove any visible track-out into traveled public streets within 30 minutes of occurrence. • Wet wash the construction access point at the end of each workday if any vehicle travel on unpaved surfaces has occurred. • Provide sufficient perimeter erosion control to prevent washout of silty material onto public roads. • Cover haul trucks or maintain at least 12 inches of freeboard to reduce blow-off during hauling. • Suspend all soil disturbance and travel on unpaved surfaces if winds exceed 25 mph. • Cover/water onsite stockpiles of excavated material. • Enforce a 15-mph speed limit on unpaved surfaces. • Sweep up any dirt and debris spilled onto paved surfaces immediately to reduce resuspension of particulate matter caused by vehicle movement. Clean approach routes to construction sites daily for construction-related dirt in dry weather. • Hydroseed, landscape, or develop as quickly as possible all disturbed areas and as directed by the District and/or SDAPCD to reduce dust generation. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p><u>Should non-compliance with any of the measures listed above occur, the project proponent shall correct the violation immediately and shall notify the District within five days from the day the violation occurred.</u></p> <p>MM-AQ-5: Use Low-VOC Interior and Exterior Coatings During Construction of All PMPU-Consistent Projects. To reduce VOC emissions from painting activities during construction, the project proponents/operator and/or its contractor(s) that uses coatings shall use low-VOC coatings for all surfaces that go beyond the requirements of SDAPCD Rule 67.0. If architectural coatings (painting) of any single component or multiple components would exceed 10,000 square feet per day, then each project component active on that day shall use coatings with a VOC content of 10 grams per liter or less for all surfaces to be painted. If architectural coatings (painting) of any single component or multiple components would be below 10,000 square feet per day, then each component shall use coatings with a VOC content of 75 grams per liter or less. Prior to the commencement of construction activities of any project component, the project proponent shall submit a list of coatings to be used, their respective VOC content, and a summary of surface area to be painted to the District's Development Services Department. The District shall conduct inspections during construction as needed to verify the use of low-VOC coatings. Within 30 days after construction completion, tThe project proponent shall submit final evidence of compliance with this mitigation measure to the District for final verification and recordkeeping.</p> <p>MM-AQ-6: Use Modern Harbor Craft and Dredgers During Construction Activities. Prior to <u>commencement of</u> waterside construction, the project proponent shall ensure that any harbor craft, including</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>but not limited to tugboats, pusher tugs, tow boats, work boats, crew and supply boats, and dredgers for use during the duration of any in-water work shall meet the following criteria:</p> <ul style="list-style-type: none"> • For all construction activities through 2025, ensure all equipment is Tier 3 or better (cleaner). • For all construction activities after 2025, ensure all equipment is alternatively fueled or electrically powered. If alternatively fueled or electrically powered equipment that emits less emission than Tier 4 or better (cleaner) is not <u>commercially</u> available (<u>defined in MM-AQ-3</u>), then the project proponent shall ensure all equipment is Tier 4 or better. • Use renewable diesel fuel in all heavy-duty off-road diesel-fueled equipment. Renewable diesel must meet the most recent ASTM D975 specification for Ultra Low Sulfur Diesel and have a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum diesel fuels sold in California. <p>If clean harbor craft and dredgers are not available within 200 miles of the project site for the duration of all dredging activities, the project proponent shall prioritize use of equipment that is maintained and properly tuned in accordance with manufacturers' specifications. The project proponent shall document and submit evidence to the District's Development Services Department prior to commencement of waterside construction activities that tugboats, survey vessels, and dredgers meeting the above tiering requirements or better standards are not available for use during the duration of all in-water activities, <u>which shall be subject to the District's concurrence and approval</u>. Regardless of the equipment used, the project proponent shall verify that all equipment has been</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>checked by a mechanic experienced with such equipment and determined to be running in proper condition prior to admittance into the construction area. The project proponent shall submit a report prepared by the mechanic experienced with such equipment of the condition of the construction and operations vehicles and equipment to the District's Development Services Department prior to commencement of their us.</p> <p>MM-AQ-7: Conduct an Annual Technology Review for Construction- and Operation-related Activities.</p> <p>To promote the use of new emission control technologies during future construction- and operation- <u>related</u> activities, the District will perform an Periodic Annual <u>Periodic Annual</u> Technology Review, <u>commencing one year after the certification of the PMPU and continuing annually thereafter.</u> The Periodic Annual <u>Periodic Annual</u> Technology Review shall include a review of technological advancements in the form of alternative-fuel or zero emissions construction equipment, vessels, or trucks.</p> <p>If the Periodic Annual <u>Periodic Annual</u> Technology Review identifies new technology that will be <u>equally or more</u> effective in reducing emissions compared to default construction equipment, vessels, and trucks, and the District determines that use of the technology is feasible <u>within the meaning of PRC section 21061.1</u>, the District shall require the use of such technology as a condition of any subsequent discretionary approval issued by the District.</p> <p>MM-AQ-8: Project-Level Environmental Reviews. If project-level environmental review of a future development projects allowed under the PMPU is required, <u>would have the potential to result in significant impacts that were not identified and mitigated in the PMPU PEIR and a project-level environmental review is required,</u> <u>then</u> the District shall</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-AQ-3: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations. Project emissions during operations, before mitigation, would exceed thresholds for VOC, NO _x , CO, PM10, and PM2.5. As a result, the proposed PMPU would have a significant impact on air quality because future development allowed under the proposed PMPU may result in a cumulatively considerable net increase in criteria pollutants for which the proposed PMPU region is in nonattainment under Federal or State regulations.	PS	<p>prepare or cause require the preparation of the project proponent to prepare an air quality technical report that analyzes all phases of project construction and operations and determine whether emissions would exceed SDAPCD thresholds. If a project's air quality technical report determines that construction or operations emissions exceed the SDAPCD threshold(s), the project proponent shall be required to implement site-specific mitigation measures to avoid or reduce emissions to SDAPCD thresholds. Where mitigation measures are required, the District shall identify these measures in the project-level environmental document and include them in a mitigation monitoring and reporting program (MMRP) for the individual development project.</p> <p>MM-AQ-9: Incorporate Sustainability Measures in All Development through 2030. Project proponents shall incorporate into project design for new project components various efficiency and sustainability measures to reduce emissions from energy, water, and solid waste. The following measures shall apply in all planning districts through 2030 in the PMPU area.</p> <p><i>Energy</i></p> <ul style="list-style-type: none"> • Incorporate energy efficiency design features that exceed 2019 applicable Title 24 California Building Energy Efficiency Standards by 20 percent, or comply with any updates to Title 24 Building Energy Efficiency Standards. Measures that may be implemented include, but are not limited to: • Use only fluorescent, light-emitting diode (LED), compact fluorescent lamp (CFL), or the most energy-efficient lighting that meets required lighting standards and is commercially available. This measure also requires replacement of existing 	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>lighting on the project site if not already highly energy efficient.</p> <ul style="list-style-type: none"> • Install occupancy sensors for vending machines, if any, in new buildings at the project site. • Implement onsite renewable energy (<u>e.g., a photovoltaic system</u>) to new buildings, unless the District determines the system cannot be built in light of structural and <u>technological operational</u> constraints. • Install co-generation systems (i.e., combined heat and power systems) in new buildings, <u>unless the District determines the system cannot be built because of structural and technological constraints of the particular proposed project as evidenced by an engineering study conducted prior issuance of a Coastal Development Permit paid for by the project applicant if deemed feasible by the District</u> • Use high-performance glazing with a low solar heat gain coefficient value that reduces the amount of solar heat allowed into the building. • Install increased insulation with an R value of 49 or better. • Install cool roofs with an R value of 30 or better. • Use sun shading devices in parking lots and asphalted common areas. • Install high-efficiency heating, ventilating, and air condition systems and controls. • Install programmable thermostats. • Install Energy Star rated appliances. • <u>Install exterior electrical outlets to facilitate use of electric landscaping equipment.</u> <p><i>Water</i></p> <ul style="list-style-type: none"> • Reduce indoor water consumption by 20 percent lower than baseline buildings (defined by Leadership 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>in Energy and Environmental Design [LEED] as indoor water use after meeting Energy Policy Act of 1992 fixture performance requirements) through use of low-flow fixtures in all bathrooms.</p> <ul style="list-style-type: none"> • Install low-water plantings and drip irrigation, and minimize domestic water demand <u>on</u> the system for landscaping purposes. Use recycled or grey water for landscaping, if available. <p><i>Waste</i></p> <ul style="list-style-type: none"> • Comply with AB 341 and the relevant jurisdiction's recycling ordinances, and include recycling at least 50 percent of solid waste. Compliance with relevant jurisdiction's construction and demolition waste requirements shall be mandatory and shall include recycling at least 65 percent of all construction and demolition debris. This measure shall be applied during construction and operation of a project. • Ensure that all commercial, restaurant, and retail uses implement recycling, composting of food waste and other organics, and the use of reusable products instead of disposal of products thus diverting solid waste from the landfill stream. <p><i>Mobile Sources</i></p> <ul style="list-style-type: none"> • Ensure that each project component implements a Transportation Demand Management plan that incentivizes, to the extent allowed by law, voluntary implementation of employer commuting measures, such as carpooling, transit subsidies, and vanpools to reduce worker trips and parking demand, <u>which is consistent with as described in MM-TRA-3.</u> • Ensure that bicycle parking is included in new building construction or renovation of buildings. The 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>number of spaces will be at a minimum 5 percent of new automobile parking spaces.</p> <ul style="list-style-type: none"> • <u>Telecommuting shall be considered consistent with MM-TRA-3.</u> <p><i>Carbon Sequestration and Land Use</i></p> <ul style="list-style-type: none"> • <u>Within the Commercial Recreation and Recreation Open Space land use designations, the project proponent shall install trees and shrub planters throughout the project area, as part of the landscape plan. Within other land use designations, the project proponent shall install tree and shrub planters along the street frontage and adjacent to any perimeter that abuts sensitive land uses.</u> <p>MM-AQ-10a: Require All New Hotels to Use Electric Energy OnlyReduce Natural Gas Prior to 2030 and All New Development to be Carbon Neutral After 2030. For all new hotel projects constructed prior to 2030, the District shall require all new hotel projects to forbid the use of natural gas usage shall use electricity only, except for cooking and kitchen uses, or achieve equivalent reductions through other energy or emission reduction strategy.</p> <p>MM-AQ-10b: Require All Future New Development to be Carbon Neutral After 2030. For all new development Future projects that would be constructed after 2030, the District shall require all development to meet the State's Zero Net Energy (ZNE) standards, if ZNE is adopted. Applicability (i.e., types of projects that that are targeted by the State's ZNE standards) will be set by the State. If by 2030, no ZNE standard has been adopted by the State, the District shall require all project proponents to construct ZNE buildings, unless the District determines that such construction cannot occur in light of structural and technological constraints of the particular proposed future project as evidenced</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>by an engineering study conducted prior to issuance of a Coastal Development Permit paid for by the project applicant or submit written documentation as to why ZNE standards cannot be complied with. Moreover, the District shall encourage project developers to construct all electric buildings. The project proponent shall document and submit evidence to the District's Development Services Department prior to commencement of construction activities.</p> <p>MM-AQ-11: Install EV Charging Infrastructure. <u>The District has a goal of installing a minimum of 1) 399 Level 2 chargers and 22 DC Fast chargers by 2030, and 2) 476 Level 2 chargers and 31 DC Fast chargers by 2050 to reduce air and GHG emissions. This goal is based on recommendations in the CSE EV Infrastructure Scoping Study and is a forecast of the number of anticipated parking spaces that would potentially be required by 2030 and 2050, respectively, as a result of development assumptions used in the impact analysis. This measure applies to both District projects and tenant projects.</u></p> <ul style="list-style-type: none"> The <u>Prior to the commencement of project operations, a project proponent shall install provide electric vehicle (EV) charging stations ready parking spaces, at a rate that is consistent with the CalGreen Code, which presently is of a minimum of six-ten percent of the total required new parking spaces for a project. The number of electric vehicle charging stations required shall be rounded up to the nearest whole number (e.g., 1.5 EV parking spaces would equate to 2 full EV parking spaces, whereas 1.4 EV parking spaces would equate to 1 EV parking space).</u> as part of any new building construction or renovation of buildings. The District shall install, or cause the installation of, EV charging infrastructure on Tidelands. These installations shall at minimum 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-AQ-4: Health Effects During PMPU Buildout Construction from ROG and NO_x Emissions. Project-related emissions during construction could contribute a significant level of air pollution from ROG and NO _x within the SDAB. Specific construction details (such as timing, phasing, and overlapping of possible construction projects implemented over the life of the proposed PMPU) are not known at this time and emissions could exceed relevant thresholds that have been set by SDAPCD to attain the NAAQS and CAAQS, the purpose of which is to provide for the protection of public health.	PS	<p>include, but not be limited to: 1) 400 Level 2 chargers and 22 DC Fast chargers, by 2030; and 2) Installation of 500 Level 2 chargers and 30 DC Fast chargers, by 2050. This is based on recommendations in the CSE EV Infrastructure Scoping Study.</p> <p>MM-AQ-12: Advance Recreational Boat Electrification. Prior to the commencement of project operations, the project proponent of any future site-specific development that proposes to add recreational boat slips shall install a 240-volt electrical outlet at each new slip.</p> <p>Implement MM-AQ-2 through MM-AQ-8, as described above.</p>	LTS
Impact-AQ-5: Health Effects During PMPU Buildout Operations from ROG, NO_x, and CO. Project-related emissions during operations could contribute a significant level of air pollution from ROG, NO _x , and CO within the SDAB. Implementation of the proposed PMPU could exceed relevant thresholds that have been set by SDAPCD to attain the NAAQS and CAAQS, the purpose of which is to provide for the protection of public health.	PS	<p>Implement MM-AQ-9 through MM-AQ-12, as described above.</p>	SU
Impact-C-AQ-1. New Land Use Designations Not Accounted for in the RAQS and SIP. The proposed PMPU would redesignate various water and land uses that could increase activity within the Tidelands. These uses were not known at the time the RAQS and SIP were last updated,	PS	<p>Implement MM-AQ-1, as described above.</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
thus resulting in a conflict because the proposed land uses and the intensities proposed are not included in RAQS and SIP growth projections.			
Impact-C-AQ-2 Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction. The proposed PMPU emissions during construction activities, before mitigation, would result in a cumulatively considerable contribution to a significant cumulative impact with respect to a net increase in criteria pollutants for which the region is nonattainment under an applicable Federal or State ambient air quality standard.	PS	Implement MM-AQ-2 through MM-AQ-8 , as described above.	LTS
Impact-C-AQ-3 Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations. The proposed PMPU emissions during operations, before mitigation, would result in a cumulatively considerable contribution to a significant cumulative impact with respect to a net increase in criteria pollutants for which the region is nonattainment under an applicable Federal or State ambient air quality standard.	PS	Implement MM-AQ-9 through MM-AQ-12 , as described above.	SU
Impact-C-AQ-4 Health Effects During PMPU Buildout Construction from ROG and NO_x Emissions. Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.3 Biological Resources			
Project Impacts			
Impact-BIO-1: In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species Such as California Least Tern and California Brown Pelican. In-water construction-induced noise impacts from overwater construction activities such as pile driving could disrupt the foraging behavior of the California least tern if construction occurs during the California least tern nesting season, as well as other sensitive fish-foraging avian species such as California brown pelican. This impact would be significant.	PS	MM-BIO-1: Implement Construction Measures to Avoid or Reduce Noise Impacts on that May Affect Foraging Behavior of California Least Tern and Other Sensitive Fish Foraging Avian Species. For future development projects that the District determines have the potential to disturb foraging behavior of California least tern and other sensitive fish foraging avian species due to in-water construction activities (e.g., pile driving), the project proponent shall retain a qualified biologist, approved by the District, to monitor onsite construction activities. <u>The qualified biologist must have at least four years of university training in marine biology or a related science and/or have at least three years of demonstrated field experience monitoring sensitive species in the Southern California marine environment. A qualified biologist with more than 10 years of experience monitoring for sensitive marine species in Southern California shall oversee the monitoring work.</u> The project proponent shall take specific actions, as approved by the District, to reduce or temporarily stop noise-producing activities if the qualified biologist identifies that the activities are impacting the foraging behavior of sensitive avian species from April 1, or when the California least terns first appear in the Bay, until the California least terns have left the bay or September 15th. These actions shall include, but not be limited to, the following: <ul style="list-style-type: none"> For all pile driving activities performed during the California least tern nesting season <u>of sensitive fish foraging avian species</u>, a qualified biologist shall be on site observing for foraging California least terns <u>sensitive avian species</u>. 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-BIO-2: Construction Noise Impacts on Nesting Behavior of Marine-Dependent Species Protected Under the Migratory Bird Treaty Act and California Fish and Game Code. Construction-induced noise impacts from landside and over <u>in</u> -water construction activities can disturb nesting marine dependent bird species protected	PS	<ul style="list-style-type: none"> • If any <u>sensitive avian species</u> California least terns are observed, the qualified biologist shall have the authority to halt or modify pile driving activity to ensure foraging behavior is not altered by construction. Work modifications that may limit pile driving noise impacts may include: <ul style="list-style-type: none"> ◦ Reducing the intensity of pile driving. ◦ Placing sound dampening panels on pile driving equipment. ◦ Restricting pile driving to periods when sensitive avian species are not present. ◦ A project that is within 500 feet of a California least tern nesting colony shall be required to conduct preconstruction nest surveys, nest monitoring, and implement sound and visual barriers (See MM-BIO-2). • A biological monitor shall be on-site during any construction activities that would occur within foraging habitat to ensure no sensitive species are agitated, killed, or injured. • For all pile driving projects that may impact any other sensitive nesting avian species (<u>including California least terns</u>), refer to MM-BIO-2. • <u>For in-water activities that may result in increased turbidity that would potentially temporarily obscure foraging habitat, refer to MM-BIO-4.</u> • <u>For proposed activities and development features that may result in increased shading of foraging habitat, refer to MM-BIO-7.</u> 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
under the MBTA and California Fish and Game Code. Disturbance can lead to nest abandonment or altered behavior that results in lowered nesting success. This impact would be potentially significant.		<p>dependent avian species, the project proponent shall ensure that nesting bird behavior is not modified during construction activities that generate noises above ambient conditions. The project proponent shall implement the following measures during construction:</p> <ul style="list-style-type: none"> • <u>During the nesting season for sensitive avian species with the potential to occur at the construction site,</u> The the project proponent shall retain a qualified biologist <u>as defined in MM-BIO-1</u>, approved by the District, to perform a nesting bird survey within 500 feet of the noise-generating activity 1 week prior to the start of construction utilizing heavy equipment, and, i If nests are found, the qualified biologist shall perform a survey once per week during construction until use of noise-generating heavy equipment ceases. <u>Specific criteria for California least terns are included at the end of this mitigation measure.</u> • The project proponent shall submit the survey to the District for review and approval of the survey and the buffer area, defined below, if any, prior to the commencement of these activities at the project site. • The nesting bird survey area shall include the entire limits of disturbance plus a 300-foot buffer for non-raptors and a 500-foot buffer for raptors to ensure indirect impacts would be avoided. The nesting surveys shall consist of a thorough inspection of the project area by a qualified biologist(s). The survey shall occur between sunrise and 12:00 p.m., when birds are most active. If no active nests are detected during these surveys, t The qualified biologist(s) shall prepare and submit to the District a letter report documenting the results of the survey. If there is a delay of more than 7 days between when the nesting bird survey is performed and construction activities begin, the qualified biologist shall resurvey to confirm that no new nests have been established. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<ul style="list-style-type: none"> • If the survey confirms nesting within 300 feet of the disturbance footprint for non-raptors or within 500 feet for raptors, the project proponent shall establish a no-disturbance buffer around each nest site to avoid disturbance or destruction of the nest until after the nesting season or a qualified biologist determines that the nest is no longer active. The size and constraints of the no-disturbance buffer shall be determined by the qualified biologist <u>and included in the letter report documenting the survey results, at the time of discovery, but shall not be greater than 300 feet for non-raptors and 500 feet for raptors.</u> In addition, if the qualified biologist(s) prepares any subsequent reports, the reports shall be submitted to the District. • The qualified biologist shall establish a baseline ambient sound level by measuring ambient sound levels during the time of day that work is expected to occur. The monitoring distance from the nest shall be chosen <u>to determine the noise levels present at the nest without causing to not disturbance to the sensitive species.</u> • If noise-generating activities are within 300 feet for non-raptors and 500 feet for raptors and the <u>sensitive</u> species behavior is modified due to noise, the qualified biologist shall monitor noise levels daily, during construction activities, at a distance that would prevent the disturbance of the relevant species. Sound levels at nest sites shall not exceed 10 dBA above ambient levels. This monitoring shall occur until the nest is no longer active. • If sensitive avian species begin nesting within 300 feet for non-raptors and 500 feet for raptors of noise-generating construction and the species behavior is modified, the qualified biologist shall establish a baseline ambient sound level by measuring sound 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>levels at a distance without disturbing the species during a representative construction day. The qualified biologist shall monitor those nests daily during construction activities, until after the nesting season or a qualified biologist determines that the nest is no longer active. If the monitoring shows sound levels more than 10 dBA above the baseline ambient levels (representative construction noise included), and the species behavior is modified, the qualified biologist shall have the authority to halt or modify construction activity to ensure the behavior of sensitive nesting avian species is not altered by construction noise.</p> <ul style="list-style-type: none"> • If the above noted sound thresholds are exceeded, the project proponent shall implement actions recommended by the qualified biologist and approved by the District to reduce sound levels to within thresholds. Example actions to reduce noise include installation of noise barriers with a minimum STC rating of 28, place noise attenuation dampers on equipment, replace or retrofit noisy equipment to reduce noise, stage work to reduce the hourly average equivalent sound level (L_{eq}), and relocate noise-generating activities. • If the qualified biologist determines that noise cannot be attenuated, noise-generating activities must cease until such time that adequate noise attenuation is achieved, or nesting is complete. • <u>For California least terns specifically:</u> <ul style="list-style-type: none"> ○ <u>Pile driving shall be conducted outside of the California least tern nesting season (September 16th to March 31st).</u> ○ <u>If the nesting season cannot be avoided and the project is within 500 feet of a nest, then California least tern preconstruction nest surveys, nest</u> 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-BIO-3: In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fishes. In-water pile driving activities could generate enough underwater noise to physically injure marine mammals, green sea turtles, and fishes should impact hammer or vibratory pile driving occur during construction. Any noise-related impacts would be dependent on the type of activity being performed, the proximity of the activity to marine waters, and the biology of the considered species. In-water impact hammer or vibratory pile driving activity by comparison could potentially generate enough underwater noise to injure</p>	PS	<p>MM-BIO-3: Implement a Marine Mammal, Green Sea Turtle, and Fishes Monitoring Program During Pile Installation Activities. Prior to commencement of construction activities involving in-water impact hammer pile installation or vibratory pile installation or removal, the project proponent shall retain a qualified biologist as defined in MM-BIO-1, who shall conduct preconstruction surveys to identify the presence of sensitive marine species (i.e., marine mammals, green sea turtles, and fishes), and during construction monitoring the qualified biologist will have the ability to stop work, prepare a marine mammal, green sea turtle, and fishes monitoring program for implementation. Additionally, the project proponent</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
(Level A Harassment) or alter behavior (Level B Harassment) for marine mammals, green sea turtles, and fishes. This impact would be significant.		<p>shall submit the monitoring program to the District for approval 60 days prior to commencing construction involving in-water pile activities and shall <u>This measure includes the following requirements within the monitoring program:</u></p> <ul style="list-style-type: none"> For a period of 15 minutes prior to the start of in-water <u>piling</u> construction, a qualified biologist, retained by the project proponent and approved by the District, shall monitor an impact radius around the active pile installation areas to ensure that special-status <u>sensitive marine species (i.e., marine mammals, green sea turtles, fish, special-status aquatic birds)</u> are not present. The qualified biologist must meet the minimum requirements as defined by the NOAA's Guidance for Developing a Marine Mammal Monitoring Plan (2017). The impact radius shall be established by determining the largest zone of influence associated with in-water construction activities occurring that workday. The project proponent shall not start work if the qualified biologist observes any <u>sensitive marine</u> special-status species prior to starting pile installation. In-water pile driving shall begin with soft starts in accordance with Section 4.5 of the District's Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District (District 2019), gradually increasing the force of the pile driving. The qualified biologist shall monitor for <u>special-status aquatic</u> avian species <u>(e.g., California least tern, California Brown Pelican)</u>, marine mammals, and green sea turtles, and fishes within appropriate zones of influence during all pile installation activities in order to identify when any <u>special-status of these</u> 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-BIO-4: Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity. In-water construction activities can suspend sediment that results in water quality and turbidity impacts that limit the ability of fish foraging avian species to locate prey and disrupts eelgrass productivity. Additionally, incidental vessel contact with bottom substrate and vessel propeller wash within shallow areas could result in increased turbidity. This impact would be significant.</p>	PS	<p><u>wildlife</u> species are approaching or within the appropriate zone of influence, and by coordinating with construction crews to halt pile driving until the species have left this area.</p> <ul style="list-style-type: none"> <u>In-water sound level monitoring for fishes shall be conducted if the project-specific in-water noise analysis determines that anticipated Sound Exposure Levels (SELs) exceed acceptable levels described in the Interim Criteria for Injury to Fish (see Table 4.3-6 of the PEIR). If SELs would be exceeded, then a qualified marine biologist shall monitor pile driving activities and shall have the authority to stop in-water pile installation if harm to fish is observed.</u> <u>To reduce in-water sound levels during pile driving, all piles shall be driven with a vibratory hammer or other less impactful forms of pile driving where feasible (feasibility shall include not conflicting with MM-WQ-1, MM-WQ-2, and MM-WQ-3). If an impact hammer is required, additional sound attenuation, such as wood cushion block, isolation casing, and/or an air bubble curtain shall be required if determined necessary by the monitoring biologist.</u> <p>MM-BIO-4: Implement Construction Measures to Eliminate Water Quality Impairment Impacts on California Least Tern, Other Sensitive Fish Foraging Avian Species, and Eelgrass. During all in-water construction activities that would disturb sediment, the project proponent shall implement the following construction measures in accordance with applicable Federal, State, and local regulations, including CWA Sections 401 and 404, Rivers and Harbors Act Section 10, the NPDES permit, and Stormwater Management and Discharge Control Ordinance:</p> <ul style="list-style-type: none"> The project proponent shall implement contractor education for vessel operations. Vessel operators 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>shall be trained that any contact with the bottom from the vessel, barges, anchors, or spuds can suspend sediment that results in water quality and turbidity impacts that limit the ability of fish foraging avian species to locate prey and disrupt eelgrass productivity. Additionally, vessel operators shall be instructed to minimize activities that direct propeller wash toward shallow areas with substrates that can be suspended and result in increased turbidity.</p> <ul style="list-style-type: none"> • The project proponent shall deploy a turbidity curtain around the pile driving or other sediment-disturbing activity areas to restrict the visible surface turbidity plume to the area of construction. The turbidity curtain shall consist of a hanging ballast-weighted curtain with a surface float line and shall extend from the surface into the water column without disturbing the bottom based on the lowest tidal elevation and swing of the curtain within the water column. The turbidity curtain shall meet the specifications for design, installation, use, performance, and/or modification outlined in the District's <i>Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District</i> (District 2019). The goal of this measure is to minimize the area in which visibility of prey by California least terns and other sensitive fish foraging avian species (e.g., California brown pelican) is obstructed. • The project proponent shall follow all regulatory requirements to minimize the reduction in impacts on water quality in San Diego Bay. Construction of future development would include preparation and implementation of either a SWPPP in accordance the SWRCB Construction General Permit or a Construction 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>BMP Plan in accordance with the District's JRMP, and compliance with appropriate regulatory permits (as applicable), including the CWA Section 401 Water Quality Certification, CWA Section 404 permit, and Rivers and Harbors Act Section 10 permit. A full explanation of these requirements can be found in Section 4.8. <u>In addition, future projects that propose in-water construction will be required to obtain applicable permits from federal and state agencies, including but not limited to USACE (Section 404 of the CWA, Section 10 of the Rivers and Harbors Act), RWCQB (Section 401 of the CWA), and reviewing agencies including NOAA, USFWS, and CDFW. Any applicable permits must be obtained prior to the commencement of in-water construction. In addition, consistent with the USACE/RWCQB permit requirements, projects that would disturb sediment must submit a Caulerpa survey as part of the permitting process. The survey must be consistent with the Caulerpa Control Protocol developed and maintained jointly by NOAA and CDFW.</u></p> <ul style="list-style-type: none"> • If impacts on eelgrass due to water quality <u>occur and</u> cannot be mitigated through contractor education and deployment of silt curtains, the project proponent shall implement mitigation measures for losses to eelgrass in accordance the CEMP and with MM-BIO-10. • The project proponent shall implement MM-WQ-1, Monitoring Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance; MM-WQ-2, Implement Best Management Practices During Construction-Related Sediment Disturbance; and MM-WQ-3, Apply Silt Curtains During Construction-Related Sediment Disturbance, as described in Section 4.8, <i>Hydrology and Water Quality</i>. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-BIO-5: Potential Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code.</p> <p>Removal of existing trees and demolition of existing structures, as well as generation of noise, dust, or nighttime lighting from construction activity, could impede the use of breeding sites during the general avian nesting season (February 15 through August 31). The disturbance or destruction of an occupied nest would be considered a significant impact.</p>	PS	<p>MM-BIO-5: Avoid Nesting Season for Birds or Conduct Preconstruction Nest Surveys. To ensure compliance with the ESA and/or CESA, MBTA and similar provisions under Sections 3503 and 3503.5 of the California Fish and Game Code, the project proponent shall conduct all vegetation removal (e.g., ornamental trees), demolition of existing structures, and construction activities between September 1 and February 14 (i.e., outside of the general avian nesting season). If the District determines that such avoidance is not feasible, the project proponent shall implement the following:</p> <ul style="list-style-type: none"> • The project proponent shall retain a qualified biologist <u>as defined in MM-BIO-1</u>, who shall conduct a focused nesting bird survey within potential nesting habitat 1 week prior to the start of vegetation removal, demolition of existing structures, and/or construction activities. The project proponent shall submit the survey to the District for review and approval of the survey and the buffer area, defined below, if any, prior to the commencement of these activities at the project site. • The nesting bird survey area shall include the entire limits of disturbance plus a 300-foot buffer for non-raptors and a 500-foot buffer for raptors to ensure indirect impacts would be avoided. The nesting surveys shall consist of a thorough inspection of the project area by a qualified biologist(s). The survey shall occur between sunrise and 12:00 p.m., when birds are most active. If no active nests are detected during these surveys, the qualified biologist(s) shall prepare and submit to the District a letter report documenting the results of the survey. If there is a delay of more than 7 days between when the nesting bird survey is performed and construction activities 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-BIO-6: Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat Through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment. Aquaculture within the proposed PMPU area allows for the cultivation of shellfish and seaweed. If viewed in the context of available fish habitat and forage, shellfish operations compete with natural populations of fish and invertebrates that consume plankton and organic particles and limit foraging opportunities for coastal pelagic fish species. Additionally, benthic impacts of shellfish aquaculture can result from the presence of gear and equipment, shell debris, and the accumulation of pseudofeces or fouling organisms due to natural processes and dependent upon culture methods. Collectively, these impacts are considered significant.</p>	PS	<p>begin, the qualified biologist shall resurvey to confirm that no new nests have been established.</p> <ul style="list-style-type: none"> • If the survey confirms nesting within 300 feet of the disturbance footprint for non-raptors or within 500 feet for raptors, the project proponent shall establish a no-disturbance buffer around each nest site to avoid disturbance or destruction of the nest until after the nesting season or a qualified biologist determines that the nest is no longer active. The size and constraints of the no-disturbance buffer shall be determined by the qualified biologist, at the time of discovery, but shall not be greater than 300 feet for non-raptors and 500 feet for raptors. In addition, if the qualified biologist(s) prepares any subsequent reports, the reports shall be submitted to the District <u>for review</u>. <p>MM-BIO-6: Develop a Shellfish Aquaculture Mitigation Program Plan in Coordination with the Appropriate Resource Agencies and the District to Minimize the Potential for Degraded Essential Fish Habitat and Potential Benthic Impacts. Prior to the District's approval of any future aquaculture operation involving shellfish, the project proponent shall prepare and submit to the District for approval a Shellfish Aquaculture Mitigation Plan<u>Program</u>. The project proponent shall prepare the Shellfish Aquaculture Mitigation Plan<u>Program</u> in coordination with the appropriate regulatory and resource agencies, as well as the District, and shall implement the program during project design and operation of the future shellfish aquaculture facility. The removal of organic particles and plankton from the water column, the associated impacts on essential fish habitat, and the potential for benthic impacts shall be mitigated through</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>implementation of the following as part of the Shellfish Aquaculture Mitigation Program.</p> <p>Mitigation for Impacts on Essential Fish Habitat:</p> <ul style="list-style-type: none"> The project proponent shall prepare a mitigation plan that shall use best available science to evaluate the size of the aquaculture facility, the filtration rates and biomass of the cultured species, the mean phytoplankton biomass and production, and the tidal flushing rates of the facility location to determine potential impacts on organic particulate matter food resources. The mitigation plan shall include: <ul style="list-style-type: none"> An adaptive management strategy that accommodates cultivated shellfish density as necessary without significantly affecting food resources available to other organisms in the Bay. <p>Mitigation for Benthic Impacts:</p> <ul style="list-style-type: none"> The project proponent shall prepare a mitigation plan that evaluates various benthic impacts as affected by the species, and culture methods utilized, the size of the aquaculture facility, accumulation of materials such as pseudofeces, shell debris, and gear. The mitigation plan shall contain the following elements: <ul style="list-style-type: none"> A monitoring plan that evaluates the seabed beneath and adjacent to the facility to monitor for bacterial mats, sediment hypoxia, benthic infauna, or other indicators of ecosystem health. An adaptive management strategy that responds to negative indicators of benthic health as described in the monitoring plan to appropriately reduce the cultivated shellfish density, as necessary. Site-specific BMPs are to be developed and implemented during construction and operation of the aquaculture facility to lessen or eliminate potential benthic impacts. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-BIO-7: Permanent and Long-Term Overwater Coverage from Introduction of New Structures. The introduction of newly constructed berthing structures for commercial and recreational vessels, and vessels using berthing structures, would result in a permanent increase in overwater coverage. In addition, the introduction of large construction-related structures for prolonged periods of time may result in long-term overwater coverage impacts. The overwater coverage in each of these cases would result in a permanent reduction of potential open water foraging habitat for California least tern and other sensitive fish-foraging species. The overwater coverage also leads to lower primary productivity due to shading. The managed and sensitive species of eelgrass would be impacted in areas where overwater coverage shades eelgrass. This lost productivity impacts all higher trophic levels due to the lost production of organic carbon. Primary productivity is impacted any time eelgrass is shaded. In the case of landside structures the level of impact is more variable, and the impact will increase with taller structures and with structures that are closer to the water. Structures with a southern aspect (water to north of structure) will have a greater impact relative to structures with other aspects. This impact would be significant.</p>	PS	<p>MM-BIO-7: Implement Overwater Coverage Mitigation in Coordination with the Appropriate Resource Agencies and the District to Compensate for Loss of Open Water Habitat. For <u>Prior to the approval of a future development</u> projects that may result in the loss of open water habitat or shading, the project proponent shall implement the following:</p> <ol style="list-style-type: none"> 1. During site-specific environmental review and as required by applicable laws and regulations, the project proponent shall consult with the appropriate resource agencies, including but not limited to, NMFS, CDFW, USFWS, RWQCB, and/or USACE, regarding mitigation of impacts associated with loss of beneficial uses from overwater coverage, loss of open water habitat function, and shading. The project proponent shall secure all applicable permits for the mitigation of overwater coverage prior to commencement of waterside construction. One or more of the appropriate resource agencies may require additional or greater mitigation than specified under options 2.A, 2.B, 2.C, and 2.D of this mitigation measure (see below). 2. For impacts that the District determines are significant, a project proponent shall implement one of the following mitigation options, or a combination thereof. These options provide the minimum mitigation for overwater coverage impacts and/or shading impacts. One or more of the appropriate resource agencies may require additional or greater mitigation than specified in this mitigation measure. <ol style="list-style-type: none"> A. Remove an amount of existing overwater coverage within San Diego Bay that is equivalent to the proposed project's net increase in overwater coverage. This would replace the area affected by a future project at a 1:1 mitigation 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>ratio, subject to the District's review and approval.</p> <p>B. Restore or create an amount of wetland or eelgrass habitat within San Diego Bay equivalent to the proposed project's net increase in overwater coverage at a suitable location within San Diego Bay, at a 1:1 ratio for wetlands and a 1.2:1 ratio for eelgrass consistent with the CEMP, which would offset the net increase in overwater coverage by improving the habitat structure and primary productivity at the restoration site. The restoration or creation of wetland or eelgrass habitat shall require the project proponent to prepare a mitigation plan for the District's review and approval. The mitigation plan at a minimum shall include a description of the restoration site, mitigation requirements, planting plan (e.g., transplant sites, donor sites, reference site), restoration methods (e.g., plant collection or purchase, transplant units), timing of the restoration work, and a monitoring program to include a mitigation success criteria. The mitigation project shall secure all applicable permits and all applicable District Real Estate agreements for the mitigation site prior to commencement of construction. Additionally, all fill materials proposed for discharge into San Diego Bay for the development of the mitigation site shall meet the requirements of the USACE's <i>Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S. – Testing Manual (Inland Testing Manual)</i>.</p> <p>C. If a suitable mitigation bank within the Coastal Zone that is not yet available becomes available in the future, prior to construction of the proposed project, the project proponent shall</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>purchase saltmarsh wetland or overwater coverage credits to offset the net increase in overwater coverage.</p> <p>D. Subject to the Board of Port Commissioners' approval and findings, the project proponent may purchase an amount of credits from the District's shading credit program established pursuant to BPC Policy 735, at a fair market value, equivalent to that of the project's final shading total (i.e., to the satisfaction of the appropriate resource agencies).</p> <p>E. For projects where landside structures cause shading of eelgrass, the project proponent shall conduct a shading analysis reviewed by a qualified biologist to determine the time and amount of shading for all eelgrass areas impacted by the shading for the District's review to determine the anticipated impacts on eelgrass. If the shading analysis determines that impacts will occur, then mitigation for the loss of eelgrass will be conducted per the CEMP at a 1.2:1 mitigation ratio based on the amount of impacted eelgrass.</p> <p>F. For overwater coverage, a qualified biologist <u>as defined in MM-BIO-1</u>, shall conduct eelgrass surveys per the CEMP to determine potential impacts on eelgrass from construction.</p> <ul style="list-style-type: none"> If pre- versus post-construction eelgrass surveys determine that overwater structures will shade and impact eelgrass, then mitigation for the loss of eelgrass will be conducted pursuant to the CEMP at a 1.2:1 mitigation ratio based on the amount of impacted eelgrass. 	
Impact-BIO-8: Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches	PS	MM-BIO-8: Implement Raptor Perching Deterrent Measures on New Structures. Prior to the District's	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>to Hunt Protected Avian Species in Their Nesting Habitats. Future development projects under the proposed PMPU that would lead to increasing the susceptibility of protected avian species to predation from raptors and other large predatory birds include the addition of landside structures such as hotels, restaurants, and retail, or the addition of nearshore berthing structures. The addition of these structures could inadvertently create permanent additional perches for raptors and other large predatory birds that prey on other marine-based protected species. This impact would be significant.</p>		<p>approval of a future development project, the project proponent shall retain a qualified biologist <u>as defined in MM-BIO-1</u>, approved by the District and familiar with local sensitive species, to review the project plans for the following:</p> <ol style="list-style-type: none"> 1. Proximity of the proposed structure (i.e., within 500 feet) to sensitive avian nesting, loafing, or foraging habitat. 2. Potential for the proposed structure to act as a perch for raptors that may prey on any nearby sensitive avian species. <p>In the event that the qualified biologist identifies that both of the above conditions exist, the project proponent shall implement one or more of the following mitigation measures to mitigate the impact, as determined by the District.</p> <ul style="list-style-type: none"> • Install avian perching deterrents such as spikes on top of structures that can act as perches, such as pilings, building ledges, posts, fences, lights and ornaments. • Redesign structures and features of structures to prevent perching such as by use of pointed or uneven surfaces and recessing lights and ornaments that protrude from structures. 	
<p>Impact-BIO-9: Bird Strikes Resulting from Use of Reflective Materials. Use of reflective building and glass finishes may confuse birds in flight, leading to an increase in strikes. Future activities under the proposed PMPU that could result in increased bird strike potential include construction of new hotels and meeting space, restaurants, and retail in PD2 and PD3, if the future new buildings would not be surrounded by existing buildings that are taller. The increased potential for bird strikes would be a significant impact on avian species protected under the</p>	PS	<p>MM-BIO-9: Implement Bird Strikes Reduction Measures on New Structures. Prior to the District's approval of a future development project proposing the use of reflective surfaces and/or glass finishes, building plans shall be reviewed by a qualified biologist <u>as defined in MM-BIO-1</u>, familiar with avian species, retained by the project proponent and approved by the District, to verify that the proposed building has incorporated specific design strategies that qualify for Leadership in Energy and Environmental Design (LEED) credits, as described in the American Bird</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
MBTA and sensitive and listed species protected under ESA and/or CESA. This impact would be significant.		<p>Conservancy's <i>Bird-Friendly Building Design</i> (Sheppard and Phillips 2015) or an equivalent guide to avoid or reduce the potential for bird strikes. Final building design must demonstrate to the satisfaction of the qualified biologist and the District, as well as be confirmed by USFWS and/or CDFW, that design strategies, in accordance with the <i>Bird-Friendly Building Design</i>, have been incorporated and approved by the District. Design measures shall include, but not be limited to, the following:</p> <ul style="list-style-type: none"> • Building Façade and Site Structures <ul style="list-style-type: none"> ○ Develop a building façade and site design that are visible as physical barriers to birds. • Incorporate elements like windows, netting, screens, grilles, shutters, and exterior shades to preclude collisions. <ul style="list-style-type: none"> ○ Incorporate materials that have a low threat potential based on the Bird Collision Threat Rating and the Bird Collision Threat Rating Calculation Spreadsheet to achieve a maximum total building Bird Collision Threat Rating of 15 or less. <ul style="list-style-type: none"> • Least Threat Potential: Opaque Surface • Exterior Lighting <ul style="list-style-type: none"> ○ Fixtures not necessary for safety, entrances, and circulation shall be automatically shut off from midnight until 6:00 a.m. ○ Lighting is to be shaded and face down with a minimum spread to avoid lighting off site. ○ Exterior luminaires must meet these requirements for all exterior luminaires located inside project boundary based on the following: <ul style="list-style-type: none"> • Photometric characteristics of each luminaire shall be mounted in the same orientation and tilt as specified in the project design; and 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-BIO-10: Temporary Water Quality and Sedimentation Impacts on Eelgrass Beds During Project Construction. The construction of overwater berthing structures and aquaculture facilities would require in-water construction activities such as pile driving, equipment storage, and barge and other construction vessel operations. These activities would	PS	<ul style="list-style-type: none"> The project shall be classified under one lighting zone using the lighting zones definitions provided in the <i>Illuminating Engineering Society and International Dark Sky Association (IES/IDA) Model Lighting Ordinance (MLO) User Guide</i> (2011). Performance Monitoring Plan <ul style="list-style-type: none"> The project proponent shall develop a 3-year post-construction monitoring plan to routinely monitor the effectiveness of the building and site design in preventing bird collisions, <u>for a minimum of 18 months after implementing mitigation efforts and for at least two peak collision seasons (often the fall in urban areas), consistent with Bird-Friendly Building Design.</u> The post-construction monitoring plan shall include methods to identify and document locations where repeated bird strikes occur, the number of collisions, the date, the approximate time, and features that may be contributing to collisions. The post-construction monitoring plan shall list potential design solutions and provide a process for voluntary corrective action. The project proponent shall provide an annual performance monitoring report demonstrating which design strategies have been incorporated and the results of performance monitoring for review and approval by the District. 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
induce temporary water quality impacts in instances where measures provided under MM-BIO-4 could not prevent impacts on eelgrass beds.		<p>any future development project that has the potential to cause temporary or permanent eelgrass impacts, as determined by the District during project-specific environmental review. All mitigation and monitoring requirements shall be performed in accordance with the CEMP (NMFS 2014).</p> <ul style="list-style-type: none"> • The project proponent shall retain a qualified biologist <u>as defined in MM-BIO-1</u>, approved by the District, to conduct a preconstruction eelgrass survey during the project planning phase prior to commencement of construction activities. Surveys for eelgrass will be conducted during eelgrass growing season (March–October), and results will be valid for 60 days, unless completed in September or October; if completed in September or October, results will be valid until resumption of next growing season. The project proponent shall provide the preconstruction eelgrass survey to the District and the NMFS as well as regulatory points of contact for agencies that will be required to provide project permits such as the CDFW, CCC, USACE, and San Diego RWQCB. • If the results of project planning (e.g., proposed overwater structures or shading analysis) identify potential impacts on eelgrass, the project proponent shall consult with the NMFS, CCC, USACE, RWQCB, and the District to determine appropriate mitigation to achieve the 1:2:1 eelgrass mitigation ratio specified in the CEMP. A qualified biologist shall then prepare an eelgrass mitigation plan for the District's review and approval. The qualified biologist shall also submit the plan to the NMFS for review and consultation. The eelgrass mitigation plan shall identify the potential extent of eelgrass impact; the means, methods, and location to mitigate for impacts; and mitigation success criteria; and shall provide a monitoring schedule to monitor for mitigation success. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<ul style="list-style-type: none"> • Projects may reference a baywide eelgrass survey for planning purposes (i.e., during environmental review), and are required to conduct a preconstruction survey within 30 days of initiating construction per the CEMP. • The qualified biologist shall also prepare and submit to the District, NMFS, and other pertinent agencies a post-construction eelgrass survey. The post-construction survey shall be conducted within 30 days of completion of construction. If construction ends during the non-growing season (November 1 to February 28), the monitoring shall be delayed until the resumption of the growing season. The post-construction survey shall document the extent of eelgrass impacts following project completion. • For projects with anticipated long-term impacts on eelgrass where the extent of impact cannot be determined immediately following construction, the qualified biologist shall also perform at least 2 years of annual post-construction eelgrass surveys. The results of the surveys shall be submitted to the District, and NMFS, other pertinent agencies for review. These annual surveys shall evaluate if any longer-term or operational impacts were caused to eelgrass and the benthic community. Specifically, the surveys shall be designed to evaluate potential shading, vessel movements or/any other potential impacts. • The project proponent shall commence implementation of the eelgrass mitigation in accordance with the eelgrass mitigation plan within 135 days of any impacts on eelgrass identified in the post-construction survey report(s). • The project proponent shall implement mitigation performance monitoring at 0, 12, 24, 36, 48, and 60 months as required by the CEMP and consistent with 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>the eelgrass mitigation plan after completing of eelgrass transplanting or restoration as specified in the eelgrass mitigation plan. All performance standards shall be in accordance with the CEMP.</p> <ul style="list-style-type: none"> In the event that impacts on eelgrass are detected during the 2-year post-construction period, the project proponent shall provide additional mitigation for eelgrass impacts by transplanting eelgrass at a suitable restoration site at a ratio <u>identified in the CEMP of 1.2:1</u>. Conservative mitigation planning can avoid this additional mitigation through planning for long term impacts and providing eelgrass transplantation prior to monitoring and evaluation of all impacts. 	
<p>Impact-BIO-11: Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures. Operational impacts on marine resources would potentially include permanent overwater shading of eelgrass beds by newly built permanent overwater structures (e.g., piers, docks), and potentially from newly built landside structures, depending on the height and locations of those structures relative to San Diego Bay and any eelgrass beds. Any future development project that causes shading over eelgrass beds would impact eelgrass by reducing the photosynthetic production and therefore plant production. Because of the uncertainty regarding the height and other characteristics of future development projects that may be adjacent to San Diego Bay and eelgrass beds, permanent eelgrass shading impacts are considered significant.</p>	PS	Implement MM-BIO-10 , as described above.	LTS
<p>Impact-BIO-12: Direct Loss of Eelgrass from Dredging Activities. Any construction activities that would involve dredging or fill of underwater habitat could directly impact eelgrass if present within the footprint of these activities. Dredging bottom habitat containing eelgrass beds would</p>	PS	Implement MM-BIO-10 , as described under Threshold 2.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
uproot existing eelgrass. Fill of submerged habitats would entirely cover all eelgrass if present, which would be considered a significant impact.			
Impact-BIO-13: Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters. Newly installed pile clusters could result in permanent alteration of Bay water hydrodynamics, which would be considered a significant impact.	PS	MM-BIO-11: Implement Measures that Improve Water Quality, Enhance Habitat, Restore Habitat, or Purchase Credits in a Mitigation Bank. The project proponent shall implement the following: 1. As required by applicable law or regulation, the project proponent shall obtain permits from the RWQCB and USACE to meet requirements under Sections 401 and 404 of the CWA and Section 10 of the RHA. Appropriate mitigation measures such as those described below shall be developed through consultation with the appropriate resource agencies, including but not limited to, NMFS, CDFW, USFWS, RWQCB, and/or USACE. The mitigation measure(s) shall be described in permit applications filed with the RWQCB and USACE such that they can be incorporated as permit conditions to be implemented by the project proponent. One or more of the appropriate resource agencies may require additional or greater mitigation than specified under options 2.A, 2.B, 2.C, and 2.D of this mitigation measure. 2. Prior to the commencement of construction activities, the project proponent shall implement one of the following mitigation options, or a combination thereof. The below options provide the minimum mitigation for structural fill impacts associated with altered hydrodynamics. A. Remove an amount of existing fill, such as pilings, equivalent to the proposed project's net increase in fill from structures placed within San Diego Bay, which would replace the area affected by the	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>proposed project at a 1:1 mitigation ratio, subject to the District's review and approval.</p> <p>B. Restore or create an amount of wetland or eelgrass habitat equivalent to the proposed project's net increase in fill or fill associated impacts at a suitable location within San Diego Bay at a 1:1 ratio for wetlands and a 1.2:1 ratio for eelgrass consistent with the California Eelgrass Mitigation Policy, which would offset the net increase in fill by improving the habitat structure and primary productivity. The restoration or creation of wetland or eelgrass habitat shall require the project proponent to retain a qualified biologist to prepare and submit a mitigation plan for the District's review and approval, which shall include a description of the restoration site, mitigation requirements, planting plan (e.g., transplant sites, donor sites, reference site), restoration methods (e.g., plant collection or purchase, transplant units), timing of the restoration work, and a monitoring program (e.g., establishment of monitoring and mitigation success criteria). The project proponent shall obtain all applicable permits and all applicable District Real Estate agreements for the mitigation site prior to commencement of construction. Additionally, all fill materials proposed for discharge into San Diego Bay for the development of the mitigation site shall meet the requirements of the USACE' <i>Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S. – Testing Manual (Inland Testing Manual)</i>.</p> <p>C. If a suitable mitigation bank within the Coastal Zone that is not yet available becomes available in the future, prior to construction of the</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>proposed project, the project proponent shall purchase saltmarsh wetland or overwater coverage credits <u>at a 1:1 mitigation ratio</u> to offset the proposed project's net increase in fill. The District shall balance the impacts of the fill against the benefits provided by the mitigation bank to determine the appropriate credit purchase required.</p> <p>D. Subject to the Board of Port Commissioners' approval and findings, the project proponent may purchase credits from the District's shading credits program established pursuant to BPC Policy 735 at a fair market value. The District shall determine the equivalency of fill impact and shading credit by comparing the ecological and hydrological losses associated with the fill to the increased value of ecosystem productivity achieved through reduced shading.</p>	
<p>Impact-BIO-14: Reduction in the Ecological Value of Benthic Communities from Increased Depths Created by Dredging Activities. Ongoing dredging of underwater habitat would temporarily lower the ecological value of benthic communities <u>and would potentially lead to long-term impacts</u>, which would be considered a significant impact.</p>	PS	Implement MM-BIO-10 , as described under Threshold 2, and MM-BIO-11 , as described above.	LTS
<p>Impact-BIO-15: Potential for Future Projects to Result in a Conflict with the Integrated Natural Resources Management Plan. The PMPU provides the general policy framework for future projects to abide with and has several policies that are intended to protect the environment and the natural resources within the Tidelands. While the proposed PMPU goals, objectives, and policies are not in conflict with the INRMP, it cannot be determined at the programmatic level of analysis contained with this PEIR exactly where and how future</p>	PS	Implement MM-BIO-1 through MM-BIO-11 , as described above under Threshold 1.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>projects, consistent with the proposed PMPU, would be implemented. This includes considerations such as the exact location and siting of development projects and related activities such as material laydown and construction staging areas in relation to natural resources and environmentally sensitive areas. Because significant impacts on biological resources were identified under Thresholds 1 through 4, implementation of the proposed PMPU would have the potential to conflict with the INRMP.</p>			
<p>Impact-C-BIO-1: In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species such as California Least Tern and California Brown Pelican. In-water construction-induced noise impacts from overwater construction activities such as pile driving could disrupt the foraging behavior of the California least tern if construction occurs during the California least tern nesting season, as well as other sensitive fish-foraging avian species such as California brown pelican. This impact would be significant.</p>	PS	Implement MM-BIO-1 , as described above.	LTS
<p>Impact-C-BIO-2: Construction Noise Impacts on Nesting Behavior of Marine Dependent Species Protected under the Migratory Bird Treaty Act and California Fish and Game Code. Construction induced noise impacts from landside and over<u>in</u>-water construction activities can disturb nesting marine dependent bird species protected under the MBTA and California Fish and Game Code. Disturbance can lead to nest abandonment or altered behavior that results in lowered nesting success. This impact would be potentially significant.</p>	PS	Implement MM-BIO-2 , as described above.	LTS
<p>Impact-C-BIO-3: In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fishes. In-water pile driving activities could generate</p>	PS	Implement MM-BIO-3 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>enough underwater noise to physically injure marine mammals, green sea turtles, and fishes should impact hammer or vibratory pile driving occur during construction. Any noise related impacts would be dependent on the type of activity being performed, the proximity of the activity to marine waters, and the biology of the considered species. In-water impact hammer or vibratory pile driving activity by comparison could potentially generate enough underwater noise to injure (Level A Harassment) or alter behavior (Level B Harassment) for marine mammals, green sea turtles, and fishes. This impact would be significant.</p>			
<p>Impact-C-BIO-4: Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity. In-water construction activities can suspend sediment that results in water quality and turbidity impacts that limit the ability of fish foraging avian species to locate prey and disrupts eelgrass productivity. Additionally, incidental vessel contact with bottom substrate and vessel propeller wash within shallow areas could result in increased turbidity. This impact would be significant.</p>	PS	Implement MM-BIO-4 , as described above.	LTS
<p>Impact-C-BIO-5: Potential Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code. Removal of existing trees and demolition of existing structures, as well as generation of noise, dust, or nighttime lighting from construction activity, could impede the use of breeding sites during the general avian nesting season (February 15 through August 31). The disturbance or destruction of an occupied nest would be considered a significant impact.</p>	PS	Implement MM-BIO-5 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-C-BIO-6: Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment. Aquaculture within the proposed PMPU area allows for the cultivation of shellfish and seaweed. If viewed in the context of available fish habitat and forage, shellfish operations compete with natural populations of fish and invertebrates that consume plankton and organic particles and limit foraging opportunities for coastal pelagic fish species. Additionally, benthic impacts of shellfish aquaculture can result from the presence of gear and equipment, shell debris, and the accumulation of pseudofeces or fouling organisms due to natural processes and dependent upon culture methods. Collectively, these impacts are considered significant.</p>	PS	Implement MM-BIO-6 , as described above.	LTS
<p>Impact-C-BIO-7: Permanent and Long-Term Overwater Coverage from Introduction of New Structures. The introduction of newly constructed berthing structures for commercial and recreational vessels, vessels using berthing structures would result in a permanent increase in overwater coverage. In addition, the introduction of large construction-related structures for prolonged periods of time may result in long-term overwater coverage impacts. The overwater coverage in each of these cases would result in a permanent reduction of potential open water foraging habitat for California least tern and other sensitive fish-foraging species. The overwater coverage also leads to lower primary productivity due to shading. The managed and sensitive species of eelgrass would be impacted in areas where overwater coverage shades eelgrass. This lost productivity impacts all higher trophic levels due to the lost production of organic carbon. Primary productivity is impacted anytime eelgrass is shaded. In the case of landside structures the level of impact is more variable and the impact will increase with taller structures and with structures that are closer to the</p>	PS	Implement MM-BIO-7 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
water. Structures with a southern aspect (water to north of structure) will have a greater impact relative to structures with other aspects. This impact would be significant.			
Impact-C-BIO-8: Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in their Nesting Habitats. Future development projects under the proposed PMPU that would lead to increasing the susceptibility of protected avian species to predation from raptors and other large predatory birds include the addition of landside structures such as hotels, restaurants, and retail , or the addition on nearshore berthing structures. The addition of these structures could inadvertently create permanent additional perches for raptors and other large predatory birds that prey on other marine-based protected species. This impact would be significant.	PS	Implement MM-BIO-8 , as described above.	LTS
Impact-C-BIO-9: Bird Strikes Resulting from Use of Reflective Materials. Use of reflective building and glass finishes may confuse birds in flight, leading to an increase in strikes. Future activities under the proposed PMPU that could result in increased bird strike potential include construction of new hotels and meeting space, restaurants, and retail in PD2 and PD3, if the future new buildings would not be surrounded by existing buildings that are taller. The increased potential for bird strikes would be a significant impact on avian species protected under the MBTA and sensitive and listed species protected under ESA and/or CESA. This impact would be significant.	PS	Implement MM-BIO-9 , as described above.	LTS
Impact-C-BIO-10: Temporary Water Quality and Sedimentation Impacts to Eelgrass Beds During Project Construction. The construction of overwater berthing structures and aquaculture facilities would require in-water construction activities such as pile driving, equipment storage, and barge and other construction	PS	Implement MM-BIO-9 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
vessel operations. These activities would induce temporary water quality impacts in instances where measures provided under MM-BIO-4 could not prevent impacts to eelgrass beds.			
Impact-C-BIO-11: Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures. Operational impacts on marine resources would potentially include permanent overwater shading of eelgrass beds by newly built permanent overwater structures (e.g., piers, docks), and potentially from newly built landside structures, depending on the height and locations of those structures relative to San Diego Bay and any eelgrass beds. Any future development project that causes shading over eelgrass beds would impact eelgrass by reducing the photosynthetic production and therefore plant production. Because of the uncertainty regarding the height and other characteristics of future development projects that may be adjacent to San Diego Bay and eelgrass beds, permanent eelgrass shading impacts are considered significant.	PS	Implement MM-BIO-10 , as described above.	LTS
Impact-C-BIO-12: Direct Loss of Eelgrass from Dredging Activities. Any construction activities that would involve dredging or fill of underwater habitat could directly impact eelgrass if present within the footprint of these activities. Dredging bottom habitat containing eelgrass beds would uproot existing eelgrass. Fill of submerged habitats would entirely cover all eelgrass if present, which would be considered a significant impact.	PS	Implement MM-BIO-10 , as described above.	LTS
Impact-C-BIO-13: Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters. Newly installed pile clusters could result in permanent alteration of Bay water hydrodynamics, which would be considered a significant impact.	PS	Implement MM-BIO-11 , as described above.	LTS
Impact-C-BIO-14: Reduction in the Ecological Value of Benthic Communities from Increased Depths Created	PS	Implement MM-BIO-10 , and MM-BIO-11 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
by Dredging Activities. Ongoing dredging of underwater habitat would temporarily lower the ecological value of benthic communities <u>and would potentially lead to long-term impacts</u> , which would be considered a significant impact.		Implement MM-BIO-1 through MM-BIO-11 , as described above.	LTS
Impact-C-BIO-15: Potential for Future Projects to Result in a Conflict with the Integrated Natural Resources Management Plan. The PMPU provides the general policy framework for future projects to abide and has several policies that are intended to protect the environment and the natural resources within the Tidelands. While the proposed PMPU goals, objectives, and policies are not in conflict with the Integrated Natural Resources Management Plan, it cannot be determined at the programmatic level of analysis contained with the proposed PMPU PEIR exactly where and how future projects, consistent with the proposed PMPU, would be implemented. This includes considerations such as the exact location and siting of development projects and related activities such as material laydown and construction staging areas in relation to natural resources and environmentally sensitive areas. Because significant impacts on biological resources were identified under Thresholds 1-4, implementation of the proposed PMPU would have the potential to conflict with the Integrated Natural Resources Management Plan.	PS	Implement MM-BIO-1 through MM-BIO-11 , as described above.	LTS
4.4 Cultural Resources and Tribal Cultural Resources			
Project Impacts			
Impact-CUL-1: Future Construction Activities Within the Proposed PMPU Area May Adversely Impact Current and Future Significant Historical Resources. Future construction activities consistent with the proposed PMPU would have the potential to: 1. Demolish a historical resource.	PS	MM-CUL-1: Conduct a Historical Resource Assessment. <u>Prior to the approval of a future project</u> Concurrently with any application submitted to the District for development activity that may cause a substantial adverse change, as defined in State CEQA Guidelines Section 15064.5(b)(1), in the significance of a historical resource, the project proponent shall be	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>2. Alter a historical resource such that it no longer retains sufficient historical integrity to convey significance.</p> <p>3. Alter the setting of a historical resource for which the setting is in important character-defining feature that expresses the resource's significance.</p> <p>Any one of these outcomes would be considered a significant impact on a historical resource.</p>		<p>required to submit a historical resource assessment prepared by a Secretary of the Interior's (SOI) Standards-qualified architectural historian approved by the District. Development activities that could cause a substantial adverse change in the significance of a historical resource include those that would potentially demolish or diminish the historical integrity of a building or structure that is equal to or greater than 50 years old, or which will be equal to or greater than 50 years old at the time disturbance of the building or structure occurs. <u>Additionally, built resources that have the potential to meet CRHR or NRHP criteria, even if less than 50 years old, shall be evaluated for significance by a qualified SOI-qualified architectural historian to determine if a historical resource assessment, as directed under this mitigation measure, is required.</u></p> <p>In order to determine if there are one or more historical resources in a proposed project <u>study area</u>, the historical resource assessment shall be completed according to the following steps: (i) define an appropriate historical resources study area for the proposed project, (ii) survey and research the area to identify built resources known to qualify as historical resources under CEQA as a result of previous designation, and (iii) formally evaluate built resources not previously designated that could potentially qualify as historical resources under CEQA by applying the criteria for listing in the CRHR (14 CCR 4852). The study area shall account for potential direct and indirect impacts on historical resources, including alterations to the immediate setting of any historical resource that could cause an adverse change in the resource's significance. Based on the historical resource assessment and analysis of project activities, the District shall determine if any built environment</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>resources qualifying as historical resources will be subject to potentially significant impacts from the project as defined by Section 15064.5(b)(1) of the State CEQA Guidelines. The District shall determine that a future project may have a significant impact on a historical resource if the proposed project:</p> <ul style="list-style-type: none"> • Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR (State CEQA Guidelines Section 15064.5[b][2][A]), or • Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to PRC Section 5024.1(g), unless the District reviews the effects of the project and establishes by a preponderance of evidence that the resource is not historically or culturally significant (State CEQA Guidelines Section 15064.5[b][2][B]), or • Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR was determined by the District for purposes of CEQA (State CEQA Guidelines Section 15064.5[b][2][C]). <p>If the proposed project would directly or indirectly impact an historical resource, the District shall identify feasible mitigation measures appropriate to avoid, minimize, or otherwise substantially reduce significant impacts. Mitigation measures shall include one or more of the following, in the following order of preference:</p> <ol style="list-style-type: none"> 1. Avoidance. The project proponent shall avoid demolition or materially altering the historical 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>resource by avoidance measures, such as the following:</p> <ul style="list-style-type: none"> Establish environmentally sensitive areas, including all or part of a historical resource depending on its spatial relationship to project activities, and arrange for them to be identified and protected by clearly defined barriers during construction to ensure avoidance. Conduct a construction condition assessment(s) or Historic Structure Report(s) of historical resources adjacent to construction to determine if those resources are at risk of being damaged, including a determination of tolerable levels of construction vibration and potential for damage. Redesign relevant portions of the proposed project to avoid destruction or damage to the historical resource. Design and implementation of stabilization measures to ensure that fragile built resources are not damaged by construction activities, and that any stabilization measures are implemented in accordance with SOI Standards for the Treatment of Historic Properties (USDI NPS 2020). Temporarily move built resources. <p>In implementing avoidance measures, the project proponent shall arrange for an SOI-qualified architectural historian or historic architect, approved by the District, to participate in preconstruction meetings and construction monitoring activities to ensure continuing adherence to avoidance measures.</p> <p>2. Alteration of Historical Resources in Accordance with SOI Standards. If the District determines that a project cannot avoid a historical</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>resource, the project proponent shall design the proposed project to comply with SOI Standards for the Treatment of Historic Properties (SOI Standards) and thereby avoid any impacts that could cause an adverse change in the significance of a historical resource (USDI NPS 2020). The project proponent shall retain an SOI- qualified architectural historian or historic architect (approved by the District) to identify the applicable SOI Standards, assist in the project design, review the design plans, and provide a written report to the District assessing the design plans' compliance with the applicable SOI Standards. The District shall review the report and confirm the design plans' compliance with the applicable SOI Standards. The project proponent shall adhere to the design plan approved by the District. This will ensure that alterations to the historical resource are implemented in accordance with the SOI Standards and that the historical resource retains sufficient character-defining features to express its historical significance.</p> <p>3. Relocation. If the District determines that it would not be feasible to minimize significant impacts on a historical resource through avoidance or by designing the project to comply with the SOI Standards, the project proponent shall retain a District-approved, SOI-qualified historic architect or architectural historian to provide measures and oversight for the relocation of a significant historic building that would otherwise be demolished, altered, or subject to neglect and deterioration if the proposed project is implemented. The SOI-qualified professional shall prepare a historic building relocation plan at the project proponent's expense. The relocation plan shall identify the site</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>where the resource would be relocated as well as all relevant permits required for the resource to be moved from its existing location and transported to the relocation site. The relocation plan shall identify the qualifications required of the building relocation company to ensure that relocation is undertaken by a company experienced in moving historic buildings comparable to the building subject to potential significant impacts from the proposed project. The relocation plan shall ensure that the building will be moved without irreparable damage to the character-defining historic fabric of the building and shall specify protective measures for vulnerable character-defining features. The project proponent shall incorporate into construction specifications for the proposed project a requirement that the building relocation company and the construction contractor(s) use all feasible means to avoid damage to the historic building during its relocation, including, but not limited to, relocation methods and relocation activity routes, closures, and timing. The District shall review and provide final approval of the historic building relocation plan. The project proponent shall implement the relocation plan.</p> <p>4. Historical Resource Archival Documentation. If the District determines that it would not be feasible to minimize significant impacts on a historical resource through avoidance, designing the project to comply with the SOI Standards, or relocation of the historical resource, archival documentation shall be prepared if the resource is the type of historical resource for which archival documentation would reduce the impact. Historical resources for which archival documentation can reduce an impact are generally those recognized as</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>significant (i) for their architectural design or engineering qualities; (ii) for exemplifying the work of a master architect, builder, or engineer; or (iii) for embodying the distinctive characteristics of a type, period, or method of construction. The level of archival documentation shall be determined by the District based on the evidence in the record. The project proponent shall arrange for the preparation of archival documentation of the historical resource by an SOI-qualified architectural historian or historian and a professional photographer, approved by the District, at the project proponent's expense. The documentation shall consist of archival photography, written data (physical description and historical narrative), and, depending on the historical resource's level of significance, measured drawings to be distributed to one or more appropriate local repositories. Potentially appropriate repositories include the San Diego Public Library, the San Diego History Center, other local historical societies, the San Diego Maritime Museum, and local university library special collections. Archival documentation of historical resources shall be prepared in accordance with the National Parks Service's (NPS) guidelines for Historic American Buildings Survey (HABS) Historic American Landscape Survey (HALS) and Historic American Engineering Record (HAER) documentation. The level and degree of documentation shall be determined by the District and shall be commensurate with the size, extent, and level of the documented historical resource's significance. The District shall review and approve all archival documentation prepared as historical resource mitigation prior to its submittal to the</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>chosen repository or repositories. The project proponent shall submit the District-approved archival documentation and confirm its receipt by the repository or repositories.</p> <p>5. Interpretation. If it is not feasible to minimize significant impacts on a historical resource through avoidance, designing the project to comply with the SOI Standards, or relocation of the historical resource, as determined appropriate by the District the project proponent shall arrange for a District-approved SOI-qualified architectural historian or historian to prepare appropriate historical resource interpretive or educational media at the project proponent's expense. Historical resources for which interpretive or educational media would reduce the impact are generally those that have significance for (i) direct association with an event or pattern of events important to history, or (ii) for direct association with the life of a historically significant individual. The type of interpretive or educational media shall be determined by the District based on the evidence in the record. The SOI-qualified preservation professional shall work with the District and the project proponent to determine the type of interpretive media that is appropriate for the impacted historical resource. Such interpretive or educational media may include displays in public spaces, print materials, or websites. Interpretive and educational media may incorporate written, photographic, and archival documentation (such as those compiled according to NPS HABS/HAER/HALS guidelines) oral history interviews, video, or animation to tell the story of the heritage represented by the impacted resource. At the expense of the project proponent, the District-approved SOI-qualified historic</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>preservation professional shall prepare the chosen type of interpretive or educational media with District approval. The District shall review the interpretive or educational media prior to final approval. The project proponent shall be responsible for displaying or providing public access to the interpretive or educational media.</p> <p>6. Materials Salvage. If it is not feasible to minimize significant impacts on a historical resource through avoidance, designing the project to comply with the SOI Standards, or relocation of the historical resource, and a historical resource is subject to complete or partial demolition from a proposed project, the project proponent shall arrange for salvage of historically important materials as deemed appropriate by the District. The project proponent shall arrange for a District-approved SOI-qualified historic preservation professional (historic architect or architectural historian in this case) to assess portions of the historical resource to be demolished to identify important salvageable materials. These may include materials that a historic preservation organization may be interested in using to restore an architecturally similar building, materials or objects that may be used in interpretive or educational media, or objects of interest to historical societies. The District-approved historic preservation professional shall prepare a materials salvage plan at the expense of the project proponent and shall coordinate with potentially interested preservation organizations and historical societies as deemed appropriate by the District and the project proponent. The District shall review and provide final approval of the materials salvage plan. The</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-OPT3-CUL-1: Future Construction Activities Associated with Option 3 May Adversely Impact Current and Future Significant Historical Resources Within North Embarcadero. Future construction activities associated with Option 3 would have the potential to impact the County Administration Center (CAC), which is listed on the NRHP and the CRHR, as well as structures that are over or will be over 50 years old, by:</p> <ol style="list-style-type: none"> 1. Demolishing contributing elements of a historical resource; 2. Altering a historical resource such that it may no longer retains sufficient historical integrity to convey significance; 3. Altering the setting of a historical resource for which the setting is in important character-defining feature that expresses the resource's significance. <p>Any one of these outcomes would be considered a significant impact on a historical resource.</p>	PS	<p>project proponent shall be responsible for implementation of the materials salvage plan.</p> <p>7. <u>Requirement to Coordinate with Affected Agency.</u> Where a potential impact on a historical resource stemming from implementation of the PMPU may occur on an agency-owned property or on non-District land (e.g., County Administration Center and Waterfront Park), the District shall provide notice and coordinate with the applicable agency at least one year prior to planned construction.</p> <p><u>The Historical Resource Assessment Plan will be subject to the District's review and approval and no development shall proceed until the Historical Resource Assessment plan is deemed acceptable to the District.</u></p>	SU
<p>Impact-CUL-2: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact</p>	PS	<p>MM-CUL-2: Conduct an Archaeological Resource Assessment. Prior to any approval of a future</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Archaeological Resources that are Historical Resources or Unique Archaeological Resources.</p> <p>Ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to damage or destroy archaeological resources that are historical resources (as defined in State CEQA Guidelines Section 15064.5(a)) or qualify as a unique archaeological resource (as defined in PRC Section 20183.2(g)), which would be considered a significant impact.</p>		<p>discretionary project (as defined by the CEQA Guidelines Section 15357) with ground-disturbing activities <u>that may affect an archaeological site</u>, the project proponent shall retain an SOI-qualified archaeologist to prepare an Archaeological Resources Assessment (ARA), which shall be submitted to the District for its review and approval. The ARA is a preliminary inquiry into the potential for archaeological resources being present on site and will assist the District in determining if a future project may or may not have an effect on archaeological sites that are historical resources or unique archaeological resources, per State CEQA Guidelines Section 15064.5(c)(1-4) and PRC Section 21083.2(g).</p> <p>In order to determine if there are one or more archaeological historical resources or unique archaeological resources in a proposed project, the ARA shall be completed according to the following steps:</p> <ol style="list-style-type: none"> 1. Desktop Analysis. The ARA shall define an appropriate archaeological study area for the proposed project, and research the study area to determine its sensitivity for subsurface archaeological resources. Research shall include but is not limited to reviewing the prehistoric archaeological sensitivity analysis under Archaeological Resources in Section 4.4.2 of the PMPU PEIR, a records search, and a review of historic maps such as Sanborn fire insurance <u>maps</u>, and U.S. Geological Survey (USGS) topographic maps, <u>and Tax Factor 1928-1929 aerial photos</u>. The ARA shall make recommendations regarding the need for further archaeological studies to be completed. If the ARA shows to the District's satisfaction that the study area consists entirely of fully developed fill with no undisturbed land, or entirely of land with little or no potential for 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>subsurface prehistoric or historic archaeological resources preserved within depositional context, no field survey, additional study, or measures for protecting archaeological resources that are historical resources, or qualify as a unique archaeological resource, would be necessary. A brief ARA memo shall serve as documentation of the findings.</p> <p>Based on the information and recommendations provided in the ARA memo, if further archaeological studies are required, the project proponent shall take one or more of the following sequential actions, which are determined by the District to be necessary to avoid or reduce the proposed project's impacts on archaeological resources that are historical resources, or qualify as a unique archaeological resource, to a level below significance:</p> <ol style="list-style-type: none"> 2. Archaeological Survey. If the ARA finds that the study area contains previously identified prehistoric or historic archaeological resources preserved in depositional context, undeveloped land with undisturbed or minimally disturbed surface soils, or historic archaeological resource potential based on historic map research, the project proponent will retain an SOI-qualified archaeologist (approved by the District) to conduct a preconstruction archaeological resources field survey of the project area. 3. Archaeological Testing and Evaluation. If the District determines that the resource cannot be avoided through project design, the SOI-qualified archaeologist retained by the project proponent shall implement an evaluative subsurface testing program to determine the resource boundaries within the project area, assess the site's eligibility 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>for listing in the NRHP and CRHR, or for its potential to be a unique archaeological resource, and assess the integrity of the resource, all subject to verification and approval from the District. The testing and evaluation program shall be used to determine whether the site is a historical resource or unique archaeological resource. The SOI-qualified archaeologist shall prepare an Archaeological Survey Evaluation Report (ASER) at the conclusion of the field survey and evaluative subsurface testing program. The ASER will conform with the California Office of Historic Preservation (OHP) recommended contents and format for cultural resources reports. The report shall be submitted to the District for review and, upon the District's determination that the report is satisfactory, shall be deposited at the SCIC.</p> <p>If the District determines the site is not a historical resource or a unique archaeological resource, the effects of the project on the resource shall not be considered a significant effect on the environment and need not be considered further in the CEQA process, per State CEQA Guidelines Section 15064.5(c)(4). If the archaeological site is a historical resource, and where impacts may occur to a historical resource, the District would require one or more of the following measures in MM-CUL-12. If an archaeological site is not a historical resource but meets the definition of a unique archeological resource in Section 21083.2 of the PRC, the site shall be treated in accordance with the provisions of Section 21083.2. The time and cost limitations described in PRC Section 21083.2 (c-f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>4. Preservation in Place. Preservation in place is the preferred manner of mitigating impacts on archaeological historical resources and unique archaeological resources. If the District determines the site is a historical resource or unique archaeological resource, and the project can be designed to avoid the historical resource or unique archaeological resource, preservation in place may be accomplished by, but not limited to: planning construction to avoid the resource; incorporating sites within parks, greenspace, or open space; covering the site with chemically stable soil prior to construction; or deeding the site into a permanent conservation easement, per State CEQA Guidelines Section 15126.4(b)(3)(A) – (B) and PRC Section 21083.2(b).</p> <p>5. Archaeological Data Recovery. If the District determines the site is a historical resource, preservation in place is not possible, and data recovery is the only feasible mitigation, an archaeological Data Recovery Plan (DRP) will be designed to record and remove scientifically important data that would otherwise be destroyed through construction-related ground disturbance, per State CEQA Guidelines 15126.4(b)(3)(C). The DRP and data recovery fieldwork will be completed prior to the start of project construction. After the archaeological data recovery fieldwork is complete, the SOI-qualified archaeologist retained by the project proponent shall prepare an archaeological data recovery report (DRR). The report will conform with the California Office of Historic Preservation (OHP) recommended contents and format for cultural resources reports. The report shall be submitted to the District for review and, upon the District's determination that the report is</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>satisfactory, shall be deposited at the SCIC. Any artifacts collected during data recovery will be curated at the San Diego Archaeological Center, at the project proponent's expense. Per State CEQA Guidelines Section 15126.4(b)(3)(D), if the District determines that testing or studies already completed have adequately recovered the scientifically important information from and about the archaeological or historical resource, data recovery will not be required, provided that the determination is documented and that the studies are deposited with the SCIC.</p> <p>6. Archaeological Construction Monitoring. In the event the District determines that archaeological construction monitoring is necessary in order to mitigate the potential for project construction <u>(including geotechnical borings)</u> to impact as-yet unknown archaeological resources, then the project proponent shall retain an SOI-qualified archaeologist, approved by District. <u>Depending on whether a TCR is present, as defined by PRC Section 21074, At its discretion, the District may require request</u> a Native American monitor also be present during ground-disturbing construction activities. <u>The District may utilize a monitor qualified to monitor both archaeological and tribal cultural resources.</u> During project-specific environmental review, the approved SOI-qualified archaeologist shall prepare and submit to the District for approval an Archaeological Monitoring and Discovery Plan (AMDP). The AMDP shall describe the project, archaeological sensitivity of and known archaeological resources in the project area, monitor qualifications, monitoring and discovery procedures, roles and responsibilities, and reporting. Upon completion of archaeological construction</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>monitoring, a Final Monitoring Report (FMP) shall be prepared in conformance with the OHP's guidelines for the preparation of cultural resources management reports and will be deposited at the SCIC. Any diagnostic artifacts collected during archaeological construction monitoring will be curated at the San Diego Archaeological Center, at the project proponent's expense. If an artifact is determined to be a tribal cultural resource, the District shall consult with the applicable Native American tribes to determine the appropriate treatment of the artifact.</p> <p>7. Unanticipated Discovery Procedures. For those projects where there is the potential for encountering unknown archaeological resources, if an unanticipated discovery of an archaeological resource occurs during construction of a project, construction-related ground disturbance would be diverted or temporarily halted until the SOI-qualified archaeologist <u>and/or Native American monitor</u> can assess if it is a historical resource, <u>or a unique archaeological resource, or has tribal cultural significance</u>. The District, based on information provided by the SOI-qualified archaeologist <u>or Native American monitor (for tribal cultural resources)</u>, would determine the significance of the discovered resources in accordance with <u>this mitigation measure and MM-CUL-2, MM-CUL-3</u>, and per PRC 21083.2(i) and State CEQA Guidelines Section 15064.5(f). <u>For archaeological resources, significance would be based on the results of evaluative archaeological testing completed by the SOI-qualified archaeologist and applying the criteria for listing in the CRHR, per State CEQA guidelines Section 15064.5(a)(1-4) and identifying unique archaeological resources per Section 21083.2 of the</u></p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-CUL-3: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Tribal Cultural Resources. Ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to cause a substantial adverse change in the significance of a TCR, as defined in PRC Section 21074, which would be considered a significant impact.	PS	<p>PRC. <u>For tribal cultural resources, the significance would be based on the opinion of the Native American monitor, consistent with PRC Section 21074 related to a potential tribal cultural resource (See MM-CUL-3).</u> For cultural resources determined by the District to be a historical resource or a unique archaeological resource, the SOI-qualified archaeologist shall prepare a Research Design and Data Recovery Program (RDDR), which shall mitigate impacts in accordance with MM-CUL-2 <u>this mitigation measure</u> and State CEQA Guidelines Section 15126.4(b)(3) and Section 15064.5(f), and the project proponent would be required to retain an SOI-qualified archaeologist for continuous archaeological monitoring, until the completion of ground-disturbing construction activities in the vicinity of the unanticipated discovery.</p> <p>Implement MM-CUL-2, as described above.</p> <p>MM-CUL-3: Require Standard Mitigation Measures for Impacts on TCRs. If AB 52 tribal consultation occurs for a future development project under the proposed PMPU, and a tribe and the District cannot come to an agreement on mitigation measures, PRC Section 21084.3 lists examples of standard mitigation measures that the District may require, when feasible, to mitigate impacts on TCRs:</p> <ol style="list-style-type: none"> 1. Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space to incorporate the resources with culturally appropriate protection and management criteria. 2. Treating the resource with culturally appropriate dignity and taking into account the tribal cultural 	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-C-CUL-1: Future Construction Activities Within the Proposed PMPU Area May Adversely Impact Current and Future Significant Historical Resources.</p> <p>Future construction activities consistent with the proposed PMPU would have the potential to:</p> <ol style="list-style-type: none"> 1. Demolish a historical resource. 2. Alter a historical resource such that it no longer retains sufficient historical integrity to convey significance. 3. Alter the setting of a historical resource for which the setting is in important character-defining feature that expresses the resource's significance. <p>Any one of these outcomes would be considered a significant impact on a historical resource.</p>	PS	<p>values and meaning of the resource, including, but not limited to, the following:</p> <ol style="list-style-type: none"> a. Protecting the cultural character and integrity of the resource. b. Protecting the traditional use of the resource. c. Protecting the confidentiality of the resource. <ol style="list-style-type: none"> 3. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or using the resources or places. 4. Protecting the resource. <p>Implement MM-CUL-1, as described above.</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-C-CUL-2: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Archaeological Resources that are Historical Resources or Unique Archaeological Resources. Ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to damage or destroy archaeological resources that are historical resources (as defined in State CEQA Guidelines Section 15064.5(a)) or qualify as a unique archaeological resource (as defined in PRC Section 20183.2(g)), which would be considered a significant impact.	PS	Implement MM-CUL-2 , as described above.	SU
Impact-C-CUL-3: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Tribal Cultural Resources. Ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to cause a substantial adverse change in the significance of a TCR, as defined in PRC Section 21074, which would be considered a significant impact.	PS	Implement MM-CUL-2 and MM-CUL-3 , as described above.	SU
4.5 Geology			
Project Impacts			
Impact-GEO-1: Future Construction Activities Within PD1, PD3, PD8, PD9, and PD10 May Adversely Impact Unique Paleontological Resources. Planning Districts 1, 3, 8, 9 and 10 contain areas with the Bay Point Formation, which is known to contain sensitive paleontological resources and is assigned a high paleontological sensitivity. Ground disturbance of more than 1,000 cubic yards at a depth of 10 feet or greater within these locations from future construction activities allowed under the proposed PMPU would have the potential to result in a significant impact on unique paleontological resources or sites.	PS	MM-GEO-1: Require Paleontological Sensitivity Screening and Monitoring in Areas of Sensitivity. Future development allowed under the proposed PMPU shall be subject to Prior to approval of a future project, a paleontological and geologic resource sensitivity screening analysis shall be performed as part of the application process for District approval. The paleontological resource sensitivity screening shall examine whether the proposed development would include ground disturbance with the potential to encounter undisturbed soils and whether the development is located on a site (or sites) underlain by Bay Point Formation, and meets one or more of the	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>following conditions: (1) construction would involve ground disturbance of a fossil recovery site or within 100 feet of a mapped fossil recovery site, or (2) construction would require over 1,000 cubic yards of excavation and depth of excavation exceeding 10 feet. The Paleontological Sensitivity Screening analysis will be subject to the District's review and approval and no development shall proceed until the Paleontological Sensitivity Screening analysis is deemed acceptable to the District.</p> <p>If the proposed development meets either or both of the above-stated criteria, the project proponent shall retain a Qualified Paleontologist, approved by the District, who shall conduct paleontological monitoring during all ground-disturbing activities. The paleontological monitoring required by this mitigation measure shall include the following measures:</p> <ul style="list-style-type: none"> • The project proponent shall retain a Qualified Paleontologist, approved by the District. A "Qualified Paleontologist" shall be defined as an individual (i) who has a M.S. or Ph.D. in paleontology, or geology, (ii) who also has demonstrated familiarity with paleontological procedures and techniques, (iii) who is knowledgeable in the geology and paleontology of San Diego County, and (iv) who has worked as a paleontological mitigation project supervisor <u>within the County of San Diego County</u> for at least 1 year. • The Qualified Paleontologist shall attend the preconstruction meeting(s) to consult with the grading and excavation contractors or subcontractors concerning excavation schedules, paleontological field techniques, and safety issues. • The Qualified Paleontologist or Paleontological Monitor shall be on site, on a full-time basis, during ground-disturbing activities that occur 10 feet or 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>more below ground surface, to inspect exposures for contained fossils. The Paleontological Monitor shall work under the direction of the project's Qualified Paleontologist. A "Paleontological Monitor" shall be defined as an individual selected by the Qualified Paleontologist who has experience in monitoring excavation and the collection and salvage of fossil materials.</p> <ul style="list-style-type: none"> • If fossils are discovered on a development site, the Qualified Paleontologist shall recover them and temporarily direct, divert, or halt grading to allow recovery of fossil remains. • The Qualified Paleontologist shall be responsible for the cleaning, repairing, sorting, and cataloguing of fossil remains collected during the monitoring and salvage portion of the mitigation. • The Qualified Paleontologist shall deposit and donate prepared fossils, along with copies of all pertinent field notes, photos, and maps, in a scientific institution with permanent paleontological collections, such as the San Diego Natural History Museum, approved by the District. Curation costs of the fossils shall be paid for by the project proponent. • Within 30 days after the completion of excavation and pile-driving activities, a final data recovery report shall be completed by the Qualified Paleontologist and submitted to the District for review and approval. The final report shall document the results of the mitigation and shall include discussions of the methods used, stratigraphic section(s) exposed, fossils collected, and significance of recovered fossils. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-C-GEO-1: Future Construction Activities Within PD1, PD3, PD8, PD9, and PD10 May Adversely Impact Unique Paleontological Resources. Planning Districts 1, 3, 8, 9 and 10 contain areas with the Bay Point Formation, which is known to contain sensitive paleontological resources and is assigned a high paleontological sensitivity. Ground disturbance of more than 1,000 cubic yards at a depth of 10 feet or greater within these locations from future construction activities allowed under the proposed PMPU would have the potential to result in a significant impact on unique paleontological resources or sites.	PS	Implement MM-GEO-1 , as described above.	LTS
4.6 Greenhouse Gas Emissions			
Project Impacts			
Impact-GHG-1: Inconsistency with the Statewide Reduction Target for 2030 (Project-Adjusted) and Goal for 2050. Proposed PMPU buildout emissions would be inconsistent with the statewide reduction 2030 target and 2050 goal. Therefore, the contribution of PMPU-related GHG emissions is considered significant.	PS	Implement MM-AQ-2 , MM-AQ-3 , and MM-AQ-6 through MM-AQ-12 , as described above in Section 4.2, <i>Air Quality and Health Risk</i> . Implement MM-TRA-1 through MM-TRA-3 , as described in Section 4.14, <i>Transportation, Circulation, and Mobility</i> below. MM-GHG-1: Secure All Electricity from Renewable Sources. Prior to the operation District's approval of any future development Commercial Recreation land use designation projects under the proposed PMPU, the project proponent shall ensure that all <u>non-emergency</u> electricity <u>used by the project</u> obtained is provided by renewable sources by 2030. <u>Emergency conditions in this case are defined as loss of power to the tenant or District facilities, under which circumstances generators may be used for a short duration until normal functions return.</u> Renewable energy is defined as <u>energy from a source that is not permanently depleted when used, such as solar power.</u> Tenants shall submit evidence of compliance with this requirement annually to the District's Development Services Department . This can be met by purchasing and	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		installing renewable energy systems, <u>entering into power purchase agreements with renewable energy providers, or</u> by opting into carbon-free electricity through an offsite provider, such as Direct Access. <u>MM-GHG-2: Purchase Alternative Fuel, Electric, or Hybrid Replace Fossil-Fueled Vehicles and Equipment with Zero Emission Vehicles and Equipment.</u> <u>As vehicles are retired,</u> The District shall replace all fossil-fueled on-road vehicles in its fleet with zero-emission vehicles by 2030. For fossil-fueled on-road vehicles still operating past 2030, the District shall deprioritize their operation in favor of ZE vehicles until all fossil-fueled on-road vehicles have been replaced with ZE vehicles. For specialized equipment where zero-emission vehicles are not <u>commercially</u> available, the District shall replace such specialized on-road vehicles in its fleet <u>as they are retired,</u> with the lowest emitting option <u>commercially</u> available.	
Impact-GHG-2: Conflict with Plans, Policies, and Regulations Adopted to Reduce GHG Emissions. Project emissions, before mitigation, would be inconsistent with plans, policies, and regulations adopted to reduce GHG emissions.	PS	Implement MM-AQ-2 and MM-AQ-3 , and MM-AQ-6 through MM-AQ-12 , as described above. Implement MM-TRA-1 through MM-TRA-3 , as described in Section 4.14 <i>Transportation, Circulation, and Mobility</i> below. Implement MM-GHG-1 and MM-GHG-2 , as described above.	LTS
Impact-EN-1: Potential Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources. Implementation of the proposed PMPU would have the potential to result in the wasteful, inefficient, or unnecessary consumption of energy resources during construction and operation.	PS	Implement MM-AQ-2 , MM-AQ-3 , MM-AQ-6 , and MM-AQ-9 through MM-AQ-12 , as described above. Implement MM-GHG-1 and MM-GHG-2 , as described above. Implement MM-TRA-3 , as described in Section 4.14 below.	LTS
Impact- EN-2: Potential Inconsistency with Applicable Energy Use Reduction Plans. The proposed PMPU would be consistent with statewide renewable energy or energy efficiency plans and regulations, but would not be consistent with local plans, such as the District's CAP, prior	PS	Implement MM-AQ-9 , MM-AQ-10a , MM-AQ-10b , MM-AQ-11 , and MM-AQ-12 , as described above. Implement MM-GHG-2 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
to mitigation. This would be considered a significant impact prior to mitigation.			
Impact-C-GHG-1: Inconsistency with the Statewide Reduction Targets for 2030 and 2050. Proposed PMPU buildout emissions would be inconsistent with the statewide reduction 2030 target and 2050 goal. Therefore, the contribution of PMPU-related GHG emissions is considered significant.	PS	Implement MM-AQ-2 and MM-AQ-3 , and MM-AQ-6 through MM-AQ-12 , as described above. Implement MM-GHG-1 and MM-GHG-2 , as described above.	LTS
Impact-C-GHG-2: Conflict with Plans, Policies, and Regulations. Project emissions, before mitigation, would be inconsistent with plans, policies, and regulations adopted to reduce GHG emissions.	PS	Implement MM-AQ-2 , MM-AQ-3 , and MM-AQ-6 through MM-AQ-12 , as described above. Implement MM-GHG-1 and MM-GHG-2 , as described above.	SU
Impact-C-EN-1: Potential Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources. Implementation of the proposed PMPU would have the potential to result in the wasteful, inefficient, or unnecessary consumption of energy resources during construction and operation.	PS	Implement MM-AQ-2 , MM-AQ-3 , MM-AQ-6 , MM-AQ-9 , MM-AQ-10a , MM-AQ-10b , and MM-AQ-12 , as described above. Implement MM-GHG-1 and MM-GHG-2 , as described above.	LTS
Impact-C-EN-2: Potential Inconsistency with Applicable Energy Use Reduction Plans. The proposed PMPU would be consistent with statewide renewable energy or energy efficiency plans and regulations, but would not be consistent with local plans, such as the District's CAP, prior to mitigation. This would be considered a significant impact prior to mitigation.	PS	Implement MM-AQ-9 through MM-AQ-12 , as described above. Implement MM-GHG-2 , as described above.	LTS
4.7 Hazards and Hazardous Materials			
Project Impacts			
Impact-HAZ-1: Possible Onsite Contamination. Environmental database searches indicate properties with historic and ongoing investigation and remediation of contaminated soil, groundwater, and/or sediment may be encountered during construction activities in certain areas of PD1, PD2, PD3, and PD4. Construction activities with soil, sediment, or groundwater disturbance within 300 feet	PS	MM-HAZ-1: Conduct an Environmental Site Assessment, Prepare a Remediation Plan, and Remediate Accordingly. This mitigation measure applies to future development projects that include ground-disturbing activities and are located within 300 feet of a known open hazardous materials case or documented contaminant plume, or 150 feet from a	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>of a known open case or documented contaminant plume, or 150 feet from a closed case, either listed in the HMTS or documented since on a hazardous materials database, would potentially result in the accidental upset or release of hazardous materials and create a potentially significant hazard to workers, the public, and the environment. Impacts are therefore considered significant.</p>		<p>closed case. During the preparation of a site-specific environmental review and before the District approves the future development project Prior to approval of a project, the project proponent shall retain a licensed, qualified, and experienced Environmental Professional, approved by the District, who shall conduct or directly oversee the preparation and implementation of the site assessment and remediation plans specified below. The Environmental Professional shall be a California-licensed Professional Geologist or Professional Engineer with more than 3 years of experience conducting hazardous materials environmental assessments, consistent with the definition of an environmental professional according to ASTM E1527-13 (Standard Practice for ESAs: Phase I ESA Process). For A.1. below, qualified District staff, with at least 3 years of experience interpreting and conducting hazardous materials desktop investigations consisting of environmental database searches, historical site use archival research, and environmental review of available aerial and site photography, may conduct the Desktop Investigation. Environmental site assessments, including the preparation of testing and remediation plans, shall include one or more of the following steps. Every assessment type mentioned below may not be required for each future development project, depending on onsite conditions and proposed elements of the development projects. The District shall determine which of the following site assessment and/or plans will be required for a future development project.</p> <p>A. Steps for Land Disturbance Activities</p> <p>1. Desktop Investigation. The project proponent shall either submit to the District for review and approval, or the District shall prepare, a desktop-based investigation (e.g., hazardous materials</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>technical study, hazardous materials database review, or review of other similar reference documents) to evaluate the likelihood of contaminated soils, sediments, and/or groundwater to be present within or adjacent to the future project site, due to historic uses on or near the project site, or past or present investigations or remediations that have occurred on adjacent or nearby properties that have the potential to affect development on the project site. The desktop investigation shall be performed by an Environmental Professional and reviewed and approved by the District or may be performed by qualified District staff with at least 3 years of experience interpreting and conducting hazardous materials desktop investigations consisting of database searches, historical site use archival research, and review of available aerial and site photography. The investigation shall consider the potential presence of structures or former structures on the site built prior to 1980, and shall determine if a potential for lead and organochlorine pesticides may be present in the soil at the project site due to proximity to a structure built prior to 1980. The desktop investigation shall include, at a minimum, a summary of the history of the project site, the current conditions on the project site, and a review of available documentation regarding previous evaluation(s) of the site. The desktop review shall take into account the site conditions and features of the project, including the location, depth, and quantity of soil disturbance resulting from construction of the project, the historic uses and former or existing buildings on the project site, the presence of former or current monitoring or</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>investigation on the project site, past abatement and/or remediation of contaminants at the project site, whether the site has been previously graded, and the condition of existing site facilities on the project site. If the results of the desktop investigation indicate the potential for contamination to exist on site or adjacent to the site, further investigation and site planning would be required, and the project proponent shall perform one or more of the following steps, as determined by the District.</p> <ol style="list-style-type: none"> 2. Prepare Phase I ESA. The Environmental Professional, shall, at the project proponent's expense, prepare a Phase I ESA in accordance with the standard of care at that time (currently the ASTM Standard Practice E1527-13) and applicable regulations (currently the EPA's "Standards and Practices for All Appropriate Inquiries [40 CFR 312]") and submit the Phase I ESA to the District for its review and approval. 3. Prepare Phase II ESA. In the event the findings of the Phase I ESA recommend further evaluation through a Phase II ESA, the Environmental Professional, shall, at the project proponent's expense, prepare a Phase II ESA to adequately evaluate the project area for the presence of contaminants of potential concern (COPCs), as indicated by the Phase I ESA. Sites with cases under regulatory oversight shall coordinate with the appropriate oversight agency (e.g., SWRCB, DTSC, USACE, or other) and the District prior to commencement of the Phase II ESA. The Environmental Professional shall prepare a Phase II work plan, which shall describe sampling and testing methodology that shall be followed while conducting the Phase II ESA. The Phase II work 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>plan shall be submitted to and reviewed and approved by the oversight agency and/or the District. The Phase II ESA shall also include a review of any available existing documentation of previous ESAs, UST removal sampling data, remediation, or other assessments of the project site. Results of previous assessments and results of onsite testing shall be reported in the Phase II ESA, which shall be submitted to the District and oversight agency (if applicable) for review and approval.</p> <p>4. Prepare Soil and/or Groundwater Management Plan. The project proponent for future development of impacted or potentially impacted properties (as determined by the Phase I and II ESAs) involving ground-disturbing activities, such as, but not limited to, soil excavation, demolition, grading, or other subsurface disturbance, shall be required to prepare and implement a Soil and/or Groundwater Management Plan (Management Plan) that addresses soil and groundwater (as applicable). The plan shall be prepared by the Environmental Professional, and be implemented during ground-disturbing activities under the oversight of the Environmental Professional. The plan, at a minimum, shall address (1) monitoring of excavated soil or other ground-disturbing activities; (2) community and worker health and safety; (3) soil and groundwater handling, stockpiling, characterization, onsite reuse, export, and disposal protocols; (4) permitting; (5) notifications; (6) contingency plans for encountering unanticipated contamination; and (7) reporting. Appropriate references of the potential to encounter contaminated soils and/or groundwater shall be included in construction</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>specifications and bid documents so various environmental factors (e.g., construction dewatering, soil disposal) and worker and community health and safety are appropriately and cost-effectively planned for and managed by the contractor. The Management Plan shall be submitted to the District for review and approval during the project's site-specific environmental review. After the District's review and approval, the project proponent shall implement the Management Plan as a condition of approval of the project.</p> <p>a. When Dewatering is Proposed/Required. When dewatering is proposed/required during construction that may generate contaminated groundwater, the Management Plan shall include additional measures applicable to dewatering activities. If dewatering is expected during construction, the project proponent shall obtain a NPDES permit from the RWQCB, or <i>Discharge Permit</i> or a <i>Batch Discharge Authorization</i> from the Cities of Coronado, Imperial Beach, or San Diego prior to commencing construction activities. The project proponent shall comply with the requirements of the discharge permit; and if the discharge water is contaminated, these requirements may include characterization of the water to be discharged and pretreatment of groundwater prior to discharge. The project proponent shall coordinate with the RWQCB and any other agency providing oversight of wastewater discharge for the project site, to ensure consistency between all applicable requirements for discharge pertaining to the property (i.e., existing NPDES permit, etc.). All</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>requirements and measures regarding the dewatering process shall be included in the Management Plan. The Management Plan shall be submitted for the District's review and approval. After the District has reviewed and approved the Management Plan, it shall be implemented by the project proponent as a condition of approval of the project.</p> <p>b. Prepare Site Health and Safety Plan. The Management Plan shall include a Site Health and Safety Plan to reduce potential health and safety hazards to workers and the public. The Site Health and Safety Plan shall require compliance with 29 CFR Part 120, Hazardous Waste Operations and Emergency Response regulations for site workers at uncontrolled hazardous waste sites. The Site Health and Safety Plan shall be based on the due diligence completed for the site (Phase I ESA and Phase II ESA) and the planned site construction activity to ensure that site workers potentially exposed to site contamination in soil and groundwater have the proper training, equipment, and hazard monitoring action levels during site activity. The Site Health and Safety Plan shall be submitted to the District for review and approval during the project's environmental review and implemented under the oversight of a Certified Industrial Hygienist, retained by the project proponent as a mitigation measure and/or condition of approval of the project. The project proponent along with its contractors shall implement the training, equipment, and monitoring activities outlined in the Health and Safety Plan to ensure that workers are not exposed to contaminants above permissible</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		exposure limits established by Table Z, 29 CFR Part 1910.1000.	
		B. Steps for Bay Sediment Disturbance Due Diligence	
		<p>1. Prepare Sediment Management Plan. The project proponent for future development of impacted or potentially impacted properties (as determined by the Phase I and II ESAs) involving sediment-disturbing activities, such as, but not limited to, dredging, excavation, pile removal, pile installation, or other subsurface disturbance, shall be required to obtain and implement a management plan that addresses sediment ("Sediment Management Plan"). The Sediment Management Plan shall be prepared by a California-licensed Professional Geologist, Professional Engineering Geologist, or Professional Engineer, retained by the project proponent. The Sediment Management Plan, at a minimum, shall address (1) monitoring of dredging, excavation, or other sediment-disturbing activities; (2) community and worker health and safety; and (3) sediment handling, stockpiling, characterization, onsite reuse, export, and disposal protocols. The Sediment Management Plan shall describe in detail the methods to be employed to minimize disturbance of contaminated sediment during waterside construction activities and the monitoring that will occur during construction activities. Appropriate references to the potential to encounter contaminated sediment shall be included in construction specifications and bid documents so that the contractor can ensure various environmental factors (e.g., sediment disposal) are appropriately and cost-effectively managed by the contractor. The Sediment Management Plan shall be submitted to the District for review and approval.</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-HAZ-2: Potential to Encounter Undocumented Contamination During Reasonably Foreseeable Construction Activities. Due to the historic uses within and adjacent to the proposed PMPU area, it is possible previously undiscovered contaminated soil, groundwater, and/or sediment may be present. Ground-disturbing activities at these sites could result in the accidental exposure of hazardous materials to workers, or the accidental release or spill of hazardous materials to the environment. Therefore, disturbance of undocumented contamination would have the potential to result in reasonably foreseeable upset and accidental conditions involving the release of hazardous materials to the environment. Impacts are therefore considered significant.	PS	<p>After the District's review and approval, the project proponent shall implement the Sediment Management Plan as a condition of approval of the project. This measure shall be consistent with and shall not conflict with MM-WQ-5.</p> <p>Implement MM-HAZ-1, as described above.</p> <p>MM-HAZ-2: Identify Unknown Hazardous Materials Encountered During Construction. If, during ground-disturbing construction activities, the project proponent or its contractors encounter indications of potential contamination, including but not limited to discoloration of the soil, a sheen on the surface of groundwater, or an odor, the project proponent or contractor shall halt work in the vicinity of the potential contamination. Before the project proponent resumes work, the project proponent shall retain an Environmental Professional, approved by the District, to characterize the potential contamination. If the Environmental Professional determines that the potential contamination is a hazardous material, the Environmental Professional shall prepare a Management Plan and a Health and Safety Plan (as described in MM-HAZ-1) for the project site. The project proponent shall submit the Management Plan and the Health and Safety Plan to the District for review and approval. The project proponent shall implement the approved Management Plan and Health and Safety Plan prior to and throughout the remainder of construction activities. Additionally, if the substance encountered is determined to be a hazardous material, the project proponent shall notify the County DEH, and shall comply with any additional requirements of the County DEH.</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-HAZ-3: Potential to Encounter Lead or Organochlorine Pesticides in Soil During Reasonably Foreseeable Construction Activities. Concentrations of lead in the soil may be above acceptable levels at sites either containing or formerly containing structures built prior to 1980 as a result of lead used in building materials or paint that may have leached from the structure into the soils. In addition, organochlorine pesticides, often used historically as termiticides for wooden structures, may be present in the soil surrounding existing or former structures. Impacts are therefore considered significant.	PS	Implement MM-HAZ-1 and MM-HAZ-2 , as described above.	LTS
Impact-HAZ-4: Potential to Encounter Contamination On Site Due to Listing on a Hazardous Materials Database. Future development allowed under the PMPU that includes ground- or sediment-disturbing activities could encounter contaminated soil, groundwater, and/or sediment related to sites listed on a hazardous materials site database pursuant to Government Code Section 65962.5. Impacts would be significant.	PS	Implement MM-HAZ-1 and MM-HAZ-2 , as described above.	LTS
Impact-C-HAZ-1: Possible Onsite Contamination. Environmental database searches indicate properties with historic and ongoing investigation and remediation of contaminated soil, groundwater, and/or sediment may be encountered during construction activities in certain areas of PD1, PD2, PD3, and PD4. Construction activities with soil, sediment, or groundwater disturbance within 300 feet of a known open case or documented contaminant plume, or 150 feet from a closed case, either listed in the HMTS or documented since on a hazardous materials database, would potentially result in the accidental upset or release of hazardous materials and create a potentially significant hazard to workers, the public, and the environment. Impacts are therefore considered significant.	PS	Implement MM-HAZ-1 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-C-HAZ-2: Potential to Encounter Undocumented Contamination During Reasonably Foreseeable Construction Activities. Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.8 Hydrology and Water Quality			
Project Impacts			
<p>Impact-WQ-1: Disturbance of Contaminated Sediment During Construction. Contaminated sediments are present in PD1, PD2, PD3, and PD4. In-water construction activities within these areas have the potential to disturb contaminated sediments, which could be released back into the water column and resuspended, resulting in the spread of the contaminants. Dredging of contaminated sediment could also degrade water quality by resuspending contaminated sediments and releasing constituents of concern. In addition, constituents of concern could be released when sediments are suspended in the water column. Resuspended contaminants may dissolve into the water column and become available for uptake by biota. Redeposition may occur near the dredge or construction areas, or, depending on the environmental conditions and controls, resuspended sediment may be transported to other nearby locations in the water body. Resuspension of contaminated sediments and release of constituents of concern could impact water quality by increasing contaminant levels to levels toxic to aquatic receptors. Lastly, the removal of creosote piles could result in resuspension of sediments contaminated with PAHs.</p>	PS	<p>MM-WQ-1: Monitor Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance. Prior to the approval of a future development project that would occur in an area with known or suspected contaminated sediments and would involve in-water construction activities that could disturb sediment (e.g., dredging, pile removal or installation, or other in-water construction-related activities that will disturb Bay floor sediment), the project proponent shall retain an <u>expert in sediment and water quality</u> monitor, approved by the District, who shall prepare a water quality monitoring plan and shall conduct water quality monitoring to demonstrate to the satisfaction of the District and the RWQCB that construction activities do not violate the Basin Plan or project-specific water quality objectives. Approval of the plan by the District and appropriate regulatory agencies is required before field activities can be initiated. The plan shall incorporate: (1) all permit-specific regulatory monitoring and reporting requirements and (2) a detailed description of the proposed water quality monitoring program. The plan will clearly identify the project boundaries, and chemical constituents of concern and water quality thresholds; and provide a detailed description of the water quality monitoring to be conducted prior to, during, and after construction activities to ensure compliance with this mitigation measure. The project proponent shall inform the District and the RWQCB of the results of water quality monitoring within 60 days after sample are taken. The monitoring plan will be robust enough to ensure that any exceedances of water quality objectives are identified. Depending upon the</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>scope of the project and the potential for the release of project-derived contaminants, the water quality monitoring shall include visual inspections of turbidity and debris as well as water-column monitoring using appropriate and calibrated water quality monitoring field equipment to measure, at a minimum: turbidity, dissolved oxygen, pH, temperature, and salinity. The District, in consultation with the RWQCB and other resource agencies (as applicable), shall determine the types of constituents to be monitored, and appropriate water quality thresholds and standards for the project (e.g., San Diego Basin Plan, California Toxics Rule, applicable TMDLs, and/or other site-specific considerations). If water column monitoring indicates exceedances of water quality thresholds (e.g., turbidity or dissolved oxygen), then water column samples shall be collected and analyzed for project-specific chemicals of concern. The project proponent shall use a State of California Environmental Laboratory Accreditation Program (ELAP)-certified laboratory for all analytical testing.</p> <p>The designated water quality monitor shall stop work to ensure that turbidity does not extend outside of the immediate construction area <u>or silt curtain</u>. If turbidity is 20 percent higher outside the work area versus inside the work area <u>of the silt curtain compared to a representative reference site upstream</u>, the water quality monitor may direct the temporary halt of construction activities. The District shall direct the project proponent to implement additional control measures necessary to protect water quality per CWA Section 401 and 404 permits, the San Diego Basin Plan, and the project-specific permits. Depending upon the requirements in the permit, the project proponent and/or District may be required to alert the <u>RWQCB/regulatory agencies</u> if a water quality violation</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>is observed. In addition, the project proponent shall coordinate water quality monitoring efforts and shall provide copies of all monthly water quality monitoring data to the RWQCB and District throughout the duration of project construction, as outlined in the reporting schedule of the agency-approved monitoring plan or project-specific permits.</p> <p>MM-WQ-2: Implement Best Management Practices During Construction-Related Sediment Disturbance.</p> <p>Prior to the approval of a future development project that involves dredging, pile removal (especially the removal of creosote-treated piles), pile installation, and other construction-related activities that may disturb Bay floor sediment within areas of known or suspected sediment contamination, the District shall identify BMPs necessary for minimizing resuspension, spillage, and misplaced sediment during construction activities, as the deposition of such material would increase turbidity and degrade water quality. BMPs shall be implemented by the project proponent and shall include, but shall not be limited to, the following:</p> <ul style="list-style-type: none"> • The project proponent shall not stockpile material on the bottom of the San Diego Bay floor and shall not sweep or level the bottom surface with the bucket. • The project proponent shall use and maintain silt curtains for dredging operations that encircle the area of construction activities and shall minimize the times in which these curtains are temporarily opened (allowing only necessary openings for operation of the <u>dredge and barge movements</u> curtain), to contain suspended sediments, as more specifically described in MM-WQ-3. • Based on a determination of the District and applicable Federal and/or State permitting agency (as applicable), air curtains in conjunction with silt curtains may be used to contain resuspended 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>sediment, and allow barges containing dredge material or empty barges to transit into and out of the work area without the need to open and close silt curtain gates.</p> <ul style="list-style-type: none"> <p><i>In-Water Activity–Specific Procedures (Pile Installation or Removal).</i> The project proponent shall conduct pile installation or removal in a manner that implements applicable permit requirements, including the CWA Section 404 permit and CWA Section 401 Water Quality Certification. The following additional measures shall be required based on the type of pile installation, or removal, that occurs.</p> <ul style="list-style-type: none"> <p>Impact Hammer Pile Driving or Jetting</p> <p>Turbidity curtains shall be installed for District projects or non-District projects by the proponent consistent with the District’s Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District (District 2019).</p> <p>Spudding</p> <p>Lifting Spuds lifted during in-water construction shall be lifted done slowly—at least a quarter of the speed that spuds are lifted during normal operation. Before the spud reaches the subsurface of the Bay floor during removal, the operator shall conduct spud extraction in 2-minute intervals (repeated 2-minute extraction followed by 2-minute pause) to reduce <u>turbidity</u> or the disturbance of Bay sediment.</p> <p>MM-WQ-3: Apply Silt Curtains During Construction-Related Sediment Disturbance with Contaminants of Concern. Each <u>Any</u> future development project that involves dredging, pile installation, and/or other construction-related activities that will disturb Bay</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>floor sediment within areas of known or suspected sediment contamination shall utilize silt curtains for containment of the contaminants of concern. Prior to the District's approval of each future project, the project proponent shall provide details about the silt curtain installation, curtain configurations, technologies, and actual locations to the District for its review and approval. During dredging activities where contaminated sediment conditions are present (based on the results of MM-WQ-1 or based on other recent available evidence), the project proponent shall deploy inner- and outer-boundary floating silt curtains that enclose the construction area. The floating silt curtain shall consist of connected lengths of fabric. A continuous length of floating silt curtain shall be arranged to fully surround the construction equipment. The silt curtain shall be supported by a floating boom in open water areas (such as along the bayward side of the dredging areas). Along pier edges, the project proponent shall have the option of connecting the silt curtain directly to the structure. The project proponent shall continuously monitor the silt curtain for damage, dislocation, or gaps and immediately fix any locations where it is no longer continuous or where it has loosened from its supports. The bottom of the silt curtain shall be weighted with ballast weights or rods affixed to the base of the fabric that do not touch the Bay floor at the lowest tide even with curtain float/swing. Where the District determines it is feasible and applicable based on specific site conditions and constraints such as water depth and habitat, as evidenced by a biological resource report paid for by the project proponent, the floating silt curtains shall be anchored and deployed from the surface of the water to just above the substrate allowing for tidal action. If deemed necessary by the District once project</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>construction details and plans are available, silt curtains with tidal flaps shall be installed to facilitate curtain deployment in areas of higher flow. Based on a determination by the District and the Federal and/or State permitting agencies (as applicable), air curtains may be used in conjunction with silt curtains to contain resuspended sediment and allow barges containing dredge material or empty barges to transit into and out of the work area, without the need to open and close silt curtains.</p> <p>MM-WQ-4: Implement a Dredging Management Program. Prior to the District's approval of a future development project that involves dredging in known or suspected areas with sediment contamination, excluding maintenance dredging with low level constituents of concern (COCs) that would allow for beneficial reuse or other unconfined aquatic disposal options as approved by the EPA and USACE, the project proponent shall prepare and submit to the District for review and approval a Dredging Management Program (DMP) that complies with applicable permit requirements, including the CWA Section 404 permit and CWA Section 401 Water Quality Certification. The DMP shall be implemented by the project proponent prior to, during, and upon completion of dredging activities. The DMP shall contain the following elements, each of which have specific timing mechanisms as identified in the description of each element below:</p> <p>A. <i>Dredging Operations Plan.</i> The project proponent shall develop a Dredging Operations Plan that identifies the standard operating procedures (SOPs) that will be implemented during dredging activities. The Dredging Operations Plan shall include step-by-step procedures to complete dredging operations safely, in an efficient manner, and to avoid releases</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>of hazardous materials into the environment (i.e., from the resuspension of contaminated sediments as well as contaminants associated with construction activities such as oil or other equipment-related hazardous materials). The SOPs shall include guidance with respect to, among other things, the following:</p> <ul style="list-style-type: none"> • Proper operation of the dredge bucket. • Proper positioning of the barge vessel to minimize propeller wash. • Placement and maintenance of double silt curtains. • Proper operation and maintenance of all construction equipment. <p>In addition, the Dredging Operations Plan shall identify sediment control BMPs to be implemented during dredging activities. The project proponent, or their contractor, shall at a minimum, implement the following BMPs for the safe handling of dredged material:</p> <ul style="list-style-type: none"> • Sediment Unloading. During dredging activities, the contractor shall reduce water column impacts by controlling the swing radius of the unloading equipment, using a spillage plate, and using a power wash unit to reduce impacts related to spillage from the excavator arm onto transport vehicles. • Filling Transport Vehicles. During dredging activities, the contractor shall ensure that truck volumes are limited to 90 percent based on visual observations, and that trucks shall be covered and secured per California Department of Transportation (Caltrans) regulations during transport to the disposal facility. • Sediment Loading. During dredging activities, the contractor shall ensure that trucks are loaded within 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>a constructed loading zone to confine sediment spilled during the loading process.</p> <p>B. <i>Contingency Plan.</i> The project proponent shall develop a Contingency Plan, which shall be implemented in the case of equipment or operational failures, such as, but not limited to, silt curtain damage, spillage of sediment resulting from overloading the material barge, contact with sediment on or around the materials barge during loading, equipment failure of bucket or shear pin during loading procedures, or material barge or tugboat collision with another vessel. The Contingency Plan shall contain step-by-step procedures for response to equipment or operational failures and shall reduce the potential for the release of sediments to the water column outside the silt curtains.</p> <p>C. <i>Health and Safety Plan for Dredging Activities.</i> The project proponent shall prepare a Health and Safety Plan for Dredging Activities (Health and Safety Plan) and shall implement the Health and Safety Plan for the duration of the dredging activity. The Health and Safety Plan shall be prepared in general accordance with Federal Occupational Safety and Health Administration Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120) and California Code of Regulations, Title 8, Section 5192. The Health and Safety Plan shall provide procedures for workers for safe operation, personal protection, and emergency response during dredging operations.</p> <p>D. Communication Plan<i>Notice of Planned Dredging Activities.</i> The project proponent shall <u>comply with RGP No. 72 (p. 13) and any update thereto that requires prepare a Communication Plan and operation guidelines for communications between</u></p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>among the U.S. Coast Guard, and Harbor Police, and a local notice to mariners, all vessel operators to ensure the safe movement of project vessels from the dredge site to the unloading area. The contractor shall comply with the notice requirements of RGP No. 72 (and related updates) implement the Communication Plan throughout the duration of dredging activities.</p> <p>MM-WQ-5: Implement a Sediment Management Program. Prior to the commencement of any in-water construction activities within an area of known or suspected sediment contamination, the project applicant shall retain a Qualified Professional, approved by the District, with substantial experience (i.e., more than 5 years) in marine sediment contamination, sediment sampling, and contamination remediation. The Qualified Professional shall prepare and oversee the implementation of a Sediment Management Program for the project area. The Sediment Management Program, which shall be the responsibility of the project applicant to implement, shall be in effect throughout the duration of in-water construction activities for the proposed project. the District's approval of any future development involving dredging within an area of known or suspected sediment contamination, the project proponent shall prepare a Sediment Management Program to be implemented prior to and throughout the duration of waterside construction activities. The Sediment Management Program shall be prepared and implemented in accordance with CWA Section 401 and 404 requirements, at a minimum, as well as other project-specific mitigation measures or enhanced BMPs. This will include the following elements, each of which have specific timing mechanisms, as identified in the description of each element below:</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>A. <i>Sampling and Analysis Plan (SAP)</i></p> <p>B. Contaminated Sediment Management Plan (if contamination is found during implementation of the SAP)</p> <p>C. <i>Post-Construction Sampling and Analysis</i></p> <p>Sampling and Analysis Plan (SAP) Preparation and Implementation. The SAP shall be approved by the USACE/EPA using USACE/EPA guidance documents for sediment testing based on either the “green book” or “inland testing manual,” and shall determine and delineate the area of potential disturbance (Disturbance Area); implement the agency approved SAP; and compile the findings of the sediment testing program in a Sediment Characterization Report for submittal to the District and regulatory agencies. The SAP, which shall include a Quality Assurance/Quality Control (QAPP) with Standard Operating Procedures (SOPs), shall apply to the entire project sediment disturbing activities shall include project specific details identified in regulatory guidance and shall set forth the methodology to be used, the locations where sampling would occur, analysis of the constituents of concern, and proper decontamination and disposal procedures for both pre-construction and post-construction sampling and analysis. The sediment samples shall be tested for the presence of the COCs. The sampling area and sampling methodology shall identify sample locations determined to be appropriate delineating the vertical and lateral extent and concentration of the project site’s potential COCs, at the discretion of the USACE, EPA, and RWQCB (or other applicable agencies), in concurrence with the District to adequately characterize any Disturbance Area associated with dredging. Depending on the proposed actions and related disturbance to sediment, the SAP must be submitted to the District for concurrence and by the RWQCB, EPA, and USACE for</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>approval, <u>if required by state or federal law</u>. Sediment sampling and analysis shall be performed in accordance with the requirements of the SAP to determine whether the <u>extent of sediment contamination is contaminated</u>. The results of all sediment sampling shall be documented in a Sediment Characterization Report and submitted to the District for concurrence and USACE, EPA, and RWQCB for their approval prior to any marine-side sediment-disturbing activities. The project shall be implemented in accordance with the regulatory permits and any project-specific conditions.</p> <p>Contaminated Sediment Management Plan (Sediment Management Plan). <u>The Qualified Professional retained by the project applicant shall prepare a Sediment Management Plan based upon the findings of the Sediment Characterization Report described above in consultation with and subject to the approval of the RWQCB and the District. Once approved, the Sediment Management Plan shall be implemented by the project applicant and shall be subject to regulatory oversight of the RWQCB and the District. The Sediment Management Plan shall describe in detail the required actions that will be employed when disturbing sediment in the Disturbance Area to prevent waterside construction activity from creating contamination or exacerbating existing sediment contamination conditions documented in the Sediment Characterization Report. If contaminated sediment is identified based on sediment sampling, the project proponent shall prepare a Contaminated Sediment Management Plan, which shall be submitted to the District for concurrence and the appropriate regulatory agencies for approval. Once approved, the Contaminated Sediment Management Plan shall be implemented by the project proponent and be subject to permit compliance oversight by the appropriate</u></p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>regulatory agencies, <u>such as the USACE (e.g., Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act) and the RWQCB (Section 13304 of the California Water Code and Section 401 of the CWA)</u> as well as the District. The Contaminated Sediment Management Plan shall describe in detail the methods to be employed to minimize disturbance of contaminated sediment during waterside in-water construction activities (as identified in the SAP) and the monitoring that will occur during <u>in-water</u> construction activities.</p> <p>Post-Construction Sampling and Analysis. At the conclusion of <u>in-water</u> construction activities within an area with known or suspected COCs (not including areas of maintenance dredging that have been determined suitable for beneficial reuse or other unconfined aquatic disposal options as approved by the EPA and USACE), the project proponent shall conduct post-construction sediment quality confirmation sampling <u>consistent with the SAP, which shall be compared to pre-construction sampling levels to determine if in-water sediment disturbance activities resulted in COCs above the preconstruction levels documented in the Sediment Characterization Report.</u> The results of the <u>post-construction sampling and analysis shall be submitted to the RWQCB and the District, within 30 days after concluding the sampling.</u> This sampling will be performed in the manner and to the extent determined by the EPA, USACE, and RWQCB to be necessary to adequately characterize potential residual contamination resulting from construction activities. The project proponent shall prepare, for submittal to the District for concurrence and approval by the EPA, USACE, and RWQCB, a Post-Construction Sampling Plan that shall outline the methodology to be</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>used, the locations where sampling would occur, and the COCs to be analyzed.</p> <p>MM-WQ-6: Implement Post-Construction Dredging Remediation. If, after the completion of any dredging sediment disturbing activity in an area with COCs, consistent with the requirements of MM-WQ-4 and MM-WQ-5, post-dredge construction sediment quality confirmation sampling required by MM-WQ-5 shows that concentrations of COCs exceed preconstruction sampling levels also required under MM-WQ-5 those set forth by the RWQCB or other regulatory agency with jurisdiction, the project proponent shall propose and conduct remediation-additional dredging consistent with levels prescribed by the RWQCB or other regulatory agency with jurisdiction, subject to approval by the RWQCB or other regulatory agency with jurisdiction, and concurrence by the District. The project proponent's remediation approaches may include, but are not limited to, additional dredging, placement of sand cover, or Enhanced Monitored Natural Recovery sand containing active carbon. If additional dredging is required, the remediation shall be conducted with permitting oversight from the appropriate local, State, and Federal regulatory agencies. In addition, documentation evidencing the remediation work and completion thereof shall be submitted by the project proponent to the District. The project proponent shall monitor the remediation for its effectiveness, consistent with the standards, schedules, and reporting requirements set forth by the RWQCB. A monitoring report shall be submitted by the project proponent to the District and the RWQCB for their review at a frequency determined appropriate by the District and RWQCB.</p> <p>If, after the completion of any dredging remediation activity within a disturbance area, consistent with the</p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>requirements of MM-WQ-4 and MM-WQ-5, concentrations of COCs in the area of potential contamination do not exceed those preconstruction levels set forth by the RWQCB, no further mitigation is required.</p> <p>MM-WQ-7: Remove and Dispose of Creosote Piles Properly. Removal of creosote piles shall be conducted <u>using vibratory extraction methods to the maximum extent feasible, as defined in PRC 21061.1. The project proponent shall submit evidence of infeasibility to the District for its concurrence, which shall explain all reasons for why this method is infeasible. If not determined feasible, extraction shall be conducted using a direct pull method. In all cases, rocking of piles shall be avoided.</u> During extraction of creosote treated piles, if piles cannot be completely removed, the project proponent shall cut them at least 1 foot <u>2 feet</u> below the mud line. If treated piles are fully extracted or if they are cut below the mudline, the project proponent shall cap the holes or piles with appropriate material such as clean sand. The project proponent shall dispose of removed creosote-treated piles in a manner approved by the District and applicable agencies that precludes their further use. The methodology for removal of creosote-treated piles is the same as non-treated piles with the exception that should any pile cuttings shall be removed <u>hand collected and/or screened</u> from the water for disposal at an appropriate waste facility (for creosote-treated wood guidelines, please see NOAA Fisheries Guidelines [NOAA Fisheries SW 2009] and EPA's Ecological Risk Assessment for Creosote [EPA 2008]). Creosote pile handling and disposal follows typical contaminated material methods with the manifest documented and the licensed landfill recorded (<i>Best Management Practices and Environmental Standards for Overwater Structural Repair and</i></p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-WQ-2: Contribution to Water Quality Impairments from Future Marina Operations. Operation of future development and redevelopment of marinas may impair water quality by increasing the chances of accidental discharge of gray water or black water directly into marine waters. In addition, pollutants potentially generated from boat maintenance without appropriate BMPs, in-water hull cleaning of copper-based anti-fouling paint, and accidental discharges of fuel and oil could negatively affect water quality. In addition, copper associated with anti-fouling hull paints has contributed to water quality impairments in San Diego Bay. The potential net increase in the number of vessel slips would potentially result in additional contributions to water quality impairments within the Bay.</p>	PS	<p><i>Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District, 2019).</i> The piles must be cut into manageable lengths for transport and disposal by the project proponent in an approved upland location. Extracted piles and debris should <u>shall</u> be placed by the project proponent in a lined stockpile area or directly loaded into a transport container or vehicle. Appropriate landside discharge controls (i.e., stormwater BMPs, including the use of tarps, wattles, and/or berms) approved by the District shall be identified by the project proponent prior to pile removal and implemented to prevent runoff from leaving the stockpile and entering surface- or groundwater. <u>Finally, use of creosote wood piles that would have the potential to contact water shall not be allowed for future development projects. This requirement is consistent with CDFW's recommendation that treated wood piles in contact with Bay waters are not consistent with Fish and Game Code Section 5650(6).</u></p> <p>MM-WQ-8: Prepare and Implement a Marina Best Management Practice Plan and Copper Reduction Measures. To reduce potential impacts on water quality <u>associated with marina-related projects</u>, the project proponent <u>of a marina-related project</u> shall prepare a Marina Best Management Practice Plan specifically identifying best management practices that will be used within the Marina to (1) minimize the pollutant load, including measures to prevent, eliminate, and/or otherwise effectively protect water quality of the Bay and (2) reduce inputs of total and dissolved copper resulting from increased berthing of boats. Best management practices would be designed to adhere with the water quality criteria defined in the Basin Plan. The Marina Best Management Practice Plan</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>and copper reduction measures shall be reviewed and approved by the District prior to the District's approval of a future development involving new or expanded marina operations. The project proponent shall be responsible for implementation and maintenance of the Marina Best Management Practice Plan and copper reduction measures. Such plans may include but are, which at a minimum, shall include, but not be limited to, the following:</p> <ul style="list-style-type: none"> • Use of educational materials provided to boat owners and their crews by the project proponent, that specify types of activities that shall be avoided and types of BMPs that shall be implemented in order to protect water quality (e.g., no in-slip refueling). Recommendations to reduce oil leaks include conducting periodic maintenance of all fuel lines, hoses, and gaskets; putting an oil-absorbent pad in the bilge; and installing a filtration system to remove oil from bilge water. • Docking agreements containing specific use restrictions to prevent degradation of water quality, such as restricting boat repairs and cleaning operations within the marinas. These specific use restrictions shall be similar to the recommendations from the <i>San Diego Bay Boaters Guide</i> (District 2006) and the California State Parks Division of Boating and Waterways' and California Coastal Commission's Boating Clean and Green Program (California DBW 2017), both of which promote environmentally sound boating practices to marine business and boaters in California. • Provide information to marinas and boat owners to support copper reduction, including hull-cleaning BMPs that comply with the District's in-water hull 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>cleaning ordinance and other applicable laws and regulations (Ordinance No. 2681).²</p> <ul style="list-style-type: none"> • <u>Consideration of implementation</u> of an incentive structure within the docking agreements' rent rates for occupants with non-copper hull paint boats. • Identification of copper-free zones within the innermost portions of the marina, or limitation of copper hull paint boats to only well-flushed zones of the marina. • Prohibition of hull bottom scraping and the use of toxic detergents to clean vessels topside, and no overwater repairs. • Limitations on in-slip hull cleaning (restrict or limit number of cleanings per year). <p><u>For marina-related projects proposing to add slips in impaired waters.</u> The project proponent shall include a baseline assessment of dissolved copper levels within the project footprint prior to construction. Baseline conditions shall be compared to the periodic monitoring (annually at a minimum) to assess increases in copper directly attributed to project operations. Dissolved copper levels shall be compared to Basin Plan and TMDL-specific water quality objectives. The project proponent shall submit a baseline monitoring report and periodic monitoring reports (annually at a minimum) to the District for its review. <u>If the District determines that the project results in an adverse change in at any time during monitoring the water quality, equals or exceeds the Basin Plan water quality objectives, the District shall require an update to the project's Marina Best Practice Management Plan to</u></p>	

² Ordinance No. 2681 terms and conditions addressing the use of best management practices for in-water hull cleaning state: "1. No Person shall perform In-Water Hull Cleaning without complying with Best Management Practices generally recognized by the industry as being effective and environmentally sound. 2. No Person shall perform In-Water Hull Cleaning that results in visible paint plume or cloud."

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-WQ-3: Water Quality Degradation from Aquaculture Operations. Depending on the type of aquaculture being practiced and the methods used, water quality degradation, which could include turbidity caused during harvesting and other similar operations, as well as biological oxygen demand, may occur during operation of aquaculture facilities.	PS	<p>include additional BMPs to reduce copper attributed to the project and bring the water quality back into compliance with the Basin Plan.</p> <p>MM-WQ-9: Conduct Water Quality Monitoring of Aquaculture Operations. Prior to the District's approval of an aquaculture project, the project proponent shall (1) conduct a siting study to predict potential water quality impacts due to physical factors such as reduced flushing as well as any potential operational impacts, (2) develop an aquaculture water quality monitoring plan consistent with the requirements of the Shellfish Aquaculture Mitigation Plan, and (3) identify site-specific BMPs to be implemented during operation of the aquaculture facility to lessen or eliminate potential water quality impacts. The project proponent shall submit the siting study, monitoring plan, and BMPs to the District for review and approval. The siting study shall include physical site-specific characteristics that may influence the local waterbody (e.g., hydrodynamic conditions, nearby natural resources, potential impacts on navigation). The water quality monitoring plan shall include an existing conditions report, an outline of water quality monitoring parameters and objectives as issued by relevant permitting authorities and resource agencies. Throughout the duration of the project's operations, the project proponent shall comply with relevant permit conditions issued by permitting authorities and shall implement the water quality monitoring plan, as issued, reviewed, and approved by the appropriate regulatory and resource agencies in coordination with the District, which shall ensure water quality is not impaired by the proposed aquaculture operation. If at any time during this monitoring, the water quality equals or exceeds the <u>operational permit conditions</u> Basin Plan's water quality objectives, as</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-C-WQ-1: Disturbance of Contaminated Sediment During Construction. Contaminated sediments are present in PD1, PD2, PD3, and PD4. In-water construction activities within these areas have the potential to disturb contaminated sediments, which could be released back into the water column and resuspended, resulting in the spread of the contaminants. Dredging of contaminated sediment could also degrade water quality by resuspending contaminated sediments and releasing constituents of concern. In addition, constituents of concern could be released when sediments are suspended in the water column. Resuspended contaminants may dissolve into the water column and become available for uptake by biota. Redeposition may occur near the dredge or construction areas, or, depending on the environmental conditions and controls, resuspended sediment may be transported to other nearby locations in the water body. Resuspension of contaminated sediments and release of constituents of concern could impact water quality by increasing contaminant levels to levels toxic to aquatic receptors. Lastly, the removal of creosote piles could result in resuspension of sediments contaminated with PAHs.</p>	PS	<p>updated and amended, the project proponent shall immediately notify the relevant permitting authorities and the District, and shall immediately identify specific actions that would eliminate the water quality impairments, approved by the relevant permitting authorities and the District.</p> <p>Approved BMPs shall include a regular monitoring, reporting, and site inspection program, as issued through operational permit conditions by relevant permitting authorities and resource agencies, to ensure that the operations are in compliance with BMPs related to the specific type of aquaculture being implemented.</p> <p>Implement MM-WQ-1 through MM-WQ-7, as described above.</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-C-WQ-2: Contribution to Water Quality Impairments from Future Marina Operations. Operation of future development and redevelopment of marinas may impair water quality by increasing the chances of accidental discharge of gray water or black water directly into marine waters. In addition, pollutants potentially generated from boat maintenance without appropriate BMPs, in-water hull cleaning of copper-based anti-fouling paint, and accidental discharges of fuel and oil could negatively affect water quality. In addition, copper associated with anti-fouling hull paints has contributed to water quality impairments in San Diego Bay. The potential net increase in the number of vessel slips would potentially result in additional contributions to water quality impairments within the Bay.</p>	PS	Implement MM-WQ-8 , as described above.	SU
<p>Impact-C-WQ-3: Water Quality Degradation from Aquaculture Operations. Depending on the type of aquaculture being practiced and the methods used, water quality degradation, which could include turbidity caused during harvesting and other similar operations, as well as biological oxygen demand, may occur during operation of aquaculture facilities.</p>	PS	Implement MM-WQ-9 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.10 Noise and Vibration			
Project Impacts			
<p>Impact-NOI-1: Exceed Thresholds at Parks During Construction. Proposed construction activities may exceed the construction noise thresholds during permissible construction hours, as summarized in Table 4.10-17 (i.e., 75 dBA L_{eq} 1-hour average for projects in Coronado, 75 dBA L_{eq} 8-hour average for projects in Imperial Beach, and 75 dBA L_{eq} 12-hour average for projects in San Diego), at existing parks. These impacts could occur if one or more project construction phase(s) occur within the relevant screening distances of a park, as identified in Table 4.10-19. (Actual impact distances could be shorter depending on site-specific details such as ground conditions and the presence of any acoustical screening.)</p>	PS	<p>MM-NOI-1: Notify Users of Impacted Parks. As part of a development application, a project proponent <u>Prior to the approval of a future project, the District shall determine whether construction noise will exceed 75 dBA L_{eq} at any nearby parks, if applicable, based on evidence provided by the project proponent as part of the project review process.</u> This determination may be based on the construction noise impact (screening) distances summarized in Table 4.10-19. Alternatively, the project proponent shall may be required to retain a <u>The project proponent shall may be required to retain a</u> qualified acoustical consultant, approved by the District, to conduct a new or more detailed analysis based on project- and site-specific details <u>if construction noise has the potential to exceed the established noise thresholds.</u> If construction noise levels at parks are determined to exceed 75 dBA L_{eq}, <u>the District and/or project proponent shall provide advanced notice and consultation with the local jurisdiction. Exception to this consultation requirement is provided for any emergency work where time is of the essence to rectify an unexpected condition requiring an immediate response (e.g., important utility repair, urgent health and safety-related issues).</u> <u>In addition, for non-emergency work, the project proponent or its construction contractor shall post public noticing at affected parks not less than 48 hours prior to the start of construction activities. The signage shall notify users of possible high noise levels and provide details of alternative parks that are open nearby. The project proponent shall include this measure in the construction specification documents for the project. Prior to issuance of the construction specification documents for bid, the project proponent</u></p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-NOI-2: Exceed Thresholds at Other Noise-Sensitive Receptors During Construction. Proposed construction activities may exceed the construction noise thresholds during permissible construction hours, as summarized in Table 4.10-17 (i.e., 75 dBA Leq 1-hour average for projects in Coronado, 75 dBA Leq 8-hour average for projects in Imperial Beach, and 75 dBA Leq 12-hour average for projects in San Diego), at existing noise-sensitive receptors. These impacts could occur if one or more project construction phase(s) occur within the relevant screening distances of noise-sensitive receptors, as identified in Table 4.10-19. (Actual impact distances could be shorter depending on site-specific details such as including ground conditions and the presence of any acoustical screening.)</p>	PS	<p>shall submit a copy of the documents and the proposed public notice sign to the District's Development Services Department for review and approval. Prior to the commencement of construction activities, the project proponent shall submit documentation (including photographs) to the District's Development Services Department demonstrating compliance with this measure.</p> <p>MM-NOI-2: Avoid or Reduce Construction Noise from Pile Driving. During construction activities <u>associated with a future project</u>, the project proponent shall require all contractors to take steps to reduce pile driving noise, if any, associated with the project by implementing one of the following noise reduction methods:</p> <ul style="list-style-type: none"> • Avoid impact and vibratory pile driving by using quieter alternative installation methods, such as press-in piles or drilled piles (e.g., cast-in-drilled-hole, poured-in-place piles). • Use an acoustical shroud around impact pile driving. The shroud will be constructed of materials that provide a minimum sound transmission class of 28 (e.g., sound-rated acoustical blankets). <p>MM-NOI-3: Implement General Best Practices for Construction Noise Abatement. During construction of <u>a future projects</u>, the project proponent shall require all contractors to adhere to the following noise abatement measures:</p> <ul style="list-style-type: none"> • All construction equipment and vehicles using internal combustion engines will be equipped with mufflers; air-inlet silencers where appropriate; and any other shrouds, shields, or other noise-reducing features in good operating condition that meet or exceed original factory specification. 	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<ul style="list-style-type: none"> • All mobile or fixed construction equipment used on the project that is regulated for noise output by a local, State, or Federal agency will comply with such regulation while in the course of project activity. • All construction equipment will be properly maintained and serviced. • All construction equipment will be operated only when necessary and will be switched off when not in use, <u>and stationary construction equipment shall be located as far from sensitive receptors as possible.</u> • Construction employees will be trained in the proper operation and use of the equipment to avoid careless or improper operation of equipment that could increase noise levels. • Construction site speed limits will be established and enforced during the construction period. • The use of noise-producing signals, including horns, whistles, alarms, and bells, will be for safety warning purposes only. • The contractor will provide advance written notification of construction activities to residences within 300 feet of the construction site for projects that do not include pile driving, and to residences within 700 feet of the construction site for projects that include pile driving. Notification will include a brief overview of the proposed construction activity and its purpose and schedule. It also will include the name and contact information of the project manager or representative responsible for resolving any noise concerns. <p>MM-NOI-4: Install Temporary Noise Barriers to Shield Noise-Sensitive Receptors from Excessive Construction Noise Levels. As part of a development application, a project proponent <u>Prior to the approval of a future project, the District shall ascertain whether</u></p>	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>construction noise will exceed 75 dBA L_{eq} at any noise-sensitive receptors <u>based on evidence provided by the project proponent as part of the project review process</u>.</p> <p>If so, prior to commencing construction, the project proponent shall install temporary noise barrier(s) between construction activities and noise-sensitive receptor(s) where noise levels exceed 75 dBA L_{eq}. Barriers may be constructed around the site perimeter or, when construction activities are restricted to a smaller portion of the site, around that smaller portion of the site, or around any noisy stationary construction equipment, such as generators or dewatering pumps. All such barriers must be at least 8 feet high and of sufficient height to break the line of sight between the construction equipment and the ground floor of any noise-sensitive receiver. These barriers shall be constructed in one of the following ways that the project proponent establishes, in writing and to the satisfaction of the District, will achieve a minimum sound transmission class (STC) rating of 28:</p> <ul style="list-style-type: none"> • From acoustical blankets hung over or from a supporting frame. The blankets should be firmly secured to the framework. The blankets should be overlapped by at least 4 inches at seams and taped and/or closed with hook-and-loop fasteners (i.e., Velcro®) so that no gaps exist. The largest blankets available should be used in order to minimize the number of seams. The blankets shall be draped to the ground to eliminate any gaps at the base of the barrier. • From commercially available acoustical panels lined with sound-absorbing material (the sound-absorptive faces of the panels should face the construction equipment). • From common construction materials such as plywood. 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-NOI-3: Exceed Local Noise Limits for Construction During Prohibited Hours. Although construction during prohibited hours (evening, nighttime, Sundays, or holidays) is not specifically proposed as part of the PMPU, it cannot be ruled out. Unless associated noise levels at existing noise-sensitive receptors can be reduced to comply with the stationary noise source limits of the applicable municipal code (refer to Tables 4.10-8, 4.10-10, and 4.10-13), construction noise impacts will be significant.	PS	MM-NOI-5: Prohibit Exterior Construction Activities Outside of the Permitted Construction Hours. The project proponent shall not conduct typical exterior construction activities during the prohibited hours summarized in Table 4.10-17 (based on the city in which the construction site is located). Also, material or equipment deliveries and collections shall be prohibited during these hours <u>to the extent feasible unless otherwise allowed by the noise ordinance of the City where the project is located.</u> Except for construction personnel specifically working on interior construction tasks within a completed building shell, construction personnel shall not start construction equipment on the job site during the prohibited hours. Subject to the District's review and approval, non-typical time-sensitive construction activities may occur <u>during outside the permitted hours</u> summarized in Table 4.10-17. Examples may include, but are not limited to, large concrete pours that must occur continuously once started, or activities requiring road closures that are deemed to be safer or less disruptive when implemented at night.	SU
Impact-NOI-4: Excessive Traffic Noise Increases on Existing Roadways Above Local Standards. Traffic on some roadways may increase noise levels at existing noise-sensitive receptors by 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member city. This impact may occur at hotels/motels, parks, and homes adjacent to segments of Harbor Island Drive, Pacific Highway, and West Ash Street.		MM-NOI-6: Conduct Project-Specific Traffic Noise Analyses for Projects that Would Double the Traffic Volume on One or More Affected Streets. <u>As part of a development application, the project proponent Prior to the approval of a future project, the District shall ascertain whether project implementation would double the vehicular traffic volume on any affected street(s) based on evidence provided by the project proponent as part of the project review process.</u> If no such increase is predicted, then no further traffic noise analysis is required. However, if such an increase is anticipated <u>has potential to occur</u> , the project proponent shall retain a qualified traffic transportation consultant and a qualified acoustical consultant, each approved by	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>the District. The consultants shall identify the roadways that would be affected by the project, quantify daily traffic volumes with and without the project, and determine what, if any, additional analysis is required to quantify traffic noise levels and identify potential noise control measures. If significant impacts are predicted, the assessment shall identify traffic noise abatement or reduction measures to be implemented by the project proponent as necessary to ensure project traffic does not cause: (1) an increase of 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member city, or (2) any traffic noise increase of 5 dB CNEL or more, at a noise-sensitive receptor. Such measures may include, but would not be limited to:</p> <ul style="list-style-type: none"> • Noise barriers. • Quiet pavement. • Increased separation between roadways and sensitive land uses. • Upgrades, such as retrofitted sound-rated windows and doors for impacted sensitive buildings. • Traffic calming or other measures to reduce traffic speeds. 	
<p>Impact-NOI-5: Substantial Traffic Noise Increases Due to Roadway Improvements and Modifications. This impact may occur for proposed roadway improvement and modification projects if they remove acoustical shielding between the roadway and an adjacent noise-sensitive receptor, or horizontally realign the roadway so that the distance between traffic and the receiver is reduced by at least 50 percent.</p>	PS	<p>MM-NOI-7: Design Roadway Improvement and Modification Projects to Avoid Noise Increases Greater than 3 dB CNEL. During the design phase for specific roadway improvements and modifications, the project proponent shall ensure the proposed design does not: (1) remove existing noise barriers (if any) between the roadway and adjacent noise-sensitive receptors without replacing such barriers with like-kind, or (2) reduce the distance between the <u>traffic closest travel lane</u> and the receiver by 50 percent or more. <u>As an example of the latter condition, in a hypothetical case where the current distance between</u></p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-NOI-6: Significant Noise Impact from Regional Mobility Hubs. Regional Mobility Hubs that provide new parking facilities may generate significant noise impacts if located within 125 feet of a noise-sensitive receptor.	PS	<p><u>the center of the closest travel lane and the receiver is 1,000 feet, a project shall not be allowed to modify the roadway to shorten the distance between the roadway and the receiver by more than 499 feet, which is less than 50 percent of the distance. Therefore, the closest distance between the closest traffic lane and a receiver that would be allowed under this mitigation measure would be 501 feet under the project condition.</u></p> <p>MM-NOI-8: For Regional Mobility Hubs Within 125 feet of Noise-Sensitive Receptors, Design and Construct Facilities to Control Noise from New Sources Such as Parking Lots. During the architectural and engineering design phases of a Regional Mobility Hub, and prior to the District's approval of a Regional Mobility Hub, the project proponent shall retain an acoustical consultant approved by the District to evaluate the potential noise impacts of new parking lots or other proposed potential noise sources. The consultant shall assess the project details and prepare submit a written report to the District that identifies what, if any, additional analysis is required to quantify operational noise levels and potential noise abatement measures. Based on the consultant's written report, the District shall determine whether additional technical analysis is necessary to quantify operational noise levels and to identify noise abatement measures in order to meet the noise standards specified below. Noise abatement or reduction measures, if required, may include, but are not limited to, reorientation or relocation of noise sources, administrative controls on the times and intensity of use, control of mechanical equipment noise (such as parking garage exhaust fans), or the addition of noise barriers or other acoustical screening. Noise abatement or reduction measures shall be implemented by the project proponent to ensure the Regional</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-NOI-7: Exceed Local Noise Limits for Commercial Developments. Building systems (e.g., mechanical equipment, plumbing systems, trash compactors) and other activities at commercial developments may generate noise at existing noise-sensitive receptors in excess of applicable local limits for stationary noise sources.	PS	<p>Mobility Hub does not cause: (1) an increase of 3 dBA or more over ambient noise levels resulting in a combined noise level greater than the applicable municipal code standard (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at a noise-sensitive receptor, or (2) any increase of 5 dBA or more over ambient noise levels at a noise-sensitive receptor. <u>The noise report will be subject to the District's review and approval, and no future project shall proceed until the noise report is deemed acceptable to the District.</u></p> <p>MM-NOI-9: Design, and Construct, and Operate New Commercial Uses to Control Noise from All Onsite Equipment and Activities. The project proponent shall design, and construct, and operate all proposed commercial uses to ensure their compliance with the applicable municipal code noise limits (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at noise-sensitive receptors. To achieve this performance standard, during the architectural and engineering design, and prior to the District's approval of the applicable a future <u>commercial</u> development project <u>deemed consistent with the PMPU</u>, the project proponent shall retain an acoustical consultant approved by the District to evaluate the <u>proposed</u> design and provide written recommendations to the District, as necessary, to abate or reduce noise from all onsite equipment and activities. Such recommendations may include, but are not limited to, changes in site layout or equipment locations; sound power limits or specifications; rooftop parapet walls; acoustical absorption, louvers, screens, or enclosures; intake and exhaust silencers; or administrative controls (such as restricting <u>the location or hours of</u> certain activities to daytime hours). The District shall identify the noise abatement or reduction measures to be implemented by the project proponent, which are necessary to ensure compliance with the</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-NOI-8: Exceed Local Noise Limits for Outdoor Use Areas and Outdoor Special Events. If new developments include outdoor use areas (e.g., parks, outdoor dining, patios, roof decks, pool decks) with amplified music, or host large outdoor special events such as weddings, exhibits, social gatherings, fundraisers, concerts, music festivals, and art exhibits, such activities may exceed applicable local noise limits at existing noise-sensitive receptors, especially if events are attended by large numbers of people or would include live or recorded music.	PS	<p>applicable municipal code noise limits. If such compliance is infeasible, a project-level environmental review shall be required. The noise abatement measures will be subject to the District's review and approval and no future project shall proceed until the District deems the noise abatement measures sufficient to reduce noise levels to below established thresholds. If a future project cannot meet the applicable thresholds, subsequent CEQA review shall be required.</p> <p>MM-NOI-10: Design and Operate Outdoor Activity Areas to Control Operational Noise. The project proponent and any future owner/operator of proposed developments shall design, construct, and operate outdoor activity areas (e.g., outdoor dining areas, patios, roof decks, pool decks), to ensure their compliance with the applicable municipal code noise limits (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at noise-sensitive receptors. To achieve this performance standard, as part of the site-specific environmental review of a proposed project, the project proponent shall retain an acoustical consultant approved by the District to evaluate the <u>proposed</u> design and provide written recommendations to the District, as necessary, to abate or reduce noise from all outdoor activity areas. Such recommendations may include, but are not limited to, changes in location and layout, sound power limits or specifications for audio systems, loudspeaker placement and direction, acoustical shielding (barriers, walls, or roofs), or acoustical absorption. The District shall identify the noise abatement or reduction measures to be implemented by the project proponent that are necessary to ensure compliance with the <u>applicable relevant</u> municipal code noise limits. If such compliance is infeasible, a project-level environmental review shall be required. <u>Any recommendations will be subject to the District's review and approval, and no</u></p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p><u>future development shall proceed until the District deems the recommended noise abatement measures acceptable.</u></p> <p>MM-NOI-11: Incorporate Operational/Contract Specifications to Minimize Exterior Special Event Noise and Regulate Special Events at New Parks.</p> <p>Special events may include, <u>but are not limited to</u>, occasional outdoor gatherings, public dances, shows, sporting events, entertainment events (including concerts), parades, and civic functions. Such events at new parks proposed under the PMPU shall be properly regulated for noise control and shall observe the requirements identified below. In addition, the project proponent and any future owner/operator of proposed developments hosting exterior special events shall observe the following requirements and incorporate them into the contract specifications for outdoor events:</p> <ol style="list-style-type: none"> 1. Any special event at a new park and any exterior special events at proposed developments shall not exceed the applicable <u>relevant</u> municipal code noise limits (refer to Tables 4.10-8, 4.10-10, and 4.10-13) at a noise-sensitive receptor. 2. Any event that fails to comply with requirement 1, above, shall only be permitted if an applicable event permit, or variance or exemption from the code, has been sought and granted by the appropriate agency (city or District). 3. The project shall comply with all city and District <u>noise</u> requirements related to hosting outdoor events. 4. <u>All amplified public address systems shall be oriented away from adjacent sensitive receptors.</u> 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-NOI-9: Exceed Caltrans Guideline Criteria for Potential Building Damage During Construction.</p> <p>Vibration levels due to various construction activities could exceed recommended criteria for potential building damage. The actual impacts, if any, would depend on the equipment used and the distance to the affected structure(s). Specifically, a significant impact would occur if project construction occurs within one or more of the threshold distances identified in Table 4.10-22 based on the actual construction equipment to be used.</p>	PS	<p>MM-NOI-12: Avoid or Reduce Potentially Damaging Vibration at Nearby Buildings from Project Construction. During construction activities, the project proponent shall avoid working within the potential damage threshold distances identified in Table 4.10-22 based on the construction equipment to be used and the type, age, and condition of nearby structures (including structures owned or occupied by neighboring District tenants). In the event the District determines that it is not feasible for the project proponent to avoid construction activities within the potential damage threshold distances, the project proponent shall reduce the potential impact to the maximum extent feasible through the implementation of alternate construction equipment or techniques approved by the District such as, but not limited to, the following:</p> <ul style="list-style-type: none"> • Replacing impact pile driving with press-in piles or drilled piles (e.g., cast-in-drilled-hole, poured-in-place piles). • Using smaller categories of equipment, such as a Bobcat or skid steer instead of full-size graders or bulldozers. <p>If the District determines that these techniques cannot be fully implemented or are not sufficient to place the affected receivers outside of the applicable threshold distance, then the project proponent shall take the following additional steps to protect buildings within the potential damage threshold distances for construction vibration damage:</p> <ul style="list-style-type: none"> • The project proponent/contractor shall retain a qualified structural or geotechnical engineer to conduct preconstruction surveys of neighboring structures (including photographing and/or videotaping) to document existing building 	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>conditions for future comparison if any vibration-related damage is suspected or results from construction-related activities.</p> <ul style="list-style-type: none"> Based on professional judgment and review of the specific buildings involved, the structural/geotechnical engineer shall provide written recommendations to the District for updated vibration thresholds and revised impact distances for potentially affected buildings. If considered appropriate by the District, the project proponent shall conduct monitoring during construction to check for vibration-related damage during pile driving. Such monitoring may include vibration measurements obtained inside or outside of the buildings or other tests and observations deemed necessary by the District. If any damage to existing buildings is determined to occur because of project construction, the project proponent shall be financially responsible for the necessary repairs, structural or cosmetic, to return the damaged building to its pre-existing state. 	
<p>Impact-NOI-10: Exceed Caltrans Guideline Criteria for Potential Human Annoyance at Sensitive Receptors During Project Construction. Vibration levels due to various construction activities could exceed recommended criteria for potential human annoyance. The actual impacts, if any, would depend on the equipment used and the distance to the affected sensitive buildings. Specifically, a significant impact would occur if project construction occurs within the “distinctly perceptible” threshold distance of an occupied sensitive building, as identified in Table 4.10-23, based on the actual construction equipment to be used.</p>	PS	<p>MM-NOI-13: Avoid or Reduce Potentially Annoying Vibration at Occupied Sensitive Buildings During Project Construction. During construction activities, the project proponent shall avoid working within the distinctly perceptible threshold distances identified in Table 4.10-23 from occupied sensitive buildings, based on the construction equipment to be used. In the event the District determines that it is not feasible for the project proponent to avoid construction activities within the potential annoyance threshold distances, the project proponent shall reduce the potential impact to the extent feasible through the implementation of alternate construction equipment or techniques</p>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>approved by the District such as, but not limited to, the following:</p> <ul style="list-style-type: none"> • Replacing impact pile driving with press-in piles or drilled piles (e.g., cast-in-drilled-hole, poured-in-place piles). • Using smaller categories of equipment, such as a Bobcat or skid steer instead of full size graders or bulldozers. • <u>Other construction techniques or measures that are as effective and approved by the District.</u> 	
Impact-C-NOI-1: Exceed the Established 75 dBA L_{eq} Thresholds at Noise-Sensitive Receptors. Cumulative construction activities may exceed the established 75 dBA L_{eq} thresholds at noise-sensitive receptors during permissible construction hours.	PS	Implement MM-NOI-1, MM-NOI-2, MM-NOI-3, and MM-NOI-4 , as described above.	SU
Impact-C-NOI-2: Generate Noise in Excess of Local Limits. Cumulative construction activities occurring during prohibited hours (evening, nighttime, Sundays, or holidays) may generate noise in excess of local limits for stationary noise sources at existing noise-sensitive receptors.	PS	Implement MM-NOI-5 , as described above.	SU
Impact-C-NOI-3: Increase Noise Levels at Existing Noise-Sensitive Receptors by 3 dB CNEL or More. Cumulative traffic on some roadways could increase noise levels at existing noise-sensitive receptors by 3 dB CNEL or more to a level that is above the local standards or guidelines of the applicable member City.	PS	Implement MM-NOI-6 and MM-NOI-7 , as described above.	SU
Impact-C-NOI-4: Generate Noise at Sensitive Receptors in Excess of Local Limits. Cumulative operation of future developments may generate noise at sensitive receptors in excess of local limits for stationary noise sources.	PS	Implement MM-NOI-8, MM-NOI-9, MM-NOI-10, and MM-NOI-11 , as described above.	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-C-NOI-5: Exceed Caltrans Guideline Criteria for Potential Building Damage. Cumulative groundborne vibration may exceed Caltrans guideline criteria for potential building damage during project construction.	PS	Implement MM-NOI-12 , as described above.	LTS
Impact-C-NOI-6: Exceed Caltrans Guideline Criteria for Potential Human Annoyance at Sensitive Receptors. Cumulative groundborne vibration may exceed Caltrans guideline criteria for potential human annoyance at sensitive receptors during project construction.	PS	Implement MM-NOI-13 , as described above.	SU
4.12 Public Services			
Project Impacts			
Impact-PS-1: Potential to Result in Substantial Adverse Physical Impacts from the Provision of New or Physically Altered Police Protection Facilities Associated with Operation of Future Development Projects Consistent with the Proposed PMPU. Implementation of the proposed PMPU, which includes development and operation of future projects (including visitor-serving facilities) would result in higher daily visitation to the proposed PMPU area, creating a greater demand for police services, which could require the expansion of, or new construction of, police facilities. The timing, duration, location, and extent of possible construction activities, as well as the certainty of the need for new or expanded police facilities are all unknown at this time. Potential impacts from the construction of new or expanded police facilities include construction-related air emissions, GHG emissions, noise and vibration, and energy use; disturbance of biological resources, cultural resources, tribal cultural resources, and/or contaminated soils; drainage and soil-related impacts; and impacts from the expanded connection of utilities to serve the new or expanded government facility. Operational impacts could include new or additional siren noise near sensitive receptors that may cause ambient noise levels to exceed	PS	MM-PS-1: Conduct Project-Specific Reviews of the Adequacy of Police Protection Services with the SDPD and Coast Guard to Determine if a New or Expanded Government Facility Will Be Required. During project-specific environmental review of future development projected under the proposed PMPU <u>Prior to the approval of a future project</u> , the District shall require a site-specific study, consisting of coordination with the SDPD and/or Coast Guard (whichever agency[ies] provide police protection services to the area) regarding the future project, which shall include a written record of the results of the coordination, to determine whether the project would increase the demand on police services such that new or expanded facilities would be required to maintain adequate police services as determined by the SDPD and/or Coast Guard. Should it be determined that the future project would cause or contribute to the need for new or expanded police facilities, the District shall: (1) analyze the potential environmental effects of the construction and operation of the police facility in accordance with CEQA and ensure any impacts from the construction of any such facilities are mitigated to the extent feasible under the law; (2) confirm a CEQA document has been	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
hourly or 24-hour noise level standards of the City's Municipal Code and General Plan, increased VMT, and the associated effects on air quality, GHGs, and energy use.		approved and certified for the new or expanded police facility and any associated mitigation required associated with its construction and operation; or (3) confirm a CEQA document is under preparation for construction and operation of the new or expanded police facility. If the District conducts the CEQA analysis as part of the project analysis, the analysis must consider all details about the needed police facility, including the known location, design, construction and operational details, and timing. In addition, the CEQA analysis must identify mitigation measures to reduce any significant impacts that could result from construction and operation of any new or expanded government facility. Mitigation measures as listed in the proposed PMPU's Mitigation Monitoring and Reporting Program (MMRP) shall be considered where needed to avoid a significant impact. Importantly, this mitigation measure shall also be required for Impact-C-PS-1 and shall be applicable to potential cumulative fire protection facility-related impacts and require coordination with SDFD and HPD consistent with the direction provided within this mitigation measure.	
Impact-PS-2: Potential to Result in Substantial Adverse Physical Impacts from the Construction of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include construction of new or expanded parks. Potential impacts from the construction of new or expanded parks include construction-related air emissions (Impact-AQ-2), biological resources (Impact-BIO-2 and Impact-BIO-5), cultural resources (Impact-CUL-1 and Impact-CUL-2), tribal cultural resources (Impact-CUL-3), paleontological resources (Impact-GEO-1), noise and vibration (Impact-NOI-1 through Impact-NOI-5), and/or contaminated soils (Impact-HAZ-1 and Impact-HAZ-2).	PS	Implement MM-AQ-2 through MM-AQ-8 , as described in Section 4.2, <i>Air Quality and Health Risk</i> . Implement MM-BIO-2 and MM-BIO-5 , as described in Section 4.3, <i>Biological Resources</i> . Implement MM-CUL-1 through MM-CUL-3 , as described in Section 4.4, <i>Cultural Resources and Tribal Cultural Resources</i> . Implement MM-GEO-1 , as described in Section 4.5, <i>Geology and Soils</i> . Implement MM-GHG-2 , as described in Section 4.6, <i>Greenhouse Gas Emissions and Energy</i> . Implement MM-NOI-1 through MM-NOI-5 , as described in Section 4.10, <i>Noise and Vibration</i> .	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		Implement MM-HAZ-1 and MM-HAZ-2 , as described in Section 4.7, <i>Hazards and Hazardous Materials</i> .	
Impact-PS-3: Potential to Result in Substantial Adverse Physical Impacts from the Operation of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include new or expanded parks. Potential impacts from the operation of such new or expanded parks include operation-related air emissions (Impact-AQ-9 through Impact-AQ-12), biological resources (Impact-BIO-8 and Impact-BIO-9), and greenhouse gas emissions (Impact-GHG-1 and Impact-GHG-2).	PS	Implement MM-AQ-9 through MM-AQ-12 , as described in Section 4.2. Implement MM-BIO-8 and MM-BIO-9 , as described in Section 4.3. Implement MM-GHG-1 and MM-GHG-2 , as described in Section 4.6.	SU
Impact-REC-1: Potential to Result in Substantial Adverse Physical Impacts from the Construction of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include construction of new or expanded recreational facilities. Potential impacts from the construction of new or expanded recreational facilities could involve construction-related air emissions (Impact-AQ-2 and Impact-AQ-4); biological resources (Impact-BIO-2 and Impact-BIO-5), cultural resources (Impact-CUL-1 and Impact-CUL-2), tribal cultural resources (Impact-CUL-3), paleontological resources (Impact-GEO-1), noise and vibration (Impact-NOI-1 through Impact-NOI-5), contaminated soils (Impact-HAZ-1 and Impact-HAZ-2), and water quality (Impact-WQ-1).	PS	Implement MM-AQ-2 through MM-AQ-9 , as described in Section 4.2. Implement MM-BIO-2 and MM-BIO-5 , as described in Section 4.3. Implement MM-CUL-1 through MM-CUL-3 , as described in Section 4.4. Implement MM-GEO-1 , as described in Section 4.5. Implement MM-GHG-2 , as described in Section 4.6. Implement MM-HAZ-1 and MM-HAZ-2 , as described in Section 4.7. Implement MM-NOI-1 through MM-NOI-5 , as described in Section 4.10. Implement MM-WQ-1 through MM-WQ-7 , as described in Section 4.8.	SU
Impact-REC-2: Potential to Result in Substantial Adverse Physical Impacts from the Operation of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include operation of new or expanded recreational facilities. Potential impacts from new or expanded recreational facilities could involve operation-related air emissions (Impact-AQ-3 and	PS	Implement MM-AQ-9 , through MM-AQ-12 , as described in Section 4.2. Implement MM-BIO-8 and MM-BIO-9 , as described in Section 4.3. Implement MM-GHG-1 and MM-GHG-2 , as described in Section 4.6. Implement MM-WQ-8 , as described in Section 4.8.	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-AQ-5), biological resources (Impact-BIO-8 and Impact-BIO-9), greenhouse gas emissions (Impact-GHG-1), and/or water quality (Impact-WQ-2).			
Impact-C-PS-1: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Provision of New or Physically Altered Fire and Police Protection Facilities. Implementation of the proposed PMPU, when combined with past, present, and reasonably foreseeable future development projects, would create a greater demand for fire and police protection services. This increased demand may require the construction of new or physically altered government facilities in order to maintain acceptable service ratios for the region. Because the timing, duration, location, and extent of any new or expanded fire and police facilities required to serve future development under the proposed PMPU are not known, construction of these facilities could result in physical impacts on the environment. In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded fire and police protection facilities could result in a cumulatively considerable contribution to a significant cumulative impact related to fire and police protection.	PS	Implement MM-PS-1 , as described above.	SU
Impact-C-PS-2: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Construction of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include construction of new or expanded parks. Potential impacts from the construction of new or expanded parks could involve construction-related air emissions (Impact-AQ-2), biological resources (Impact-BIO-1 and Impact-BIO-2), cultural resources (Impact-CUL-1 and Impact-CUL-2), tribal cultural resources (Impact-CUL-3), energy use (Impact-EN-1), noise and vibration (Impact-NOI-1 through Impact-NOI-3), and/or contaminated soils	PS	Implement MM-AQ-2 through MM-AQ-8 , as described in Section 4.2, <i>Air Quality and Health Risk</i> . Implement MM-BIO-2 and MM-BIO-5 , as described in Section 4.3, <i>Biological Resources</i> . (Impact-HAZ-1 through Impact-HAZ-4). In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded parks could result in a cumulatively considerable contribution to a significant cumulative impact related to parks.		Implement MM-NOI-1 through MM-NOI-5 , as described in Section 4.10, <i>Noise and Vibration</i> . Implement MM-HAZ-1 and MM-HAZ-2 , as described in Section 4.7, <i>Hazards and Hazardous Materials</i> .	
Impact-C-PS-3: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Operation of New or Physically Altered Parks Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include new or expanded parks. Potential impacts from the operation of new or expanded parks could involve operation-related air emissions (Impact-AQ-3 and Impact-AQ-6), biological resources (Impact-BIO-8 , Impact-BIO-12 , and Impact-BIO-14), and greenhouse gas emissions (Impact-GHG-1). In combination with other projects in or adjacent to the proposed PMPU area, operation of new or expanded parks could result in a cumulatively considerable contribution to a significant cumulative impact related to parks.	PS	Implement MM-AQ-9 through MM-AQ-12 , as described in Section 4.2. Implement MM-BIO-8 and MM-BIO-9 , as described in Section 4.3. Implement MM-GHG-1 and MM-GHG-2 , as described in Section 4.6.	SU
Impact-C-REC-1: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Construction of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include new or expanded recreational facilities. Potential impacts from the construction of new or expanded recreational facilities could involve construction-related air emissions (Impact-AQ-2 and Impact-AQ-4), biological resources (Impact-BIO-1 , Impact-BIO-2 , Impact-BIO-3 , Impact-BIO-4 , and Impact-BIO-11), cultural resources (Impact-CUL-1 and Impact-CUL-2), tribal cultural resources (Impact-CUL-3), energy use (Impact-EN-1), noise and vibration (Impact-NOI-1 through Impact-NOI-3), contaminated soils (Impact-HAZ-1 through Impact-HAZ-4), and/or water quality (Impact-	PS	Implement MM-AQ-2 through MM-AQ-9 , as described in Section 4.2. Implement MM-BIO-2 and MM-BIO-5 , as described in Section 4.3. Implement MM-CUL-1 through MM-CUL-3 , as described in Section 4.4. Implement MM-GEO-1 , as described in Section 4.5. Implement MM-GHG-2 , as described in Section 4.6. Implement MM-HAZ-1 and MM-HAZ-2 , as described in Section 4.7. Implement MM-NOI-1 through MM-NOI-5 , as described in Section 4.10. Implement MM-WQ-1 through MM-WQ-7 , as described in Section 4.8.	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
WQ-1). In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded recreational facilities could result in a cumulatively considerable contribution to a significant cumulative impact related to recreational facilities.		Implement MM-AQ-9 , through MM-AQ-12 , as described in Section 4.2. Implement MM-BIO-8 and MM-BIO-9 , as described in Section 4.3. Implement MM-GHG-1 and MM-GHG-2 , as described in Section 4.6. Implement MM-WQ-8 , as described in Section 4.8.	SU
Impact-C-REC-2: Potential to Result in Cumulatively Considerable Substantial Adverse Physical Impacts from the Operation of New or Expanded Recreational Facilities Implemented Under the Proposed PMPU. Implementation of the proposed PMPU would include operation of new or expanded recreational facilities. Potential impacts from new or expanded recreational facilities could involve operation-related air emissions (Impact-AQ-3 and Impact-AQ-6), biological resources (Impact-BIO-8 , Impact-BIO-12 , and Impact-BIO-14), greenhouse gas emissions (Impact-GHG-1), and/or water quality (Impact-WQ-2). In combination with other projects in or adjacent to the proposed PMPU area, construction of new or expanded recreational facilities could result in a cumulatively considerable contribution to a significant cumulative impact related to recreational facilities.	PS		SU
4.14 Transportation Impact Fee Program			
Project Impacts			
Impact-TRA-1: Increase in Total VMT Associated with Future Development Consistent with the Proposed PMPU. Future development under the proposed PMPU would result in a net increase in VMT in PD1, PD2, PD3, PD8, PD9, and PD10 as a result of developing retail, restaurant, and recreational land uses in the future. This would result in a conflict with State CEQA Guidelines Section 15064.3, subdivision (b).	PS	MM-TRA-1: Establish a <u>Vehicle Miles Traveled (VMT) Infrastructure Mitigation Transportation Impact Fee Program</u>. Consistent with ECON Policy 1.2.6 of the proposed PMPU, prior to approval of the first future development project allowed under the proposed PMPU <u>To reduce vehicle miles traveled (VMT), within three years of the PMPU's certification,</u> the District shall establish an <u>impact fee program and implement a VMT Infrastructure Mitigation Program that provides for the funding installation of transportation multi-modal infrastructure improvements that would reduce VMT, including both</u>	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p><u>existing and future VMT within the District. This program may include, but not be limited to, the following improvements: mobility hubs; transit facilities; bicycle improvements; pedestrian improvements; Bayfront Circulator, hotel shuttle service, or comparable service; and/or other mobility-related infrastructure improvements and amenities, as specified in the proposed PMPU. The District may finance these improvements through one or more of the following methods:</u></p> <ul style="list-style-type: none"> • <u>Transportation Impact Fees;</u> • <u>District-Wide General In-Lieu Fee Program for Public Benefits (e.g., mobility improvements, and parks and recreational improvements);</u> • <u>Private Investments;</u> • <u>Public Investments;</u> • <u>Private-Public Partnerships, based on a District-established schedule;</u> • <u>Conditions of approval to CDPs for future development, related to funding VMT-reducing measures; or</u> • <u>Other funding mechanisms (e.g., grant awards).</u> <p><u>The VMT Infrastructure Mitigation Program shall identify needed improvements throughout the PMPU area consistent with Chapter 4, Baywide Development Standards, of the proposed PMPU and include guidelines to determine the proportionate fair share contributions made by public and private project proponents on a case-by-case basis and based on the project's contribution to VMT within the proposed PMPU area. These improvements may be implemented through a combination of private investments, public investments, and private-public partnerships based on a schedule established by the District to minimize and offset VMT-related impacts on</u></p>

4.15 Utilities and Service Systems			
Project Impacts			
Impact-UTIL-1: Utility-Related Land Disturbance. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded utility facilities to serve specific future development are generally known, and significant impacts associated with ground-disturbing activities would potentially occur. The impacts of ground-disturbing activities are analyzed within this PEIR, including in Sections 4.3, 4.4, 4.5, 4.7, and 4.8. Based on the determinations within these sections, land disturbance associated with installing utility facilities would also have the potential to result in a significant impact on these resources.	PS	Implement MM-BIO-2 , MM-BIO-5 , MM-BIO-8 , and MM-BIO-9 , as described in Section 4.3, <i>Biological Resources</i> Implement MM-CUL-1 through MM-CUL-3 , as described in Section 4.4, <i>Cultural Resources and Tribal Cultural Resources</i> Implement MM-GEO-1 , as described in Section 4.5, <i>Geology and Soils</i> Implement MM-HAZ-1 and MM-HAZ-2 , as described in Section 4.7, <i>Hazards and Hazardous Materials</i> Implement MM-WQ-1 through MM-WQ-7 , as described in Section 4.8, <i>Hydrology and Water Quality</i> .	SU

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-UTIL-2: Insufficient Water Supplies Available to Serve the Proposed PMPU During Operation of Future Development. Due to the significant increase in water demand as a result of implementation of the proposed PMPU, sufficient water supplies may not be available to serve future development under the proposed PMPU during normal, dry, and multiple dry years. Therefore, given the increase in water demand, which is necessary for operation of future development allowed under the proposed PMPU, potential impacts are considered significant.</p>	PS	<p>MM-UTIL-1: Update the UWMP with New Growth Projections. Within 6 months of California Coastal Commission certification of the proposed PMPU, the District shall provide SANDAG with amended growth assumptions and changes to water and land use designations associated with the proposed PMPU. The District shall coordinate with SANDAG and the City of San Diego to ensure the UWMPs are updated as part of the upcoming revision cycle to reflect the updated growth assumptions of the proposed PMPU. Until the UWMP is updated to account for projects proposed under a certified PMPU, the District shall implement MM-UTIL-2 to ensure sufficient water supply exists for individual projects.</p> <p>MM-UTIL-2: Prepare a Water Demand Analysis to Determine if Sufficient Water Supplies are Available. Prior to District's approval of any future development project that would equate to a water demand project, as defined by State CEQA Guidelines Section 15155, and before the successful update to the applicable UWMP(s) required under MM-UTIL-1, the District shall require the project proponent to prepare a water demand analysis.</p> <p>In the event that project demand exceeds available supplies after incorporation of all feasible water-efficient measures, the project proponent shall be required to demonstrate how and where additional supply to meet the project's demand will be secured, as well as analyzing the potential impacts of acquiring water from a new water source; or the project shall be redesigned to further reduce the demand for water to be within the available supplies. The District shall not approve any future development proposal unless the project proponent can demonstrate that the project's water supply demands will be met.</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
		<p>MM-UTIL-3: Implement Water Conservation Measures. The project proponent shall incorporate and implement water-efficient design measures into project design. Water-efficient design measures shall at a minimum, include:</p> <ul style="list-style-type: none"> • Implement indoor water reduction measures, including high-efficiency toilets, high-efficiency urinals, low-flow faucets, and low-flow showers (as applicable). • Install only drought-tolerant landscaping, per PMPU ECO Policy 1.1.8, and perform any landscaping watering through a drip system or low-flow irrigation devices. • Install cisterns above or below ground that shall collect and store runoff from rooftops and other impervious surfaces. • Install water-efficient water coolers and equipment and monitor cooling tower and boiler water chemistry to minimize mineral buildup in the system and maximize the number of times water can be recycled through the system. • Limit the use of turf. • Educate employees on water conservation measures on an annual basis and post water conservation stickers, signs, and posters in bathrooms, kitchens, cafeterias, conference rooms, and other places where employees congregate. • <u>Reduce indoor water consumption by 20 percent lower than baseline buildings through the use of low-flow fixtures in all bathrooms (see also MM-AQ-9) (baseline water consumption for buildings is defined by LEED as indoor water use after meeting Energy Policy Act of 1992 fixture performance requirements).</u> 	

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-C-UTIL-1: Potential to Result in a Cumulatively Considerable Adverse Impact Related to the Requirement for New or Expanded Utilities. Operation of future development consistent with the proposed PMPU could increase demand on utilities serving the proposed PMPU area, including water, wastewater, stormwater, electricity, natural gas, and telecommunications, potentially requiring the relocation or construction of new or expanded utilities to serve future development and uses. While the specifications of individual future development, including timing, location, and size, are not known at this time, the potential impacts associated with installation of new or expanded utility facilities to serve specific future development are generally known and significant impacts associated with ground-disturbing activities would potentially occur. In combination with other operational activity in or adjacent to the proposed PMPU area, construction of these facilities could result in cumulatively considerable physical impacts on the environment.</p>	PS	Implement MM-BIO-2, MM-BIO-5, MM-BIO-8, MM-BIO-9, MM-CUL-1 through MM-CUL-3, MM-GEO-1, MM-HAZ-1, MM-HAZ-2, and MM-WQ-1 through MM-WQ-7 , as described above.	SU
<p>Impact-C-UTIL-2: Potential to Result in a Cumulatively Considerable Insufficient Water Supplies During Operation. Due to the significant increase in water demand as a result of implementation of the proposed PMPU, sufficient water supplies may not be available to serve future development under the proposed PMPU during normal, dry, and multiple dry years. Therefore, in combination with the operation of other future development in or adjacent to the proposed PMPU area, given the increase in water demand, which is necessary for operation of future development, this would result in a cumulatively considerable impact related to water supplies.</p>	PS	Implement MM-UTIL-1, MM-UTIL-2, and MM-UTIL-3 , as described above.	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
<p>Impact-C-UTIL-3: Potential to Result in Cumulatively Considerable Adverse Impacts Related to Exceeding Capacity at Existing Landfills During Construction.</p> <p>Construction activities associated with future development under the proposed PMPU could produce substantial quantities of demolition debris, the disposal of which could exceed existing landfill capacity. In combination with other construction activity in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable impact related to capacity at existing landfills.</p>	PS	<p>MM-C-UTIL-1: Update the Five-Year Review Report with New Growth Projections. Within 6 months of the California Coastal Commission's <u>full</u> certification and <u>approval</u> of the proposed PMPU, the District shall provide the County of San Diego with amended growth assumptions and changes to water and land use designations associated with the proposed PMPU. The District will <u>shall</u> coordinate with County of San Diego Local Enforcement Agency to ensure the Five-Year Review Report is updated as part of the next soonest revision cycle to reflect the updated growth assumptions of the proposed PMPU. Until the Five-Year Review Report is updated to account for projects proposed under a certified PMPU, the District shall implement MM-C-UTIL-2 to ensure sufficient landfill capacity exists for individual projects.</p> <p>MM-C-UTIL-2: Conduct Site-Specific Environmental Review to Assess Landfill Capacity and Implement Measures to Reduce Solid Waste. Prior to implementation of MM-C-UTIL-1, <u>and prior to approval of a future project</u>, the District shall assess the capacity of existing landfills serving the project site during construction and operation. Project proponents shall incorporate measures that reduce a project's solid waste, including, but not limited to, compliance with the City of San Diego's Recycling Ordinance, which requires 50 percent of solid waste to be recycled, and the City of San Diego's Construction and Demolition Debris Deposit Ordinance, which would require 65 percent of all construction and demolition debris be recycled. In addition, the District shall encourage project proponents to use recycled, regional, and rapidly renewable materials during construction. The District shall not approve any <u>a future project development proposals</u> unless the project proponent can</p>	LTS

Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Impact-C-UTIL-4: Potential to Result in Cumulatively Considerable Adverse Impacts Related to Exceeding Capacity at Existing Landfills During Operation. Operation associated with future development under the proposed PMPU could result in a substantial increase in solid waste, the disposal of which could exceed existing landfill capacity. In combination with other operational activity in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable impact related to capacity at existing landfills.	PS	demonstrate sufficient landfill capacity is available to meet the project's solid waste demands. Implement MM-C-UTIL-1 and MM-C-UTIL-2 , as described above.	LTS
Notes: "PS" means "Potentially Significant," "SU" means "Significant and Unavoidable," and "LTS" means "Less Than Significant." The term "PS" is used interchangeably with "Significant" as defined on page 4-3 of the Final PEIR, Volume 2.

1.1 Project Overview

The San Diego Unified Port District (District) is undertaking a comprehensive update to its existing Port Master Plan (PMP). The proposed Port Master Plan Update (PMPU) provides the official goals and planning policies, as well as water and land uses, for development and conservation of the District lands, tidelands, and submerged lands (collectively, Tidelands or District Tidelands) that comprise the PMPU area. The proposed PMPU would implement the approximately 30-year planning vision by identifying allowable water and land uses and providing policies that address the following six Elements in eight of the District's 10 planning districts (individually, PD and collectively, PDs):

- ~~Water and Land Use~~ Ecology
- ~~Mobility~~ Economics
- ~~Ecology~~ Environmental Justice
- Safety and Resiliency
- ~~Environmental Justice~~ Mobility
- ~~Economics~~ Water and Land Use

The 10 planning districts consist of the following:

- PD1: Shelter Island
- PD2: Harbor Island
- PD3: Embarcadero
- PD4: Working Waterfront
- PD5: National City Bayfront¹
- PD6: Chula Vista Bayfront
- PD7: South Bay
- PD8: Imperial Beach Oceanfront
- PD9: Silver Strand
- PD10: Coronado Bayfront

1.2 Purpose of the California Environmental Quality Act and the Program Environmental Impact Report

This ~~Draft~~Final Program Environmental Impact Report (PEIR) evaluates the environmental effects of the proposed PMPU and has been prepared in compliance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and the procedures for implementing CEQA set forth in the State CEQA Guidelines (California Code of Regulations, Title 14, Section 15000 et seq.). This ~~Draft~~Final PEIR has also been prepared in compliance with the District's *Guidelines for Compliance with CEQA* (Resolution 97-191; Clerk Document No. 36294).

CEQA was enacted by the California legislature in 1970. As noted under State CEQA Guidelines Section 15002, CEQA has four basic purposes:

1. Inform governmental decision-makers and the public about the potential significant environmental effects of proposed activities.

2. Identify the ways in which environmental damage can be avoided or significantly reduced.
3. Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures, when the governmental agency finds the changes to be feasible.
4. Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

An environmental impact report is an informational document, the purpose of which is to inform members of the public and agency decision-makers of the significant environmental effects of a proposed project, identify feasible ways to reduce the significant effects of the proposed project through mitigation measures, and describe a reasonable range of feasible alternatives to the project that would reduce one or more significant effects and still meet the proposed project's basic objectives. In instances where significant impacts cannot be avoided or mitigated, a proposed project may nonetheless be carried out or approved, if the approving agency finds that economic, legal, social, technological, or other benefits outweigh the unavoidable significant environmental impacts.

The proposed PMPU is a comprehensive update to the existing PMP to establish water and land uses on District Tidelands and to guide future development and conservation over the approximately 30-year planning horizon. The PMPU identifies land use policies and delineates broad categories of uses on water and land use maps by planning district, which are further discussed in Chapter 3, *Project Description*, of this Final PEIR. Consistent with the requirements of the California Coastal Act (CCA) and where known, the PMPU includes a list of appealable projects for associated planning districts that could be considered for future project-specific development. Importantly, however, the District is not proposing to approve and/or implement any specific projects with the PMPU. Because sufficient details regarding the timing, design, development intensity, and location of future projects of the PMPU are not available to facilitate a project-level impact analysis and because no approvals would be provided for specific development projects at this time, this Final PEIR evaluates the potential physical changes to the environment associated with the PMPU at a programmatic level.

According to State CEQA Guidelines Section 15168, a program EIR is an PEIR that may be prepared on a series of actions that can be characterized as one large project and that are related either geographically or as individual activities carried out under the same authorizing statutory or regulatory authority, and that generally have similar environmental effects that can be mitigated in similar ways. One of the benefits of preparing a program PEIR is that it allows for a reduction in paperwork by streamlining the environmental review of future subsequent activities found to be within the scope of the program described in the ~~Draft Final~~ PEIR. A program EIR is distinct from a project EIR, which is prepared for a specific project and must examine site-specific considerations in detail.

A program EIR may be used in combination with "tiering" of environmental review under State CEQA Guidelines Section 15152. Tiering refers to using the analysis of general matters contained in a broader EIR, such as one prepared for a general plan or policy statement, with later EIRs and negative declarations on narrower projects. CEQA encourages agencies to tier the environmental analyses, which they prepare for separate but related projects, such as general plans and subsequent development projects. This allows the agency to focus on the actual issues ripe for decision at each level of environmental review.

Tiering is appropriate when the sequence of analysis is from an EIR prepared for a general plan, policy or program to an EIR or negative declaration for a site-specific project. Under CEQA's tiering principles, a lead agency may exercise its discretion to focus a first-tier program EIR on only a general plan or program, leaving project-level details of future development to subsequent EIR's or negative declarations when specific projects are proposed. This type of tiering permits a lead agency to use a first-tier EIR to adequately identify "significant effects of the planning approval at hand" while deferring the less feasible development of detailed, site-specific information to future environmental documents.

The District, as lead agency, has exercised its discretion to prepare a first tier Draft PEIR, which focuses on the PMPU and leaves the project-level analysis of future development to subsequent environmental documents when individual, site-specific projects are proposed. The environmental review of future development projects will be performed in accordance with State CEQA Guidelines Sections 15168, 15162, and 15152⁶³.

Pursuant to State CEQA Guidelines Section 15168(c), the District will use a written checklist or similar device to document its evaluation of the site and the activity of future development proposals to determine whether the environmental effects of the project are within the scope of the PEIR. If a future development project would have impacts that were not examined in this PEIR, an Initial Study would be prepared leading to preparation of either a project EIR or a negative declaration. That later analysis may tier from this PEIR as provided in State CEQA Guidelines Section 15152. If the environmental effects of a future development project were adequately addressed in the PEIR and the District finds that none of the circumstances requiring subsequent environmental review under State CEQA Guidelines Section 15162 have occurred, the District can approve the activity as being within the scope of the program covered by the Final PEIR, and no new environmental impact analysis pursuant to CEQA would be required;¹ if the District finds that: (1) no substantial changes to a project have occurred that would require major revisions of a previously certified PEIR due to the involvement of new significant environmental effects, or an increase in the severity of previously identified significant environmental effects; and (2) no substantial changes with respect to circumstances under which a project is undertaken have occurred that triggers major revisions to a previously certified PEIR due to the involvement of new significant environmental effects, or an increase in the severity of previously identified significant environmental effects; and (3) no new information of substantial importance exists, which was not known or could not have been known with the exercise of reasonable diligence at the time the previous PEIR was certified showing (a) new significant environmental effects from the project; or (b) significant effects will be substantially more severe than shown in the previous PEIR; (c)

¹Subsequent environmental review under State CEQA Guidelines Section 15162 is required only if the District finds that: (1) substantial changes to a project have occurred that would require major revisions of a previously certified PEIR due to the involvement of new significant environmental effects, or an increase in the severity of previously identified significant environmental effects; and (2) substantial changes with respect to circumstances under which a project is undertaken have occurred that triggers major revisions to a previously certified PEIR due to the involvement of new significant environmental effects, or an increase in the severity of previously identified significant environmental effects; and (3) new information of substantial importance exists, which was not known or could not have been known with the exercise of reasonable diligence at the time the previous PEIR was certified showing (a) new significant environmental effects from the project; or (b) significant effects will be substantially more severe than shown in the previous PEIR; (c) mitigation measures or alternatives previously found infeasible and rejected by a project proponent are now feasible and would reduce significant environmental effects; or (d) mitigation measures or alternatives which are considerably different from those previously analyzed and were rejected by a project proponent are identified and would reduce significant environmental effects.

mitigation measures or alternatives previously found infeasible and rejected by a project proponent are now feasible and would reduce significant environmental effects; or (d) mitigation measures or alternatives which are considerably different from those previously analyzed and were rejected by a project proponent are identified and would reduce significant environmental effects. However, if any of the foregoing findings cannot be made or if it is determined that additional environmental review is required for future subsequent actions, these future projects, in accordance with State CEQA Guidelines Sections 15168 and 15152, may tier from this PEIR when preparing site specific CEQA documents.

The proposed PMPU is a comprehensive update to the existing PMP to establish water and land uses on District Tidelands and guide future development and conservation over the approximately 30-year planning horizon. The PMPU identifies land use policies and delineates broad categories of uses on water and land use maps by planning district, which are further discussed in Chapter 3, *Project Description*, of this Draft PEIR. Consistent with the requirements of the California Coastal Act (CCA) and where known, the PMPU includes a list of appealable projects for associated planning districts that could be considered for future project specific development. Importantly, however, the District is not proposing to approve and/or implement any specific projects with the PMPU. Because sufficient details regarding future projects of the PMPU are not available to facilitate a project level impact analysis and because no approvals would be provided for specific development projects at this time, this Draft PEIR evaluates the potential physical changes to the environment associated with the PMPU at a programmatic level.

1.3 Background

The following sections describe the District, the San Diego Unified Port District Act (Port Act), the CCA, and the current PMP.

1.3.1 San Diego Unified Port District Act

The District was created with the Port Act,² adopted by the California State Legislature in 1962, as amended from time to time (see California Harbors and Navigation Code, Appendix 1). Consistent with the Public Trust Doctrine, the Port Act states that tidelands and submerged lands are to be used only for statewide public purposes and consistent with Section 87 of the Port Act. Section 87 enumerates the statewide purposes, including: for the use harbors, wharves, docks, piers, slips, quays and all other facilities used for the promotion of commerce and navigation; for all commercial and industrial uses and purposes; for the use of airport, heliport, and aviation facilities, and all other facilities for the promotion and accommodation of air commerce and air navigation; for the use of highways, streets, roadways, bridges, railroads, parking facilities, telephone and power lines, pipelines, and all other transportation and utility facilities for the promotion of any of the uses set forth in Section 87; for the construction and operation of public buildings, parks, meeting spaces, and other recreational spaces; and for the establishment of small harbors, marinas, and other recreational uses; and for the establishment and maintenance of those lands for open space,

² Made available by the California State Lands Commission, found here: https://www.slc.ca.gov/programs/Granted_Lands/G10_San_Diego/G10-08_San_Diego_Unified_Port_District/S1962_Ch67.pdf. State of California. 1962. Statutes of California. Chapter 67. Approved May 8, 1962. The Port Act is hereafter incorporated in this Draft PEIR by reference.

ecological preservation, and habitat restoration. Additionally, Section 19 of the Port Act requires the District Board of Port Commissioners (Board) to adopt a PMP for the use of tidelands and submerged areas conveyed to the District.

The mission of the District is to protect the resources in its jurisdiction, by providing economic vitality and community benefit through a balanced approach to maritime industry, tourism, water and land recreation, environmental stewardship, and public safety. To this end, the District is charged with management of the tidelands and diverse waterfront uses along San Diego Bay that promote commerce, navigation, fisheries, recreation, and ecological preservation on the Tidelands granted to the District by the Port Act. Section 19 of the Port Act requires the District to adopt a PMP for harbor and port improvement and for the use of all District Tidelands.

The area of San Diego Bay encompassed by the historic mean high tide line amounts to approximately 14,951 acres of filled and submerged lands and an existing length of shoreline that measures approximately 54 miles (District 2020). These historic tideland areas are owned or controlled by the federal government, the State of California, local governments, and the District. The District is one of several governmental agencies with jurisdiction over the water and land areas of San Diego Bay. Specifically, prior to 2020, the District has been granted approximately 5,483 acres, or about 37 percent, of the tidelands on San Diego Bay. This total includes the land covered by the San Diego International Airport (SDIA)) that the District leases to the San Diego County Regional Airport Authority (approximately 675 acres). The District's land use jurisdiction does not include the SDIA, and therefore, approximately 5,129 total acres are within the District's water and land use jurisdiction. The shoreline frontage granted to the District amounts to approximately 33 miles, which is equivalent to 61.3 percent of the total San Diego Bay shoreline. In 2020, the District was granted an additional approximately 8,300 acres of tidelands and submerged lands pursuant to Senate Bill 507, however these are not a part of the PMPU effort.

1.3.2 California Coastal Act

The CCA went into effect on January 1, 1977, and granted the California Coastal Commission (CCC) authority to review and approve land use plans and development located within the California coastal zone. The California coastal zone is defined in Section 30103(a) of the CCA as the water and land area of the State of California from the Oregon border to the border of the Republic of Mexico, depicted on maps identified and set forth in Section 17 of that chapter of the Statutes of the 1975-76 Regular Session enacting Public Resources Code Division 20 (i.e., the Coastal Act of 1976), extending seaward to the State's outer limit of jurisdiction, including all offshore islands, and extending inland generally 1,000 yards from the mean high tide line of the sea. In significant coastal estuarine, habitat, and recreational areas it extends inland to the first major ridgeline paralleling the sea or 5 miles from the mean high tide line of the sea, whichever is less, and in developed urban areas the zone generally extends inland less than 1,000 yards.

Chapter 8 of the CCA (Sections 30700 to 30721) requires that certain port governing bodies, including the District, prepare and adopt a PMP. The draft PMP is then submitted to the CCC for certification, to show compliance with the CCA. Once the PMP is certified, a port district is then authorized to issue Coastal Development Permits (CDPs) or Coastal Act exclusions, as prescribed by the adopted PMP for coastal zone development within its permitting jurisdiction. Chapter 8, Section 30702 of the CCA stipulates that port-related developments in port areas are not appealable to the CCC after certification of a PMP, except as otherwise provided in Chapter 8, Section 30715, which identifies the development categories that are appealable to the CCC, as follows:

1. Developments for the storage, transmission, and processing of liquefied natural gas.
2. Wastewater treatment facilities.
3. Roads or highways not for internal circulation within the port boundaries.
4. Office and residential buildings not for administrative activities of the port; hotels, motels, and shopping facilities not devoted to water-oriented commercial goods; commercial fishing facilities; and recreational small craft marina related facilities.
5. Oil refineries.
6. Petrochemical production plants.

Section 30714 states the CCC shall certify a PMP or portion of a PMP if it finds that the PMP or portion of a PMP: (1) conforms with and carries out the CCA policies of Chapter 8; and (2) where a PMP or portion thereof provides for any of the development categories listed above, that the development or developments in the categories conform to all the Chapter 3 policies of the CCA. Chapter 3 (Sections 30200 to 30265) outlines the coastal resource management policies, including those policies that apply to public access, recreation, the marine environment, land resources, and development.

1.3.3 Current Port Master Plan

Consistent with Section 19 of the Port Act, the Board adopted the first PMP in 1964. In 1972, an extensive master plan revision was completed with the adoption of a PMP amendment. Subsequent updates to the PMP occurred in 1975 and 1976. The latter amendment was adopted in response to the State Legislature's enactment of the CCA of 1976. The amended PMP conformed to the applicable provisions of that CCA.

The District's current PMP was certified by the CCC on January 21, 1981. It includes numerous subsequent PMP amendments that were approved by the District Board and certified by the CCC. The current PMP provides the official planning policies for the development of District Tidelands and is also the primary document that governs water and land and ~~water~~ uses within the District's jurisdiction. The current PMP is organized into four sections: (I) Introduction, (II) Planning Goals, (III) Master Plan Interpretation, and (IV) Precise Plans. Section II establishes planning goals and related policies that pertain to development and operation of water and land within the District's jurisdiction. Section III provides additional water and land use objectives and the criteria that apply to specific water and land use types, including commercial, industrial, recreation, conservation, military, and public facility uses. Section IV identifies 10 planning districts, each of which is guided by a Precise Plan that plans for future development. Section IV of the PMP also includes a list of appealable projects in each planning district.

1.4 District CEQA Documents Incorporated by Reference

According to Section 15150 of the State CEQA Guidelines, an EIR may incorporate by reference all or portions of another document, which is a matter of public record or is generally available to the public. Where all or part of another document is incorporated by reference, the incorporated language is considered to be set forth in full as part of the text of the EIR. Additionally, where an EIR

uses incorporation by reference, the incorporated part of the referenced document can be briefly summarized where possible or briefly described if the data or information cannot be summarized.

The following District documents have been incorporated by reference into this ~~Draft~~Final PEIR. Copies of these documents are available for inspection in the Office of the District Clerk, at the San Diego Unified Port District Administration Building, located at 3165 Pacific Highway, San Diego, CA 92101. Readers are also referred to the individual resource analyses in Chapter 4, *Environmental Analysis*, and to the references in Chapter 7, *References*, which provide additional documents incorporated by reference.

1.4.1 Tenth Avenue Marine Terminal Redevelopment Plan, Final Environmental Impact Report, and Addenda to the Final Environmental Impact Report

The Tenth Avenue Marine Terminal (TAMT) Redevelopment Plan (Redevelopment Plan) includes a variety of infrastructure investments that may be undertaken over the long term to accommodate an increase of the project site's capabilities and capacity. These include: (1) up to five gantry cranes; (2) additional and consolidated dry bulk storage capacity, which may include a new 100,000-square-foot dry bulk structure or an equivalent vertical storage facility; (3) enhancements to the existing conveyor system; (4) demolition of the molasses tanks and Warehouse C; (5) additional open storage space; (6) establishment of an on-dock rail facility; (7) a centralized gate facility; and (8) the demolition and Initial Rail Component, which includes a project-level analysis of the demolition of two underutilized transit sheds and on-terminal rail upgrades. The Demolition and Initial Rail Component was the necessary first step in modernizing the TAMT and would enable the subsequent implementation of the various development scenarios contemplated in the Redevelopment Plan.

The District prepared an EIR for the project analyzing the potential environmental impacts of the various improvements specified in the Redevelopment Plan. ~~The Draft EIR was~~ and circulated it for a 45-day public review period on June 30, 2016. Based on comments received during the public review period for the Draft EIR related to the air quality and greenhouse gas impacts of the project, District staff recommended approval of an alternative to the maximum practical capacity (MPC) throughput scenario analyzed within the June 2016 Draft EIR. This alternative throughput scenario is referred to as the Sustainable Terminal Capacity (STC) Alternative. The STC Alternative represents what the TAMT could handle on a regular basis without having to maximize all facilities concurrently as described in the MPC scenario. On December 13, 2016, the Board certified the Final EIR and adopted the STC Alternative and the Redevelopment Plan. As part of that certification, the Board approved the Mitigation, Monitoring, Reporting Program and the Statement of Overriding Considerations (Resolution 2016-200; UPD# EIR-2015-39; SCH# 2015031046; Clerk Document No. 66093).

Following certification of the Final EIR, modifications were made to the Demolition and Initial Rail Component during final design, including a larger on-terminal office facility and minor changes to other site-specific improvements. Because of these changes, the District prepared an Addendum to the Final EIR to analyze the potential environmental impacts of those modifications. The Addendum to the Final EIR determined that the proposed changes would not result in any new or more severe significant environmental effects. The Board adopted the Addendum to the Final EIR on July 11, 2017 (Resolution 2017-100; SCH# 2015-031046, Clerk Document Nos. 1136341, 113644, 113645,

113647). A Second Addendum to the Final PEIR was approved in April 2018 to implement and install a renewable microgrid to satisfy a portion of the mitigation requirements for the project's greenhouse gas impacts (Resolution No. 2018-061, SCH # 2015031046; Clerk Document No. 68288).

1.4.2 North Embarcadero Port Master Plan Amendment Project Final Environmental Impact Report

The District prepared a North Embarcadero Port Master Plan Amendment, which proposed an amendment to the PMP, to create a clear, simple, and consistent Port Master Plan for the North Embarcadero portions of the Embarcadero PD3 (North Embarcadero Subdistrict), through modifications to the text, tables, and graphics. This plan is known as the North Embarcadero Alliance Visionary Plan or NEVP-Phase 1 (Clerk Document No. 57882) that included infrastructure improvements in the Phase I component, as well as the Coastal Access Features Project. Further improvements in the NEVP-Phase 1 Amendment generally included the addition of 1.5 acres of public waterfront park, a waterfront shuttle (the Circulator Shuttle), and the construction of a public plaza and/or park within a 150-foot-wide setback from Harbor Drive on Lane Field. The North Embarcadero portion of PD3 encompasses the District's waterfront from the Laurel Street/North Harbor Drive intersection in the northwest to the (and including) the G Street Mole Park in the southeast. The Lane Field (1220 Pacific Highway) project was also approved by the Board as part of the NEVP-Phase 1 project. This project included a mixed use of hotel, retail, recreation, and office square footage.

On April 25, 2001, the District certified the Final Master EIR for the original NEVP (Resolution No. 2000-82; SCH#1999031037; Clerk Document No. 40610). That Draft EIR was originally circulated for a 45-day public review period between December 13, 1999, and January 26, 2000.

Subsequently, on July 7, 2009, the District adopted an Addendum to the 2000 Final Master EIR and the NEVP-Phase 1 Addendum (Resolution No. 2009-130; UPD#83356EIR; SCH# 9931037 [1999031037]; Clerk Document No. 55323) for the project analyzing the potential environmental impacts of the PMP Amendment. Although not required by CEQA, the Addendum was circulated for a 45-day public review period between February 6, 2009 and March 23, 2009.

On October 1, 2010, the District approved a Memorandum of Understanding among the District, the Lane Field San Diego Developers, LL1037C, and the San Diego Navy Broadway Complex Coalition. The District adopted a second Addendum and issued a CDP for the NEVP Phase I on January 11, 2011. This Addendum included a Mitigation and Monitoring Report (Resolution 2011-09; UPD# 83356EIR -351; SCH# 99031037 [1999031037]; Clerk Document No. 57060).

1.5 Scope and Content of the ~~Draft-Final~~ Program Environmental Impact Report

As the CEQA lead agency, the District is responsible for determining the scope and content of this ~~Draft-Final~~ PEIR, a process referred to as *scoping*. As part of the scoping process, the District considered the environmental resources present within its jurisdiction and the surrounding area and identified the potential environmental effects of the proposed project. On March 30, 2017, the District filed a Notice of Preparation (NOP) (Clerk Document No. 66681) with the County Clerk in accordance with Section 15082 of the State CEQA Guidelines. The NOP was mailed to public

agencies, organizations, and other interested individuals to solicit their comments on the scope and content of the environmental analysis. The District also held a public scoping meeting on April 12, 2017, at the District's Administration Building at 3165 Pacific Highway, San Diego, CA, 92101.

Comments received in response to the NOP and during the public scoping meeting were used to inform the scope of this ~~Draft~~ Final PEIR. The comments are summarized in Table 1-1. Based on the District's preliminary evaluation of the potential effects of the proposed project and a thorough review of the comments on the NOP, the ~~Draft~~ Final PEIR analyzes effects associated with the following resources:

- Aesthetics and Visual Resources
- Air Quality and Health Risk
- Biological Resources
- Cultural Resources
- Geologic Hazards and Soils
- Greenhouse Gas Emissions and Energy
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise and Vibration
- Population and Housing
- Public Services and Recreation
- Sea Level Rise
- Transportation, Circulation, and Mobility
- Utilities and Service Systems

There are no agricultural, forestry, or mineral resources identified within the PMPU area; therefore, the proposed PMPU would not have an adverse effect on any of these resources. In addition, there are no wildfire hazard designated areas within or adjacent to the PMPU area; therefore, the proposed PMPU would not result in impacts related to wildfire. Chapter 5, *Additional Consequences of PMPU Implementation*, includes a brief analysis as to why impacts on agricultural, forestry, and mineral resources, as well as impacts related to wildfire, would not be significant.

1.5.1 Comments Received in Response to the Notice of Preparation and Areas of Controversy

A number of specific environmental issues were raised in the comments on the NOP. A brief summary of comments that pertain to the environmental scope of this ~~Draft~~ Final PEIR is provided in Table 1-1. Copies of the NOP and all NOP comment letters are provided as appendices to this ~~Draft~~ Final PEIR (Appendices A and B, respectively). These comments were considered by the District in the preparation of this ~~Draft~~ Final PEIR.

Table 1-1. Summary of NOP Comments Received

Commenter	Environmental Issue(s) Raised
Federal	
Federal Emergency Management Agency, Region 9, Gregor Blackburn, April 3, 2017	Review the current effective countywide Flood Insurance Rate Maps for the County of San Diego (Community Number 060284) and City of San Diego (Community Number 06029), May 16, 2012.
	The minimum, basic National Flood Insurance Program floodplain management building requirements are described in 44 Code of Federal Regulations 59 through 65.
	Summary of National Flood Insurance Program floodplain management building requirements.
	Contact the local community's floodplain manager for more information on local floodplain management building requirements.
National Oceanic and Atmospheric Administration National Marine Fisheries Service, Eric Chavez, May 1, 2017	The Draft PEIR should consider the marine resources under National Marine Fisheries Service jurisdiction known to be present within the project area (e.g., green sea turtles, essential fish habitat, and habitat areas of particular concern).
State	
State of California, Governor's Office of Planning and Research, State Clearinghouse and Planning Unit (SCH), March 30, 2017	Provides SCH# 2017031070 and notes which state agencies received a copy of the NOP.
Native American Heritage Commission (NAHC), Gayle Totton, April 5, 2017	Notes that CEQA was amended in 2014 to create a separate category for tribal cultural resources in CEQA Appendix G: Environmental Checklist Form.
	Notes the requirement to analyze impacts on tribal cultural resources as required under Assembly Bill (AB) 52 and indicates the tribal consultation requirements pursuant to Senate Bill (SB) 18 and AB 52.
	Recommends that lead agencies consult with all California Native American Tribes traditionally and culturally affiliated with the geographic area of the proposed PMPU.
	Summarizes the additional CEQA requirements added by AB 52 as well as other requirements.
	Summarizes the applicability and requirements of SB 18, and identifies the specific provisions included under SB 18.
	Provides NAHC recommendations for cultural resources assessments to avoid, preserve, and/or mitigate impacts on tribal cultural resources.
San Diego Regional Water Quality Control Board, Jeremy Haas, April 28, 2017	Recommends evaluation of alternatives that would measurably increase ecosystem integrity.
	Asks that the PEIR identify and characterize the current and anticipated habitats in tidal and subtidal areas within each planning district.
	The evaluation of potential impacts should rely on the most recent scientific estimates of sea level rise from the Ocean Protection Council.

Commenter	Environmental Issue(s) Raised
California Department of Transportation, Kimberly Dodson, May 1, 2017	Alternatives that provide for migration of intertidal habitats may be the only way to preserve their existence under projected climate change scenarios.
	The Traffic Impact Study (TIS) should include all regionally significant arterial system segments and intersections, including State highway facilities where the proposed PMPU will add over 100 peak hour trips.
	State highway facilities experiencing noticeable delays should be analyzed in the TIS for projects that add 50 to 100 peak hour trips.
	The analysis should include the proposed Intermodal Transit Center and Interstate (I-) 5 direct connector ramps.
	Focused analyses may be required for project trips assigned to State highway facilities experiencing significant delay and if there is an increased risk of potential traffic accidents.
	The TIS could consider implementing vehicle miles traveled (VMT) analysis into the modeling projections.
	Recommends coordinating early with relevant agencies including the San Diego Association of Governments (SANDAG), Metropolitan Transportation System (MTS), the cities of Chula Vista, National City, San Diego, and the CCC to determine modeling assumptions for the TIS.
	The TIS should address any increase in goods movement operations, and its impacts on State highway facilities.
	The data in the TIS should not be more than 2 years old.
	Encourages the District to include Transportation Demand Strategies into the PMPU.
California Department of Fish and Wildlife, Craig Shuman, May 4, 2017	Identify in the PEIR where existing freight cargo facilities are located.
	If freight operations will change at the Working Waterfront, then identify where these operations will move or address how the change will be mitigated.
	Any direct and cumulative impacts on the State highway system should be eliminated or reduced below a level of significance pursuant to CEQA and National Environmental Policy Act (NEPA) standards.
	Biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for a California Endangered Species Act (CESA) Incidental Take Permit.
	The Draft PEIR should include a full impact analysis of CESA-listed species and their habitats that may be in the project area.
	The Draft PEIR should include a full impact analysis of California Fully Protected Species that may be in the PMPU area.
	If a species can be shown to meet the criteria for Endangered, Rare, or Threatened as specified in the State CEQA Guidelines, it should be considered in the analysis for the PMPU.
	The analysis should include species of special concern that are known to the PMPU area or found in the California Native Diversity Database (CNDDDB) or the RareFind database, such as Western snowy plover. Impacts on this species and its habitat must be identified and avoided, and unavoidable impacts mitigated to a less-than-significant level.
	The Draft PEIR should include a discussion of the potential impacts on species of special concern that may occur within the various PMPU sites and alternative sites.

Commenter	Environmental Issue(s) Raised
	The Draft PEIR should include a comprehensive discussion of the potential impacts on marine protected areas that may result from the PMPU.
	The Draft PEIR should provide a complete survey assessment of the flora and fauna within and adjacent to the PMPU area, with particular emphasis on rare, endangered, threatened, sensitive, and locally unique species and sensitive habitats.
	The Draft PEIR should identify habitats for endangered, threatened, and sensitive marine species, including those that are part of Federal and State fishery management plans.
	Focused species-specific surveys are required, and a focused inventory of the rare, endangered, threatened, and sensitive species found within the areas of potential effects should be prepared.
	Specific impact analysis of marine habitats should be conducted for intertidal sand and mud flats, sand beaches, eelgrass beds, Olympia oyster beds, and saltmarsh, ponds, shallow intertidal, and subtidal habitats.
	The Draft PEIR should contain a complete discussion of the PMPU description, purpose, and need and the alternatives for buildings, dredging and dredge fill areas, shipping routes, anchorage areas, docks, and wharf improvements.
	The Draft PEIR should include alternatives that could be developed to avoid adverse impacts and losses of eelgrass, mud flats, sandy flats, salt flats, and shallow water habitats, and to fully avoid or minimize temporary impacts on marine species and birds.
	The Draft PEIR should identify potential construction and operational impacts on marine species, local resident and migratory species, and habitats.
	A discussion of potential adverse impacts from dredging, contaminants, filling, water turbidity, lighting, noise, human activity, spread or introduction of invasive species, and drainage should be included.
	An analysis of indirect PMPU impacts on biological resources of nearby open Bay waters, adjacent eelgrass and subtidal habitats, sandy beach, and intertidal ecosystems should be conducted.
	Impacts on wildlife corridor/ movement areas, including access to undisturbed habitats in adjacent waters, intertidal flats, and upland areas should be evaluated.
	The Draft PEIR should include a comprehensive discussion identifying potential mitigation areas and measures to fully mitigate any unavoidable significant impacts on habitat and species.
	For proposed preservation and/or restoration, the Draft PEIR should include measures to perpetually protect the targeted habitat values from direct and indirect negative impacts. Issues that should be addressed include access restrictions, proposed shallow water and intertidal habitat dedications, monitoring and management programs, control of illegal dumping, water pollution, and increased human intrusion.
	The PEIR should include a discussion of possible conflicts associated with zoning of areas for development projects or other uses that are nearby or adjacent to natural areas that may contribute to wildlife-human interactions and introduction of nonnative species.

Commenter	Environmental Issue(s) Raised
	<p>General and specific plans, as well as past, present, and anticipated future projects should be analyzed relative to their cumulative impacts on fish and wildlife habitats.</p> <p>The Draft PEIR should include a discussion of sound impacts associated with underwater construction activities, as well as a discussion of sound pressure level monitoring for in-water work if applicable.</p> <p>The Draft PEIR should include a discussion of measures to avoid impacts on nesting birds.</p>
Regional	
San Diego Gas & Electric (SDG&E), Hilary Haskell, April 28, 2017	Any relocations or alterations to SDG&E facilities that may be required must be addressed in the Draft PEIR.
San Diego Association of Governments, Katie Hentrich, Seth Litchney, May 1, 2017	<p>Include a discussion of impacts and mitigation measures associated with traffic congestion on nearby and surrounding streets, including but not limited to the I-5 connections and improvements, Pacific Highway, Hawthorne Street, Grape Street, Harbor Drive, Silver Strand Boulevard, and other arterials and streets.</p> <p>Consider potential impacts on goods movement on I-5, Harbor Drive, and Bay Marina Drive in relation to the Working Waterfront and National City Bayfront districts, and all multimodal facilities and local communities within the planning districts.</p> <p>Consider the integration of Transportation Demand Modeling (TDM) strategies to help reduce greenhouse gas (GHG) emissions associated with single-occupancy vehicle trips.</p>
Local	
City of San Diego (City) Planning Department, Kurtis Steiner, May 1, 2017	<p>The Draft PEIR should address how the proposed Mixed-Use Overlay for the Convention Center site would impact the Phase II expansion of the Convention Center and the existing Convention Center, such as coastal access, truck loading, and resulting traffic, noise, air quality, GHG emissions, and public views.</p> <p>A separate land use under the Commercial land use category titled “Convention Center” provides a clearer understanding of the intended use and allows for a more defensible environmental analysis within the Draft PEIR.</p> <p>Include a discussion of the Convention Center expansion should it occur outside of the District Tidelands in the cumulative condition.</p> <p>A TIS, or mobility and circulation analysis, should compare the impacts of the PMPU against existing conditions and future 2035 and 2050 traffic demand.</p> <p>Include analysis of vehicular circulation from District lands to I-5 and State Route (SR-) 15 within the City of San Diego.</p> <p>Address the traffic impacts of the proposed PMPU, including a plan-to-ground comparison, comparing existing conditions to projected traffic in years 2035 and 2050 with the PMPU.</p> <p>Address how vehicle traffic (cars and freight trucks) associated with the PMPU would affect at-grade rail crossings and operations in the rail corridor for existing, 2035, and 2050 vehicle and rail traffic conditions, including any additional future rail operations from the proposed project.</p>

Commenter	Environmental Issue(s) Raised
	Identify City street and roadway improvement measures to mitigate the PMPU's traffic impacts based on future 2035 and 2050 traffic demand.
	Address freeway and ramp improvement measures to mitigate PMPU traffic impacts based on future 2035 and 2050 traffic demand, including direct truck access roads from Harbor Drive to I-5 and/or SR-15.
	Address transit priority strategies to mitigate potential impacts on transit services in 2035 and 2050.
	Address transit improvements to and from the Cruise Ship Terminal to increase transit ridership and reduce 2035 and 2050 traffic impacts along Harbor Drive.
	Address how the proposed PMPU would impact existing and planned bicycle and pedestrian facilities within City rights-of-way.
	Address if any mitigation measures would require the City to amend the Circulation Element of an affected community plan, public facilities financing plan, or impact fee study.
	Address TDM strategies to mitigate future 2035 and 2050 traffic impacts.
	Address intelligent transportation system strategies to mitigate future 2035 and 2050 traffic impacts.
	Provide a Transportation Improvements Phasing Plan for the required transportation mitigation measures based on the traffic need and existing right-of-way constraints.
	Consider the methods and strategies proposed in the City's Climate Action Plan (CAP) for reducing GHG emissions and, where feasible, incorporate design and operational mitigation measures for future projects.
	Address both roadway and rail noise associated with port traffic and operational noise that could affect sensitive noise receptors for existing, 2035, and 2050 conditions.
	Determine if the proposed PMPU would expose sensitive receptors to substantial pollutant concentrations within the PMPU area and surrounding community plan areas.
	Address how any future structures that could result from the PMPU would impact view corridors within the PMPU area and surrounding community plan areas.
	Address how the proposed PMPU would affect existing and future visual character or quality of the PMPU area and surrounding community plan areas.
	Address how the proposed PMPU would affect existing and future land uses within surrounding community plan areas.
	Address how the proposed PMPU would affect existing and future public facilities within surrounding community plan areas.
	Address how the proposed PMPU would affect existing and future population-based parks within surrounding community plan areas.
	Include an analysis of how the proposed PMPU would affect coastal access plans adopted by the City for surrounding communities.
	Coordinate with City Storm Water Division to assure potential impacts on City stormwater infrastructure are addressed.

Commenter	Environmental Issue(s) Raised
	<p>Establish a framework assuring that environmental reviews for subsequent projects potentially affecting City drainage systems fully address drainage facility capacity, operation, and maintenance.</p> <p>Address potential effects of air emissions on water quality. Through aerial deposition, certain pollutants may have the potential to be transported by stormwater runoff.</p> <p>Include potential stormwater impacts when considering infrastructure improvements such as roadway modifications.</p> <p>Note that new stormwater drainage facilities or the expansion or modification of existing drainage facilities may be tidally influenced.</p>
Organizations	
San Diego County Archaeological Society, Inc., James W. Royle, Jr., April 8, 2017	Pleased that cultural resources are to be evaluated in Draft PEIR and looking forward to reviewing during public comment period. Request to be included on Draft PEIR distribution list and to be provided with a copy of any cultural resources technical reports.
Southwest Wetlands Interpretative Association, Mike McCoy, Bill Tippetts, April 28, 2017 <u>with Introductory Email by Bill Tippetts, May 1, 2017</u>	<p>The Draft PEIR must analyze potentially significant impacts associated with placing projects in hazardous locations, including locations potentially affected by climate change.</p> <p>Essential that the PMPU describes a reasonable range of alternatives, which should include alternatives to the goals and land use maps.</p> <p>The Draft PEIR must clearly identify and provide as much information as possible about future appealable and non-appealable projects so the public can understand the scope of potential impacts and determine sufficient mitigation.</p> <p>The District's various adopted natural resource plans/documents that address environmental resources and Federal and State regulations should be used to establish significance thresholds and be addressed in the PEIR.</p> <p>The PEIR must fully analyze the potential direct and indirect environmental impacts on the five adjacent cities from future District projects.</p> <p>How the PMPU lays out principles and guidelines for maintaining the Bay's aesthetics will greatly affect whether a proposed project can avoid or mitigate project impacts.</p> <p>The PMPU should provide guidance for conserving and restoring sensitive Bay habitats and minimizing further impacts.</p> <p>New information regarding the linkage between the Rose Canyon Fault and the Newport-Inglewood Fault must be included in the Draft PEIR's evaluation of impacts, as it could dictate the types and locations of future projects.</p> <p>Concerned about how the PMPU will address GHG emissions from its facilities and tenants. The PMPU should review and have similar goals as the San Diego Regional Airport Authority to reduce overall energy by 30% and transition supply to 100% green energy.</p> <p>The effects of sea level rise on flood hazards, tsunami threats, water circulation, and water quality in conjunction with foreseeable projects under the PMPU must be fully analyzed.</p> <p>Concerned that the PMPU could allow developments that conflict with or constrain related developments and infrastructure in adjacent member cities.</p>

Commenter	Environmental Issue(s) Raised
Environmental Health Coalition, Joy Williams, May 1, 2017	Adopted resource plans of local, state, and federal jurisdictions must be addressed in relation to future projects that could be implemented under the PMPU.
	Effects of excessive noise on sensitive and threatened bird species and wildlife should be analyzed in the Biological Resources section.
	The PMPU must provide sufficient specificity regarding the anticipated future projects to allow the Draft PEIR to serve as a tiering EIR for processing those projects.
	Recommends that environmental justice and greenhouse gas emission policies be included in all planning elements.
	If no project list is included in the PEIR, plausible worst-case scenarios for all land and water uses must be developed that can be used for the analysis.
	The PMPU description should include all known and foreseeable appealable and non-appealable projects.
	The air quality study should be based on a plausible worst-case scenario for land and water development and include identification of hot spot impacts and regional impacts.
	Recommends that the threshold for particulate matter, ozone, and toxic air contaminant emissions should be set at no net increase.
	Provides recommended mitigation measures for air quality impacts.
	GHG analysis should be based on worst-case analysis of potential emissions.
	Thresholds of significance for GHGs should be based on the State's GHG emissions reduction targets set by SB 32, and emissions above these targets should be considered significant.
	Provides recommended mitigation measures for GHG impacts.
	Analyze sea level rise impacts that could result in hazardous materials entering San Diego Bay or neighboring communities from the industrial waterfront.
	Recommends recommitment to adhering with District Policy 725, the Transition Zone Policy, as a mitigation measure that reduces potential land use plan conflicts.
	Recommends that the Draft PEIR analyze nighttime and daytime noise and impacts on workers on Tidelands.
	The District should adopt the City's noise standard for noise at homes and schools without averaging noise standards for two adjoining zoning types. The District should also adopt the City's noise standard of 40 to 50 decibels (dB) for residences.
	Suggest that one mitigation measure for population and housing impacts is to maximize local hire of workers who are already in the area.
	States that recreation facilities must be low cost and accessible to all, including transit-dependent people, to address environmental justice impacts.
	Transportation impact analysis should include estimates of VMT and not just congestion/level of service (LOS) impacts, as well as parking impacts on adjacent communities.
	Include mitigation for biking and walking hazards, such as Class I bike routes and walking routes separated from traffic.

Commenter	Environmental Issue(s) Raised
Citizens Coordinate for Century 3, Roger Lewis, May 1, 2017	Recommends a Harbor Drive haul road to separate truck traffic on Harbor Drive from other traffic as mitigation for this impact.
	Utilities analysis must include worst-case analysis, including high water use projects and continuing drought.
	Anticipated impacts of climate change such as increased heat and drought should be factored into the utilities analysis.
	Recommends mitigation that requires energy generation and/or storage for new projects that will increase energy use.
	There are possible and/or pending projects that could significantly affect the environmental impacts of development within the District's planning districts. These could result in significant environmental impacts that would not be analyzed in this PEIR.
	The PMPU description of the PEIR should make it clear that the PEIR is focusing on the overall program objectives and that individual projects such as the Seaport Village Development would require their own EIR.
	There are land use decisions that could impact the environment that are not part of the EIR process, such as the long-term plans for the location of parking on the waterfront.
Climate Action Campaign, Sophie Wolfram, May 1, 2017	Potential "other agency projects" should be integrated into the PEIR analyses. To the extent there are specifics identified by project applicants they should be incorporated into the environmental review.
	The PEIR should consider a broad range of alternatives for development of key District properties including the B Street Pier.
	The PEIR should analyze impacts at a programmatic level but must identify projects in sufficient detail to allow for future streamlining of projects.
	The baseline for GHG emissions should reflect the best available data on existing conditions; business as usual projections should not be used as a baseline.
	The thresholds of significance for GHGs should be any level of emissions that will cause a violation of the State's GHG emissions reductions targets of 40% below 1990 levels by 2030. Emissions above targets should be considered significant.
	Recommends that the District utilize a CAP as mitigation for GHG impacts, which would require the District to update the document to be legally binding with enforceable measures leading to reductions in line with State goals.
	The District's current targets of 10% emissions reductions below 2006 levels by 2020 and 25% by 2035 set forth in the CAP do not track the State's reduction targets. The CAP should be updated with new targets in line with State goals.
	If the CAP is mitigation it must mitigate emissions through the planning horizon of the PMPU.
	Recommends that mitigation measures planned as strategies in the CAP include electrification of cargo-handling and other equipment, hybrid or other clean technologies for equipment, and on- and offsite clean energy.
	Suggests that the air quality analysis be based on a plausible worst-case scenario for land and water development.
The Draft PEIR must address sea level rise through the life of the plan.	

Commenter	Environmental Issue(s) Raised
Cleveland National Forest Foundation and Save Our Forest and Ranchlands, Duncan McFetridge, May 1, 2017	<p>The impact analysis requires recognition of the current state of transit and rail freight in the downtown area in which the port infrastructure is situated.</p> <p>Recommends five studies that should be reviewed and considered to implement a functional transit system: The Independent Transit Planning Review, Urban Area Transit Strategy, Destination Lindbergh, LOSSAN Draft EIR, and the Complete Mobility Plan.</p> <p>The LOSSAN Corridor Draft EIR is especially pertinent to the PMPU PEIR in relation to Port movement of goods and cargo.</p>
San Diego Convention Center Corporation, Clifford Rippetoe, May 1, 2017	<p>Concurs with and shares the concerns identified by the various departments in the City of San Diego's letter dated May 1, 2017.</p>
San Diego County Regional Airport Authority, Ted Anasis, AICP, May 1, 2017	<p>Any land uses changes/ intensifications proposed within the Airport Influence Area should take into account the proximity of the airport and consider consistency with the allowed uses delineated in the Airport Land Use Compatibility Plan (ALUCP).</p> <p>The Draft PEIR should include analyses of the circulation and traffic impacts, including cumulative impacts on the streets that serve PD2 and PD3, as they also serve the airport.</p> <p>Any potential uses that increase the demand for vehicle use and parking at and surrounding the airport should be identified and describe how the demand for parking will be served.</p> <p>The PEIR should consider the cumulative impacts of the proposed next phase of the Airport Development Plan.</p> <p>Coordinate with the San Diego County Regional Airport Authority to ensure that the data and analyses in the PEIR is accurate and that no conflict between the Airport Development Plan and PMPU would occur.</p>
Save Everyone's Access, Scott Andrews, May 8, 2017	<p>The Draft PEIR should quantify the acreage of all major parks, public piers, fishing, small craft, waterside access, public parking, and Bay viewshed impacts.</p> <p>Mitigation for loss of park space should occur on an acre for acre basis. Any park mitigation acreage should avoid the health impacts of air and noise pollution near Lindbergh Field and idling traffic at the North Harbor Drive/Grape Street intersection.</p> <p>The Draft PEIR should quantify and mitigate significant tideland loss to privatization.</p>
Citizens Coordinate for Century 3, John Lomac, February 1, 2012	<p>No environmental issues raised.</p>
Individuals	
Interested Party, Donald Wood, April 12, 2017	<p>Distinguish between <i>program</i> and <i>project</i> in the PEIR as it relates to the PMPU and future development projects.</p> <p>Treat the PMPU process as a program and plan on developing future project EIRs for individual Bayfront projects. Indicate in the Draft PEIR which proposed future activities and development will get project EIRs for each district.</p>

Commenter	Environmental Issue(s) Raised
	<p>Detail how the District plans to coordinate planned actions in compliance with its adopted CAP.</p> <p>Detail projected reductions in VMT and reductions in GHG emissions as the PMPU is implemented.</p> <p>Suggests refining vision, developing concrete long-term goals, and indicating where future projects will be located in the PMPU.</p> <p>Requests making preservation and enhancement of public access to the Bayfront and shorelines a priority.</p> <p>Recommends assuming that all future proposed projects will be appealable to the CCC.</p> <p>Suggests that the Draft PEIR detail how the District anticipates working with the U.S. Navy, CCC, California State Lands Commission, the airport, and each of the neighboring cities.</p>
Interested Party, Donald Wood, April 30, 2017	<p>Clarify how staff is using <i>program</i> and <i>project</i> within the context of its planning efforts, enabling legislation, and complying with CEQA and the Coastal Act. Explain how the program and individual project planning and zoning help to achieve the Board's long-term vision.</p> <p>The Draft PEIR should indicate which proposed future redevelopment projects will get individual project EIRs in each district.</p> <p>The Draft PEIR should detail how the District proposes to coordinate its planning actions in a manner that fully complies with state law and its updated CAP.</p> <p>The Draft PEIR should detail projected reductions in VMT and projected reductions in GHG emissions the District plans to achieve for each planning district and proposed future project.</p> <p>The Draft PEIR should detail how the District plans to work with the Navy, CCC, California State Lands Commission, airport, and each of its surrounding member cities.</p> <p>The Draft PEIR should examine the impacts on public access and viewsheds of the harbor from potential future hotel projects.</p> <p>The Draft PEIR should examine the benefits and liabilities of expanding the San Diego Maritime Museum's use of the Embarcadero.</p> <p>As part of the Draft PEIR process, the District should analyze where cruise ships should be berthed around the Bay in the future. The analysis should include the following alternatives: status quo, Convention Center lagoon pier expansion, and moving the cruise ship terminal to Harbor Island.</p> <p>The Draft PEIR should evaluate the positive economic and environmental effects that could be achieved by expanding the current ferry system to provide regular commuter trips to and from downtown.</p> <p>The Draft PEIR should examine potential GHG and VMT reductions from creating new ferry landings at Harbor Island, the Naval Training Center, and Seaport Village.</p> <p>The Draft PEIR should analyze the environmental effects undergrounding all future tidelands parking would have on increasing developable properties, public access, and the environment.</p> <p>The Draft PEIR should limit proposed mitigation measures to public tidelands under jurisdiction of the District and within the same planning district where impacts would occur, where possible.</p>

Commenter	Environmental Issue(s) Raised
	The Draft PEIR should analyze potential impacts on harbor ships and boat traffic when considering any new piers or docking facilities.
	The Draft PEIR should analyze the environmental impacts of expanding parking on Navy Pier and continuing to use it for museum visitor parking rather than obtaining upland parking. The analysis should identify impacts on air quality and traffic around the Embarcadero.
	The Draft PEIR should look at the potential benefits and environmental impacts of zoning the west end of Shelter Island for park land versus construction of a small hotel.
	The Draft PEIR should analyze the environmental and other effects and benefits of creating linear parking along the east side of Harbor Drive from Broadway to Hawthorne Street versus leaving a gap on the western end of the Wyndham Hotel.
	The Draft PEIR should identify and examine the negative impacts on Barrio Logan from truck traffic associated with the Tenth Avenue Marine Terminal and examine alternative transportation mechanisms to reduce the negative impacts on the neighborhood.
Interested Party, Bill Tippetts, May 1, 2017	No environmental issues raised.

1.6 Organization of the ~~Draft~~ Final Program Environmental Report

The content and format of this ~~Draft~~ Final PEIR are designed to meet the requirements of CEQA and the State CEQA Guidelines. Table 1-2 summarizes the organization and content of the ~~Draft~~ Final PEIR.

Table 1-2. Document Organization and CEQA Requirements

Draft <u>Final</u> PEIR Chapter	Contents
<i>Executive Summary</i>	Includes a brief summary of the proposed PMPU; identifies each significant effect, including proposed mitigation measures and alternatives to reduce or avoid the effect; identifies the areas of controversy known to the lead agency, including issues raised by agencies and the public; and summarizes the issues to be resolved, including the choice among alternatives and whether or how to mitigate the significant effects (State CEQA Guidelines Section 15123).
Chapter 1 <i>Introduction</i>	Discusses the purpose of CEQA and this Draft <u>Final</u> PEIR, the scope and content of this Draft <u>Final</u> PEIR, the documents incorporated by reference into this Draft <u>Final</u> EIR, the organization of this Draft <u>Final</u> PEIR, and comments received on the Notice of Preparation of this Draft PEIR (State CEQA Guidelines Section 15124(d)).

DraftFinal PEIR Chapter	Contents
Chapter 2 <i>Environmental Setting</i>	Describes the overall existing physical conditions in the vicinity of the proposed PMPU when the analysis was initiated. In addition, the specific existing setting/conditions for each resource area are described in the applicable resource section in Chapter 4, <i>Environmental Analysis</i> (State CEQA Guidelines Section 15125).
Chapter 3 <i>Project Description</i>	Contains both a map of the precise location and boundaries of the proposed PMPU and its location relative to the region; lists the proposed PMPU's central objectives, underlying purpose, as well as PMPU benefits; provides a detailed description of the proposed PMPU's characteristics, and the intended uses for this Draft Final PEIR, including a list of the agencies that expect to use this Draft Final EIR and a list of permits and other approvals required to implement the proposed PMPU (State CEQA Guidelines Section 15124(a), (b), and (c)).
Chapter 4 <i>Environmental Analysis</i>	Describes the existing physical conditions for each resource area; lists the laws and regulations germane to the specific resource; describes the impact assessment methodology; lists the criteria for determining whether an impact is significant; identifies the direct, indirect, and cumulative significant impacts on the environment that would result from implementation of the proposed PMPU and PMPU options; and lists proposed mitigation measures that would avoid or reduce the identified significant impacts (State CEQA Guidelines Sections 15125–15126.4).
Chapter 5 <i>Additional Consequences of PMPU Implementation</i>	Discusses the way the proposed PMPU could foster economic or population growth, either directly or indirectly, in the surrounding environment; describes the significant irreversible changes associated with the proposed PMPU's implementation; and provides a brief discussion of the environmental resource impacts that were found to be not significant during preparation of this Draft Final PEIR (State CEQA Guidelines Sections 15126.2(c) and (d), 15127, and 15128).
Chapter 6 <i>Alternatives to the Proposed PMPU</i>	Describes a reasonable range of alternatives to the proposed PMPU, including the No-Project Alternative; compares and contrasts the significant environmental impacts of alternatives to the proposed PMPU; and identifies the environmentally superior alternative (State CEQA Guidelines Section 15126.6).
Chapter 7 <i>List of Preparers and Agencies Consulted</i>	Lists the individuals and agencies involved in preparing this Draft Final PEIR (State CEQA Guidelines Section 15129).
Chapter 8 <i>References</i>	Provides a comprehensive listing by chapter of all references cited in this Draft Final PEIR, including documents incorporated by reference (State CEQA Guidelines Sections 15148 and 15150).
Acronyms and Abbreviations	A list of acronyms and abbreviations is provided for the reader's reference immediately following the list of tables and figures in the Table of Contents.
Appendices	Presents additional background information and technical detail for several of the resource areas (State CEQA Guidelines Section 15147).

2.1 Introduction

This chapter describes the physical environment in the proposed Port Master Plan Update (PMPU) vicinity, from both a local and regional perspective, as it existed at the time the Notice of Preparation (NOP) was published on March 30, 2017 (Clerk Document No. 66681). Resource-specific conditions are ~~addressed~~ ~~provided~~ within each resource section of Chapter 4, *Environmental Analysis*, which also describes any inconsistencies with applicable plans.

2.2 Existing Setting

This section provides a general overview of the existing environmental setting (or “baseline”) for the proposed PMPU. For an EIR, the “Environmental Setting” is controlled by State CEQA Guidelines Section 15125, which states in part:

An EIR must include a description of the physical environmental conditions in the vicinity of the project. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to provide an understanding of the significant effects of the proposed project and its alternatives. The purpose of this requirement is to give the public and decision makers the most accurate and understandable picture practically possible of the project’s likely near-term and long-term impacts. (1) Generally, the lead agency should describe physical environmental conditions as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. Where existing conditions change or fluctuate over time, and where necessary to provide the most accurate picture practically possible of the project’s impacts, a lead agency may define existing conditions by referencing historic conditions, or conditions expected when the project becomes operational, or both, that are supported with substantial evidence. In addition, a lead agency may also use baselines consisting of both existing conditions and projected future conditions that are supported by reliable projections based on substantial evidence in the record.

The State CEQA Guidelines and case law recognize that the date for establishing an environmental baseline cannot be rigid (see State CEQA Guidelines Sections ~~15125~~~~15146~~, ~~15151~~, and ~~15204~~). As noted above, the NOP was published in March 2017. In some instances, information is presented in the environmental setting that differs from the precise time of the NOP. Environmental conditions may vary from year to year, and in some cases, it is necessary to consider conditions over a range of periods. Furthermore, environmental conditions for 2020 and 2021 were generally affected by the COVID-19 pandemic, which caused a lull in activity. The baseline conditions relevant to the resource areas being analyzed are described within each specific resource area in Chapter 4.

2.2.1 Location

As shown on Figure 2-1, the proposed PMPU encompasses the lands, tidelands, and submerged lands under the San Diego Unified Port District's (District's) jurisdiction adjacent to the cities of Coronado, Imperial Beach, and San Diego.

2.2.2 Surrounding Conditions

The District's jurisdiction is surrounded by several other municipalities and public agencies, which are further described in this section. The City of Chula Vista is the second-largest city in San Diego County and contains an area of approximately 52 square miles and a population of approximately 274,000 residents (U.S. Census 2019a). Chula Vista is 7.5 miles from downtown San Diego and 7.5 miles from the U.S.-Mexico border. Chula Vista is bordered by the following: (1) on the north by the City of National City and the unincorporated community of Bonita; (2) also on the north and east by the unincorporated areas of San Diego County; (3) on the south by the City of San Diego; and (4) on the west by San Diego Bay.

Across San Diego Bay from downtown San Diego, the City of Coronado encompasses nearly 14 square miles with approximately 24,000 residents (U.S. Census 2019b). Coronado is bordered on the north and east by San Diego Bay (and the City of San Diego beyond that), and on the south by the City of Imperial Beach, which connects to Coronado via the narrow strip of land known as the Silver Strand, which is within the incorporated area of Coronado. Coronado is also connected to the City of San Diego via the Coronado Bridge (part of State Route 75), which connects downtown San Diego to the east side of Coronado. The Pacific Ocean borders Coronado to the west.

The City of Imperial Beach is a beach community in the southwestern-most corner of the continental United States and San Diego County. It is bordered on the north by the City of Coronado and San Diego Bay, on the east by the City of San Diego, on the west by the Pacific Ocean, and on the south by the U.S.-Mexico border. It encompasses approximately 4.5 square miles with a population of approximately 27,000 residents (U.S. Census 2019c).

The City of National City is 5 miles south of downtown San Diego, along San Diego Bay, and 10 miles north of the U.S.-Mexico border. National City is bordered by the City of San Diego to the north and east, the City of Chula Vista to the south, the unincorporated areas of Lincoln Acres and Bonita to the south and southeast, and San Diego Bay to the west. National City comprises approximately 9.2 square miles and has an estimated population of approximately 61,000 residents (U.S. Census 2019d).

The City of San Diego, which is the largest city in the region, covers approximately 323 total square miles and is home to an estimated population of approximately 1.42 million residents (U.S. Census 2019e). Downtown San Diego is approximately 13 miles north of the U.S.-Mexico border, and the northern portion of the city is bordered on the north by the cities of Del Mar and Poway and unincorporated San Diego County land; on the east by the cities of Santee, El Cajon, La Mesa, and Lemon Grove, and unincorporated County of San Diego land; on the south by the City of National City; and on the west by the Pacific Ocean. Additionally, the City of San Diego's jurisdiction includes an approximately 34-square-mile area in south San Diego County, which is bordered on the north by the City of Chula Vista, on the east by unincorporated San Diego County, on the south by the U.S./Mexico border, and on the west by the City of Imperial Beach. The neighborhoods of the City of San Diego that are in the vicinity of the planning area include Point Loma to the north (adjacent to Shelter Island); downtown San Diego, which includes Little Italy (adjacent to Harbor Island and

North Embarcadero); Barrio Logan, which is south and east of the South Embarcadero; and a portion of Otay Mesa-Nestor located in South Bay.

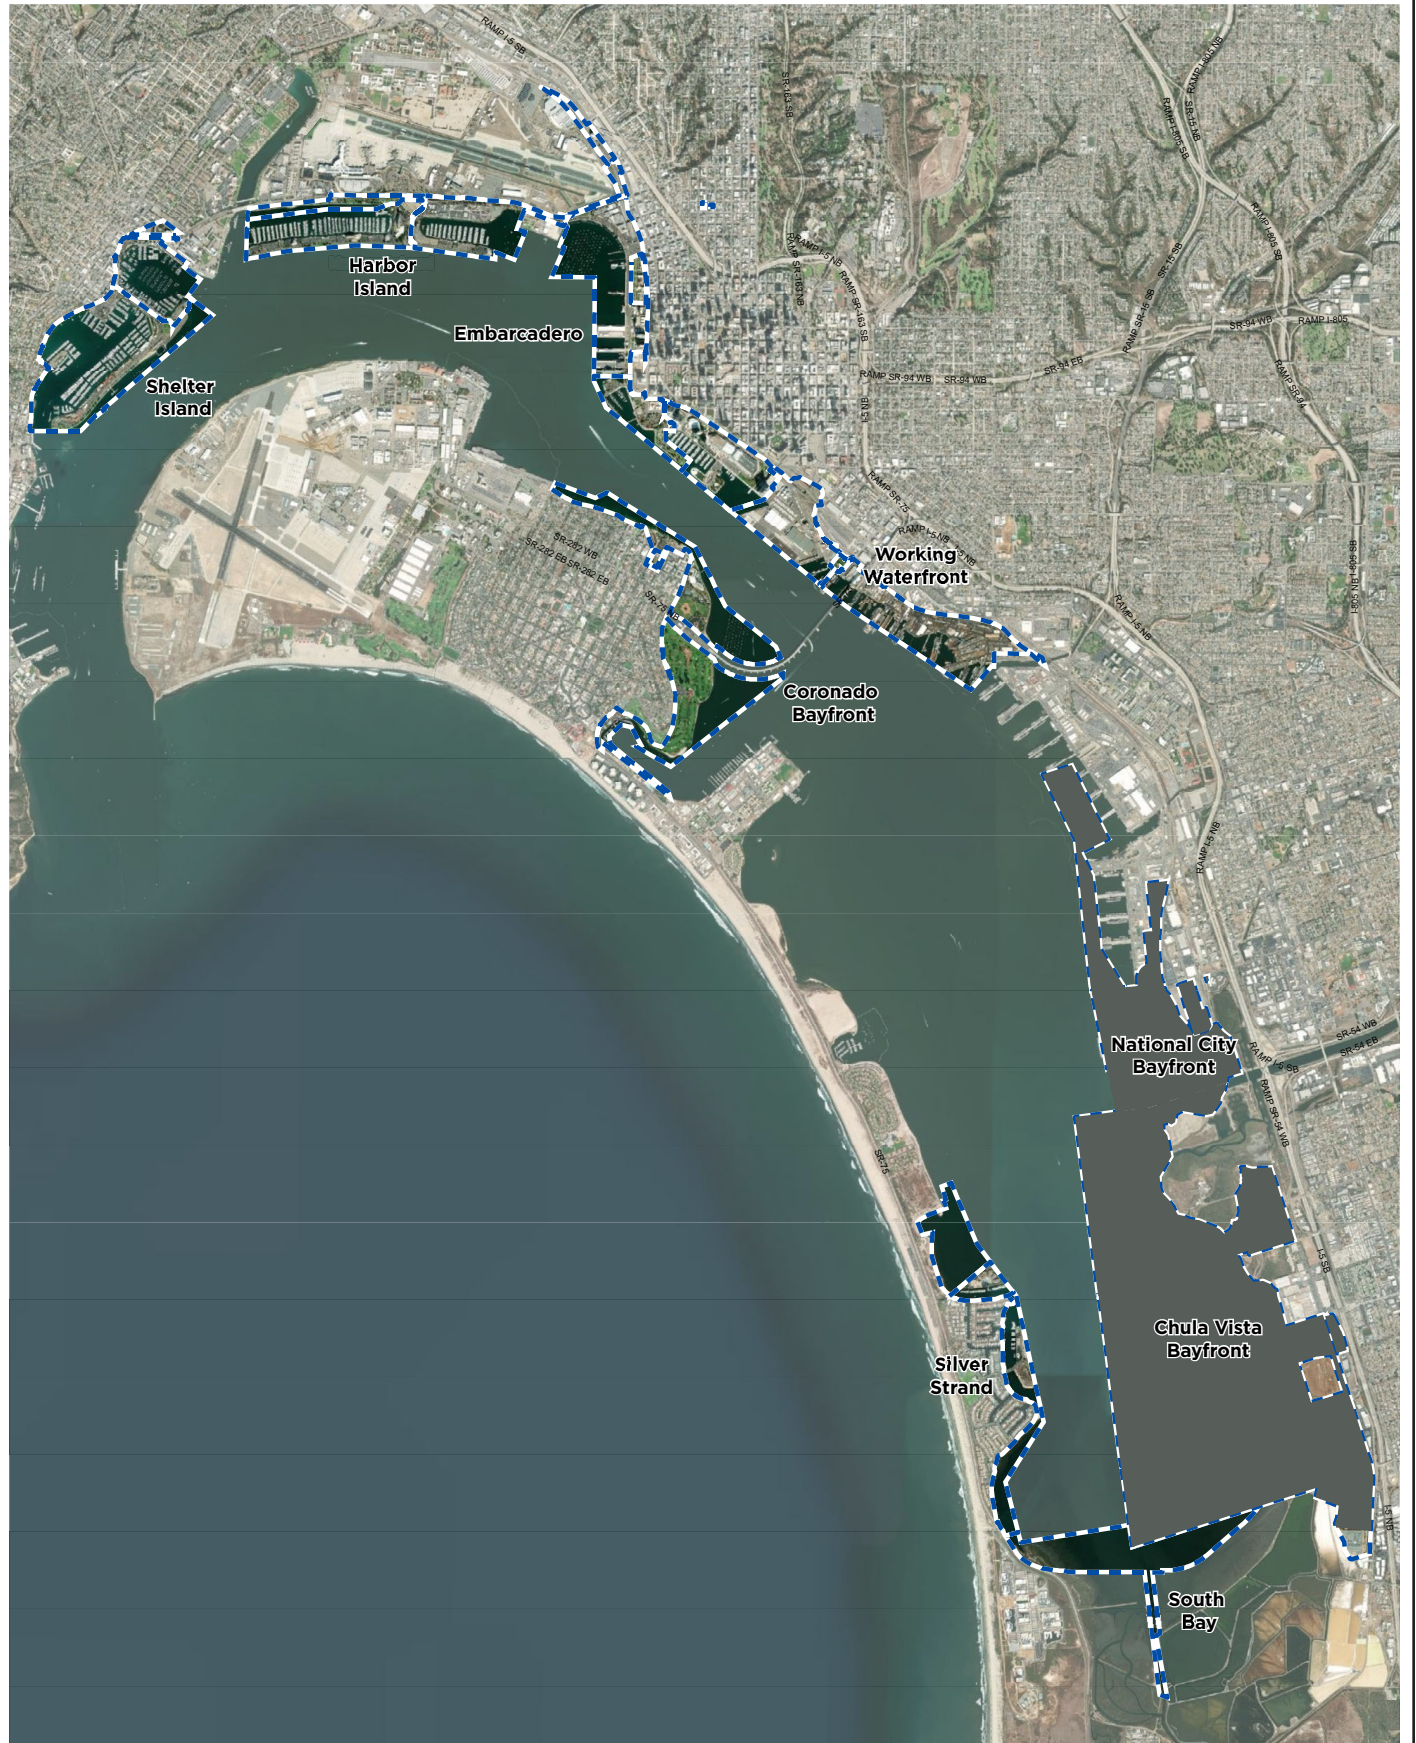

In addition to these municipalities, the U.S. Navy and Coast Guard own large areas of land and water within and adjacent to the PMPU area. Naval Base San Diego, located south of downtown San Diego and west of National City, is the principal homeport of the Pacific Fleet. Naval Base San Diego comprises over 1,600 acres of land and 326 acres of water and is also responsible for the Commander, Navy Region Southwest, and Naval Facilities Engineering Command Southwest headquarters in downtown San Diego. Other Navy facilities in the surrounding area include the U.S. Naval Training Center San Diego, U.S. Naval Radio Station Imperial Beach, U.S. Naval Amphibious Base Coronado, and the U.S. Naval Air Station North Island. U.S. Coast Guard Sector San Diego is located in downtown San Diego along the San Diego Bay, south of San Diego International Airport, and encompasses approximately 18 acres.

2.2.3 Existing Conditions

The District's jurisdiction covers 10 planning districts (individually, PD, and collectively, PDs) each with a distinctive character. The following discussion briefly describes the existing physical conditions present within each PD, as well as in the vicinity of each. As detailed below, the PMPU area is within a highly urbanized area and contains an intense development pattern with a variety of uses. As discussed further in Chapter ~~3, *Project Description*~~~~1, *Introduction*~~, PD5, National City Bayfront, and PD6, Chula Vista Bayfront, and the Pond 20 portion of PD7, South Bay, are not part of the proposed PMPU, as no changes to those planning districts are proposed by the PMPU. Therefore, PD5, PD6, and the Pond 20 portion of PD7 are not analyzed in this Program Environmental Impact Report (PEIR). Specific details related to the existing conditions or baseline setting, for each resource area, are provided within the *Environmental Setting* of each section of Chapter 4.

The District's current Port Master Plan (PMP) was certified by the California Coastal Commission (CCC) on January 21, 1981, and includes numerous subsequent amendments that were approved by the District and certified by the CCC. The PMP provides the official planning policies for the development of District Tidelands and is also the primary document that governs land and water uses within the District's jurisdiction.

To improve the accuracy and precision of jurisdictional data in this PEIR, such as the acreages of the water and land use designations and the 10 planning districts, the certified PMP designations were converted from the hand-prepared paper maps included in the certified PMP, to digitized geographic information system (GIS) data, which allowed for more refined and accurate acreage measurements. The District used this data to modernize its geospatial maps and data. This GIS conversion led to refinements in the number of acres, within the water and land use designations and the 10 planning districts. Table 2-1 demonstrates the acreage per designation identified within the certified PMP and the GIS conversion. While the certified PMP includes designations of certain water areas (primarily assigned Navigation Corridor or Anchorage designations) that are managed by the California State Lands Commission, the acreage for those designations is not included in the total acreage tables in the certified PMP or in Table 2-1.

Project Location
Port Master Plan Update

Table 2-1. Certified Port Master Plan Water and Land Use Designations

Designations	Existing Acres included in Certified Port Master Plan	Existing Acres from GIS Conversion of Designations
Water Use		
Commercial Fishing Berthing	18.8	25.38
Marine Services Berthing	17.7	16.69
Sportfishing Berthing	11.1	10.67
Recreational Berthing	287.0	282.18
Specialized Berthing	153.1	153.52
Terminal Berthing	33.5	28.85
Open Bay/Water	677.7	665.39
Estuary	117.4	116.41
Harbor Services	10.5	10.20
Boat Navigation Corridor	110.8	105.63
Ship Navigation Corridor	15.1	13.38
Boat Anchorage	25.0	30.87
Ship Anchorage	24.2	27.62
Navy Ship Berthing	2.7	2.4
Navy Small Craft Berthing	6.2	7.16
Total	1,510.80	1,496.35
Land Use		
Commercial Fishing	8.3	6.46
Marine Sales and Services	9.1	10.45
Sportfishing	4.3	4.11
Commercial Recreation	260.1	283.61
Airport Related Commercial	38	5.37 ¹
Aviation Related Industrial	152.9	11.47 ¹
Industrial Business Park	33.1	32.34
Marine Related Industrial	170	172.88
Marine Terminal	65.6	64.35
Open Space	19.2	30.64
Park/Plaza	118.9	128.09
Golf Course	97.8	100.14
Wetlands	192	101.33
Harbor Services Land	2.6	4.85
Streets	172.5	144.07 ¹
City Pump Station	0.4	0.75
Navy Fleet School	25.9	27.28
Total	1,370.70	1,128.19
Total Water and Land Use		
	2,881.50	2,624.54²

¹ Some areas included in the Certified PMP (e.g., the San Diego International Airport) and the corresponding designations were removed from the District's permitting jurisdiction and land use authority and are not proposed within the proposed PMPU area. Through the exercise of converting the Certified PMP to GIS, these removed areas were not included in the GIS conversion. Thus, certain land use designations may show a large decrease in acreage between the Certified PMP and the GIS Conversion (e.g., Airport Related Commercial, Aviation Related Industrial, Streets), and were not included at all in the GIS Conversion (e.g., International Airport).

² The change in total acreage between the Certified PMP and the GIS Conversion of the Certified PMP is due to mapping corrections, as well as the removal of certain areas (e.g., San Diego International Airport) from the District's permitting jurisdiction and land use authority. These removed areas were not included in the exercise of converting the Certified PMP to GIS, thus the total acres show an overall decrease.

2.2.3.1 Planning District 1: Shelter Island

The Shelter Island Planning District (PD1) is located on the southeastern side of the Point Loma Peninsula, at the entrance to the Bay, near upland communities, military installations, and the Cabrillo National Monument. The island segment of Shelter Island is a narrow strip of land, approximately 1 mile in length and less than 0.1 mile in width, that extends off the Point Loma peninsula via Shelter Island Drive. West Shelter Island wraps around the Shelter Island Yacht Basin and includes a diverse mix of water-oriented development and activities, including marinas, yacht clubs, transient docking, resort hotels, restaurants, and boatyards. Recreational areas include Shelter Island Shoreline Park, the Yokohama Friendship Bell, Shelter Island Pier, Shelter Island Boat Launch, La Playa Trail, La Playa Piers, and Kellogg Beach. East Shelter Island wraps around America's Cup Harbor and includes coastal-dependent marine services and fishing industries that provide for long-term economic viability and growth in the region. The predominant uses in this area consist of commercial recreation, marine sales and services, commercial fishing, and sportfishing. Figure 2-2 depicts the existing conditions in PD1.

Figure 2-2
PD1 – Shelter Island Existing Conditions
Port Master Plan Update

2.2.3.2 Planning District 2: Harbor Island

The Harbor Island Planning District (PD2) is located east of the Point Loma Peninsula and PD1, north of the Coronado military installations, west of the Embarcadero, and directly south of the San Diego International Airport. With nearly 5 miles of waterfront, the Harbor Island Planning District offers views of the Bay from the shoreline parks, shoreline path and play areas, and restaurants located on the water's edge of the western and eastern tips of the island. The island segment of Harbor Island primarily includes hotels, restaurants, and marinas that are located on the basin side of Harbor Island. Additionally, a portion of east Harbor Island includes surface parking lots, former off-airport rental car facilities, and the San Diego Harbor Police facility. The U.S. Coast Guard Station San Diego is to the east of Harbor Island, and San Diego International Airport is to the north. West of Harbor Island lies the U.S. Naval Training Center, and the residential neighborhood of Point Loma.

Spanish Landing Park is a linear park located along the western basin of Harbor Island that lies adjacent to Harbor Drive. Existing amenities at Spanish Landing Park include pedestrian and bicycle paths, public art, a play structure, and a beach area. Additionally, PD2 includes the District Administration Building, former rental car services and off-airport parking, and surface parking lots associated with industrial maritime businesses along Pacific Highway. Figure 2-3 depicts the existing conditions in PD2.

2.2.3.3 Planning District 3: Embarcadero

The Embarcadero spans the length of the Bayfront within the downtown San Diego area, beginning at Laurel Street to the north (just south of San Diego International Airport) and ending roughly at Park Boulevard, which is south of the Convention Center and north of Tenth Avenue Marine Terminal (TAMT). Harbor Drive, which runs the length of PD3, provides vehicular access and on-street parking to development along the Embarcadero. The Embarcadero consists of three sub-districts in the existing PMP: North Embarcadero, Central Embarcadero, and South Embarcadero. The physical conditions within each of these sub-districts are described below. Figure 2-4 depicts the existing conditions in PD3.

North Embarcadero

The North Embarcadero runs north to south and spans the downtown Bayfront from Laurel Street to the north to just before North Harbor Drive to the south (where it turns east, just north of Ruocco Park and Seaport Village). North Embarcadero provides a diverse waterside experience including water-based transit vessel berthing and commercial fishing activities at the Grape Street Piers, recreational vessel berthing and anchorage locations, and cultural facilities in the form of the Maritime Museum and USS Midway Museum. Cruise ship operations are located within North Embarcadero with facilities on B Street Pier and Broadway Pier connecting visitors to Tidelands and downtown San Diego. A waterside promenade providing continuous waterside access extends the entire North Embarcadero with public art features and plaza areas for visitors. A mix of visitor-serving commercial and recreational activities including hotels and restaurants are also located within the North Embarcadero. The U.S. Navy's Commander, Naval Base San Diego, and Naval Supply Center also occupy large areas on the eastern side of North Harbor Drive, adjacent to the North Embarcadero. The San Diego County Administration Building, Little Italy, and the central business district of downtown San Diego are east of the North Embarcadero. Development adjacent to the planning district is typical of a downtown and includes a mix of high-density residential dwellings, high- and medium-rise office buildings, restaurants, and retail establishments.

Figure 2-4
PD3 – Embarcadero Existing Conditions
Port Master Plan Update

Central Embarcadero

The Central Embarcadero is located south of the Maritime Museum and USS Midway Museum (within the Northern Embarcadero) and northwest of the San Diego Convention Center. The Central Embarcadero provides a mix of recreational, visitor-serving commercial, and commercial fishing uses. Waterfront open spaces, such as Tuna Harbor Park, Ruocco Park, and Embarcadero Marina Park North, provide recreational opportunities and views of the water. Tuna Harbor Basin, home to San Diego's well-established historic commercial fishing industry, allows visitors to see activities such as net mending and fish offloading firsthand, as well as visit the commercial fishermen's Dockside Market. This is also the location of the American Tunaboat Association. Old Police Headquarters, together with Seaport Village's small-scale commercial development located along the waterfront, provides visitors with a mix of restaurants and specialty retail. East of the Central Embarcadero, Downtown San Diego and the Gaslamp Quarter ~~are east of the Central Embarcadero,~~ which are dominated by dense urban development of mainly high- and medium-rise hotel, residential, and office buildings, along with restaurant and retail buildings.

South Embarcadero

The South Embarcadero is bounded to the north by Seaport Village and to the south by the TAMT. Development within the South Embarcadero area includes hotels, restaurants, the San Diego Convention Center, and public parks, including Embarcadero Marina Park South where a permanent performance venue is located. Marinas occupy the inlet created by the two L-shaped segments that form Embarcadero Marina Parks North and South. The South Embarcadero is adjacent to the Gaslamp Quarter of the City of San Diego, which includes high- and medium-rise residential buildings, medium-rise office buildings, Petco Park stadium, and numerous tourist-oriented facilities, such as hostels and hotels, restaurants, and boutique retail shops.

2.2.3.4 Planning District 4: Working Waterfront

The Working Waterfront Planning District (PD4) is located southeast of the San Diego Convention Center and is composed predominantly of marine-related industrial facilities, including a strategic regional, State, and Federal port located on the TAMT, ship building facilities, and ship repair yards, as well as a waterfront park. Planning District 4 contains a highly productive consolidation of marine terminal and maritime services and industrial land uses, facilitating maritime trade and providing large-scale coastal-dependent industrial activities with direct access to heavy rail service and deep-water berthing. The TAMT is located on a 96-acre parcel, which was formerly a landfill, and includes eight deep-water berths capable of accommodating four large ocean-going vessels. The TAMT is connected to the regional rail and roadway network, which provides critical connections and allows the transportation of cargo. Historically, the terminal has focused on the following cargo types: dry bulk, liquid bulk, refrigerated and nonrefrigerated containers, and multipurpose/break bulk. The area south of TAMT contains the BAE Systems San Diego Ship Repair Yard, the General Dynamics NAASCO shipbuilding and repair facility, a Chevron terminal, and other ship building facilities and ship repair yards, including marine-related engineering businesses. Nestled between the TAMT and the shipbuilding and ship repair facilities to the south, Cesar Chavez Park and the adjacent Cesar Chavez Pedestrian Pier provide valuable public access to the Bay and visitor-serving amenities. The community of Barrio Logan is located east/northeast of the Working Waterfront. Barrio Logan includes single- and multi-family residential dwellings, as well as commercial and industrial development. Figure 2-5 depicts the existing conditions in PD4.

Figure 2-5
PD4 – Working Waterfront Existing Conditions
Port Master Plan Update

2.2.3.5 Planning District 7: South Bay

The South Bay Planning District (PD7) encompasses the water and land area at the southern end of the San Diego Bay. The area surrounding this planning district is composed of the Chula Vista Wildlife Reserve to the north, the San Diego Bay National Wildlife Refuge South San Diego Bay Unit managed by the United States Fish and Wildlife Service to the south, and State Highway 75 to the west. In addition, PD7 includes a marshy habitat conservation area and a narrow inlet that extends between the salt evaporation ponds. Figure 2-6 depicts the existing conditions in PD7.

2.2.3.6 Planning District 8: Imperial Beach Oceanfront

The Imperial Beach Oceanfront Planning District (PD8) is not located along the San Diego Bay; rather it lies on the Pacific Ocean side, west of the City of Imperial Beach. The planning district consists of a long, uninterrupted beach and the Imperial Beach Pier, an approximately 1,300-foot-long publicly accessible pier that includes a promenade and restaurant and provides public fishing opportunities. Adjacent to the beach is predominantly residential development, including single-family homes, condominium complexes, and multi-family apartment complexes that is within the jurisdiction of the City of Imperial Beach. Figure 2-7 depicts the existing conditions in PD8.

2.2.3.7 Planning District 9: Silver Strand

The Silver Strand Planning District (PD9) is located on the western side of San Diego Bay between the Bay and the Pacific Ocean, with Coronado located to the north and Imperial Beach to the south. Crown Cove is located in the northern portion of PD9, which is adjacent to the Crown Cove Aquatic Center, which offers recreational activities, such as paddling, sailing, kayaking, surfing, and safe boating education. The Crown Cove Anchorage (A7) also provides transient docking and mooring for boaters. Continuing south onto Coronado Bay Road, Crown Isle offers visitor-serving commercial amenities, including a hotel and restaurants, as well as a recreational boat berthing marina. Piers and docks extend into Crown Isle from private residences located off Tidelands, connecting directly to the residences with no ability to provide public access due to physical constraints. Further, Grand Caribe Isle and South Cays include the small land mass east of the Coronado Cays that is connected to the Silver Strand by Grande Caribe Causeway. Additional piers and docks with no associated public access extend into the planning district from off Tidelands private residences. The northern portion of Grand Caribe Isle includes commercial recreation, marinas, and boat storage. The southern portion includes Grand Caribe Shoreline Park, which was created as a native plant garden and natural habitat restoration area. Figure 2-8 depicts the existing conditions in PD9.

Port Master Plan Update

2.2.3.8 Planning District 10: Coronado Bayfront

The Coronado Bayfront Planning District (PD10) is located along the San Diego Bay on the southeastern side of the City of Coronado. Commercial development is concentrated toward the northern portion of PD10, including the Ferry Landing Marketplace, which offers a number of restaurants and small boutique or visitor-serving retail. Additionally, the Coronado Ferry Landing offers public water-based transit to and from downtown San Diego. Tidelands Park provides a variety of land-based recreational opportunities, including play fields, a public beach, and a skate park. Additionally, development along the southern portion of PD10 includes a marina, boat rental facilities, yacht clubs, hotels, and the Coronado Municipal Golf Course. North and west of the Coronado Bayfront, development includes the Naval Air Station North Island, single- and multi-family residences, and commercial centers. South of the Coronado Bayfront includes high-rise condominiums, a community center and public parks, and the U.S. Naval Amphibious Base. Figure 2-9 depicts the existing conditions in PD10.

2.3 Cumulative Setting

2.3.1 Cumulative Methodology

According to Section 15130(b) of the State CEQA Guidelines, a cumulative impact analysis may be conducted using one of two methods: the List Method, which includes “a list of past, present, and probable future projects producing related or cumulative impacts,” or the Plan Method, which uses “a summary of projections contained in an adopted local, regional, or statewide plan or related planning document,” or in a prior environmental document for such a plan which has been adopted or certified, that described or evaluated regional or area wide conditions contributing to the cumulative impact. Because the proposed project involves a comprehensive update to the current PMP and would guide growth within the District to the 2050 planning horizon, the cumulative analysis for most issue areas addressed in the PEIR utilizes the Plan Method (unless otherwise specified), supplemented by plans or programs recently adopted or currently in the planning phase. Due to the regional draw of uses along the Bay, which typically attracts local and visiting regional populations, utilization of the Plan Method is appropriate, as the regional growth projections can be correlated to a potential increase in future visitors to the Port upon buildout of the PMPU.

Source: Port of San Diego, 2020.

2.3.2 Application of the Plan Method

In the San Diego region, the San Diego Association of Governments (SANDAG) serves as the regional planning agency responsible for forecasting the region's population growth. These growth projections serve as the foundation for regional planning documents, such as water supply management plans and general plans, and provide the basis for determining housing, infrastructure, and transportation needs across the San Diego region. On October 25, 2019, the Series 14: 2050 Regional Growth Forecast was accepted by the SANDAG Board of Directors for planning purposes (SANDAG 2019). The Series 14 Regional Growth Forecast represents a combination of economic and demographic projections, the land use plans and policies that existed when it was developed, as well as any anticipated land use plan changes that could occur in the region through the year 2050. (Note that at the time of this analysis, SANDAG still recommends use of the Series 13 for transportation modeling, including assessing regional vehicle miles traveled [VMT].)

According to the Series 14 forecast, SANDAG projects that, between 2016 and 2050, the region's population will grow by approximately 700,000 people (SANDAG 2019). The growth in population will drive job growth and housing demand within the region, adding nearly 408,000 jobs and more than 420,000 housing units by 2050. Over half of the growth in new housing is anticipated to occur in the City of San Diego (SANDAG 2019). However, some resource chapters may rely upon resource-specific projections, such as those contained in Urban Water Management Plans. Resource-specific information from other cumulative documents is provided in the individual resource chapters, and weblinks to these documents are provided in Chapter 8, *References*.

Since the Series 14 Regional Growth Forecast was adopted in 2019, additional regionally significant plans and programs have been adopted or are currently in the planning phase and, therefore, were not explicitly included in the data used to prepare the Series 14 growth forecast. Table 2-2 lists these additional plans and programs. Approval of the PMPU does not constitute approval of any of the projects in Table 2-2, which have been, or will be, subject to their own environmental review under CEQA.

Table 2-2. Additional Cumulative Plans and Programs

#	Plan/Program	Agency	Description	Status
1	Chula Vista Bayfront Master Plan (CVBMP) ¹	San Diego Unified Port District	The CVBMP was prepared to guide the redevelopment of underutilized and vacant areas with a mix of land uses, as well as infrastructure throughout the Chula Vista Bayfront Planning District. The Board of Port Commissioners certified the Final EIR and approved the CVBMP in May 2010 and authorized the issuance of a Coastal Development Permit (CDP) in June 2019.	Approved in May 2010
2	Midway-Pacific Highway Community Plan Update	City of San Diego	The project involved a comprehensive update to the Midway-Pacific Highway Community Corridor Plan to guide development through 2035. The update included changes to public and private land uses; local streets and the transit network; provision of parks and public facilities; urban design guidelines; and	Approved in September 2018

#	Plan/Program	Agency	Description	Status
			recommendations to preserve and enhance historic and cultural resources within the community.	
3	Old Town San Diego Community Plan Update	City of San Diego	The project involved a comprehensive update to the 1987 Old Town San Diego Community Plan to guide development through 2035. The update included changes to public and private land uses; local streets and the transit network; provision of public facilities; architectural and urban design guidelines; and recommendations to preserve and enhance natural open space and historic and cultural resources within the community.	Approved in October 2018
4	Mission Valley Community Plan Update	City of San Diego	The project involves a comprehensive update to the 1985 Mission Valley Community Plan. The update provides a vision for the community and identifies how the City and development community will implement that vision, through implementing actions, design guidelines, and policies for development.	Approved in September 2019
5	2019 General Plan/Local Coastal Program Land Use Plan Update	City of Imperial Beach	The 2019 update of the General Plan/Local Coastal Plan focuses on policy changes that have occurred since the General Plan was adopted in 1994. Issues being addressed in the update include climate change and resiliency, environmental justice, sustainability, housing, community health, economic prosperity, multi-modal mobility, and sea level rise. The update included changes to the General Plan/Local Coastal Program elements to address these issues.	<u>Negative Declaration and Final GP/LCP approved on July 17, 2019 and Final Draft revised in August 2022</u> Plan in preparation
6	National City Bayfront Projects and Plan Amendments	San Diego Unified Port District	The proposed project includes landside (58 acres) and waterside (17 acres) development components, as well as an amendment to the District's PMP and the City's General Plan, Local Coastal Program, Harbor District Specific Area Plan, and Land Use Code to change the allowable land and water uses on the approximately 75-acre project site. Primary development components include a recreational vehicle (RV) park; modular cabins; dry boat storage; an expanded marina; hotels; restaurants; retail; a rail connector and storage track; closure and/or narrowing of roads; and Segment 5 of the Bayshore Bikeway.	EIR in preparation <u>Final EIR certified and project approved by District in November 2022. Currently under review by the California Coastal Commission.</u>

#	Plan/Program	Agency	Description	Status
7	Wetland Mitigation Bank at Pond 20	San Diego Unified Port District	The project involves the establishment of a mitigation bank on a 76-acre site located at Pond 20. and would incorporate three adjacent parcels (A, B, and C) into the PMP and designate them as Commercial Recreation. Although no commercial recreation-related development is proposed at this time, the EIR identified a reasonably foreseeable scenario to include up to 105,000 square feet of commercial space up to two stories tall.	EIR certified in April 2021. <u>Currently under review by the California Coastal Commission.</u>
8	San Diego International Airport, Airport Development Plan	San Diego County Regional Airport Authority	The Airport Development Plan (ADP) is a master planning effort to identify the facilities needed to meet the region's air travel demand through 2035. The primary project of the ADP is the replacement of the aging Terminal 1 with up to 30 gates and associated facilities. Other proposed components include a new on-airport entry roadway, dual level roadways and curb front, expanded close-in parking, and airfield improvements.	EIR certified on January 9, 2020, with National Environmental Policy Act (NEPA) Environmental Assessment in public review <u>until August 2, 2021</u> <u>approved on October 22, 2021</u>
9	Naval Air Station North Island Airport Land Use Compatibility Plan	San Diego County Regional Airport Authority	The Naval Air Station North Island (NASNI) Airport Land Use Compatibility Plan (ALUCP) is being prepared by the San Diego County Regional Airport Authority to serve as the primary tool for reviewing proposed development in the NASNI environs for compatibility with military aviation operations. The ALUCP is also intended to assist local agencies in preparing or amending land use plans and regulations and in the review of proposed development within their jurisdiction.	ALUCP and Final EIR approved and certified, respectively, on October 1, 2020
10	2021 Regional Plan	San Diego Association of Governments	The project involves an update to the current Regional Plan, which is required to be updated every 4 years pursuant to State and Federal law. When adopted, the 2021 Regional Plan will include a new Regional Transportation Plan, Regional Comprehensive Plan, and Sustainable Communities Strategy for the San Diego region.	<u>Adopted by SANDAG's Board of Directors on December 10, 2021</u> <u>Proposed</u>
11	The Seaport San Diego Project	San Diego Unified Port District	Based on the proposal accepted by the Board on November 8, 2016 (2016-0607) and the Exclusive Negotiating Agreement adopted by the Board, on May 16, 2017 (2017-0155), and signed	<u>Proposed. On November 8, 2022, the Board of Port Commissioners</u>

#	Plan/Program	Agency	Description	Status
			<p>on October 2, 2017 (Doc# 67343) at the time of this writing, this proposal comprises the following potential development intensity (all square footages, hotel rooms, retail square feet, restaurant square feet, parking spaces, and project components are approximate and could change in the future):</p> <p>(1) 390,000 square feet of retail space;</p> <p>(2) 480-foot-tall observation tower, including 10,000 square feet of restaurant and a 10,000-square-foot observation tower;</p> <p>(3) 19,130 square feet of office space;</p> <p>(4) a 500-room hotel at 405,805 square feet;</p> <p>(5) a 170-room (350 beds) micro-hotel with affordable pricing, at 117,450 square feet;</p> <p>(6) a 225-room (475 beds) hostel at 122,381 square feet;</p> <p>(7) a 20,000-square-foot event center;</p> <p>(8) 65,150 square feet of marine education space;</p> <p>(9) a 178,490-square-foot aquarium;</p> <p>(10) 164 marina slips, both for commercial fishing and recreational use;</p> <p>(11) 30 acres of public space, 21 acres of which are park space; and</p> <p>(12) 2,410 new parking spaces.</p>	<u>authorized staff to begin the environmental review process for the proposed project.</u>
12	Tenth Avenue Marine Terminal (TAMT)	San Diego Unified Port District	The TAMT Redevelopment Plan includes a variety of infrastructure investments to be undertaken over the long-term to increase the terminal's capabilities and capacity. These include up to five gantry cranes, additional and consolidated dry bulk storage capacity, enhancements to the existing conveyor system, demolition of the molasses tanks and Warehouse C, additional open storage space, on-dock intermodal rail facilities, a centralized gate facility, and the Demolition and Initial Rail Component, which would demolish two underutilized transit sheds in order to accommodate rail upgrades and other improvements. The TAMT EIR analyzed cargo growth to 4,675,567 metric tons (MT) per year.	Approved
13	B Street Cruise Ship Terminal Interior	San Diego Unified Port District	The interior improvements to the B Street Cruise Terminal (Terminal) will improve customer service, accessibility,	Approved

#	Plan/Program	Agency	Description	Status
	Improvements by Port of San Diego at B Street Pier		and safety in the Terminal. The project comprises the following, with a 1-year construction period beginning in 2023, and lasting approximately one year: (1) new exterior cladding and cut-in one new exterior door opening; (2) easterly end, 3,181-square-foot North Berth Embark Bag Scan; (3) easterly center, 12,643-square-foot Embark Entry and Queuing for Security; (4) 1,190-square-foot corridor – enclosed area includes interior doors, partitions, and fire alarm and fire sprinkler upgrades for passage to North and South Berth check-ins; (5) 8,300-square-foot demolition of existing Exhibit Hall; (6) 20,919-square-foot Check-In for North Berth and Check-In for South Berth; (7) 20,379-square-foot seating and waiting for North Berth and seating and waiting for South Berth	

¹ Although included in this table, the CVBMP was approved in May 2010, and therefore was included in the Series 14 Regional Growth Forecast adopted by SANDAG in October 2019.

This page was intentionally left blank.

3.1 Introduction

Pursuant to Chapter 8, Article 3 (commencing with Section 30710) of the California Coastal Act (CCA), the San Diego Unified Port District (District) is undertaking an extensive update of its existing Port Master Plan (PMP).¹ In accordance with CCA, Public Resources Code, Section 30711, the proposed Port Master Plan Update (proposed PMPU) provides the official goals and planning policies, and identifies permissible water and land uses, for development and conservation of the District lands, tidelands, and submerged lands (collectively, Tidelands or District Tidelands) that comprise the PMPU planning area (PMPU area). The PMPU area encompasses the majority of the District's jurisdiction (with the exceptions explained below), including acquired upland parcels, which amounts to approximately 1,009 acres of land² and 1,454.2 acres of submerged lands in and around San Diego Bay (Bay) and along the Imperial Beach oceanfront. In addition, as required by Section 30711 of the CCA, the proposed PMPU identifies a list of proposed appealable projects, as defined in Section 30715 of the CCA.³ Appealable projects are analyzed in this Draft Program Environmental Impact Report (PEIR) at a programmatic level using the square footages and development projections identified for these improvements in the proposed PMPU. The PMPU does not include the approval of any site-specific development projects. Any future appealable projects would be subject to project-level environmental review once specific developments are proposed.

The proposed PMPU will implement the District's approximately 30-year planning vision through a series of goals, objectives, and policies that set the foundation and direction for planned improvements and development standards, as established within the following six elements:

- Water and Land Use Element
- Mobility Element
- Ecology Element
- Safety and Resiliency Element
- Environmental Justice Element
- Economics Element

¹ Per Section 30716 of the CCA, because the District already has a certified PMP, the proposed PMPU is considered an amendment to the existing PMP. The update to the PMP excludes two planning districts, PD5: National City Bayfront and PD6: Chula Vista Bayfront, and the Pond 20 portion of PD7: South Bay. Further, effective January 1, 2020, pursuant to Senate Bill (SB) 507, certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District by the California State Lands Commission (CSLC), as part of the granted approximately 8,300 acres (subject to a survey) of additional submerged lands within San Diego Bay. Thus for consistency, those parcels that had previously been assigned designations in the Certified PMP and have been granted to the District, are to be incorporated into the proposed PMPU area and within the District's coastal permitting authority (see Figure 3-13). The remaining SB 507 waters are not incorporated within the PMPU.

² This excludes approximately 670 acres of land that is currently leased to the San Diego International Airport.

³ As established in CCA Sections 30711(a)(4), a port master plan shall include proposed projects listed as appealable in Section 30715. Appealable projects include the storage, transmission, and processing of liquefied natural gas and crude oil; wastewater treatment facilities; roads or highways not principally intended for internal circulation within port boundaries; office and residential buildings not principally devoted to the administration of activities within the port; hotels, motels, and shopping facilities not principally devoted to the sale of commercial goods utilized for water-oriented purposes; commercial fishing facilities; and recreational small craft marina related facilities; oil refineries; and petrochemical production plants. (See CCA, Section 30715.)

Chapter 4 of the PMPU also proposes baywide⁴ development standards, which establish requirements for the physical development of property. As stated in the PMPU, they provide standards for design that enlivens and enriches Tidelands experience for visitors, businesses, and workers, and will be used to implement new development in a manner that is consistent with the surrounding pattern and character.

In addition, the District's jurisdiction is divided into 10 planning districts (PDs) that group Tideland properties into identifiable and functional units. Planning district boundaries conform closely to the boundaries of established municipal jurisdictions following logically grouped geographic areas and provide the detailed planned improvements, development standards, special allowances, and water and land use maps. The 10 ~~proposed~~ planning districts are as follows:

- PD1 – Shelter Island
- PD2 – Harbor Island
- PD3 – Embarcadero
- PD4 – Working Waterfront
- PD5 – National City Bayfront (excluded from the PMPU)
- PD6 – Chula Vista Bayfront (excluded from the PMPU)
- PD7 – South Bay (Pond 20 is excluded from the PMPU)
- PD8 – Imperial Beach Oceanfront
- PD9 – Silver Strand
- PD10 – Coronado Bayfront

National City Bayfront (PD5), Chula Vista Bayfront (PD6), and the Pond 20 portion of South Bay (PD7), are not part of the proposed PMPU because no changes to those planning districts, or portions thereof, are proposed by the PMPU. The National City Bayfront is ~~currently being~~ planned under the National City Bayfront Projects & Port Master Plan Amendment program, which extends into the City of National City jurisdiction and ~~was is anticipated to be~~ completed prior to the approval of the proposed PMPU and certification of the PMPU PEIR. The Chula Vista Bayfront has a recently approved land use plan for the entire planning district that is currently under implementation. No changes are proposed to that land use plan. Finally, the District-owned property in the southern portion of Pond 20 was evaluated under the Wetland Mitigation Bank at Pond 20 Project EIR and Port Master Plan Amendment for the creation of a wetland mitigation bank and to incorporate the property into the current PMP, ~~The Final PEIR which~~ was certified by the District's Board of Port Commissioners (Board) on April 13, 2021. The proposed PMPU ~~amendments~~ would not affect the water or land use designations and the anticipated buildout of these districts. As such, PD5, PD6, and the Pond 20 portion of PD7 are not a part of the proposed PMPU area and are not analyzed in this ~~Draft Final~~ PEIR; however, these programs or projects are considered as cumulative projects in the analysis of cumulative impacts in this Draft PEIR (see Table 2-2 in Chapter 2, *Environmental Setting*).

⁴ Anytime the term “baywide” is used in this EIR, it applies to the PMPU area.

3.2 Project Background and Purpose

At a special meeting held on February 4, 2013, the District’s Board proposed goals to implement an overall vision for the future development and uses of District Tidelands. The Board consensus was that comprehensive changes to the existing PMP would be required to achieve a coherent overall vision for the District. The Board’s decision kicked-off the first large-scale update of the PMP in the District’s history and initiated a multi-faceted planning effort referred to as *integrated planning*, which involved extensive public outreach and stakeholder engagement to form the basis for preparation of the proposed PMPU.⁵ The integrated planning process proposed a set of long-range planning principles that form a framework for future planning on Tidelands and consisted of two primary components: the *Vision Statement and Guiding Principles* and the *Integrated Planning Framework Report*, as detailed below.

- **Vision Statement and Guiding Principles.** The initial step was to define the proposed vision and guiding principles for the proposed PMPU by conducting a high-level assessment of District-wide assets and engaging in extensive public input. At the Board meeting on August 12, 2014, the Board accepted the Vision Statement and Guiding Principles. This document represented a culmination of a public engagement process and an effort to achieve a balance of all baywide interests.
- **Framework Report.** The visioning process was further refined by consideration of a core set of comprehensive ideas with broad scope or content that could be applied to the entire Bay, and which would be incorporated into the proposed goals, objectives, and policies of the proposed PMPU, as well as through the planned improvements. The comprehensive ideas developed in the Framework Report revolve around the following concepts:
 - The Green Necklace⁶
 - The Baywide Water Plan
 - An Accessible Bayfront
 - The Comprehensive Park Plan
 - Natural Resources
 - Safety and Resilience
 - Economic Development

At the November 17, 2015, meeting, the Board accepted the Framework Report. This report provides guidance and informs the preparation of the proposed PMPU by describing several comprehensive ideas that are based upon core principles that cover a broad range of issues. The report is intended to provide the basic foundation for establishing the proposed goals, objectives, and policies of the PMPU.

⁵As of June 2, 2023, the public outreach and engagement process thus far has included over 500480 meetings with key stakeholders, and partner agencies, as well as public events (e.g., open houses, community meetings, stakeholder gatherings) and Board meetings and workshops over the 108-year planning process.

⁶ The idea of the Green Necklace is to provide a connected, continuous public greenway surrounding the Bay. While it may change character as it passes through each of the three major parts of the Bay (the North Bay, Working Waterfront, and the South Bay), the “architecture” of the Green Necklace is proposed to be a cohesive element, adding to the sense of the Bay as the major entity defining the whole region.

Together, the Vision Statement and Guiding Principles and the Framework Report (collectively referred to as the *Integrated Planning Vision*) provided a bridge between the visioning conducted for integrated planning and the drafting of the proposed PMPU. Preliminary planning concepts developed during these efforts resulted in the creation of cross-connecting themes that have been integrated into the proposed goals, objectives, and policies of the draft PMPU and include the following:

- Healthy Bay and Healthy Communities, which includes natural resource protection, environmental justice, climate change resiliency, and pollution reduction.
- Improved Mobility and Coastal Access, which includes mobility strategies with a strong focus on multimodal systems and land use integration; methods for planning, funding, and building regional infrastructure needs in partnership with other public agencies to ensure efficient development and operation of District lands; and optimization of coastal access to the Bay.
- Regional Economic Engine, which includes consideration of public-private partnerships, regional public-public agency initiatives, capital improvements, and innovative funding mechanisms.

Copies of the *Integrated Planning Vision* are available in the Office of the District Clerk as Clerk Document No. 63989.

3.3 Project Objectives

CEQA Guidelines Section 15124(b) requires an EIR to contain a statement of objectives that address the underlying purpose of the project, which may also show a project's benefits. The District has identified the following objectives for the proposed PMPU:

1. Create an integrated vision for the District that governs the use, design, and improvement of public trust lands in accordance with Section 30711 of the California Coastal Act (CCA), the Public Trust Doctrine, and the San Diego Unified Port District Act (Port Act).
2. Within the PMPU area, create standards for new development, which serve to: 1) enhance and blend development with the surrounding character; 2) provide a balanced and diverse range of complementary uses; and 3) provide enough activation year-round and during the day for visitors and minimize the seasonally-related downtimes of uses on Tidelands.
3. Streamline the project review and entitlement process for implementation of the Port Master Plan.
4. Allow for an intensity and diversity of development that provides on-going and sustainable revenues to the District to ensure the longevity of the District's operations and its ability to fulfill its legislative responsibilities; balance the future needs of the maritime industry, tourism, water and land recreation; and reinvestment in critical infrastructure and maintenance of waterfront amenities and facilities as required by the Port Act and Public Trust Doctrine.
5. Provide an interconnected mobility network that encourages a range of travel modes, including the expansion of water- and land-based transit opportunities to support the movement of people, goods, and military operations.

6. Enliven the public realm by providing and maintaining recreation open space opportunities, through the creation and maintenance of: 1) public accessways; 2) physical and visual access to the water; and 3) an interconnected open space network.
7. Provide opportunities for creating a vibrant waterfront destination with a range of attractions for visitors, while protecting and restoring the environment through the proactive management of sensitive biological resources and ensuring coastal access around San Diego Bay.

These project objectives support several benefits of the PMPU, which are discussed under Section 3.4, *Project Benefits*.

3.4 Project Benefits

The proposed PMPU will provide substantial benefits to the District and the region. The benefits comprise enhancing environmental protection of San Diego Bay and the Tidelands, creating opportunities for more public access to San Diego Bay, and increasing the District's economic contribution to the San Diego region. Some examples of the PMPU's benefits are listed below (note that these do not represent an all-encompassing list).

1. **Honoring the Water:** The proposed PMPU provides for the continued use of the Bay in step with the requirements of the CCA and the Port Act. It also furthers the goals of preserving and protecting the Bay and its shoreline, while promoting the water as a focal point to the mission and purpose of the District. To illustrate these points, the PMPU's Water Use Designations Table identifies water-dependent uses and lists a myriad of water-dependent Allowable Use Types permissible within these water use designations. Examples of water use designations include Anchorages, Commercial Fishing Berthing, Industrial Deep-Water Berthing, and Recreational Berthing. The proposed PMPU contains numerous goals, and associated objectives and policies, in both the Mobility and Ecology Elements that provide for both: (1) maintaining and improving access to the Bay, for use by the public; and (2) protecting the Bay and the Pacific Ocean (PD8). Examples of these goals include the following:
 - a. Water and Land Use Element Goal 1 - Balance the District's responsibilities under the Port Act with Coastal Act responsibilities and priorities.
 - b. Mobility Element Goal 1 - An integrated and diverse network that facilitates the movement of people and goods.
 - c. Ecology Element Goal 1 - Tidelands that support vibrant and healthy ecosystems.
 - d. Ecology Element Goal 2 - Clean, healthy waters and landside areas.
 - e. Ecology Element Goal 4 - Collaborative stewardship for the ecological health of San Diego Bay.
2. **Promoting Clean Air, Healthy Communities, and Environmental Justice:** The PMPU includes an Environmental Justice Element that focuses on providing equitable opportunities for people from disadvantaged communities to access Tidelands and enjoy a healthy environment. The goals, objectives, and policies in the proposed Environmental Justice Element support enhanced mobility linkages to Tidelands, improved air and water quality within disadvantaged communities, and increased opportunities for people from disadvantaged communities to participate in the District's planning processes. The PMPU also advances goals and objectives to

reduce air pollution from District operations in other elements. In addition to the Environmental Justice Element, the Ecology Element, and the Safety and Resiliency Element provide for improving air quality and providing coastal access. Examples include the following:

- a. Environmental Justice Element Goal 1 – Ensure Tidelands are accessible.
 - b. Environmental Justice Element Goal 3 – Healthy, thriving communities in and around Tidelands.
 - c. Ecology Element Goal 3 – Clean air for a healthy environment and healthy communities.
 - d. Safety and Resilience Element Goal 3 – Climate and coastal resilient Tidelands.
3. **Ensure Job Creation, Prudent Economic Policies, and Financial Sustainability:** The District is one of the region’s largest economic generators. The PMPU represents this by including goals, objectives, and associated policies that foster job creation, prudent economic policies, and financial sustainability to create a balance among the public good, economic growth, and the protection of natural resources. The District does not collect any taxes. Accordingly, the PMPU includes goals and objectives that provide for future investment that considers economic feasibility and long-term financial sustainability, not only for the District, but also for the State and the broader San Diego region. Examples of goals from the Economics Element that illustrate this include:
- a. Goal 1 – A Financially Secure and Sustainable District.
 - b. Goal 2 – A Thriving Business Base and Regional Economy.
 - c. Goal 3 - A Growing and Diverse Economic Portfolio of Coastal-Dependent Industries and Businesses.
4. **Streamline the Approval Process:** A major benefit to the District by the proposed PMPU is its goal to streamline the approval process for development projects. The PMPU adds certainty throughout the development review and approval process. The PMPU, by including individual planning district development standards for scenic vistas, landscaping, walkway, promenades, and street design clearly defines what can be achieved without a future site-specific project requiring a Port Master Plan Amendment to the certified PMPU. Additionally, Chapter 4 of the PMPU shows the Baywide Development Standards for: (1) mobility hubs, (2) recreation open space and activating features, (3) pathways, (4) views, (5) structure height, setback, and stepbacks, and (6) signage. ~~(1) recreational uses, (2) building design and setback requirements, (3) viewshed preservation, (4) landscaping design, and (5) mobility hubs.~~ Chapter 6 of the PMPU ~~includes~~ summarizes the PMPU Implementation and Development Conformance and describes the various aspects of future PMPU implementation, as well as the requirements for determining conformance with the PMPU. Chapter 6 is necessary to guide future development on Tidelands and to successfully carry out the broad vision and goals presented in the PMPU. ~~Other Chapters in the PMPU~~ provide the requirements for development within the District and specify how these requirements are to be applied.

A detailed description of the proposed PMPU is provided in Section 3.5 below. It includes the proposed water and land uses for each planning district, proposed planned improvements and development standards established for each planning district, as well as a summary of each of the six proposed elements.

3.5 Proposed PMPU Description

The proposed PMPU would serve as the primary tool for implementing the *Integrated Planning Vision* described under Section 3.2, *Project Background and Purpose*, and represents an extensive update of the existing PMP. Under the proposed PMPU, new proposed baywide goals, objectives, policies, and standards would be implemented through proposed elements; and designated water and land uses have been modified to respond to the evolving water and land use demands of each planning district. The proposed goals, objectives, and policies are described within each of the six elements and are specific to the ~~theme~~ topic of each element. The proposed development standards and planned improvements would generally be implemented through compliance with the individual planning district sections. Information relevant to the analyses in this Draft PEIR, including policies, planned improvements, or development standards, from the elements and the planning districts are described in more detail in the following sections.⁷ A full copy of the PMPU is available for review in Appendix ~~Nf~~.

While the proposed PMPU plans for a certain amount of development to occur on Tidelands in the future (i.e., planned improvements), approval of the PMPU does not automatically approve, or result in, any specific development project being implemented. However, to analyze a “worst-case” scenario, this Draft PEIR assumes all such planned development would occur over the approximately 30-year planning horizon of the proposed PMPU, with full buildout assumed to occur by 2050.⁸ Planned improvements for each planning district are identified in Section 3.5.3, *Proposed Planning Districts*, and are summarized in Table 3-4.

3.5.1 Proposed Elements and Policies

As noted above, the proposed PMPU contains six elements that apply across District Tidelands: Water and Land Use, Mobility, Ecology, Safety and Resiliency, Environmental Justice, and Economics. A general overview of each of these elements is provided below. Proposed goals, objectives, and policies for each element are provided in the PMPU (Appendix ~~Nf~~).

3.5.1.1 Water and Land Use Element

The purpose of the Water and Land Use Element is to identify future water and land use designations and guide development on Tidelands. ~~Specifically In addition to the goals, objectives, and policies proposed in this element, it~~ establishes a balanced range of allowable uses in each designation that are intended to support the District’s role as a steward of Tidelands. The proposed Water and Land Use Element has been developed in conformance with the Coastal Act, the Public Trust Doctrine, and the Port Act and was created to meet the District’s goal of protecting priority uses, which have been established in part based on their functional dependency to the water.⁹ The proposed Element’s goals, objectives, and policies support:

⁷ Terms used to reference various components within the overall PMPU boundaries are provided in ~~Section 2.3.3 and in the Glossary included starting on page G-1 of the FPEIR as Appendix X.~~

⁸ Please note that the term “worst-case” refers to analyzing a scenario that could occur if all planned improvements are implemented during the life of the PMPU. While this is a reasonable approach for CEQA purposes, it is likely that not all planned improvements would be developed due to numerous potential factors.

⁹ The CCA prioritizes coastal-dependent and coastal-related uses, and the proposed PMPU mirrors this approach. (See e.g., CCA Sections 3001.5, 30233 and 30255.)

- Honoring the unique relationship between the diverse character of Tidelands and the water.
- Balancing the requirements of the Port Act and Coastal Act.
- Improving the public's access to, and experience on, Tidelands.

In addition, the proposed goals, objectives, and policies contained in this element provide a framework for the District to:

- Provide a diversity of Public Trust-consistent water and land uses. When the Public Trust Doctrine is administered, all categories of modern Public Trust uses—commerce, environmental stewardship, fisheries, navigation, and recreation—have equal footing. One use is not favored over another. The District is a grantee of certain tidelands and submerged lands (Tidelands) of the San Diego Bay. This Plan balances consideration of the Public Trust Doctrine categories through a framework that will help guide future protection and development on Tidelands.
- Enhance coastal access throughout Tidelands.
- Retain and expand priority coastal uses.
- Provide coastal and landside improvements.
- Encourage coordination with agency stakeholders.

Water and Land Use Designations

The proposed PMPU establishes 19 water and land use designations to ensure that a wide variety of uses are located throughout Tidelands and that an appropriate amount of space is provided for each use. The PMPU also ensures that each use is appropriately sited based on character and compatibility with adjacent uses. Each water and land use designation includes allowable use types (both primary and secondary) that are permitted within each designation, which are defined in Table 3.1.5 of the proposed PMPU and the designations under which these allowable use types are permitted as either a primary or secondary use are identified in Table 3.1.2 and Table 3.1.3 of the proposed PMPU (Appendix J).

The designations proposed in the PMPU consolidated the 35 water and land use designations from the certified Port Master Plan into 19 broader designations to more appropriately capture associated use types, while allowing for greater efficiency when implementing the plan. Some use designations, such as Commercial Fishing (both water and land), Marine Sales and Services, and Sportfishing, are considered high-priority, water-dependent uses under the CCA and maintained more individualized designations in recognition of their CCA status. Most designations were consolidated into broader designations, except Marine Terminal, which was divided into two separate designations in the proposed PMPU: Marine Terminal and Visitor-Serving Marine Terminal. In addition, several designations were not carried forward because they could be consolidated into more than one of the broader proposed designations (e.g., Specialized Berthing) or the areas with those designations were not included in the proposed PMPU (e.g., Navy Fleet School, International Airport). Table 3-1 summarizes how the certified Port Master Plan water and land use designations, respectively, were consolidated into the proposed PMPU designations.

Table 3-1. Water and Land Use Designation Consolidation

Certified PMP Designations	Proposed PMPU Designations
Water Use Designation	
Commercial Fishing Berthing	Commercial Fishing Berthing
Sportfishing Berthing	Sportfishing Berthing
Recreational Boat Berthing	Recreational Berthing
Marine Services Berthing	Marine Services Berthing
Terminal Berthing	Industrial and Deep-Water Berthing
Specialized Berthing	
Open Bay/Water	Open Bay/Water
Open Ocean	
Estuary	Conservation/Intertidal
Wetlands ¹	
Boat Anchorage	Anchorage
Ship Anchorage	
Boat Navigation Corridor	Navigation Corridor
Ship Navigation Corridor	
Navy Ship Berthing	Designations not carried forward in the PMPU and redistributed to other designations depending on the planning district
Harbor Services Water	
Navy Small Craft Berthing	
Land Use Designation	
Commercial Fishing	Commercial Fishing
Marine Sales and Services	Marine Sales and Services
Sportfishing	Sportfishing
Commercial Recreation	Commercial Recreation
Industrial Business Park	Maritime Services and Industrial
Marine Related Industrial	
Marine Terminal	Marine Terminal
	Visitor-Serving Marine Terminal
Open Space	Recreation Open Space
Park/Plaza	
Golf Course	
Wetlands ¹	Conservation Open Space
Habitat Replacement	
Harbor Services Land	Institutional/Roadway
Streets	
Aviation Related Commercial	Designations not carried forward in the PMPU and redistributed to other designations depending on the planning district
Aviation Related Industrial	
City Pump Station	
International Airport	
Navy Fleet School	

¹ Areas designated as Wetlands in the certified PMP were consolidated to either a proposed water use designation (Conservation/Intertidal) or land use designation (Conservation Open Space) depending on the location of the designated area.

Figure 3-1 provides a map of the water and land uses, and Table 3-2 describes each of the proposed water and land use designations in detail with acreages.

Table 3-2. Proposed PMPU Water and Land Use Designation Descriptions¹

Use Designation	Description
Water Use	
Anchorage	Water areas primarily used to moor small and large private recreational and commercial watercraft. This designation includes the management and regulation of short- to long-term anchorages subject to permit requirements. Anchorage areas include access areas, surrounding navigable waters, and areas appropriate for the natural movement of moored vessels.
Commercial Fishing Berthing	Water areas primarily used for commercial fishing berthing. This designation allows collocation with other supporting primary and secondary water uses or facilities and usually is located adjacent to shoreside facilities designated for the promotion and protection of commercial fishing – a priority use in the CCA. This designation is supportive of the Commercial Fishing land use designation.
Conservation/ Intertidal	Water areas primarily reserved for the management of habitat, wildlife conservation, and environmental protection. This designation allows scientific research, education and other uses that support environmental protection, creation and restoration. This designation is complementary to land use designations of Conservation Open Space, Open Bay/Water, and Recreational Open Space, which may involve public access points or piers where appropriate.
Industrial and Deep-Water Berthing	Water areas primarily dedicated to ship berthing directly adjacent to berths. This designation supports the Marine Terminal, Visitor-Serving Marine Terminal, and Maritime Services and Industrial land use designations, with functional dependencies on direct access to, or association with, deep-water berthing and allows other supporting primary and secondary water uses or facilities.
Marine Services Berthing	Water areas primarily reserved for boat sales, vessel building and repair facilities, and marine services berthing. This designation allows other supporting primary and secondary water uses or facilities.
Navigation Corridor	Water areas primarily devoted to the maneuvering of vessels.
Open Bay/ Water	Water areas adjoining shoreline recreation areas, boat and nonmotorized launch facilities, transient docking, water-based transfer points, public access points, public fishing piers, public vista areas, and other public recreational facilities. Multiple uses of Open Bay/Water areas for recreation and for natural habitat purposes are possible under this designation.
Recreational Berthing	Water areas primarily associated with the mooring, docking, and operations of recreational vessels. This designation allows numerous other primary water uses or facilities.
Sportfishing Berthing	Water areas primarily serving sportfishing vessels and associated waterside facilities. This designation allows collocation with other supporting primary and secondary water uses or facilities and usually is located adjacent to shoreside facilities designated to support sportfishing.
Land Use	
Commercial Fishing	Commercial fishing water and land use areas are designated for the promotion and protection of these priority CCA uses. Facilities and operations, including 24-hour, 365-day truck access and parking, related and complementary to commercial fishing. This designation allows collocation with other supporting primary and secondary land uses or shoreside facilities designated for the promotion and protection of commercial fishing. Cannery facilities and operations are prohibited in this use type.

Use Designation	Description
Commercial Recreation	Land areas primarily for visitor-serving facilities and accommodations providing shoreside public access to coastal areas. This designation supports the Recreational Berthing and Open Bay/Water use designations. This designation includes a wide range of allowable uses, including, without limitation, hotels/motels, restaurants, and retail and all uses in the Commercial Recreation land use designation are considered activating.
Conservation Open Space	Land and open space primarily reserved for the management of habitat and wildlife conservation and environmental protection. This designation supports the Conservation/Intertidal and Open Bay/Water use designations. This designation allows scientific research, education, and other uses that support environmental protection, creation and restoration.
Institutional/Roadway	Land areas primarily reserved for uses and facilities operated by nonmunicipal government agencies, including land areas and roads devoted to public safety and District regulatory activities.
Marine Sales and Services	Land areas primarily reserved for coastal-dependent marine industry, including boat sales and vessel building and repair services. This designation supports the Marine Services Berthing water use designation. This designation allows other supporting primary and secondary land uses or facilities.
Marine Terminal	Land areas primarily for coastal-dependent marine terminal facilities and uses necessary to operate, support, or maintain terminal operations, goods movement, goods- and cargo-handling, and other coastal-, marine-, and shipping-dependent activities. This designation has functional dependencies on direct access to, or association with, deep-water berthing.
Maritime Services and Industrial	Land areas primarily reserved for heavy industrial activities and facilities with functional dependencies on direct access to, or association with, deep-water berthing or other waterfront berthing, large-scale energy generation, or industrial and manufacturing-related activities. This designation allows other supporting primary and secondary land uses or facilities.
Recreation Open Space	Land areas primarily for visitor-serving, public open spaces that provide public access, public views, activating features, or access to coastal areas. <u>Active and passive uses are allowed in the Recreation Open Space designation, unless other location-specific requirements are stated in Chapter 5, Planning Districts.</u> This designation includes golf courses and associated facilities. This designation is complementary to the Recreational Berthing, Conservation/Intertidal, Open Bay/Water and Commercial Recreation use designations.
Sportfishing	Areas dedicated to the operations necessary to accommodate sportfishing and containing the facilities necessary to support this use. This designation allows collocation with other supporting primary and secondary land uses or shoreside facilities.
Visitor-Serving Marine Terminal	Land areas primarily for facilities and uses to accommodate cruise ships, including operation, support, and maintenance of terminal operations; cargo handling; and other coastal-dependent or coastal-related activities. This designation has functional dependencies on direct access to, or association with, deep water berthing. Cruise terminal uses are the priority allowable use type in this designation; other listed uses are allowed only if they do not interfere with cruise terminal operations.

¹ The water and land use descriptions provided in this table correspond with PMPU Table 3.1.4, *Description of Water and Land Use Designations*.

² The refined acreages represent final acreages the District will use for water and land uses.

³ There is no land designated as COS within the boundaries of the proposed PMPU.

Table 3-3 shows a comparison of the existing acres from the certified PMP and the proposed designations and corresponding acres in the proposed PMPU.¹⁰ As part of the planning process to develop the proposed PMPU, water and land use designations were assigned, re-assigned, or removed, which led to the redistribution of acres across those designations. Changes in water and land use designations occurred to better reflect operations of the various use types across Tidelands that are anticipated to continue throughout implementation of the proposed PMPU, and to plan and allow for future uses on the proposed designations as stipulated in each planning district's vision and planned improvements, and the Water and Land Use Element Tables: *Allowable Use Types for Water Use Designations* and *Allowable Use Types for Land Use Designations* (PMPU Tables 3.1.2 and 3.1.3, respectively). These changes are described in detail for each planning district in Section 3.5.3, *Proposed Planning Districts*. Acreages for individual designations identified in Table 3-3 and each planning district's table of water and land use acreages (Tables 3-4, 3-5, 3-6, 3-8, 3-9, 3-10, 3-11, and 3-12) are rounded to one-hundredth of an acre. Planning district and baywide acreage totals are sums of the rounded individual designation acreages.

Table 3-3. Baywide Water and Land Use Designations

Certified PMP Designations (Existing)	Existing Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Commercial Fishing Berthing	25.38	Commercial Fishing Berthing	29.79	+4.41

Total Water and Land Use Designations²	2,624.54		<u>2951.27</u> <u>2944.97</u>	<u>+326.73⁴</u> <u>320.43³</u>

¹ Wetlands counted in "Total Land Use" for Existing Acres in certified PMP.

² Certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District from the California State Lands Commission. Thus, for consistency, parcels that had previously been assigned designations in the Certified PMP and have been granted to the District pursuant to SB 507 are proposed to be incorporated into the proposed PMPU area and within the District's coastal permitting authority.

³ ~~The change in total acreage within the proposed PMPU area is due to mapping corrections related to land transactions, within the District's jurisdictions, and several parcels added into the proposed PMPU that were recently granted to the District pursuant to SB507. See planning district discussions in Sections 3.5.3.1 through 3.5.3.10, below. Includes 6.3 acres of above-grade Recreation Open Space.~~

⁴ ~~The change in total acreage within the proposed PMPU area is due to mapping corrections related to land transactions, within the District's jurisdictions, and several parcels added into the proposed PMPU that were recently granted to the District pursuant to SB507. See planning district discussions in Sections 3.5.3.1 through 3.5.3.10, below.~~

Allowable Use Types

Tables 3.1.2 and 3.1.3 of the proposed PMPU identify types of primary and secondary uses allowed, as well as uses that are not permitted, in each of the proposed water and land use designations defined above. Table 3.1.5 of the PMPU provides a description of the allowable uses (see Appendix J see Volume 4 of the Final PEIR). To allow flexibility for development, and concurrently provide greater certainty to the prioritization and protection of certain uses, the proposed "Allowable Use Types" (for both water and land) are identified as primary uses, secondary uses, or not permitted

uses, as further described below, with the intent for the primary uses to take precedent over secondary uses:

1. **Primary uses** are the dominant use in a water or land use designation—the primary use(s) for which land or a building is or may be intended, occupied, maintained, arranged, or designed.
2. **Secondary uses** complement primary uses identified in a water and land use designation but are not the preferred use and should not dominate any development site or impede, interfere, or create conflicts with the functionality of the priority primary use. The following requirements apply to secondary use developments and are summarized from Section 3.1.8 of the proposed PMPU. Refer to Section 3.1.8 for a complete list of considerations and requirements for secondary uses.
 - a. Up to 25 percent of the land area, measured as either the total surface area or total gross building area in a development, whichever is greater, may include secondary uses.
 - b. At least 75 percent of the linear waterfront land frontage within a development shall be composed of primary uses.
 - c. Up to 25 percent of the total number of available slips and berthings in a water area (e.g., marina) may be allocated for secondary uses.
3. **Not permitted uses** are uses that are not allowed within a water or land use designation.
4. **Additional uses** ~~types are uses~~ that are currently not listed as a primary use or secondary use in any water or land use designation ~~and may be a permitted, if use but must be compatible with the associated water or land use designation for that site and its allowable uses and treated in the same manner.~~ They must also be an allowed Public Trust use.

3.5.1.2 Mobility Element

The purpose of the proposed Mobility Element is to provide direction for the establishment, maintenance, enhancement, and integration of the travel options to, from, and throughout Tidelands. This element reinforces the District’s vision of providing an interconnected mobility network that supports a range of travel modes while also being flexible and adaptable to the future technologies and demands of transportation, transit, parking, cargo, freight, and the U.S. military. Specifically, the focus of this element is to:

- Provide alternative modes of transportation, which could reduce vehicle miles travelled consistent with California’s greenhouse gas reduction goals.
- Encourage the improvement and expansion of existing mobility networks to provide users with diverse travel options, including transit, on both water and land.
- Provide efficient cargo transfer points to maintain a sustainable freight network.
- Continue coordination with the Department of Defense to support and maintain the Strategic Port designation that facilitates U.S. military operations on Tidelands.

Proposed mobility modes throughout Tidelands facilitate three key types of movement: the movement of people, goods, and U.S. military forces. These types of movement use both water and land. The District collaborates with adjacent jurisdictions, the airport, and the regional, state, and federal planning agencies for the planning of accessways that provide access to and from Tidelands. The District also serves an important role as a Strategic Port and, when needed, is responsible for movement of military assets.

Proposed policies in this element are focused on the expansion of landside and waterside networks through enhanced links and hubs, and including opportunities to provide alternative modes of transit and the creation of transportation demand management (TDM)—the programs and strategies that manage and reduce vehicle miles traveled (VMT) and traffic congestion and parking demand by encouraging the use of transportation alternatives, such as transit, carpools, biking, walking, and teleworking, and discouraging single-occupancy vehicle trips. Proposed policies in this element also advance implementation of zero-emission or near-zero emission technologies and supportive infrastructure improvements for both water and land mobility modes focused on the movement of people or the movement of goods.

Central to this notion for the movement of people is the proposed creation throughout the Tidelands of an interconnected mobility hub network to serve as connection points where visitors and workers accessing Tidelands are provided the opportunity to change from one mode of travel to another to reach their destinations. These hubs would link landside modes (cars, transit, biking, walking, micromobility options, etc.) and some may also link landside modes to waterside features through three types of mobility hubs (regional, local gateway, and connector). Table 4.1, *Mobility Hub: Accessibility Requirements and Amenities*, of the proposed PMPU's baywide development standards (Chapter 4) defines the various proposed mobility hub types and their accessibility and amenity requirements and Figure 3.2.5 of the PMPU, *Planned Connection Points*, of the Mobility Element, identifies potential locations of mobility hubs, water-based transfer points, and short-term public docking. In addition, the District proposes to expand operation of an existing summertime shuttle service (i.e., bayfront circulator) to create a continuous connection between Shelter Island and the Convention Center on a year-round basis.

The proposed PMPU also identifies goods movement improvements, including, but not limited to the following:

- Truck queuing management.
- Off-peak dedicated lanes that segregate trucks from other vehicles to increase safety.
- Separated dedicated truck lanes that can also be used for transit and military vehicles.
- Freight Signal Priority for freight vehicles.
- Gate Operating System to manage the flow through the terminals' gates.
- Geofencing that tracks the location and path of freight vehicles and can incentive trucks to follow designated or alternative freight routes.

Policies related to a sustainable cargo network focus on coordinating with stakeholders, such as railway companies, trucking companies, cargo and freight shipping lines, and service providers, to identify and implement feasible sustainable strategies in accordance with both the District's environmental regulations and the State's sustainability objectives.

3.5.1.3 Ecology Element

As a trustee of public lands, the District is responsible for safeguarding its natural resources and the public's access to nature. The purpose of this proposed element is to identify goals, objectives, and policies that serve to enhance, conserve, and restore natural resources and foster a healthy environment. The balance between the natural environment and the built environment is a key consideration in protecting the ecological health and natural resources of the Bay and on Tidelands.

This proposed element furthers the District's intentions related to the protection of natural resources and ecological health of Tidelands by building on applicable environmental laws and existing District policies and programs to guide future planning and development, with focus on healthy ecosystems, a clean environment, and collaborative stewardship. The proposed goals, objectives, and policies presented in this element demonstrate the District's commitment as a steward of the environment and its role in supporting a healthy and sustainable ecosystem through:

- Requirements for future development adjacent to or otherwise near environmentally sensitive areas.
- Protection, enhancement, and conservation of biologically diverse resources.
- Pollution prevention and improving the quality of the land, water, and air.
- Enhanced collaboration with local partners on shared priorities.

In addition, proposed policies call for exploring or pursuing opportunities to restore or enhance habitats around the Bay (such as ecological opportunity areas), continuing to conduct efforts to improve water and sediment quality, and identify the need to protect protection of threatened or endangered species or sensitive habitat (such as by the establishment and maintenance of ecological buffers, including 100 feet between the landside development and saltmarsh wetland to preserve and protect the wetland habitat for the anticipated life of the development).

3.5.1.4 Safety and Resiliency Element

The proposed Safety and Resiliency Element establishes goals, objectives, and policies to ensure that the District is prepared to respond to natural and human-caused hazards and fulfill its responsibilities to protect and maintain critical infrastructure, public assets, and coastal access. The focus of this element is public safety and security, emergency preparedness and recovery, and climate resiliency. The proposed PMPU describes the District's commitment to safety and resiliency throughout Tidelands in this element, through the following activities:

- Creating and maintaining safe access to and within Tidelands and the Bay.
- Enhancing safety and security features through design and use of the public realm and development.
- Collaborating with adjacent jurisdictions and other partners within the region to effectively mitigate, prepare for, respond to, and recover from emergencies.
- Applying an adaptive management approach to mitigate, prepare for, respond to, and recover from human-caused and natural hazards, including sea-level rise (SLR), through an iterative cycle of planning, monitoring, evaluating, and adapting.

The first part of this proposed element addresses public safety; security and emergency preparedness; and recovery for natural disaster. The second part addresses climate resiliency and identifies the District's strategies related to reducing greenhouse gas emissions and adapting to SLR by using an adaptive management approach, which involves an iterative process of planning, implementing, and modifying strategies for managing resources in the face of uncertainty and change.

3.5.1.5 Environmental Justice Element

The Environmental Justice Element focuses on the disadvantaged communities surrounding the Tidelands, such as the communities of Barrio Logan, Logan Heights, Sherman Heights, and Imperial Beach, and indigenous communities and tribes. The Environmental Justice Element establishes goals, objectives, and policies to ensure that disadvantaged communities, surrounding the District's jurisdiction, are afforded equitable opportunity to access Tidelands, participate in District planning and public involvement processes, and enjoy a healthy environment through:

- Improved mobility and transit linkages from adjacent disadvantaged communities throughout Tidelands and additional free and lower cost recreational opportunities.
- Greater opportunities to participate in the District's planning and decision-making processes.
- Reduced pollution in disadvantaged communities to improve those communities' quality of life.
- Enhanced collaboration locally and regionally, as well as deepening relationships with indigenous communities, so that disadvantaged communities near Tidelands and adjacent areas are cleaner and thriving places to work, live, and play.

In addition, the proposed Environmental Justice Element includes policies aimed at reducing land use conflicts between Tidelands and adjacent residential uses, ~~and the Transition Zone Policy (Board of Port Commissioners Policy No. 725), which creates appropriate~~ transition zones between the working waterfront and adjacent residential neighborhoods. These policies serve to:

- Minimize land use conflicts between industrial, working water uses and historical, adjacent residential uses.
- Reduce the cumulative health burdens on neighboring communities.
- Collaborate with adjacent jurisdictions, occupants, tenants, permittees, and community stakeholders to provide transition zone areas adjacent to Tidelands between maritime industrial, commercial, and residential uses as well as other sensitive receptors in Portside Communities.
- Identify methods for advancing clean air and water programs near adjacent disadvantaged communities ~~Portside Communities~~.

3.5.1.6 Economics Element

The District supports more than ~~44,300~~64,400 jobs in the county, many of which are high paying, and generates close to ~~\$9.25-6~~ billion in economic output in the county that continues to grow annually. Therefore, the proposed Economics Element is centered on financial sustainability, thriving businesses, a dedicated work force, and a growing and diverse economic portfolio. It proposes goals, objectives, and policies to ensure that the District supports the economic vitality of the District and the region, with an emphasis on promoting equity and the Tidelands economy. The proposed policies in this element emphasize the District's commitment through:

- Continued strengthening of public and private partnerships.
- Exploration of innovative financing mechanisms.
- Provision of infrastructure to support businesses on Tidelands.

- Encouraging a diverse suite of uses and businesses to operate on Tidelands, which can support local and regional economic prosperity.

Goals, objectives, and policies in this element center on establishing diverse and sustainable revenue sources for reinvestment in the District Public Trust obligations, providing infrastructure to support existing and future industry needs and the environment, ensuring maintenance of the Strategic Port designation, retaining and encouraging a diverse mix of coastal-dependent and coastal-related industries and businesses, encouraging recreational activities and coastal-enhancing industries to create a vibrant waterfront, creating and maintaining programs and services that address the needs of the District's business community; and attracting and supporting innovating and emerging industries. In addition, this element identifies the District's intentions related to ocean-related enterprises, referred to as the "blue economy," including, for example, shipbuilding and repair, commercial and recreational fishing, aquaculture, and environmental stewardship for coastal and marine resources. The region's scientific community and growing technology economy has contributed to a blue economy and unique marine technology cluster. As discussed in this element, the District plans to continue to invest in infrastructure and new enterprises to help grow and diversify the blue economy portfolio on Tidelands.

3.5.2 Baywide Development Standards

Chapter 4 of the PMPU establishes proposed baywide development standards, which are requirements that are meant to be applied consistently baywide throughout the individual planning districts. The ~~proposed~~ baywide development standards propose rules for the physical development of property, such as building heights and setbacks, particularly related to view corridors, scenic areas, waterside areas, and recreational open space areas. The baywide development standards are intended to enliven and enrich the Tidelands experience for visitors, businesses, and workers, and will be used to implement new development in a manner that is consistent with the surrounding pattern and character of development.

The proposed baywide development standards will be applied consistently to future development in all planning districts, except where specifically noted in a subdistrict development standard. In addition to compliance with the baywide development standards, the proposed PMPU requires that all future development must conform to the subdistrict development standards described in Chapter 5, *Planning Districts*, of the PMPU. The proposed Baywide Development Standards specifically address the following topic areas.

- **Mobility Hubs** – The proposed PMPU defines the proposed standards for each of the three types of mobility hubs, including land use and siting standards, public access standards, and amenities. Details of these standards are provided in Section 4.1 of the PMPU (Appendix J). All mobility hubs proposed in the planning districts or subdistricts in the proposed PMPU must be in accordance with the respective mobility hubs requirements (e.g., Regional, Local Gateway, or Connector) included in this section.
- **Recreation Open Space and Activating Features** – Proposed development standards for recreation and open space include siting standards (e.g., be located directly adjacent to the waterfront or be visually accessible from grade or rooftop open spaces) and, where applicable, requirements for landscaping, amenities or activities, and public access. Proposed development standards for activating features identify the frequency and intensity of these features as well as specific location, design, and parking criteria for pavilions. Activating features include recreational uses, such as fitness activities and play structures, moveable kiosks or carts, or

pavilions. Details of these standards are provided in Section 4.2 of the proposed PMPU (Appendix J).

- **Pathways** – Proposed pathway standards identify the requirements for waterside promenades, including walkways, and amenity zones. Standards for waterside promenades include requirements for which types of development must provide a waterside promenade, minimum width, and design. The proposed development standards also identify criteria for the provision of amenity zones, which the proposed PMPU defines as an area intended to improve comfort, convenience, or enjoyment by providing a variety of facilities or street furnishings, such as pedestrian seating, trash receptacles, and signage. In addition, they identify standards for walkways with the intent to create a pedestrian sense of scale along the waterfront and to avoid a walling-off effect. Details of these standards are provided in Section 4.3 of the proposed PMPU (Appendix J).
- **Views** – The proposed PMPU defines view standards for scenic vistas and view corridor extensions, including what features may be allowed or prohibited within the viewsheds of a scenic vista or view corridor extension and the siting and design of new development occurring adjacent to the viewsheds. Details of these standards are provided in Section 4.4 of the proposed PMPU (Appendix J).
- **Structure Height, Setback, and Stepback Standards** – The proposed standards identify requirements for measuring structure height, as well as the requirements related to Regional Airport Land Use Compatibility and Federal Aviation Administration notification. Proposed setback and stepback standards are also defined to allow for implementation of parkways and sidewalks and to ensure a pedestrian scale is maintained. Details of these standards are provided in Section 4.5 of the proposed PMPU (Appendix J).
- **Wayfinding Signage Standards** – Standards related to wayfinding signage identify location and design standards for signage and appropriate use for wayfinding signage (i.e., should be used for informational purposes and not advertising, etc.). Details of these proposed standards are provided in Section 4.6 of the proposed PMPU (Appendix J).

3.5.3 Proposed Planning Districts

As discussed above, the District's jurisdiction is divided into 10 planning districts that group Tideland properties into identifiable and functional units, eight of which are being amended as part of the proposed PMPU.¹¹ Planning district boundaries conform closely to those of established municipal jurisdictions following logically grouped geographic areas. Chapter 5 of the proposed PMPU has a section devoted to each planning district. For each proposed planning district, the proposed PMPU includes the following:

- Existing Setting
- Location and Context Map
- Water and Land Use Acreages
- Water and Land Use Map
- Coastal Access: Mobility Map

¹¹ As noted above, PD5 and PD6, and the Pond 20 portion of PD7 are not part of the PMPU as they have separate comprehensive development plans underway (i.e., PD5, Pond 20 of PD7) or approved (i.e., PD6).

- Coastal Access: Views and Pathways Map

In addition, most of the planning districts are further divided into proposed subdistricts to provide descriptions and standards applicable to smaller and distinct geographic areas. Discussions of the subdistricts are organized as follows:

- Vision – describes the long-term vision and character for the subdistrict.
- Special Allowances – addresses unique situations for the subdistrict.
- Planned Improvements – identifies anticipated development or improvements (which includes identifying development of an appealable category) for each subdistrict (see footnote #3 in Section 3.1, *Introduction*, for the definition of appealable projects per CCA Section 30715). The planned improvements are based on multi-year planning and extensive outreach with stakeholders and residents in the region, and the build-out of these projections would be subject to feasibility studies, economic conditions, and site-specific analyses.
- Development Standards – requirements for development including size, location, siting, and orientation of the required public realm features, buildings, and structures.¹²

The following sections summarize the vision, special allowances, planned improvements, and development standards for each planning district.

In addition, for the purposes of the analysis in this Draft PEIR, the construction and operation of future development that may occur indirectly,¹³ should the proposed PMPU be approved and implemented, must be estimated to analyze the whole of the action. These buildout projections, which are identified in Table 3-4, are based upon written policy language in the individual planning districts of the PMPU. Because the PMPU does not propose any specific development project and the timing, location, and characteristics of the increase in future development allowed under the PMPU is not yet known, this PEIR analyzes the potential environmental impacts that may result from full buildout of the increased development allowed under the PMPU by the planning horizon year of 2050. This buildout scenario also assumes the associated infrastructure required to implement the planned improvements. Individual future development projects allowed under the PMPU will be subject to further environmental review pursuant to State CEQA Guidelines Section 15168 when site-specific development applications are submitted to the District.

Moreover, future development that is not currently anticipated in the planned improvements or the planning district's Vision may still occur. Such development would need to be consistent with the water or land use designation for the proposed development site, as described in Table 3.1.4,

¹² As stated in the proposed PMPU and Section 3.5.2, *Baywide Development Standards*, it is proposed that all development in each subdistrict shall comply with the subdistrict's Development Standards, as well as the standards identified in Chapter 4, *Baywide Development Standards*, of the PMPU. The subdistrict Development Standards may be an extension of, or a supplement to, a specific baywide element policy, or a standard identified in Chapter 4. Accordingly, proposed subdistrict Development Standards may refer to, and therefore receive guidance from, a specific element policy, or standard in Chapter 4. Where a proposed exception to a standard identified in Chapter 4 is applicable to a specific location, it is noted in the relevant subdistrict standard.

¹³ Development that occurs consistent with the PMPU would be considered an indirect consequence of the proposed PMPU's approval and implementation. While the PMPU plans for future development, it would not actually propose any of the future development itself for implementation. Any such proposals would occur after the PMPU's approval and would not include any assurance of being approved and implemented as such approvals would be subject to environmental review pursuant to State CEQA Guidelines Section 15168 and to future discretionary decisions by the District's Board.

Description of Water and Land Use Designations, of the PMPU, as well as the goals, objectives, and policies of the proposed PMPU, baywide development standards, and the development standards established for each planning district, which by extension would be consistent with the Port Act and CCA.

Table 3-4. Baywide Development Projections

Use	Proposed PMPU Planned Net New¹
Water Use	
Anchorage (moorings)	75
Commercial Fishing Berthing (slips)	65
Institutional Berthing (slips)	0
Marine Services Berthing (slips)	0
Recreational Berthing (slips)	485
Sportfishing Berthing (slips)	0
Total – Waterside Development	575
Land Use	
Hotels (rooms; without associated retail/restaurant)	0
Hotels (rooms; with associated retail/restaurant)	3,910
Meeting Space (sf)	162,000
Retail (sf)	92,250
Restaurant (sf)	89,750
Standalone Retail/ Restaurant (sf)	67,489
Convention (sf)	180,000
Total – Landside Development Use	
Hotel Rooms	3,910
Meeting Space (sf)	162,000
Retail/Restaurant (sf)	340,000
Convention (sf)	180,000

¹The PMPU Net-new potential proposed future development is calculated based on the allowable Planned Improvements located in each planning district or subdistrict. The Planned Improvements are appealable and non-appealable development or improvements for each subdistrict, which are described for each planning district below. sf = square feet

3.5.3.1 Planning District 1: Shelter Island

The Shelter Island Planning District (PD1) is located on the southeastern side of the Point Loma Peninsula, at the entrance to the Bay, near vibrant upland communities, military installations, and the Cabrillo National Monument. Defined by the unique shape of the land, this planning district includes a total of ~~464.98~~ ~~322.8~~ acres, with ~~348.53~~ ~~206.3~~ acres of water and ~~116.715~~ acres of land and has two subdistricts: West Shelter Island and East Shelter Island. A variety of existing uses, such as commercial fishing, sportfishing, recreational berthing, marine sales and services, and commercial recreation, are found in this planning district.

Proposed Water and Land Use Designations

Proposed water and land use designations for PD1, as well as the proposed acreages of each, are provided in Table 3-5. As shown, proposed water use designations would include Anchorage, Commercial Fishing Berthing, Marine Services Berthing, Navigation Corridor, Open Bay/Water, Recreational Berthing, and Sportfishing Berthing. Proposed land use designations include Commercial Fishing, Commercial Recreation, Institutional/Roadway, Marine Sales and Services, Recreation Open Space, and Sportfishing. The proposed water and land use map for PD1 is provided as Figure 3-2.

Table 3-5. Shelter Island Planning District Water and Land Use Designations (Certified PMP and Proposed PMPU)

Certified PMP Designations (Existing)	Existing Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Commercial Fishing Berthing	6.61	Commercial Fishing Berthing	11.08	+4.47 ¹
Marine Services Berthing	16.69	Marine Services Berthing	15.46	-1.23
Recreational Boat Berthing	103.28	Recreational Boat Berthing	103.74	+0.46
Sportfishing Berthing	10.59	Sportfishing Berthing	11.11	+0.52
Navy Small Craft Berthing	7.16	<i>(Designation and some acreage not carried forward in the PMPU; remaining acreage redistributed to other designations)</i>	--	-7.16 ²
Open Bay/Water	45.54	Open Bay/Water	62.25 61.99	+16.45 ^{3,5}
Harbor Services	4.16	<i>(Designation not carried forward in the PMPU and acreage redistributed to other designations)</i>	--	-4.16 ⁴
Boat Navigation Corridor	3.97	Navigation Corridor	108.45	+104.48 ⁵
Boat Anchorage	1.47	Anchorage	36.45	+34.98 ⁵
Navy Ship Berthing	2.4	<i>(Designation and acreage removed in PMPU)</i>	--	-2.40 ⁶
Total Water Use	201.87	Total Water Use	348.27	+146.40
Land Use				
Commercial Fishing	2.47	Commercial Fishing	2.48	+0.01
Commercial Recreation	53.57	Commercial Recreation	54.04	+0.47
Marine Sales and Service	10.45	Marine Sales and Service	8.67	-1.78
Sportfishing	4.11	Sportfishing	4.57	+0.46
Open Space	7.21	<i>(Consolidated to Recreation Open Space)</i>	--	--

Certified PMP Designations (Existing)	Existing Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Park/Plaza	18.77	<i>(Consolidated to Recreation Open Space)</i>	--	--
<i>Total Consolidated Recreation Open Space</i>	25.98	Recreation Open Space	<u>29.16</u> 28.90	+3.18 2.92
Harbor Services Land	2.10	<i>(Consolidated to Institutional/Roadway)</i>	--	--
Streets	22.42	<i>(Consolidated to Institutional/Roadway)</i>	--	--
<i>Total Consolidated Institutional/Roadway</i>	24.52	Institutional/Roadway	17.80	-6.72 ⁷
Navy Fleet School	27.28	<i>(Designation and acreage removed in PMPU)</i>	--	-27.28 ⁶
Total Land Use	148.38	Total Land Use	116.7145	-31.6793

¹ Additional acreage from redistribution of Navy Small Craft Berthing.

² Reduced acreage from elimination of designation and some of the area from the PMP; remaining acreage redistributed to Commercial Fishing Berthing.

³ Additional Open Bay/Water acreage from redistribution of Harbor Services.

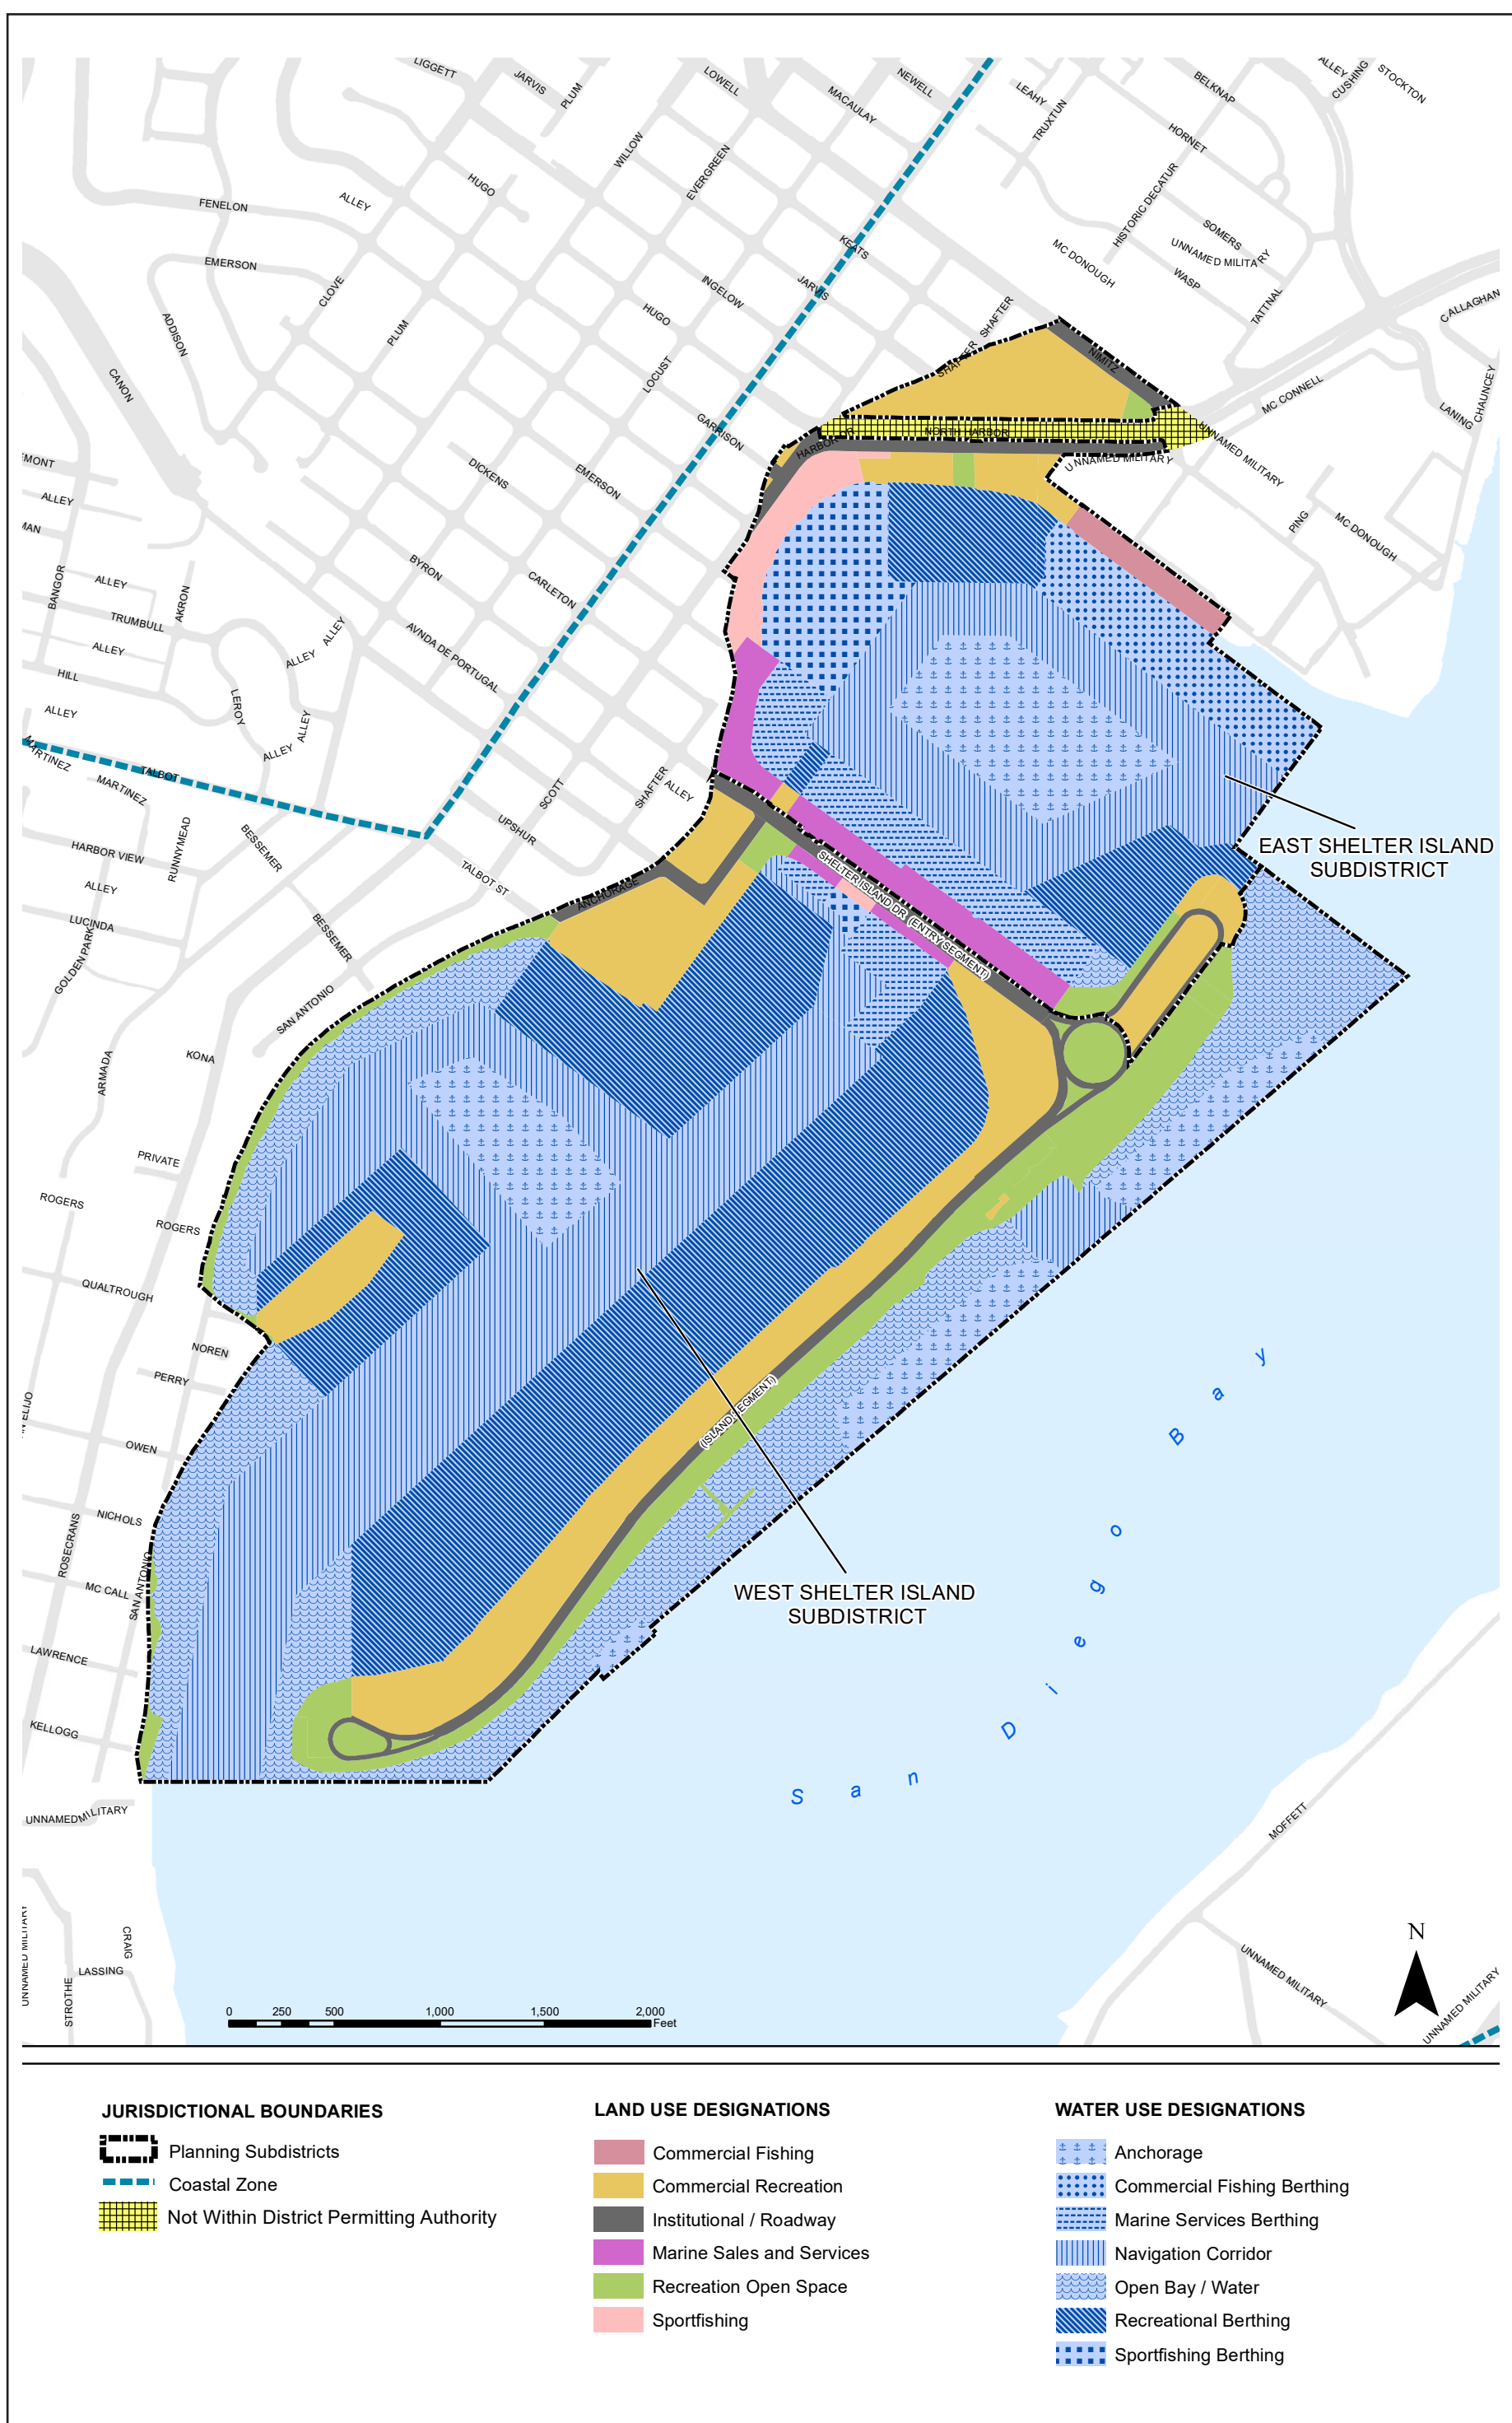

⁴ Reduced acreage from redistribution to Open Bay/Water.

⁵ Certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District from the California State Lands Commission. Thus, for consistency, parcels that had previously been assigned designations in the Certified PMP and have been granted to the District pursuant to SB 507 are proposed to be incorporated into the PMPU area and within the District's coastal permitting authority. In PD1, this includes additional Navigation Corridor, Anchorage, and Open Bay/Water parcels in West Shelter Island, and additional Navigation Corridor and Anchorage parcels in East Shelter Island.

⁶ Reduced acreage from removal of designation and corresponding acreage from the proposed PMPU area.

⁷ Reduced acreage from redesignation of Harbor Services Land to Commercial Recreation and removal of Harbor Services Land and Streets designation in East Shelter Island (identified as "Not Within District Permitting Authority").

This page was intentionally left blank.

This page was intentionally left blank.

West Shelter Island Subdistrict

The West Shelter Island Subdistrict includes the water and land area from the west of Shelter Island Drive to the western end of Shelter Island/Kellogg Street, including the La Playa Trail adjacent to the Point Loma neighborhood (see Figure 3-2).

Vision

The vision for the West Shelter Island Subdistrict is to celebrate the maritime and coastal character and honors its connection with the water by preserving its unique mix of coastal uses, activities, and access, with an emphasis on maintaining thriving maritime and recreational opportunities. The proposed intensity of commercial development is not planned to change over the life of the proposed PMPU. Proposed future development and planned improvements are intended to further enhance and enliven the area, consistent with this subdistrict's character and scale of development.

Special Allowances

La Playa Piers

The four existing piers within the West Shelter Island subdistrict are proposed to ~~be remain~~ maintained, and overwater coverage will not be expanded. The piers ~~will shall~~ be accessible to the public daily from sunrise to sunset and may have security gates to control access outside of these required time frames ~~for public accessibility~~. Signs ~~are proposed that~~ indicating e availability for public use ~~shall and such signs will~~ be clearly posted on the landward portion of the pier for all piers retained. Gangways and docks on these four piers may remain closed to the public (see *Figure PD1.5, Major Components of a Pier*, in Appendix ~~N~~ of the PEIR). The pier at the La Playa Yacht Club may remain ~~in the capacity of as~~ its current use, in the location shown in PMPU, Figure PD1.1, and is exempt from the requirements of PD1.1. No new quasi-private/quasi-public piers or docks associated with residential properties, or residential use, ~~shall be allowed. are proposed and will be explicitly disallowed.~~

Planned Improvements

Planned improvements for West Shelter Island target improved landside and coastal access. Specifically, the proposed PMPU would plan for mobility hubs, including a Connector Mobility Hub on the western portion of Shelter Island Drive, near the Shelter Island Pier, and a Local Gateway Hub at the Shelter Island Yacht Club (near the intersection of Anchorage Lane and Shelter Island Drive), which would provide wayfinding and pathway connections to the potential water-based transfer point in the West Basin, when established. Planned improvements in this subdistrict also propose development and operation of a bayfront circulator to provide connections between Shelter Island, Harbor Island, and the Embarcadero Planning District.

Roadway improvements are proposed that would involve enhancements to the public realm by updating and improving signage, creating wide sidewalks, and removing obstacles to improve visibility and create safe pedestrian crossings facilities; and enhancements to and reconfigurations along Shelter Island Drive by narrowing to two general travel lanes, reconfiguring off-street parking, and creating a multi-use path, in order to allow the expansion of the waterside promenade and Recreation Open Space, and the provision of a series of garden spaces, an amenity zone, and up to five activating features. The proposed PMPU also ~~proposes~~ allows for the addition of an activating

feature at the intersection of Anchorage Lane and Shelter Island Drive, and enhancements to pedestrian crossings and pedestrian access throughout the subdistrict. La Playa Trail would remain and be maintained and improved for the benefit of public access and natural resources, as a nature trail with a variable width. The La Playa Trail trailhead would be enhanced with minimal activating features such as benches and the existing cultural markers would remain.

Coastal access enhancements include modification or replacement of the existing water-based transfer point at the Shelter Island Pier, as well as the development of up to four water-based transfer points throughout the subdistrict. Improvements are also proposed for existing short-term public docking, marina facilities, launch areas, the Shelter Island Boat Launch, and anchorages.

While the proposed PMPU ~~plans~~ allows for modifications to, or replacement in-kind of, existing retail and/or restaurant, existing hotel rooms, including associated retail or restaurant space, the proposed PMPU does not plan for the addition ~~include an increase in the number of new~~ hotel rooms ~~allowed~~ in this subdistrict.

~~Within In addition to the subdistrict proposed~~ planned improvements discussed above, there are also planned improvements that are considered appealable projects. These appealable projects are described below.

Appealable Projects

The proposed PMPU allows ~~plans~~ for the following appealable projects for the West Shelter Island subdistrict:

- Allow development of up to four water-based transfer points in the following locations, as generally depicted in PMPU, Figure PD1.3:
 - Near the intersection of Anchorage Lane and Shelter Island Drive (Entry Segment);
 - Northeast of the opening of the Shelter Island Yacht Basin;
 - At the opening of the Shelter Island Yacht Basin; and
 - In between the Shelter Island Boat Launch and Shelter Island Pier. This water-based transfer point should be developed for small recreational watercraft, such as dinghies.
- Develop up to four additional short-term public docking slips in association with recreational marina-related facilities, provided there is no net increase in slips within the subdistrict.
- Allow for modifications to moorings to accommodate a cumulative increase of up to 10 moored vessels at existing Shelter Island Anchorages, including the A-1, A-1a, A-1b, and A-1c anchorage areas, provided the boundaries of each of the anchorages do not change, and there is no unmitigated increase in shading or fill.

Development Standards

The development standards apply to development in the West Shelter Island Subdistrict. The standards provide requirements for development, as well as the size, location, siting, and orientation of required public realm features or buildings and structures.

The Proposed public realm standards for future development, include the requirement to install provision of a continuous waterside promenade, unless it is at a coastal-dependent maritime industrial use. ~~Wand~~ walkways would also be required to enhance physical access perpendicular to

the waterfront. View corridor extensions are also ~~allowed for proposed at~~ Bessemer Street, Nichols Street, and McCall Street; and the development standards propose scenic vistas at the following locations:

- View of the Bay, from Kellogg Beach.
- View of the La Playa waterfront from the entrance to the Southwestern Yacht Club leasehold, immediately adjacent to Qualtrough Street.
- View of the Shelter Island Yacht Basin from the La Playa trailhead.
- View of the Shelter Island Yacht Basin from the water's edge near Shelter Island Drive at Anchorage Lane.
- View of the Bay from Shelter Island Shoreline Park, north of Anchorage A-1c.
- View of the Bay from Shelter Island Park near Shelter Island Pier.
- View of the Bay and Pacific Ocean from Shelter Island Point.

Building standards ~~would allow for propose that new~~ structures not exceeding 30 feet in height. However, structures that exceed 30 feet in height and are existing as of the certification of the PMPU, may maintain their structure heights.

East Shelter Island Subdistrict

The East Shelter Island Subdistrict includes the water and land area from the east of Shelter Island Drive, including the America's Cup Harbor and the immediately adjacent landside area bounded by North Harbor Drive, except for an additional triangular area bounded roughly by Shafter Street on the north and Nimitz Boulevard on the east (see Figure 3-2).

Vision

The vision for East Shelter Island proposes continued strong support for the area's boating and fishing communities, integrated with visitor-serving uses. ~~This is envisioned to~~ The vision for the East Shelter Island Subdistrict includes improved public access through enhanced mobility and pedestrian connections, to allow workers and visitors to safely work in and explore the area. The PMPU ~~proposes enabling the would enable the~~ development of new opportunities that will complement the commercial fishing and sportfishing industries, and promote recreational boating, as well as modernize the commercial fishing, sportfishing, and recreational boating facilities. The intensity of commercial development is not planned to substantially increase. Planned improvements are intended primarily to further enhance and enliven the area, consistent with the subdistrict's character and scale of development.

Special Allowances

No special allowances are proposed for East Shelter Island.

Planned Improvements

Planned improvements for East Shelter Island target improvements related to landside and coastal access. Specifically, the proposed PMPU plans for a Connector Mobility Hub south of North Harbor Drive with wayfinding and pathway connections to connect the existing water-based transfer points and existing short-term public docking south of the North Harbor Drive and adjacent to Point Loma

Marina Park. As noted in the West Shelter Island *Planned Improvements* subsection, development and operation of a bayfront circulator is proposed to provide connections between Shelter Island, Harbor Island, and the Embarcadero Planning District. Proposed roadway improvements would include enhancement of pedestrian crossing throughout the subdistrict and the development of a multi-use path to connect Shelter Island to Spanish Landing Park located in the Harbor Island Planning District.

Proposed coastal access enhancements include modification or replacement of the existing water-based transfer points and existing short-term public docking adjacent to Point Loma Marina Park, at the opening of America's Cup Harbor, and at America's Cup Harbor near the intersection of Anchorage Lane and Shelter Island Drive. In addition, the proposed PMPU plans for the development of a new water-based transfer point for small recreational watercraft. Coastal access planned improvements could also include modification or replacement of existing commercial fishing marina facilities and existing recreational marina-related facilities, including sportfishing facilities.

While the proposed PMPU would allow modifications to, or replacement in-kind of, existing hotel rooms, including associated retail or restaurant space, the PMPU does not plan for the addition of new hotels rooms in this subdistrict. Similarly, modifications to, or replacement in-kind of, existing retail and/or restaurant space would be allowed to the same or lesser size facilities and in the same general footprint.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

Of the planned improvements for East Shelter Island, the following are appealable projects:

- Modify North Harbor Drive to accommodate vehicular traffic, pathways, and bikeways.
- Modify Nimitz Boulevard to accommodate vehicular traffic, pathways, and bikeways.
- Develop a water-based transfer point at the southern end of Shelter Island Drive (Entry Segment), in America's Cup Harbor, as generally depicted in PMPU, Figure PD1.3. This water-based transfer point should be developed for small recreational watercraft, such as dinghies.
- Allow development of up to two additional short-term public docking slips, in association with recreational marina-related facilities.
- Allow for development up to 35 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities in this subdistrict, to allow for the accommodation of various-sized vessels.
- Allow for modifications to moorings to allow for an increase of up to 20 moored vessels at America's Cup Harbor Anchorage (A-2) provided the boundaries of the anchorage do not change and there is no unmitigated increase in shading or fill.
- Allow development of up to 65 additional commercial fishing berthing vessel slips in association with commercial fishing marina-related facilities in this subdistrict, to allow for the accommodation of various-sized vessels.

Development Standards

Proposed public realm standards include the provision of a continuous waterside promenade and walkways to enhance physical access to the waterfront. Waterside promenades are not required for development that is a coastal-dependent maritime industrial use. View corridor extensions are also allowed for proposed at Garrison Street and Dickens Street, and the development standards would establish scenic vistas at the following locations:

- View of America's Cup Harbor and the Bay from Point Loma Marina Park.
- View of America's Cup Harbor from the point of East Shelter Island.
- View of America's Cup Harbor from the America's Cup Harbor pier lookout.

Building standards require propose that structures shall must not exceed 30 feet in height. However, structures that exceed 30 feet in height and are existing as of the certification of the PMPU, may maintain their structure heights. Further these building standards require that all non-water-oriented uses located along Shelter Island Drive, between Anchorage Lane and the Shelter Island Roundabout, must orient the building's primary frontage along Shelter Island Drive, and that buildings must be oriented in a manner that promotes the public visibility of waterside sportfishing and commercial fishing activities.

3.5.3.2 Planning District 2: Harbor Island

Located just north of Downtown San Diego and south of San Diego International Airport (SDIA), the Harbor Island Planning District (PD2) is a prominent entry point to San Diego and downtown San Diego, introducing the area as a quality destination to visit and inviting people to enjoy District Tidelands. PD2 includes ~~391.8382.8~~ total acres, with ~~204.09195.08~~ acres of water area and 187.74 acres of land area. PD2 is divided into four proposed subdistricts: Spanish Landing, West Harbor Island, East Harbor Island, and the Pacific Highway Corridor. The four proposed subdistricts include park and open space area, pedestrian and bicycle pathways, and recreational marinas. Visitor-Serving Recreation Commercial uses also comprise much of PD2, with large surface parking lots occupying areas within East Harbor Island and the Pacific Highway Corridor. The Pacific Highway Corridor subdistrict also includes the District's existing Administration Building.

While PD2 also includes the SDIA, and the District retains trusteeship of this land, this subdistrict, including all land uses, activities, and improvements, is under the land use authority of the San Diego County Regional Airport Authority and the California Coastal Commission; and the proposed PMPU does not provide policies or identify planned improvements for this area. Future development planned for and associated with the SDIA is included in the cumulative impact analysis provided in Chapter 4, *Environmental Analysis*.

Proposed Water and Land Use Designations

Proposed water and land use designations as well as the proposed acreages of each water and land use designation are provided in Table 3-6. As shown, water use designations would include Anchorage, Navigation Corridor, Open Bay/Water, and Recreational Berthing. Proposed land use designations would include Commercial Recreation, Institutional/Roadway, Maritime Services and Industrial, and Recreation Open Space. The proposed water and land use map for PD2 is provided on Figure 3-3.

JURISDICTIONAL BOUNDARIES

- Planning Subdistricts
- Coastal Zone
- San Diego International Airport - Not Within District Permitting Authority

LAND USE DESIGNATIONS

- Commercial Recreation
- Institutional / Roadway
- Maritime Services and Industrial
- Recreation Open Space

WATER USE DESIGNATIONS

- Anchorage
- Conservation / Intertidal
- Navigation Corridor
- Open Bay / Water
- Recreational Berthing

This page was intentionally left blank.

Table 3-6. Harbor Island Planning District Water and Land Use Designations

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Recreational Boat Berthing	90.5	Recreational Boat Berthing	98.90	+8.40
Specialized Berthing	11.9	<i>(Designation removed in the PMPU, and acreage distributed to other designations)</i>	0.00	-11.9
Boat Anchorage	--	Anchorage	9.08	+9.08 ¹
Open Bay/Water	38	Open Bay/Water	42.50	+4.50 ²
Harbor Services	6.04	<i>(Designation removed in the PMPU, and acreage distributed to other designations)</i>	--	-6.04
Boat Navigation Corridor	10.2	Navigation Corridor	48.60	+38.40 ¹
--	--	Conservation/Intertidal	5.02	+5.02 ²
Total Water Use	156.57	Total Water Use	204.09	+47.52
Land Use				
Airport Related Commercial	5.37	<i>(Designation and acreage removed in the PMPU)</i>	--	-5.37 ³
Commercial Recreation	53.30	Commercial Recreation	105.66	+52.36 ³
Aviation Related Industrial	11.47	<i>(Designation and most acreage not carried forward in the PMPU)</i>	--	-11.47 ³
Industrial Business Park	32.34	Maritime Services and Industrial	4.06	-28.28 ³
Open Space	17.49	<i>(Consolidated to Recreation Open Space)</i>	--	--
Park/Plaza	20.76	<i>(Consolidated to Recreation Open Space)</i>	--	--
<i>Total Consolidated Recreation Open Space</i>	38.25	Recreation Open Space	37.47	-0.78 ⁴
Harbor Services Land	2.62	<i>(Consolidated to Institutional/Roadway)</i>	--	--
Streets	43.85	<i>(Consolidated to Institutional/Roadway)</i>	--	--
<i>Total Consolidated Institutional/Roadway</i>	46.47	Institutional/Roadway	40.56	-5.91 ⁵
Total Land Use	187.20	Total Land Use	187.74	+0.54

¹ Certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District from the California State Lands Commission. Thus, for consistency, parcels that had previously been assigned designations in the Certified PMP and have been granted to the District pursuant to SB 507 are proposed to be incorporated into the PMPU area and within the District's coastal permitting authority. In PD2, this includes additional Navigation Corridor parcels in West Harbor Island, and additional Navigation Corridor and Anchorage parcels in East Harbor Island.

²Additional acreage from redistribution of Harbor Services.

³Additional Commercial Recreation acreage from redistribution of Aviation Related Industrial, Airport Related Commercial, Industrial Business Park, and some Park/Plaza.

⁴Reduced acreage from redistribution to Commercial Recreation.

⁵Reduced acreage from redistribution to Recreation Open Space.

West Harbor Island Subdistrict

The West Harbor Island Subdistrict includes the water and land area north of the Harbor Island Drive entry segment and south of the Spanish Landing Subdistrict, including the area to the west of Harbor Island Drive (see Figure 3-3).

Vision

The ~~proposed~~ vision for the West Harbor Island Subdistrict is to create a premier, visitor-serving destination welcoming visitors to San Diego. The District envisions increased intensity of commercial development with new hotel rooms, retail and restaurant space, and attractions in West Harbor Island, providing greater opportunities for visitors to explore and enjoy the area. Future mobility improvements will enhance connections to, from, and through the subdistrict with dedicated bikeways, a mobility hub, and integration of the bayfront circulator.

Special Allowances

No special allowances are proposed for this subdistrict.

Planned Improvements

Proposed landside access planned improvements for West Harbor Island include the development of a Local Gateway Mobility Hub on the western portion of Harbor Island Drive, as generally depicted on Figure PD2.3 of the proposed PMPU. The mobility hub would provide wayfinding and pathway connections to link to the existing water-based transfer point near the western portion of Harbor Island Drive, on the basin side of the subdistrict.

In addition, a bayfront circulator is proposed to be developed, as generally depicted on Figure PD2.3 of the proposed PMPU, to provide connections between the Shelter Island, Harbor Island, and Embarcadero Planning Districts. The bayfront circulator may be phased so that it starts during the summer months and, if demand warrants, will then be expanded during other times of the year.

An entry gateway is proposed on or adjacent to Harbor Island Drive (Entry Segment) at the entrance to West Harbor Island, welcoming visitors and highlighting the unique visitor-serving, public access, and recreational opportunities available on Harbor Island. North Harbor Drive would be modified in coordination with other agencies, by developing a multi-use path along the south side of North Harbor Drive due to constrained roadway widths, as generally depicted on Figure PD2.4 of the proposed PMPU, adjacent to the potential dedicated transit lane(s), to ultimately connect to the Shelter Island and Embarcadero Planning Districts. (See the appealable projects list below for additional proposed modifications to North Harbor Drive.)

The east-west portion of Harbor Island Drive (Island Segment) is proposed to be modified (see the concept shown as Figure PD2.6 of the proposed PMPU) and may include narrowing Harbor Island Drive to two or three general travel lanes to accommodate vehicular traffic; reconfiguring off-street public parking as diagonal parking, to increase on street parking supply and avoid loss of existing public parking unless parking is provided in the Local Gateway Mobility Hub as described in Planned Improvement PD2.1 in Section 5.2.2(C)-I of the proposed PMPU; incorporating high-visibility crosswalks in alignment with walkways and at intersections, including controlled crossings and curb extensions to reduce crossing distances; and, upon reconfiguration of Harbor Island Drive, expanding and activating Recreation Open Space as described in Planned Improvement PD2.7 in Section 5.2.2(C)-I of the proposed PMPU.

Upon reconfiguration of Harbor Island Drive, as described in PMPU Planned Improvement PD2.6 and illustrated on PMPU Figure PD2.6 of the proposed PMPU, the Recreation Open Space is proposed to be expanded and improved (potentially in phases), which may include an expanded waterside promenade, a series of garden spaces; an amenity zone landside of the waterside promenade; and up to five activating features, three of which may be pavilions, in accordance with the requirements of Chapter 4 of the proposed PMPU.

The existing water-based transfer point at the western portion of Harbor Island Drive, on the basin side of the subdistrict, is proposed to be modified, or replaced in-kind, as generally depicted on Figure PD2.3 of the proposed PMPU, and development of a water-based transfer point at the northeast side of the West Basin is proposed.

Existing recreational marina-related facilities in the West Basin of Harbor Island are proposed to be modified or replaced in-kind, provided there would be no unmitigated increase in shading or fill.

Upon reconfiguration of Harbor Island Drive (see Planned Improvements PD2.6 and PD2.7 in Section 5.2.2(C)-I of the proposed PMPU), the PMPU plans for step-down areas that may be integrated into the area between the Scenic Vista Areas depicted on Figure PD2.4 of the proposed PMPU to offer direct, physical access to the water, and enable the public to touch the water. Step-down areas would be integrated into the design of adjacent Recreation Open Space areas as well.

The PMPU also allows for modification or replacement in-kind of existing retail and/or restaurant, to the same or lesser size, and in the same general footprint in the Commercial Recreation-designated area along Harbor Island Drive (Entry Segment and Island Segment).

Planned improvements for visitor-serving commercial uses include development of up to 25,000 additional square feet of restaurant space, which could be substituted for development of up to 25,000 square feet of retail and/or retail with restaurant space as indicated in the *Appealable Projects* section below, in the Commercial Recreation-designated area along Harbor Island Drive (Entry Segment and Island Segments).

The PMPU also allows for modification or replacement in-kind of existing hotel rooms, including associated retail, restaurant, and/or meeting space, to the same or lesser size, and in the same general footprint in the Commercial Recreation-designated area along Harbor Island Drive (Entry Segment and Island Segment).

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for the West Harbor Island subdistrict:

- Modify North Harbor Drive, in coordination with other agencies, by narrowing North Harbor Drive to four general travel lanes to accommodate vehicular traffic and providing ~~a potential~~ dedicated transit lane(s) along the south side of North Harbor Drive, east of Harbor Island Drive, to support a bayfront circulator or other transit options. The ~~potential~~ dedicated transit lane(s) ~~are~~ is planned to ultimately provide a connection between the SDIA and the San Diego Convention Center.
- Modify Harbor Island Drive (Entry Segment) to accommodate:

- Vehicular traffic, pathways, bikeways, and other improvements, including new signage welcoming visitors to San Diego and Harbor Island;
 - An arrival gateway at the intersection of Harbor Drive and Harbor Island Drive;
 - Pedestrian connections between North Harbor Drive and Harbor Island Drive (Entry Segment), through improvements such as high-visibility crosswalks, controlled crossings, and curb extensions or safety islands to reduce crossing distances;
 - Pedestrian and landscape improvements along both the west and east sides of Harbor Island Drive, including street furniture, seating, pedestrian lighting, a parkway with a minimum of 8 feet in width with landscaping and street trees, a multi-use path measuring a minimum width of 12 feet along the west side of the street, and a sidewalk measuring 8 feet in width along the east side of the street;
 - Safety islands integrated into the design of street crossings to shorten pedestrian crossing distances where needed; and
 - Where they exist, medians improved in coordination with the design of the above improvements, which may include a combination of signage, lighting, landscaping, and/or public art.
- Develop a water-based transfer point on the northeast side of the West Basin of Harbor Island, as generally depicted in PMPU, Figure PD2.3.
 - Develop up to four short-term public docking slips in association with recreational marina-related facilities in the West Basin of Harbor Island.
 - Develop up to 165 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities in this subdistrict to allow for the accommodation of various-sized vessels.
 - Develop up to 25,000 additional square feet of retail and/or retail with restaurant space in the Commercial Recreation-designated area along Harbor Island Drive (Entry Segment and Island Segments), ~~which could be substituted for development of up to 25,000 square feet of restaurant space as indicated in the Planned Improvements section above.~~
 - In addition to existing facilities, develop up to 1,700 additional hotel rooms, with up to 32,000 additional square feet of associated retail and restaurant, and/or up to 37,000 additional square feet of meeting space along Harbor Island Drive (Island Segment), for a total of 2,985 hotel rooms plus ancillary facilities in the West Harbor Island Subdistrict.

Development Standards

Proposed public realm standards include the provision of a continuous waterside promenade and walkways to enhance physical access to the waterfront. Proposed waterside promenades would be required as part of all development that abuts the waterfront and that is not a coastal-dependent use, and in any other location where a waterside promenade is generally depicted on Figure PD2.4 of the proposed PMPU. Proposed waterside promenades would have a minimum width of 15 feet in the West Harbor Island Subdistrict, as generally depicted on Figure PD2.7 of the PMPU and aligned with the guidance in PD2.7. Walkways would be provided to offer physical access perpendicular to the waterfront, in accordance with the requirements of Chapter 4 of the PMPU.

Scenic vista areas are proposed to be preserved in accordance with the requirements of Chapter 4 of the PMPU, in the following locations, as generally depicted on Figure PD2.4 of the proposed PMPU:

- Bayside of Harbor Island Drive near the west point of Harbor Island.
- Harbor Island Park on the bayside of Harbor Island Drive.
- Bayside of Harbor Island Drive (Island Segment) near the intersection of the Entry and Island Segments of Harbor Island Drive.

Building standards propose that structures must not exceed 160 feet in height. A 10- to 15-foot-wide building setback would be provided, as generally depicted on Figure PD2.7 of the proposed PMPU, between all waterside promenades and all landside development. The setback area is proposed to include landscaping and bicycle and pedestrian facilities, such as bike racks, fixed or movable seating, and/or other possible improvements.

Proposed buildings located on Tidelands at the intersection of Harbor Drive and Harbor Island Drive would be oriented to the corner to create a welcoming entry. Roof forms and other architectural features, such as doors, windows, and canopies, are proposed to be oriented toward the corner and Harbor Island Drive. Open space, patios, plazas, and/or landscaping may be located at this intersection; however, they are proposed to be accessible and scaled for pedestrian use. Allowable surface parking or structured parking would not be allowed to front this intersection and would not be oriented toward Harbor Island Drive. Parking would be located internal to the block, or oriented toward Harbor Drive. Proposed buildings located on Tidelands along the Harbor Island Drive (Entry Segment) would be oriented to front the street and open onto Harbor Island Drive, to create a pedestrian-oriented “main street” environment.

The location and configuration of existing public parking areas may be modified if an equivalent amount of public parking is provided through a mobility hub, on-street parking, or a combination thereof, subject to the requirements of the Mobility Element.

When a proposed development site would be located between the waterfront (Bay or Basin) and Harbor Island Drive, parking would be located toward the most interior, roadside portion of the development site. Proposed parking may be located partially underground or in a structure but would not directly abut the water’s edge.

East Harbor Island Subdistrict

The East Harbor Island Subdistrict includes the water and land area south of the Harbor Island Drive entry segment, west of North Harbor Drive, and north of the U.S. Coast Guard facility (see Figure 3-3).

Vision

The ~~proposed~~ vision for the East Harbor Island Subdistrict is to create a regional destination that is welcoming to visitors with improved mobility, increased recreation, and enhanced coastal access. The intensity of commercial development in East Harbor Island is ~~proposed~~ planned to increase with new hotel rooms, retail and restaurant space, and attractions. Mobility improvements are proposed to expand access to and through the area, with the integration of bayfront circulator routes connecting directly to the SDIA, the Convention Center, and dedicated bikeways. A new mobility hub, together with water-based transfer points, is proposed and ~~would~~ provide options for workers and visitors to transfer between modes of transportation and reduce reliance on single-occupancy vehicles. The vision includes coordination with agencies that have transportation

authority on the location of an airport transit connection, along with supporting transit stations and infrastructure. The proposed reconfiguration of Harbor Island Drive would allow for safer cycling, while providing new areas for recreation open space.

Special Allowances

The following special allowance, consistent with WLU Goal 2 (Chapter 4.1, Water and Land Use Element), addresses unique situations in the East Harbor Island Subdistrict. No special allowances are proposed for this subdistrict.

The consolidated Harbor Police Facilities (PMPU, PD2.28) would include the future consolidation of all of the District's Harbor Police water and land facilities, which may potentially be located within the East Harbor Island Subdistrict. Such a facility would include development of up to a 15,000-square-foot dock for mooring of patrol watercraft and include a nearby land area of approximately 3 acres for construction of a new headquarters building and supporting service areas.

Planned Improvements

Landside proposed access planned improvements for East Harbor Island include the development of a Regional Mobility Hub near the northwestern portion of the East Basin of Harbor Island, and development and operation of a bayfront circulator, which would meet the criteria of a Regional Mobility Hub, in accordance with the proposed requirements of Chapter 4 of the proposed PMPU, and provide wayfinding and pathway connections to connect to the nearby water-based transfer points on the northwestern portion of the East Basin of Harbor Island.

A bayfront circulator, as generally depicted on Figure PD2.3 of the PMPU, is proposed to be developed to provide connections between the Shelter Island, Harbor Island, and Embarcadero Planning Districts. The proposed bayfront circulator may be phased so that it starts during the summer months and, if demand warrants, is then expanded during other times of the year. An entrance gateway may be developed on or adjacent to the entry segment of Harbor Island Drive. Proposed modifications to North Harbor Drive, in coordination with other agencies, would include providing potential dedicated transit lane(s) along the south side of North Harbor Drive, east of Harbor Island Drive, to support a bayfront circulator or other transit options and developing a multi-use path along the south side of North Harbor Drive due to constrained roadway widths, as generally depicted on Figure PD2.4 of the proposed PMPU, adjacent to the dedicated transit lane, to ultimately connect to the Shelter Island and Embarcadero Planning Districts. Additional proposed appealable projects associated with modifications to North Harbor Drive are discussed in the *Appealable Projects* section below.

The east-west portion of Harbor Island Drive (Island Segment) is proposed to be modified and may include the following:

- Narrowing to two or three general travel lanes to accommodate vehicular traffic.
- Reconfiguring off-street public parking as diagonal parking to increase on street parking supply and avoid loss of existing public parking unless parking is provided in the Regional Mobility Hub, as described in Planned Improvement PD2.29~~6~~ in Section 5.2.3(C)-I of the proposed PMPU.
- Incorporating high-visibility crosswalks in alignment with walkways and at intersections, including controlled crossings and curb extensions to reduce crossing distances.

- Upon reconfiguration of Harbor Island Drive, the proposed PMPU plans for the expansion and activation of Recreation Open Space, as described in Planned Improvement PD2.363 in Section 5.2.3(C)-I of the proposed PMPU.

Additionally, Liberator Way is proposed to be modified and may include the following:

- Narrowing to two general travel lanes to accommodate vehicular traffic.
- On-street parking.
- Crosswalks at Liberator Way and Harbor Island Drive.
- Pedestrian and landscape improvements along both sides of Liberator Way, as generally depicted on Figure PD2.8 of the proposed PMPU, including landscape improvements, street furniture, seating, and pedestrian lighting.
- Sidewalks with a minimum width of 8 feet along each side of the street.
- A minimum 9-foot-wide parkway located between the street (roadway) and the sidewalk, with enhanced native and drought tolerant landscaping and street trees.

Upon reconfiguration of Harbor Island Drive the proposed Recreation Open Space would be expanded and activated. Recreation Open Space improvements are proposed to provide an expanded waterside promenade, a series of garden spaces, an amenity zone landside of the waterside promenade, and up to five proposed activating features within the Recreation Open Space area, three of which may be pavilions, in accordance with the requirements of Chapter 4 of the proposed PMPU.

Upon reconfiguration of Liberator Way, Recreation Open Space would be created in the Recreation Open Space-designated area north of the basin. Recreation Open Space improvements are proposed to provide a waterside promenade, a step-down area, a potential hand-launched, non-motorized watercraft launch area, a potential water-based transfer point, a potential skate park; and other potential health and wellness features.

Proposed coastal access improvements would include developing water-based transfer points on the northwest side of the East Basin of Harbor Island, and the northeast side of the East Basin of Harbor Island. This proposed water-based transfer point would also be developed to allow for small recreational watercraft, such as dinghies. Existing short-term public docking in the East Basin of Harbor Island is proposed to remain, and one short-term public docking slip in the northwest side of the East Basin of Harbor Island would be developed.

Existing recreational marina-related facilities in the East Basin of Harbor Island are proposed to be modified, or replaced in-kind, provided there is no unmitigated increase in shading or fill. A launch area for hand-launched nonmotorized watercraft is proposed on the northeast side of the East Basin, as generally depicted on Figure PD2.3 of the proposed PMPU. Existing moorings in the Harbor Island Anchorage (A-9) could be modified or replaced in-kind. Upon reconfiguration of Harbor Island Drive, proposed step-down areas would be provided to offer direct, physical access to the water, and enable the public to touch the water at the west end of the basin and the northeastern edge of the basin, in the vicinity of the Scenic Vista Area in the proposed Recreation Open Space. Where provided, step-down areas would be integrated into the design of adjacent Recreation Open Space areas.

The PMPU also allows for modification or replacement in-kind of existing retail and/or restaurant, to the same or lesser size, and in the same general footprint in the Commercial Recreation-designated area along Harbor Island Drive, south of the basin.

Finally, in the Commercial Recreation-designated area north of the basin, development of up to 92,500 square feet of restaurant space is proposed, which could be substituted for development of up to 92,500 square feet of retail and/or retail with restaurant space as indicated in the *Appealable Projects* section below. Also in this Commercial Recreation-designated area north of the basin, a visitor-serving attraction with up to approximately 70,000 square feet of associated retail and/or retail with restaurant is proposed.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for the East Harbor Island subdistrict:

- Modify North Harbor Drive, in coordination with other agencies, by narrowing North Harbor Drive to four general travel lanes to accommodate vehicular traffic and providing ~~a potential~~ dedicated transit lane(s) along the south side of North Harbor Drive, east of Harbor Island Drive, to support a bayfront circulator or other transit options. The ~~potential~~ dedicated transit lane(s) ~~are is~~ planned to ultimately provide a connection between the SDIA and the San Diego Convention Center.
- Modify Harbor Island Drive (Entry Segment) to accommodate vehicular traffic, pathways, bikeways, and other improvements, including:
 - New signage welcoming visitors to San Diego and Harbor Island;
 - An arrival gateway at the intersection of Harbor Drive and Harbor Island Drive;
 - Pedestrian connections between North Harbor Drive and Harbor Island Drive (Entry Segment), through improvements such as high-visibility crosswalks, controlled crossings, and curb extensions or safety islands to reduce crossing distances;
 - Pedestrian and landscape improvements along both the west and east sides of Harbor Island Drive, including street furniture, seating, pedestrian lighting, a parkway with landscaping and street trees, a multi-use path measuring a minimum width of 12 feet, along the west side of the street, and an 8-foot-wide sidewalk along the east side of the street; and
 - Where they exist, medians improved in coordination with the design of the above improvements, which may include a combination of signage, lighting, landscaping, and/or public art.
- Develop water-based transfer points in the following locations, as generally depicted in Figure PD2.3 of the PMPU:
 - The northwest side of the East Basin of Harbor Island; and
 - The northeast side of the East Basin of Harbor Island. This water-based transfer point should also be developed to allow for small recreational watercraft, such as dinghies.

- Develop one short-term public docking slip in the northwest side of the East Basin of Harbor Island.
- Develop up to 60 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities, to allow for the accommodation of various-sized vessels.
- Allow for modifications to moorings to allow for an increase of up to five moored vessels at existing Harbor Island Anchorage (A-9), provided the boundaries of the anchorage do not change and there is no unmitigated increase in shading or fill~~an increase of up to five moored vessels at the existing Harbor Island Anchorage.~~
- In the proposed Commercial Recreation-designated area north of the East Basin, ~~develop retail, restaurant, and/or overnight accommodations,~~ including:
 - Overnight accommodations of up to 1,360 hotel rooms with up to 40,000 square feet of meeting space; and/or
 - 92,500 square feet of associated retail and/or retail with restaurant ~~(which could be substituted for development of up to 92,500 square feet of restaurant space as indicated in the *Planned Improvements* section above).~~
- In the Commercial Recreation-designated area north of the East Basin, develop a site that has been reserved for the provision of lower cost overnight accommodations with up to 400 beds or camping/recreational vehicle sites, or equivalent rooms, and may be constructed as a component of the Regional Mobility Hub (as generally depicted in Figure PD2.3 of the PMPU). This may also include associated visitor-serving retail, restaurant, and/or meeting space. ~~Develop up to 400 beds or camping/recreational vehicle sites, or equivalent rooms, of lower cost overnight accommodations in the Commercial Recreation-designated area north of the East Basin.~~
- Develop up to 500 hotel rooms (as approved under the previously certified Port Master Plan in 1991) along Harbor Island Drive near the intersection of the Entry Segment and the Island Segment. This development may also include associated visitor-serving retail, restaurant, and/or meeting space, including piers, and ancillary uses, along Harbor Island Drive, near the intersection of the Entry Segment and Island Segment of Harbor Island Drive.

Development Standards

Proposed public realm standards include the provision of a continuous waterside promenade and walkways for physical access to the waterfront, as generally described and depicted in PMPU, Planned Improvement PD2.53 and Figure PD2.4, respectively. With the exception that promenades would not be required for coastal-dependent maritime industrial uses. Scenic vistas are proposed for the following:

- View of the Bay from the northeast side of the East Basin of Harbor Island.
- View of the Bay from the eastern point of Harbor Island.

~~The Subdistrict B building standards would require~~ propose that: structures must not exceed 225 feet in height (subject to FAA determination); building shall be ~~setbacks of~~ 26 feet from the Liberator Way roadway and 20 feet from the North Harbor Drive roadway right-of-way; and between all waterside promenades and all landside development, a setback between 10 and 15 feet would be required, in all other areas of the subdistrict (PMPU, PD2.58). ~~U; and upper story~~

stepbacks shall be provided, limiting structure height to a maximum of two stories and height of 40 feet, in the following locations and as generally depicted in Figure PD2.10:

- Between 26 to 51 feet from Liberator Way;
- Between 20 to 45 feet from North Harbor Drive; and
- Within 25 feet adjacent to walkways.

The PMPU includes parking development standards that relate to location and configuration standards are also proposed for parking (PDs 2.61 and 2.62).

Spanish Landing Subdistrict

The Spanish Landing Subdistrict (Spanish Landing) includes a linear park formed by Spanish Landing Park West, Spanish Landing Park East, and Cancer Survivor Park, located along Harbor Drive adjacent to West Harbor Island (see Figure 3-3).

Vision

The ~~proposed~~ vision for the Spanish Landing Subdistrict is to preserve Spanish Landing's recreation and pedestrian-focused character while enhancing bicycle and transit access and expanding commercial amenities. The intensity of commercial development is ~~proposed-expected~~ to increase in Spanish Landing, with the addition of new retail and restaurant space. Future waterside development will promote public access throughout the area and activate the shoreline with a continuous waterfront promenade.

Special Allowances

There are no special allowances for this subdistrict.

Planned Improvements

Proposed landside access planned improvements for Spanish Landing include the development of the bayfront circulator, modification of North Harbor Drive, and development of a multi-use path along the south side of Harbor Island Drive. Specifically, the bayfront circulator, as generally depicted on Figure PD2.3 of the proposed PMPU, would provide connections between the Shelter Island, Harbor Island, and Embarcadero Planning Districts. The bayfront circulator may be phased so that it starts during the summer months and, if demand warrants, be expanded during other times of the year.

Proposed modifications to North Harbor Drive, in coordination with other agencies, would include a multi-use path along the south side of North Harbor Drive as generally depicted on Figure PD2.4 of the ~~proposed~~ PMPU, adjacent to a potential dedicated transit lane(s), to ultimately connect the Shelter Island, Harbor Island, and Embarcadero Planning Districts. A proposed multi-use path would be allowed for development to connect Spanish Landing Park to Shelter Island in coordination with the adjacent jurisdictions and appropriate agencies.

Proposed coastal access improvements would involve development of a water-based transfer point at the northwest side of the West Basin and maintenance of an existing launch area for hand-launched nonmotorized watercraft, with both planned improvements generally depicted in PMPU, Figure PD2.3.

Development of up to 90,000 additional square feet of restaurant space in the Commercial Recreation–designated area along Spanish Landing is proposed, which could be substituted for development of up to 90,000 square feet of retail and/or retail with restaurant space as indicated in the *Appealable Projects* section below.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU identifies the following proposed appealable projects for the Spanish Landing subdistrict:

- Modify North Harbor Drive, in coordination with other agencies, by narrowing the roadway to four general travel lanes to accommodate all modes of travel.
- Develop a water-based transfer point at the northwest side of the West Basin of Harbor Island along Spanish Landing Park, as generally depicted in Figure PD2.3 of the PMPU.
- Develop up to 90,000 square feet of Retail and/or Retail with Restaurant space in the Commercial Recreation–designated area along Spanish Landing, ~~which could be substituted for development of up to 90,000 square feet of restaurant space as indicated in the *Planned Improvements* section above.~~

Development Standards

~~This Subdistrict's Proposed~~ public realm standards include the provision of a continuous waterside promenade and walkways to enhance physical access to the waterfront in accordance with the proposed requirements of Chapter 4 and Figure PD2.11 of the proposed PMPU. ~~Moreover, proposed~~ ~~waterside~~ promenades would be required as part of all development that abuts the waterfront and that is not a coastal-dependent maritime industrial use, and in any other location where a waterside promenade is generally depicted on Figure PD2.4 of the proposed PMPU. Proposed waterside promenades would have a minimum width of 15 feet in the Spanish Landing Subdistrict. Walkways would offer physical access perpendicular to the waterfront, in accordance with the proposed requirements of Chapter 4 of the proposed PMPU.

Scenic vistas are proposed for the following:

- View of the Bay from the western edge of Spanish Landing Park.
- View of the West Basin of Harbor Island and Bay from the middle of Spanish Landing Park.
- View of the West Basin of Harbor Island from the eastern edge of the Spanish Landing Subdistrict.

Proposed building standards include height limits, building setback requirements, and parking requirements. Specifically, structure heights ~~would be~~ ~~are proposed to be~~ limited to 30 feet, and buildings are proposed to provide a 10-foot-wide development setback between all waterside promenades and all landside development (as generally depicted on Figure PD2.11 of the ~~proposed~~ PMPU). Development setbacks could and which would include landscaping, public access, and waterfront activation, as well as bicycle and pedestrian facilities, such as bike racks and fixed or movable seating. Parking would not be allowed within the development setback. The PMPU also

proposes that modifications may be made to the location and configuration of existing public parking areas if an equivalent amount of public parking is maintained in this subdistrict.

Pacific Highway Corridor Subdistrict

The Pacific Highway Corridor Subdistrict consists of a narrow strip of land adjacent to and including a segment of Pacific Highway and Laurel Street to the south and southeast of SDIA (see Figure 3-3).

Vision

The ~~proposed~~ vision for the Pacific Highway Corridor Subdistrict is to improve multi-modal access in the Pacific Highway Corridor while providing opportunities for limited commercial development and lower cost overnight accommodations. The District envisions the existing roadway, administrative, and parking uses will be preserved throughout the area, while also providing limited commercial development and lower cost opportunities for visitors to stay on Tidelands. ~~p~~Planned improvements proposed for this subdistrict include enhanced mobility connections that offer enhanced access for vehicular traffic, pedestrians, and bicyclists, as well as supporting regional mobility. The vision includes coordination with agencies that have transportation authority on the location of an airport transit connection, along with supporting mobility hubs, transit stations, and infrastructure.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

All planned improvements for this subdistrict are appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for the Pacific Highway Corridor Subdistrict:

- Modification of Pacific Highway to accommodate vehicular traffic as well as pathways and bikeways.
- In the Commercial Recreation-designated area along Pacific Highway, develop a site that has been reserved for the provisionment of up to 1,000 beds (or equivalent in rooms) of lower cost overnight accommodations with up to 1,000 beds (or equivalent in rooms). This in the Commercial Recreation-designated area along Pacific Highway, which may also include visitor-serving retail, restaurant, and/or meeting space.

Development Standards

Building standards for the Pacific Highway Corridor Subdistrict would require ~~propose~~ that structures ~~must do~~ not exceed 130 feet in height.

3.5.3.3 Planning District 3: Embarcadero

Located along the waterfront adjacent to Downtown San Diego, the Embarcadero Planning District (PD3) comprises a total of ~~456.98~~484.34 acres with ~~228.86~~206.5 acres of water area and ~~255.48~~50.46 acres of land area. PD3 is divided into three subdistricts: North Embarcadero, Central Embarcadero,

and South Embarcadero. PD3 is a vibrant area, with broad regional recreation opportunities, bayfront coastal access, tourism, and economic value. This waterfront area combines visitor-serving uses with waterside maritime activities that showcase and celebrate the history of San Diego's waterfront, including commercial fishing, maritime museums, military history, recreational boating, and recreation areas, all of which contribute to the area's dynamic urban setting and enliven the waterfront user experience.

Proposed Water and Land Use Designations

Proposed water and land use designations for PD3, as well as the proposed acreages of each, are provided in Table 3-7. As shown, proposed water use designations would include Anchorage, Commercial Fishing Berthing, Industrial and Deep-Water Berthing, Navigation Corridor, Open Bay/Water, Recreational Berthing, and Sportfishing Berthing. Land use designations would include Commercial Fishing, Commercial Recreation, Institutional/Roadway, Maritime Services and Industrial, Recreation Open Space, and Visitor-Serving Marine Terminal. The proposed water and land use map for PD3 is provided on Figure 3-4.

Table 3-7. Embarcadero Planning District Water and Land Use Designations

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Commercial Fishing Berthing	18.77	Commercial Fishing Berthing	18.71	-0.06
Recreational Boat Berthing	28.88	Recreational Berthing	76.52	+47.64 ¹
Specialized Berthing	37.54	<i>(Designation removed in the PMPU and acreage redistributed to other designations)</i>	--	--
Terminal Berthing	18.05	Industrial and Deep-Water Berthing	36.04	+17.99 ²
Open Bay/Water	1.53	Open Bay/Water	3.06 ²⁷	+1.53 ⁷⁴³
Boat Navigation Corridor	31.82	<i>(Consolidated to Navigation Corridor)</i>	--	--
Ship Navigation Corridor	13.38	<i>(Consolidated to Navigation Corridor)</i>	--	--
<i>Total Consolidated Navigation Corridor</i>	45.20	Navigation Corridor	44.30	-0.90
Boat Anchorage	24.46	<i>(Consolidated to Anchorage)</i>	--	--
Ship Anchorage	27.62	<i>(Consolidated to Anchorage)</i>	--	--
<i>Total Consolidated Anchorage</i>	52.08	Anchorage	47.73	-4.35 ^{4,5}
	--	Conservation/Intertidal	2.51	+2.51 ³
Total Water Use	202.05	Total Water Use	2298.86⁰⁷	+26.81^{7.02}

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Land Use				
Commercial Fishing	3.99	Commercial Fishing	4.76	+0.77
Commercial Recreation	116.76	Commercial Recreation	102.67	-14.09 ⁶
Aviation Related Industrial	22.44	Maritime Services and Industrial	24.43	+1.99
Marine Terminal	6.28	Visitor-Serving Marine Terminal	12.11	+5.83 ⁷
Open Space	1.10	<i>(Consolidated to Recreation Open Space)</i>	--	--
Park/Plaza	50.97	<i>(Consolidated to Recreation Open Space)</i>	--	--
<i>Total Consolidated Recreation Open Space</i>	52.07	Recreation Open Space	63.33 56.82 ⁸	+4.9675 ⁹
Streets	50.54	Institutional/Roadway	48.17	-2.37 ¹⁰
Total Land Use	252.08	Total Land Use	255.48.97	+3.403.11

¹ Additional acreage from redistribution of Ship Navigation Corridor, Specialized Berthing, and Ship Anchorage.

² Additional acreage from redistribution of Terminal Berthing and Specialized Berthing.

³ Additional acreage from redistribution of Specialized Berthing.

⁴ Reduced acreage from redistribution to Recreational Berthing.

⁵ Certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District from the California State Lands Commission. Thus, for consistency, parcels that had previously been assigned designations in the Certified PMP and have been granted to the District pursuant to SB 507 are proposed to be incorporated into the proposed PMPU area and within the District's coastal permitting authority. In PD3, this includes an additional Anchorage parcel in North Embarcadero.⁶ Reduced acreage from redistribution to Recreation Open Space and Visitor-Serving Marine Terminal

⁷ Additional acreage from redistribution of Commercial Recreation, Park/Plaza, and Marine Terminal

⁸ Does not include 6.3 acres of above-grade Recreation Open Space

⁹ Additional acreage from redistribution of Commercial Recreation and addition of Navy Pier

¹⁰ Reduced acreage from removal of areas designated as Streets that are not within PMPU area

North Embarcadero Subdistrict

The North Embarcadero Subdistrict generally encompasses the water and land area bounded by Laurel Street on the north, F Street on the south, Pacific Highway on the east, and the pierheads on the west—with the exclusion of the San Diego County Administration property and a block bounded by Broadway on the north, North Harbor Drive on the west, Pacific Highway on the east, and West Harbor Drive on the south, which belongs to the Navy (see Figure 3-4).

Vision

The vision for this subdistrict is that of a premier visitor destination on Tidelands, with recreational and commercial activating uses that encourage interaction with the waterfront. In addition to new attractions and enhancements to existing water-based museum attractions in the area, the intensity of commercial development is expected to increase to accommodate new hotel rooms and retail and restaurant space. Future waterside development will contribute to a continuous waterside promenade to promote public access throughout the area. In addition to new development, enhancements to existing uses and activation of new uses should increase coastal access opportunities. New and enhanced recreational space, including the completion of the Lane Field

Setback Park, is a primary component of this area's vision, where proposed reconfiguration of roadways and reallocation of parking areas will expand open space to add both passive and active amenities that enhance the visitor experience. Finally, the numerous piers in this subdistrict are a focal point for this area, and the District envisions a subdistrict in which these piers will provide expansive views of the Bay and unique waterfront recreational space with activating features, continue to serve as a welcoming entry point for cruise passengers, and provide additional commercial fishing space.

Special Allowances

The PMPU proposes three special allowances for the North Embarcadero Subdistrict: B Street Cruise Operations Staging, Broadway Pier, and Navy Pier.

B Street Cruise Operations Staging

This special allowance proposes the temporary closure of the completed B Street connection, between Pacific Highway and North Harbor Drive, which may occur when needed for truck and other staging uses associated with cruise operations.

Broadway Pier

This special allowance proposes the following requirements for the use of Broadway Pier:

- Wayfinding signage shall be provided to communicate that public access is permitted on the pier during days with no cruise ship calls.
- During cruise ship calls at Broadway Pier, Broadway Plaza (the area landward of the Broadway Pier) shall facilitate vehicle access to Broadway Pier for cruise operations and allow public access along the promenade consistent with security regulations.
- Up to 12 public meetings and 40 nonprofit events per year may occur, as long as they do not disrupt maritime operations.

Navy Pier

The final special allowance proposes to designate the entire Navy Pier as Recreation Open Space on the Embarcadero Planning District Water and Land Use Map (PMPU, Figure PD3.2), ~~with the phasing of development of parking and a park on the pier.~~

Planned Improvements

Proposed planned improvements for the North Embarcadero Subdistrict would involve improvements to landside circulation. Specifically, the proposed PMPU plans for a Regional Mobility Hub to be developed on the block bounded by Grape Street, North Harbor Drive, Hawthorne Street, and Pacific Highway (as depicted on Figure PD3.3 of the proposed PMPU), and a Local Gateway Mobility Hub be developed between Ash and B Streets (as depicted on Figure PD3.3 of the proposed PMPU).

The Regional Mobility Hub would be accessible from Hawthorne Avenue and Pacific Highway. In accordance with Chapter 4 of the proposed PMPU for Regional Mobility Hubs, the mobility hub would provide wayfinding and pathway connections to connect to the potential water-based transfer point and short-term public docking at the Window to the Bay Pier. The Mobility Hub would also accommodate existing parking—if the mobility hub is located on a parcel(s) with existing public

and/or private parking—and would include a mix of commercial uses that are integrated to help visually screen structured parking, including the development of up to 25,000 additional square feet of restaurant space (which could be substituted for development of up to 25,000 square feet of retail and/or retail with restaurant as indicated in the *Appealable Projects* section below).

The ~~proposed~~ Local Gateway Mobility Hub would meet the criteria of a Local Gateway Mobility Hub, or larger, in accordance with Chapter 4 of the proposed PMPU; provide wayfinding and pathway connections to connect to the existing water-based transfer point and short-term public docking at the restaurant at the foot of Ash Street; and serve as the potential water-based transfer point at Navy Pier.

The proposed PMPU plans for the development and operation of a bayfront circulator to provide connections between the Shelter Island, Harbor Island, and Embarcadero Planning Districts. The District may expand the summer shuttle service that operates along Harbor Drive to establish year-round connections as a form of the bayfront circulator.

The PMPU plans for roadway reconnections, as described further in the appealable projects list below, and includes that if a north-south connection is provided linking Ash Street to B Street, the minimum width of that connection shall be 30 feet, building face to building face, measured at grade, as generally depicted in PMPU, Figure PD3.4. The ~~proposed~~ PMPU also plans for the reconfiguration of North Harbor Drive to more efficiently accommodate vehicular traffic while allowing intermittent curbside management areas (i.e., dedicated short-term parking and longer term Americans with Disabilities Act [ADA] accessible parking; passenger, taxi, and ride-share loading areas; and tenant servicing on the west side of North Harbor Drive); providing a multi-use path along the west side of the street as part of the Recreation Open Space; and, upon reconfiguration, expanding and activating Recreation Open Space on the bayside of North Harbor Drive, as described in PD3.10 of the proposed PMPU.

To accomplish the proposed reconfiguration of North Harbor Drive, existing on-street parking would first be consolidated into mobility hubs, as described in PD3.4 and PD3.5 of the proposed PMPU (see PD3.8 of the PMPU).

Upon the proposed reconfiguration of Harbor Drive, as described in Planned Improvement PD3.8 in Section 5.3.2(C)-I of the proposed PMPU, Recreation Open Space would be expanded and activated, as generally depicted on Figure PD3.5 of the proposed PMPU, by creating Recreation Open Space along the west side of North Harbor Drive, including a series of garden spaces that are linked through pathways, with the intent of creating a cohesive waterfront experience that also protects maritime operations. A multi-use path is proposed along the landside of the Recreation Open Space with a minimum of 40 percent of the surface area as soft surfaces to provide users with visual and physical relief from paved surfaces (soft surfaces may include planting ground cover and other materials, such as mulch and turf). Moreover, Recreation Open Space between Grape Street and Ash Street would be designed as a waterfront destination park with active uses.

Up to 16 activating features are proposed to be added, 9 of which may be pavilions, in Recreation Open Space areas and along the waterside promenade in accordance with the requirements of Chapter 4 of the proposed PMPU. The activating features would be dispersed throughout the Recreation Open Space, while pavilions may be sited as single buildings or in pairs. As new proposed Recreation Open Space areas are developed, consideration would be given to service loading for all existing and future Tideland amenities and tenants.

Proposed coastal access improvements would involve modification, replacement, or development of new water-based transfer points, short-term public docking at the restaurant at foot of Ash Street, and the development of a new 12,000-square-foot transient dock with up to 85 vessel slips associated with the Window to the Bay Pier, all as generally depicted on Figure PD3.3 in the proposed PMPU (PEIR Appendix N). ~~The PMPU further allows for; development of a new 12,000-square-foot transient dock with up to 20 vessel slips associated with the a modification or replacement in-kind of the southernmost, existing Grape Street Pier used for commercially operated passenger vessels. The PMPU plans for the development of a 30,000-square-foot public pier referred to as the Window to the Bay Pier (located just south of the Grape Street Pier); installation of a new launch area for hand-launched, non-motorized watercraft at the northwestern corner of the subdistrict; and the provision of step-down areas to provide direct access to the water at the Window to the Bay Pier and in Recreation Open Space areas in the waterfront destination park on the west side of North Harbor Drive.~~

The PMPU would allow modification to, or replacement in-kind of the Embarcadero Anchorage (A-3) and cruise ship terminal facilities to the same or lesser size and in the same general footprint-and the modification or expansion of existing water-based museum attractions to allow up to 20,000 square feet of additional museum space, with associated retail and/or retail with restaurant space constructed over two stories on an overwater platform of up to 15,000 square feet that includes coastal access features, and up to 110,000 square feet of berthing area for historic vessels and barges, along with a water-based transfer point. In the Commercial Recreation-designated area located on the block bounded by Grape Street, North Harbor Drive, Hawthorn Street, and Pacific Highway It would further allow for up to an additional 25,000 square feet of restaurant space (PMPU, PD3.23). Other visitor-serving commercial uses include allowance of modifications to, or replacement in-kind of, existing retail and/or restaurant, and existing hotel rooms, including associated retail or restaurant space, in the same general footprint in the Commercial Recreation-designated area between Ash Street and Broadway.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for the North Embarcadero Subdistrict:

- Reconnect roadways in the area bounded by Ash Street, B Street, Pacific Highway, and North Harbor Drive, including portions of the block south of B Street (PMPU, Figure PD3.4), as follows:
 - Extend A Street to North Harbor Drive to provide a link between North Harbor Drive and Pacific Highway for pedestrian, bicycle, and vehicle use, as described in PMPU, PD3.7. The minimum width of this connection shall be 80 feet, building face to building face, measured at grade.
 - Reconnect B Street between Pacific Highway and North Harbor Drive for pedestrian, bicycle, and vehicle use, in addition to temporary truck and other staging associated with cruise ship operations, as described in PD3.1 and PD3.7. The minimum width of this connection shall be 80 feet, building face to building face, measured at grade.
- Reconfigure North Harbor Drive to more efficiently accommodate all modes of travel while allowing for the following:

- Four general travel lanes, north of Grape Street.
- Two general travel lanes, one in each direction, between Grape Street and F Street.
- Bayfront circulator stops, including a potential dedicated transit lane.
- Develop up to three water-based transfer points, as generally depicted in Figure PD3.3 of the PMPU and as described below:
 - South of the Grape Street Piers in association with the Window to the Bay Pier;
 - At the foot of Beech Street in association with the Maritime Museum; and
 - At the west end of Navy Pier.
- Allow for modifications to the moorings at the Embarcadero Anchorage (A-3) to allow for an increase of up to 20 moored vessels.
- Develop retail, restaurant, and/or lower cost accommodations at the Regional Mobility Hub located on the Commercial Recreation–designated area located on the block bounded by Grape Street, North Harbor Drive, Hawthorn Street, and Pacific Highway, including up to 500 beds (or equivalent rooms) of lower cost overnight accommodations, and/or up to 25,000 additional square feet of Retail and/or Retail with Restaurant space ~~(which could be substituted for development of up to 25,000 square feet of restaurant space as indicated in the *Planned Improvements* section above).~~
- In addition to existing facilities, develop up to 750 additional hotel rooms, with 30,000 additional square feet of associated Retail and Restaurant, and/or 30,000 additional square feet of Meeting Space, For a total of up to ~~2,350~~ 2,150 hotel rooms plus ancillary facilities, in the Commercial Recreation–designated area between Ash Street and Broadway.
- Modify and/or expand the two northernmost existing Grape Street Piers, which are used for commercial fishing operations, by up to 0.2 net new acres and allow for the support of on- and off-loading needs, such as providing a truck loading area at the foot of the piers.

Development Standards

Proposed public realm standards include the provision of a continuous waterside promenade, new pedestrian linkages, walkways, and amenity zones to enhance physical access to the waterfront. The PMPU proposes specific standards for the location, width, and other requirements for these features. Specifically, waterside promenades would be required as part of all development that abuts the waterfront and that is not a coastal-dependent maritime industrial use, and in any other location where a waterside promenade is generally depicted on Figure PD3.4 of the proposed PMPU. The proposed waterside promenades would have a minimum width of 30 feet, as generally depicted on Figure PD3.6 of the PMPU, except where minimum width is not physically possible because of existing features, such as roadways or trees, in which case the waterside promenade would not be less than 16 feet wide in such areas. In addition, amenity zones would be located on the landside of the waterside promenade.

Moreover, the PMPU proposes that all development along North Harbor Drive must provide a sidewalk and parkway, as generally depicted on Figure PD3.7 of the proposed PMPU. Proposed sidewalks would be provided along both the east and west sides of North Harbor Drive, extend through the entire subdistrict, be continuous along the length of the street, and should be noncontiguous with the curb, incorporating a parkway between the sidewalk and roadway.

In the area bounded by Ash Street, B Street, Pacific Highway, and North Harbor Drive, including portions of the block south of B Street, as generally depicted on Figure 3.8 of the proposed PMPU, a midblock, north-south pedestrian link may be incorporated as an option. The east-west pedestrian linkages along Grape Street and Ash Street to connect the San Diego County Administration Building and the waterside promenade along North Harbor Drive are proposed to be maintained.

The PMPU proposes scenic vistas at the following locations:

- Area near Laurel Street and North Harbor Drive.
- The Crescent along North Harbor Drive.
- The Window to the Bay Pier (the Window to the Bay Pier must preserve physical access to the scenic views from public spaces along the North Embarcadero Subdistrict, between Date Street and Beech Street).
- The waterside promenade around the restaurant at the foot of Ash Street.
- The public viewing platform north of Broadway Pier.
- The west end of Broadway Pier.
- The west end of Navy Pier.
- ~~The public viewing deck on the Midway Museum.~~

In addition, the PMPU proposes view corridor extensions at the following locations:

- Hawthorn Street
- Grape Street
- Ash Street
- A Street
- B Street
- C Street
- West Broadway
- E Street
- F Street

Proposed building standards include bulk and scale, such as height limits, building setbacks, upper story setbacks, tower separation and spacing, and building frontages and orientation. Specifically, on the block bounded by Grape Street, North Harbor Drive, Hawthorn Street, and Pacific Highway, structures may not exceed 80 feet in height. Along Hawthorn Street and Grape Street, upper story setbacks would be provided, limiting the base building height to 30 feet, for a minimum depth of 15 feet.

In the area bounded by Ash Street, North Harbor Drive, B Street, and Pacific Highway, including portions of the block south of B Street, as generally depicted on Figure 3.8 of the proposed PMPU, the PMPU proposes that structures north of A Street, within the western portion of the block, adjacent to North Harbor Drive, may not exceed 120 total feet in height; north of A Street, within the

eastern portion of the block, adjacent to Pacific Highway, may not exceed 175 total feet in height; in the area between A Street and B Street, within the western portion of the block, adjacent to North Harbor Drive, may not exceed 150 total feet in height; and in the area between A Street and B Street, within the eastern portion of the block, adjacent to Pacific Highway, may not exceed 200 total feet in height. Structures south of the B Street reconnection may not exceed 65 feet in height.

Proposed building frontages would be required to incorporate activating uses and features, such as these:

- Locating coastal-dependent primary uses and visitor-serving uses on the ground floor facing the promenade, recreation areas, Recreation Open Space areas, and streets.
- Prohibiting secondary uses on the ground floor for multi-story buildings.
- Providing direct access between development and the waterside promenade.
- Providing direct access between development and Recreation Open Space.
- Providing a high degree of building transparency along the promenade, recreation areas, Recreation Open Space areas, and ground floor building frontages.

North Embarcadero Subdistrict Options

In addition to the proposed PMPU, this Draft PEIR analyzes the potential environmental impacts associated with three options for future development along North Harbor Drive in the Embarcadero Planning District.

- Option 1: Waterfront Destination Park at Foot of Navy Pier.
- Option 2: 205-Foot Setback East of North Harbor Drive.
- Option 3: 205-Foot Setback West of North Harbor Drive.

Analyzing Option 1 is a requirement of the 2011 North Embarcadero Visionary Plan (NEVP) Phase 1 Coastal Development Permit (CDP). Options 2 and 3 are commitments of the 2010 Lane Field Project Memorandum of Understanding (MOU) with the District, Lane Field San Diego Developers, LLC, and the San Diego Navy Broadway Complex Coalition (Coalition) ("Lane Field MOU").

The options prioritize pedestrians over vehicles. A description of each option is detailed further, below. In accordance with these legal commitments, each option is considered and analyzed in the individual resource sections of this Draft PEIR for the area, and not in Chapter 6, *Alternatives to the PMPU*. The options could primarily affect three land uses – Commercial Recreation, Institutional/Roadway, and Recreation Open Space, as shown in Table 3-8 below. The options would not include any changes to the water uses identified in the proposed PMPU within the North Embarcadero Subdistrict. These options are shown on Figures 3-5 through 3-7.

Table 3-8. Subdistrict Land Use Options

Option	Land Uses (acres)		
	Commercial Recreation	Institutional/Roadway	Recreation Open Space
Proposed PMPU <u>PD3</u> (see Table 3-7, above)	93.60 102.67	46.39 48.17	63.33 52.84
Option 1: Waterfront Destination Park at Foot of Navy Pier	102.43 (+1.49-0.24)	46.19 (-6.711.98)	64.5374 (+3.981.41)
Option 2: 205-Foot Setback East of North Harbor Drive	98.32 (-3.344.35)	47.72 (-5.240.45)	67.8368.04 (+4.507.35)
Option 3: 205-Foot Setback West of North Harbor Drive	100.09 (-0.842.58)	44.93 ¹ (-8.033.24)	68.5778 ² (+5.248.08)

¹ Total does not include 2.01 acres of Institutional/Roadway outside of the District's jurisdiction.

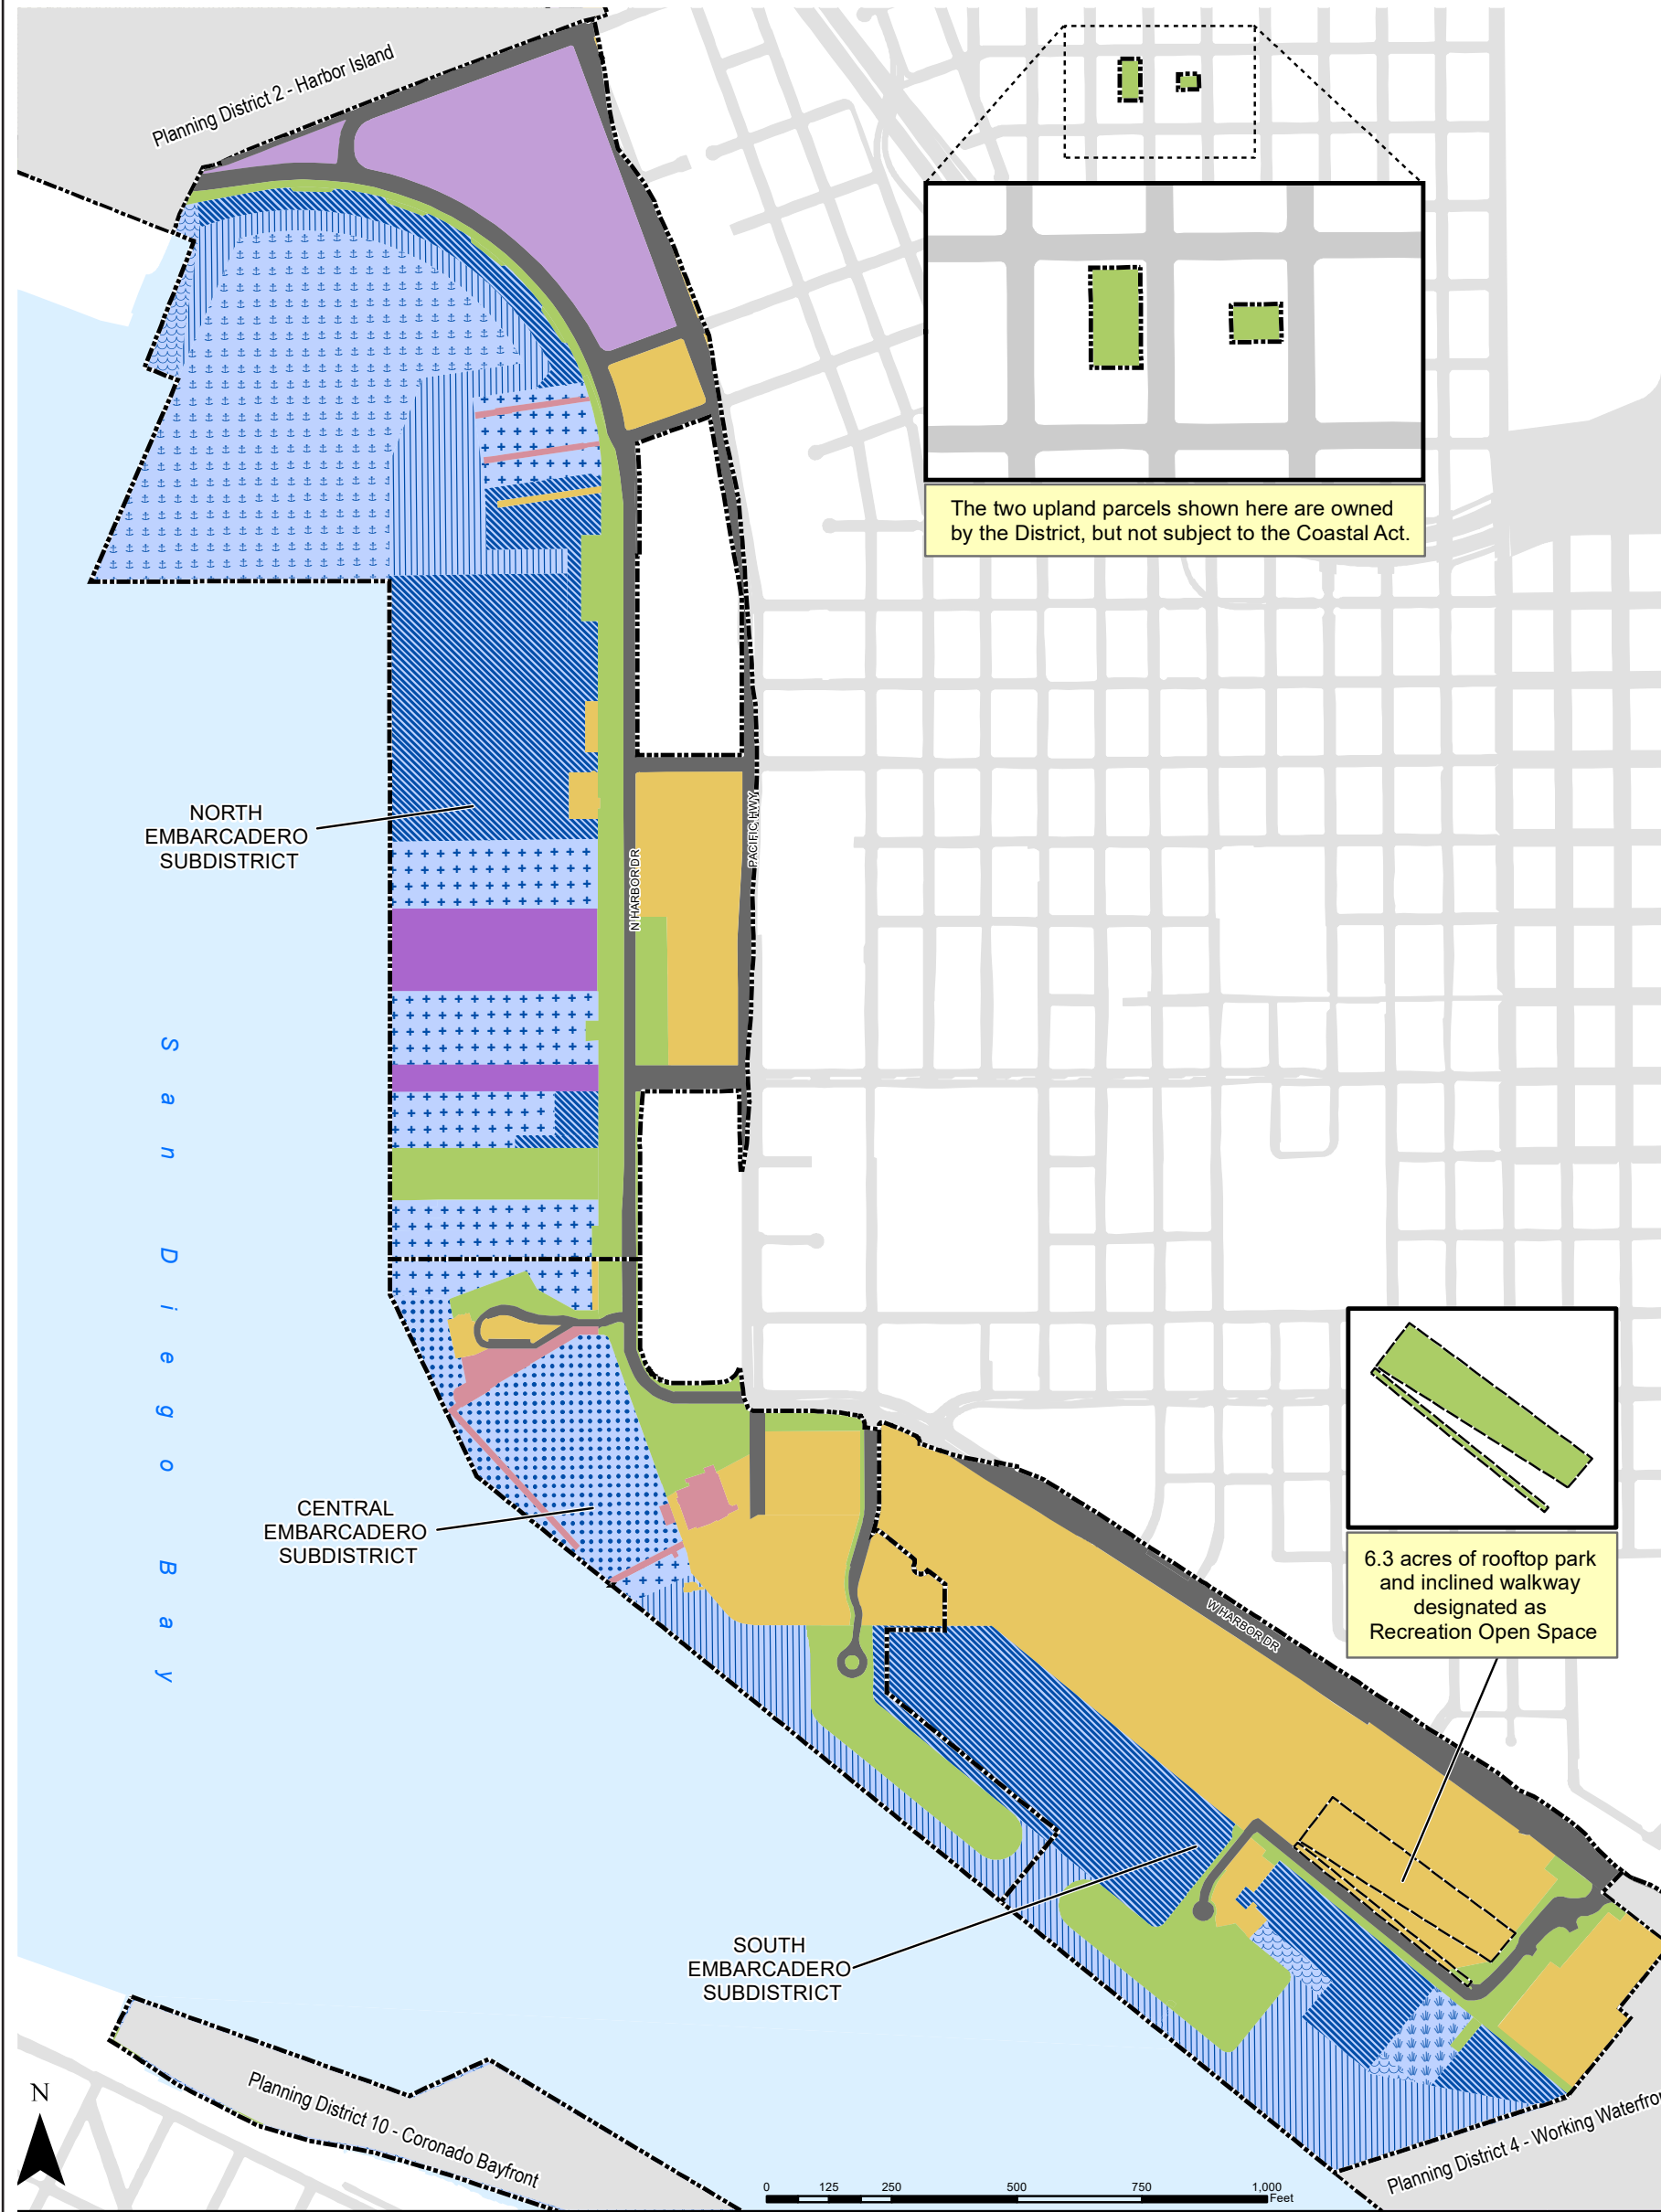

² Total does not include 1.92 acres of Recreation Open Space outside of the District's jurisdiction.

Note: Numbers in parentheses represent delta between the proposed PMPU and the options.

Option 1: Waterfront Destination Park at Foot of Navy Pier

The NEVP Phase 1 CDP requires the District, as part of this PEIR, to identify and analyze certain project components that are not now found in the PMPU. The District is using this Draft PEIR and the proposed PMPU to satisfy the NEVP Phase 1 CDP requirements. First, the NEVP Phase 1 CDP requires the District to identify the location of the proposed “replacement” Waterfront Destination Park, which is the final component of the District’s replacement of the formerly proposed oval-shaped park/plaza at the foot of Broadway. The NEVP Phase 1 CDP requires that the Waterfront Destination Park encompass a minimum of 1.25 acres and provides that the public space, which was constructed at the foot of Broadway Pier (approximately 0.37 acre), as part of the NEVP Phase 1 project “may count towards the 1.25 acres required to be part of the Waterfront Destination Park.” Thus, the minimum required size of the replacement Waterfront Destination Park is 0.88 acre (1.25 acres minus 0.37 acre = 0.88 acre).

JURISDICTIONAL BOUNDARIES

- Planning Subdistricts
- Coastal Zone

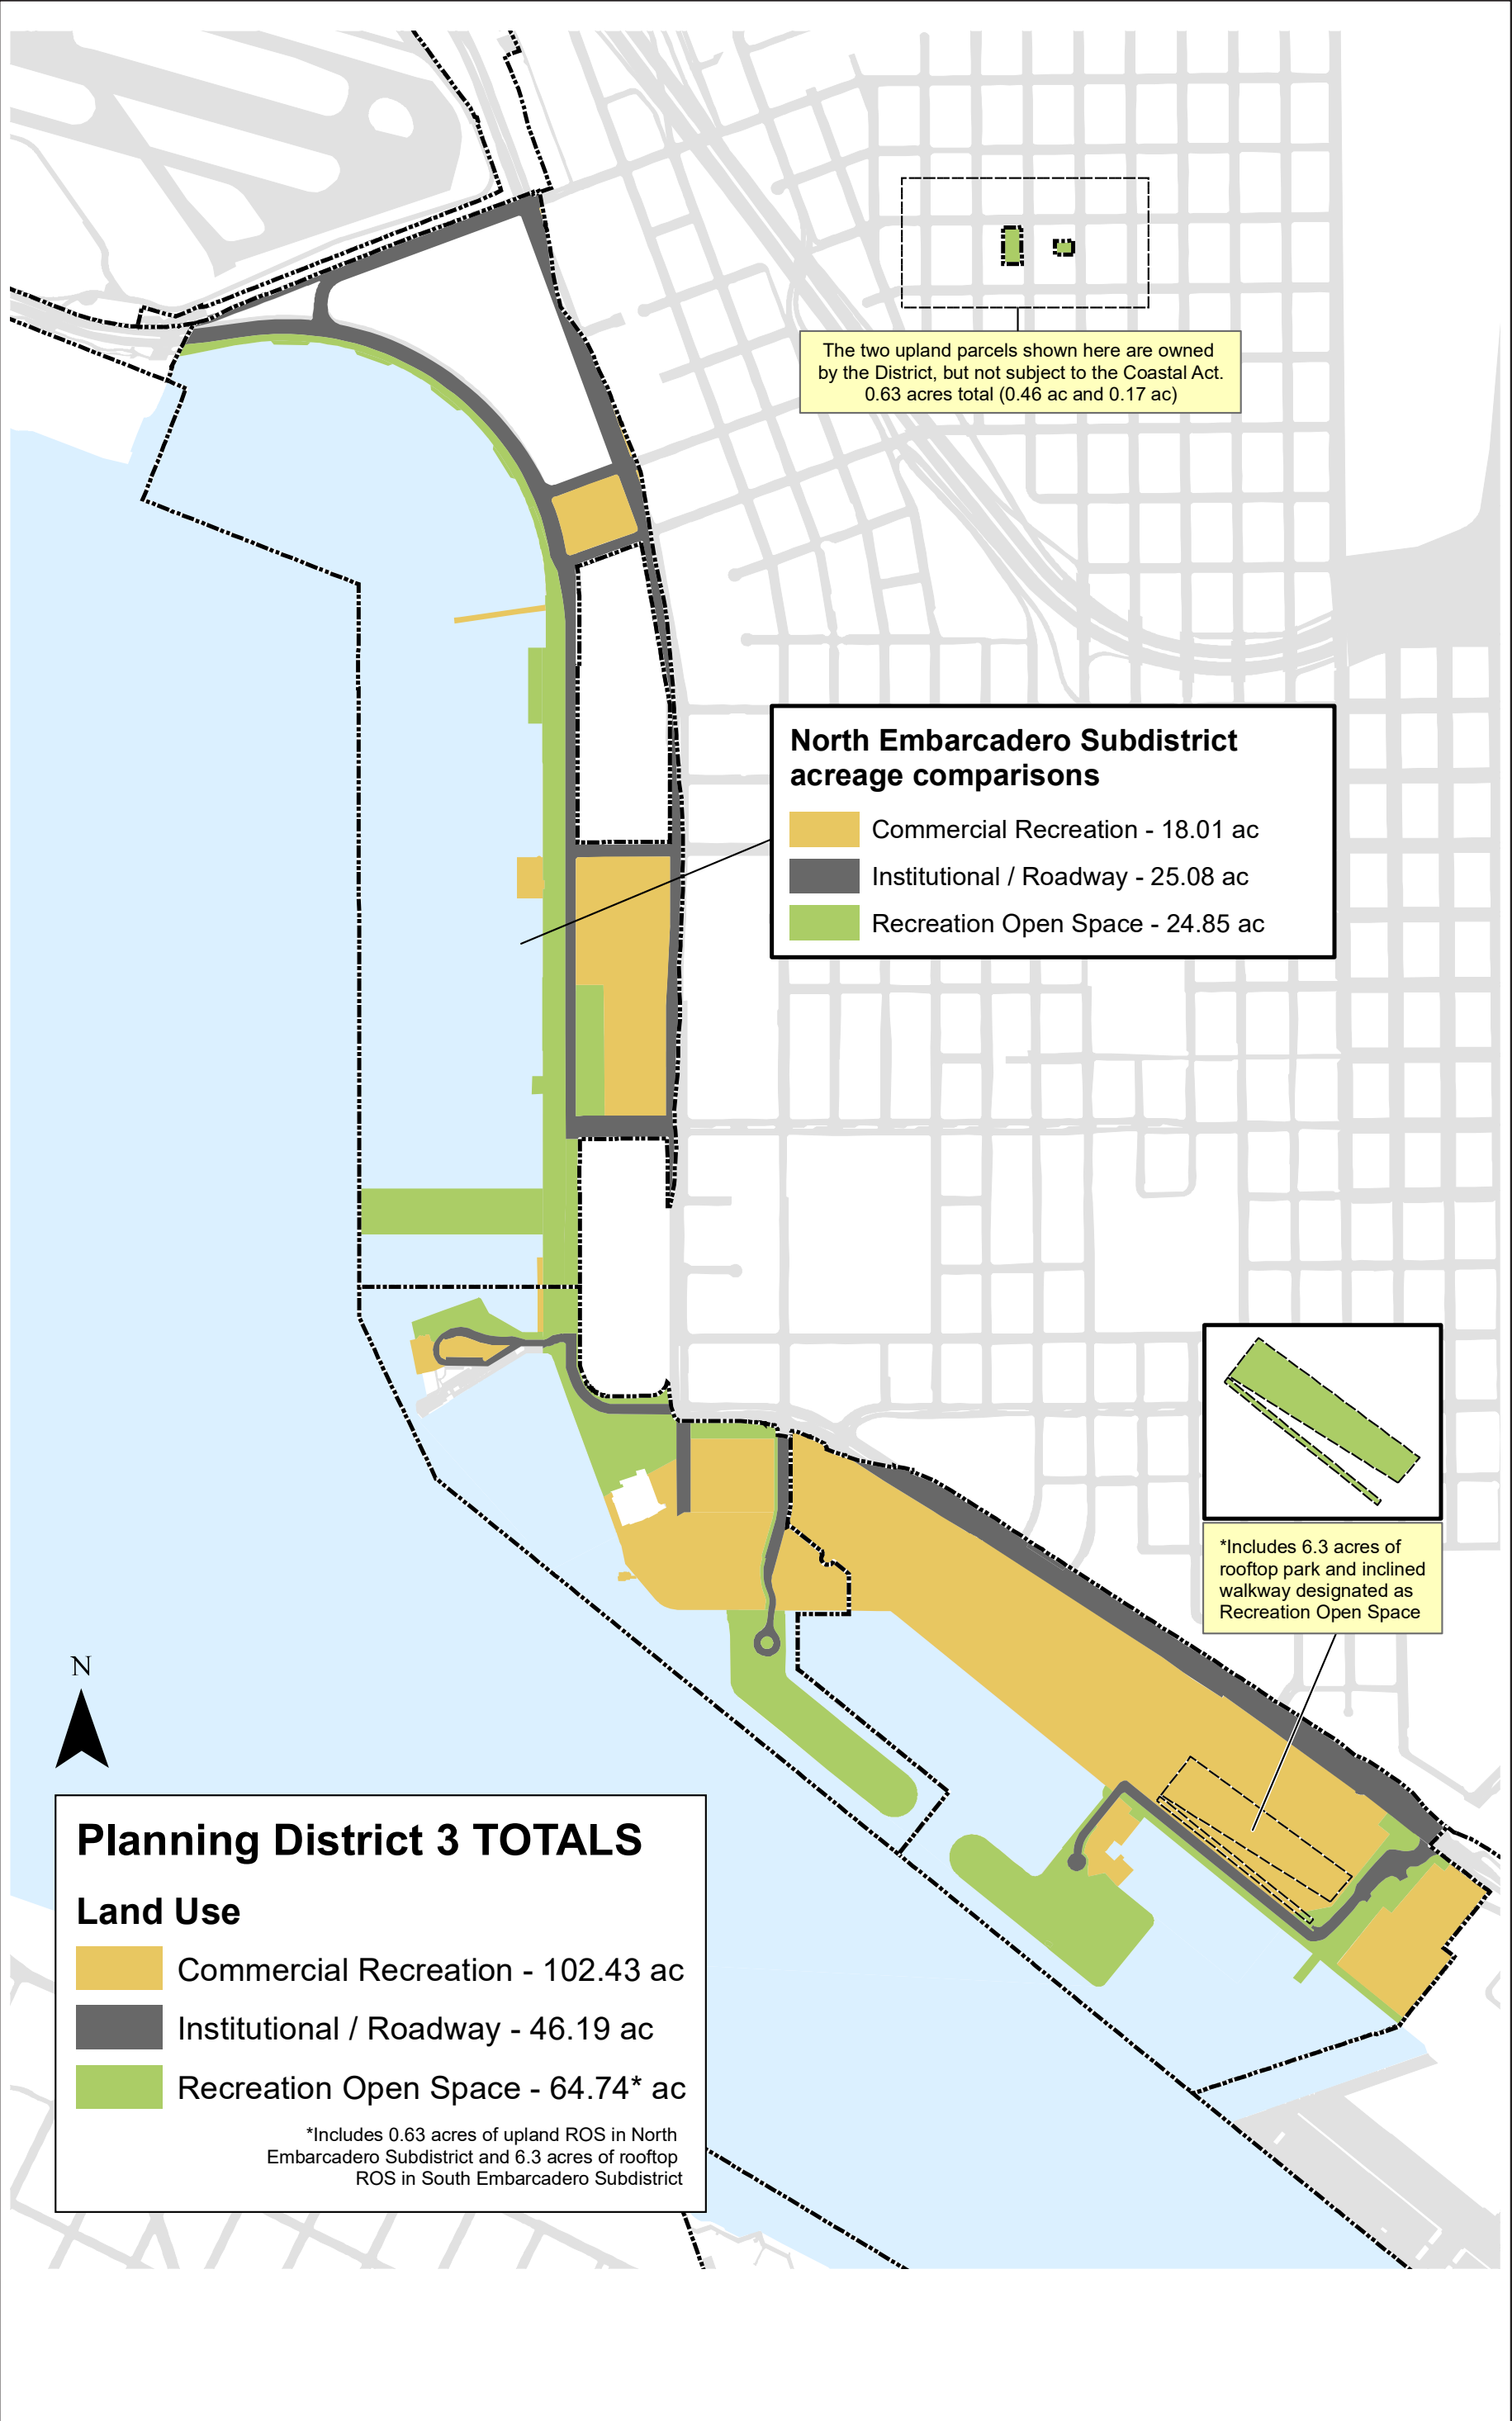

LAND USE DESIGNATIONS

- Commercial Fishing
- Commercial Recreation
- Institutional / Roadway
- Maritime Services and Industrial
- Recreation Open Space
- Visitor-Serving Marine Terminal

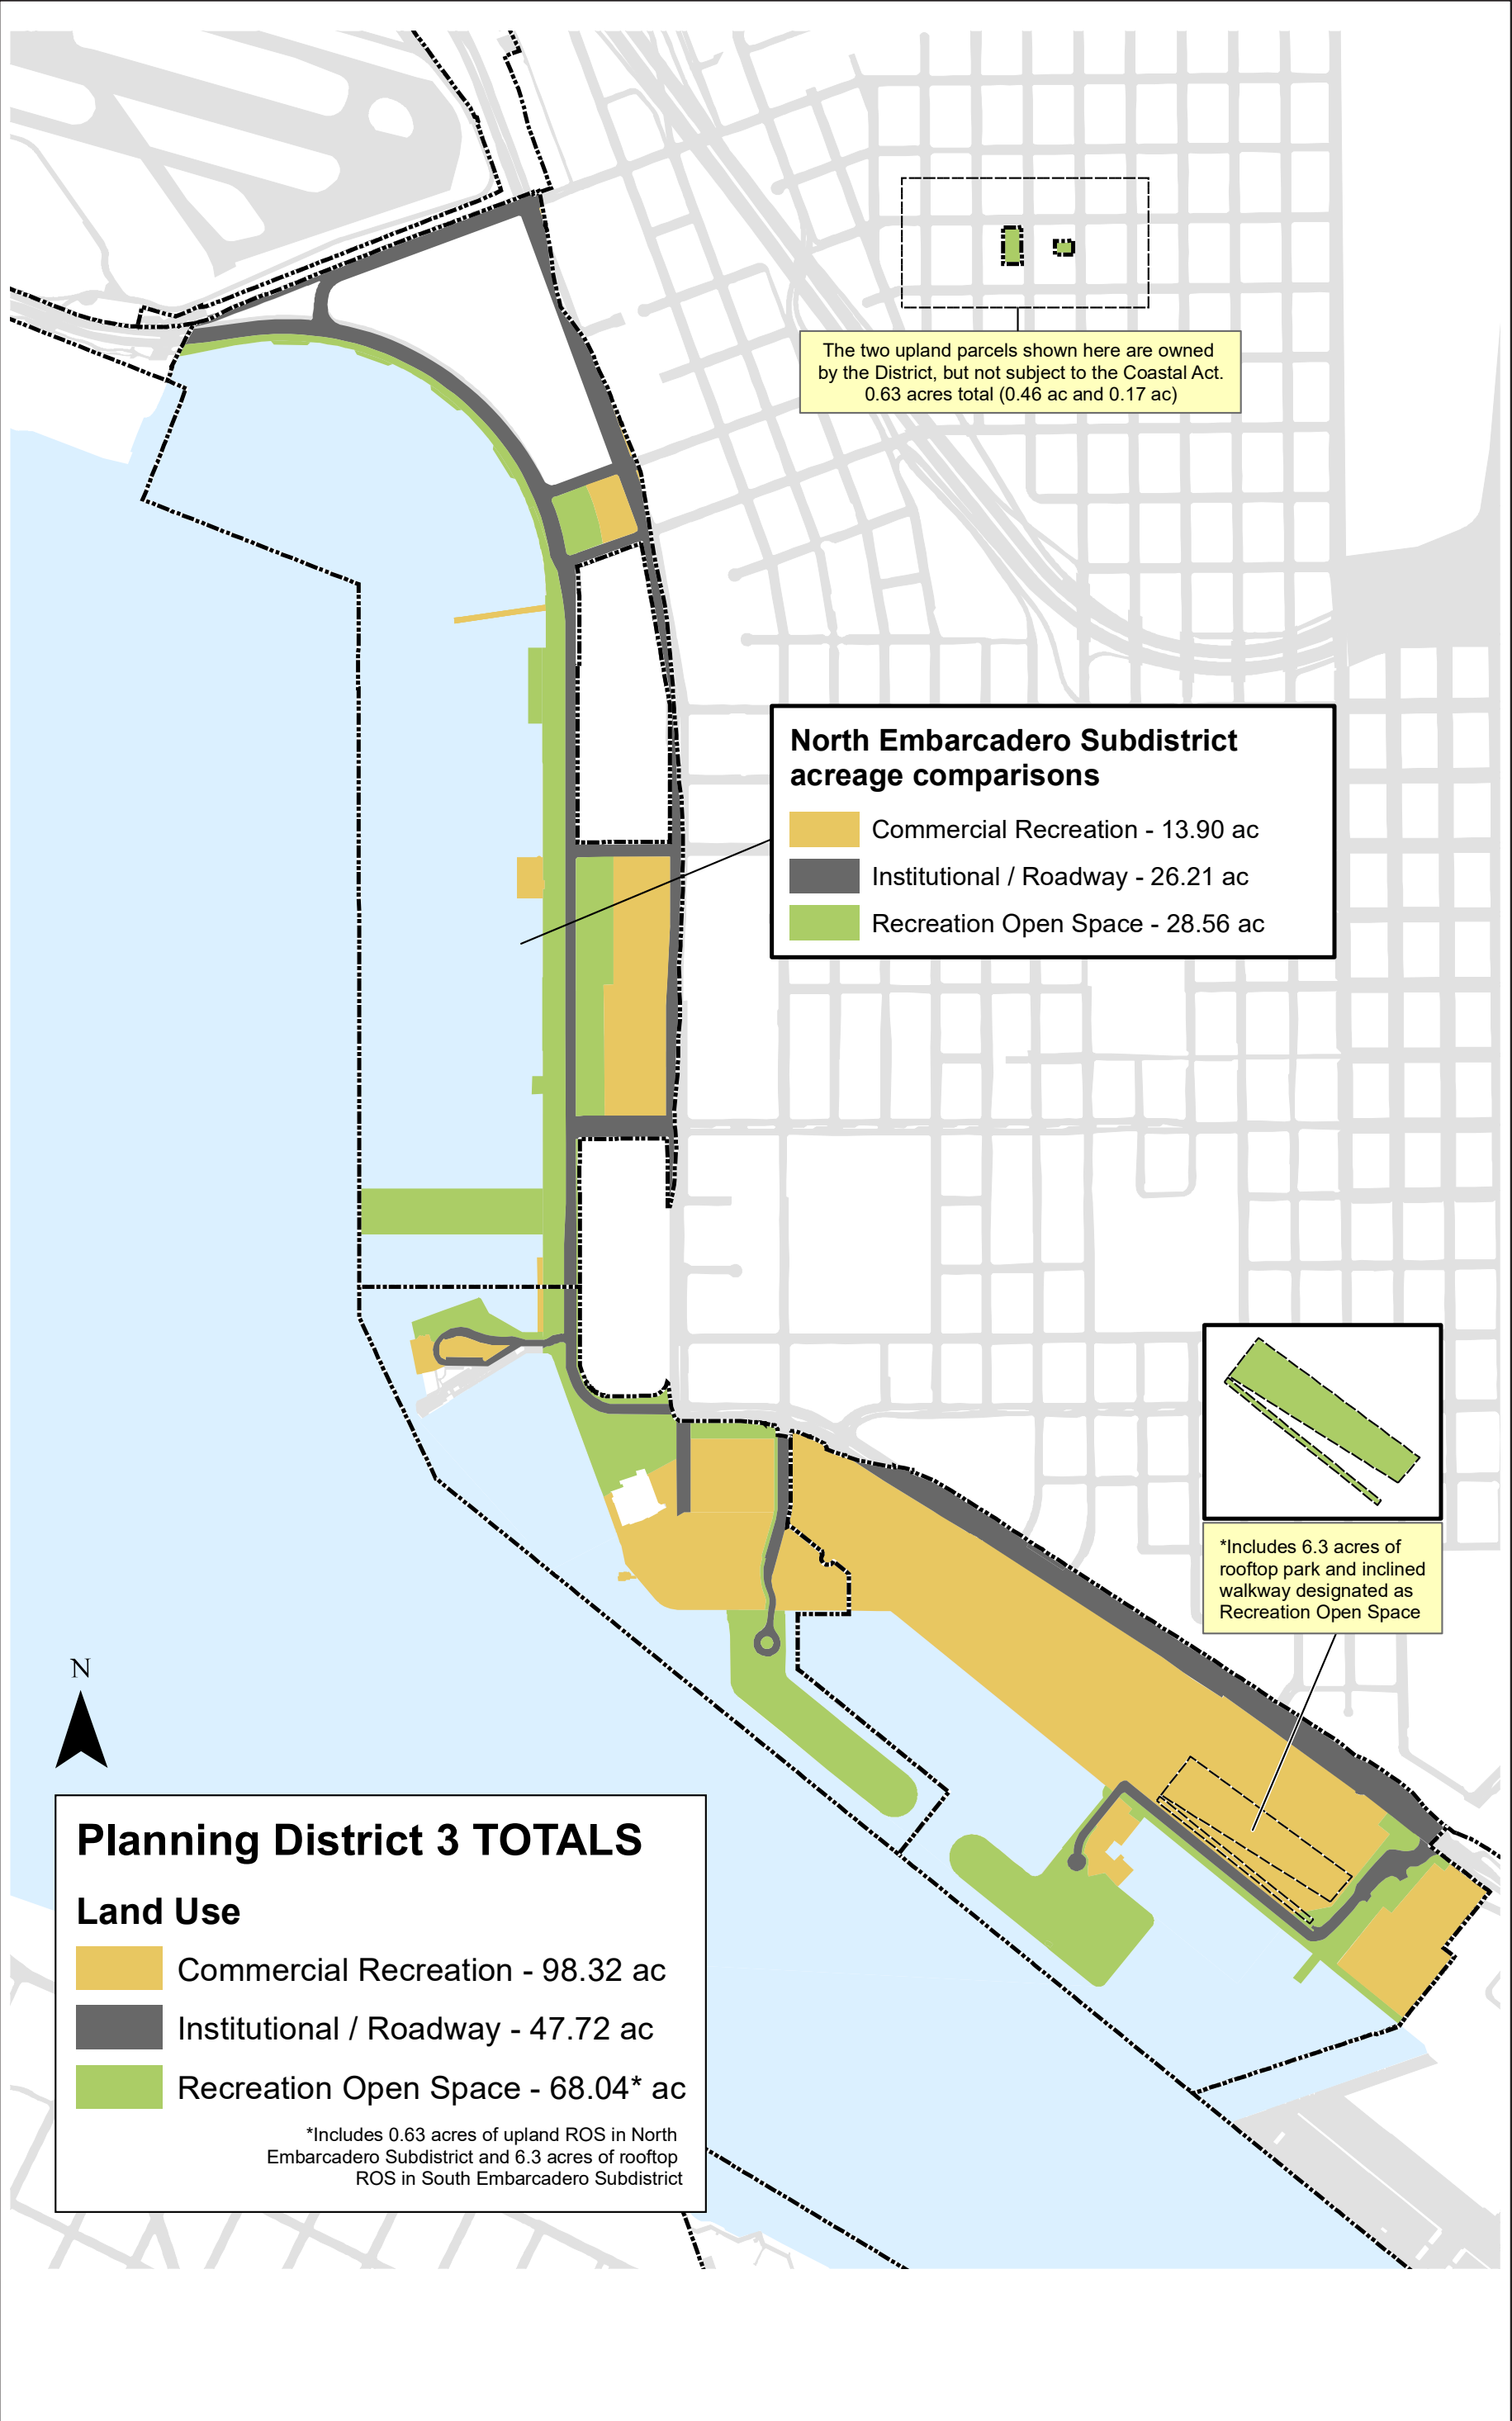

WATER USE DESIGNATIONS

- Anchorage
- Commercial Fishing Berthing
- Conservation / Intertidal
- Industrial and Deep-Water Berthing
- Navigation Corridor
- Open Bay / Water
- Recreational Berthing
- Sportfishing Berthing

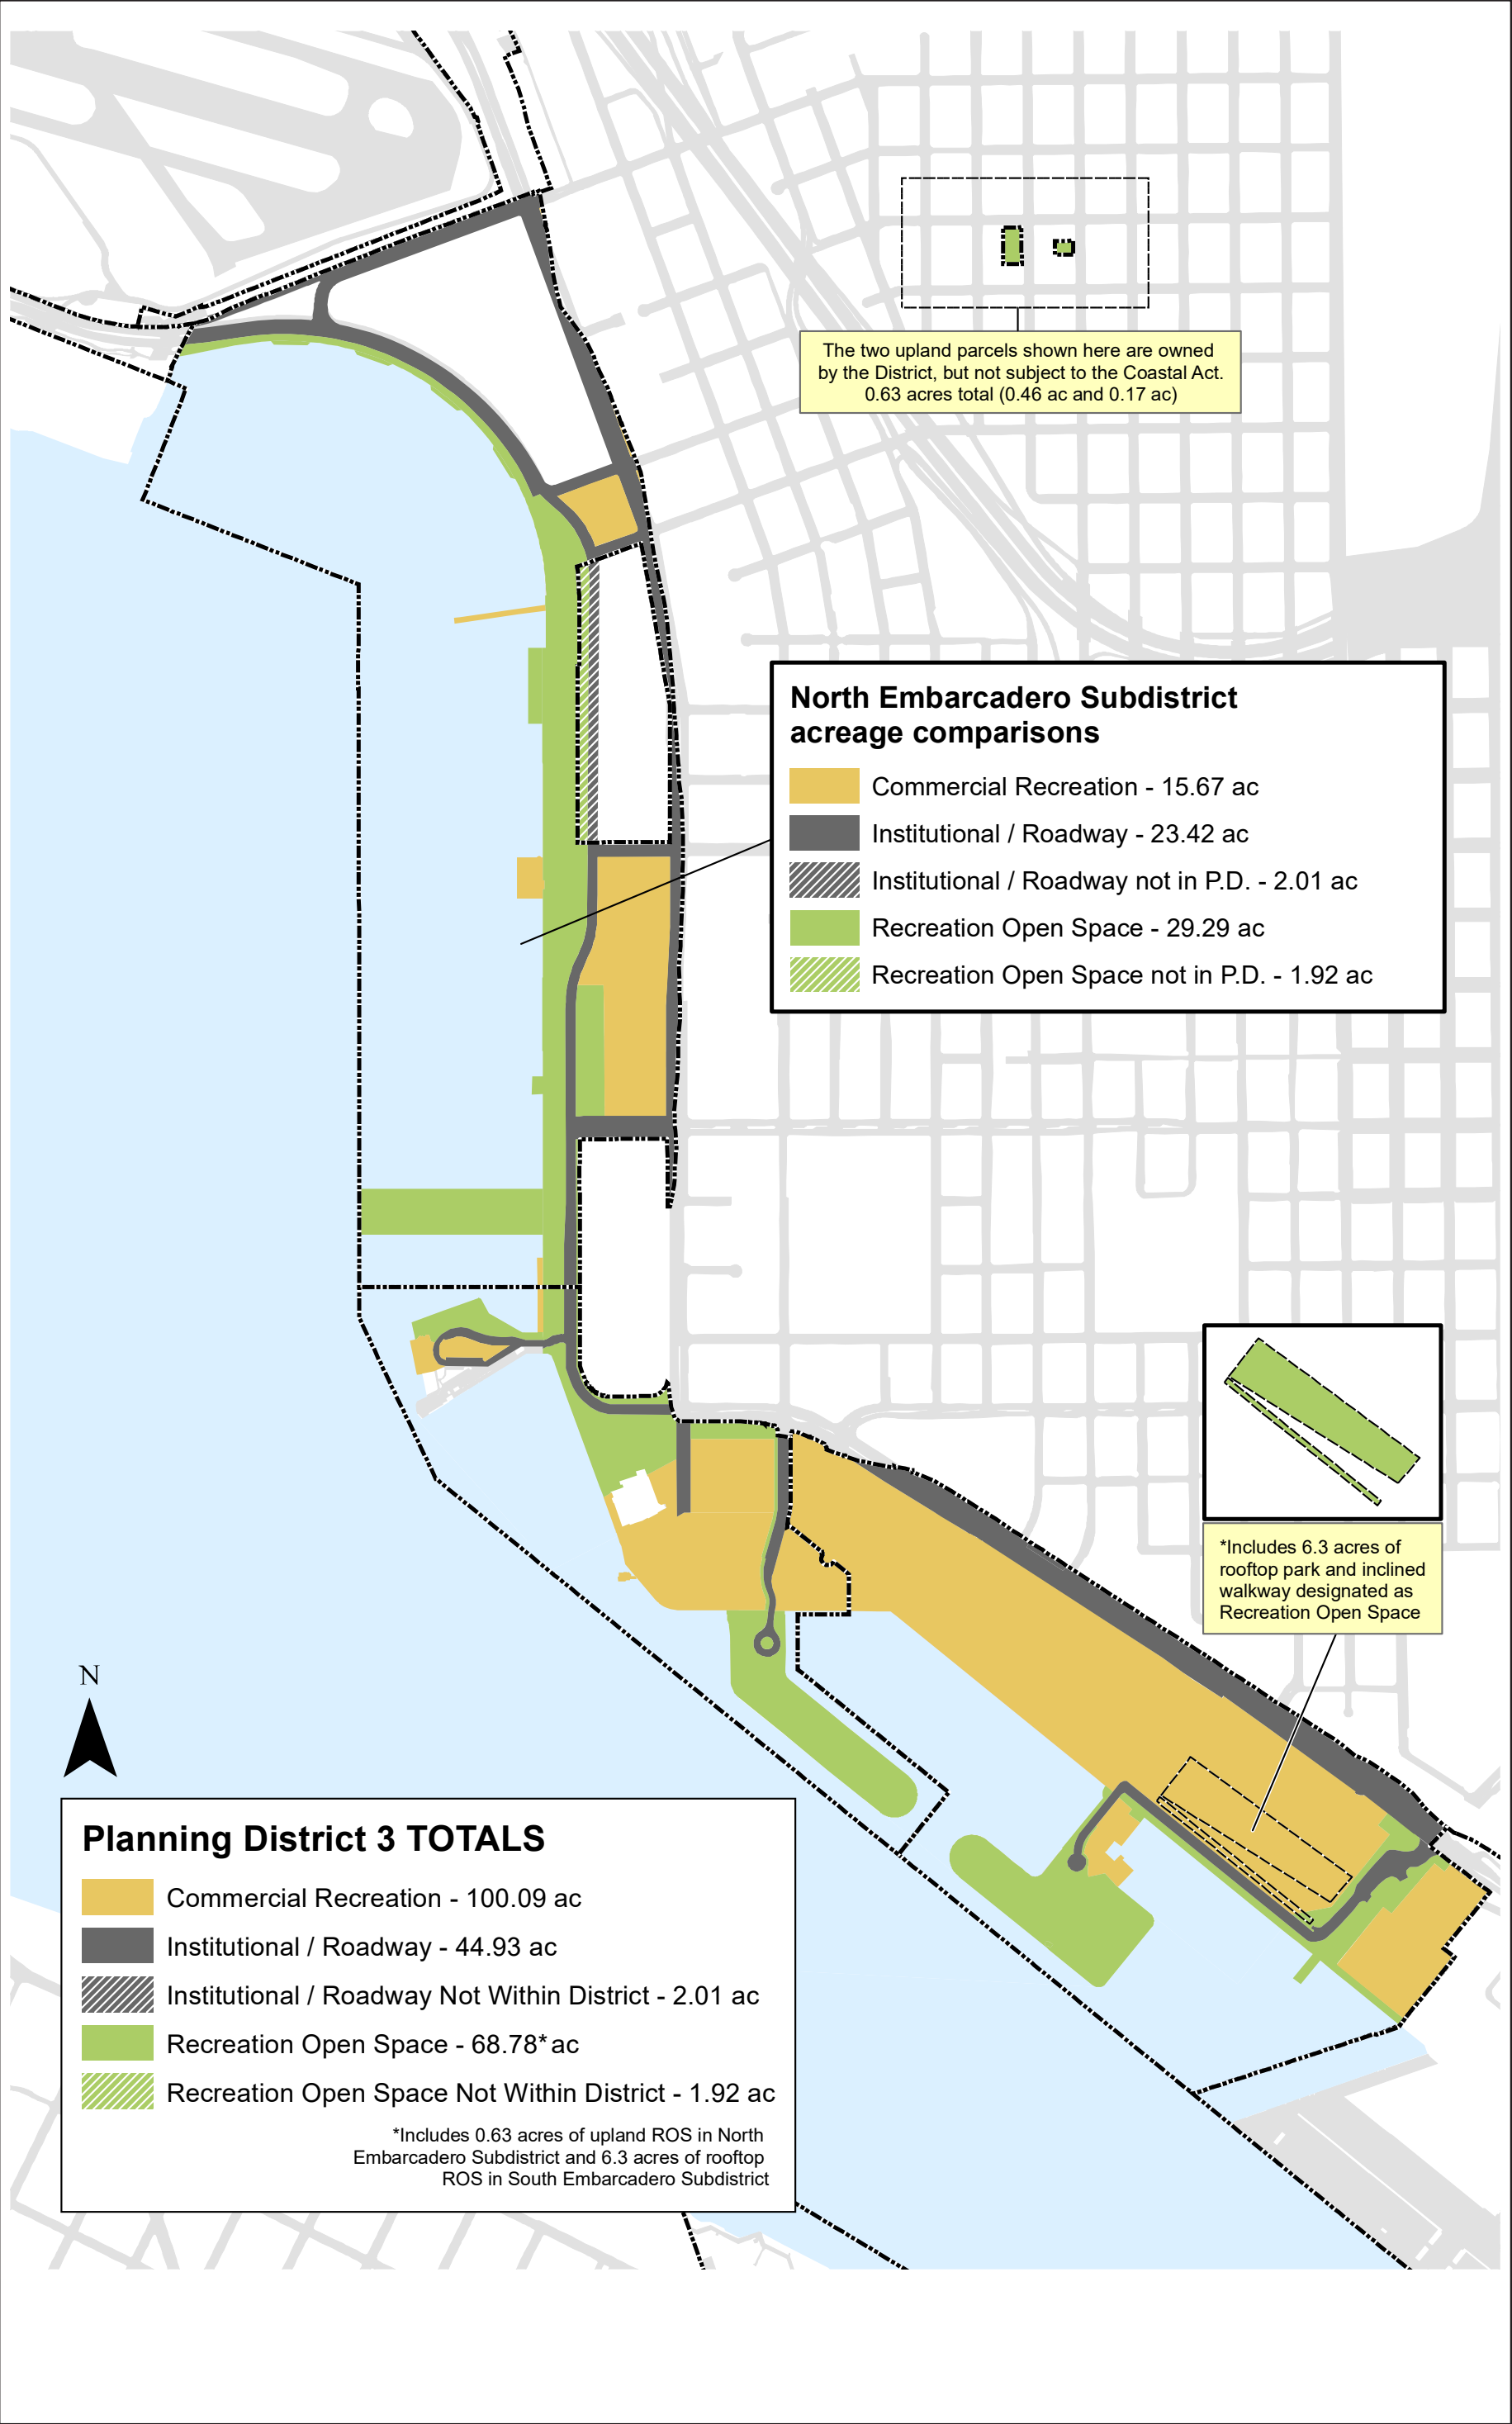

This page was intentionally left blank.

This page was intentionally left blank.

This page was intentionally left blank.

This page was intentionally left blank.

The NEVP Phase 1 CDP also requires that this Draft PEIR and the proposed PMPU study at least two potential locations for the Waterfront Destination Park: (1) along the esplanade near Navy Pier, between the Navy Broadway Complex (also known as, the IQHQ Research and Development District (RaDD) site) and the waterfront, which must also examine the closure of North Harbor Drive to automobile circulation; and (2) along the esplanade across from or near the County Administration Center. The first potential location is the area being studied as Option 1. The second is included in the proposed PMPU as the preferred location for the Waterfront Destination Park, which is identified as PD3.10 in Chapter 5.3 of the PMPU. Per the proposed Planned Improvement PD3.10 (as described in Section 5.3.2I-I of the PMPU), this second location is situated along the west side of North Harbor Drive between Grape Street and Ash Street.

In order to accommodate this park space in the Option 1 area, North Harbor Drive would be closed to vehicles (with the exception of emergency vehicles and shuttles) from the prolongation of West G Street to Broadway, to promote pedestrians, bicycles, and pedicab circulation. Park space in this Option 1 area would include a mix of hardscape and landscape, including lawn or turf space for passive recreation such as sitting and picnicking.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 involves establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. Option 2 would create additional Recreation Open Space east of North Harbor Drive, between West B Street and West Ash Street, as well as the parcel bounded by North Harbor Drive, West Hawthorne Street, West Grape Street, and Pacific Highway. The Lane Field Setback Park, which was constructed as part of the Lane Field Hotel Project, previously established a 150-foot setback east of North Harbor Drive between the prolongation of B Street to the north and Broadway to the south. The 1.66-acre existing Lane Field Setback Park can be expanded by another approximately 0.5 acre with the addition of land from the 1220 Pacific Highway site (currently leased to the U.S. Navy), for a contiguous 2.16-acre setback park. Under this Option 2, the setback park would be contiguously expanded north of the Lane Field Setback Park and would be an average 205-foot setback from north of the Lane Field Setback Park (which is the same as the prolongation of B Street) to Hawthorn Street. Although an exact alignment is not yet known, if selected, this option would also potentially result in demolition of existing structures (e.g., the buildings that currently include Ruth's Chris and Hazelwoods) within the averaged 205-foot setback.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 involves realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, and establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and to the immediate east of the promenade planned under NEVP Phase 1 adjacent to San Diego Bay. Implementation of Option 3 would require an addition of land ~~from~~ and, depending on the alignment, could entail demolition of existing structures at: 1220 Pacific Highway (currently leased by the U.S. Navy) and Wyndham San Diego Bayfront Hotel (which includes Ruth's Chris and Hazelwoods); the parcel bounded by North Harbor Drive, West Hawthorne, West Grape, and Pacific Highway; and a portion of the CAC parcel containing the park, between the present alignment of North Harbor Drive and the County Administration building.

Central Embarcadero Subdistrict

The Central Embarcadero Subdistrict includes the water and land area bounded roughly by F Street on the north, West Harbor Drive on the east, and the pierheads on the west. The southern portion of the subdistrict includes the continuation of Kettner Boulevard as well as Embarcadero Marina Park North, but does not include the adjacent marina (see Figure 3-4).

Vision

With the exception of the redevelopment of the existing restaurant at G Street Mole (currently, the Fish Market), and roadway improvements along Harbor Drive, the PMPU does not propose any new uses, development, or change in intensity of development in Central Embarcadero. Rather, the continuation of the existing uses, with potential maintenance of and minor improvements to, existing development, such as Seaport Village and Tuna Harbor, could be allowed under the proposed PMPU.¹⁴

Accordingly, the proposed vision in the PMPU reflects the existing state of the Central Embarcadero. The vision for this subdistrict is to continue it as a premier Tidelands destination that provides continuous coastal access and dining and shopping attractions while honoring the area's long-standing maritime and commercial fishing legacy. The Central Embarcadero will continue to provide a mix of recreational, commercial, and commercial fishing uses along the existing 6-mile-long waterside promenade, which will continue to provide continuous coastal access with connections north to Spanish Landing Park and south toward the Working Waterfront, and a waterside promenade loop around G Street Mole.

Existing waterfront open spaces, such as Tuna Harbor Park, Ruocco Park, and Embarcadero Marina Park North, provide recreational opportunities and expansive views of the water. The continuation of the commercial uses will serve as an anchor for the Embarcadero, providing dining and shopping attractions. Pedestrian linkages from the upland areas will continue to provide access to the waterfront, making this a lively activity center for residents and visitors alike. The existing commercial fishing uses at Tuna Harbor Basin, including the fish processing facility, the marina, and the piers, will honor the long-standing maritime and commercial fishing legacy of this area and allow opportunities for visitors to witness the commercial fishing activities firsthand. Commercial fishing uses will continue to use and maintain the existing fish unloading dock, with direct, unrestricted access to joint use of the pier/dockside facilities.

¹⁴ A proposal for redevelopment of a portion of the Central Embarcadero is presently in the planning stage. In February 2016, the District issued a request for proposals for redevelopment of the Seaport Village area, and later that year selected 1HWY1, LLC as the potential developer. In October 2017, the District and 1HWY1 entered into an Exclusive Negotiating Agreement intended to govern the parties' exchange of information and 1HWY1's preparation of a project description with sufficient detail to begin environmental review. The 1HWY1 proposal, known as the "Seaport San Diego Project," continues to evolve. On March 8, 2022, the Board of Port Commissioners considered a preliminary project description and directed staff and the project proponent to conduct additional public outreach and obtain additional public input on the proposed project description. On November 8, 2022, the Board of Port Commissioners considered a revised project description and determined it was sufficiently stable and complete to commence environmental review of the Seaport San Diego project. Although it would have been premature to include the Seaport San Diego proposal in the PMPU, the District fulfilled CEQA's goal of ensuring the fullest possible protection of the environment by including the Seaport San Diego proposal as a reasonably foreseeable future project in the analysis of cumulative impacts in this PEIR. In addition, 1HWY1's application for approval of the Seaport San Diego Project is subject to site-specific environmental review pursuant to CEQA Guidelines Sections 15152 and 15168. Additional information about the status of the Seaport San Diego proposal is available on the District's website (<https://www.portofsandiego.org/projects/central-embarcadero>). Also, find additional information about the PMPU and this project in Master Response to Comments M-1 (Final PEIR, Volume I).

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed planned improvements related to landside access for this subdistrict involve reconfiguring North Harbor Drive/West Harbor Drive (see details in Appealable Projects below); adding a multi-use path north of Market Street, landscaping, and curbside management program (i.e., dedicated short-term parking and longer term ADA accessible parking; passenger, taxi, and ride-share loading areas; tenant/business servicing on the west side of Harbor Drive); and improving the efficiency and safety of the G Street/North Harbor Drive intersection. The PMPU also proposes that the existing waterside promenade on G Street Mole will remain.

Related to retail and restaurant space, the District may allow for the redevelopment of the existing restaurant on G Street Mole. In addition, the District would allow modification or replacement-in-kind of existing commercial fishing facilities. The remainder of the Subdistrict, which is mostly made up of Seaport Village, would remain as existing conditions with the exception of maintenance, such as, without limitation, roof replacements, painting, resurfacing of façades, mechanical equipment upgrades, and tenant improvements to the existing structures, and the addition of activating uses like live music, outdoor dining, etc.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for the Central Embarcadero Subdistrict:

- Reconfigure the North Harbor Drive/West Harbor Drive ~~right-of-way~~ roadway to accommodate all modes of travel while allowing for the following:
 - Two general travel lanes north of Market Street.
 - Four general travel lanes south of Market Street.
 - Bayfront circulator stops, including potential dedicated transit lanes.

Development Standards

Proposed public realm standards include the continued provision of a continuous waterside promenade.

The PMPU proposes to keep the existing scenic vistas at the following locations:

- Bayside of G Street Mole.
- View of Tuna Harbor.
- Along the waterfront south of Ruocco Park and north of Market Pier.

Redevelopment of the existing restaurant on G Street Mole shall be a maximum height of 45 feet.

South Embarcadero Subdistrict

The South Embarcadero Subdistrict includes the water and land area bounded roughly by Seaport Village and Embarcadero Marina Park North to the north/northwest, West Harbor Drive to the northeast, and the Tenth Avenue Marine Terminal to the south/southeast. The Embarcadero Marina Park South encompasses the southwestern area of the subdistrict (see Figure 3-4).

Vision

~~Similar to the Certified PMP, the PMPU's vision for this subdistrict is to provide an expansion of the San Diego Convention Center (SDCC) as previously approved by the Board of Port Commissioners and California Coastal Commission [CCC], a mix of convention center support services, coastal recreation areas, activating features, and programmed activities so that visitors have multiple opportunities to access and enjoy the area.~~ The vision for this subdistrict is an easily accessible area that includes provides an expansion of the San Diego Convention Center (SDCC) as previously approved by the Board of Port Commissioners and California Coastal Commission [CCC], a mix of convention center uses and support services, coastal recreation areas, activating features, and programmed activities so that visitors have multiple opportunities to access and enjoy the area. The intensity of commercial development is expected to increase to accommodate new hotel rooms and retail space, and recreational enhancements are planned to offer coastal access and enhance the visitor experience in the subdistrict's recreation open spaces. In addition, the performance venue in Embarcadero Marina Park South is a unique feature of this subdistrict, and low-cost visitor-serving opportunities will continue to be a part of the venue's programming to encourage visitors to stay and enjoy this area.

Additionally, there has been interest in improving mobility for all modes, especially pedestrians, in this subdistrict. While not in the District's jurisdiction, one area of opportunity includes Market Street, between West Harbor Drive and Columbia Street, and providing a pedestrian scramble or roundabout at the West Harbor Drive/Market Street intersection, in coordination with the City of San Diego.

Special Allowances

Embarcadero Marina Park South Programming

The permanent performance venue located in Embarcadero Marina Park South, as a condition of the coastal development permit, will remain open to the public 85 percent of the year, except for the performance stage, back-of-house facilities, pavilions, and box office, which will be unavailable to the public at all times. No physical or visual barriers to public access will be present during the 85 percent of the year when the permanent venue is open to the public. As part of the annual operation of the permanent performance venue, low-cost visitor-serving opportunities will include some combination of reduced admission pricing, free rehearsals, community events, and public educational programming offered free of charge to the general public.

Planned Improvements

Proposed planned improvements related to landside access for this subdistrict involve modifications to or replacement of the existing Local Gateway Mobility Hub near the SDCC, and development and operation of a bayfront circulator. Proposed landside access planned improvements would also include modifications to roadways, such as ~~closure of Market Street~~

~~between West Harbor Drive and Columbia Street and reconfigurations to West Harbor Drive/East Harbor Drive to more efficiently accommodate a multi-use path connecting to Martin Luther King, Jr. Promenade and reconfiguring the Convention Way geometry to enable the consolidation of development parcels; and enhancing Park Boulevard bayward of Harbor Drive to facilitate access to the water.~~ Within the proposed Recreation Open Space areas, planned improvements include the introduction of six activating features (PMPU, PD3.60).

The PMPU would allow modification or replacement in-kind of existing water-based transfer points in the locations generally at the northwest end of the basin south of Embarcadero Marina Park South and at the northeast end of the basin south of Embarcadero Marina Park South. Additionally, the PMPU would allow for the relocation of the water transit center (used for harbor excursion boats, water taxis, ferries) to the west, onto the former Spinnaker Hotel site, and would include a public plaza (minimum 1,900 square feet) east of the relocated water transit building, and a public parking lot with at least 12 short-term public parking spaces adjacent to the water transit center. It would also allow for modifications to, or replacement in-kind of, existing recreational marina-related facilities. The PMPU would further allow for the development of water-based transfer points, at the northeast corner of the Marriott Marina and the South Embarcadero public access mole pier, as generally depicted on Figure PD3.3 of the proposed PMPU.

- ~~Proposed coastal access planned improvements would involve development of a new water-based transfer point, at the South Embarcadero public access mole pier.~~

Related to convention center space, the SDCC may be expanded to provide a contiguous expansion, including up to 400,000 additional square feet of exhibit area, meeting rooms, and ballrooms; 560,000 additional square feet of support spaces; and approximately 15,000 additional square feet of visitor-serving uses (as approved under the previously certified Port Master Plan in 2013). The expanded SDCC would also include at least 11.10 acres of recreation open space, which would consist of approximately 4.80 acres at-grade and approximately 6.30 acres above-grade, the latter of which would include a 5-acre rooftop park and an approximately 1.3-acre inclined walkway from the ground level to the rooftop. The 5-acre rooftop park would include at least five scenic vista areas, all of which would face the Bay.

Visitor-serving commercial uses include allowance of modifications to, or replacement in-kind of, existing retail and/or restaurant, and existing hotel rooms, including associated retail, restaurant and/or restaurant space, in the same general footprint in the Commercial Recreation-designated area in this subdistrict.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for the South Embarcadero Subdistrict:

- ~~Support Market Street closure between West Harbor Drive and Columbia Street, and provide a pedestrian scramble or roundabout at the West Harbor Drive/Market Street intersection, if determined feasible following coordination with the adjacent jurisdiction.~~
- Reconfigure West Harbor Drive/East Harbor Drive, between the Harbor Drive/Market Street intersection and Park Boulevard, to more efficiently accommodate all modes of travel while

allowing for four general travel lanes between Market Street and Park Boulevard and ~~a~~a potential dedicated transit lane(s), including bayfront circulator stops.

- Develop ~~a~~a water-based transfer points ~~at the northeast corner of the Marriott Marina, as in the locations~~ generally depicted on Figure PD3.3 of the proposed PMPU.
- Develop up to two short-term public docking slips in association with recreational marina-related facilities, as generally depicted on Figure PD3.3 of the proposed PMPU.
- Develop new marina-related facilities with up to 30 recreational boat berthing vessel slips and associated recreational marina-related facilities, southeast of the South Embarcadero public access mole pier, to accommodate various-sized vessels.
- Develop up to 35 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities in the subdistrict, to accommodate various-sized vessels.
- Develop up to 600 hotel rooms (100 net new rooms above the number of rooms approved under the previously certified Port Master Plan in 2013), with 2,500 additional square feet of associated Retail and Restaurant, and/or 55,000 additional square feet of Meeting Space along Harbor Drive.

Development Standards

Proposed public realm standards include the provision of a continuous waterside promenade with stipulations for minimum widths and amenities. Specifically, the PMPU proposes that the waterside promenades would have a minimum width of 30 feet. If minimum width is not physically possible because of existing features, such as roadways, the promenade would be not less than 24 feet wide in such areas. Moreover, the proposed waterside promenade would incorporate a multi-use path, which should be located on the landside side of the promenade. Where provided, amenity zones would be located on the waterside of the waterside promenade.

The PMPU proposes scenic vistas at the following locations:

- View of the Marriott Marina from the waterside promenade, west of the Convention Center.
- View of the Bay from the fishing pier at Embarcadero Marina Park South.
- View of the Bay from the South Embarcadero public access mole pier.

In addition, the PMPU proposes preservation of the Park Boulevard View Corridor Extension. The PMPU does not propose any building standards for the South Embarcadero Subdistrict.

3.5.3.4 Planning District 4: Working Waterfront

Located south of downtown San Diego, the Working Waterfront Planning District (PD4) serves as a strategic regional, state, and federal port of entry supporting maritime trade operation and water-based commerce. PD4 comprises a total of 368~~7.199~~^{7.199} acres with 114.50~~49~~⁴⁹ acres of water area and 253.69~~50~~⁵⁰ acres of land area. PD4 includes three subdistricts: Tenth Avenue Marine Terminal, Cesar Chavez Park, and Harbor Drive Industrial. The planning district is a highly productive consolidation of marine terminal and maritime services and industrial land uses, facilitating maritime trade and providing large-scale coastal-dependent industrial activities with direct access to heavy rail service and deep-water berthing. This planning district includes water and land uses supporting a range of coastal-dependent maritime trade operations and water-based commerce with a competitive and

sustainable freight movement system. It provides high-quality jobs in goods movement and in shipbuilding and ship repair for maritime and national defense interests.

Proposed Water and Land Use Designations

Proposed water and land use designations for PD4, as well as the proposed acreages of each, are provided in Table 3-9. Proposed water use designations would include Industrial and Deep-Water Berthing. Proposed land use designations would include institutional/Roadway, Marine Terminal, Maritime Services and Industrial, and Recreation Open Space. The proposed water and land use map for PD4 is provided on Figure 3-8.

Table 3-9. Working Waterfront Planning District Water and Land Use Designations

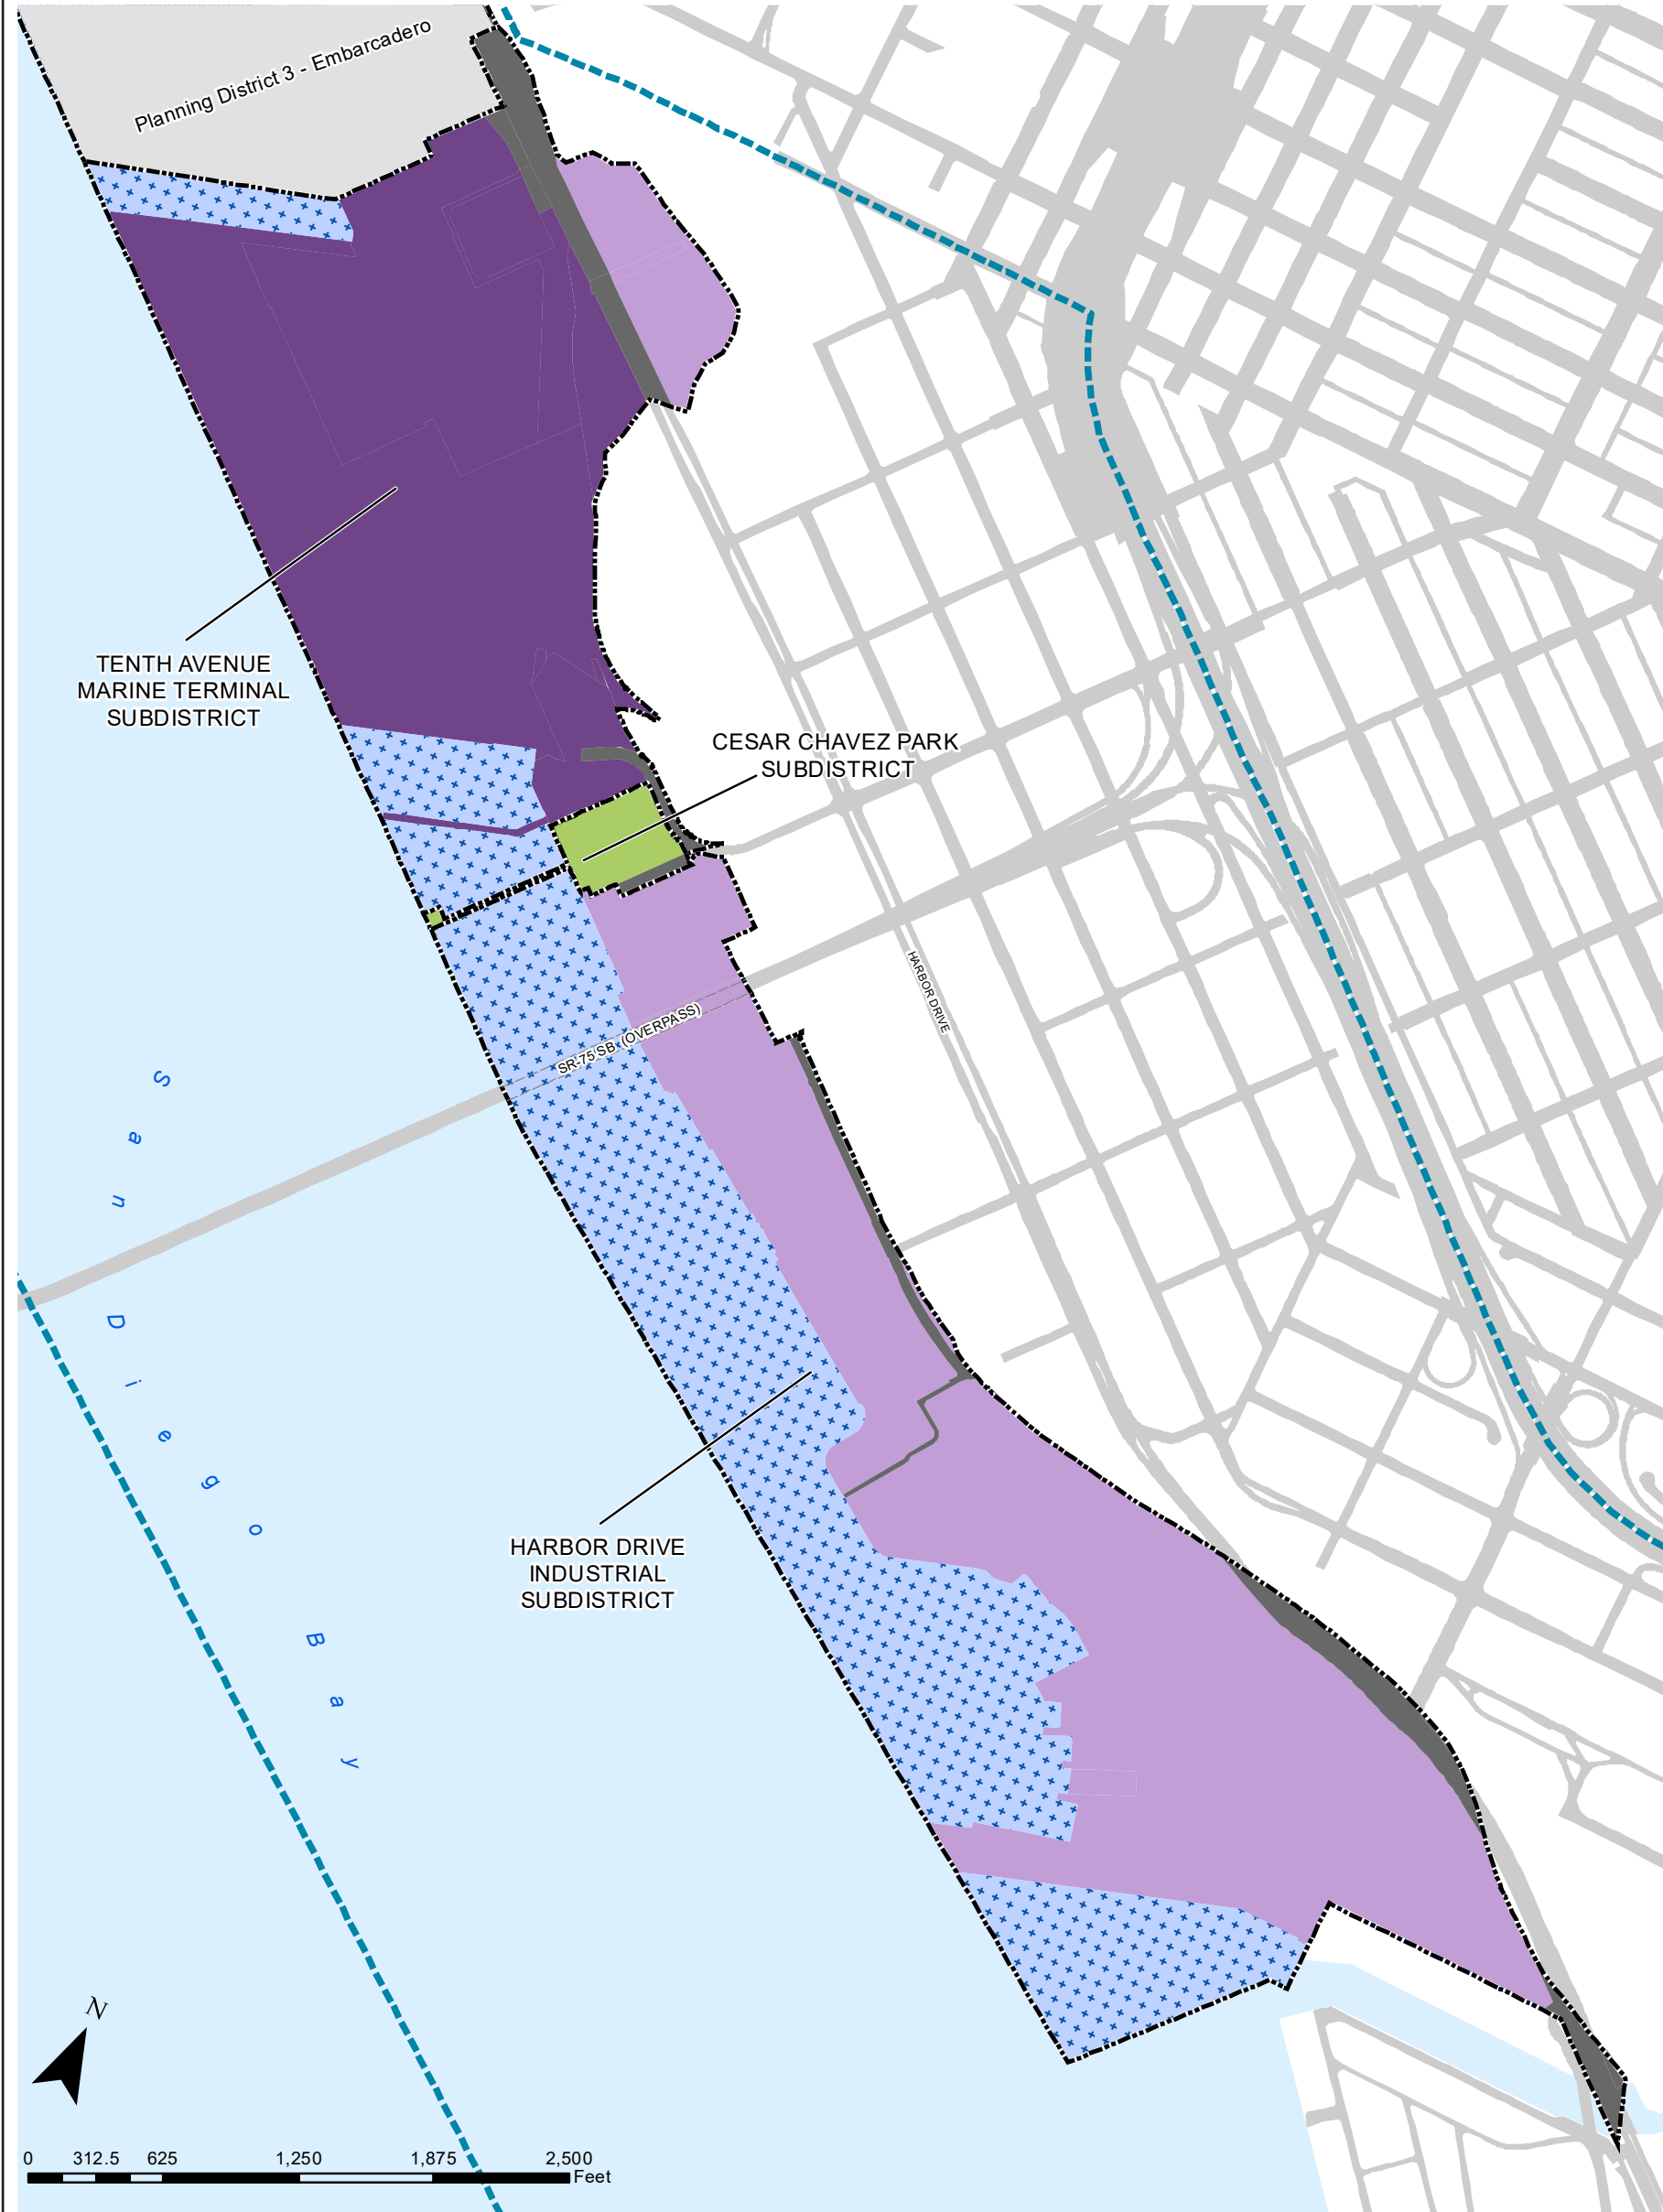

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Specialized Berthing	104.07	<i>(Consolidated to Industrial and Deep-Water Berthing)</i>	--	--
Terminal Berthing	10.8	<i>(Consolidated to Industrial and Deep-Water Berthing)</i>	--	--
<i>Total Consolidated Industrial and Deep-Water Berthing</i>	114.87	Industrial and Deep-Water Berthing	114.50	-0.37
Total Water Use	114.87	Total Water Use	114.50	-0.37
Land Use				
Marine Related Industrial	172.88	Maritime Services and Industrial	127.40	-45.48 ¹
Marine Terminal	58.07	Marine Terminal	105.62	+47.55 ²
Park/Plaza	4.23	Recreation Open Space	4.63	+0.40
Streets	17.95	Institutional/Roadway	16.04	-1.91 ³
Total Land Use	253.13	Total Land Use	253.69	+0.56

¹ Reduced acreage from redistribution to Marine Terminal.

² Additional acreage from redistribution of Marine Related Industrial.

³ Reduced acreage from redistribution to Maritime Services and Industrial and Marine Terminal, other Institutional/Roadway areas added but overall Institutional/Roadway acreage in planning district decreased from Streets in Certified PMP (GIS Conversion).

This page was intentionally left blank.

Tenth Avenue Marine Terminal Subdistrict

The Tenth Avenue Marine Terminal Subdistrict abuts PD3 on the north and roughly encompasses the water and land area bounded by Park Boulevard (the Hilton San Diego Bayfront Hotel), Harbor Drive and a portion of the railyards east of Harbor Drive, Cesar E. Chavez Parkway and the Cesar Chavez Pedestrian Pier, and the Bay (see Figure 3-8). The PMPU does not propose any changes to the cargo throughput or improvements for this subdistrict in comparison to what was previously approved as part of the *Tenth Avenue Marine Terminal Redevelopment Plan* and analyzed in the TAMT Redevelopment Plan PEIR (SCH# 2015-031046), which is incorporated herein by reference.¹⁵ As detailed below, planned improvements in the Tenth Avenue Marine Terminal Subdistrict will add new or enhance existing mobility connections to allow for safe public access for pedestrians and bicyclists, as well as roadway reconfigurations and improvements, often through interagency coordination. There are no planned improvements related to railroad reconfigurations for this subdistrict.

Vision

The vision for this subdistrict is a modern marine terminal that serves as a vital, global gateway for imports and exports supported by safe, efficient, and environmentally sensitive operations and technology. The subdistrict would have mobility connections to access the terminal, enhanced infrastructure that provides convenient and safe access to jobs, and safe public access for pedestrians and bicyclists. Modifications to modernize the marine terminal will help to optimize sustainable terminal operations while ensuring that it remains flexible and responsive to future market conditions and the environment. The modifications will include upgraded facilities and a competitive and sustainable freight movement system that handles cargo in an efficient, safe, and environmentally responsible way.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed planned improvements related to landside access for this subdistrict involve modifications to the entire segment of northbound and southbound Harbor Drive within the District's jurisdiction to provide a multi-use pathway and to include one "flexible" lane in each direction (further described in appealable projects below). The District would also coordinate with transportation agencies and adjacent jurisdictions to reconfigure portions of Harbor Drive outside the District's jurisdiction to implement roadway improvements consistent with the improvements described above supporting improved efficiency and safety for vehicular traffic, goods movement, and pedestrian and bicycle facilities. The District would also coordinate with adjacent jurisdictions to provide appropriate signage to identify designated truck routes, and coordinate with the City of San Diego to ensure that truck route requirements and truck parking prohibitions in adjacent neighborhoods are followed.

¹⁵ TAMT Available at: <https://www.portofsandiego.org/projects/tenth-avenue-marine-terminal-redevelopment> (click links for Parts 1 through 4).

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for the Tenth Avenue Marine Terminal Subdistrict:

- Modify the entire segment of northbound and southbound Harbor Drive within the District's jurisdiction by including one multi-use pathway (as described in the section above) and one "flexible" lane in each direction that is dedicated for trucks, transit buses, and/or shuttles with an information technology system (or similar technology) and signalization improvements that can be modified or adjusted during peak and nonpeak hours between the Tenth Avenue Marine Terminal's back gate and Cesar Chavez Parkway.

Development Standards

Consistent with the *Tenth Avenue Marine Terminal Redevelopment Plan*, the proposed PMPU incorporates proposed development standards for public realm (e.g., views) and goods movement standards (e.g., freight movement, sustainable freight and shipping methods, dry bulk goods conveyance, and parking). Proposed public realm standards include limitations to the size, bulk, and scale of any permanent devices and/or dry docks intended to lift vessels from the water for service or repair in order to preserve scenic vista areas in the Cesar Chavez Park Subdistrict. The development standards also propose standards for goods movement, including requiring use of designated truck routes, implementation of sustainable freight and shipping methods to achieve the emissions reductions goals of the California Sustainable Freight Action Plan or similar future plans (such as vessel speed reduction program, requiring development on the terminal to implement electrification, installation of electric infrastructure, onsite energy production and battery storage, and infrastructure for zero-emission vehicles and trucks), and expanding shore power capabilities. In addition, the development standards propose implementation of the best available control and retrofit technologies for conveyor systems and bulk discharge unloaders for future dry bulk operations. Parking requirements are also identified.

Cesar Chavez Park Subdistrict

The Cesar Chavez Park Subdistrict includes the land area and a pier nestled between the Tenth Avenue Marine Terminal and the Harbor Drive Industrial Subdistricts. This subdistrict currently consists almost entirely of the park and an adjacent roadway, as well as the Cesar Chavez Pedestrian Pier (see Figure 3-8).

Vision

The vision for the Cesar Chavez Park Subdistrict is to protect and enhance recreation and public access opportunities at Cesar Chavez Park by preserving the existing recreational character of the area, while providing better accessibility to the public, through enhanced water and land mobility connections and infrastructure improvements that provide physical and visual public access opportunities at Cesar Chavez Park.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed planned improvements for this subdistrict include public access improvements related to landside access involving modification, or replacement in-kind, of pathways to Cesar Chavez Park and the Cesar Chavez Pedestrian Pier, and expanding public access by providing a connection to the Bayshore Bikeway. The District proposes to collaborate with adjacent jurisdictions to improve rail and road crossings for pedestrians and bicycles, including to and from Barrio Logan Trolley Station and to and from Cesar Chavez Park, to increase safety and prioritize active transportation users by providing high-visibility crosswalks and designated controlled crossings. Finally, interpretive signage and wayfinding in the scenic vista area on the Cesar Chavez Pedestrian Pier is proposed to be incorporated to guide safe public viewing of the waterfront.

Proposed coastal access improvements include the development of a water-based transfer point at the pedestrian pier as well as providing direct, physical access to the water via step-down areas or to support other opportunities that restore or enhance ecological value.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for this subdistrict:

- Modify Cesar Chavez Parkway to accommodate vehicular traffic while allowing for pedestrian, bicycle, and mobility enhancements. This includes partnering with adjacent jurisdictions to support urban greening efforts, such as walkability improvements, enhanced tree canopy, and stormwater treatment opportunities, consistent with the City of San Diego's planned Bay to Park link along Cesar Chavez Parkway between 25th Street and Cesar Chavez Park.
- Develop a water-based transfer point at the Cesar Chavez Pedestrian Pier, as generally depicted in Figure PD4.3 of the PMPU.

Development Standards

Proposed public realm standards include the preservation establishment of scenic vistas for the following, as generally depicted on PMPU, Figure PD4.4:

- View of the Bay from the promenade along Cesar Chavez Park, north of the Cesar Chavez Pedestrian Pier.
- View of the Bay from the western end of the Cesar Chavez Pedestrian Pier.

In addition, development standards propose that permanent above-water vessel repair operations shall not affect views from designated scenic vista areas. Furthermore, development standards propose the development of additional urban greening features to Cesar Chavez Park to establish an enhanced buffer between the park and industrial uses, where feasible.

Harbor Drive Industrial Subdistrict

The Harbor Drive Industrial Subdistrict includes the water and land area located southwest of Harbor Drive between Cesar Chavez Park and Chollas Creek (see Figure 3-8).

Vision

The vision for this subdistrict is a premier and high-performing center for shipbuilding and ship repair for the defense and maritime industries, with dedicated mobility connections to access this center and enhanced infrastructure that provides convenient and safe access to jobs. This includes upgraded facilities and a competitive and sustainable freight movement system that handles cargo in an efficient, safe, and environmentally responsible way.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed planned improvements related to landside access for this subdistrict involve modifications to the entire segment of northbound and southbound Harbor Drive within the District's jurisdiction to: provide a multi-use pathway; include one "flexible" lane in each direction (further described in appealable projects below); and develop additional bus/truck loading, parking, and queuing areas to facilitate better drop-off movements at Belt Street and Sampson Street.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for this subdistrict:

- Modifying northbound and southbound Harbor Drive to include one multi-use pathway (as described in the section above) and develop additional bus/truck loading, parking, and queuing (as described in the section above), and one "flexible" lane in each direction, that is dedicated for trucks, transit buses, and/or shuttles, with an information technology system (or similar technology) and signalization improvements that can be modified and/or adjusted during peak and nonpeak hours between Schley Street and 32nd Street.

Development Standards

The proposed development standards for the Harbor Drive Industrial Subdistrict apply to goods movement, and relate to sustainable shipyards, truck routes, and parking. Specifically, development would be required to invest in electrification or other improvements on-site to reduce the reliance on fossil fuels, reduce criteria air pollutants and greenhouse gas emissions, and demonstrate consistency with State goals and requirements, which may include investment in a compilation of improvements, such as installation of electric infrastructure to support equipment and operations on-site. Proposed truck route development standards include use of designated truck routes to, from, and through the planning district and coordination with the City of San Diego to ensure that truck route requirements and truck parking prohibitions in adjacent neighborhoods are followed. Proposed parking development standards may include a multi-phased approach, such as District occupants, tenants, and permittees at the Harbor Drive Industrial Subdistrict collectively or individually establishing an offsite parking strategy to ensure that workers do not adversely affect adjacent areas and coordinating with the City of San Diego and other regional partners to address workforce parking, including implementing a shared parking facility or other parking solutions, for public off-street parking.

3.5.3.5 Planning District 5: National City Bayfront (Not a Part of the Proposed PMPU)

The National City Bayfront Planning District (PD5), often referred to as the “National City Balanced Plan,” is an amendment to the existing certified PMP, and associated use designations have not been included and are not a part of the proposed PMPU, as at the time of public review for this PEIR, the draft EIR for the National City Balanced Plan PMP amendment had been circulated for public review. This draft PMP amendment was adopted by the Board on November 16, 2022 (Item 2022-0360 – Resolution No. 2022-018; District Clerk Document No. 74950) and in March 2023, the District submitted the draft PMPA to the CCC to begin the certification process. The National City Balanced Plan PMP amendment is anticipated to ~~could likely~~ be certified prior to the CCC’s consideration of the proposed PMPU. This existing planning district and associated use designations were not revised or readopted as part of the PMPU. However, the buildout of the National City Bayfront is a cumulative project, as listed in Chapter 2, *Environmental Setting*. Therefore, analysis of any future development within this planning district is not included in this Draft PEIR, except as a cumulative project analyzed in the discussion of cumulative impacts in Chapter 4.

3.5.3.6 Planning District 6: Chula Vista Bayfront (Not a Part of the Proposed PMPU)

The bayfront area of the Chula Vista Bayfront Planning District (currently PD7 but proposed to be PD6 in the updated Port Master Plan) has already undergone an extensive update and planning process, known as the Chula Vista Bayfront Master Plan (CVBMP). The EIR and Port Master Plan Amendment for the CVBMP were approved by the District in 2010 and certified by the CCC in 2012. The CVBMP is currently being implemented. The PMPU does not propose any changes in the Chula Vista Bayfront Planning District and associated use designations.

However, buildout of the Chula Vista Bayfront Master Plan is considered a past, present, or probable future project with related impacts. Therefore, the CVBMP is one of the cumulative projects included in the analysis of cumulative impacts in Chapter 4 of this Draft PEIR.

3.5.3.7 Planning District 7: South Bay

The South Bay Planning District (PD7) includes both water and land areas at the southern end of San Diego Bay. Located adjacent to the San Diego Bay National Wildlife Refuge, the planning district offers a diverse range of natural resources and ecosystems. A portion of the Bayshore Bikeway near the planning district offers both physical and visual access to the Bay. The South Bay Planning District encompasses a total area of 211.91 acres, including 210.53 acres of water area and 1.45 acres of land area, at the southerly end of San Diego Bay. The Final EIR and The Wetland Mitigation Bank at Pond 20 project was approved by the Board of Port Commissioners on April 13, 2021, and a Port Master Plan Amendment is currently in process to incorporate the wetland mitigation bank parcel into the existing Port Master Plan. As discussed in Chapter 2, the Wetland Mitigation Bank at Pond 20 project is not included in the PMPU but is considered as a cumulative project and is part of the cumulative analyses contained within Chapter 4 of this Draft PEIR. There are no subdistricts identified for PD7.

Proposed Water and Land Use Designation

Proposed water and land use designations for PD7, as well as the proposed acreages of each, are provided in Table 3-10. As shown, the proposed water use designation is Conservation/Intertidal, and the proposed land use designation is Institutional/Roadway. The proposed water and land use map for PD7 is provided on Figure 3-9.

Table 3.10. South Bay Planning District Water and Land Use Designations

Certified PMP Designations (Existing)	Acre (GIS Conversion)	Proposed PMPU Designations	Acre	Net Change (acres)
Water Use				
Estuary	110.65	Conservation/Intertidal	210.53	+99.88 ¹
Total Water Use	110.65	Total Water Use	210.53	+99.88¹
Land Use				
Wetlands	101.33	<i>(acreage redistributed as a water use to Conservation/Intertidal)</i>	--	-101.33 ²
--	--	Institutional/Roadway	1.45	+1.45 ³
Total Land Use	101.33	Total Land Use	1.45	-99.88

¹ Additional acreage from redesignation of Wetlands to a water use.

² Reduced acreage from redesignation of Wetlands to a water use and distribution to Institutional/Roadway.

³ Additional acreage from redistribution of Wetlands.

Vision

The proposed vision for the South Bay Planning District is to preserve the existing coastal and intertidal habitats and natural resources in this area through complementary habitat restoration, enhancement, and creation activities. Maintaining the connection between the Bayshore Bikeway and Tidelands is also a part of the vision, along with improving public access opportunities through views and linkages for the enjoyment of the Bay's natural beauty.

Given the natural character of this planning district, the PMPU proposes no special allowances, coastal access requirements, or development standards for this district.

Special Allowances

There are no special allowances proposed for this planning district.

Planned Improvements

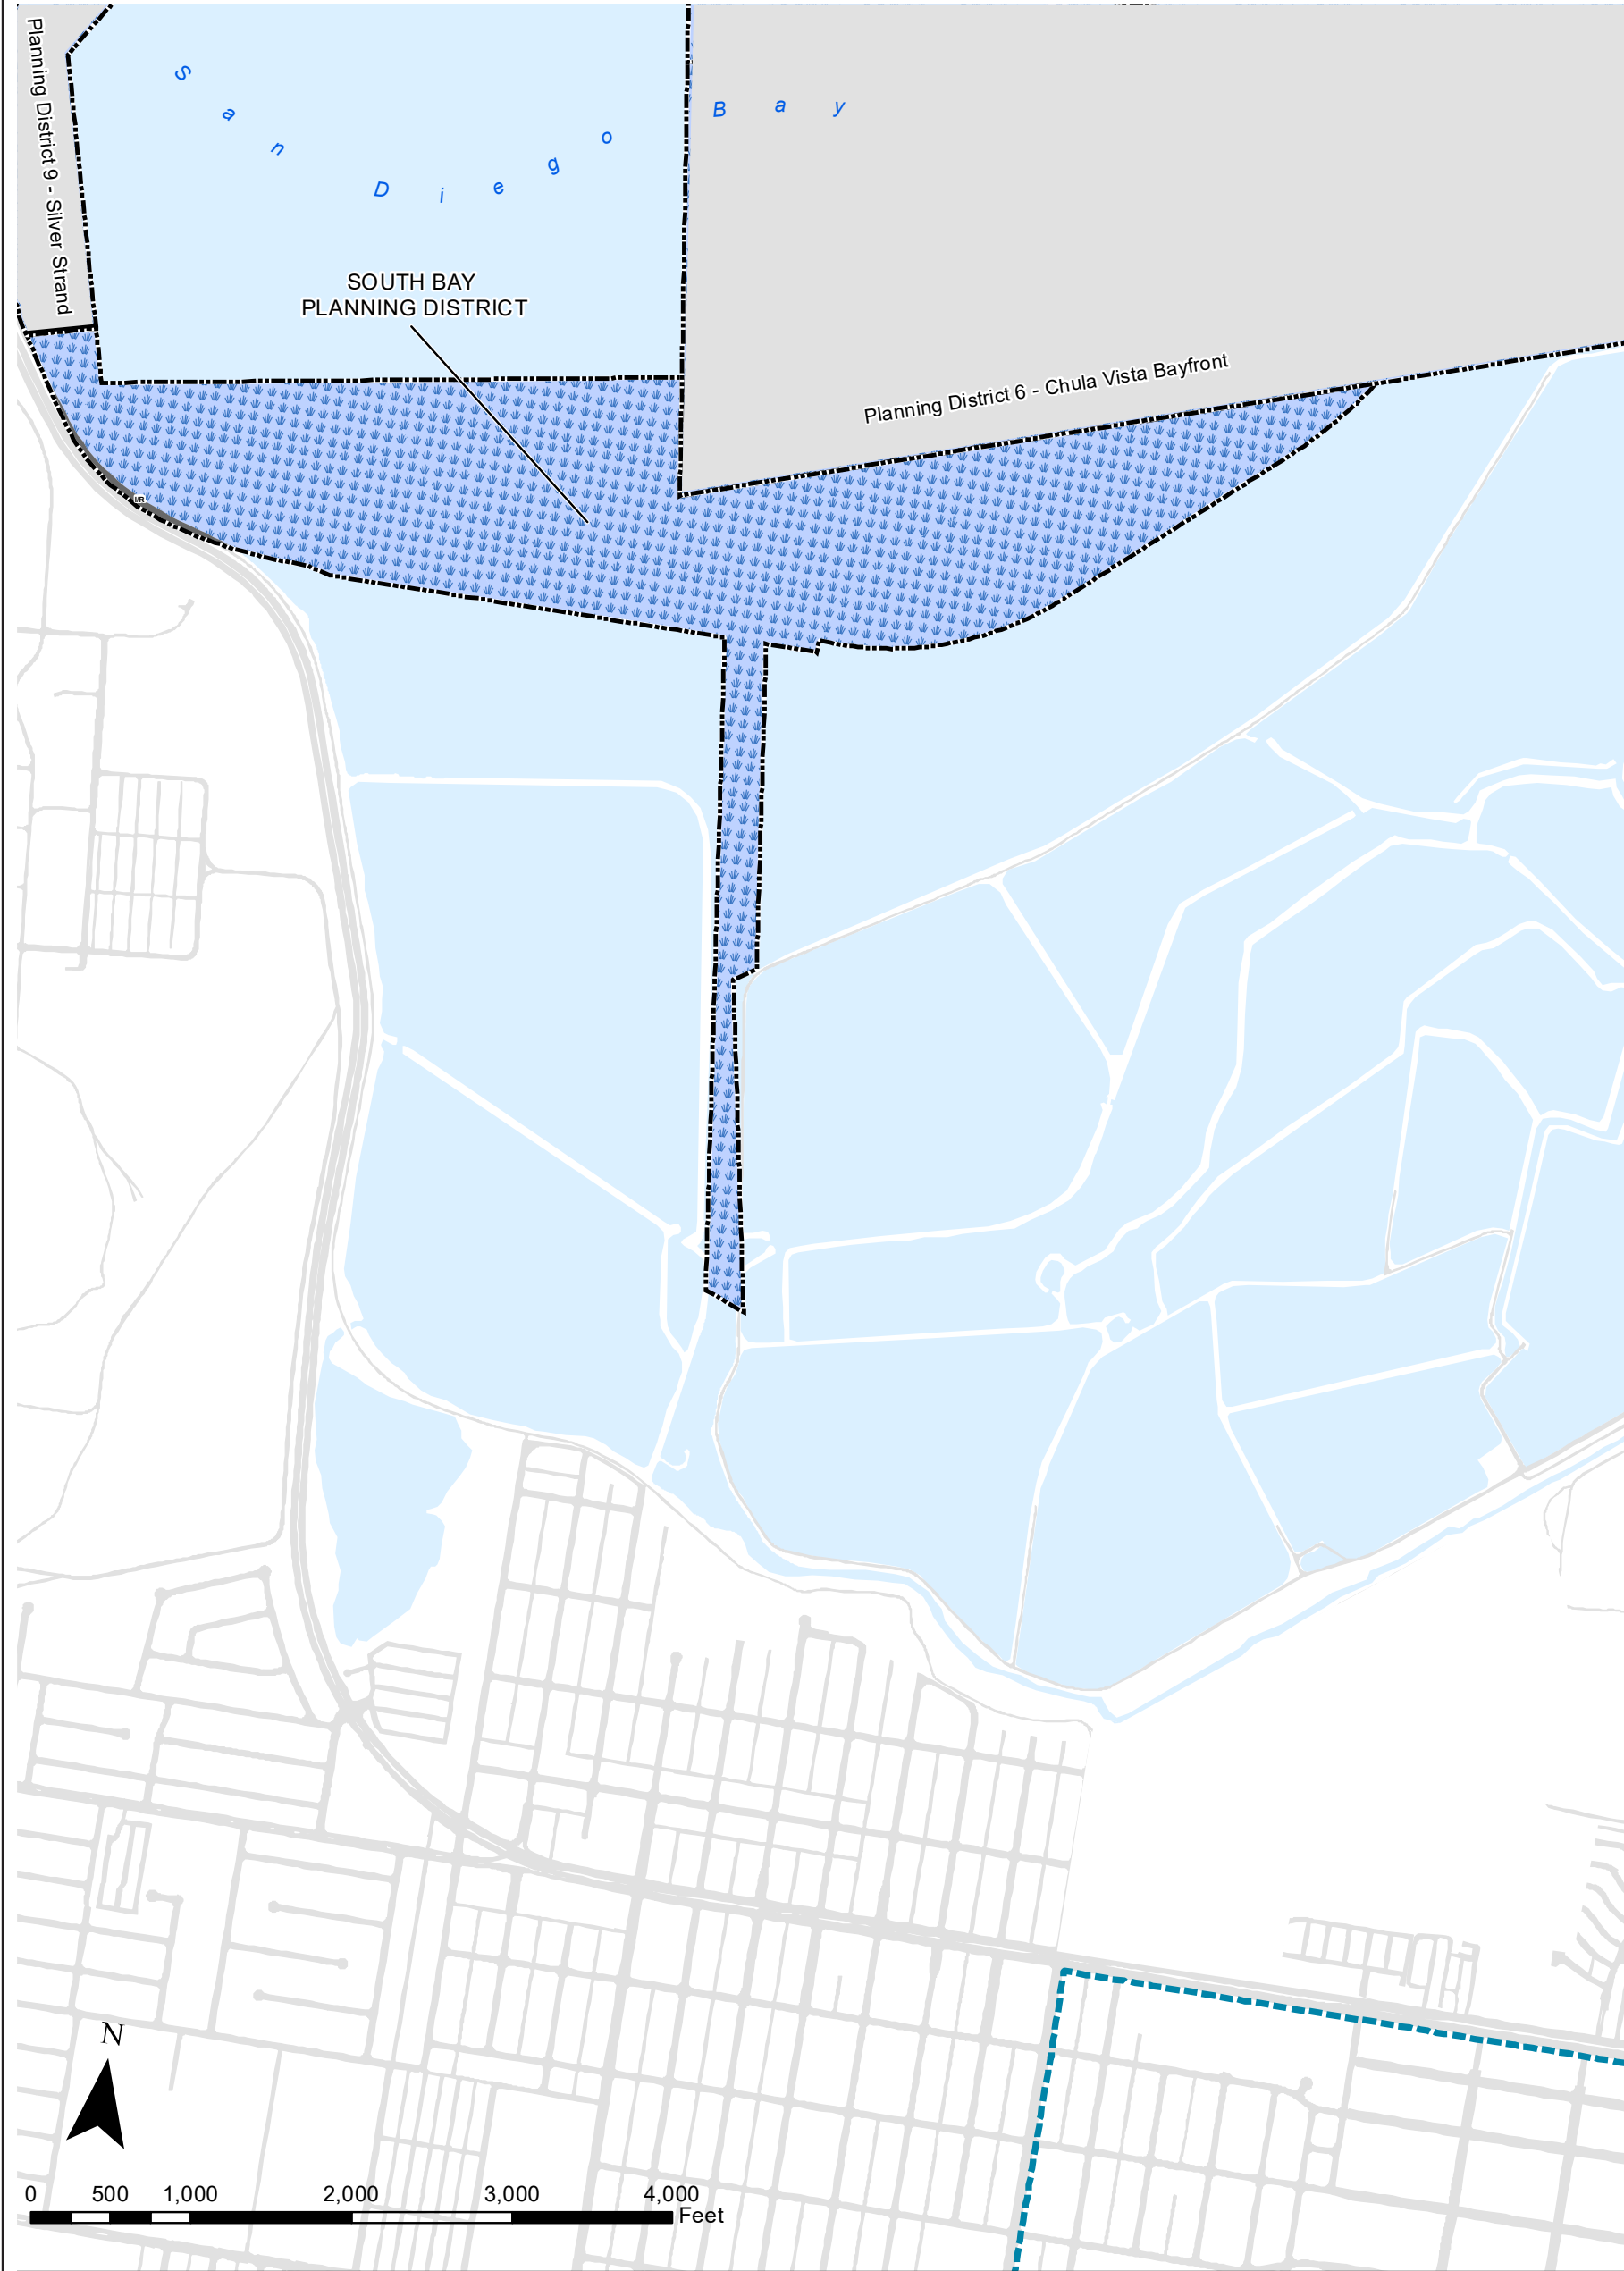

There are no planned improvements proposed for this planning district.

Appealable Projects

There are no appealable projects proposed for this planning district.

Development Standards

There are no development standards proposed for this planning district.

3.5.3.8 Planning District 8: Imperial Beach Oceanfront

The Imperial Beach Oceanfront Planning District (PD8) is located along the Pacific Ocean shoreline within the City of Imperial Beach from roughly Carnation Avenue on the north to just beyond the terminus of Seacoast Drive on the south. The Imperial Beach Oceanfront Planning District includes retail, restaurant, and open space uses. Beach- and water-based recreational activities, community beach festivals, and special events are among the public access opportunities available along the shoreline. The sandy ocean beach is a prominent public amenity and natural physical asset, and the Imperial Beach Pier provides visitors with fishing opportunities, expansive views, and commercial recreation facilities. PD8 comprises a total of 404.16⁷ acres, the majority of which is water (402.03 acres) with smaller landside areas (2.13³ acres). There are no subdistricts proposed for PD8.

Proposed Water and Land Use Designations

Proposed water and land use designations for PD8, as well as the proposed acreages of each, are provided in Table 3-11. As shown, the water use designation in PD8 is Open Bay/Water. The proposed land use designations are Commercial Recreation, Institutional/Roadway, and Recreation Open Space. The proposed water and land use map for PD8 is provided on Figure 3-10.

Table 3-11. Imperial Beach Oceanfront Planning District Water and Land Use Designations

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Sportfishing Berthing	0.08	<i>(Not proposed in this planning district)</i>	--	-0.08
Open Ocean	393.12	Open Bay/Water	402.03	+8.91 ¹
Total Water Use	393.20	Total Water Use	402.03	+8.83
Land Use				
Commercial Recreation	1.67	Commercial Recreation	1.05	-0.62
Park/Plaza	0.26	Recreation Open Space	0.95	+0.69
Public Service Facility	0.13	<i>(Consolidated to Institutional/Roadway)</i>	--	--
Street	3.1 ²	<i>(Area removed from the PMPU)</i>	--	--
		Institutional/Roadway	0.13	0.13
Total Land Use	2.06	Total Land Use	2.13	+0.07

¹ Additional acreage from updated boundary

² From existing PMP not GIS Conversion, and not accounted for in total land use for this planning district.

Vision

The vision for PD8 is to create a prominent public destination with safe coastal access and opportunities for visitors to explore the area and enjoy the spectacular ocean views. Development intensity is proposed to increase in this planning district to accommodate additional visitor-serving uses and potential aquaculture opportunities. Safe public access would continue to be integrated into new development to enhance physical and visual access and recreation opportunities, as well as provide improved pedestrian features for visitors.

Special Allowances

There are no special allowances proposed for this planning district.

Planned Improvements

Proposed planned improvements associated with landside access would involve development of a Connector Mobility Hub in the vicinity of Seacoast Drive and Elkwood Avenue (see Figure PD8.3 of the proposed PMPU). The PMPU proposes modification of public access to the shoreline, oceanfront, and the pier to include wayfinding signage and pedestrian lighting, as well as the development of bicycle parking at the Imperial Beach Pier Plaza for the Imperial Beach Pier. The public services facility (Dempsey Holder Safety Center) would be allowed to remain, the existing public amenities at Dunes Park on Daisy Avenue would be maintained, and up to ~~three~~two activating features, one of which may be a pavilion, are proposed to be developed at Dunes Park.

Proposed coastal access planned improvements would involve maintenance of contiguous coastal access along the perimeter of the pier; provision of a 150-foot wide pier safety zone in the ocean to separate swimmers, surfers, and watercraft from the potential hazards of submerged obstructions, collisions with pier pilings, and entanglement with fish hooks and lines; and modifications to the Imperial Beach Pier and Pier Plaza, including but not limited to development that serves beach visitors, such as seasonal activating features and recreational equipment rental along the length of the pier, installation of overwater lighting on the pier, and expansion of the pier, as needed and feasible, to provide additional public and shoreside open space in the area.

For visitor-serving commercial uses, the PMPU proposes modification or replacement-in-kind of the existing visitor-serving uses in the Pier Plaza building, and the development of up to 15,000 square feet of restaurant space. ~~Alternatively, the same 15,000 square feet, which could be substituted for development of up to 15,000 square feet of retail and/or retail with restaurant space as indicated in the Appealable Projects section below, on the Palm Avenue and Elkwood Avenue parcels.~~

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

Proposed appealable projects for PD8 are as follows:

- Modify, or replace in-kind, the existing pier building, with a potential increase of up to 3,000 additional square feet of Retail and/or Retail with Restaurant space, to improve visual and physical access at the western end of the pier.
- On the Palm Avenue and Elkwood Avenue sites designated Commercial Recreation, develop up to 15,000 additional square feet of Retail and/or Retail with Restaurant space, ~~which could be substituted for development of up to 15,000 square feet of restaurant space as indicated in the Planned Improvements above.~~

Development Standards

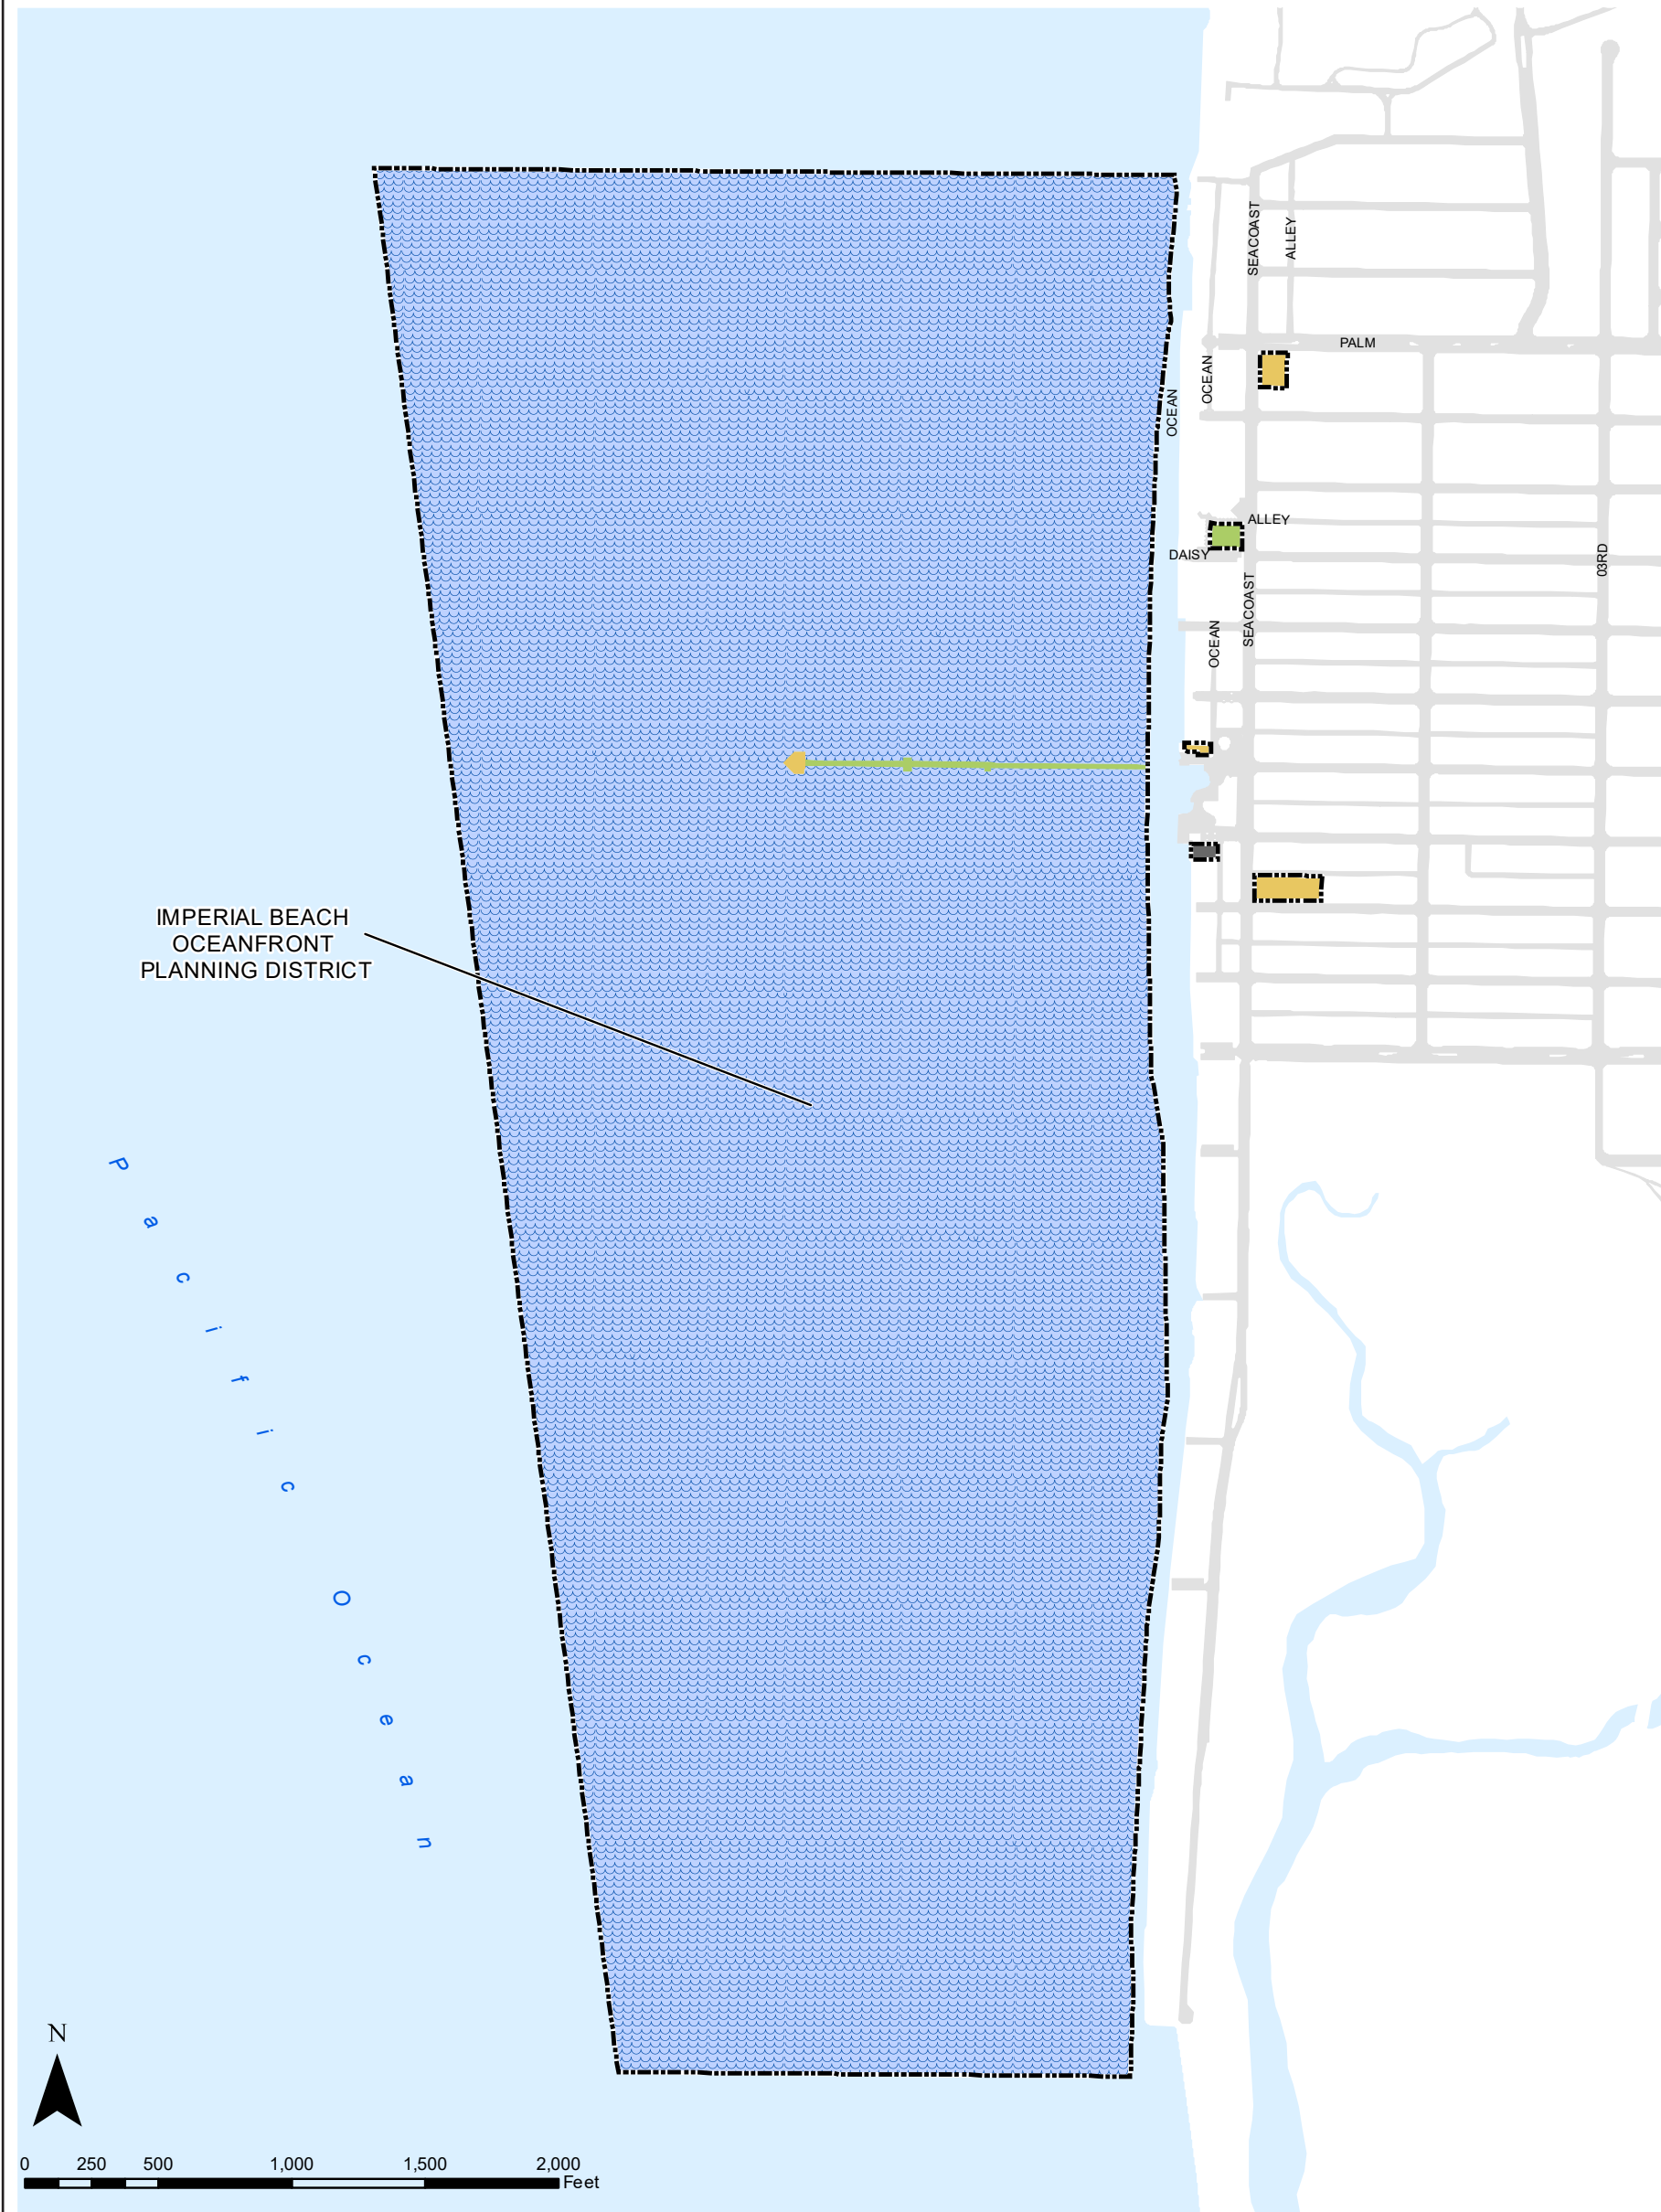

The PMPU proposes the preservation of the following scenic vistas within PD8:

- View of the ocean to the north, from the north side of the Imperial Beach Pier.
- View of the ocean to the south, from the south side of the Imperial Beach Pier.

- View of the ocean to the west, from the west end of the Imperial Beach Pier.

In addition, the PMPU proposes that structures, other than those on Imperial Beach Pier, must not exceed 30 feet in height and shall not have more than three stories. Structures on Imperial Beach Pier shall not exceed 26 feet in height from the deck of the pier and will not have more than one story. Development standards related to parking include collaboration with the City of Imperial Beach to implement parking solutions related to public off-street parking.

3.5.3.9 Planning District 9: Silver Strand

The Silver Strand Planning District (PD9) is located in the southwest corner of San Diego Bay, east of Silver Strand State Beach. A variety of recreational activities are provided in this planning district, including walking along nature trails, enjoying expansive views of the Bay, and bird watching. Additional features include visitor-serving commercial amenities, such as hotels and restaurants, as well as recreational boat berthing marinas. Piers and docks with no associated public access extend into the planning district from off-Tidelands residences. PD9 is divided into three subdistricts and includes a total of 235.26 ~~1.7~~ acres, with 202.72 ~~199.1~~ acres of water area and 32.54 ~~6~~ acres of land area.

Proposed Water and Land Use Designations

Proposed water and land use designations are provided in Table 3-12. Proposed, primary water use designations would include Anchorage, Conservation/Intertidal, Navigation Corridor, Open Bay/Water, and Recreational Berthing. Allowable land use designations would include Commercial Recreation, Institutional/Roadway, and Recreation Open Space. The proposed water and land use map for PD9 is provided on Figure 3-11.

Table 3-12. Silver Strand Planning District Water and Land Use Designations

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Recreational Boat Berthing	37.84	Recreational Berthing	26.53	-11.31 ¹
Open Bay/Water	84.93	Open Bay/Water	95.88	+10.95 ²
Boat Anchorage	--	Anchorage	7.54 0	+7.54 ³
Estuary	5.76	Conservation/Intertidal	50.64	+44.88 ⁴
Boat Navigation Corridor	59.69	Navigation Corridor	22.12	-37.57 ⁵
Total Water Use	188.22	Total Water Use	202.72	+14.50
Land Use				
Commercial Recreation	30.54	Commercial Recreation	20.76	-9.78 ⁶
Open Space	1.94	<i>(Consolidated to Recreation Open Space)</i>	--	--
Park/Plaza	4.24	<i>(Consolidated to Recreation Open Space)</i>	--	--
<i>Total Consolidated Recreation Open Space</i>	6.18	Recreation Open Space	9.02	+2.84 ⁷
Streets	2.76	Institutional/Roadway	2.76	0.00
Total Land Use	39.48	Total Land Use	32.54	-6.94

¹ Reduced acreage from redistribution to Conservation/Intertidal.

² Additional acreage from redistribution of Boat Navigation Corridor.

³ Certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District from the California State Lands Commission. Thus, for consistency, parcels that had previously been assigned designations in the Certified PMP and have been granted to the District pursuant to SB 507 are proposed to be incorporated into the proposed PMPU area and within the District's coastal permitting authority. In PD9, this includes an additional Anchorage parcel in State Park Basin.

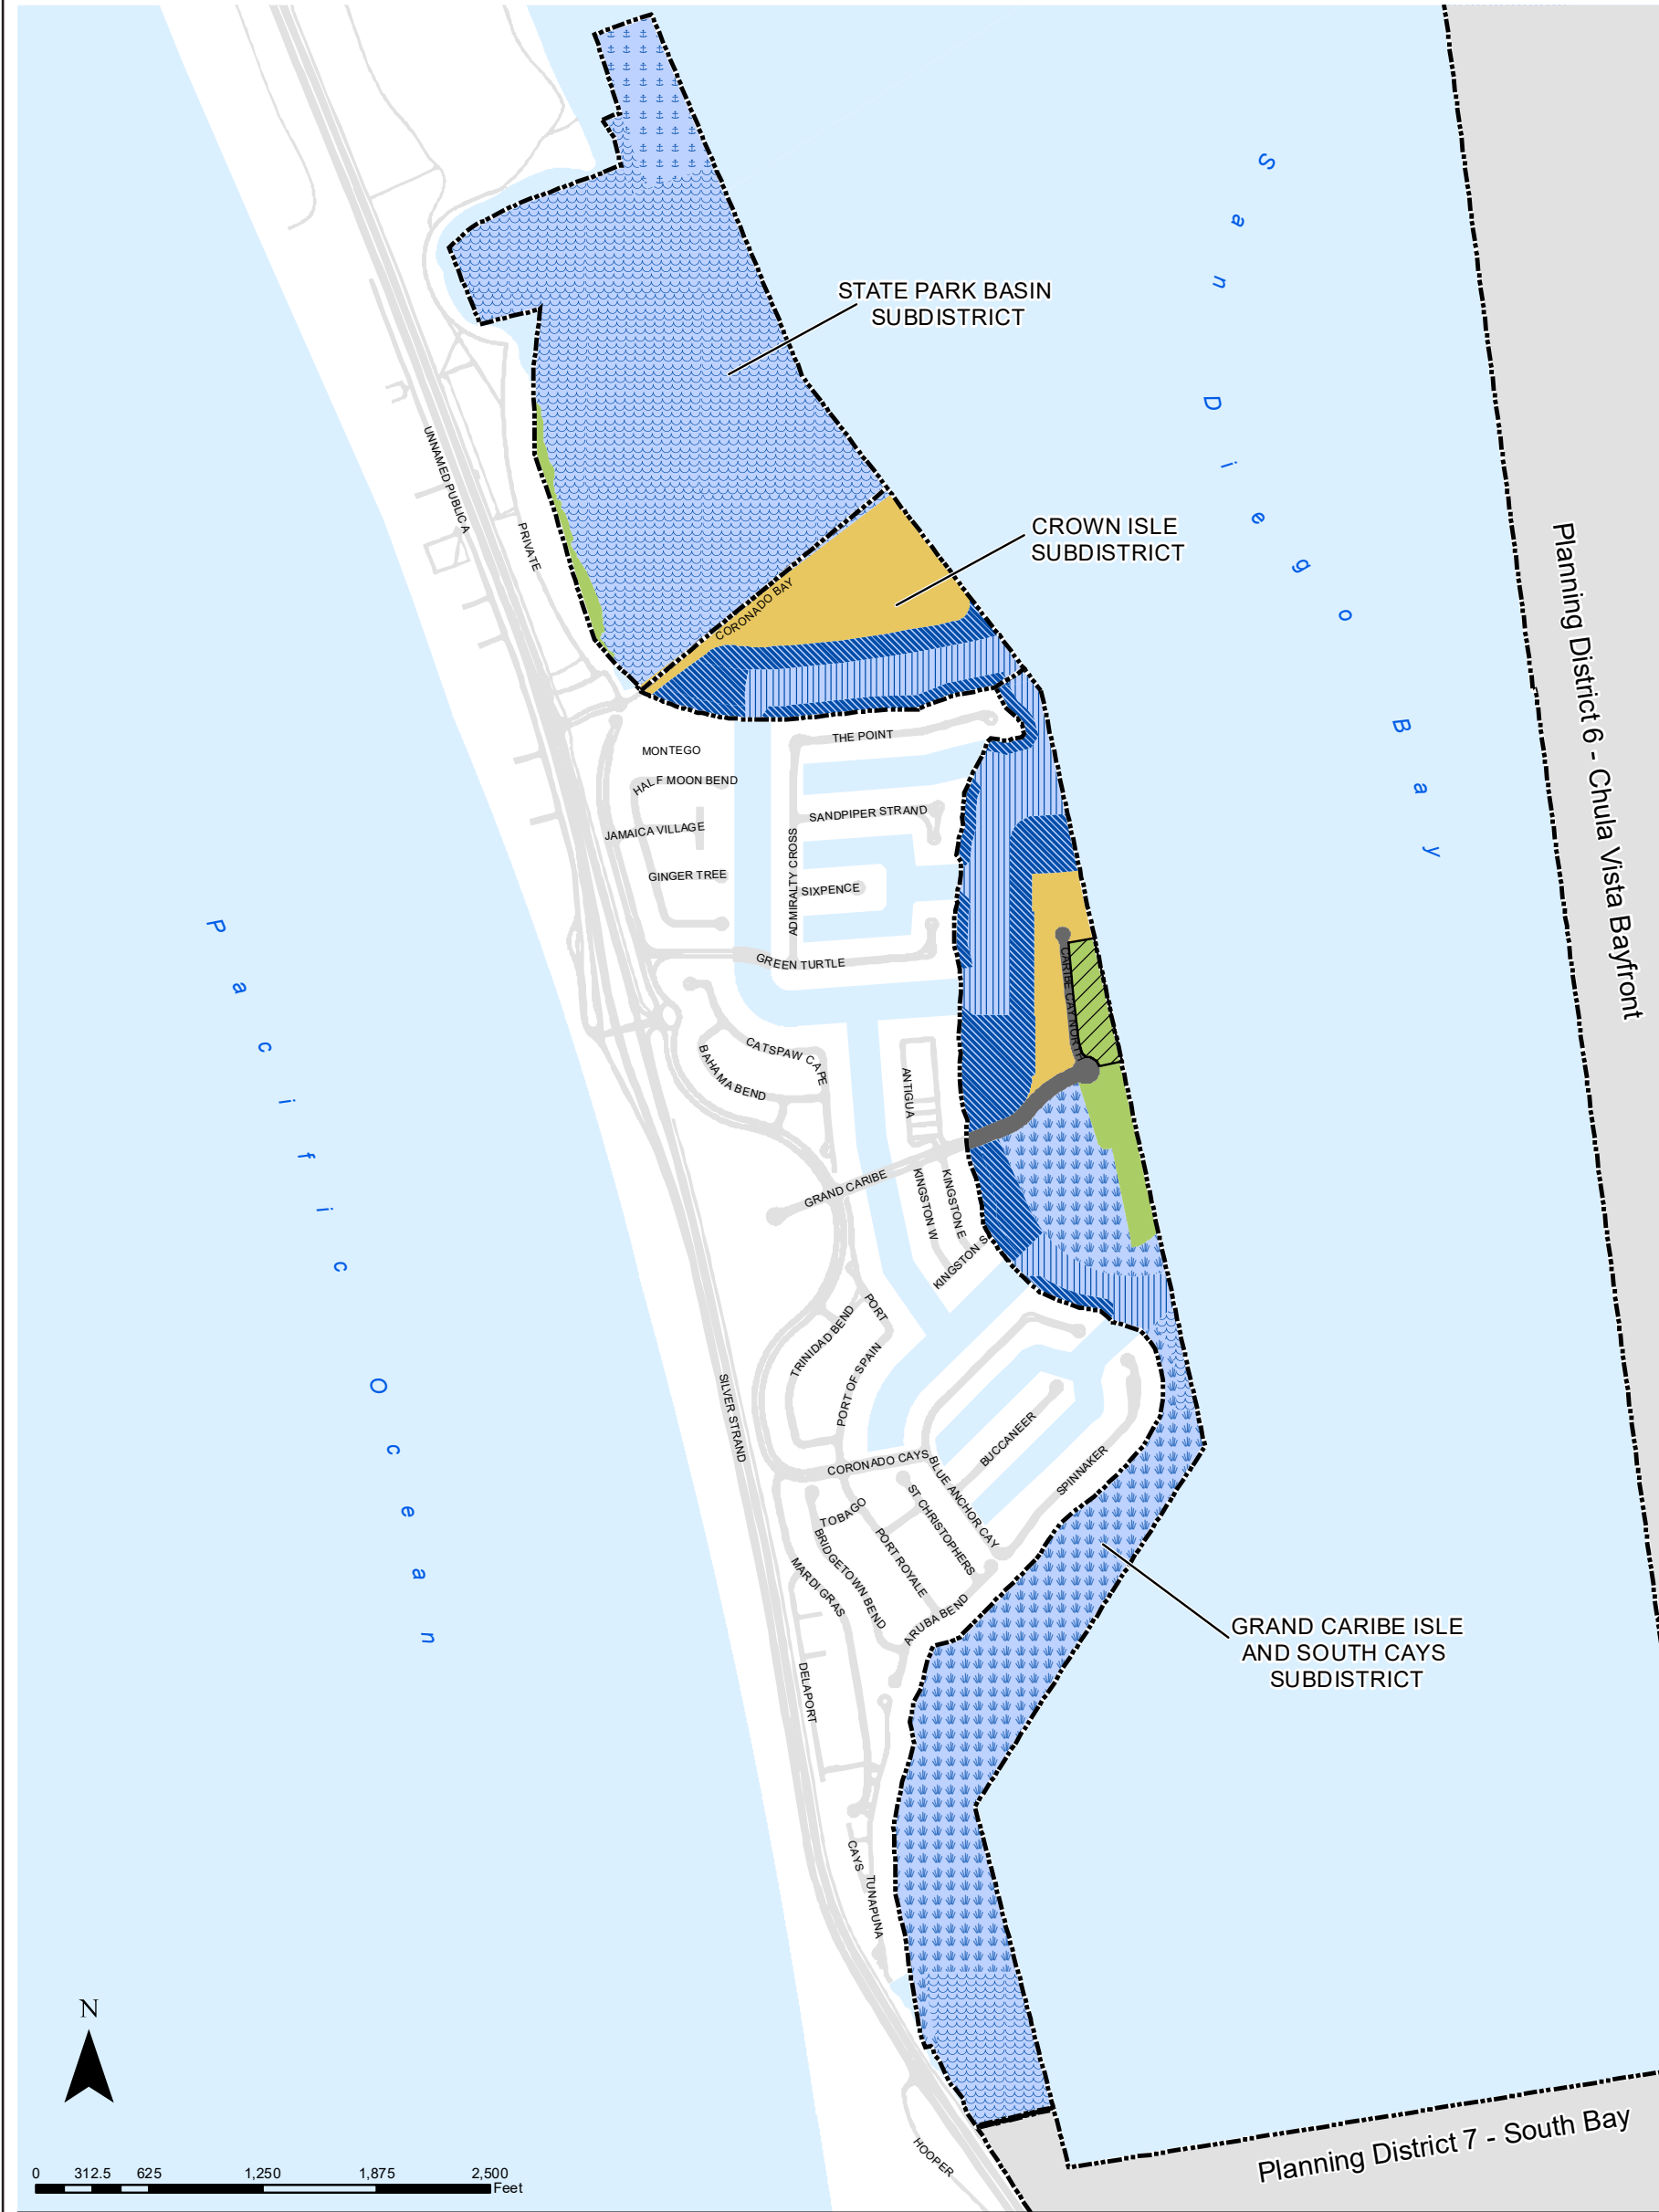

⁴ Additional acreage from redistribution of Boat Navigation Corridor and Recreational Boat Berthing.

⁵ Reduced acreage from redistribution to Conservation/Intertidal and Open Bay/Water.

⁶ Reduced acreage from redistribution to Conservation/Intertidal and Recreation Open Space.

⁷ Additional acreage from redistribution of Commercial Recreation.

This page was intentionally left blank.

JURISDICTIONAL BOUNDARIES

 Planning Subdistricts

 A parcel consisting of approximately 2.38 acres on the northern portion of Grand Caribe Isle in the Grand Caribe Isle and South Cays Subdistrict of Planning District 9 is subject to an existing lease which expires in 2034 (District Document No. 17678). Under the Port Master Plan Update, the Commercial Recreation land use designation has been changed to Recreational Open Space (ROS). Notwithstanding the ROS designation, nothing in the Port Master Plan Update shall impair or infringe upon any rights or obligations existing under the lease when the Port Master Plan Update took effect.

 Recreational Berthing

This page was intentionally left blank.

State Park Basin Subdistrict

The State Park Basin Subdistrict consists primarily of the water area (Crown Cove) and shoreline on the east side of the Silver Strand, south of an undeveloped parcel that lies south of the Lincoln Military Housing and north of Coronado Bay Road (see Figure 3-11). The State Park Basin Subdistrict is adjacent to Silver Strand State Beach, which provides both overnight campsites and day use areas, and Crown Cove Aquatic Center, which provides recreational activities such as paddling, sailing, kayaking, surfing, and safe boating education. Park facilities include four large parking lots, which can accommodate up to 1,000 vehicles. Restroom and cold showers are available on each side of the park. Southwestern College operates the aquatic center at Silver Strand State Beach in collaboration with the California Department of Parks and Recreation and California Division of Boating and Waterways.

Vision

The vision for this subdistrict is to preserve the existing character of the State Park Basin area, protect natural resources through environmental restoration and habitat preservation, and honor its connection to the water, by maintaining and enhancing its recreational marinas and scenic views of San Diego Bay and its wildlife.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed planned improvements include maintenance of the existing recreational marina-related facilities at the Crown Cove Aquatic Center, and modification or replacement-in-kind of the moorings at the Crown Cove Anchorage (A-7).

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for this subdistrict:

- Allow for modifications to moorings to allow for an increase of five moored vessels at the Crown Cove Anchorage (A-7), provided the boundaries of the anchorage do not change and there is no unmitigated increase in shading or fill.

Development Standards

The proposed development standards identify the preservation of the following scenic vista:

- View east from the shore in front of the Crown Cove Aquatic Center.

Additionally, the District shall coordinate with the adjacent jurisdiction to provide and maintain access to recreational areas and scenic view areas in this subdistrict.

Crown Isle Subdistrict

The Crown Isle Subdistrict consists of the water and land area of Crown Isle, including the existing resort and a marina, and is abutted by Crown Cove to the north and Coronado Cays to the south (see Figure 3-11).

Vision

The vision for this subdistrict is to honor Crown Isle's connection to the water, and protect the subdistrict's natural resources while preserving its unique mix of recreational boat berthing marinas and visitor-serving commercial amenities. The intensity of commercial development is to remain generally unchanged in the Crown Isle Subdistrict because modifications to the commercial areas are planned to occur within the existing footprint of the development. Modest modifications or upgrades are planned for the hotel, which includes the associated retail and restaurant areas. ~~Proposed modifications or in-kind replacements for existing hotel rooms, including associated retail and/or restaurant, may be allowed if they are limited to the same or lesser size and in the same general footprint.~~ Any proposed future development or planned improvements in the Crown Isle Subdistrict are intended to further enhance the area while being consistent with the subdistrict's character.

Special Allowances

Coronado Cays Residential Piers and Docks

Residential piers and docks adjacent to off-Tidelands residences in the Coronado Cays may be repaired or replaced in-kind provided changes in configuration result in no net increase in square footage of ~~occupied~~ surface area coverage of San Diego Bay water and/or fill in the Bay floor.

Planned Improvements

Proposed planned improvements related to landside access include the development of a Connector Mobility Hub, or a larger hub, south of the existing hotel along Coronado Bay Road, including wayfinding and pathway connections to connect with the existing water-based transfer point and short-term public docking. Proposed coastal access improvements would include modification or replacement in-kind of the existing water-based transfer point south of the existing hotel and modification or replacement in-kind of the existing short-term public docking located south of the existing hotel. In addition, the PMPU proposes the modification or replacement of marina-facilities. Proposed planned improvements related to visitor-serving commercial uses would allow for modification or replacement in-kind of existing hotel rooms, including associated retail, restaurant, and/or meeting space to the same or lesser square footage and room count and the same general footprint. The proposed PMPU does not plan for any new hotel rooms in this subdistrict.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for this subdistrict:

- Develop up to 10 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities in the subdistrict.

Development Standards

The proposed development standards include the provision of a continuous waterside promenade with a minimum width of 12 feet as part of all development abutting the waterfront that is not considered a coastal-dependent maritime industrial use to offer public coastal access along the waterfront. In addition, the PMPU proposes that structures shall not exceed 35 feet in height, and that modification or replacement in-kind of existing visitor-serving commercial uses would be consistent with the following: building design must be compatible with the character of the surrounding community, with a minimum 15 percent of the site area set aside for landscaping, exclusive of any required parking areas.

Grand Caribe Isle and South Cays Subdistrict

The Grand Caribe Isle and South Cays Subdistrict consists primarily of the water area and shoreline, as well as the Grand Caribe Shoreline Park, on the east side of the Silver Strand abutting the east side of the Coronado Cays residential community (see Figure 3-11).

Vision

The vision for this subdistrict is to continue to honor Grand Caribe Isle and South Cays' connection to the water with small-scale amenities and access improvements, environmental restoration, and habitat creation. The intensity of development is not planned to significantly increase because modifications are intended to enhance the recreational and public access aspects of the area. Planned improvements in the Grand Caribe Isle and South Cays Subdistrict are intended to add new or enhance existing amenities that support the area's ties to the recreational boating community, such as public docking and marina areas and the addition of a water-based transfer point. Planned public access improvements will enhance physical and visual access through new public pathways and recreational areas that provide opportunities to enjoy views of the Bay and the neighboring natural open space, as well as enhance the area's connection to the region through the Bayshore Bikeway. Environmental restoration and habitat creation in this area will continue to protect the subdistrict's natural resources.

Special Allowances

Coronado Cays Residential Piers and Docks

Residential piers and docks adjacent to off-Tidelands residences in the Coronado Cays may be repaired or replaced in-kind provided changes in configuration result in no net increase in square footage of occupied surface area coverage of San Diego Bay water and/or fill in the Bay floor.

Planned Improvements

Proposed planned improvements related to recreation and landside access include expansion of the Grand Caribe Shoreline Park to the north of the Grand Caribe Causeway and that adjacent development in Commercial Recreation areas shall include amenities to serve the public visiting Grand Caribe Shoreline Park, and coordination with adjacent jurisdictions to maintain connections between the Bayshore Bikeway and Tidelands.

Proposed coastal access planned improvements would involve development of a water-based transfer point at the northern portion of Grand Caribe, as generally depicted on Figure PD9.3 of the PMPU. The PMPU also proposes planned improvements to allow for modification or replacement in-kind of existing recreational marina-related facilities on Grand Caribe Isle, without an unmitigated

increase in shading or fill. No new hotel rooms are planned within this subdistrict ~~would be allowed~~ under the proposed PMPU.

Proposed planned improvements relate to the creation of wetland habitat to be used as a mitigation bank at Grand Caribe Isle south.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for this subdistrict:

- Develop a water-based transfer point at the northern portion of Grand Caribe, as generally depicted in Figure PD9.3 of the PMPU.
- Develop short-term public docking slips at the northern portion of Grand Caribe in association with recreational marina-related facilities, as generally depicted on PMPU, Figure PD9.3.
- Develop up to 10 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities in the subdistrict. Landside facilities must be small-scale, water-oriented or marina-related development that is in character with the scale and size of the existing surrounding development.

Development Standards

The proposed development standards call for the provision of a continuous waterside promenade or nature trail, or a combination of the two, as part of all development abutting the waterfront that is not a coastal-dependent maritime industrial use to offer public access along the waterfront. North of Grand Caribe Causeway, extending to the west side of Grand Caribe Isle along the basin, looping around the north side of Grande Caribe Isle, the nature trail or waterside promenade shall have a minimum width of 6 feet, and south of Grand Caribe Causeway, on the east side/bayside of Grand Caribe Isle, in the areas with a Recreation Open Space land use designation and extending to the southern point of Grand Caribe Isle, the existing, continuous nature trail shall be maintained and shall not exceed 6 feet in width. The development standards also include the preservation of the following scenic vista areas:

- View of the Bay from Grand Caribe Shoreline Park, and
- View of the Bay from the northeast portion of Grand Caribe.

Development standards also include preservation of the Grand Caribe Causeway View Corridor Extension.

In addition, the PMPU proposes that structures shall not exceed 35 feet in height, and building design shall be water-oriented and context-sensitive to the Coronado Cays community, surrounding Commercial Recreation development west of Caribe Cay North Boulevard, and views of the Bay, with a minimum 15 percent of the development site landscaped, and required parking spaces shall not be considered as portion of the required landscaping.

3.5.3.10 Planning District 10: Coronado Bayfront

The Coronado Bayfront Planning District (PD10) is located along the northern and eastern bayfront of the City of Coronado. The Coronado Bayfront Planning District includes recreation and shopping

areas that have a strong relationship with the surrounding Coronado neighborhoods in the City of Coronado. It is a recreational jewel on the Bay, providing strong public access to the shoreline, coastal-dependent activities, and passive and active open space, as well as other recreational opportunities and diverse opportunities for east-facing views of the Bay and the San Diego skyline and waterfront. PD10 includes a total of ~~390.53~~ ~~272.7~~ acres, with ~~219.43~~ ~~102.9~~ acres of water area and ~~169.8~~ ~~171.10~~ acres of land area. PD10 is divided into two subdistricts, North Coronado Subdistrict and South Coronado Subdistrict, which are separated by the San Diego-Coronado Bridge.

Proposed Water and Land Use Designations

Proposed water and land use designations for PD10, as well as the proposed acreages of each, are provided in Table 3-13. As shown, primary water use designations would include Anchorage, Open Bay/Water, and Recreational Berthing. Allowable land use designations would include Commercial Recreation, Institutional/Roadway, and Recreation Open Space. The proposed water and land use map for PD10 is provided on Figure 3-12.

Table 3-13. Coronado Bayfront Planning District Water and Land Use Designations

Certified PMP Designations (Existing)	Acres (GIS Conversion)	Proposed PMPU Designations	Acres	Net Change (acres)
Water Use				
Recreational Boat Berthing	21.66	Recreational Berthing	26.48	+4.82 ¹
Open Bay/Water	76.32	Open Bay/Water	143.19	+66.87 ^{2,4}
Boat Anchorage	4.93 ³	Anchorage	49.76	+44.83 ⁴
Total Water Use	102.91	Total Water Use	219.43	+116.52
Land Use				
Commercial Recreation	27.77	Commercial Recreation	28.70	+0.93
Golf Course	100.14	(Consolidated to Recreation Open Space)	--	--
Open Space	5.63	(Consolidated to Recreation Open Space)		
Park/Plaza	28.86	(Consolidated to Recreation Open Space)	--	--
<i>Total Consolidated Recreation Open Space</i>	134.63	Recreation Open Space	135.86	+1.23 ⁵
Streets	6.55	Institutional/Roadway	6.55	0.00
Total Land Use	168.95	Total Land Use	171.10	+2.15

¹ Additional acreage from redistribution of Open Bay/Water

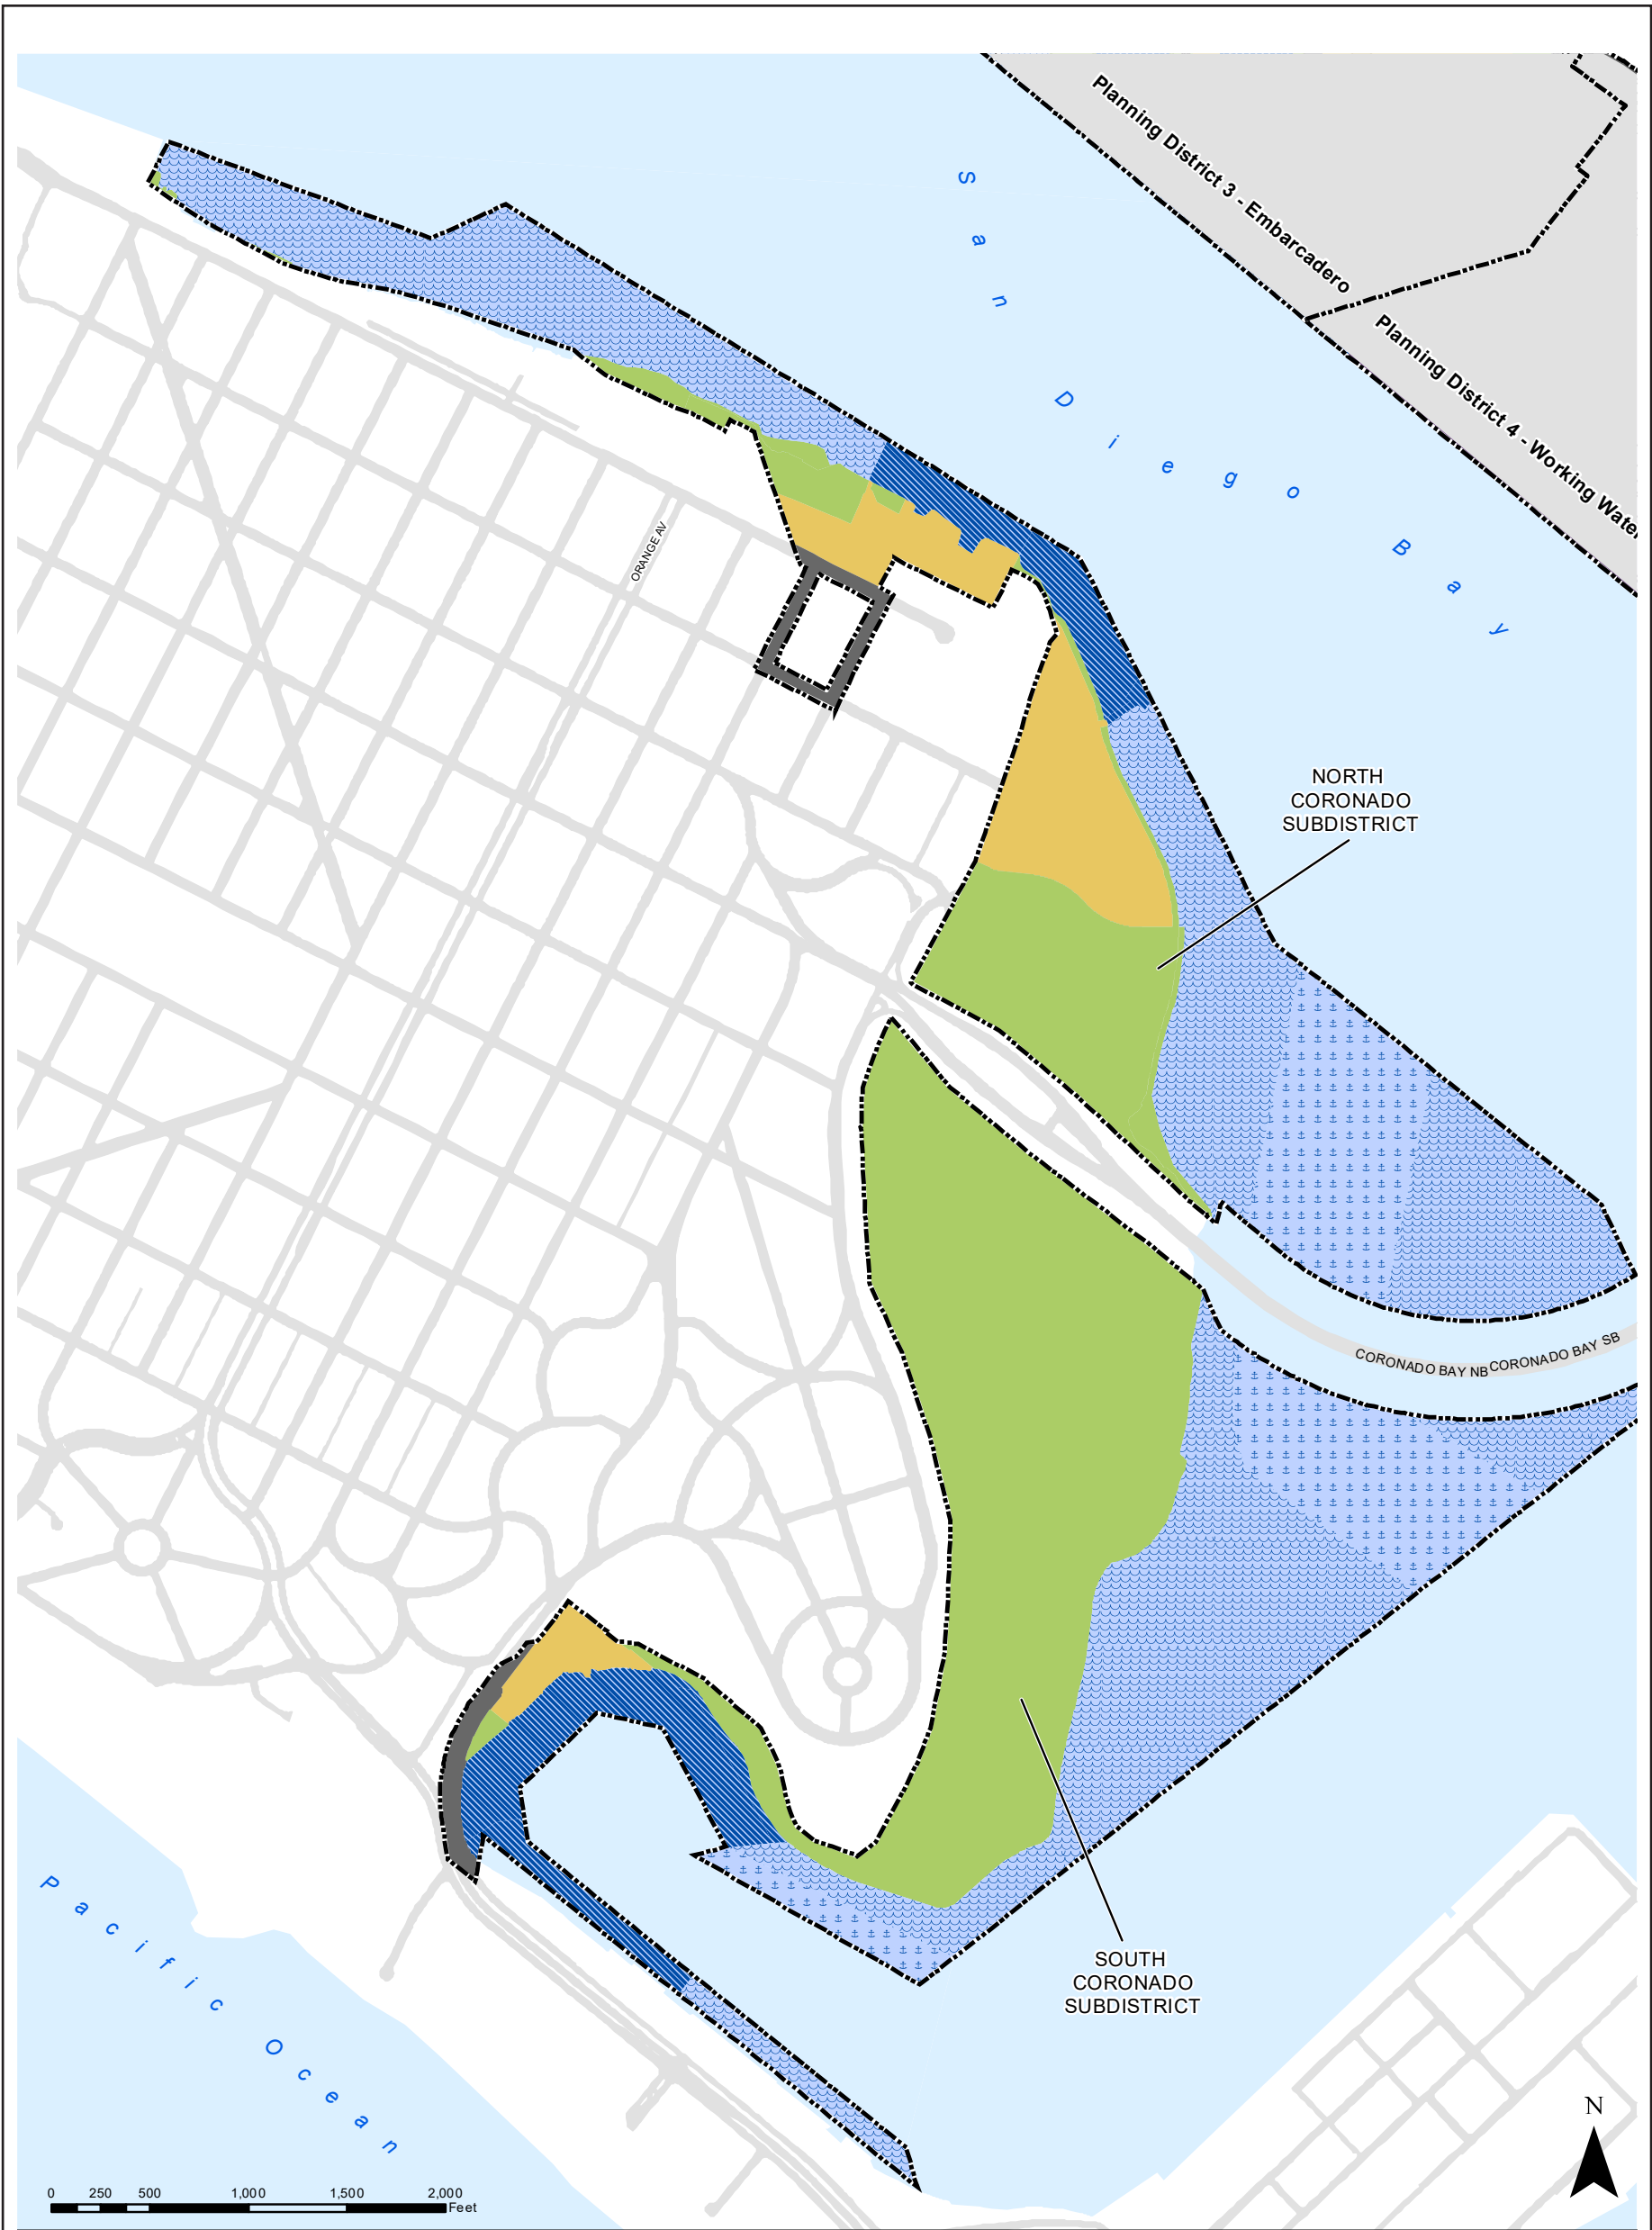

² Reduced acreage from redistribution to Recreational Berthing

³ Acreage from A-5 not previously accounted for Certified PMP

⁴ Certain water parcels had previously been assigned designations in the Certified PMP for informational purposes but were not a part of the District's coastal permitting authority. Pursuant to SB 507, those parcels have since been granted to the District from the California State Lands Commission. Thus, for consistency, parcels that had previously been assigned designations in the Certified PMP and have been granted to the District pursuant to SB 507 are proposed to be incorporated into the proposed PMPU area and within the District's coastal permitting authority. In PD10, this includes additional Open Bay/Water and Anchorage parcels in North Coronado and South Coronado.

⁵ A small portion of the Coronado Golf Course was recently granted to the District pursuant to SB 507 and proposed to be added to the District's coastal permitting authority through the proposed PMPU.

 Recreational Berthing

This page was intentionally left blank.

North Coronado Subdistrict

The North Coronado Subdistrict includes the water and land area along the northern and northeastern shoreline of Coronado, extending from Naval Air Station North Island to the San Diego-Coronado Bridge (see Figure 3-12).

Vision

The proposed vision for this subdistrict is to maintain North Coronado's existing character and strong connections to the water through physical and visual coastal access and coastal-focused recreational activities. The District's vision includes preservation of the existing water mobility system and walkways to ensure coastal access. North Coronado is proposed to continue to provide visitors with the opportunity to explore Tidelands through low-intensity commercial amenities, open space recreation areas, pathways, and access to the Bayshore Bikeway.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed landside access improvements would include development of a Local Gateway Mobility Hub, or larger hub, to support Tidelands uses near the Ferry Landing, including wayfinding and pathway connections to connect to the water-based transfer points and short-term public docking and be integrated with a surface-level or below-grade single parking facility that consolidates or reconfigures public parking, and maintaining continuous public coastal access to the Coronado Bayfront via the Bayshore Bikeway. Other landside access improvements include coordination with the adjacent jurisdiction on streetscape improvements for roadways within this subdistrict and providing marketing support and enhanced links between Tidelands and the adjacent jurisdiction for the operation of the City of Coronado's free summer shuttle.

Proposed coastal access improvements would involve modification or replacement in-kind of the existing water-based transfer points and short-term public docking at the Ferry Landing Pier and at the existing pier east of the Ferry Landing Pier, ~~and development of water-based transfer points at the existing pier facing northeast, and at the southern portion of Tidelands Park, near the beach north of the San Diego-Coronado Bridge, and development of one short-term public docking slip on the existing dock.~~ Coastal access improvements would also involve modification or replacement in-kind of the moorings within A-4 and maintenance of existing hand-launched non-motorized watercraft launch points at the beach south of Ferry Landing and at Tidelands Park beach. Finally, proposed coastal access would include the provision of step-down areas to provide physical access to the water at the beach south of the Ferry Landing Pier and north or south of the Tidelands Park beach.

Proposed planned improvements associated with the visitor-serving commercial uses would include modification or replacement in-kind of existing retail and/or restaurant spaces and/or hotel rooms, as well as development of a new restaurant with up to 7,500 square feet in the southern portion of the commercial development at Ferry Landing (as approved under the previously certified Port Master Plan in 1990). ~~No increase in the number of existing new hotel rooms is~~ are planned.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable project for the North Coronado subdistrict:

- Develop a water-based transfer point at the existing pier facing northeast, as generally depicted in Figure PD10.3 of the PMPU.
- Develop a water-based transfer point at the southern portion of Tidelands Park, near the beach north of the San Diego-Coronado Bridge, as generally depicted in Figure PD10.4 of the PMPU. This water-based transfer point should be developed for small recreational watercraft, such as dinghies.
- Develop one short-term public docking slip on the existing dock facing northeast, as generally depicted in Figure PD10.3 of the PMPU.
- Allow for modifications to moorings to allow for a cumulative increase of up to 20 moored vessels at existing Coronado Anchorage (A-4), provided the boundaries of the anchorage do not change, and there is no unmitigated increase in shading or fill.

Development Standards

Proposed public realm standards include provision of a continuous waterside promenade with a minimum width of 30 feet, which will be required of all development abutting the waterfront that is not a coastal-dependent maritime industrial use. The PMPU requires the preservation of ~~proposes~~ the following scenic vistas for the North Coronado Subdistrict:

- View of downtown San Diego from the sandy beach located at the foot of D Avenue.
- View of downtown San Diego from Centennial Park at the foot of Orange Avenue.
- View of the working waterfront from Tidelands Park.

~~Proposed~~ Preserved View Corridor Extensions are located at:

- Orange Avenue
- C Avenue
- B Avenue
- Second Street
- Third Street

Proposed parking standards include coordination between District occupants, tenants, and permittees to coordinate with the adjacent jurisdiction to collectively, or individually, establish an offsite parking strategy. Proposed building standards include a height limit of 40 feet and a setback 20 feet from the waterside promenade, as generally depicted on Figure PD10.5 of the proposed PMPU. The setback area shall include landscaping, public access, and bicycle and pedestrian facilities, such as bike racks, fixed or movable seating, and/or other possible improvements. Building orientation and character shall be context-sensitive in size, scale, and design, in character with the adjacent community, and should result in comprehensive, integrated development of commercial and public areas in a cohesive landscaped setting as well as building setback, orientation, and

landscaping requirements. The PMPU proposes that buildings orient toward the waterfront along the Bay, include active uses on the ground floor adjacent to the waterfront, and provide a minimum landscaped area of 15 percent of the total site area separate from required parking spaces.

South Coronado Subdistrict

The South Coronado Subdistrict includes the water and land area south of the San Diego-Coronado Bridge, including Glorietta Bay and an approximately 0.60-mile-long stretch along Silver Strand Boulevard (see Figure 3-12).

Vision

The proposed vision for this subdistrict is to enhance South Coronado's connection to the water by increasing recreational boat berthing opportunities and promoting public access throughout the area. Proposed planned public improvements for this subdistrict are intended to increase connections to the water mobility system through new water-based transfer points and public docking opportunities.

Special Allowances

There are no special allowances proposed for this subdistrict.

Planned Improvements

Proposed planned improvements to landside access include the proposed maintenance of continuous public coastal access to the Coronado Bayfront via the Bayshore Bikeway. Other landside access improvements include coordination with the adjacent jurisdiction on streetscape improvements for roadways within this subdistrict and providing marketing support and enhanced links between Tidelands and the adjacent jurisdiction for the operation of the City of Coronado's free summer shuttle.

Proposed planned improvements to coastal access include modifying or replacing in-kind the existing water-based transfer point at the south side of Glorietta Bay and the existing short-term public docking at the Glorietta Bay Boat Launch, as well as modifying or replacing in-kind the existing recreational marina-related facilities and moorings within the Coronado Anchorage (A-4) and Glorietta Bay Anchorage (A-5), all subject to certain restrictions specified in the proposed PMPU.

In addition to the proposed planned improvements discussed above, there are also planned improvements that are considered appealable projects. These are described below.

Appealable Projects

The proposed PMPU plans for the following appealable projects for South Coronado subdistrict:

- Develop one additional short-term public docking slip within this subdistrict in association with recreational marina-related facilities in collaboration with the City of Coronado.
- Develop up to 55 additional recreational boat berthing vessel slips in association with existing recreational marina-related facilities in this subdistrict, in coordination and in partnership with the City of Coronado, to allow for the accommodation of various-sized vessels.

- Allow for modifications to moorings to allow for a cumulative increase of up to 20 moored vessels at existing Coronado Anchorage (A-4), provided the boundaries of the anchorage do not change, and there is no unmitigated increase in shading or fill.
- Allow for modifications to moorings, in coordination and in partnership with the City of Coronado, to allow for an increase of up to five moored vessels at existing Glorietta Bay Anchorage (A-5), provided the boundaries of the anchorage do not change, and there is no unmitigated increase in shading or fill.

Development Standards

Proposed public realm standards include maintenance of existing pathways to offer public coastal access through and along the Tidelands. The proposed PMPU notes that a waterside promenade is not required on the waterfront around Coronado Municipal Golf Course due to safety concerns. A waterside promenade is also not required on the waterfront around the Coronado Yacht Club, and a waterside promenade alternative alignment is encouraged in order to avoid operational and safety conflicts.

The PMPU proposes preservation of physical access to a scenic vista area overlooking Glorietta Bay from the Coronado Bay Promenade Park.

Proposed building standards include a height limit of 40 feet and calls for the orientation and character of buildings to be context-sensitive in size, scale, and design, in character with the adjacent community. The development standards propose comprehensive, integrated development of commercial and public areas in a cohesive landscaped setting as well as building setback, orientation, and landscaping requirements. Buildings are proposed to be oriented toward the waterfront along the Bay, and should include active uses on the ground floor adjacent to the waterfront and provide a minimum landscaped area of 15 percent of the total site area separate from required parking spaces.

3.5.4 Plan Implementation and Development Conformance

The proposed PMPU represents the District's long-range vision for future growth and development on Tidelands. Future issuance of Coastal Development Permits for development must conform to the proposed PMPU. Chapter 6, *Plan Implementation and Development Conformance*, of the PMPU describes how the plan will be implemented and the requirements for determining conformance with the proposed PMPU. Both the plan implementation and development conformance sections described in this chapter are necessary to guide future development on Tidelands and successfully carry out the broad vision, goals, objectives, and policies presented in the proposed PMPU, as well as Planned Improvements and Development Standards in each subdistrict. Chapter 6 also explains the parameters for interpretation and potential amendments of the PMPU, as well as the interplay between Chapter 3, *Elements*, Chapter 4, *Baywide Development Standards*, and Chapter 5, *Planning Districts*. Together, these chapters provide a road map for determining conformance with the proposed PMPU.

3.6 Intended Uses of the Program Environmental Impact Report

This section discusses the intended uses for this Draft PEIR and includes (1) a list of agencies that would be expected to use this PEIR for decision-making, and (2) a list of required permits and other approvals that would be required to implement the proposed PMPU. Environmental review and consultation requirements under Federal, State, or local laws, regulations, or policies that are in addition to CEQA are discussed in the applicable individual resource sections within Chapter 4, *Environmental Analysis*.

3.6.1 Agencies Expected to Use this Program Environmental Impact Report

The District is the CEQA lead agency, as defined in State CEQA Guidelines Sections 15050 and 15051, because it has principal responsibility for carrying out and approving the proposed PMPU. As the lead agency, the District has primary responsibility for complying with CEQA. As such, the District has analyzed the environmental effects of the proposed PMPU, the results of which are presented in this Draft PEIR.

This PEIR is intended to be an informational document to be used by the Board, public agencies, stakeholder organizations and individuals, and the general public during the decision-making process for the proposed PMPU. In accordance with the State CEQA Guidelines and the District's *Guidelines for Compliance with CEQA*, this PEIR will inform readers of the potential significant environmental effects of the proposed PMPU, identify mitigation measures if feasible or project changes to lessen the proposed PMPU's significant effects, and describe a range of reasonable alternatives to the proposed PMPU. The Board will consider the PEIR, along with other substantial evidence in the administrative record, when making a decision whether to approve the proposed PMPU. The Board, in its role as the decision-making body of the District, is responsible for certifying the Final PEIR, approving the Mitigation Monitoring Reporting Program, and adopting Findings of Fact and Statement of Overriding Considerations pursuant to Sections 15090–15093 and 15097 of the State CEQA Guidelines prior to approval of the proposed PMPU.

The CCC is a responsible agency, as defined in State CEQA Guidelines Section 15381, because it would have discretionary approval over the proposed PMPU. Similar to the District's current PMP, the CCC will decide whether to certify the proposed PMPU and will rely on the information and environmental determinations contained in this PEIR. No other responsible agencies have been identified for the proposed PMPU.

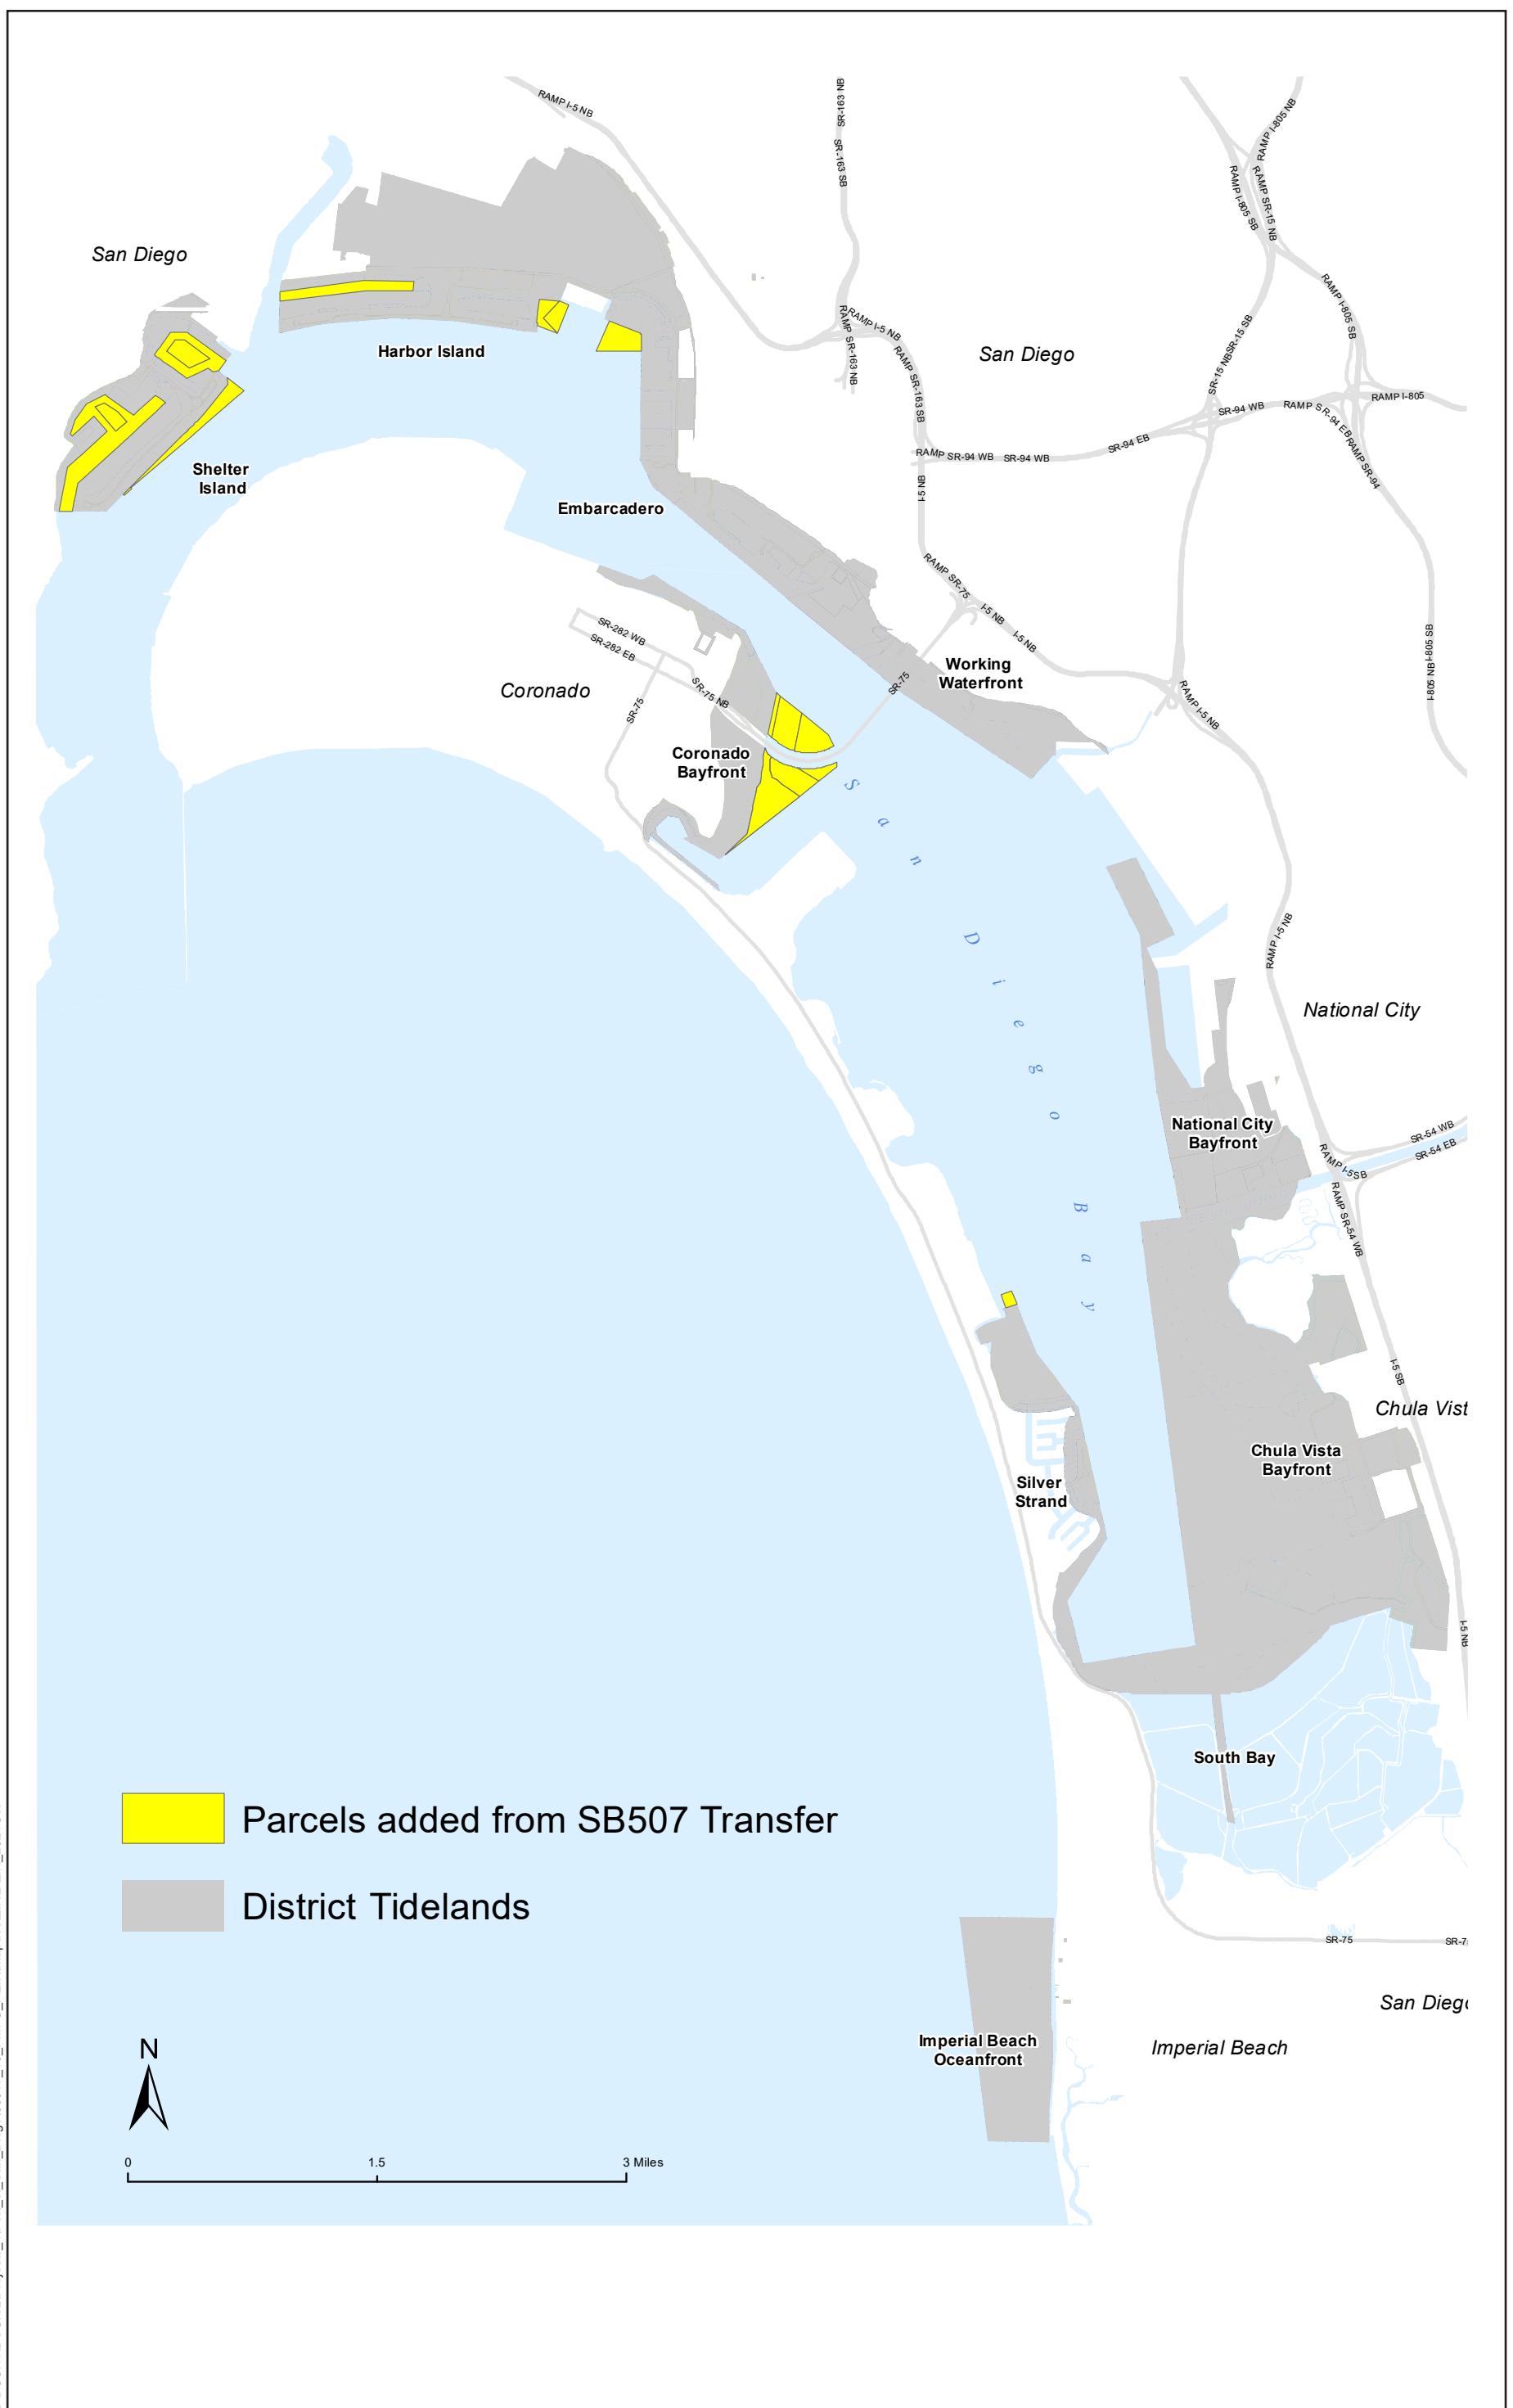

As defined in State CEQA Guidelines Section 15386, a trustee agency is a State agency that has jurisdiction by law over natural resources affected by a project that are held in trust for the people of the state of California. The California State Lands Commission (CSLC) is a trustee agency because it has jurisdiction and management control over those public trust lands of the State received by the State upon its admission to the United States in 1850. Historically, CSLC had jurisdiction over submerged lands within San Diego Bay that were not under the jurisdiction of the District. However, effective January 1, 2020, certain additional tidelands and submerged lands previously held by the CSLC within San Diego Bay were transferred to the District's jurisdiction per Senate Bill 507, which granted and conveyed in trust to the District all right, title, and interest of these additional tidelands and submerged lands. Certain granted parcels from SB 507 already within existing planning district

boundaries are proposed to be incorporated into the proposed PMPU. However, the majority of these newly granted lands are not a part of the proposed PMPU and are not currently within the District's coastal permitting authority. In the future, the additional tidelands and submerged lands will be incorporated into the District's Port Master Plan through a subsequent amendment (see Figure 3-13). The California Department of Fish and Wildlife (CDFW) is also a trustee agency with regard to: (1) the fish and wildlife of the State, (2) designated rare or endangered native plants, (3) game refuges, (4) ecological reserves, and 5) other areas administered by the CDFW. Both the CSLC and CDFW may have an interest in the proposed PMPU; however, neither CSLC nor CDFW would be required to issue approvals or permits for the proposed PMPU.

Table 3-14 provides a summary list of the approvals and permits that would be required.

Introduction

In accordance with Sections 15126 through 15151 of the California Environmental Quality Act (CEQA) Guidelines, Sections 4.1 through 4.15 of Chapter 4 of this ~~Draft~~ Final Program Environmental Impact Report (PEIR) contain discussions of the potential significant environmental effects resulting from implementation of the proposed Port Master Plan Update (PMPU), including information related to existing conditions, criteria for determining the significance of potential environmental impacts, analyses of the type and magnitude of direct, indirect, and cumulative environmental impacts, and feasible mitigation measures that would reduce or avoid significant environmental impacts.

Potential Environmental Impacts

This chapter provides an analysis of the following potential environmental impacts of the PMPU.

- 4.1 *Aesthetics and Visual Resources*
- 4.2 *Air Quality and Health Risk*
- 4.3 *Biological Resources*
- 4.4 *Cultural Resources and Tribal Cultural Resources*
- 4.5 *Geologic Hazards and Soils*
- 4.6 *Greenhouse Gas Emissions and Energy*
- 4.7 *Hazards and Hazardous Materials*
- 4.8 *Hydrology and Water Quality*
- 4.9 *Land Use and Planning*
- 4.10 *Noise and Vibration*
- 4.11 *Population and Housing*
- 4.12 *Public Services and Recreation*
- 4.13 *Sea Level Rise*
- 4.14 *Transportation, Circulation, and Mobility*
- 4.15 *Utilities and Service Systems*

The San Diego Unified Port District (District) determined during preparation of the project's Initial Study/Environmental Checklist (see Appendix A) that the proposed PMPU would have either a less-than-significant impact or no impact associated with the following resources: Agriculture and Forestry Resources, Mineral Resources, and Wildfire. These issues are described in Chapter 5, Section 5.4, *Effects Found Not to Be Significant*, of this ~~Draft~~ Final PEIR.

Format of the Environmental Analysis

Each of the 15 environmental resource sections of this chapter includes the following subsections.

Overview

This subsection briefly describes the thresholds of significance considered in the particular resource section, identifies any reports that contain information presented in the environmental analysis, and summarizes the environmental effects of the proposed PMPU and any necessary mitigation measures.

Existing Conditions

According to Section 15125 of the State CEQA Guidelines, an EIR must include a description of the existing physical environmental conditions in the vicinity of a project to provide the “baseline condition” against which project-related impacts are compared. Normally, the baseline condition is the physical conditions that exist at the time the Notice of Preparation (NOP) is published; however, a different baseline may be used in specific cases where it is deemed appropriate and supported by substantial evidence. The NOP for the proposed project was published on March 30, 2017. Unless indicated otherwise, the environmental setting described in each of the resource sections will be that which existed at the time the NOP was published.

Laws, Regulations, Plans, and Policies

This subsection provides a summary of laws, regulations, plans, and policies at the Federal, State, and local levels that are relevant to the PMPU as they relate to the particular environmental resource area in discussion. Compliance with these laws and regulations is typically mandatory unless noted otherwise within the analysis. Therefore, as it relates to the *Project Impact Analysis* below, compliance is assumed for existing mandatory regulations because they are required by law.

Project Impact Analysis

This subsection describes the methodology used for the analysis of the potential environmental impacts of the PMPU; identifies the criteria for determining the significance of potential impacts; discusses the facts, data, and other information that relates to potential environmental impacts; determines whether the environmental impacts would be significant; identifies feasible mitigation measures that may avoid or reduce the significant impacts; and states a conclusion as to whether the environmental impacts would be considered significant and unavoidable, less than significant with mitigation incorporated, or less than significant (see definitions below). Each topic analyzed is divided into specific issues, based on potential impacts, and addresses construction and operation impacts separately wherever relevant. The discussion of potential impacts is based on the applicable threshold of significance (see below) for each issue. Where potential impacts are significant, feasible mitigation measures are identified to minimize, rectify, reduce, eliminate, or compensate for significant impacts with the goal of reaching a less-than-significant impact determination.

Methodology

Each methodology subsection describes the means used to analyze potential impacts on a particular resource, discussing the steps followed and listing any studies relied on to determine significance.

Thresholds of Significance

Thresholds of significance are criteria used to assess whether potential environmental effects are significant. The significance criteria used in this analysis are primarily based on the recommendations provided in Appendix G of the State CEQA Guidelines. The thresholds of significance define the type, amount, and/or extent of impact that would be considered a significant adverse change in the environment. The thresholds of significance for some environmental topics, such as certain air quality and noise issues, are quantitative, while thresholds for other topics, such as visual quality, are often qualitative. The thresholds of significance are intended to assist the reader in understanding how an impact is determined to be significant and are based on substantial evidence in the administrative record.

Project Impacts and Mitigation Measures

Impact Analysis

The analysis of environmental impacts considers both the construction and operation of future development under the proposed PMPU. As required by Section 15126.2(a) of the State CEQA Guidelines, direct, indirect, short-term, long-term, onsite, and/or offsite impacts are addressed, as appropriate, for the environmental issue being analyzed. This ~~Draft~~ Final PEIR utilizes the following terms to describe the level of significance of impacts identified during the course of the environmental analysis.

No Impact: This term is used when the PMPU's construction and/or operation would have no adverse effect on a resource.

Less than Significant: This term is used to refer to impacts resulting from implementation of the proposed PMPU that would not exceed the defined thresholds of significance, and potentially significant impacts that are reduced to a level that does not exceed the defined thresholds of significance after implementation of mitigation measures. In the latter case, the determination is commonly stated as "less than significant with mitigation incorporated."

Significant: This term is often used to refer to impacts resulting from implementation of the proposed PMPU that exceed the defined thresholds of significance before identification of any mitigation measures. A "significant effect" is defined by Section 15382 of the State CEQA Guidelines as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment [but] may be considered in determining whether the physical change is significant." For impacts that exceed a threshold of significance, mitigation measures that avoid or reduce the potential significant impact are identified, which may cause the impact to be reclassified as less than significant if it is sufficiently reduced, or the impact may remain significant, in which case it is referred to as a significant and unavoidable impact (or unavoidable significant impact).

Significant and Unavoidable: This term is used to refer to significant impacts resulting from implementation of the proposed PMPU that cannot be eliminated or reduced to below a threshold of significance through implementation of feasible mitigation measures.

Mitigation Measures

Section 15126.4 of the State CEQA Guidelines requires an EIR to “describe feasible measures which could minimize significant adverse impacts.” As defined in State CEQA Guidelines Section 15364, “‘feasible’ means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.” Mitigation is only required when a significant impact has been identified, and any mitigation requires an essential nexus and must be roughly proportional to the magnitude of a project’s impacts (State CEQA Guidelines Section 15126.4(a)). Mitigation includes avoiding an impact altogether, minimizing impacts, rectifying impacts, reducing or eliminating impacts over time, or compensating for impacts by replacing or providing substitute resources. This subsection lists the mitigation measures that could reduce the severity of impacts identified in the *Impact Analysis*. Mitigation measures are the specific environmental requirements for construction or operation of future development under the PMPU that will be included in the Mitigation Monitoring and Reporting Program and adopted as conditions of approval of the proposed PMPU.

Cumulative Impact Analysis

The cumulative impact analysis contained in each of the resource sections in this chapter evaluates potential significant cumulative impacts resulting from the PMPU in combination with projected regional growth. These growth projections serve as the foundation for regional planning documents such as water supply management plans and general plans, and provide the basis for determining housing, infrastructure, and transportation needs across the San Diego region. The cumulative impact analysis relies on the Series 14: 2050 Regional Growth Forecast, which addresses projected growth from 2030 to 2050, as well as any regionally significant plans and programs that were adopted or are currently in the planning phase and were not accounted for in the Series 14 Growth Forecast. The past, present, and reasonably foreseeable future plans and programs considered in the cumulative impact analysis are listed and described in Chapter 2, *Environmental Setting*.

The cumulative impact analysis considers two separate impacts: the significance of the cumulative effect from projected regional growth and regionally significant plans and programs and, in the event a cumulative effect is identified, the PMPU’s incremental contribution to the identified cumulative effect. If it is determined that the PMPU’s contribution to the cumulative effect is considerable, a cumulatively significant impact is identified, and feasible mitigation is imposed.

Section 4.1

Aesthetics and Visual Resources

4.1.1 Overview

This section describes the existing aesthetic and visual conditions that could be adversely affected by the proposed Port Master Plan Update (PMPU), discusses the laws and regulations related to aesthetics and visual resources, and analyzes the PMPU's potential effect on (1) designated scenic views, (2) scenic resources from a designated highway, (3) the existing visual character of the site and its surroundings, and (4) day and nighttime views affected by introducing light or glare. Visual concepts and terminology are presented below.

Table 4.1-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.1.4.5, *Project Impacts and Mitigation Measures*.

Table 4.1-1. Summary of Significant Aesthetics and Visual Resources Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-AES-1: Potential to Interfere with Designated Scenic Vista Areas or View Corridors During Construction Associated with Implementation of the Proposed PMPU	PD1, PD2, PD3, PD4, PD8, PD9, PD10	MM-AES-1: Plan Construction Schedule and Storage/Staging to Avoid Scenic Vista Areas and View Corridor Extensions.	Significant and Unavoidable	Implementation of MM-AES-1 would reduce impacts by requiring review of the future project proponent's construction schedule and staging location to avoid blocking scenic vista areas and view corridor extensions. Because the type, duration, and location of construction equipment is unknown, Impact-AES-1 would remain significant and unavoidable.
Impact-AES-2: Potential to Result in Substantial Degradation of Visual Character	PD1, PD2, PD3, PD4, PD8, PD9, PD10	MM-AES-2: Install Construction Fencing	Significant and Unavoidable	Implementation of MM-AES-2 would minimize the visibility of construction activities at a

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
and Quality During Construction Associated with Implementation of the Proposed PMPU				project site. However, because the location, duration, and scale of future development is not yet known, Impact-AES-2 would remain significant and unavoidable.
Impact-AES-3: New Permanent Source of Glare Generated by Potential High- Rise Development	PD2, PD3	MM-AES-3: Incorporate the Use of Reduced Glare Building Materials	Less than Significant	Implementation of MM-AES-3 would require the project proponent of any future high-rise hotel towers to use non-reflective materials that would reduce the potential sources of glare on the building. MM-AES-3 would be reduced to less than significant.
Impact-C-AES-1: Potential to Result in Cumulatively Considerable Adverse Impacts on Scenic Vista Areas or View Corridors During Construction	PD1, PD2, PD3, PD4, PD8, PD9, PD10	MM-AES-1 , as described above	Cumulatively Significant and Unavoidable	Implementation of MM-AES-1 would reduce impacts by requiring review of the future project proponent's construction schedule and staging location to avoid blocking scenic vista areas and view corridor extensions. Because the type, duration and location of construction equipment is unknown, Impact-C-AES-1 would remain significant and unavoidable.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-AES-2: Potential to Result in Cumulatively Considerable Substantial Degradation of Visual Character and Quality During Construction	PD1, PD2, PD3, PD4, PD8, PD9, PD10	MM-AES-2 , as described above	Cumulatively Considerable and Unavoidable	Implementation of MM-AES-2 would minimize the visibility of construction activities at a project site. However, because the location, duration and scale of future development is not yet known, Impact-AES-2 would remain cumulatively significant and unavoidable.
Impact-C-AES-3: Potential to Result in a Cumulatively Considerable New Permanent Source of Glare Generated by Potential High-Rise Development	PD2, PD3	MM-AES-3 , as described above	Less than Significant	MM-AES-3 would require the use of low-reflectivity glass and would limit the area of a high-rise building that could contain glazed surfaces. Therefore, this would reduce impacts related to glare to less than significant.

4.1.1.1 Concepts and Terminology

Key concepts and terminology used to describe existing aesthetic and visual resource conditions or to describe the change in existing conditions after implementation of the proposed PMPU are provided below. Although there may be more than one definition for any of the terms below, these common definitions are used for analytical consistency.

Views refer to visual access and obstruction, or whether it is possible to see a focal point or panoramic scene from an area. Views may be discussed in terms of *foreground*, *middleground*, and *background*. Foreground views are those immediately presented to the viewer and include objects at close range that may tend to dominate the view. Middleground views occupy the center of the viewshed and tend to include objects that are the center of attention if they are sufficiently large or visibly different from adjacent visual features. Background views include distant objects and other objects that make up the horizon. Objects in the background eventually fade to obscurity with increasing distance. In the context of background, the skyline or the ocean can be an important visual feature because objects above this point are highlighted against the background of the sky or

water. These “skylined” elements are typically more evident to the viewer because of their inherent contrast.

Visual and scenic resources. Although the perception of what is considered scenic may vary according to the environmental setting, visual/scenic resources are generally defined as those areas in the public viewshed that provide substantial scenic value. Scenic resources may include unique mature trees or other unique landscape or structures that provide a unique component of the visual experience of the place. For example, the San Diego Bay is considered a scenic resource within the proposed PMPU area.

Visual character. The visual context of an area includes the features of its landforms, vegetation, water surfaces, and cultural modifications (physical changes caused by human activities) that give the landscape its visually aesthetic qualities. Landscape features, natural appearing or otherwise, form the overall impression of an area. This impression is referred to as *visual character*. Visual character is studied as a point of reference to assess whether a given project would appear compatible with the established features of the setting or would contrast noticeably and unfavorably with them.

The following additional definitions pertain to terminology used in visual analysis.

- *Viewer sensitivity*, or viewer concern about noticeable changes to views, is based on the visibility of a scenic resource, proximity of viewers to the resource, relative elevation of viewers to the resource, frequency and duration of views, number of viewers, and types and expectations of the viewers. Visual sensitivity is typically used to assess changes to visual character. Generally, visual sensitivity increases as the total number of viewers, frequency, and duration of viewing activities increases. The degree of visual sensitivity is treated as occurring at one of the following four levels.
 - *High sensitivity* suggests that the majority of the public is likely to react strongly to an adverse change to visual character. A highly concerned public is assumed to be more aware of any given level of adverse change and is substantially less tolerant than a public that has little to moderate concern.
 - *Moderate sensitivity* suggests that the public would probably voice concern over substantial adverse changes in visual character. Often, the affected views are secondary in importance or are similar to others commonly available to the public.
 - *Low sensitivity* is considered to prevail where the public is expected generally to have little concern about adverse changes in the landscape, or only a small minority may be expected to voice such concern, even where the adverse change is substantial in intensity and duration.
 - *No sensitivity* occurs when the views are not public, or there are no indications of public concern over, or interest in, scenic/visual character in the affected area.
- *Viewshed* is all of the surface area visible from a particular location or sequence of locations (e.g., roadway or trail).
- *Scenic vista areas* (or *vista areas*) are publicly accessible viewpoints that provide an expansive/panoramic view of a large geographic area. Furthermore, panoramic views provide visual access to a large geographic area for which the field of view can extend into the distance

and are normally identified by an elevated viewing position in comparison to their surroundings.¹

- *View corridor extensions* preserve view corridors that begin at the San Diego Unified Port District's (District's) boundary farthest from the waterfront or the nearest terminus of an existing public right-of-way that is on Tidelands, and end at the waterfront or the end of a pier or land mass that extends over the water.
- *Principle public view groups* are the groups of people that would be present in the vicinity of the public views of designated scenic vista areas, view corridor extensions, or designated scenic highways that would experience a particular view. The principal public viewer groups for views in the proposed PMPU are motorists and pedestrians within public roadways and rights-of-way and downtown/bayfront tourists and recreationists, such as promenade and park users and boaters in the Bay.

4.1.2 Existing Conditions

The proposed PMPU area comprises the majority of the District's jurisdiction, including approximately 1,009 acres of land and 1,454 acres of water in and around the Bay and along the Imperial Beach oceanfront.² While the waters of the Bay are calm due to the enclosed and protected nature of the Bay, it is a busy waterway with a high level of activity associated with commercial, maritime, and recreational boating activities. In addition, the majority of the proposed PMPU area falls within or adjacent to developed and highly urbanized areas within the city of San Diego (such as Downtown San Diego) and the cities of Coronado and Imperial Beach. Scenic resources within the proposed PMPU area generally consist of the waters within the Bay, or, within the Imperial Beach area, the ocean. In general, views of watercraft, ranging from small recreational craft to large vessels, such as container and general cargo vessels as well as U.S. naval vessels, are present primarily within foreground and middleground views, while the San Diego-Coronado Bay Bridge and views of the developed and urbanized shorelines of Coronado, the Point Loma peninsula, or Downtown San Diego comprise background views (depending on the perspective). Along the Imperial Beach oceanfront, views include the Pacific Ocean, consisting of open ocean and the beach. Along the oceanfront, views of watercraft, such as those seen in the Bay, are also present; however, they are generally farther out and part of the background views. Views of landside areas of the proposed PMPU area largely include developed, urbanized waterfronts with a variety of uses, including parks, restaurants, hotels, office uses, maritime museums, shipping terminals, and ancillary uses for water-dependent uses (offices for marinas, shipbuilding facilities, boat repair facilities, etc.). Landside areas also include wildlife preserves in the south Bay. The visual character of each planning district (PD) is detailed below.

¹ The existing Port Master Plan (PMP) refers to these areas as *vista areas* whereas the PMPU uses the term *scenic vista areas*. While the two documents use slightly different terminology, they are essentially describing the same resource. See the discussion in Section 4.1.4.4, *Proposed Scenic Vistas*, for a description of existing versus proposed scenic vista areas.

² As explained in Chapter 3, *Project Description*, these acreages exclude PD5, PD6, Pond 20 (in PD7), and the San Diego International Airport.

4.1.2.1 Scenic Highways and Scenic Resources

Scenic highways are highways, or segments of highways, that have been designated by the State as containing views of outstanding scenic quality, striking views, flora, geology, or other unique natural attributes (Caltrans 2008). The only State-designated scenic highway within the vicinity of the planning area is a 9-mile segment of State Route (SR)-75 as it crosses the San Diego–Coronado Bay Bridge and continues through Coronado and down the Silver Strand, terminating at the city limits of Imperial Beach (the segment of SR-75 that travels through Coronado and connects the bridge and the Silver Strand is an eligible state scenic highway but is not officially designated as such) (Caltrans 2019).

Specifically, from the 200-foot tall SR-75/San Diego-Coronado Bay Bridge views of the San Diego Bay are expansive in all directions. The Coronado Bayfront (PD10) features in foreground views to the north as do views of the Working Waterfront (PD4) to the north and south. Given the prominence of the buildings of Downtown San Diego that are within and adjacent to the Embarcadero (PD3), views of this planning district are also prominent within the viewshed of the SR-75/San Diego-Coronado Bay Bridge. Views of the remaining planning districts are largely obscured by distance. Scenic resources within the viewshed of this designated scenic highway include the Bay and the skyline of Downtown San Diego. It should be noted, however, that the bridge is only open to motor vehicles, there are no pullouts for viewing, and stopping on the bridge is prohibited by law. Also, the bridge has a speed limit of 50 miles per hour and a concrete guardrail that limits the view in lower profile vehicles.

Scenic resources visible from the Silver Strand segment of SR-75/Silver Strand Boulevard include foreground views of narrow strips of sandy waterfront areas, middleground views of the open waters of the Bay, and background views of the Downtown San Diego skyline; as well as wide sandy beaches in foreground views to the west, with glimpses of the Pacific Ocean stretching to the horizon in the background. Cranes and vessels of the Tenth Avenue Marine Terminal (TAMT) are also visible to the east.

4.1.2.2 Designated Public Views

As noted above, the existing PMP designates vista areas that are defined as, “points of natural visual beauty, photo vantage points, and other panoramas.” Vista areas have been designated in all existing planning districts with the exception of PD4. Vista areas for each planning district are discussed in Section 4.1.2.4 through Section 4.1.2.11, below.

4.1.2.3 Light and Glare

There are two typical types of light intrusion in the proposed PMPU area. First, light emanates from the interior of structures and passes out through windows. Second, light projects from exterior sources, such as street, security, and landscape lighting, as well as flood lighting for overnight offloading work at the marine terminals and nighttime work at the shipyards in PD4. *Light spillover* is typically defined as the presence of unwanted or misdirected light on properties adjacent to the property being illuminated. Light spillover can be a nuisance to adjacent areas and can diminish views of the clear night sky. Throughout and adjacent to the proposed PMPU area, sources of light generally include commercial and residential—ranging from high-rise office buildings, hotels, and residential towers to single-story, single-family homes and small shops. Industrial development also contributes to nighttime lighting in the proposed PMPU area, specifically TAMT. Throughout the

proposed PMPU area, street lighting is a significant source of nighttime lighting as well, as are transitory sources such as headlights from vehicles. Waterside lighting sources include the boats, cruise ships, and shipping vessels that use the Bay.

Glare is described as the distraction, discomfort, or impairment of vision caused by extreme contrasts in the field of vision, where light sources such as sunlight, lamps, luminaries, or reflecting surfaces are excessively bright in relation to the general brightness of surroundings. Glare also results from sunlight reflecting off flat building surfaces, with glass typically contributing the highest degree of reflectivity. A primary source of existing daytime glare within the proposed PMPU area is sunlight reflecting off the open waters of the Bay and Pacific Ocean. Glare from horizontal water surfaces is most prevalent in the early and late portions of the day when reflected sunlight is most likely to affect viewers. Another scattered source of daytime glare is sunlight reflecting off windows of vehicles in parking lots and traveling the streets, or boats docked at the marina, which produces minor amounts of glare.

4.1.2.4 Planning District 1: Shelter Island

Visual Character and Quality

The Shelter Island Planning District (PD1) is located adjacent to the Point Loma community of San Diego and comprises the land and water area roughly between Nimitz Boulevard on the northeast and Kellogg Street on the southwest. Overall, PD1 contains low-profile development, i.e., hotels and restaurants, that do not exceed two to three stories.

In addition, two harbors exist within Shelter Island—the America's Cup Harbor, which is located within the eastern area of the planning district, and the Shelter Island Yacht Basin, which is the larger of the two harbors and is located within the western portion of PD1. Collectively, these two harbors contain approximately 13 marinas/yacht clubs with hundreds of boat slips that accommodate sailboats, yachts, and fishing boats. From a visual perspective, middleground and background views of marinas generally consist of a high concentration of regularly spaced (and often white) boats topped by a dense collection of masts. In closer foreground views, individual features of the boats are evident, and the regular spacing of the boats is not distinguishable. The collection of masts, however, still forms a prominent visual component. The high concentration of masts may obscure but generally does not completely block views through and beyond the marinas.

West Shelter Island

The visual character of the southern side of West Shelter Island is largely defined by the visitor-serving uses that occupy the area. Development consists primarily of low-rise (i.e., no more than three stories) but expansive hotels and yacht clubs and one- or two-story restaurants and retail stores that are separated from each other and/or the roadway by large surface parking lots. The buildings are contemporary in style. Many include beige or yellow stucco siding, while others have elements reminiscent of island or “tiki” architectural styles, such as the use of dark woods, shutters, and/or steeply pitched and extended porch roofs.

A waterfront park, consisting primarily of wide green lawns, and narrow surface parking lots, occupies the majority of the shoreline. Although the open green lawns are the most visually prominent component of the park, other visual elements include trees, public art (statues), play equipment, walking paths, picnic tables, a fishing pier, and the Shelter Island Boat Launch. Four quasi-private/

quasi-public piers associated with residential properties are located adjacent to the La Playa Trail in the northwestern portion of PD1.

West Shelter Island includes panoramic views of the San Diego Bay, which are available along the entire length of the publicly accessible southern waterfront. From the northern portion of West Shelter Island, views are available from the public walkways that border the shoreline, including La Playa Trail, which runs along the northern shore of the Shelter Island Yacht Basin. Views consist of the many marinas and comprise the somewhat cluttered appearance of a large collection of boats of varying shapes and sizes topped by a dense collection of sailboat masts. In addition, from the southernmost portion of the subdistrict, background views of the Bay and San Diego International Airport (SDIA) are available.

Overall, the visual quality of West Shelter Island is considered to be moderate. While the visual context as a whole is relatively unified, there are no particularly distinctive visual elements within the subdistrict itself. Nevertheless, because the subdistrict draws a high number of visitors, provides ample public access space, and is located on the Bay, and contains the La Playa Trail, viewer sensitivity in this area would be considered high.

East Shelter Island

East Shelter Island contains mostly visitor-serving commercial uses, such as restaurants and souvenir shops, and marina-related uses, such as yacht sales, boat supply shops, boat repair services, support facilities for sportfishing operations, and boat tour kiosks. In addition, East Shelter Island is home to one of two commercial fishing facilities in San Diego Bay.

The development pattern in this area is erratic. While buildings typically do not exceed two stories, there is no dominant architectural style; and building size, massing, and lot orientation vary from one lot to another. Most buildings are small, stand-alone single-story box-shaped structures with no evident architectural style, sporadically spaced along the waterfront and separated by large surface parking lots. Some architectural elements are repeated in the architecture of the northern portion of the area, including the use of hipped roofs and/or corrugated roofing materials.

Similar to West Shelter Island, expansive views of the Bay are available in East Shelter Island from public walkways, with offshore anchorages in the foreground, open navigation channels with vessels passing in the middleground, and the Downtown San Diego skyline in the background. Again, from the northern side of the subdistrict, views from the public walkways are obstructed by the many vessels that are docked at the marinas within the America's Cup Harbor.

Overall, the visual quality of East Shelter Island is moderate to low. The visual context is not unified and there are no particularly distinctive visual elements within the subdistrict. Likewise, viewer sensitivity within this subdistrict would be moderate to low as well along the landside portion of the subdistrict except within the southeastern area, adjacent to the roundabout, where viewer sensitivity would be considered high.

Scenic Vistas

West Shelter Island

The existing PMP identifies seven scenic vistas within Shelter Island, five of which are within the West Shelter Island Subdistrict. Two are designated along the southern bayfront—one at the

southwestern corner of the island, oriented toward the southwest out toward the Bay. Expansive views of the Bay are available within this scenic vista, including views of Naval Air Station (NAS) North Island, Coronado, and the channel between Point Loma and Coronado that leads to the ocean all the way down to the skyline of Downtown San Diego. Open water of the Bay dominates foreground and middleground views, with background views comprising the military vessels, warehouses, etc. of North Island, and the high-rise buildings of Downtown San Diego. The second scenic vista is located roughly at the midpoint of the West Shelter Island Subdistrict along Shelter Island Drive, in front of the Best Western Island Palms Hotel. Similar to the first scenic vista, views from this area include expansive views of the Bay stretching from the Point Loma peninsula to the Downtown San Diego skyline.

The other three scenic vistas identified within West Shelter Island are along the northern shore of the Shelter Island Yacht Basin on the mainland side of Shelter Island. The first is near the southwest corner of the intersection of Anchorage Lane and Shelter Island Drive and is oriented in a southwesterly direction. Views from this vista comprise foreground views of a dense concentration of sailboats and masts. Middleground and background views from this vantage point are largely obstructed by the concentration of docked vessels. The second designated scenic vista is near the southwest corner of the intersection of Anchorage Lane and Talbot Street and, again, is oriented toward the southwest. Foreground and middleground views comprise a dense concentration of sailboats and masts that are docked at the adjacent marinas. Background views comprise the Point Loma peninsula. Finally, the third scenic vista in this area is at the bayfront terminus of Kellogg Street and is oriented in a southeasterly direction, looking into the Shelter Island Yacht Basin. Foreground views from this vista point include the open water of the Shelter Island Yacht Basin, middleground views include the eastern side of the West Shelter Island Subdistrict, and background views include the open waters of the Bay beyond.

East Shelter Island

There are two designated scenic vistas within East Shelter Island. The first is at the easternmost extension of Shelter Island Drive in the circular drive that provides access to the Bali Hai restaurant. This vista is oriented toward the northeast and includes foreground views of an offshore small-vessel anchorage, middleground views of the open waters of the Bay, and background views of Harbor Island and Downtown San Diego, including the high-rise buildings that comprise the skyline. The second vista is along the northernmost shore of the East Shelter Island subdistrict and is oriented southwesterly, looking into the America's Cup Harbor. Foreground and middleground views consist of the several marinas that are located within the harbor and the varying shapes and sizes and dense concentration of masts of the vessels that are docked at these marinas. Background views include the higher elevations of the Point Loma peninsula.

Light and Glare

West Shelter Island

Lighting sources along West Shelter Island include security lighting along the waterfront promenade, lighting along Shelter Island Drive, lighting in the parking lots of the hotels and restaurants, and security and operational lighting for the hotels and their marinas. Cars and boats also contribute to ambient lighting conditions in this area. The northern shore of West Shelter Island is predominantly single- and multi-family residential with some commercial uses in the northern end. Sources of light within West Shelter Island include lighting for streets and parking lots, signage

and operational lighting at the commercial buildings, lighting along the piers and walkways for the marinas, and safety and security lighting for the residential buildings and single-family residences. Because there are older structures in this subdistrict, there may be unshielded outdoor lighting that could contribute to light spillage in the area. Cars and boats are another source of lighting in the area. There are not many nighttime activities (such as commercial or nighttime recreational activities) that require substantial amounts of lighting in this subdistrict, thus lighting is concentrated near walkways and entrances. Therefore, the overall nighttime lighting environment is considered low to moderate.

Sources of glare include the sunlight reflecting off the waters of the Shelter Island Yacht Basin and the Bay, as well as sunlight reflecting off of cars and boats. The overall glare environment is considered moderate to low due to the lack of buildings with reflective architectural finishes.

East Shelter Island

East Shelter Island consists mostly of commercial uses. Lighting sources include parking lot lighting, street lighting, and interior and exterior lighting of the buildings that house restaurants and various shops. The overall nighttime lighting environment is considered low to moderate because the area does not require substantial amounts of night lighting.

Sources of glare include the sunlight reflecting off the waters of the America's Cup Harbor and the Bay, as well as sunlight reflecting off of cars and boats. The overall glare environment is considered moderate to low due to the lack of buildings with reflective architectural finishes.

4.1.2.5 Planning District 2: Harbor Island

The Harbor Island Planning District (PD2) includes the water and land area between the North Harbor Drive bridge that crosses to Liberty Station in the north and United States Coast Guard facility in the south. This planning district also includes a portion of the corridor along Pacific Highway. Although SDIA is within the Tidelands, jurisdiction for this facility falls under the San Diego County Regional Airport Authority and is not a part of the proposed PMPU area. The shape and visual features of Harbor Island are similar to those of Shelter Island, consisting of three main segments, including a narrow strip of waterfront area along the mainland along North Harbor Drive, an approximately 1.5-mile long island, and an approximately 0.30-mile entrance segment over which Harbor Island Drive travels and connecting to two portions of Harbor Island. The planning district includes the two inlets between the land and island portions of Harbor Island, which are named Harbor Island East Basin and Harbor Island West Basin. For planning purposes, Harbor Island is divided into four subdistricts:

- West Harbor Island, which includes the area west of Harbor Island Drive not within the Spanish Landing subdistrict.
- Spanish Landing, which includes a narrow area of land within the northern portion of the planning district adjacent to North Harbor Drive and a narrow portion of the northern side of the West Basin.
- East Harbor Island, which includes the mainland and island portions of Harbor Island that are east of Harbor Island Drive.
- Pacific Highway Corridor, which includes a segment of land adjacent to Pacific Highway, roughly between Vine Street and Laurel Street, to the northeast of SDIA.

The visual character and quality, scenic vistas, and sources of light and glare of these four subdistricts are discussed below.

Visual Character and Quality

West Harbor Island

West Harbor Island is dominated by visitor-serving uses. Overall, development within West Harbor Island is somewhat sparse and buildings are separated by large parking lots, which tend to be shielded from drivers on Harbor Island Drive or users of the waterfront walkway by landscaping, mostly palm or other ornamental trees, that lines Harbor Island Drive. The most prominent structures within West Harbor Island are three hotels, each about ten stories tall. Other uses, primarily restaurants and marina boathouses, are generally one or two stories. The buildings tend to be of contemporary design and materials, and there is no dominant or unifying architectural style to the various structures. However, most of the buildings utilize beige or white stucco or concrete siding and red tiled roofs.

The waterfront public walkway, bordered mostly by narrow strips of green lawn and the roadway, consists of a narrow concrete sidewalk that runs the entire length of the Harbor Island Planning District along the Bay, and there is a larger bayside park midway down the island's western side. The most notable views available to viewers from Harbor Island are of the Bay, including expansive views from along the entire length of the southern waterfront walkway.

There are four marinas containing hundreds of slips in the West Basin, creating visual elements similar to those described above for Shelter Island (i.e., a dense concentration of small- to medium-sized vessels and their masts).

The visual quality of West Harbor Island is generally considered moderate. The overall landscape is unified in appearance, but the architecture of the most prominent buildings (i.e., the hotels) is not distinctive, and the public parks also lack any unique visual elements. However, because the subdistrict receives a high number of visitors, is highly accessible to the public, and is located adjacent to the Bay, viewer sensitivity is considered high.

Spanish Landing

Spanish Landing includes the Spanish Landing Park, which is a narrow linear park that fronts the West Basin. The park includes a waterside promenade, picnic areas, play areas, public art, the Callaway Carillon bell tower, and a small beach. The park largely consists of pockets of green lawn separated by parking lots and a narrow internal roadway. Shade trees are spaced regularly along the promenade and next to the parking lots and North Harbor Drive. Built structures include two small restroom buildings made of light brown bricks and red tiled roofs. This subdistrict also includes the open water area within the northern portion of the West Basin. Views available from Spanish Landing Park include the marinas and hotels within and adjacent to the Harbor Island West Basin. While views of the basin are not expansive, viewers would expect and appreciate the presence of the marinas within these views. Given the dense concentration of sailboat masts and the tall hotel buildings within Harbor Island West, views of the Bay are not available from Spanish Landing Park.

The visual quality of Spanish Landing is generally considered moderate. The overall landscape is unified in appearance, but the park lacks any unique visual elements. However, because the

subdistrict receives a high number of visitors, is highly accessible to the public, and is located adjacent to the Bay, viewer sensitivity is considered high.

East Harbor Island

In contrast to the visitor-serving uses that dominate West Harbor Island, much of East Harbor Island has a more industrial character and is largely dominated by the parking lots used by the former car rental lots, which occupy the northern landward side of East Harbor Island, north of the Harbor Island East Basin. Expansive surface parking lots are dotted by small single-story warehouse buildings, out of which the car rental operations were managed. The Harbor Police Department administrative building and storage lot are also located in this area. The promenade that begins in Spanish Landing Park continues through this side of the island; however, it is situated north of the car rental area, adjacent to North Harbor Drive, and is not directly adjacent to the Bay.

The southern portion of East Harbor Island, south of the Harbor Island East Basin, is similarly occupied by parking lots, and visually the island side of East Harbor Island is dominated by large expanses of gray concrete—both from the parking lots and from the wide roadway of Harbor Island Drive, interrupted by some vegetation within the medians between the parking lots and the roadway, and the narrow strip of green lawn that separates Harbor Island Drive from the waterfront walkway that extends the entire length of Harbor Island. However, the south side of East Harbor Island does include some stand-alone commercial and recreational uses, including the Sunroad Resort Marina, and two restaurants at the eastern tip of the subdistrict: Coastera and Island Prime & C Level. These three buildings are relatively small, comprising single-story, contemporary structures. From East Harbor Island, views of Downtown and the San Diego-Coronado Bay Bridge are more prominent given the closer distance to these features. Due to intervening opaque fencing adjacent to the walkway along the northern side of East Harbor Island, views of the Harbor Island East Basin or the Bay beyond are not available from the vantage points available along the sidewalk. The clusters of tall masts from the recreational boats that occupy the marina, including over 600 boat slips, within the East Basin are also visible from Harbor Island Drive and the waterfront promenade through the parking lots that exist on either side of the marina's main building. An additional waterside walkway extends behind the Coastera building.

Due to its industrial nature, large expansive parking lots, and disjointed development pattern, the visual quality of East Harbor Island is considered low. However, viewer sensitivity in this area is considered high due to the public bayfront promenade along the southern shoreline and the intact views of the Downtown San Diego skyline that are available from areas within the subdistrict (see the *Scenic Vistas* discussion below).

Pacific Highway Corridor

The Pacific Highway Corridor Subdistrict comprises a narrow segment of land generally along the east side of Pacific Highway between Vine Street and Laurel Street. The visual character of this area is influenced by its adjacency to major transportation uses such as SDIA and Interstate 5. Elevated freeway on-ramps occupy the area from Vine Street to Sassafras Street. Parking lots for offsite long-term airport parking reside underneath the on-ramps and are enclosed by chain-link fencing. The freeway on-ramps, large surface parking lots, dense concentrations of parked cars, chain-link fencing, no vegetation, and high-power transmission lines in the background lend an industrial appearance to this area, especially in contrast to the newly constructed and abundantly landscaped airport parking and rental car facility on the west side of Pacific Highway, off of District property.

The District's headquarters are located south of Sassafras Street within the Pacific Highway Corridor. The District's eight-story building pops up out of this array of parking lots. The building has a utilitarian design and resembles a large white box with minimal exterior ornamentation and limited fenestration, which is confined to the upper stories. The size of the structure seems out of place in this area where other buildings and structures are substantially shorter. More parking lots are located south of the District's building; however, these lots generally include some landscaping and wrought-iron fences, which create a more attractive appearance compared to those to the north of Sassafras Street. Buildings in this area vary in their size and spacing within the lots. They are usually set back a considerable distance from the road with surface parking lots fronting the roadway, and they tend to consist of white one- or two-story warehouse structures.

Viewsheds within the Pacific Highway Corridor are very narrow and are generally confined to the roadway width of Pacific Highway and the immediately adjacent uses. Views of the high-rise buildings of Downtown are intermittently available, and views of SDIA are also intermittently available at crossroads.

This subdistrict generally lacks a cohesive visual context or any distinctive visual elements. Overall, visual quality and viewer sensitivity in this area is low.

Scenic Vistas

West Harbor Island

The existing PMP designates three scenic vistas within West Harbor Island: one at the intersection of the entry segment of Harbor Island Drive and Harbor Island Drive, one within the park farther west down Harbor Island Drive, and one near the western terminus of Harbor Island Drive.

The first scenic vista at the end of the entry segment of Harbor Island Drive is oriented in a southerly direction and includes the expansive views of the Bay in the foreground and middleground. NAS North Island in Coronado, the Downtown San Diego cityscape, and the San Diego-Coronado Bay Bridge comprise background views.

The second scenic vista is oriented in a southerly direction and includes the same views provided by the previous scenic vista (i.e., expansive views of the Bay stretching from Point Loma to Downtown San Diego).

The third is at the westernmost corner of the subdistrict, near the circular drive that provides access to the Tom Ham's Lighthouse restaurant. This vista is oriented in a southerly direction and provides expansive views of the Bay stretching from the Point Loma peninsula in the west to Downtown San Diego in the east. Foreground and middleground views include the open waters of the Bay, including the navigation channels where passing vessels of varying shape, size, and purpose can be seen. Background views include the Point Loma peninsula, the bayfront of Coronado Island, including NAS North Island, and the high-rise buildings comprising the skyline of Downtown San Diego. A portion of the San Diego-Coronado Bay Bridge is also discernible in background views.

Spanish Landing

Along the mainland, one scenic vista is located at the westernmost boundary of the Harbor Island Planning District at Spanish Landing Park, off of Harbor Drive (just west of SDIA). This vista is oriented to the southwest. Views from this scenic vista include foreground views of the open water

of the Harbor Island West Basin, middleground views of the many sailboats and their masts in the marinas of the basin, and background views of Shelter Island and Point Loma. The second scenic vista along the mainland is located at the eastern end of Spanish Landing Park, near the intersection of Harbor Drive and Harbor Island Drive. This vista is oriented to the south and looks into the Harbor Island West Basin. Foreground views comprise the open waters of the harbor, middleground views include the sailboats docked at the marinas, and background views are generally limited to the high-rise hotels that are located along Harbor Island Drive.

East Harbor Island

The existing PMP designates one scenic vista within East Harbor Island, which is located at the easternmost extent of the island, adjacent to the Island Prime restaurant, and is oriented in a southeasterly direction. Again, expansive views of the Bay are the primary visual feature within the viewshed of this vista. The views are very similar to the other scenic vista within East Harbor Island, including expansive views of the open waters and navigation channels of the Bay in the fore- and middleground views, and background views that include the Point Loma peninsula, the Coronado Bayfront, the skyline of Downtown San Diego, and the San Diego-Coronado Bay Bridge.

Pacific Highway Corridor

The existing PMP does not designate any scenic vistas within the Pacific Highway Corridor Subdistrict, and other vista areas identified for other planning districts do not contain views of this area.

Light and Glare

West Harbor Island

Primary sources of light within West Harbor Island include lighting on the exterior of the hotel buildings and restaurants, security lighting in the many parking lots, street lighting, and lighting along the docks of the marinas. Sources of glare generally include sunlight reflecting off the waters of the Bay and the Harbor Island West Basin, and sunlight reflecting off the surfaces of cars and boats. The overall nighttime lighting environment is considered low to moderate because the area does not require substantial amounts of night lighting; and the glare environment is considered low due to the lack of large structures containing highly reflective surfaces.

Spanish Landing

Primary sources of light within Spanish Landing include lighting on the exterior of the restroom buildings and security lighting in the parking lots, street lighting, and lighting from vehicles traveling along North Harbor Drive. Because there are older structures in this subdistrict, there may be unshielded outdoor lighting that could contribute to light spillage in the area. The brightly lit terminals and parking lots from the airport may also spill over into some portions of Spanish Landing, although given the distance and intervening structures and landscaping, visible lighting would not likely be highly intrusive to the users of this subdistrict.

Sources of glare generally include sunlight reflecting off the waters of the Bay and the Harbor Island West Basin, and sunlight reflecting off the surfaces of cars and boats. There are few nighttime activities (such as commercial or recreational activities that operate at night) that require substantial amounts of lighting in this subdistrict; thus, lighting is concentrated near walkways,

parking lots, and intersections for safety. Therefore, the overall nighttime lighting environment is considered low to moderate. In addition, the glare environment is considered low due to the lack of large structures containing highly reflective surfaces.

East Harbor Island

Sources of light within East Harbor Island also include exterior lighting at the marina, restaurants, and other buildings within the subdistrict as well as security lighting at the many parking lots along this portion of the subdistrict. Sources of glare include sun reflecting off the waters of the Bay and the surfaces of cars parked at the parking lots and boats within the marina. The overall nighttime lighting environment is considered low to moderate because the area does not require substantial amounts of night lighting; the glare environment is considered low due to the lack of large structures containing highly reflective surfaces.

Pacific Highway Corridor

Most of the sources of light within the Pacific Highway Corridor are from streetlights and security lights in the parking lots of the long-term airport parking facilities along this roadway. Sources of glare include reflections off parked cars in these parking facilities and occasionally light reflecting off airplanes. The overall nighttime lighting environment is considered moderate due to the long-term parking facilities, which maintain brightly lit parking lots for security reasons. The glare environment is considered low due to the lack of large structures containing highly reflective surfaces.

4.1.2.6 Planning District 3: Embarcadero

The Embarcadero Planning District (PD3) extends the length of San Diego Bay within the Downtown San Diego area, beginning at Laurel Street on the north end (just south of SDIA) and ending roughly at Park Boulevard, which is south of the Convention Center and north of the TAMT. The Embarcadero is broken down into three subdistricts: North Embarcadero, Central Embarcadero, and South Embarcadero, as described below. Overall, the visual character of the Embarcadero reflects a highly developed urban environment with a diverse mix of uses and building types, which are characteristic of active waterfront and downtown environments. The specific visual character and quality, scenic vistas, and sources of light and glare of each subdistrict are described below.

Visual Character and Quality

North Embarcadero

The North Embarcadero is bounded by Laurel Street and the “Crescent Zone” (the curvilinear portion of coastline that is located between the U.S. Coast Guard facility and the Grape Street Piers) at its northern end and Seaport Village at its southern end. The landside features at the northern end are dominated by the manufacturing facilities and office buildings of Solar Turbines, an industrial use that manufactures gas turbines for onshore and offshore electrical power generation, marine propulsion, and natural gas and oil production. Although somewhat obscured by vegetation, the cranes, piping, and scaffolding associated with Solar Turbines’ operations are visible in the midst of the large, white, approximately two- or three-story warehouse/office buildings of this large multi-block facility. Views consist of offshore small-craft anchorages as well as the skyline of Downtown

San Diego. Views of the open navigation channels of the Bay with boats and ships of varying sizes, shapes, and purposes are also available from the Crescent Zone.

Moving south, the industrial character of Solar Turbines transitions to institutional uses with the four-story Beaux-Arts/Spanish Revival-style San Diego County Administration Center, which features a prominent clock tower, pink stucco siding, and a red tiled roof. The County Administration Center's large pink, architecturally embellished building set within an expansive 1,500-foot long parcel creates a visually prominent feature within the North Embarcadero; however, it is not located on District property. The building is situated in a park setting that features a centrally located fountain within six segments of green lawn along the western side of the property; a long linear reflection pool with fountains that runs the length of the central portion of the site; and gardens with meandering paths and a whimsically designed splash park featuring undulating bright green, blue, and beige surfaces that flank the northern and southern sides of the building along the eastern length of the parcel. (Note that the gardens are in the process of being converted into active recreation.) Views shift from offshore anchorages to large piers containing considerably larger vessels that are immediately adjacent to the waterfront.

The Administration Center is followed by a large hotel complex with multiple buildings that reach up to 14 stories. The remainder of the landside area of North Embarcadero is occupied by administration buildings for the U.S. Navy, including multi-story structures and single-story barracks-style facilities. The U.S. Navy buildings located south of Broadway are not located on District property.

The waterfront side of North Embarcadero is characterized by concrete pedestrian pathways and wide drives/parking aisles that provide direct vehicular and pedestrian access to the piers and anchorages of the various maritime enterprises that are accessible from the North Embarcadero. In addition, the newly constructed Phase 1 of the North Embarcadero Visionary Plan includes an outside café, waterside promenade, and gardens with jacaranda trees. Piers of varying lengths, widths, and materials punctuate the coastline of the North Embarcadero. The larger piers, comprising very wide, concrete-paved piers, include the B Street Pier, the Broadway Pier, and Navy Pier. These piers include buildings usually consisting of low-rise warehouses. In addition, parking lots are located on the B Street and Navy Piers.

Various types of ships and boats also contribute to the character of the waterfront along the North Embarcadero, ranging from small- to medium-sized harbor tour vessels to the nineteenth-century merchant ship *Star of India*, the USS Midway Museum, large cruise ships, and medium-sized commercial fishing vessels. There is also a considerable amount of public art located along and adjacent to the continuous waterfront promenade, ranging from small, colorful, whimsically themed statuettes to large, somber war memorials.

Overall, due to the high variations in the development pattern, the mix of uses and activities, and the lack of any unique visual elements, the North Embarcadero Subdistrict has a low to moderate visual quality. However, given that this is a location that draws a high number of visitors and provides public access to the waterfront, viewer sensitivity is considered moderate to high.

Central Embarcadero

The Central Embarcadero begins west and south of Harbor Drive and includes Tuna Harbor Park and Ruocco Park and the Seaport Village retail complex, which wraps around the waterfront connecting North Embarcadero with South Embarcadero. Tuna Harbor Park is located on the

G Street Mole and includes green lawns, pedestrian pathways, public art, a surface parking lot, and a restaurant. The Tuna Boat Basin, which provides commercial fishing boat berthing, is located on the south side of the G Street Mole. Ruocco Park is a small waterfront park that features green lawn, public art, and benches. Seaport Village is situated in a park-like setting south of Ruocco Park and houses more than 70 tourist-oriented gift shops, art galleries, and restaurants, one of which, the San Diego Pier Café, sits on a pier extending into the Bay in the middle of the Central Embarcadero. While there are several parking lots on the periphery of Seaport Village (mostly off of Harbor Drive), the whole of Seaport Village is pedestrian-oriented and contains a meandering network of paths. Similar to North Embarcadero, the parks within Central Embarcadero include public art. One of the more prominent pieces in the area is *Unconditional Surrender*, a statue featuring a 25-foot-tall sailor kissing an equally tall nurse, situated directly across from the *USS Midway*, in Tuna Harbor Park.

The western end of Seaport Village includes a collection of low-rise (one- or two-story) freestanding buildings that are clustered around and extending off a central plaza area. The buildings feature mostly historically themed architectural styles ranging from traditional Mission and Spanish Revival to Victorian. From vantage points within the western portion of Seaport Village views are more congested due to the presence of several piers and other water-dependent uses contained within this area, such as small-craft marinas and a commercial fishing operation, that jut into the Bay off the south end of Tuna Harbor Park, which is at a perpendicular angle to the western end of Seaport Village.

The central portion of Seaport Village (i.e., the area generally located between Pacific Highway and Kettner Boulevard) includes a public waterfront park, the Embarcadero Marina Park North (EMPN), which is on a peninsula that extends off Seaport Village into the Bay, and a large surface parking lot. EMPN includes passive-use amenities such as pedestrian pathways, green lawns, benches, and shade trees. The central portion of Seaport Village also houses a large square building with a central courtyard that fronts Harbor Drive, and houses The Headquarters at Seaport, which contains other shops and restaurants. In the central portion of Seaport Village, where the shoreline shifts from a north-south to an east-west orientation, views of the Bay broaden and encompass a large swath of the Bay spanning from the Point Loma peninsula in the north all the way to the low, elongated arch of the San Diego-Coronado Bay Bridge in the south.

Finally, the eastern end of Seaport Village includes a small collection of shops and restaurants, approximately 10 buildings, along the waterfront nestled behind the Manchester Grand Hyatt San Diego and west of the San Diego Marriott Marquis and Marina hotels. The buildings in this part of Seaport Village tend to feature architectural elements that are reminiscent of New England seaside villages such as one- or two-story brick or gray clapboard sided structures, cupulas, faux lighthouses, etc. The view from the eastern end of Seaport Village also includes large swaths of the Bay, with the Coronado northern shoreline in the background.

The Central Embarcadero has a more unified and cohesive development pattern than other portions of PD3 as it is generally confined to two public parks that border the seaside-village themed Seaport Village. The visual quality is considered moderate to high, and because Seaport Village draws visitors seeking a waterfront shopping/dining location and is surrounded by other visitor-serving uses (hotels, the San Diego Convention Center [SDCC], etc.), visual sensitivity in this area is considered high.

South Embarcadero

The South Embarcadero area is bounded on the north by Seaport Village and on the south by the TAMT. It comprises mostly hotels and the SDCC.

Reflecting the South Embarcadero's proximity to Downtown and the SDCC, high-rise hotels, featuring multiple glass-clad towers of 20 or more stories, are located to the southeast of Seaport Village. The multi-story SDCC is situated centrally within the South Embarcadero and dominates the majority of the area. The SDCC features a modern architectural style, with an emphasis on geometry and horizontality. Two elongated, mid-rise segments extend off a central outdoor stairway. Building materials make heavy use of glass and concrete buttressing, with varying surface shapes, such as side-rounded glass walls on one story, diagonal glass walls on another, and vertical glass walls on another. The distinctive Sails Pavilion, with its white pointed fabric roof intended to be reminiscent of the sails and masts of a ship, is just north of center within the complex.

Embarcadero Marina Park South (EMPS) extends into the Bay from behind the SDCC and, similar to its northern counterpart (EMPN), includes publicly accessible open space with a parking lot, green lawns, pedestrian pathways, and benches. This park also includes basketball courts and a public fishing pier. A recreational boat marina, which is part of the San Diego Marriott Marquis and Marina, is located within the cove created by the two L-shaped segments that form EMPN and EMPS. The southernmost end of the South Embarcadero area is occupied by another modern high-rise hotel. Views from the South Embarcadero are similar to those of the southern portion of Central Embarcadero and generally include broad vistas of the Bay stretching from Point Loma to the San Diego-Coronado Bay Bridge; these views are particularly prominent from within the EMPS.

While the development pattern in this subdistrict is not as varied as it is in the North Embarcadero, it still contains a high degree of irregularity in terms of building sizes, massing, and lot orientation. In addition, there are no particularly unique visual elements within this subdistrict. As such, visual quality is considered moderate to low. Nevertheless, given that this is a waterfront location that provides a great deal of public access opportunities, viewer sensitivity in this area is generally considered high.

Scenic Vistas

North Embarcadero

There are seven designated scenic vistas within the North Embarcadero Subdistrict under the current PMP. Four are within the Crescent Zone, one is along the bayfront adjacent to the San Diego County Administration Center, one is from the end of Broadway Pier, and one is on top of the *USS Midway*. All of these scenic vistas are oriented toward the Bay. From the northern portion of the North Embarcadero, foreground views of the Bay are limited to the U.S. Coast Guard Facility and the small sailboats and other small watercraft anchored within the cove created by the Crescent Zone. Middleground views consist of the open water and navigation channels of the Bay, and background views include views of the land masses of Coronado and Point Loma. The northern portion of the North Embarcadero also includes views of the assemblage of high-rise buildings that comprise the Downtown San Diego skyline.

Views from Broadway Pier and from the top of the *USS Midway* include the open waters of the Bay in the foreground and middleground. Background views include the bayfront of Coronado.

Central Embarcadero

There are three designated scenic vistas within Central Embarcadero—one at the end of Tuna Harbor Park, one in Ruocco Park near the intersection of Pacific Highway and Harbor Drive, and the third from Seaport Village. Again, within the Central Embarcadero Subdistrict, views of the Bay comprise the primary scenic vistas. The bayfront within this area curves around from a north-south orientation to a northeasterly-southwesterly orientation, and the components within the vistas adjust accordingly. Within the north-south portion, views look west and primarily include open water of the Bay within background views of the Coronado waterfront spanning from the military uses of NAS North Island southward to residential and visitor-serving commercial uses (restaurants, small shops, etc.). Along the portion of the waterfront that is oriented northeast-southwest, foreground and middleground views are available of the open waters of the Bay with passing vessels of varying shape and size, as is Coronado's entire northern bayfront, from NAS North Island down to the San Diego-Coronado Bay Bridge (visible in background views). For the first time along the Embarcadero, the San Diego-Coronado Bay Bridge becomes a prominent visual component within the scenic vistas of the Bay.

South Embarcadero

There are seven designated scenic vistas within South Embarcadero under the current PMP—one is adjacent to the marina of the San Diego Marriott Marquis and Marina, five are within a designated (but not yet constructed) rooftop park/plaza in an area along the waterfront behind the existing SDCC that is proposed as an expansion to SDCC, and the last is off the pier adjacent to the Hilton San Diego Bayfront hotel. All of these scenic vistas are oriented toward the Bay and include expansive views of the Bay. Specifically, scenic vistas within the South Embarcadero Subdistrict are the same as those available from the northeastern-southwestern waterfront of the Central Embarcadero and consist of open waters of the Bay in foreground and middleground views and the northern Coronado waterfront from NAS North Island to the San Diego-Coronado Bay Bridge in the background.

Light and Glare

Within PD3, the land area surrounding the Bay is highly urbanized and supports a mixture of commercial, industrial, recreational, and marine-related uses. The existing nighttime lighting environment consists mainly of ambient light produced by interior and exterior building lights (office and commercial), park lighting, street lighting, parking lot lighting, and transitory lighting from headlights on automobiles and transit-related vehicles (i.e., buses and trolleys). Commercial developments, such as high-rise office buildings, contribute to ambient lighting conditions. Exterior security lighting and interior operational lighting at the buildings throughout Downtown cause light spillover, which illuminates areas along the bayfront. In addition, several high-rise hotels and nearby adjacent residential buildings contribute to ambient nighttime lighting conditions in the form of spillover light from exterior and interior security and operational lighting. Overall, because the area is highly urbanized, existing ambient lighting levels are considered to be high.

North Embarcadero

Within North Embarcadero specifically most lighting sources are large hotel complexes along Harbor Drive as well as street lighting and transitory lighting from headlights from vehicles using Harbor Drive. Lighting from the piers also contributes to nighttime lighting within this subdistrict, including interior and exterior lighting for the buildings on the piers, and the various sources of

lighting for the vessels docked at the piers. As noted above, the nighttime lighting environment is considered high in this area.

Sources of glare include sun reflecting off the glass surfaces of the nearby high-rise buildings as well as the windshields of passing and parked vehicles. Sun reflecting off the waters of the Bay is another source of glare in the area. The overall glare environment in the North Embarcadero is considered moderate.

Central Embarcadero

Within the Central Embarcadero, most of the nighttime lighting comes from Seaport Village, including interior and exterior lighting for the many shops and restaurants, and exterior lighting along the pathways and security lighting within the parking lots. The parks within Central Embarcadero, including Tuna Harbor Park, Ruocco Park, and EMPN, also include safety and security lighting. Waterside uses within this subdistrict are minimal. There are not any large piers at which large vessels are docked or upon which buildings have been constructed, and waterside sources of light are generally confined to light emanating from passing vessels. Overall, due to its adjacency to Downtown San Diego, ambient nighttime lighting conditions in this area are considered high.

Sources of glare include sun reflecting off the glass surfaces of the nearby high-rise buildings as well as the windshields of passing and parked vehicles. Sun reflecting off the waters of the Bay is another source of glare in the area. The overall glare environment in the Central Embarcadero is considered moderate.

South Embarcadero

Sources of light within the South Embarcadero comprise mostly large hotel complexes such as the Manchester Grand Hyatt San Diego, the San Diego Marriott Marquis and Marina, and, farther south, the Hilton San Diego Bayfront. The SDCC also contributes a large share of ambient lighting from interior and exterior building lighting. Finally, EMPS contributes to nighttime lighting in this area. Petco Park, just north of the South Embarcadero, is a major contributor to nighttime lighting within the immediately adjacent area during the baseball season from both normal stadium lighting and occasional fireworks displays. Finally, transitory nighttime lighting from headlights on automobiles and transit-related vehicles (i.e., buses and trolleys) further contributes to ambient lighting conditions in the area. Waterside sources of light include the large marina associated with the San Diego Marriott Marquis and Marina and the smaller large-vessel marina at the Fifth Avenue Landing behind the SDCC. Again, due to its adjacency to Downtown San Diego, ambient nighttime lighting conditions in this area are considered high.

Sources of glare include sun reflecting off the glass surfaces of the nearby high-rise buildings and the windshields of passing and parked vehicles. Sun reflecting off the waters of the Bay is another source of glare. The overall glare environment in the South Embarcadero is considered moderate.

4.1.2.7 Planning District 4: Working Waterfront

The Working Waterfront Planning District (PD4) comprises three subdistricts: the TAMT, Cesar Chavez Park, and Harbor Drive Industrial, which includes all of the remaining portion of the planning district south of Cesar Chavez Park, terminating at Chollas Creek. As indicated, this planning district is a working waterfront area primarily consisting of TAMT as well as ship

construction and ship repair yards. Overall, the visual character of PD4 is defined by the heavy industrial uses that occupy this area.

For the TAMT Subdistrict, the discussion below provides a summary of the visual character and resources and light and glare as defined by the *Tenth Avenue Marine Terminal Redevelopment Plan* and its Final Environmental Impact Report (EIR), which were adopted and certified, respectively, by the Board of Port Commissioners (Board) in December 2016. These documents have been incorporated into this Program EIR (PEIR) by reference (see Chapter 1, *Introduction*). For the remainder of PD4, visual character and resources were based primarily on field observations.

Visual Character and Quality

TAMT

TAMT is a marine terminal located on paved landfill within a trapezoidal-shaped, 96-acre parcel that extends into the Bay. TAMT includes eight berths capable of accommodating ocean-going vessels and handles over a million metric tons of import, export, and domestic cargo per year, including dry bulk, liquid bulk, refrigerated container, and multi-purpose general cargo. As such, the site contains a relatively orderly arrangement of structures and infrastructure to process this cargo, including large, nondescript warehouses and transit sheds; silo complexes and conveyer systems; bulk unloaders; cranes; stacks of containers; and large, multi-story liquid storage tanks. There is also a significant amount of paved, open storage area as well as large, paved roadways and rail tracks running into and throughout the site. The heights, size, and shape of these structures vary throughout the site. The four warehouses and transit sheds tend to be long, rectilinear structures reaching a height of approximately four stories that are utilitarian in design and contain no architectural ornamentation. In contrast, the silos include tall, cylindrical towers while the liquid bulk containers comprise large round tanks. In addition, as shipping operations occur at TAMT, the locations and activities at the site change frequently, and stacks of containers are relocated, trucks arrive and leave, and other miscellaneous equipment is relocated as needed. Also, vessels are not always berthed at the TAMT; however, they can be present several days per week.

Due to the lack of a cohesive development pattern of TAMT, which includes a collection of warehouses, cranes and other offloading equipment, trains, cargo containers, and open laydown areas, the visual quality of this area is considered low. In addition, TAMT is not publicly accessible, and while it is visible from other nearby areas that are publicly accessible, viewers would have low visual sensitivity related to the terminal.

Cesar Chavez Park

Cesar Chavez Park is a small waterfront park that is nestled amongst this otherwise highly industrial area. The park is south of TAMT and north of the Harbor Drive Industrial Subdistrict. The visual character of the park is what one would expect for a waterfront community park. It covers approximately 4 acres and consists mostly of large green lawns, which contrast sharply with the heavily paved parcels of the neighboring industrial uses. The park also includes picnic and playground areas, concrete pathways, and a narrow recreational pier extending approximately 700 feet into the Bay. The park itself does not contain any visually prominent features, but the San Diego-Coronado Bay Bridge is just south of the park and the imposing height and broad arch of the bridge provides a dramatic visual backdrop. Overall, the visual quality of this park is moderate. Given its bayfront location, viewer sensitivity in this area is considered moderate to high.

Harbor Drive Industrial

The Harbor Drive Industrial Subdistrict includes ship building facilities and ship repair yards. The irregular development pattern of this area contrasts sharply with the more orderly arrangement of the TAMT site, and the visual appearance is defined by a densely developed and haphazard collection of structures required for these uses, such as warehouses of varying shapes and sizes and piers of various lengths and widths. Many of the piers include ships in various stages of construction or repair. Cranes and other equipment are often located adjacent to these piers. Cluttered storage yards are also typical features in this area. The visual quality of this area is low, and viewer sensitivity is also low.

Scenic Vistas

TAMT

The current PMP does not identify any designated vista areas in the TAMT Subdistrict.

Cesar Chavez Park

The current PMP does not designate any vista areas within Cesar Chavez Park.

Harbor Drive Industrial

The current PMP does not identify any designated vista areas within the Harbor Drive Industrial Subdistrict.

Light and Glare

TAMT

TAMT includes nighttime security and operational lighting as well as lighting for evening and nighttime offloading operations. High-intensity boom lighting and high-mast lighting is provided throughout the terminal for security purposes and operational activities. Also, during nighttime loading or offloading of ships, barges, and containers, floodlights attached to the bottoms of crane booms and sides of crane structures illuminate cranes and the areas around them. Headlights from vehicles transferring container goods to and from the berths are another source of transitory nighttime lighting. The overall onsite nighttime lighting environment is considered high because the terminal requires nighttime lighting for operations.

Existing sources of daytime glare include bidirectional transitory glare from trucks, cars, and semi-trailers driving along adjacent streets and internal streets where sunlight reflects off windshields. Because TAMT does not contain structures with reflective architectural finishes, the overall daytime glare environment is considered low. Glare conditions on TAMT are relatively low in relation to offsite conditions.

Cesar Chavez Park

Nighttime lighting sources at Cesar Chavez Park include security lighting at the parking lot and along the park's walkways and on the recreational pier. These lights are generally lower intensity lights that are shielded and pointed downward such that most of the lighting is confined within the site

and does not spill over to adjacent areas. Overall, lighting conditions at Cesar Chavez Park are considered moderate to low.

Sources of glare generally include sunlight reflecting off windshields of vehicles parked within the parking lot or passing on the nearby local roadways, or sunlight reflecting off of the Bay. There are few structures at Cesar Chavez Park, none of which include any highly reflective surfaces; therefore, the glare environment is considered low.

Harbor Drive Industrial

Similar to TAMT, the Harbor Drive Industrial area contains security and operational lighting, and floodlights attached to the bottoms of crane booms and sides of crane structures, which illuminate cranes and the areas around them. Vehicle lighting is another source of nighttime lighting in this area. The overall nighttime lighting environment is considered moderate to high because several areas require nighttime lighting for operations.

The subdistrict includes numerous structures with metallic siding, which creates a source of daytime glare in addition to sun reflecting off of the metallic and glass surfaces of vessels and vehicles. Glare conditions in this subdistrict are considered moderate.

4.1.2.8 Planning District 7: South Bay

The South Bay Planning District (PD7) includes the area at the extreme southern end of the Bay and does not have any subdistricts.

Visual Character and Quality

The South Bay Planning District is an odd-shaped district that is entirely within the Bay and comprises either open water or small areas of marshy land on its western side. This planning district contains no development. From a visual perspective, this area melds into, and is largely indistinguishable from, the rest of the Bay. Because it is perceived as being part of the natural Bay, the visual quality is considered high, as is viewer sensitivity.

Scenic Vistas

The current PMP does not identify any designated vista areas within this planning district.

Light and Glare

The South Bay Planning District does not contain any development and does not include any sources of nighttime lighting. The main sources of transient lighting are headlights from vehicles driving along SR-75 (Silver Strand Boulevard) and some nighttime lighting from the nearby naval base (Silver Strand Training Complex). The only sources of glare are the sunlight reflecting off the water and passing vehicles on nearby roadways.

4.1.2.9 Planning District 8: Imperial Beach Oceanfront

The landside portion of the Imperial Beach Oceanfront Planning District (PD8) is largely confined to the approximately 1.4-mile long beach, but also includes portions of Dunes Park, a commercial plaza adjacent to the pier, the Dempsey Holder Safety Center, a small parking lot at the southeast corner of

Palm Avenue and Seacoast Drive, and a second small parking lot at the northeast corner of Elkwood Avenue and Seacoast Drive. The waterside portion of PD8 comprises approximately 405 acres of open water of the Pacific Ocean and extends out from the beach approximately 2,000 feet in the southern end and up to 2,700 feet in the northern end. There are no subdistricts in the Imperial Beach Oceanfront Planning District.

Visual Character and Quality

Overall, the portion of Imperial Beach adjacent to PD8 is a small coastal community. The planning district itself is limited to a portion of the narrow sandy beach and a beachside park (Dunes Park) situated along Seacoast Drive at Daisy Avenue. The park generally consists of a large green lawn with paved walking paths, trees (mostly tall palm trees), picnic tables, benches, restroom buildings, and public art (e.g., sculptures). The planning district also includes the Imperial Beach Pier, a narrow wooden recreational pier that extends approximately 1,300 feet into the ocean. The primary views are of the Pacific Ocean. Additionally, views of the Downtown San Diego skyline and the end of the Point Loma Peninsula are visible in the distance from the Imperial Beach Pier. The pier has a nautically themed seafood restaurant at its western end and is surrounded by the open ocean and the beach. Finally, two small parcels within the planning district east of Seacoast Drive contain two small, paved parking lots. The Dempsey Holder Safety Center is located along the beach at the terminus of Elder Avenue and comprises a two-story building with a three-story-tall lifeguard tower. The structure is contemporary and features asymmetrical massing, multiple gabled roofs clad with corrugated metal, and prominent, projecting eaves. The building contains several siding styles, including concrete bricks, blue bricks, board and batten, and clapboard. This planning district also includes a parcel adjacent to Pier Plaza, which is located north of the Dempsey Holder Safety Center and comprises a small, paved plaza at the entrance to the pier. This parcel includes a single-story retail building housing several small restaurant/snack establishments and a gift shop. Similar to the Dempsey Holder Safety Center, this building is of a contemporary design featuring an inverted gable roof and wide overhanging eaves supported by angled wooden beams that create a loggia-type space.

Uses surrounding PD8 along Seacoast Drive that contribute to the overall visual character of the area comprise almost entirely relatively dense residential development that fronts the beach, including closely positioned one- or two-story single-family homes. There are also several large beachside condominium complexes. Small commercial uses, such as small restaurants, boutique shops, and hotels, are also near the waterfront, fronting or set back from Seacoast Drive. Because the area typifies a quaint coastal town with a relatively modest scale of development adjacent to a beach, visual quality is considered moderate to high, and viewer sensitivity is considered high.

Scenic Vistas

The Imperial Beach Oceanfront Planning District includes seven designated scenic vistas in the current PMP. Three of the vistas are oriented to the west looking into the Pacific Ocean. These include one at the western end of the Imperial Beach Pier, one within Dunes Park, and one at the terminus of Imperial Beach Boulevard (described further below). These vistas offer expansive views of the open ocean. There are also three scenic vistas along the Imperial Beach Pier. Two are located near the beginning of the pier with one looking north and one looking south. These two vistas offer views of the coastline and the waves breaking on the beach in each respective direction. The third

vista is near the end of the pier, looking northward, and views include the coastline, with waves breaking on the beach, open ocean, and Downtown San Diego and Point Loma in the distance.

Finally, the last scenic vista within this planning district is at the corner of Imperial Beach Boulevard and Seacoast Drive, looking to the southeast. The Tijuana Slough National Wildlife Refuge is located in this direction; however, views of this resource from the corner of this intersection (where the vista area is indicated) are blocked by a three-story residential building that is not located on District property. The refuge is visible past this building along both Seacoast Drive and Imperial Beach Boulevard. Views include a large, flat open space occupied by wetlands and tall grasses.

Light and Glare

The Imperial Beach Oceanfront Planning District is a relatively urbanized area, although at a smaller scale and lower concentration of development than the more densely developed parts of the Bay (such as the Embarcadero or Coronado). Lighting sources within PD8 itself generally include security lighting at the parks and parking lots, and lighting along the pier. The lights used along the pier and in the parks include short poles with downward-oriented and shielded bulbs; thus, spillover light is minimized. Nearby lighting sources include interior and exterior lighting for the single-family and multi-family residential buildings and for the area's small commercial establishments. Street lighting and vehicular lighting are also present. The ambient nighttime lighting environment is low.

Sources of glare are largely confined to sunlight reflecting off the water and off vehicles parked within and passing through the district. Overall, glare conditions are considered low.

4.1.2.10 Planning District 9: Silver Strand

The Silver Strand Planning District (PD9) is a narrow stretch of land on the western side of the Bay that separates the Bay from the Pacific Ocean and abuts Coronado on the north and Imperial Beach on the south. A large portion of the planning district consists of open water, primarily along the Bayside shoreline of the Silver Strand within the southern half of the planning district. The planning district is divided into three subdistricts: State Park Basin, which comprises the open water and a small sliver of the shoreline of Crown Cove; Crowne Isle, which includes Crowne Isle and its marina; and Grand Caribe Isle and South Cays, which spans the rest of the length of the planning district and is bounded on the north by Crowne Isle and on the south by the U.S. Navy's Silver Strand Training Complex.

Visual Character and Quality

State Park Basin

The majority of the State Park Basin Subdistrict comprises the open water of Crown Cove, which is bordered on the north and west by the sandy narrow beach, a portion of which is also part of the subdistrict. The only structure in the waterside portion of the subdistrict is a short pier with a dock at the end that is associated with the Crown Cove Aquatic Center of Southwestern College, which is adjacent to the Silver Strand State Park, and partially located off of District property. The landside portion, as mentioned above, includes a short and very narrow stretch of beach along the straight portion of shoreline in the south of the subdistrict, just north of Coronado Bay Road. This area is mostly sand, but some vegetation also exists along the water. A view of the open water of the Bay

beyond Crown Cove is available. Visual quality within this subdistrict is considered low to moderate and viewer sensitivity is moderate.

Crown Isle

Crown Isle is a small island that is connected to the mainland by Coronado Bay Road, which is a narrow, paved roadway extending east from Silver Strand Boulevard. The road has a parking barrier gate, allowing entry to guests of Loews Coronado Bay Resort as well as the public for a fee, and is flanked by an evenly spaced row of palm trees and grass. Loews Coronado Bay Resort, which is the only use on Crown Isle, is a sprawling complex with six low-rise (approximately four-story) buildings—a large building located at the entrance, or western end, of Crown Isle, and five others that fan out along the northern and eastern shorelines of the island. Several pools and other athletic courts are centered among these buildings. There is also a collection of small cottages at the northeastern corner of the island. A roadway that provides angled parking spaces surrounds the entire complex along the outer edge of the island. A marina is located off the southern shoreline of the island. While the development pattern is unified (because all the buildings belong to the same resort), the architectural style is not distinctive, nor are there any prominent or unique visual elements within this area. Therefore, visual quality is considered moderate. However, because this area is publicly accessible and provides views of the Bay, viewer sensitivity is considered moderate to high.

Grand Caribe Isle and South Cays

The Grand Caribe Isle and South Cays Subdistrict includes the waters of the Bay offshore from the Coronado Cays, which is a large residential development (up to 1,200 condominiums, townhomes, and single-family homes). Most of this area includes narrow waterways that are lined with marinas between the residential development and Grand Caribe Isle. Grand Caribe Isle is a small “island” situated bayward (to the east) of Coronado Cays. The southern portion of the isle (south of Grand Caribe Causeway) is undeveloped and largely contains natural vegetation as well as hiking paths. A small park landscaped with green lawn is adjacent to and situated to the south of the roadway. The western side of the northern portion of the isle contains small commercial establishments and their parking lots and the Coronado Cays Yacht Club, including a small building, swimming pool, and marina at the northern tip of the island. The bayside of the isle contains undeveloped, natural open space. The visual quality is considered moderate. The area does not have a cohesive development pattern, but the presence of natural landscape set against the Bay would be considered pleasant to viewers along the hiking paths. As such, viewer sensitivity is considered moderate to high.

To the south of Grand Caribe Isle there is a waterside area adjacent to the southern end of the Coronado Cays. This area is open water and does not contain any marinas within the water.

Scenic Vistas

State Park Basin

There are no existing designated scenic vistas in the current PMP within the State Park Basin Subdistrict.

Crown Isle

There are no existing designated scenic vistas in the current PMP within the Crown Isle Subdistrict.

Grand Caribe Isle and South Cays

Grand Caribe Isle includes one scenic vista in the current PMP. That scenic vista is located at the roundabout at the end of Grand Caribe Isle. The vista is oriented toward the east, with expansive views of open water of the Bay in the foreground and the marina within the Chula Vista Bayfront Planning District (referred to as Planning District 6, Chula Vista Bayfront of the current PMP) in the background.

Light and Glare

State Park Basin

There are no existing sources of light within the State Park Basin Subdistrict. Adjacent sources of light include minimal interior/exterior building lighting associated with the Crown Cove Aquatic Center and headlights from cars traveling on SR-75/Silver Strand Boulevard. The primary source of glare in the subdistrict is sun reflecting off the waters of Crown Cove. Minor sources of glare also include sunlight reflecting off the metallic and glass surfaces of cars in the vicinity. Lighting and glare conditions in the subdistrict are considered low.

Crown Isle

Crown Isle is fully developed with a large resort comprising several buildings, outdoor tennis courts and pools, a roadway, parking lots, and a marina. Nighttime lighting associated with these uses includes interior and exterior building lighting, roadway lighting, and security lighting throughout the site. Other sources of light include headlights from vehicles in the area and lighting along the marina docks and for the boats at the marinas. Sources of glare include sunlight reflecting off the water of the Bay as well as the windows and metallic surfaces of cars. Lighting conditions are considered moderate, while glare conditions are considered low.

Grand Caribe Isle and South Cays

Sources of nighttime lighting within the Grand Caribe Isle and South Cays Subdistrict are limited to roadway lighting along Grand Caribe Causeway and interior/exterior lighting associated with the commercial uses and yacht club as well as parking lot lighting. There is no nighttime lighting within the southern portion of the isle or in the South Cays. Nighttime lighting conditions in this area are considered low. However, the subdistrict is adjacent to the large Coronado Cays residential development, which emits a moderate amount of nighttime lighting in the area compared to adjacent uses. Sources of glare include sunlight reflecting off the waters of the Bay and off the metallic and glass surfaces of cars in the area. Glare is considered low in this area.

4.1.2.11 Planning District 10: Coronado Bayfront

The Coronado Bayfront Planning District (PD10) includes the shoreline of Coronado from Alameda Boulevard in the northwest, adjacent to NAS North Island, to just south of Avenida ~~Alunar~~ Lunar in the southwest area of Coronado, just before the Silver Strand. This planning district is divided into two subdistricts: North Coronado, which extends from SR-75/San Diego-Coronado Bay Bridge in the south to Alameda Boulevard in the north; and South Coronado, from SR-75/San Diego-Coronado Bay Bridge in the north to approximately Avenida ~~Alunar~~ Lunar in the south.

Visual Character and Quality

North Coronado

Aside from the naval base, which is not part of the subdistrict, North Coronado comprises mostly commercial and recreational uses, including the Ferry Landing Marketplace, which is a collection of shops and restaurants that are housed in single-story buildings, reflecting the Cape Cod style (cottages with natural wood siding and moderately pitched gable roofs). The marketplace is centered around the publicly accessible Coronado Ferry Landing Park, which comprises a green lawn, a small beach area fronting the Bay, and the Bayshore Bikeway. Coronado Ferry Landing Park connects to Centennial Park, which is located off 1st Street and Orange Avenue via a bayfront promenade and is not located on District property. The northern shoreline of North Coronado includes expansive views of the Bay with the skyline of Downtown San Diego set behind it. Along the eastern shoreline of North Coronado, only peripheral views of the Downtown San Diego skyline are available, along with expansive views of the Bay, with the Working Waterfront in the background, and the San Diego-Coronado Bay Bridge, which features prominently within waterfront vantage points along this stretch of shoreline. Finally, a portion of the southern end of North Coronado is occupied by the sprawling complex of the Coronado Island Marriott Resort and Spa. The main building includes a W-shaped, white, three-story structure of a contemporary style. The property also includes a number of cottages, and multiple swimming pools and tennis courts.

The southeastern bayfront of North Coronado comprises large swaths of green lawns, associated with Coronado Tidelands Park (bounded on the south by SR-75/San Diego-Coronado Bay Bridge). The park includes four baseball diamonds, a children's playground, a small beach, a skate park, and a portion of the Bayshore Bikeway. Benches and public art are also located within the park, and a small-vessel anchorage is located offshore.

In general, the visual quality of North Coronado is considered moderate to high, given the uniformity of the development pattern, scale, and styles, all set within a waterfront location. Similarly, viewer sensitivity in this area is also considered high.

South Coronado

The vast majority of the South Coronado Subdistrict is occupied by the Coronado Municipal Golf Course, which extends along the eastern shore of the Coronado Bayfront, south of the San Diego-Coronado Bay Bridge, and wraps around into Glorietta Bay. Similar to views of most golf courses, views of the Coronado Municipal Golf Course consist of an expansive manicured green lawn dotted by sand pits, trees, water features, and putting greens. The clubhouse is situated in the middle and includes a contemporary building with eclectic Mediterranean-style architectural embellishments, such as stucco siding, a red tiled roof, columns, and arched doorways. Additionally, there is a small stretch of beach along the southern tip of the golf course. Distant views of the working waterfront are in the background.

Glorietta Bay is a small bay, nestled within the southern end of Coronado Island where the island meets the Silver Strand. It connects to San Diego Bay at an opening within its eastern end. With the exception of the Coronado Yacht Club, the District's jurisdiction is largely contained to the waterside area, which is occupied by two marinas with hundreds of boat slips. Most of the slips are intended for small vessels; however, several slips at the Glorietta Bay Marina can accommodate larger vessels. The Coronado Yacht Club is situated south of the golf course and comprises a large, surface parking

lot as well as a single-story clubhouse and green lawn. Views from waterfront vantage points in this area consist primarily of the marinas that occupy Glorietta Bay. The concentration of masts obscures longer-range views, and views of the San Diego Bay are only intermittently available within this area.

Overall, the visual quality of South Coronado is considered moderate to high. Golf courses are generally considered pleasant components within viewsheds due to their well-maintained, expansive green lawns that are dotted by small ponds or sand pits and that undulate from the dark, thick green of the rough grass to lighter greens of the smoothly cropped fairways and putting greens. However, the area surrounding Glorietta Bay has a less unified appearance due to the presence of large parking lots within which buildings of varying size and style are positioned. Nevertheless, given that this is an active and highly visible waterfront location with a high number of visitors, viewer sensitivity is considered high.

Scenic Vistas

North Coronado

There are five existing designated scenic vistas within the North Coronado Subdistrict. Three are along the northern waterfront area, all oriented toward the northeast in the direction of Downtown San Diego—one is at the end of Orange Avenue, one at the end of C Avenue, and one at the end of B Avenue. These vistas offer expansive views of the Bay with the high-rise buildings comprising the Downtown San Diego skyline in the background.

The other two scenic vistas are along the eastern side of the North Coronado Subdistrict, one at the end of 2nd Street, before the Coronado Island Marriott Resort and Spa, and one at the end of 3rd Street where it meets the Coronado Tidelands Park. Views from the 2nd Street scenic vista are dominated by the grounds and buildings of the Marriott resort with a portion of the span of the San Diego-Coronado Bay Bridge in the background and a fleeting glimpse of the waters of the Bay. However, due to the prominence of the hotel's features in foreground views, neither expansive nor prolonged views of scenic resources such as the bridge and the Bay are available from this vantage point. Views from the scenic vista on 3rd Street include the green lawns and baseball fields of Coronado Tidelands Park in the foreground with the majority of the San Diego-Coronado Bay Bridge, including a large stretch of its span and supporting piers, in the background. The waters of the Bay with the cranes from the Working Waterfront are visible behind and beneath the bridge. Because the park is only minimally developed, views of scenic resources within the viewshed of the designated vista are largely intact.

South Coronado

There are no currently designated scenic vistas within the South Coronado Subdistrict, and it is not visible from scenic vistas in other planning districts.

Light and Glare

North Coronado

North Coronado is a relatively densely developed urban area, and lighting sources are typical of urban areas, including security lighting within the waterfront parks, parking lots, and along the

Bayshore Bikeway; interior/exterior building lighting at residential uses; street lighting in the parking lots of the commercial uses along First Street; and security and operational lighting for the Marriott hotel, including bright nighttime lighting for their tennis courts. Cars also contribute to ambient lighting conditions in this area. As such, the ambient nighttime lighting environment is considered moderate.

Sources of glare include the sunlight reflecting off the waters of the Bay, as well as sunlight reflecting off of the glass and metallic surfaces of cars. The overall glare conditions are considered moderate to low.

South Coronado

The majority of South Coronado is occupied by the golf course, which does not offer nighttime tee times. Most of the course is not lit at night; however, there is some security lighting along the walking paths, and the parking lot and clubhouse also contain nighttime lighting for safety and ambience. Along Glorietta Bay, sources of nighttime lighting include interior and exterior lighting for the yacht club and marinas and their parking lots, street lighting along Pomona Avenue/Strand Way, lighting for the piers and slips at the marinas, and lighting used on the boats. Nighttime lighting conditions are moderate.

Sources of glare include the sunlight reflecting off the waters of the Bay, as well as sunlight reflecting off of the glass and metallic surfaces of cars and boats. Overall, glare conditions are considered moderate.

4.1.3 Laws, Regulations, Plans, and Policies

4.1.3.1 State

California Scenic Highway Program

The California Department of Transportation (Caltrans) manages the California Scenic Highway Program, which was created in 1963 by the California legislature to preserve and protect scenic highway corridors from changes that would diminish the aesthetic value of lands adjacent to highways. The program includes a list of highways that are eligible for designation as scenic highways or that have been designated as such. A highway may be designated as scenic based on how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes on the traveler's enjoyment of the view. State laws governing the Scenic Highway Program are found in the Streets and Highways Code, Sections 260 through 263.

California Coastal Act

The proposed PMPU area is located within the California Coastal Zone and is subject to the California Coastal Act (CCA). Pursuant to Section 30715 of the CCA, future projects that are considered to be "appealable development" as defined in the CCA must be consistent with the Chapter 3 policies of the CCA, including policies that address visual access to the coastal zone. Section 30251 states: "The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance . . . [and] [p]ermitted development shall be sited and designed . . . to be visually

compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas.”

Port of San Diego Coastal Development Permit Regulations

The District’s Coastal Development Permit (CDP) regulations include application requirements for both non-appealable and appealable developments. As part of this CDP application review process, applicants are required to provide “a description of the proposed development sufficient to determine whether the project complies with the certified Port Master Plan.” (District CDP Regulations, Sections 10(a)(1) and 11(a)(1).) As part of the CDP approval process PMP consistency findings are required (District CDP Regulations, Sections 10(c)(1)(c) and 11(c)(1)(c)). This includes review of projects for consistency with the proposed PMPU, and its implementing goals and policies described in the subsequent section.

4.1.4 Project Impact Analysis

4.1.4.1 Methodology

Aesthetic experiences can be highly subjective and vary from person to person; therefore, when feasible, it is preferable to evaluate aesthetic resources using a process that strives to objectively identify the visual features of the area, their importance, and the sensitivity of the associated viewers. The proposed PMPU-related changes to the aesthetic character of the PMPU area are identified and qualitatively evaluated based on the potential of future development to result in the substantial adverse modification to the existing physical conditions.

Proposed PMPU-related changes are evaluated using the threshold criteria discussed in Section 4.1.4.2, *Thresholds of Significance*, to determine significance. It should be noted that views from private property are generally not considered protected by the District. As such, any perceived impacts of the proposed PMPU on private views are not considered significant environmental effects under the California Environmental Quality Act (CEQA) (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477).

An evaluation of the proposed PMPU area and the potentially affected environs served to identify indicators of public sensitivity to changes to views. The range and quality of public views within the PMPU area were determined by reviewing street maps, proposed scenic vista areas and view corridor extensions identified in the proposed PMPU, and photos of areas within the planning districts. Consideration was given to how viewers within each planning district would experience changes related to implementation of the proposed PMPU, as well as the structures, vegetation, topographic features, or other intervening obstacles that may be present within the viewshed of proposed scenic vista areas and view corridor extensions.

4.1.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of aesthetics and visual resources impacts resulting from implementation of the proposed PMPU. The determination of whether an aesthetics and visual

resources impact would be significant is based on the thresholds described below and the professional judgment of the District as Lead Agency based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following.

1. Have a substantial adverse effect on a scenic vista.
2. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.
3. In non-urbanized areas, substantially degrade the existing visual character and quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage points), or in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.
4. Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

4.1.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies and development standards would have the potential to avoid or reduce impacts associated with aesthetics and visual resources and are considered in the impact analysis that follows.

WLU Policy 2.1.1 The planning districts shall be established based on their physical, recognizable location and consideration of established municipal boundaries and shall be organized in the following manner (refer to Figure 3.1.1, Baywide Water and Land Use Designations):

- Planning District 1: Shelter Island
- Planning District 2: Harbor Island
- Planning District 3: Embarcadero
- Planning District 4: Working Waterfront
- Planning District 5: National City Bayfront – not a part of this Plan
- Planning District 6: Chula Vista Bayfront – not a part of this Plan
- Planning District 7: South Bay – Pond 20 portion not a part of this Plan
- Planning District 8: Imperial Beach Oceanfront
- Planning District 9: Silver Strand
- Planning District 10: Coronado Bayfront

WLU Policy 2.1.2 Planning districts shall be organized by subdistricts, as necessary, to differentiate their distinct character. For planning districts not containing subdistricts, reference to subdistrict visions, policies, and standards shall apply to the entire planning district.

WLU Policy 2.2.1 The District and its permittees shall implement planned improvements and special allowances to facilitate public health, safety, and welfare and provide public coastal access and enjoyment of the waterfront (refer to Chapter 5, Planning Districts, Planned Improvements).

WLU Policy 2.2.2 To maintain a planning district's distinct character, all development shall be in accordance with the associated subdistrict vision (refer to Chapter 5, Planning Districts, Subdistrict Vision) or planning district vision (refer to Chapter 5, Planning Districts, Vision), where applicable.

WLU Policy 2.2.3 Phased development shall be coordinated in a manner to ensure that landside and water access improvements are integrated in a cohesive and complementary fashion (refer to Chapter 5, Planning Districts, Planned Improvements).

WLU Policy 3.1.8 Development adjacent to Recreation Open Space shall comply with, height limit, setback, and stepback requirements in accordance with:

- a. Chapter 4, Baywide Development Standards; and
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

WLU Policy 3.2.1 Visual access locations (scenic vista areas, view corridor extensions, Window to the Bay, and walkways) shall be maintained and protected, as shown in Chapter 5, Planning Districts: Coastal Access Views and Pathways Maps.

WLU Policy 3.2.2 Permittees of development shall preserve visual access through scenic vista areas, view corridor extensions, and walkways, in accordance with:

- a. Chapter 4, Baywide Development Standards;
- b. Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict; and
- c. Chapter 5, Planning Districts applicable Coastal Access Views and Pathways Maps.

WLU Policy 3.2.3 Coastal-enhancing development should provide opportunities for the public to view maritime operations when located nearby from vantage points that are physically accessible.

WLU Policy 3.2.4 Development, when located adjacent to commercial fishing operations, shall provide opportunities for public viewing of commercial fishing activities, such as fresh fish offloading, net mending, and fresh fish markets, to reinforce the working waterfront identity.

WLU Policy 3.2.5 Development shall be set back from the water's edge and recreation open space to avoid creating a walling-off effect.

WLU Policy 4.2.4 Development-related signage shall not impede or detract from public views of the coast. Signage shall be consistent with Chapter 4, Baywide Development Standards, and other District signage guidelines.

WLU Policy 4.2.5 Development shall include wayfinding signage to inform the public of nearby waterside promenades, scenic vista areas, and key public areas and amenities such as docks, piers, and beaches.

ECO Policy 1.1.10 Development above the water or adjacent to sensitive habitat areas should use ecologically sensitive lighting that is shielded and directed away from the water or sensitive habitat areas, sensor activated, and of the lowest possible color temperature that also meets public safety requirements.

In addition to the policies identified above, the proposed PMPU identifies development standards that would also avoid or reduce impacts related to aesthetic and visual resources. Specifically,

Chapter 4, *Baywide Development Standards*, of the PMPU establishes requirements for the future physical development of property and as stated, ‘shall be applied consistency baywide, to development in all planning districts, except where specifically noted in a subdistrict development standard. In addition to compliance with the baywide development standards, all development shall conform to the subdistrict development standards described in Chapter 5, *Planning Districts*, of the PMPU. Section 4.4.3, *Standards for View Protection*, of the PMPU establishes requirements related to the protection of views and physical access for view corridor extensions, and scenic vista areas, and along pathways~~walkways~~. The following requirements apply baywide:

1. The following features may be located within scenic vista areas, view corridor extensions, and walkways:
 - a. Directional and wayfinding signage;
 - b. Business signs serving a waterfront or water use;
 - c. Public art (permanent or temporary);
 - d. Educational and interpretive signage and displays;
 - e. Bicycle and pedestrian facilities, including bike racks and bike sharing;
 - f. Scooter and shared micromobility device return areas and corrals;
 - g. Street lighting, street furniture, and fixed or movable seating;
 - h. Guardrails or bollards for safety or security purposes only;
 - i. Any other improvements, facilities, or uses that enhance and activate the public realm and do not directly or permanently prohibit public access or obstruct views; and
 - j. Docked vessels or vessels associated with marinas.
2. New development adjacent to view corridor extensions and walkways shall be sited and designed to minimize adverse impacts on visual access at view corridor extensions or walkways through specific measures, including but not limited to the following:
 - a. No building, associated architectural features, design component, structure, roof projection (e.g., eave, cornice, and eyebrow projections), openly supported architectural projections (e.g., trellis and awnings), bay windows, projecting signs, structural cantilevers, or any other associated architectural encroachments or projections shall obstruct bayward pedestrian views, circulation and/or pathways ~~be permitted~~ within view corridor extensions or walkways;
 - b. No mechanical equipment, such as air conditioner units, gas meters, electrical fuse boxes, trash enclosures or dumpsters, utility boxes, or other similar building systems, shall be permitted within view corridor extensions or walkways;
 - c. The placement and design of signs shall be visually compatible and shall not obscure public views; and
 - d. Exterior lighting, where required for security, to serve development, or to provide lighting on a public path, shall be designed with low-intensity fixtures that are shielded and concealed so that light sources are not directly visible from public viewing areas and in accordance with *ECO Goal 1 (Chapter 3.3, Ecology Element)*.

- e. No elevated connecting structures (e.g., pedestrian bridges) are allowed in view corridor extensions, unless otherwise allowed within a subdistrict.
- 3. Fences or site walls ~~not associated with construction~~, where located within or along view corridor extensions and pathways~~walkways~~, should be transparent or permeable:
 - a. In locations where solid fences or site walls are used, they shall be no greater than 3 feet in height; and
 - b. Walls and fences shall not limit public access to a view corridor extension or pathway~~walkway~~ (i.e., shall not include locked gates).
- 4. The following requirements apply to parking:
 - a. On-Street parking may be permitted within view corridor extensions and walkways; and
 - b. Underground parking may be located within view corridor extensions and walkways provided it is entirely below grade; no parking ramps shall be permitted in a view corridor extension.
- 5. Landscape improvements and trees may be provided and should be selected, sited, and designed through the following techniques:
 - a. Landscaping and trees shall be maintained to minimize view blockage;
 - b. Where new trees are planted or existing trees maintained, the mature tree canopy should begin at a minimum of 8 feet above ground; and
 - c. New plantings, including any associated planter height, shall be 3 feet or less at full maturity except that landscaping used for screening along a leasehold fence may be allowed to grow to a mature height of 5 feet to screen the adjacent property while enhancing the character of the view corridor and in accordance with *ECO Goal 1 (Chapter 3.3, Ecology Element)*.
- 6. Solar facilities shall not obstruct or impact views from scenic vista areas or view corridor extensions, or obstruct access to, or along, a pathway.
- 7. Telecommunication facilities shall be located and designed to not obstruct or adversely impact views from scenic vista areas or view corridor extensions, or obstruct access to, or along, a pathway.

4.1.4.4 Proposed Scenic Vistas

The proposed PMPU proposes designated scenic vista areas and view corridor extensions within each planning district (the definition of scenic vista areas and view corridor extensions are summarized in Section 4.1.1.1, *Concepts and Terminology*, above). The following provides the specific locations of these designated scenic areas within each planning district and subdistrict.

Planning District 1: Shelter Island

West Shelter Island Subdistrict

There are seven scenic vista areas proposed in the PMPU in the West Shelter Island Subdistrict (see Chapter 5 of the PMPU for depiction of the scenic vistas). The following are descriptions of the proposed scenic vistas areas that are consistent with the existing designated scenic vistas, and proposed scenic vista areas that are new (not previously identified in the Port Master Plan).

Preserved ~~Proposed~~ scenic vista areas consistent with existing:

- Kellogg Beach facing to the southeast, including a view of the Shelter Island peninsula, as well as the open Bay.
- Yokohama Friendship Bell at the southwestern end of the Shelter Island peninsula includes a view of the open water of the Bay, facing south.
- Two along the peninsula facing the open Bay to the southeast (one was previously identified within the East Harbor Island Subdistrict, but the location and direction of views has not changed).
- Two on the bayfront shoreline facing south, both providing a view of the marinas within the Shelter Island Yacht Basin.

New proposed scenic vista areas:

- Within the Shelter Island Yacht Basin, facing north and providing a view of recreational boat berthing and the bayfront in the Point Loma area.

Three view corridor extensions are proposed in the West Shelter Island Subdistrict along the following roadways:

- McCall Street
- Nichols Street
- Bessemer Street

The McCall and Nichols Streets view corridor extensions provide a view of the marinas within Shelter Island Yacht Basin and the southwestern end of the Shelter Island peninsula. The Bessemer Street view corridor extension provides views of the marinas in the Shelter Island Yacht Basin.

East Shelter Island Subdistrict

Three scenic vista areas are proposed in the East Shelter Island Subdistrict at the following locations.

Preserved ~~Proposed~~ scenic vista areas consistent with existing:

- View of America's Cup Harbor and the Bay from Point Loma Marina Park ~~Point Loma Marina Park facing south towards the America's Cup Harbor and the Shelter Island peninsula.~~

Proposed new scenic vista areas:

- View of America's Cup Harbor from the point of East Shelter Island
- View of America's Cup Harbor from the America's Cup Harbor pier lookout. ~~Two at the northeastern portion of the Shelter Island peninsula, both facing north towards the America's Cup Harbor and Point Loma Marina Park.~~

Two view corridor extensions would be located in the East Shelter Island Subdistrict along the following roadways:

- Dickens Street
- Garrison Street

Both view corridor extensions would face southeast and would provide a view of the marinas in America's Cup Harbor.

Planning District 2: Harbor Island

West Harbor Island Subdistrict

The West Harbor Island Subdistrict contains three ~~preserved~~ ~~proposed~~ scenic vista areas (see Chapter 5.2.2(D)-I in the proposed PMPU). All three areas are located on the south side of the Harbor Island peninsula, one at the westernmost end, one in the center, and one at the southern end of the Harbor Island Drive Entry Segment, all facing south and providing open water views of the Bay. All three of the proposed scenic vista areas are consistent with the existing vista areas designated by the PMP. There are no view corridor extensions proposed for this subdistrict.

East Harbor Island Subdistrict

Two scenic vista areas are proposed for the East Harbor Island Subdistrict, one of which is proposed as a new scenic vista area and one would be a preserved existing vista, at the following locations.

~~Proposed~~ Preserved scenic vista areas consistent with existing:

- Eastern end of Harbor Island peninsula, facing southeast towards a proposed anchorage area and open water views of the Bay with PD3 in the background.

Proposed new scenic vista areas:

- Bayfront shoreline, looking towards the south, providing a view of the East Basin, the Bay, and PD3 in the background.

There are no view corridor extensions proposed for this subdistrict.

Spanish Landing Subdistrict

Three scenic vista areas are proposed for the Spanish Landing Subdistrict, one of which is proposed as a new scenic vista area and two would be preserve existing vistas.

~~Proposed~~ Preserved scenic vista areas consistent with existing:

- One located at the western end of the subdistrict, facing to the southwest, providing views of the West Basin, the western end of the Harbor Island peninsula, and the open channel and bayfront to the west.
- One at the eastern end of the subdistrict, facing to the southwest, and including a view of the marinas in the West Basin.

Proposed new scenic vista areas:

- One located in the western portion of the subdistrict, south of the terminus of McCain Road, facing to the southwest, providing views of the West Basin, the western end of the Harbor Island peninsula, and the open channel and bayfront to the west.

There are no view corridor extensions proposed for this subdistrict.

Pacific Highway Corridor Subdistrict

There are no scenic vista areas or view corridor extensions proposed in the Pacific Highway Corridor Subdistrict.

Planning District 3: Embarcadero

North Embarcadero Subdistrict

~~The existing Port Master Plan includes seven vista areas. Eight~~ Seven scenic vista areas are proposed in the North Embarcadero Subdistrict (see Chapter 5.3 in the PMPU), some of which relocate existing vista areas.

~~Proposed~~ Preserved scenic vista areas consistent with existing:

- Two within the northernmost portion of the subdistrict, situated along the waterside promenade proposed along the bayfront shoreline. One of these is directed to the southeast, capturing views of open water, Grape Street Piers, and Downtown San Diego in the background. The other is facing southwest, capturing views of the Bay.
- Window to the Bay Pier, facing west, which would provide a view of the northern portion of the Bay.
- At the end of Broadway Pier, facing west to capture the view of the open water (the existing vista area is located halfway down Broadway Pier, facing west).
- ~~At the end of the Midway Museum, facing west to capture the view of the open water.~~

Proposed new scenic vista areas:

- Along the bayfront between West Ash Street and West A Street, which would capture a view to the west of open water of the Bay.
- Along the bayfront between the B Street Pier and Broadway Pier, facing west, and providing a view of both piers as well as the Bay.
- At the end of Navy Pier, facing west to capture the view of the open water.

There are two existing vista areas designated by the PMP that would be ~~removed-replaced~~ in the proposed PMPU. They are located along Harbor Drive between West Laurel Street and West Hawthorn Street and provide views to the south and southwest.

View corridor extensions would be located at:

- ~~West~~ Hawthorn Street
- ~~West~~ Grape Street
- ~~West~~ Ash Street
- ~~West~~ A Street
- ~~West~~ B Street
- ~~West~~ C Street
- West Broadway

- ~~West~~ E Street
- ~~West~~ F Street

View corridor extensions at West Hawthorne Street and West Grape Street would face southwest to capture the view of the Bay. All others would face west and capture open water views of the Bay.

Central Embarcadero Subdistrict

The Central Embarcadero Subdistrict would contain ~~four~~three scenic vista areas.

~~Proposed~~Preserved scenic vista areas consistent with existing:

- G Street Mole, facing west, which would capture views of the Bay.
- Western end of West Harbor Drive, facing west, providing views of Tuna Harbor, the G Street Mole, and the open Bay beyond.
- Between Tuna Harbor and Market Pier, facing southwest, providing views of open water and the Coronado Bayfront across the Bay.

South Embarcadero Subdistrict

~~Three~~Eight scenic vista areas are proposed in the South Embarcadero Subdistrict at the following locations:

~~Proposed~~Preserved scenic vista areas consistent with existing:

- Along the bayfront adjacent to the SDCC, providing a view of the marina to the southwest.
- At the South Embarcadero Public Access Mole Pier, providing a view to the northwest that would include Embarcadero Marina Park South and the open Bay.
- Five scenic vistas areas are identified within a 5-acre rooftop park for the expanded SDCC. These five scenic vista areas would provide largely uninterrupted panoramic views of the Bay from Point Loma down to the SR-75/San Diego-Coronado Bay Bridge.

Proposed new scenic vista areas:

- At Embarcadero Marina Park South, facing west, providing a view that would include the open Bay and the Coronado Bayfront.

One view corridor extension would be located at the intersection of East Harbor Drive and Park Boulevard, facing southwest to capture the South Embarcadero Public Access Mole Pier, the Bay, and the Coronado Bayfront.

Planning District 4: Working Waterfront

TAMT Subdistrict

No scenic vista areas or view corridor extensions are proposed for the TAMT Subdistrict, and no vista areas are currently designated by the PMP.

Cesar Chavez Park Subdistrict

Two scenic vista areas are proposed within the Cesar Chavez Park Subdistrict at the locations noted below (see Chapter 5.4 of the PMPU). These would be new scenic vistas areas; no vista areas are currently designated by the PMP in this district.

- In Cesar Chavez Park recreation open space, facing southwest, providing views of the Cesar Chavez Pedestrian Pier, the adjacent working waterfront, the open water of the Bay, and the Coronado Bayfront.
- End of the Cesar Chavez Pedestrian Pier, facing southwest, providing views of the Working Waterfront, the open water of the Bay, and the Coronado Bayfront.

There are no view corridor extensions proposed in this subdistrict.

Harbor Drive Industrial Subdistrict

No scenic vista areas or view corridor extensions are proposed for the Harbor Drive Industrial Subdistrict, and no vista areas are currently designated by the PMP.

Planning District 7: South Bay

No scenic vista areas or view corridor extensions are proposed for the South Bay Planning District, and no vista areas are currently designated by the PMP.

Planning District 8: Imperial Beach Oceanfront

Three scenic vista areas are proposed for the Imperial Beach Oceanfront Planning District, one of which is proposed as a new scenic vista area and two would be preserve existing vistas, and all would be on the Imperial Beach Pier (see Chapter 5.8 of the PMPU).

~~Proposed~~ Preserved scenic vista areas consistent with existing:

- One at the western end of Imperial Beach Pier facing west, capturing the view of the ocean to the west.
- One in the middle of Imperial Beach Pier facing north, capturing the oceanfront view to the north.

Proposed new scenic vista areas:

- One in the middle of Imperial Beach Pier facing south, capturing the oceanfront to the south.

Two existing vista areas would be removed by the PMPU that are currently designated by the PMP. They are located near the eastern end of the Imperial Beach Pier facing north and south ~~that would be removed in the proposed PMPU.~~

No view corridor extensions are proposed for PD8.

Planning District 9: Silver Strand

State Park Basin Subdistrict

A scenic vista area is proposed at the Crown Cove Aquatic Center, facing east, capturing views of the Bay and the Chula Vista Bayfront across the Bay (see Chapter 5.9 of the PMPU). This would be a new scenic vista area; no vista areas are currently designated by the PMP.

No view corridor extensions are proposed for the State Park Basin Subdistrict.

Crown Isle Subdistrict

No scenic vista areas or view corridor extensions are proposed for the Crown Isle Subdistrict. There are no ~~existing current~~ designated vista areas.

Grand Caribe Isle and South Cays Subdistrict

Two scenic vista areas are proposed for this subdistrict.

~~Proposed~~ Preserved scenic vista areas consistent with existing:

- Located in Grand Caribe Shoreline Park, facing east to capture views of open water and the Chula Vista Bayfront across the Bay.

Proposed new scenic vista areas:

- Located in the northeast portion of Grand Caribe and captures views of the Bay.

One view corridor extension is proposed in this subdistrict, located on Grand Caribe Causeway, providing views of Grand Caribe Shoreline Park, open water, and the Chula Vista Bayfront.

Planning District 10: Coronado Bayfront

North Coronado Subdistrict

North Coronado Subdistrict would contain three ~~proposed~~ scenic vista areas at the following locations (see Chapter 5.10 of the PMPU).

~~Proposed~~ Preserved scenic vista areas consistent with existing:

- Centennial Park, at the terminus of Orange Avenue, facing northeast, capturing views of the Ferry Landing, open water of the Bay, and PD3.
- West of Centennial Park, providing views to the northeast across the open water of the Bay and PD3.

Proposed new scenic vista areas:

- In the southern portion of the subdistrict, at the base of the Coronado Bridge in Tidelands Park, providing views to the east, including open water of the Bay, the SR-75/San Diego-Coronado Bay Bridge, and PD4.
- ~~West of Centennial Park, providing views to the northeast across the open water of the Bay and PD3.~~

There are ~~four~~ five existing vista areas designated by the PMP that would be ~~removed~~ preserved in the proposed PMPU as view corridor extensions:

- At the northern terminus of C Avenue, facing northwest.
- At the northern terminus of B Avenue, facing northwest.
- At the northern terminus of Orange Avenue, facing northwest.
- At the eastern terminus of 2nd Street, facing southeast.
- At the eastern terminus of 3rd Street, facing southeast.

~~The North Coronado Subdistrict would contain five proposed view corridor extensions:~~

- ~~Orange Avenue~~
- ~~C Avenue~~
- ~~B Avenue~~
- ~~2nd Street~~
- ~~3rd Street~~

The Orange Avenue, C Avenue, and B Avenue view corridor extensions provide views of the Ferry Landing, open water of the Bay, and PD3. The 2nd Street and 3rd Street view corridor extensions provide views to the southeast of the SR-75/San Diego-Coronado Bay Bridge, open water of the Bay, and PD4.

South Coronado Subdistrict

This subdistrict would include one scenic vista area located in the northwestern corner of Glorietta Bay and is oriented in a southerly direction. There are no existing vista areas in this subdistrict designated by the PMP; thus, the proposed scenic vista area would be new. This view primarily consists of the recreational boat marinas and the small area of open water within Glorietta Bay.

No view corridor extensions are proposed for the South Coronado Subdistrict.

4.1.4.5 Project Impacts and Mitigation Measures

Threshold 1: Have a substantial adverse effect on a scenic vista?

Impact Analysis

Impacts of Water and Land Uses

Construction

The proposed PMPU would not directly result in the construction of any specific development projects or improvements, but it would guide and allow ~~subject to issuance of Coastal Development Permits or Coastal Act exclusions~~ future development consistent with the proposed water and land use designations, policies, and Development Standards set forth in the proposed PMPU. Chapter 3, *Project Description*, provides a complete list of the water and land uses and future development allowed in PD1, PD2, PD3, PD4, a portion of PD7, PD8, PD9, and PD10. Construction activities

associated with future development have the potential to occur within the viewsheds of the scenic vista areas or view corridor extensions identified under Section 4.1.4.4, *Proposed Scenic Vistas*.

Although development consistent with the PMPU's proposed water and land uses may be proposed at some future date, no planned improvements are projected for PD7 and no scenic vistas or view corridor extensions are proposed.

Future development within PD1, PD4, PD8, and PD9 would primarily involve roadway improvements within limited segments of roadway, installation of mobility hubs, and installation of new berthing slips for recreational boats or commercial fishing or sportfishing vessels, and anchorage moorings. These future developments would involve the use of standard construction equipment for demolition, grading, and site preparation for roadway improvements and mobility hubs. However, replacement of existing buildings, such as hotels, retail uses, and restaurants, would likely occur at some point in the future. Moreover, construction of future development projects associated with allowable water and land uses would be the most intense in PD2 and PD3, and would include new hotels, restaurants, and retail uses.

Future development within these planning districts would involve the use of standard construction equipment for demolition, grading, site preparation, and construction of new structures. Construction equipment may temporarily block partial access to, or partial views from, designated scenic vistas or view corridor extensions. While the majority of the scenic vistas or view corridor extensions are situated on the shoreline and directed towards the water to ~~primarily~~ provide a view of open water, construction may ~~still~~ partially block the views of certain scenic vistas or view corridor extensions. Additionally, the placement of equipment or ~~other construction~~ certain activities may block access to a designated scenic vista area, thereby temporarily diminishing its use and value. In-water construction associated with water use designations (i.e., piers, moorings, etc.) may require the use of construction equipment such as in-water cranes or barges. Such equipment could block the middleground or background of views provided by the scenic vista areas along the shoreline.

The existence of construction equipment presents short-term visual changes that are common in urban settings, and, in particular, in the City of San Diego. In addition, construction sites tend to be limited to individual parcels and generally would not wall off extended lengths of the PMPU area along the bayfront, where most scenic vista areas are located. However, it is possible larger equipment could potentially encroach into the views of a scenic vista or view corridor for a substantial amount of time. At the time of the preparation of this PEIR, the location, duration, and type of future construction is unknown; thus, it cannot be guaranteed that construction equipment would not substantially block views, or block access to scenic vistas or view corridors. Therefore, impacts from both landside and in-water construction activities that might partially obstruct a scenic vista would be significant (**Impact-AES-1**) prior to mitigation. ~~Project~~ Proponents of future development projects would be required to submit a construction schedule for review and approval by the District to reduce potential conflicts with scenic views (**MM-AES-1**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to scenic vistas during construction activities (**Impact-AES-1**).

Construction activities associated with Option 1 would occur in the vicinity of several of the view corridor extensions identified in the North Embarcadero Subdistrict and construction equipment could result in the temporary interference with views from, or temporarily prevent access to, a view corridor extension. However, construction activities under Option 1 would not require the use of in-water construction equipment and it is not anticipated that the use of cranes would be required. Therefore, construction activities under Option 1 would not result in any additional or more severe impacts related to scenic vistas than buildout of the proposed PMPU under Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to scenic vistas during construction activities (**Impact-AES-1**).

Construction activities associated with Option 2 would occur within the vicinity of several of the view corridor extensions identified in the North Embarcadero Subdistrict and construction equipment could result in the temporary interference with views from, or temporarily prevent access to, a view corridor extension. However, construction activities under Option 2 would not require the use of in-water construction equipment and it is not anticipated that the use of cranes would be required. Therefore, construction activities under Option 2 would not result in any additional or more severe impacts related to scenic vistas than buildout of the proposed PMPU under Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to scenic vistas during construction activities (**Impact-AES-1**).

Construction activities associated with Option 3 would occur within the vicinity of several of the view corridor extensions identified in the North Embarcadero Subdistrict and construction equipment could result in the temporary interference with views from, or temporarily prevent access to, a view corridor extension. However, construction activities under Option 3 would not require the use of in-water construction equipment and it is not anticipated that the use of cranes would be required. Therefore, construction activities under Option 3 would not result in any additional or more severe impacts related to scenic vistas than buildout of the proposed PMPU under Option 3.

Operation

Planning District 1: Shelter Island

West Shelter Island Subdistrict

As discussed above in Section 4.1.4.4, there are seven scenic vista areas and three view corridor extensions identified for West Shelter Island. Four of the scenic vista areas and all of the view corridor extensions are located within the landside segment of West Shelter Island and look out over the Shelter Island Yacht Basin with the exception of the scenic vista at Kellogg Beach, which is oriented toward the tip of the island segment of West Shelter Island and the open Bay. The remaining scenic vista areas are located along the island segment and look out into the open Bay. Future development within West Shelter Island would not include any landside development that would permanently block or adversely affect the viewshed of the scenic vista areas or the view corridor extensions identified above for the West Shelter Island Subdistrict.

Landside planned improvements would be limited to mobility hubs, including one connector mobility hub and one local gateway hub that are located adjacent to two of the scenic vista areas. In addition, roadway improvements are planned along the entry segment of Shelter Island Drive to enhance the public realm with signage, narrowing travel lanes, reconfigured parking, and expanded open space. Pedestrian crossings and improvements to La Playa Trail are also identified in the proposed PMPU, which would also occur near the identified scenic vistas. All of these improvements would involve low-profile features that would not introduce a structure with substantial massing, or other view-blocking features, into a viewshed of the scenic vista or view corridor extensions within West Shelter Island. While a small-scale restaurant or coffee shop would be permitted at a local mobility hub, the baywide development standards listed in Chapter 4 of the proposed PMPU identify features that are and are not allowed within scenic vista areas, including, among other standards, that no development should obstruct a designated scenic vista or view corridor extensions. Per PMPU Section 4.4 (View Standards) in Chapter 4 of the draft PMPU, structures (e.g., a coffee shop) would not be permitted features within a scenic vista area, view corridor extension, or walkway. PMPU Section 4.4.3, *Standards for View Protection 2*, states that no building, or any component of a building, shall obstruct bayward pedestrian views, circulation and/or pathways is permitted within view corridor extensions or walkways and requires siting design to minimize adverse impacts on visual access at view corridor extensions. Such standards would be enforced as part of the District's CDP process described in Section 4.1.3, *Laws, Regulations, Plans, and Policies*, above. Adherence to these development standards would ensure that views from these resources are protected.

Waterside planned improvements could involve up to 10 additional anchorage moorings within the viewshed of the scenic vistas identified along the island segment that look out into the open Bay. However, none of the anchorages are located directly in front of the scenic vista areas, and moorings are spread out from each other and do not result in the dense concentration of tightly packed boats that occurs at marinas. This would allow for views through any moored vessels and would not result in a substantial adverse effect on a scenic vista.

Based on the above, neither the landside nor waterside improvements that could occur within West Shelter Island would result in substantial adverse effects on scenic vistas, and impacts are considered less than significant.

East Shelter Island Subdistrict

East Shelter Island contains three scenic vista areas and two view corridor extensions, all of which look into the America's Cup Harbor (see Section 4.1.4.4). Similar to West Shelter Island, future development within East Shelter Island would not include any landside development that would permanently block or adversely affect views provided by the scenic vista areas or the view corridor extensions. Potential landside development would be limited to one connector mobility hub and roadway modifications to accommodate multi-modal opportunities, pedestrian crossings, or multi-use paths. All of these improvements would involve low-profile features that would not introduce a structure with substantial massing, or other view-blocking features, into a viewshed of a scenic vista or view corridor extensions. Adherence to the development standards identified in Chapter 4 of the proposed PMPU and detailed above would ensure that views from these resources are protected.

In addition, development of an additional 20 moorings, 65 commercial fishing berthing slips, and 35 recreational berthing slips would be allowed under the proposed PMPU. However, views from the scenic vistas and view corridor extensions are largely dominated with foreground views of fishing berthing and recreational boat marinas under existing conditions and, due to the already dense concentration of vessels within the foreground views, the addition of 35 additional boat slips would not result in a discernible difference within these views. In addition, per PMPU Section 4.4.3, *Standards for View Protection*, docked vessels or vessels associated with marinas are features that may be located within scenic vista areas and view corridor extensions. The additional moorings would be located within the middle of the America's Cup Harbor; however, as noted above, due to the dense concentration of berthed fishing and recreational boats within the foreground views of the scenic vistas, additional moorings within the harbor would not be discernible from the scenic vistas. As moorings and berthing slips would be consistent with the uses currently located in these areas, including marinas and anchorages, and would be consistent with the visual characteristics of the views of this area, which feature piers and docked vessels, these features are expected elements within bayfront views. Therefore, additional water uses would not adversely affect existing or proposed scenic vista areas or view corridor extensions. Impacts are considered less than significant.

Planning District 2: Harbor Island*West Harbor Island Subdistrict*

As noted in Section 4.1.4.4, West Harbor Island includes three preserved scenic vista areas located along the south side of the island segment looking outwards toward the Bay. Future landside development in the West Harbor Island Subdistrict could include additional hotel rooms, and new retail/restaurant space. The development would occur on the west side of the Harbor Island peninsula and the entryway to the peninsula. Additional future improvements for this subdistrict include a Local Gateway Mobility Hub located at Harbor Island Park, which would be an expansion of the existing transportation facilities, and a water-based transfer point. The local mobility hub would include facilities such as access points to bicycle and pedestrian routes, micro-mobility facilities, and access to parking, which are all consistent with transit-related facilities currently available in the subdistrict. Per the Baywide Development Standards (Chapter 4 of the draft PMPU), mobility hubs would be set back away from the water's edge and would not fall within the viewshed of any scenic vista. Per PMPU Section 4.4.3, *Standards for View Protection*, none of the future development described above would be visible from the scenic vistas within West Harbor Island;

however, these landside planned improvements may be visible from the viewsheds of the scenic vista areas proposed in the Spanish Landing Subdistrict. Middleground and foreground views available from the Spanish Landing scenic vistas include narrow segments of open water and the recreational boat marinas located within West Basin, and background views include the taller buildings along the island segment of West Harbor Island. Building standards for the West Harbor Island Subdistrict allow building heights of 160 feet, which is similar to the existing Sheraton San Diego Hotel & Marina and would require a 10- to 15-foot-wide building setback between all waterside promenades and landside development, consistent with current development. The building standards also provide requirements for orientation of buildings, and location and configuration of public parking. As such, new development within West Harbor Island could include tall buildings, similar in height to the existing hotels. Due to the distance and intervening features, such as the marinas, new development within West Harbor Island would become part of the background views available from the Spanish Landing scenic vista areas and would not obstruct or otherwise adversely affect these scenic vistas. In addition, the proposed types of land uses are consistent with the existing uses, would be an expansion of the existing types of development present on the Harbor Island peninsula, and would be of a similar size and scale as the existing development. Furthermore, future development would be required to adhere to the development standards for scenic vistas and view corridor extensions specific to West Harbor Island Subdistrict, as well as the development standards identified in Chapter 4 of the proposed PMPU, which establish siting and design requirements to minimize obstruction of scenic vistas and view corridor extension, including prohibiting development from obstructing designated scenic vista areas. Such standards would be enforced as part of the District's CDP process.

Future waterside development in the West Harbor Island Subdistrict could include up to 165 new recreational boat berthing slips in the West Basin. The length and width of recreational boat slips vary, but for the purposes of this analysis, an average slip size of 35 feet long by 12 feet wide was assumed. These slips would be added within existing marinas and would be consistent with the current view of piers, slips, and recreational boats in the West Basin. Furthermore, these features are expected elements within bayfront views and are allowed by the PMPU Standards for View Protection. As WLU Policy 3.2.1 states, all visual access locations, including scenic vista areas, view corridor extensions, Window to the Bay, etc., shall be maintained and protected. Lastly, there would be no future development within the viewsheds of the scenic vistas identified along the island segment of West Harbor Island. Therefore, water-based planned improvements would not result in significant adverse effects on scenic vista areas or view corridor extensions in the West Harbor Island Subdistrict.

East Harbor Island Subdistrict

Two scenic vista areas are proposed for preservation within the East Harbor Island Subdistrict, both facing south-southeast, towards the open water of the Bay and towards the North Embarcadero Subdistrict. No view corridor extensions are proposed within the East Harbor Island Subdistrict. Land-based planned improvements within the East Harbor Island Subdistrict would involve similar uses and intensity as those that could occur on West Harbor Island, including up to 1,360 new hotel rooms, up to 40,000 square feet of meeting space, and up to 92,500 square feet of new retail/restaurant uses (within hotels and stand-alone). However, these future improvements would be set back from the waterfront and would not occur in the viewsheds of the two scenic vista areas and, as such, would not affect these scenic vistas. Future water-based development for this subdistrict could include up to 60 additional recreational boating slips and up to five additional moorings. The additional moorings would occur within the viewsheds of both scenic vista areas.

However, additional moorings would be located in an area currently populated by recreation vessels and anchorage facilities, and moorings are spaced apart from each other and allow views to continue through the anchorage. In addition, recreational boats are an expected component within viewsheds of the Bay and would be consistent with the Standards for View Protection (Section 4.4.3 of the proposed PMPU):

View Protection Standard 1. “The following features may be located within scenic vista areas, view corridor extensions, and walkways:

j. Docked vessels or vessels associated with marinas.”

Therefore, additional recreational boat slips would be consistent with existing conditions and would not conflict with the character of the viewsheds of the two ~~proposed~~ scenic vista areas.

Future improvements in the North Embarcadero Subdistrict (described further below) could include additional hotel rooms, meeting space, retail/restaurant space, visitor-serving marine terminal uses, moorings, and recreational boat berthing slips that may be visible from the scenic vista areas within the East Harbor Island Subdistrict. However, future development within the subdistrict would be similar in size and scale to the existing development visible from the Harbor Island East scenic vistas. Given the distance and similarity in size and scale, future development within the North Embarcadero Subdistrict would blend with its surrounding context and would not adversely affect the Harbor Island East scenic vistas. As required by the proposed development standards and policies, including but not limited to PMPU WLU Policies 2.2.2, 2.2.3, 3.2.1, 3.2.2, 3.2.3, 3.2.4, and 3.2.5 described above, future development within PD3 would maintain the visual characteristics of the subdistrict. Additionally, building standards specific to the North Embarcadero Subdistrict would limit the height of buildings based on the city blocks in which they are located, would apply building and upper story setbacks, and would include requirements for building frontages. Such standards would be enforced as part of the District’s CDP process described in Section 4.1.3. Because development in the North Embarcadero would be in the background of the viewsheds of the two scenic vista areas and would match the visual character of the surrounding development, it would not result in significant adverse effects on the designated scenic vistas.

Spanish Landing Subdistrict

Future development in this subdistrict could include an additional 90,000 square feet of standalone retail/restaurant, as well as roadway modifications and development of a multi-use path to connect Spanish Landing Park to Shelter Island. While roadway modifications and a multi-use path would only involve low-profile development that would be minimally visible within scenic vistas, development of retail/restaurant uses would involve a more substantial structure. However, this potential future development would be set back from the waterfront away from the location and outside of the viewsheds identified for this subdistrict, consistent with PMPU WLU Policy 3.2.5. Therefore, the additional retail/restaurant space would not result in any obstructions to the proposed scenic vistas. Additionally, as noted above, West Harbor Island could include up to 165 new recreational boat berthing slips. Based on the average slip size of 35 feet long by 12 feet wide, the 165 recreational boat slips could cover up to approximately 1.6 acres of open water if they were built consecutively and these would be visible from scenic vistas in the Spanish Landing Subdistrict. These additional recreational boat berthing slips could be developed in the existing marinas where there are existing recreational boat berthing slips or in the open water along the shoreline at the eastern end of the Spanish Landing Subdistrict. Although the proposed berthing slips could occupy previously open water, this area already contains a dense concentration of

recreational boat slips and is currently very active with boat traffic and marina activity. As discussed, these uses would be expected components within views of the West Basin, would be visually cohesive with the surrounding marinas, and are allowed uses within scenic vista areas per View Protection Standard 1j (see Section 4.4.3 of Chapter 4, *Baywide Development Standards*, of the draft PMPU). In addition, WLU Policy 3.2.1 states that all visual access locations, including scenic vista areas, view corridor extensions, Window to the Bay, etc., shall be maintained and protected. Such standards would be enforced as part of the District's CDP process described in Section 4.1.3 above. Therefore, implementation of the proposed PMPU would not result in a significant adverse effect on scenic vistas from Spanish Landing.

Pacific Highway Corridor Subdistrict

There are no scenic vista areas or view corridor extensions proposed in this subdistrict, nor are there any scenic vistas that would include this subdistrict within the viewshed.

Planning District 3: Embarcadero

North Embarcadero Subdistrict

Future development in the North Embarcadero Subdistrict could include up to 750 additional hotel rooms, additional new retail/restaurant and meeting space, new anchorage moorings, and new recreational boat berthing slips. Because ~~sevensix~~ of the ~~eightseven~~ scenic vista areas abut and face the Bay to capture views of the open water, land-based development would not encroach in the viewsheds, and therefore would not affect these ~~sevensix~~ scenic vista areas. The northernmost scenic vista area is located on the border of PD2 and PD3 and is facing southeast. This view captures the boat anchorage in the foreground, North Embarcadero Subdistrict in the middleground, and Downtown San Diego in the background. Land-based future development associated with the Commercial Recreation land use designation, including hotels and retail/restaurant space, within North Embarcadero could be visible from this scenic vista area, but because the view is distant, future development would not be a main feature of the view. Additionally, the potential development would be consistent with the existing uses in the subdistrict, and future development would be compliant with baywide and subdistrict-specific development standards, which establish the appropriate size, location, and orientation of future development, including buildings, structures, and public realm features (Chapter 5.3, Section 5.3.2[D], *Development Standards*, of the proposed PMPU). Two mobility hubs are proposed for the North Embarcadero Subdistrict. However, they would be in areas already containing similar transportation infrastructure, such as water-based transfer points and transit stops, so mobility hub-related development would be consistent with the existing setting. There are nine view corridor extensions proposed in North Embarcadero Subdistrict, and as established by View Protection Standards 1 and 2a and WLU Policy 3.2.2 of the proposed PMPU, all components of any building would be designed and sited to avoid intrusion into the scenic vista area (Section 4.4.3, *Standards for View Protection*, of the proposed PMPU). View corridor extensions are located ~~within along roadways right-of-way~~, and all adjacent development would be required to comply with baywide development standards, including View Protection Standards 1 and 2. These standards would ensure architecture and development features would not ~~extend into the right-of-way of the obstruct bayward pedestrian views, circulation and/or pathways~~ within view corridor extensions, and signs and outdoor lighting would be sited appropriately so they would not interfere with the view provided by the view corridor extension. Therefore, land-based, future development would not adversely affect the designated scenic vista areas or view corridor extensions.

Water-based development would include new piers, moorings, and recreational boat berthing, which could be developed in the Bay adjacent to several scenic vista areas. The additional moorings would be allowed in the northernmost portion of the waterside of the subdistrict, where the existing use is an anchorage. Additional recreational boat berthing slips would be allowed in the waterside area between Grape Street Pier and B Street Pier, but this would represent a small fraction of the over 50 acres of open water present between Grape Street Pier and B Street Pier. This area is home to the San Diego Maritime Museum, which hosts museum vessels and the B Street Pier, which is a cruise ship terminal, and is a very active area of the Bay with substantial vessel traffic. Thus, this area is currently dominated by the view of different sized vessels, and the addition of recreational boat slips would not block a scenic vista or represent a significant change in the visual experience of viewers in this area. In addition, as noted above, docked vessels are features that may be located with a scenic vista area, per View Protection Standard 1. Thus, the water-based development assumptions would not result in significant adverse effects on the scenic vista areas in this subdistrict.

Central Embarcadero Subdistrict

The three scenic vista areas proposed for preservation in the Central Embarcadero Subdistrict face west, towards the open water. One scenic vista area, located at Tuna Harbor, captures a view of the G Street Mole, currently developed with retail/restaurant space, an open space park, and surface parking lots. The other two scenic vista areas include views of open water, and the Coronado Bayfront across the Bay. Potential future development for this subdistrict could include redevelopment of the existing restaurant and reconfiguration of North Harbor Drive/West Harbor Drive. Potential landside development within the G Street Mole area could include redevelopment of the existing two-story visitor-serving facility, which would be visible within the scenic vista area, but would be consistent with the current use, size, and scale, and would comply with all applicable baywide development standards identified in Chapter 4 of the proposed PMPU. This includes PMPU WLU Policies 2.2.2, 2.2.3, 3.2.1, 3.2.2, 3.2.3, 3.2.4, and 3.2.5 described above. All future development within the G Street Mole would also comply with the proposed building standards for Central Embarcadero Subdistrict, which limit the height of structures to 45 feet, and require that the scenic vista areas be preserved (see View Protection Standards 1 and 2 in Section 4.4.3, *Standards for View Protection*, of the proposed PMPU). Such standards would be enforced as part of the District's CDP process described in Section 4.1.3, above. Roadway improvements would be low-profile and would not occur within the proposed scenic vistas' viewsheds. While improvements within the North Coronado Bayfront Subdistrict within PD10 would be visible from these scenic vistas, this subdistrict would not include any landside development and future waterside development would only involve the addition of anchorage moorings. Given the distance from the Central Embarcadero Subdistrict and the diminutive scale of this type of development, new anchorage moorings would not introduce a feature into these scenic vistas that could block, substantially interfere with, or otherwise result in a significant adverse effect on a scenic vista area.

South Embarcadero Subdistrict

Future landside development allowed under the proposed PMPU in this subdistrict includes up to an additional 100 hotel rooms and up to 2,500 square feet of retail space, the development of a mobility hub, and a number of roadway improvements. The development would primarily occur as redevelopment of existing uses within the Commercial Recreation designation, as the majority of this subdistrict is built out or entitled. Of the ~~three~~^{eight} scenic vista areas in this subdistrict, ~~two~~^{seven} would have views of the open water of the Bay and PD10 across the Bay, and two would

have views that include EMPN and EMPS. Both of these park areas are designated as Recreation Open Space, thus would not be the location of hotel, meeting space, or retail/restaurant uses. In addition, the proposed Convention Center expansion would provide an additional five scenic vistas that would be located on a rooftop park within that development. These five vistas would provide largely uninterrupted panoramic views that look out over the existing large vessel (super-yachts) marina, EMPS, the open water of the Bay, the northern shoreline of PD10, and TAMT. Views of the San Diego-Coronado Bay Bridge would also be available from this rooftop park. Combined with its elevated position, these scenic vistas would remain unobstructed under implementation of the proposed PMPU. All future development under the proposed PMPU would be required to comply with Standards for View Protection 1 and 2a through 2j and WLU Policy 3.2.1 of the PMPU, which require maintenance and protection of scenic vista areas, view corridor extensions, Window to the Bay, and walkways, to ensure protection of designated scenic vistas and view corridor extensions. Baywide development standards would also ensure future development would not intrude in the public right-of-way of the proposed view corridor extension at the southern end of the South Embarcadero Subdistrict. While the scenic vistas areas offer views of PD10 across the Bay, no landside development is assumed in PD10. Therefore, future landslide improvements within this subdistrict would not result in significant adverse effects on scenic vistas or view corridor extensions.

Waterside development assumptions for the South Embarcadero Subdistrict include up to 65 additional recreational boat berthing slips, which would occur within the existing marinas between the shore and EMPN and EMPS, an area that totals approximately 34 acres. Approximately 8.21 acres of this area is open water; however, due to the number of vessels, the area is very active with vessel traffic. The added slips in the existing marinas would be consistent with the existing characteristics of the view.

Several scenic vista areas include background views of the North Coronado Subdistrict in PD10, which could include future waterside development of additional moorings. These would be located in an area already developed as an anchorage. Ten additional moorings would not be a substantial increase in moorings, and, given the distance of the view, the additional moorings would not result in a material change in the view of PD10. Therefore, future waterside development would not result in significant adverse effects on scenic vistas.

Planning District 4: Working Waterfront

TAMT Subdistrict

No scenic vistas or view corridor extensions are designated in this subdistrict, and planned improvements proposed by the proposed PMPU for this subdistrict would not affect any proposed scenic vistas elsewhere in the proposed PMPU area.

Cesar Chavez Park Subdistrict

There are two scenic vista areas in this subdistrict, facing west, towards the open water of the Bay and PD10's South Coronado Subdistrict, and there are no proposed view corridor extensions. Future development for this subdistrict could include modifications to Cesar Chavez Parkway and improvements to existing pathways in Cesar Chavez Park and do not include any land- or water-based development within the viewshed of either of the scenic vista areas. The background of both viewsheds includes the South Coronado Subdistrict of PD10, where future development may include additional moorings and recreational boat berthing. The additional moorings and slips would allow

for more vessels within areas already used for recreational boating and boat storage and would be consistent with the background views of these areas from the two scenic vista areas. Therefore, there would not be any significant adverse effects on the scenic vistas.

Harbor Drive Industrial Subdistrict

No scenic vistas or view corridor extensions are designated in this subdistrict, and future development allowed under the proposed PMPU for this subdistrict would not significantly affect any proposed scenic vistas elsewhere in the proposed PMPU area.

Planning District 7: South Bay

There are no scenic vista areas or view corridor extensions proposed for this planning district, nor is any potential development identified for PD7 in the proposed PMPU; therefore, the proposed PMPU would not result in significant adverse effects on a scenic vista in this planning district.

Planning District 8: Imperial Beach Oceanfront

Three scenic vista areas are proposed for PD8, all located on the Imperial Beach Pier, capturing views of the oceanfront to the north and south, and the open ocean to the west. The future development could include an increase in retail/restaurant space of up to 18,000 additional square feet and the modification or reconstruction of the existing retail and visitor-serving facilities in this planning district, along Elkwood Avenue and Palm Avenue, and an increase of the existing pier building by up to 3,000 square feet. The Elkwood Avenue and Palm Avenue parcels currently contain parking lots, and future development of retail/restaurant uses at these parcels would involve the addition of structures that may be peripherally visible from the two scenic vistas that face north and south along the Imperial Beach Pier. However, Development Standard PD8.14 restricts building heights to 30 feet within PD8, which would involve buildings with a maximum of two stories in an area where a relatively dense development pattern exists of structures ranging in height from one to four stories. Given the distance of the Palm Avenue parcel from the scenic vista on the pier and intervening development, including four-story multi-family residential buildings, any development at Palm Avenue would either not be visible or would barely be visible from this scenic vista and would not result in any adverse impacts on this vista. Similarly, while the Elkwood Avenue parcel is closer to the pier, future development at this parcel would be situated behind two- to three-story-tall residential structures located along the beachfront, and this scenic vista would not be affected by future development at this parcel. The third scenic vista at the end of the pier is oriented west looking out over open views of the ocean. The addition of 3,000 square feet of retail/restaurant uses at the end of the pier has the potential to interfere with access to this scenic vista; however, per Planned Improvement PD8.7, contiguous coastal access is to be maintained along the perimeter of the pier, and as such, the scenic vista area, which is located on the western side of the existing restaurant would be preserved. There are no view corridor extensions proposed in PD8. Therefore, the future potential development would not result in significant adverse effects on the proposed scenic vista areas.

Planning District 9: Silver Strand

State Park Basin Subdistrict

Future development allowed under the proposed PMPU in this subdistrict includes up to five new moorings in the northernmost portion of the subdistrict, but does not include any landside

development. The scenic vista area in this subdistrict captures views of Crown Cove and the Bay; the anchorage with the proposed additional moorings would be in the northernmost portion of the viewshed, approximately 1,800 feet from the scenic vista. Thus, the additional moorings would not represent a main feature of the view and would take up a very small part of the open-water views provided by the scenic vista area. Additionally, there are no proposed view corridor extensions in this subdistrict. Therefore, the proposed planned improvements would not result in significant adverse effects on the designated scenic vistas.

Crown Isle Subdistrict

No scenic vistas or view corridor extensions are designated in this subdistrict and the future development allowed under the proposed PMPU in this subdistrict could include development of a Connector Mobility Hub and up to 10 additional recreational boat berthing slips, which would be allowed within the existing marina areas. These 10 additional recreational boat berthing slips would cover approximately 4,200 square feet. The future development would not be visible from and would not interfere with scenic vistas proposed elsewhere within the proposed PMPU area; therefore, impacts would be less than significant.

Grand Caribe Isle and South Cays Subdistrict

Two scenic vista areas and one view corridor extension are proposed in this subdistrict. Future improvements would involve expansion of the Grand Caribe Shoreline Park, development of a water-based transfer point, and up to 10 additional recreational boat berthing slips. None of these planned improvements would occur within the viewshed of these vistas; therefore, there would be no adverse effects on the scenic vista areas. Future development along the proposed view corridor extension would be required to comply with baywide development standards protecting views; these would ensure that architecture and development features would not extend into the right-of-way of the view corridor, and signs and outdoor lighting would be required to be sited appropriately so they would not interfere with the view provided by the view corridor extension. Therefore, no significant adverse effects would occur on the proposed view corridor extension.

Planning District 10: Coronado Bayfront

North Coronado Subdistrict

The scenic vista areas and view corridor extensions in this subdistrict face towards the open water and capture views of the Bay and background views of PD3, PD4, and Downtown San Diego. Future landside improvements could include development of a Local Gateway Mobility Hub, which would be located near the waterfront in the vicinity of the C and B Avenue termini. This mobility hub would be situated farther inland and south of the scenic vistas designated along the waterfront near the end of Orange and D Avenues and would not be visible within the viewshed of the scenic vista areas. However, there are three proposed view corridor extensions in the vicinity of the proposed Local Gateway Mobility Hub. Future development of a mobility hub along the proposed view corridor extension would be required to comply with baywide development standards proposed as part of the proposed PMPU (see Section 4.1.4.3. *Policies that May Avoid or Reduce Impacts*, above, and Chapter 4 of the proposed PMPU) that establish requirements for protecting views. The baywide development standards for view protection would ensure architecture and development features would not extend into the right-of-way of the obstruct bayward pedestrian views, circulation and/or pathways with view corridor extensions, and wayfinding signs and outdoor lighting would be sited appropriately so they would not interfere with the view provided by the view corridor extension. In

addition, PMPU View Protection Standard 2 prohibits any component of a building to encroach into view corridor extensions. These standards would ensure that the mobility hub would not result in significant adverse effects on the view corridor extensions.

Future waterside development in this subdistrict could include the addition of 20 moorings at the existing anchorage located approximately 1,000 feet from Tidelands Park and would fall within the viewshed available from the scenic vista at the southeast corner of Tidelands Park. This scenic vista area includes views of open water in the foreground, the existing anchorage and the SR-75/San Diego-Coronado Bay Bridge in midground views, and the Working Waterfront in the background. The addition of moorings within this viewshed would be consistent with the existing uses within the Bay and would be expected components within these viewsheds. Views of the open water in the foreground would be maintained given the distance between the scenic vista and the anchorage, and, because moorings are spread farther apart than recreational boating slips in a marina (which result in a dense concentration of boats), views of the bridge and working waterfront beyond are retained through moored vessels.

The PMPU would allow future development within PD3 that could be visible in background views of the scenic vista areas; however, this development would be consistent with the existing visitor-serving uses of the planning districts. Future development in PD3 would conform to the style and the character of the views of the Downtown waterfront because all future development would be required to comply with the baywide development standards and the Embarcadero Planning District building standards, which set height and setback limits, and require the protection of scenic vista areas and view corridors. Compliance with these development standards would ensure that future development under the proposed PMPU would blend with, and would not block, the background views of the Downtown skyline in the distance. Therefore, future development allowed under the proposed PMPU would not result in significant adverse effects on the scenic vista areas or view corridor extensions.

South Coronado Subdistrict

A scenic vista area is situated within the northern corner of Glorietta Bay and is oriented in a southerly~~ly~~^{westerly} direction into Glorietta Bay. Foreground views are dominated by a dense concentration of recreational boats docked at the existing marina. Midground views include intermittent glimpses of open water in the middle of Glorietta Bay, and background views include the 10 high-rise buildings comprising the Coronado Shores condominium complex along Silver Strand Boulevard. The potential increase of up to 25 moorings at the existing anchorages would not be prominently visible from this scenic vista due to the existing marinas and the fact that the anchorage is located to the east and is not highly visible. The additional recreational boat berthing slips could add up to 55 more slips to a viewshed of a mostly enclosed water body already occupied with piers and vessels. The water along the shoreline of Glorietta Bay is dominated by piers for recreational boat berthing, with open water in the middle of the enclosed water body that is frequented by boat traffic. The additional slips would be allowed within the area already dominated by marinas, and moorings would be allowed in the existing anchorage currently populated by moored vessels. Therefore, the additional moorings and recreational berthing slips would not result in a material change to the views of the open water in the middle of Glorietta Bay or the marinas along the shoreline. In addition, PMPU Standard for View Protection 1j identifies docked vessels as an allowable feature within the viewshed of a scenic vista. Based on the above, future development occurring under the proposed PMPU would not result in a significant adverse effect on a scenic vista.

There are no proposed view corridor extensions within the South Coronado Subdistrict. Therefore, the proposed PMPU would not result in significant adverse effects on the scenic vista area or view corridor extensions.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU during the operational phasing, including within PD3, would result in a less-than-significant impact related to scenic vistas.

The new Waterfront Destination Park that could be developed under Option 1 would be within the North Embarcadero Subdistrict. All scenic vista areas and view corridor extensions are located along or within a block of the waterfront and are oriented westward. While the new Waterfront Destination Park would abut the bayfront, Option 1 would not include any components that would have the potential to block or obstruct the viewshed of any scenic vistas or view corridor extensions during operations. It is anticipated that the new Waterfront Destination Park that could be developed under Option 1 would be similar to other parks within the proposed PMPU area and, therefore, would not contain any large structures that could result in a substantial adverse effect on a scenic vista. Consequently, operations under Option 1 would not result in any additional or more severe impacts related to scenic vistas than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU during the operational phasing, including within PD3, would result in less-than-significant impacts related to scenic vistas.

The expanded Recreation Open Space that could be developed under Option 2 would be within the North Embarcadero Subdistrict. All scenic vista areas and view corridor extensions are located along or within a block of the waterfront and are oriented westward. Option 2 would not include any components that would have the potential to block or obstruct the viewshed of any scenic vistas or view corridor extensions during operations. Any new park space developed under Option 2 would be situated eastward of, and would not be within the viewshed of, any scenic vistas or view corridor extensions. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to scenic vistas than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU during the operational phasing, including within PD3, would result in less-than-significant impacts related to scenic vistas.

New park space that could be developed under Option 3 would be within the North Embarcadero Subdistrict. All scenic vista areas and view corridor extensions are located along or within a block of the waterfront and are oriented westward. Option 3 would not include any components that would have the potential to block or obstruct the viewshed of any scenic vistas or view corridor extensions during operations. Any new park space developed under Option 3 would be situated eastward of, and would not be within the viewshed of, any scenic vistas or view corridor extensions. Therefore, operations under Option 3 would not result in any additional or more severe impacts related to scenic vistas than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies identified in Section 4.1.4.3 would not result in substantial adverse effects on scenic vistas within the proposed PMPU area. Although future development or modification of structures or buildings that may occur under the proposed PMPU could be located within scenic views, the implementation of WLU Policy 3.2.1., which would require that scenic vista areas, view corridor extensions, Window to the Bay, and walkways would be maintained and protected, would ensure future development would not block or adversely affect the designated scenic views of the proposed PMPU.

Impact Determination and Mitigation

Implementation of the proposed PMPU would have substantial adverse effects on scenic vistas.

Significant Impacts

Impact-AES-1: Potential to Interfere with Designated Scenic Vista Areas or View Corridors During Construction Associated with Implementation of the Proposed PMPU. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment, that could intrude into a designated scenic vista area or view corridor extension, which would temporarily interfere with the views provided by scenic vista areas or view corridor extensions or prevent access to the scenic vista areas or view corridor extensions, which could have a substantial adverse effect on a designated scenic vista. Impacts are considered significant.

Mitigation Measures

For **Impact-AES-1**:

MM-AES-1: Plan Construction Schedule and Storage/Staging to Avoid Scenic Vista Areas and View Corridor Extensions. Prior to District approval of a future development project, the project proponent shall provide the District with the project's construction schedule, including the phasing of the construction, the type of construction equipment to be used, and the duration and location of the use of the construction equipment. The District shall review the construction schedule and may require the proponent to alter the schedule to prevent extended interference with views from

designated scenic vista areas or view corridor extensions. The project proponent shall locate construction equipment away from designated scenic vista areas or view corridor extensions when not in use or during staging to minimize potential impacts on views. The District shall review and approve the construction schedule and staging locations prior to project approval.

Significance After Mitigation

Implementation of **MM-AES-1** would minimize the visibility of construction activities within a scenic vista area or a view corridor extension. As noted in the impact analysis above, construction activities would generally not result in the substantial blockage of an extended length of the shoreline and while construction equipment could intrude into viewsheds, because construction equipment would be required to be stowed in a way to reduce its visibility within the viewshed, **MM-AES-1** would further help reduce the impact of construction activities on scenic vistas and view corridors by avoiding the temporary storage of large construction equipment within a scenic vista area. However, because the type of construction equipment and the duration and location of construction of future development projects are unknown at this time, the District cannot guarantee that implementation of **MM-AES-1** would reduce adverse impacts resulting from construction activities on scenic vistas or view corridor extensions to below significant levels. Therefore, **Impact-AES-1** would be significant and unavoidable.

Threshold 2: Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Impact Analysis

Impacts of Water and Land Uses

The only State-designated scenic highway within the vicinity of the proposed PMPU area is a 9-mile segment of SR-75 as it crosses the San Diego–Coronado Bay Bridge and continues through Coronado and down the Silver Strand, terminating at the city limits of Imperial Beach (the portion of SR-75 that travels through Coronado and connects the bridge and the Silver Strand is an eligible state scenic highway but is not officially designated as such). The following analysis focuses first on the segment of SR-75 that crosses the San Diego–Coronado Bay Bridge and then discusses potential effects on the segment of SR-75 down the Silver Strand.

San Diego–Coronado Bay Bridge

Views from the 200-foot-tall SR-75/San Diego–Coronado Bay Bridge are expansive in all directions, including views of Downtown San Diego, the Central Embarcadero and South Embarcadero Subdistricts of PD3, and much of PD4, including TAMT and the Harbor Drive Industrial Subdistrict.

Scenic resources visible from SR-75/San Diego–Coronado Bay Bridge are the expansive views of the open water of the Bay, as well as the wide landscape and cityscape views that include the City of San Diego, the City of Chula Vista, and the City of Coronado. Scenic elements within views to the northwest and northeast from the SR-75/San Diego–Coronado Bay Bridge largely comprise the high-rise buildings that form the skyline of Downtown San Diego, TAMT, ship building and repair facilities, and the open water of the San Diego Bay. Views to the southeast and southwest include the

Coronado bayfront, with the green lawns of Tidelands Park and the Coronado Golf Course being the most visible elements within the viewshed as well as the open water of the Bay and the A-5 anchorage. Given the height of the bridge and its distance from these areas, most of the features within these planning districts appear as background views. Detailed, individual features are generally not discernible from the overall development patterns that exist within these planning districts, and scenic resources such as trees or historic buildings are not highly visible from the bridge. In addition, as noted above, the bridge is only open to motor vehicles, there are no pullouts for viewing, and stopping on the bridge is prohibited by law. Also, the bridge has a speed limit of 50 miles per hour, and a concrete guardrail limits the view in lower profile vehicles.

Future development allowed under the proposed PMPU within PD4 would only involve low-profile improvements such as modifications to existing roadway or water-based access to increase multi-modal opportunities. Similarly, future development within PD10 would also involve low-profile improvements such as installation of a mobility hub, installation of new water-based transfer points, or additional moorings at the anchorages within Glorietta Bay. However, the only location within PD10 where improvements may be visible from the bridge includes the new water-based transfer point at Tidelands Park. While future development would introduce new components into these viewsheds, their distance from the bridge and the fact that views are observed from moving vehicles mean that features associated with the roadway or water-based access improvements would be minimally discernible within the broader context of the views. Furthermore, these future improvements would not involve the removal of any scenic resources, such as trees or historic structures, that contribute to the scenic value of these viewsheds.

Future development within the Central and South Embarcadero Subdistricts of PD3 could result in more intense development, including new commercial recreation uses. Central Embarcadero generally includes low-profile improvements, such as reconfiguration of roadways. In addition, per the development standards identified for this subdistrict, building heights would be limited to 45 feet (which is generally no more than three to four stories). As such, this development, or the removal of any scenic resources within Central Embarcadero, would not be noticeable from the bridge. South Embarcadero would involve the addition of new hotel rooms, retail/restaurant space, and/or convention space and could include structures with heights similar to other nearby hotels (such as the Hilton San Diego Bayfront). However, the only scenic resource in the vicinity of these planned improvements is the building that currently houses Joe's Crab Shack, which has a historic association with the San Diego Rowing Club. This building is located on a pier adjacent to EMPS. However, Joe's Crab Shack is a small building (one-story tall) that is not discernible from the San Diego-Coronado Bay Bridge, and none of the future development allowed under the proposed PMPU in South Embarcadero would involve damage to, or removal of, this resource.

Silver Strand

The second segment of the officially designated portion of SR-75 runs the length of the Silver Strand beginning at Avenida del Sol in the north to the city limits of Imperial Beach in the south. All of PD9 as well as a small portion of PD10 are in the vicinity of this scenic highway. Given how narrow, flat and minimally developed the Silver Strand is, future development allowed under the proposed PMPU is likely to be visible from SR-75/Silver Strand Boulevard. However, almost all of the future improvements within PD9 would involve the addition of moorings or recreational berthing slips at existing anchorages and marinas. There are no existing scenic resources, such as trees, historic buildings, or rock outcroppings, in the areas where these improvements would occur and, as such, no significant impacts on scenic resources within a state scenic highway would occur.

Based on the above, implementation of the proposed PMPU would not result in damage to scenic resources within a state scenic highway, and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to scenic resources within a state scenic highway.

Option 1 is situated within the North Embarcadero Subdistrict, which does not contain any scenic resources and is not in the vicinity of a designated state scenic highway. Construction and operational activities occurring at this site would not be visible from nor damage any scenic resources within a state scenic highway. Therefore, construction and operation under Option 1 would not result in any additional or more severe impacts related to scenic resources within a designated state scenic highway than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to scenic resources within a state scenic highway.

Option 2 is situated within the North Embarcadero Subdistrict, which does not contain any scenic resources and is not in the vicinity of a designated state scenic highway. Construction and operational activities occurring at this site would not be visible from nor damage any scenic resources within a state scenic highway. Therefore, construction and operation under Option 2 would not result in any additional or more severe impacts related to scenic resources within a designated state scenic highway than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in less-than-significant impacts related to scenic resources within a state scenic highway.

Option 3 is situated within the North Embarcadero Subdistrict, which does not contain any scenic resources and is not in the vicinity of a designated state scenic highway. Construction and operational activities occurring at this site would not be visible from nor damage any scenic resources within a state scenic highway. Therefore, construction and operation under Option 3 would not result in any additional or more severe impacts related to scenic resources within a designated state scenic highway than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would result in impacts related to damage to scenic resources within a state scenic highway.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway. Impacts would be less than significant, and no mitigation is required.

Threshold 3: In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point), or in urbanized areas, conflict with applicable zoning and other regulations governing scenic quality?

Impact Analysis

The PMPU area is diverse in character and differs in the amount of urbanization in each planning district. The PMPU area meets the definition of an urbanized area per Public Resources Code (PRC) Section 21071, “an incorporated city with a population of at least 100,000” persons or has a population of less than 100,000 persons if the population of that city and not more than two contiguous incorporated cities combined equals at least 100,000.” As shown in Table 4.11-1 of Section 4.11, *Population and Housing*, the combined population of the cities adjacent to the proposed PMPU area totals 1,787,498. In addition, all planning districts within the proposed PMPU area are adjacent to incorporated cities with populations of at least 100,000 or are adjacent to cities that, when combined with one or two of a contiguous incorporated city, have a population that equals or exceeds 100,000 people. As such, the proposed PMPU area qualifies as an urbanized area for the purposes of this analysis.

For urbanized areas, the analysis of impacts under Threshold 3 typically looks at whether a project would conflict with applicable zoning and other regulations governing scenic quality. However, the District presently has no adopted zoning or other regulations concerning scenic quality (other than the proposed PMPU policies) and the water and land within its jurisdiction are not subject to the zoning or other regulations concerning scenic quality adopted by other jurisdictions. Therefore, even though the proposed PMPU would occur within an urbanized area, this analysis focuses on the potential for the implementation of the proposed PMPU to substantially degrade the existing visual character or quality of public views in the proposed PMPU area.

Although the District presently does not have zoning or other regulations related to scenic quality, the District would establish development standards to protect visual quality with the adoption of the proposed PMPU. The PMPU establishes baywide development standards that would be applied to all future development in the proposed PMPU area (except where specifically noted in a subdistrict development standard), including Mobility Hub Standards (Section 4.1 of the proposed PMPU); Recreation Open Space and Activating Features Standards (Section 4.2 of the proposed PMPU); Pathway Standards (Section 4.3 of the proposed PMPU), View Standards (Section 4.4 of the proposed PMPU); Standards for Scenic Vista Areas (Section 4.4.1 of the proposed PMPU); Standards

for View Corridor Extensions (Section 4.4.2 of the proposed PMPU); Standards for View Protection (Section 4.4.3 of the proposed PMPU); Structure Height, Setback, and Stepback Standards (Section 4.5 of the proposed PMPU); and Wayfinding Signage Standards (Section 4.6 of the proposed PMPU) (see Section 4.1.4.3, *Policies that May Avoid or Reduce Impacts*, above for a list of scenic vista, view corridor extension, and view protection standards). The PMPU also establishes specific development standards for all planning districts that set height limits and setback requirements for buildings, as well as sizing, siting, and orientation of structures and public realm features (such as waterside promenades), which would maintain existing planning district and subdistrict characteristics, and protect the visual quality of the subdistricts. Such standards would be enforced as part of the District's CDP process described in Section 4.1.3, *Laws, Regulations, Plans, and Policies*. Combined, the baywide and planning-district specific development standards would focus on protecting views, preventing encroachment of development into open space and pathways, and maintaining the existing unique visual character of each planning district. These development standards are considered in the following analysis.

Impacts of Water and Land Uses

Construction

Construction activities for the proposed PMPU would be visually apparent from surrounding areas and from other parts of the proposed PMPU area. Construction equipment may include large vehicles or equipment, including temporary stationary or mobile tower cranes for the construction of multi-story structures, which could be visible from the public vantage points in the surrounding area and could cause noticeable changes in the visual character of a project site. The PMPU does not propose any changes to the improvements in PD4 that were approved as part of the Tenth Avenue Marine Terminal Redevelopment Plan, which was approved in 2016 pursuant to and analyzed in the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR (SCH# 2015-031046); thus, the proposed PMPU would not result in additional construction requiring substantial equipment in the TAMT Subdistrict. Planned improvements proposed by the PMPU for PD4 would allow for roadway modifications and new or enhanced existing mobility connections, which would introduce typical construction equipment to PD4 that would be consistent with the industrial uses in the planning district. In addition, no future development or planned improvements are proposed for PD7 as part of the proposed PMPU. Thus, there would be no potential for construction to degrade the visual quality of PD7. Given the proposed PMPU's horizon year of 2050, construction of future development associated with the proposed PMPU could occur intermittently throughout the proposed PMPU area over the 30-year life of the plan depending on economic and market conditions.

There are no specific policies or development standards in the proposed PMPU that govern visual quality during construction. Construction equipment and activities would largely be contained within the project site of future development and would be temporary such that equipment would be removed when construction is completed. Thus, construction of future development would not result in a permanent impact on the visual character of a planning district or the proposed PMPU area as a whole. Overall, however, while the proposed PMPU area is an urbanized area where construction activities are a regular occurrence, given the potential scale of some of the future development, including the high-rise structures that could be developed in PD2 and PD3, large construction equipment, including cranes or barges (for in-water construction), could be present at the project sites for extended periods of time. In addition, given the overall amount of potential development and the duration that parcels within these high-profile, waterfront areas of the

planning districts could experience construction, construction activities could temporarily result in a substantial degradation of visual character. Impacts are considered significant (**Impact-AES-2**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction of future development projects that are consistent with the proposed PMPU, including within PD3, would result in a significant impact related to visual character and quality (**Impact-AES-2**). This significant impact would still occur within PD3 under Option 1 due to future development that could still occur outside the option boundary within PD3.

Construction activities associated with Option 1 would involve similar construction activities as those described above but would generally not include the larger, more visually prominent equipment such as cranes or barges. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to visual character and quality than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction of future development projects that are consistent with the proposed PMPU, including within PD3, would result in a significant impact related to visual character and quality (**Impact-AES-2**). This significant impact would still occur within PD3 under Option 2 due to the future development that could still occur outside the option boundary within PD3.

Construction activities associated with Option 2 would involve similar construction activities as those described above but would generally not include the larger, more visually prominent equipment such as cranes or barges. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to visual character and quality than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction of future development projects that are consistent with the proposed PMPU, including within PD3, would result in a significant impact related to visual character and quality (**Impact-AES-2**). This significant impact would still occur within PD3 under Option 3 due to the future development that could still occur outside the option boundary within PD3.

Construction activities associated with Option 3 would involve similar construction activities as those described above but would generally not include the larger, more visually prominent equipment such as cranes or barges. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to visual character and quality than buildout of the proposed PMPU without Option 3.

Operation

Planning Districts 1, 8, 9, and 10 would have minimal future development with implementation of the proposed PMPU. Potential development for these planning districts mainly consists of additional moorings and recreational or commercial boat slips, and additional retail/restaurant space. Other planned improvements would include modification and realignment of existing transportation facilities and the development of mobility hubs. These planned improvements would involve low-profile or small-scale development and would not introduce visual elements that are incongruous with the existing visual character of these planning districts. Moreover, existing uses may be redeveloped in the future.

Development standards are also proposed as part of the PMPU, as described in the introduction for the Threshold 3 analysis, that establish requirements for the physical development of property and are intended to shape how new development would be designed, oriented, and accessed by the public. Per the proposed PMPU, baywide development standards would be applied consistently baywide, to development in all planning districts, except where specifically noted in a subdistrict development standard. In addition to compliance with the baywide development standards, all development would conform to the subdistrict development standards described in Chapter 5, *Planning Districts*, of the proposed PMPU. The standards outline the appropriate location for certain improvements, as well as the allowable structure heights, setbacks, stepbacks, and height exceptions. For example, Section 4.2.1 *Standards for Recreation Open Space*, of the proposed PMPU states:

“The following requirements apply to areas designated as Recreation Open Space:

1. Shall be located directly adjacent to the waterfront, i.e. between development and the water’s edge;
2. Should be designed with ~~landscaping or native vegetation~~ an appropriate balance of softscape and hardscape based on a subdistrict’s character or as specified in Chapter 5, Planning Districts for that subdistrict to provide users with visual and physical relief from paved surfaces; [...]

In addition, future development in PD1, PD8, PD9, and PD10 would be required to comply with proposed development standards that apply to development within each subdistrict. The subdistrict development standards would be implemented to ensure that future development and planned improvements in each subdistrict is compatible with existing development as well as other future projects. In this way, future development under the proposed PMPU would conform to the existing aesthetic character of the planning districts and would not degrade the visual quality. Such standards would be implemented as part of the District’s CDP process described in Section 4.1.3 above.

No future development or improvements are proposed for PD7 and no additional development in PD4 beyond that already approved as part of the *Tenth Avenue Marine Terminal Redevelopment Plan* and analyzed in the associated certified Final EIR. Planned improvements proposed by the proposed PMPU for PD4 include modifications or reconfigurations of the existing roadway system for trucks, cars, pedestrians, and bicycles. All future development and planned improvements would comply

with the baywide development standards and the PD4, subdistrict development standards, which would be enforced through the CDP process. These improvements would enhance circulation and access in PD4 but would not represent significant changes to the visual character of the planning district.

Future development in PD2 allowed under the proposed PMPU could include the development of a total of up to 4,060 additional hotel rooms, 239,500 square feet of additional retail/restaurant space, and additional in-water development including 5 moorings and 225 recreational boat slips across the four subdistricts. The planning district is dominated visually by existing hotel and marina-related buildings separated by surface parking lots and landscaped areas within the West Harbor Island Subdistrict; surface parking lots with one-story warehouses, administrative buildings, and a marina, and small restaurants in East Harbor Island; Recreation Open Space in Spanish Landing Subdistrict, and major transportation facilities, parking lots, and office buildings in the Pacific Highway Corridor Subdistrict.

Future development in the West Harbor Island Subdistrict could result in the redevelopment or modification of existing hotel or marina buildings to provide up to 1,700 additional hotel rooms and/or 37,000 square feet of meeting rooms within them; or development of new hotel space with up to 1,700 rooms, 16,000 square feet of retail and/or 25,000 square feet of retail with restaurant space, 16,000 square feet of restaurant space, or 37,000 square feet of meeting space. Development of new or expanded hotel buildings would intensify the uses within this subdistrict with buildings that are of similar scale to the existing hotels. Potential future development would be required to implement both baywide development standards (as described in the introductory paragraphs of the analysis of Threshold 3) and subdistrict development standards, including but not limited to, West Harbor Island Subdistrict Development Standards PD2.196 through PD2.274 (found in Chapter 5.2, *Planning District 2: Harbor Island*, of the proposed PMPU), which identify setback and building orientation requirements to ensure that new development would not substantially degrade the existing visual character or quality of public views of West Harbor Island.

The East Harbor Island Subdistrict is currently dominated by industrial uses and parking lots; however, future development allowed under the proposed PMPU could include visitor-oriented development. Given the industrial nature of the visual experience, and the underutilized open parking lots within the subdistrict, the potential development of up to 1,360 additional hotel rooms and 92,500 square feet of retail and restaurant uses is intended to improve the visual character of this subdistrict by providing a more consistent development pattern and a more contiguous transition from the West Harbor Island Subdistrict to the East Harbor Island Subdistrict to the west to PD3 to the east. The height, massing, and scale, as well as setback and stepback requirements, of future development would be similar to those in West Harbor Island. Future development would be required to implement both baywide development standards (as described in the introductory paragraphs of the analysis of Threshold 3) and subdistrict development standards, including but not limited to, East Harbor Island Subdistrict Development Standards PD2.5347 through PD2.6256 (found in Chapter 5.2 *Planning District 2: Harbor Island* of the proposed PMPU), which identify the standards for waterside promenade development, walkways, and buildings heights, setbacks, and parking. The future development would also provide a more continuous and engaging connection of multi-modal transportation routes across the planning districts, and increased use of landscaping, which is intended to improve and enhance the visual character of the area.

Potential future development in the Spanish Landing Subdistrict includes up to 90,000 square-feet of additional retail/restaurant space that would be situated adjacent to the existing facilities of the

Sheraton San Diego Hotel and Marina and would appear as extension of an existing developed area. As such, this structure, which would be limited to 30 feet in height (approximately three stories), and could be between approximately 0.68 and 2 acres, would not introduce development that would conflict with the existing visual character of this area, because it would be consistent in use, size, and massing with the surrounding structures. The additional 1,000 hotel rooms that could be developed in the Pacific Highway Corridor Subdistrict would provide continuity between the West Harbor Island Subdistrict and the hotel uses in the adjacent neighborhoods of Downtown San Diego and PD3. Potential future development would be required to implement both baywide development standards (as described in the introductory paragraphs of the analysis of Threshold 3) and subdistrict development standards, including Spanish Landing Subdistrict Development Standards PD2.693 through PD2.7468 (found in Chapter 5.2 *Planning District 2: Harbor Island*), which identify the standards for public realm development, buildings heights, setbacks, and parking. The development standards would be enforced by the District through the CDP process. As noted above, due to the lack of a cohesive development pattern or any distinctive visual elements, the visual quality of this subdistrict is low, as is viewer sensitivity. The introduction of a new, more modern building would not conflict with the visual character.

Like PD2, PD3 would also experience more intense future development with the implementation of the proposed PMPU. Development allowed under the proposed PMPU in PD3 would include visitor-oriented services, including up to 2,113 additional hotel rooms, 99,122 square feet of retail/restaurant space, 150 additional recreational berthing slips, and 20 additional anchorages. Because the visual character of PD3 is dominated by dense urban development, the majority of these future improvements would occur as infill development or the redevelopment of existing uses. Given its adjacency to the dense, high-rise development of Downtown San Diego, the increased development within PD3 would be visually consistent with the rest of the planning district, as well as with the surrounding character of Downtown San Diego. The redevelopment of underutilized areas, such as open surface parking lots or outdated buildings, would improve the visual continuity of PD3 and would improve the overall visitor experience. Height limits permitted in PD3 would vary and would range from 160 to 200 feet in the North Embarcadero Subdistrict to no height limit in the South Embarcadero Subdistrict (height limits in Central Embarcadero are limited to 45 feet). New development occurring in the North and South Embarcadero Subdistricts would be similar to or lower than building heights in the surrounding area and would blend in with the taller office buildings and hotels of Downtown San Diego to the east and northeast of this planning district. North Embarcadero development would also allow for modification or expansion of water-based museum attractions, which are expansions of existing visitor-serving commercial uses within this area of the North Embarcadero Subdistrict and would include elements, such as additional historic vessels, that would be consistent with the existing visual character. South Embarcadero Subdistrict development would provide more meeting spaces, hotel rooms, and retail/restaurant space, all of which would complement the existing visitor-serving uses and would support the continued utilization of the Convention Center and other visitor destinations in the area.

Potential future development would be required to implement both baywide development standards (as described in the introductory paragraphs of the analysis of Threshold 3) and subdistrict development standards, including but not limited to, North Embarcadero Subdistrict Development Standards PD3.3027 through PD3.4435, Central Embarcadero Subdistrict Development Standards PD3.5041 through PD3.5243, and South Embarcadero Subdistrict Development Standards PD3.7366 through PD3.7569 (found in Chapter 5.3 *Planning District 3: Embarcadero*), which identify the standards for public realm development (waterfront promenades,

walkways, scenic vista areas) and building standards (heights, setbacks, and parking). These standards would be enforced by the District during the CDP process.

In general, future development in PD3 would increase the intensity of uses or density of structures in certain areas but would be visually compatible with similar existing uses in the subdistricts and would maintain consistency of the development pattern.

As discussed throughout this analysis, baywide and planning district-specific development standards proposed as part of the proposed PMPU would ensure consistency with the existing character of the planning districts and provide a consistent development strategy throughout the proposed PMPU area. PMPU-wide development standards are outlined in Chapter 4 of the proposed PMPU. These development standards are intended to establish requirements for all aspects of development, including size, setbacks, location, orientation, spacing, access points, massing, and height. These standards would apply to the types of physical development that are identified in the proposed PMPU, such as mobility hubs, scenic vista areas, ~~pathways~~walkways, waterside promenades, and structures. These standards ensure that new development maintains appropriate spacing between structures, setbacks from the road, and proper widths for walkways, sidewalks, roadways, and view corridors. Through the implementation of baywide development standards, the proposed PMPU would ensure new development would be compatible with the existing pattern and character of development in each planning district.

Subdistrict development standards are established in each planning district (Chapters 5.1 through 5.10 of the PMPU). The development standards are applied to each subdistrict to provide guidance for the development of future improvements so the development complements the existing character and supports the proposed PMPU's vision for the planning districts. All future development within the planning district must comply with the requirements laid out in the subdistrict development standards as well as the baywide development standards, unless the subdistrict development standards specifically note an exception. Subdistrict development standards outline the exact location of the planned improvements proposed as part of the proposed PMPU, their orientation, and how they should be accessed. For buildings, the subdistrict development standards establish height limits, setbacks from curbs, upper story setbacks and requirements for building frontages. The development standards may even go further to establish different requirements for different blocks throughout a given subdistrict. These are proposed to carefully maintain the existing character of each subdistrict, and to achieve the goal and vision proposed by the PMPU, while acknowledging the characteristics of the subdistrict could change slightly from block to block, based on what type of visitor-serving use is proposed. New development's adherence to the subdistrict development standards would ensure the implementation of future development and planned improvements would not introduce incompatible elements that would substantially degrade the visual character and quality of the planning districts and the proposed PMPU area.

With the implementation of the baywide and subdistrict development standards, the proposed PMPU would ensure potential future development projects would be compatible with the existing development patterns in order to enhance the user experience and provide continuous bayfront access. Therefore, the future potential development associated with the implementation of the proposed PMPU would not substantially degrade the visual character or quality of the proposed PMPU area and impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to visual character and quality during operations.

Operational activities associated with the new Waterfront Destination Park under Option 1 would include features typical of a park and would be required to comply with the proposed PMPU's baywide development standards for Recreation Open Space. Conformance with these standards would ensure that Option 1 would not introduce any elements that would detract from the visual character or quality of the surrounding area. Therefore, operations under Option 1 would not result in any additional or more severe impacts related to visual character and quality than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to visual character and quality during operations.

Operational activities associated with the expanded Recreation Open Space under Option 2 would include features typical of a park and would be required to comply with the proposed PMPU's baywide development standards for Recreation Open Space. Conformance with these standards would ensure that Option 2 would not introduce any elements that would detract from the visual character or quality of the surrounding area. Therefore, operations under Option 2 would not result in any additional or more severe impacts related to visual character and quality than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to visual character and quality during operations.

Operational activities associated with the new park space that could be developed under Option 3 would include features typical of a downtown park and would be required to comply with the proposed PMPU's baywide development standards for Recreation Open Space. Conformance with these standards would ensure that Option 3 would not introduce any elements that would detract from the visual character or quality of the surrounding area. Therefore, operations under Option 3 would not result in any additional or more severe impacts related to visual character and quality than buildout of the proposed PMPU, without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies described in Section 4.1.4.3 would not result in substantial adverse effects on visual character, such that it would conflict with applicable zoning and other regulations governing scenic quality. Compliance with PMPU WLU policies identified in Section 4.1.4.3, particularly WLU Objective 2.2, which requires new development be implemented in a manner that blends with and enhances the surrounding character, would ensure that the visual character of the planning district would remain constant as future development occurs.

Impact Determination and Mitigation

Construction activities associated with implementation of the proposed PMPU would substantially degrade the visual character or quality of public views of the area.

Significant Impacts

Impact-AES-2: Potential to Result in Substantial Degradation of Visual Character and Quality During Construction Associated with Implementation of the Proposed PMPU. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment for extended periods of time, which could result in temporary substantial degradation of the visual character or quality of a site. Impacts are considered significant.

Mitigation Measures

For **Impact-AES-2**:

MM-AES-2: Install Construction Fencing. ~~Prior to the start of construction activities,~~ The project proponent shall be required to install construction-screening fencing around the entire perimeter of the project site to shield construction activities from sight. Construction screening shall include, at a minimum, installation of 8-foot-tall fencing for the duration of the construction period that is covered with view-blocking materials, such as tarp or mesh in a color that blends in with the existing environment such as a shade of green or blue, depending on the location. The District's ~~Development Services Department~~ shall confirm such fencing is depicted on the project's demolition and construction plans.

Significance After Mitigation

Implementation of **MM-AES-2** would help minimize the visibility of construction activities at a project site. However, because the location, duration, and scale of future development is not yet known, the District cannot guarantee that **MM-AES-2** would reduce adverse impacts related to the substantial degradation of a project site due to construction activities to below a level of significance. Accordingly, **Impact-AES-2** is considered significant and unavoidable.

Threshold 4: Create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?

Impact Analysis

Impacts of Water and Land Uses

Construction

Light

Most of the planning districts would experience minimal future development under the proposed PMPU, with landside improvements focusing on roadway improvements, installation of mobility hubs, and existing recreational resources enhancement, and waterside planned improvements involving improved coastal access opportunities, such as adding to or improving the number of water-based transfer points or increasing the number of anchorage moorings or recreational berthing slips. Construction activities associated with some of these improvements would be short-term and likely limited to daytime hours. However, PD2 and PD3 would include larger construction projects associated with the development of hotels and new retail/restaurant space and would involve longer construction timeframes and could include construction activities extending into evening hours.

As such, nighttime lighting sources during construction would consist of floodlights that would be focused on the work area to minimize light spillover. Throughout the proposed PMPU area, nighttime construction activities would be limited to activities that would not violate the noise ordinance of the adjacent city, including the City of San Diego's Noise Abatement and Control Ordinance Section 59.5.0404, Section 41.10.040 of the City of Coronado's Noise Abatement and Control Regulations, or Section 9.32.020 of the City of Imperial Beach's noise ordinance. These ordinances specify that any loud construction noise is only permitted from 7 a.m. to 7 p.m., Monday through Saturday, or in the case of Imperial Beach from 7 a.m. to 10 p.m. all days of the week. This would require construction activities to cease operation by 7 p.m. or 10 p.m., and lights for construction work (e.g., bright pole-mounted balloon lights) would not be used beyond these hours. However, even if no nighttime lighting would be used for construction activities, or beyond the regulated hours for construction, some lighting may be used overnight at the construction site for security reasons. Construction lighting used within PD2 and PD3 would occur within a highly urbanized environment and would blend in with the other sources of light from Downtown San Diego or SDIA. Therefore, construction of future development under the proposed PMPU would not result in a substantial new source of temporary lighting and impacts on nighttime views would be less than significant.

Glare

Increased truck traffic and transport of construction materials to various project sites during construction activities associated with implementation of the proposed PMPU would temporarily increase glare conditions as a result of light reflecting off vehicle windshields and construction materials. However, in addition to being temporary, this increase in glare would be largely indistinguishable from background glare and would be variable. The sources noted would move throughout the construction site and off the site as necessary. Thus, the increase in glare would not

affect existing glare conditions, which already involve varying degrees of vehicle and equipment activity—from light activity to heavy activity.

Travel routes for construction traffic would include roadways throughout the proposed PMPU area, with most of the future development occurring throughout PD2 and PD3, which are highly urbanized areas containing various sources of glare, including high-rise buildings with glazed façades and highly traveled routes that characteristically experience moderate levels of daytime glare from light reflecting off vehicle windshields. As such, the temporary increase in motor vehicle traffic that would occur during construction of the future development under the proposed PMPU would not be considered a new source of substantial glare. The increased truck traffic would blend in with the existing traffic and would be comparable to other truck traffic created by construction throughout the proposed PMPU area. Therefore, construction activities associated with implementation of the PMPU would not create a new source of substantial glare that would affect daytime views in the proposed PMPU area. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, construction of future development projects that are consistent with the proposed PMPU, including within PD3, would result in a less-than-significant impact related to light and glare.

Construction activities associated with Option 1 would involve similar construction activities and equipment as those described above, which would not result in substantial new sources of light and glare. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to light and glare than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, construction of future development projects that are consistent with the proposed PMPU, including within PD3, would result in a less-than-significant impact related to light and glare.

Construction activities associated with Option 2 would involve similar construction activities and equipment as those described above, which would not result in substantial new sources of light and glare. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to light and glare than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, construction of future development projects that are consistent with the proposed PMPU, including within PD3, would result in a less-than-significant impact related to light and glare.

Construction activities associated with Option 3 would involve similar construction activities and equipment as those described above, which would not result in substantial new sources of light and glare. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to light and glare than buildout of the proposed PMPU without Option 3.

Operation**Light**

Lighting sources introduced by new development that could occur with implementation of the proposed PMPU would involve interior lighting, exterior lighting for pedestrian safety and security, signage lighting, lighting along the piers for expansion of existing marinas, and lighting from the increase in vehicles traveling throughout the proposed PMPU area. For most of the planning districts, including PD1, PD4, PD7, PD9, and PD10, the proposed PMPU identifies less intense future development such as enhancements or modifications to existing roadways to allow for multi-modal opportunities or the installation of mobility hubs and activating features. These types of improvements would include new sources of lighting, including accent or security lighting, primarily along walkways, promenades, parking areas (either on-street or parking lots as part of mobility hubs), and public transit areas. These improvements would be located in urbanized and developed areas with existing lighting and would not introduce significant new sources of lighting.

Section 4.4.3 of the PMPU, *Standards for View Protection*, establishes requirements related to the protection of views and physical access for view corridor extensions, scenic vista areas, and walkways. These include the provision that exterior lighting, where required for security, to serve development or to provide lighting on a public path, must be designed with low-intensity fixtures that are shielded and concealed so that light sources are not directly visible from public viewing areas and in accordance with ECO Goal 1 (Chapter 3.3, *Ecology Element*, of the PMPU).

In PD8, retail/restaurant uses are planned to increase by a total of approximately 18,000 square feet over existing conditions, which would include a small amount of new interior and exterior building lighting and parking lot or security lighting. Around 3,000 square feet of the proposed additional retail/restaurant space would involve expanding or redeveloping the existing restaurant at the end of the Imperial Beach Pier. The additional restaurant or retail space may include lighting for nighttime uses; however, the Imperial Beach Pier already includes nighttime lighting poles spaced evenly along the entire north side of the pier. In addition, the existing restaurant building at the end of the pier currently includes several bright sources of outdoor lighting, including two spotlights mounted on the roof and directed at the rooftop cupola, and indoor lighting is visible through the restaurant windows. As such, while the additional 3,000 square feet would introduce some new lighting on the interior and exterior of the building, this new source of lighting would not be a substantial addition to the existing sources along and at the end of the pier.

The remaining 15,000 square feet of additional retail/restaurant that could be developed within PD8 would be split between a parcel at Elkwood Avenue and a parcel at Palm Avenue. These sites are currently developed with parking lots and contain outdoor lighting for safety and security. While

new retail/restaurant uses could increase the amount of lighting, both from indoor and outdoor sources, additional lighting sources would not introduce significant new sources of nighttime lighting at these parcels that would adversely affect nighttime views; they would also be subject to the proposed PMPU's lighting policies described above.

Waterside improvements would involve the addition of features such as new anchorage moorings, recreational berthing slips, and water-transfer points. While new boating slips and water-transfer points may require a small amount of security lighting, new anchorage moorings would not introduce any lighting. Therefore, waterside improvements associated with PD1, PD4, and PD7 through PD10 would not introduce a new source of substantial lighting.

The proposed PMPU planned improvements within PD2 and PD3 provide for the most substantial amount of new development. Up to approximately 4,500 new hotel rooms (including low-cost overnight accommodations) and up to approximately 240,000 square feet of new retail and restaurant space would be added to PD2 under the proposed PMPU. In addition, approximately 2,600 new hotel rooms (including low-cost overnight accommodations) as well as almost 100,000 square feet of retail/restaurant space and additional meeting and office space would be allowed in PD3 under the proposed PMPU. Waterside improvements would allow for an increase in the number of recreational boat berthing slips and moorings, as well as new water-based transfer points. This new development would increase the sources of lighting in these planning districts. The types of lighting introduced by this new development would include interior lighting, exterior lighting for pedestrian safety and security, signage lighting, lighting along piers for new boat slips, and lighting from the increase in vehicles accessing the project site. Although the lighting would be increased over existing conditions, would be visible from offsite locations and would contribute to the overall ambient glow of the project site and surrounding areas, per the proposed PMPU's developments standards, Section 4.4.3, *Standards for View Protection*, 2.d, lighting from onsite uses would be designed with low-intensity fixtures that are shielded and concealed so that light sources would not be directly visible from public viewing areas and would not spill directly onto other areas. In areas where existing uses would be redeveloped to further activate the waterfront, for example by enhancing the existing water-based museum attractions of PD3 or expanding the promenade along PD2, existing lighting that no longer fits the District's lighting parameters (i.e., is not shielded or downturned) would be replaced with new low-intensity shielded fixtures that would result in less light spillover and less interference with nighttime views. In addition, these additional sources of lighting would not be substantially brighter than existing light sources used by surrounding development, including Downtown San Diego and the brightly lit runways, parking lots, and buildings associated with SDIA.

Overall, existing nighttime views in the proposed PMPU area already experience a high level of nighttime lighting. While additional lighting would occur as a result of future development under the proposed PMPU, per PMPU View Protection Standard 2d, new lighting would be low-intensity and down-shielded, replacing much of the older lighting fixtures that are not shielded and allow for light spillage. The increased lighting would not adversely affect day or nighttime views in the area, and contributions to increased ambient glow would not represent a significant change in existing conditions that would be perceptible from surrounding sensitive viewing areas. Impacts would be less than significant.

Glare

While design specifications for specific projects are not available for this program-level analysis, exterior building materials used for future development throughout the proposed PMPU would generally be expected to be consistent with materials already used in the area and would generally consist of cement, plaster, and concrete, which are all non-reflective materials and would not create new sources of glare. Reflective materials, such as glass, mirrored glass, and metal, would largely be used for fenestration and accent materials on smaller retail or restaurant structures. New high-rise hotel buildings, defined as a building more than 75 feet above the lowest floor level having building access (California Code of Regulations, Title 24, Chapter 2, Section 202), could be constructed in PD2 and PD3, which would make greater use of reflective surfaces, including glass and metal for curtainwall façades, and have a greater potential for producing new sources of glare at various times of the day, depending on the angle of the sun and viewers relative to the building. This type of glare typically occurs during the hour or so after sunrise and before sunset. The proposed PMPU identifies height limits of up to 225 feet (approximately 15 stories) depending on the subdistrict in PD2 and no maximum height limit for buildings within the South Embarcadero Subdistrict. Given the potential height of hotel towers in PD2 and PD3, the potential for substantial glare would be highest within the bayfront area and adjacent Downtown San Diego community during times of the day when the sun is low in the horizon. Because the proposed PMPU area is highly urbanized and developed, existing daytime views already experience moderate levels of daytime glare. However, some of the future project sites may involve development on undeveloped sites or sites that currently do not contain sources of glare. Therefore, future development occurring as part of the implementation of the proposed PMPU could contribute a new source of substantial glare which would potentially affect daytime views in the area, resulting in a significant impact (**Impact-AES-3**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to glare (**Impact-AES-3**). This significant impact would still occur within PD3 under Option 1, as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities associated with a new Waterfront Destination Park under Option 1 would include new sources of lighting, such as exterior lighting for pedestrian safety and security. As discussed above, development standards would require new lighting to be low-intensity and down-shielded, which would reduce light spillage into adjacent areas. As such, new sources of lighting under this option would not affect nighttime views in the area. In addition, it is not

anticipated that any components of Option 1 would involve the use of materials that would introduce a substantial new source of glare into the area that could affect daytime views. Therefore, operations under Option 1 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to light and glare than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to glare (**Impact-AES-3**). This significant impact would still occur within PD3 under Option 2 due to the future development that could still occur outside the option boundary within PD3.

Operational activities associated with the expanded Recreation Open Space under Option 2 would include new sources of lighting, such as exterior lighting for pedestrian safety and security. As discussed above, development standards would require new lighting to be low-intensity and down-shielded, which would reduce light spillage into adjacent areas. As such, new sources of lighting would not affect nighttime views in the area. In addition, it is not anticipated that any components of Option 2 would involve the use of materials that would introduce a substantial new source of glare into the area that could affect daytime views. Therefore, operations under Option 2 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to light and glare than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to glare (**Impact-AES-3**). This significant impact would still occur within PD3 under Option 3 due to the future development that could still occur outside the option boundary within PD3.

Operational activities associated with new park space that could be developed under Option 3 would include new sources of lighting, such as exterior lighting for pedestrian safety and security. As discussed above, development standards would require new lighting to be low-intensity and down-shielded, which would reduce light spillage into adjacent areas. As such, new sources of lighting under this option would not affect nighttime views in the area. In addition, it is not anticipated that any components of Option 3 would involve the use of materials that would introduce a substantial new source of glare into the area that could affect daytime views. Therefore, operations under Option 3 would result in less-than-significant impacts and would not result in any additional or more severe impacts related to light and glare than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

There are no proposed PMPU Element policies that would result in impacts related to new sources of substantial light and glare.

Impact Determination and Mitigation

Implementation of the proposed PMPU would create new sources of substantial glare that could adversely affect daytime or nighttime views in the area.

Significant Impacts

Impact-AES-3: New Permanent Source of Glare Generated by Potential High-Rise

Development. New high-rise buildings constructed during implementation of the proposed PMPU could be designed using curtainwall façades that would use architectural finishes and materials that would increase the amount of glare produced at future project sites, which would represent a significant new source of substantial glare at the project site compared to existing conditions that would potentially affect daytime views in the area.

Mitigation Measures

For **Impact-AES-3**:

MM-AES-3: Incorporate the Use of Reduced Glare Building Materials. The project proponent ~~for any of a~~ future high-rise tower (over 75 feet or 7 stories) ~~developed under the proposed PMPU~~ shall incorporate non-reflective exterior building materials in the design, and any glass incorporated into the façade of the building shall either be of low reflectivity or accompanied by a non-glare coating. Glass and other material shall have a light reflectivity factor no more than 30% and no more than 50% of the building surface shall be made of reflective materials, to be consistent with the standards established in the City of San Diego Municipal Code §142.0730 Glare Regulations and any future amendments. Prior to issuance of a building permit for future high-rise hotel towers, the District shall confirm such non-reflective materials and low reflectivity or non-glare coating are depicted on the appropriate building plans. Building plans and materials shall be consistent with specific design strategies as described in Section 4.3, *Biological Resources*, under **MM-BIO-9**, Implement Bird Strikes Reduction Measures on New Structures, to avoid or reduce potential for bird strikes.

Level of Significance After Mitigation

Implementation of **MM-AES-3** requires future project proponents of high-rise hotel structures over 75 feet or seven stories to incorporate reduced-glare building materials into the final project design, such as non-reflective building materials and glass that has a light reflectivity factor of 30% to meet the standard of no more than 50% of the building constructed of reflective materials. The incorporation of these features would ensure that **Impact-AES-3** is reduced to less-than-significant levels.

4.1.5 Cumulative Impact Analysis

A significant cumulative impact on aesthetics and visual resources would result if the proposed PMPU, in combination with past, present, and probable future projects, would result in substantial damage to scenic resources, substantially degrade the existing visual character or public views of the area, or create a new source of substantial light or glare that would adversely affect day or nighttime views in the cumulative area.

4.1.5.1 Geographic Scope

The geographic scope of analysis for cumulative aesthetics and visual resources impacts to which the proposed PMPU may contribute includes the scenic vistas and view corridor extensions identified in the proposed PMPU as well as the areas adjacent to each of the planning districts.

4.1.5.2 Cumulative Effects

Past development projects have changed the land in and around the San Diego bayfront and surrounding areas from a natural and undeveloped setting to an urban setting defined by moderate to high density development, including single- and multi-family residential neighborhoods, high-rise structures in Downtown San Diego, industrial areas, and smaller scale commercial or mixed-use areas. In addition, past projects, along with present and future projects, have included, and will continue to include, development at or near the waterfront that has cumulatively contributed to blocking some inland views of the San Diego Bay.

Planning District 3, which is adjacent to the urban development of Downtown San Diego, has been the location for numerous projects, including the Convention Center, high rise hotel buildings, and other visitor-serving commercial uses, that have crowded the waterfront, resulting in an urbanized visual character and limiting some public views. For example, past and present development projects in PD3 have resulted in densification of development along the waterfront between the public rights-of-way and the coastal area along the Bay, reducing the quality of the views to the Bay and the waterfront from the publicly accessible viewpoints. The future proposed Seaport San Diego project (Cumulative Project # 11) is a mixed-use master development that includes retail, hotel, office, and tourism attractions (including an aquarium building and a 480-foot-tall observation tower), which would have the potential to obstruct existing or proposed scenic vistas areas and view corridors, as well as conflict with policies that regulate visual character in PD3.

Additionally, cumulative projects along the waterfront alter the view of the landscape or cityscape that is visible from scenic vistas across the Bay; for example, development along the waterfront in PD3 has altered the views from designated scenic vistas in PD2 and PD10. Current projects, including high rise hotels within the Tidelands and high-rise residential buildings within the City of San Diego's jurisdiction, continue to densify the proposed PMPU area and the vicinity, reducing public views of the Bay from upland areas contributing to the increasingly urbanized character, and resulting in significant new sources of light and glare. Past, present and future cumulative projects in other planning districts have also contributed to an increase in density of development along the bayfront; although these projects have been consistent with the visitor-serving uses of the Tidelands in most planning districts, they have nonetheless contributed to the concentration of buildings and structures in the proposed PMPU area. Past and present projects in PD4 have resulted in the planning district being developed entirely with marine terminal-related uses, contributing to the highly industrialized character of PD4 and the vicinity.

Future projects proposed within or adjacent to the proposed PMPU area, including the cumulative projects Seaport San Diego and National City Bayfront Projects and Plan Amendments EIR may introduce structures that would not be consistent with the existing land use and visual character of the proposed PMPU area due to height and scale. Future projects such as these could result in permanent adverse effects on visual character and would require a PMP amendment to ensure compliance with established visual standards and continuity with the existing and planned visual character.

Construction of the past, present, and future projects often includes the use of heavy or obtrusive equipment, such as cranes or building scaffolding, which results in a skyline view interrupted by construction equipment, or more immediate views that are blocked or diminished by the presence of visually unappealing construction equipment. Although construction is so common it is an expected characteristic of an urban setting, the combined effect of consecutive construction projects along the waterfront can result in significant intrusions to scenic vistas and cumulative effects on the overall visual quality.

Past and present cumulative projects have been generally consistent with the visual character, size, scale, and bulk of historic development in the proposed PMPU area due to existing design and viewshed regulations provided in the District's PMP and the adjacent communities' development codes. However, it is possible future cumulative projects would be incompatible with the visual character or obstruct scenic vistas due to noncompliance with land use and design regulations or conflicts between regulations and guidelines in adjacent jurisdictions. Compliance with these applicable plans and regulations would also limit future glare and light impacts; however, future cumulative projects may also be inconsistent with design and development standards and result in adverse effects on day and nighttime views.

Although development from past, present, and probable future projects has been, and will continue to be, designed in accordance with the existing viewshed regulations and design guidelines, cumulative projects have continued to change the bayfront and surrounding areas to more urbanized settings and probable future projects would continue this path of development. Consequently, past, present, and probable future projects would result in a cumulatively significant impact on scenic vistas, visual character and quality, and light and glare.

4.1.5.3 Project Contribution

The proposed PMPU would facilitate the construction of future visitor-serving uses within the proposed PMPU area, such as new hotels and lower cost accommodations, restaurants, park space and promenades, retail, convention and meeting space, office space, and other uses. As discussed in Section 4.1.4.4, future development allowed under the proposed PMPU would not damage scenic resources within a state scenic highway or degrade the visual character of the proposed PMPU area and the surrounding areas or result in substantial lighting impacts. Therefore, the proposed PMPU's incremental contribution to such impacts would not be cumulatively considerable for these issues.

Construction associated with future development under the proposed PMPU, including Option 1, 2, or 3, would result in impacts related to the potential for construction equipment to block or interfere with scenic vista areas or view corridors ~~due to construction equipment~~ or result in the substantial degradation of visual character (**Impact-C-AES-1** and **Impact-C-AES-2**), which would be a cumulatively considerable contribution to significant cumulative impacts prior to mitigation. Due to the unknown nature of the scale, location and timing of future development projects under the proposed PMPU, it is possible that likely the implementation of the PMPU could result in the placement of several construction projects within the viewsheds of scenic vistas areas or view corridors, contributing to a cumulative impact on the quality of designated scenic vistas. As such, the proposed PMPU has the potential to result in a cumulatively considerable impact on scenic vistas from construction of future development. Mitigation (**MM-AES-1** and **MM-AES-2**) would be implemented to reduce any impacts through the review and approval of the construction schedule, locating construction equipment away from designated scenic vistas, and installing construction fencing. These measures would reduce impacts, but given the unknown nature and timing of future

construction and the potential for concurrent construction with other cumulative projects, the potential impacts would remain significant. As such, the proposed PMPU would result in a cumulatively considerable contribution to these impacts.

Implementation of the proposed PMPU, including the selection of Option 1, 2 or 3, would include the future development of high-rise buildings that could result in a substantial increase in glare (**Impact-C-AES-3**), which would be a cumulatively considerable contribution to a significant cumulative impact before mitigation. Mitigation (**MM-AES-3**) would require the use of non-reflective materials for high-rise buildings over 75 feet or seven stories tall, which would reduce this impact to a less-than-significant level. As such, the proposed PMPU would not result in a cumulatively considerable contribution related to glare.

As noted above, a significant cumulative aesthetics and visual resources impact is present as a result of the past, present, and probable future cumulative projects in the proposed PMPU area. The impacts associated with future development allowed under the proposed PMPU, including implementation of Option 1, 2, or 3, would result in significant impacts that would make a cumulatively considerable contribution to the cumulative impact. Therefore, the proposed PMPU's contribution to cumulative impacts on aesthetics and visual resources would be cumulatively considerable.

4.1.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's contribution to a cumulative aesthetics and visual resources impact would be cumulatively considerable. Potential cumulatively considerable impacts include:

Impact-C-AES-1: Potential to Result in a Cumulatively Considerable Contribution to Adverse Impacts on Scenic Vista Areas or View Corridors During Construction. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment, that could intrude into a designated scenic vista area or view corridor extension, which could entirely block or interfere with the views provided by scenic vista areas or view corridors, or prevent access to the scenic vista areas or view corridors. In combination with other construction activity in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable contribution to a significant cumulative impact on scenic vista areas or view corridors.

Impact-C-AES-2: Potential to Result in a Cumulatively Considerable Contribution to Substantial Degradation of Visual Character and Quality During Construction. Construction activities associated with future development occurring under the proposed PMPU could involve the use of construction equipment, such as large cranes, construction barges, or other tall and/or bulky equipment for extended periods of time, which could result in temporary substantial degradation of the visual character or quality of a site. In combination with other construction activity in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable contribution to a significant cumulative impact on visual quality and character.

Impact-C-AES-3: Potential to Result in a Cumulatively Considerable Contribution to New Permanent Source of Glare Generated by Potential High-Rise Development. New high-rise buildings constructed during implementation of the proposed PMPU could be designed using curtainwall façades that would use architectural finishes and materials that would increase the amount of glare produced at future project sites, which would represent a significant new source of substantial glare that could potentially affect daytime views in the area. In combination with other

high-rise buildings in or adjacent to the proposed PMPU area, this would result in a cumulatively considerable contribution to a significant cumulative impact related to glare.

Mitigation Measures

For **Impact-C-AES-1**:

Implement **MM-AES-1**, as described in Threshold 1.

For **Impact-C-AES-2**:

Implement **MM-AES-2**, as described in Threshold 3.

For **Impact-C-AES-3**:

Implement **MM-AES-3**, as described in Threshold 4.

Level of Significance After Mitigation

As discussed above, implementation of **MM-AES-1** would reduce the impacts of construction of activities associated with future development under the proposed PMPU within scenic vistas or view corridor extensions, but would not reduce the proposed PMPU's contribution to **Impact-C-AES-1** to less than cumulatively considerable. Mitigation measure **MM-AES-2** would reduce impacts on visual character from construction activities; however, **MM-AES-2** may not fully reduce adverse impacts related to the substantial degradation of a project site due to construction activities. Accordingly, the proposed PMPU's contribution to **Impact-C-AES-1** and **Impact-C-AES-2** would be cumulatively considerable and unavoidable. With respect to cumulative impacts associated with glare, **MM-AES-3** would require the use of non-reflective materials for high-rise buildings over 75 feet or seven stories tall, which would reduce the proposed PMPU's contribution to **Impact-C-AES-3** to less than cumulatively considerable.

Section 4.2

Air Quality and Health Risk

4.2.1 Overview

This section describes the existing conditions and laws and regulations for air quality and health risk. The section also discusses the proposed Port Master Plan Update's (PMPU's) potential to increase air emissions in the region. Impacts on air quality are considered significant if the PMPU would (1) conflict with or obstruct implementation of the applicable air quality plan, (2) result in a cumulatively considerable net increase of any criteria pollutant for which the project region is classified as nonattainment under an applicable Federal or State ambient air quality standard, (3) expose sensitive receptors to substantial pollutant concentrations, or (4) result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. The supporting calculations and modeling of air emissions is provided in Appendix C.

Table 4.2-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.2.4.4, *Project Impacts and Mitigation Measures*.

Table 4.2-1. Summary of Significant Air Quality and Health Risk Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-AQ-1: New Land Use Designations Not Accounted for in the RAQS and SIP	All planning districts	MM-AQ-1: Update the RAQS and SIP with New Growth Projections	Less than Significant	The temporary inconsistency with the current RAQS and SIP associated with <u>With mitigation,</u> the proposed land use designation changes would be rectified <u>reflected in</u> when the RAQS and SIP when they are updated, but because the exact timing of the RAQS and SIP update is unknown, the project's additional emissions associated with new growth projections not currently reflected in the RAQS and SIP would remain inconsistent with these plans.
Impact-AQ-2: Emissions in Excess of Criteria Pollutant	All planning districts	MM-AQ-2: Implement Best Management Practices During	Less than Significant	Mitigation would reduce project-related construction emissions

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Thresholds During PMPU Buildout Construction.		<p>Construction of all Future PMPU-Consistent Projects</p> <p>MM-AQ-3: Implement Diesel Emission-Reduction Measures During Construction of All Future PMPU-Consistent Projects</p> <p>MM-AQ-4: Implement Fugitive Dust Control During Construction of All PMPU-Consistent Projects</p> <p>MM-AQ-5: Use Low-VOC Interior and Exterior Coatings During Construction of All PMPU-Consistent Projects</p> <p>MM-AQ-6: Use Modern Harbor Craft and Dredgers During Construction Activities</p> <p>MM-AQ-7: Conduct an Annual Technology Review for <u>Construction- and Operation-related</u> Activities</p> <p>MM-AQ-8: Conduct Project-Level Environmental Reviews</p>		below a level of significance during construction.
Impact-AQ-3: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations	All planning districts	<p>MM-AQ-9: Implement Sustainability Measures in All Development through 2030</p> <p>MM-AQ-10a: Require All New Hotels to <u>Use Only Electric Energy</u> Reduce Natural Gas Prior to 2030 and</p> <p>MM-AQ-10b: Require All <u>Future</u> New Development to be Carbon Neutral After 2030</p>	Significant and Unavoidable	Mitigation would reduce project-related operational emissions, but emissions would remain above thresholds.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
		MM-AQ-11: Install EV Charging Infrastructure MM-AQ-12: Advance Recreational Boat Electrification		
Impact-AQ-4: Health Effects During PMPU Buildout Construction from ROG and NO _x Emissions	All planning districts	MM-AQ-2 through MM-AQ-8	Less than Significant	Mitigation would reduce construction-related emissions that contribute to regional and local health effects below a level of significance during construction.
Impact-AQ-5: Health Effects During PMPU Buildout Operations from ROG, NO _x , and CO	All planning districts	MM-AQ-9 through MM-AQ-12	Significant and Unavoidable	Mitigation would reduce operations-related emissions that contribute to regional and local health effects, but emissions would remain above thresholds.
Impact-C-AQ-1: New Land Use Designations Not Accounted for in the RAQS and SIP	All planning districts	MM-AQ-1	Less than Significant	The temporary inconsistency with the current RAQS and SIP associated with <u>With mitigation,</u> the proposed land use designation changes would be <u>reflected in</u> rectified when the RAQS and SIP are updated. However, because the exact timing of the RAQS and SIP update is unknown, the project's additional emissions associated with new growth projections not currently reflected in the RAQS and SIP would remain inconsistent with these plans.
Impact-C-AQ-2: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction	All planning districts	MM-AQ-2 through MM-AQ-8	Less than Significant	Mitigation would reduce project-related construction emissions below a level of significance during construction.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-AQ-3: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations	All planning districts	MM-AQ-9 through MM-AQ-12	Significant and Unavoidable	<u>Mitigation would reduce the PMPU's cumulative contribution to air emissions, but the PMPU's contribution would remain cumulatively considerable.</u> Mitigation would reduce construction-related emissions that contribute to regional and local health effects below a level of significance during construction.
Impact-C-AQ-4: Health Effects During PMPU Buildout Construction from ROG and NO _x Emissions	All planning districts	MM-AQ-2 through MM-AQ-8	Less than Significant	Mitigation would reduce operations-construction- related emissions that contribute to regional and local health effects <u>to below</u> , but emissions would remain above thresholds.
Impact-C-AQ-5: Health Effects During PMPU Buildout Operations from ROG, NO _x , and CO	All planning districts	MM-AQ-9 through MM-AQ-12	Significant and Unavoidable	Mitigation would reduce project-related construction-operational emissions, <u>but emissions would remain above thresholds.</u> below a level of significance during construction.

4.2.2 Existing Conditions

This section describes the existing air quality and health risk setting of the proposed PMPU area. Section 4.2.2.1 describes climate and atmospheric conditions in the proposed PMPU area. Section 4.2.2.2 describes background air quality conditions, including monitoring data and attainment status. Section 4.2.2.3 describes air quality pollutants of concern. Section 4.2.2.4 describes background air quality and health risk data.

4.2.2.1 Climate and Atmospheric Conditions

Regional

The proposed PMPU area comprises the entirety of the San Diego Unified Port District's (District's) jurisdiction in Planning Districts (PDs) 1, 2, 3, 4, 8, 9, 10, and a portion of PD7, including approximately 3,535 acres of water and 2,403 acres of land in and around San Diego Bay and along the Imperial Beach oceanfront. The planning area is within the San Diego Air Basin (SDAB), which is bordered by the Pacific Ocean to the west, the South Coast Air Basin (SCAB) to the north, the Salton Sea Air Basin to the east, and the United States/Mexico border to the south.

The climate of San Diego is classified as Mediterranean but is incredibly diverse because of the topography. The climate is dominated by the Pacific high-pressure system that results in mild, dry summers and mild, wet winters. San Diego experiences an average of 201 days above 70°F and 9–13 inches of rainfall annually (mostly, November–March). El Niño and La Niña patterns have large effects on the annual rainfall received in San Diego (SDAPCD 2016a).

An El Niño is a warming of the surface waters of the eastern Pacific Ocean. It is a climate pattern that occurs across the tropical Pacific Ocean that is associated with drastic weather occurrences, including enhanced rainfall in Southern California. La Niña is a term for cooler than normal sea surface temperatures across the Eastern Pacific Ocean. San Diego receives less than normal rainfall during La Niña years (SDAPCD 2016a).

The Pacific High drives the prevailing winds in the SDAB. The winds tend to blow onshore in the daytime and offshore at night. In the summer, an inversion layer is created over the coastal areas and increases the ozone (O₃) levels. In the winter, San Diego often experiences a shallow inversion layer that tends to increase carbon monoxide (CO) and particulate matter (PM) less than or equal to 2.5 microns in diameter (PM_{2.5}) concentration levels due to the increased use of residential wood burning (SDAPCD 2016a).

In the fall months, the SDAB is often impacted by Santa Ana winds, which result from a high-pressure system over the Nevada-Utah region that overcomes the westerly wind pattern and forces hot, dry winds from the east to the Pacific Ocean. These winds are powerful and incessant. They blow the air basin's pollutants out to sea. However, a weak Santa Ana can transport air pollution from the SCAB and greatly increase the San Diego O₃ concentrations. A strong Santa Ana also primes the region's vegetation for firestorm conditions (SDAPCD 2016a).

Local

While regional climate patterns drive the largescale movement and dispersal of air pollutants, local meteorological and topographic conditions can influence ambient air quality conditions. The California Air Resources Board (CARB) and San Diego Air Pollution Control District (SDAPCD) maintain a network of air quality monitoring stations throughout the county that measure various atmospheric conditions, such as wind speed, wind direction, and air temperature. These variables interact with the physical features of the landscape and existing air pollution sources, and can yield slightly different air quality conditions within each of the PDs.

There are two climate monitoring stations—Lindbergh Field and Chula Vista—in the proposed PMPU vicinity. Table 4.2-2 summarizes temperature and precipitation data for each station. Historical climate conditions at these stations are assumed to be representative of the prevailing

climate conditions for the planning districts, as noted in Table 4.2-2. Note that local climate conditions in some districts may be characterized by data from more than one station.

Table 4.2-2. Summary of Local Climate Conditions (Temperature and Precipitation)

Station	Planning District(s)	Average Temperature (°F)			Average Annual Precipitation (inches)	Average Wind Speed and Direction
		Annual	Summer	Winter		
Lindbergh Field (047740)	Shelter Island (PD1) Harbor Island (PD2) Embarcadero (PD3) Working Waterfront (PD4) Coronado Bayfront (PD10)	63.2	68.8	57.0	10.13	West-Northwest at 6.33 mph
Chula Vista (041758)	South Bay (PD7) Imperial Beach Oceanfront (PD8) Silver Strand (PD9)	61.0	67.0	54.6	9.73	West at 3.87mph

Source: Western Regional Climate Center 2020, Reeve pers. comm.

mph = miles per hour

In addition to the Lindbergh Field and Chula Vista stations, there is a wind monitoring station at Perkins Elementary School, which is just east of PD4 in the Barrio Logan community. Wind patterns at Perkins School indicate a prominence of westerly winds averaging 4.27 miles per hour (mph), with calm winds present approximately 10.01 percent of the time. Wind monitoring data recorded at the Lindbergh Field Station indicate a more west-northwest prominence, averaging 6.33 mph, with calm winds present approximately 0.84 percent of the time. Wind monitoring data recorded at the Chula Vista Station indicates a prominence of westerly winds averaging 3.87 mph with calm winds present approximately 12.5 percent of the time (Reeve pers. comm.). Wind roses depicting wind directions, speeds, and frequency for these stations are shown in Appendix C of this Program Environmental Impact Report (PEIR).

4.2.2.2 Air Quality Conditions

Regional

The Federal Clean Air Act (CAA) requires the U.S. Environmental Protection Agency (EPA) to designate areas within the country as being either in attainment or nonattainment for each criteria pollutant based on whether the national ambient air quality standards (NAAQS) have been achieved. Similarly, the California CAA requires CARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the California Ambient Air Quality Standards (CAAQS) have been achieved. If a pollutant concentration is lower than the State or Federal standard, the area is classified as being in attainment for that pollutant. If a pollutant violates the standard, the area is considered a nonattainment area. If data are insufficient to determine whether a pollutant is violating the standard, the area is designated unclassified.

Under the California CAA, areas are designated as nonattainment for a pollutant if air quality data show that a State standard for the pollutant was violated at least once during the previous 3 calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a State standard and are not used as a basis for designating areas as nonattainment. The attainment status of San Diego County is summarized in Table 4.2-3.

Table 4.2-3. Federal and State Attainment Status for San Diego County

Criteria Pollutant	Federal Designation	State Designation
Ozone (O ₃) (8-hour)	Nonattainment	Nonattainment
Carbon Monoxide (CO)	Attainment	Attainment
Respirable Particulate Matter (PM ₁₀)	Unclassifiable/Attainment	Nonattainment
Fine Particulate Matter (PM _{2.5})	Attainment	Nonattainment
Nitrogen Dioxide (NO ₂)	Attainment	Attainment
Sulfur Dioxide (SO ₂)	Attainment	Attainment
Lead (Pb)	Attainment	Attainment
Sulfates	(No Federal standard)	Attainment
Hydrogen Sulfide	(No Federal standard)	Unclassified
Visibility	(No Federal standard)	Unclassified

Sources: SDAPCD 2021a.

Note: At the time of designation, if the available data do not support a designation of attainment or nonattainment, the area is designated as unclassifiable.

Local

SDAPCD maintains and operates a network of ambient air monitoring stations throughout the county. The purpose of the monitoring stations is to measure ambient concentrations of O₃, NO₂, CO, SO₂, Pb, PM₁₀, and PM_{2.5} and determine whether the ambient air quality meets the CAAQS and NAAQS. Air monitoring indicates downward concentration trends in air pollutant concentrations despite the increase in population and activity. Specifically, O₃ levels are down over the past two decades but continue to periodically exceed the NAAQS and CAAQS; NO₂ and CO levels show a substantial downward trend as a result of improved emission control technology on mobile source; trace levels of SO₂ are monitored as sulfur emissions have declined tremendously over the past 20 years due to various diesel fuel and emission regulations; lead is only monitored at McClellan-Palomar Airport (in Carlsbad), and levels are so low that SDAPCD has requested EPA to close the monitor; and PM₁₀ and PM_{2.5} emissions have trended down. While concentrations periodically and temporarily exceed standards, the largest exceedances are due to severe wildfires, and the SDAB maintains attainment status for NAAQS but is designated as nonattainment for the CAAQS (SDAPCD 2020a).

There are three monitoring stations within the vicinity of the proposed PMPU area. The San Diego-Beardsley Street and San Diego-Sherman Elementary stations are near the northern portion of the proposed PMPU area, and the Chula Vista station is near the southern portion.

None of these stations monitor CO. Thus, the maximum concentrations from the two stations in the region that do currently monitor CO—11403 Rancho Carmel Drive in San Diego and 533 First Street in El Cajon—are utilized. Concentrations of pollutants for the most recent period available from both stations are presented in Table 4.2-4.

The San Diego–Beardsley Street station closed in November 2016. The SDAPCD relocated the site to Sherman Elementary School (approximately 1 mile north of the project site) and began operating the site in March 2020. Monitoring information from the San Diego–Sherman Elementary station is shown for only for 2020, Monitoring information from the San Diego–Beardsley Street station is shown for the multi-year period of record available, which is the 2014–2016 timeframe. Monitoring data from Chula Vista is shown for the 2014–2020 time period. At the time of analysis, data from the 2021 calendar year was not yet available.

As presented in Table 4.2-4, over the 3 years of available data (2014–2016), monitoring has shown the following ambient air quality standard violations at the San Diego–Beardsley Street station.

- 8-hour O₃ CAAQS exceeded twice in 2014.
- 8-hour O₃ NAAQS exceeded once in 2014.
- PM₁₀ 24-hour CAAQS exceeded six times in 2015 and one time in 2016.
- PM_{2.5} 24-hour NAAQS exceeded one time in 2014.

As shown, the Chula Vista monitoring station recorded one violation of the 8-hour O₃ CAAQS and NAAQS in 2014, one violation of the 8-hour O₃ CAAQS in 2017, one violation of the PM₁₀ 24-hour CAAQS, and a violation of the PM_{2.5} 24-hour NAAQS in both 2017 and 2018.

As shown, in 2020, the San Diego–Sherman Elementary station recorded three violations of the 8-hour O₃ CAAQS and NAAQS, two violations of the 8-hour O₃ CAAQS, and two violations of the PM_{2.5} 24-hour NAAQS.

¹CO concentrations are taken from the monitoring stations at 11403 Rancho Carmel Drive in San Diego and 533 First Street in El Cajon.

Note: Values denoted with an "--" indicate data that was not available at the time data was accessed.

ppm = parts per million; $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

Sensitive Receptors

The impact of air pollutant emissions on sensitive members of the population is a special concern. Sensitive receptors are defined as locations where pollutant-sensitive members of the population may reside or where the presence of air pollutant emissions could adversely affect use of the land. CARB has identified the following people as the most likely to be affected by air pollution: children younger than 14, adults older than 65, athletes, and people with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive receptors (CARB 2005a). Locations that may contain a high concentration of these sensitive population groups include residential areas, hospitals, daycare facilities, elder-care facilities, elementary schools, and parks. Most health studies indicate that health effects are strongest within 1,000 feet of emission sources (CARB 2005a).

The proposed PMPU area supports a diverse range of land uses, including commercial, industrial, and recreational uses, such as hotels and parks. While there are no residential uses within the proposed PMPU area, single- and multiple-family homes are located immediately adjacent to most of the planning districts. Educational, recreational, and religious facilities are also within 0.25 mile of the proposed PMPU area.

Refer to Section 4.9, *Land Use and Planning*, for additional information on land uses within and adjacent to the proposed PMPU area.

4.2.2.3 Pollutants of Concern

Criteria Pollutants

As discussed above, the Federal and State governments have established NAAQS and CAAQS, respectively, for six criteria pollutants: O₃, Pb, CO, NO₂, SO₂, and PM₁₀ and PM_{2.5}. Ozone is considered a regional pollutant because its precursors affect air quality on a regional scale. Pollutants such as CO, NO₂, SO₂, and Pb are considered local pollutants that tend to accumulate in the air locally. PM is both a local and a regional pollutant. The primary criteria pollutants of concern generated by the project are ozone precursors (volatile organic compounds [VOC] and nitrogen oxides [NO_x]), CO, and PM.

All criteria pollutants can have human health and environmental effects at certain concentrations. The ambient air quality standards for these pollutants (Table 4.2-4) are set to protect public health and the environment within an adequate margin of safety (CAA Section 109). Epidemiological, controlled human exposure, and toxicology studies evaluate potential health and environmental effects of criteria pollutants, and form the scientific basis for new and revised ambient air quality standards.

Principal characteristics and possible health and environmental effects from exposure to the primary criteria pollutants generated by the project are discussed below.

- **Ozone**, a component of urban smog, is photochemical oxidant that is formed when VOC (also known as ROG)¹ and NO_x (both byproducts of the internal combustion engine) react with

¹ EPA formerly defined the regulated organic compounds in outdoor air as “Reactive Organic Gases” (ROG). This terminology clarified its meaning as being limited to reactive chemicals. However, EPA later changed that terminology to “VOC.”

sunlight. VOC are compounds made up primarily of hydrogen and carbon atoms. Internal combustion associated with motor vehicle usage is the major source of hydrocarbons. Other sources of VOC are emissions associated with the use of paints and solvents, the application of asphalt paving, and the use of household consumer products such as aerosols. The two major forms of NO_x are nitric oxide (NO) and NO_2 . NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperature and/or high pressure. NO_2 is a reddish-brown irritating gas formed by the combination of NO and oxygen. In addition to serving as an integral participant in ozone formation, NO_x also directly acts as an acute respiratory irritant and increases susceptibility to respiratory pathogens.

Ozone poses a higher risk to those who already suffer from respiratory diseases (e.g., asthma), children, older adults, and people who are active outdoors. Exposure to ozone at certain concentrations can make breathing more difficult, cause shortness of breath and coughing, inflame and damage the airways, aggregate lung diseases, increase the frequency of asthma attacks, and cause chronic obstructive pulmonary disease. Studies show associations between short-term ozone exposure and non-accidental mortality, including deaths from respiratory issues. Studies also suggest long-term exposure to ozone may increase the risk of respiratory-related deaths (EPA 2019a). The concentration of ozone at which health effects are observed depends on an individual's sensitivity, level of exertion (i.e., breathing rate), and duration of exposure. Studies show large individual differences in the intensity of symptomatic responses, with one study finding no symptoms to the least responsive individual after a 2-hour exposure to 400 parts per billion (ppb) of ozone and a 50 percent decrement in forced airway volume in the most responsive individual. Although the results vary, evidence suggests that sensitive populations (e.g., asthmatics) may be affected on days when the 8-hour maximum ozone concentration reaches 80 ppb (EPA 2019b).

In addition to human health effect, ozone has been tied to crop damage, typically in the form of stunted growth, leaf discoloration, cell damage, and premature death. Ozone can also act as a corrosive and oxidant, resulting in property damage such as the degradation of rubber products and other materials.

- **Organic Gases—Precursors to Ozone** include ROGs and VOCs. Hydrocarbons (HC) are organic gases that are formed solely of hydrogen and carbon. ROGs include all HC except those exempted by CARB. VOCs are similar to ROGs in that they include all organic gases except those exempted by Federal law. Both VOCs and ROGs are emitted from incomplete combustion of HC or other carbon-based fuels. Combustion engine exhaust, oil refineries, and oil-fueled power plants are the primary sources of HC. Another source of HC is evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint. Generally speaking, and in this analysis, ROGs and VOCs are used interchangeably to refer to the HC that are a precursor to O_3 formation.

The primary health effects of HC result from the formation of O_3 and its related health effects. High levels of HC in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. There are no separate ambient air quality standards for ROGs. Carcinogenic forms of ROG/VOC are considered to be toxic air contaminants (TACs), which are described below. An example is benzene, which is a carcinogen.

- **Nitrogen dioxide** is formed by the combination of NO and oxygen through internal combustion. Long-term exposure to NO_2 can aggravate respiratory diseases, such as asthma, leading to increased hospital admissions (EPA 2019c). Controlled studies demonstrate effects (airway reactivity) among asthmatics at a short-term (less than 3 hours) exposure to 0.3 parts per

million (ppm) NO₂. Effects among healthy individuals occurred at high levels of exposure (1.5 to 2 ppm) (McConnell et al. 2002). For reference, the 1-hour CAAQS for NO₂ is 0.18 ppm (see Table 4.2-3). In addition to human health effects, NO₂ can also reduce visibility and react with water, oxygen, and other chemicals to contribute to acid rain, which can harm sensitive ecosystems (EPA 2019c).

- **Carbon monoxide** is a colorless, odorless, toxic gas produced by incomplete combustion of carbon substances, such as gasoline or diesel fuel. In the study area, high CO levels are of greatest concern during the winter, when periods of light winds combine with the formation of ground-level temperature inversions from evening through early morning. These conditions trap pollutants near the ground, reducing the dispersion of vehicle emissions. Moreover, motor vehicles exhibit increased CO emission rates at low air temperatures. The primary adverse health effect associated with CO is interference with normal oxygen transfer to the blood, which may result in tissue oxygen deprivation. Exposure to CO at concentrations above the CAAQS or NAAQS (see Table 4.2-4) can also cause fatigue, headaches, confusion, dizziness, and chest pain. There are no ecological or environmental effects from ambient CO (CARB 2019a).
- **Particulate matter** consists of finely divided solids or liquids such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now regulated—inhalable coarse particles, or PM₁₀, and inhalable fine particles, or PM_{2.5}. Particulate discharge into the atmosphere results primarily from industrial, agricultural, construction, and transportation activities. However, wind on arid landscapes also contributes substantially to local particulate loading. Additionally, secondary formation of PM, primarily in the form of fine particulate, occurs through the chemical transformation of precursors such as NO_x, SO₂, ammonia, and VOCs.

Particulate pollution can be transported over long distances and may adversely affect humans, especially people who are naturally sensitive or susceptible to breathing problems. Numerous studies have linked PM exposure to premature death in people with preexisting heart or lung disease. Other symptoms of exposure may include nonfatal heart attacks, irregular heartbeat, aggravated asthma, decreased ~~lung~~ lung function, and increased respiratory symptoms. Exposure to concentrations of PM above the current ambient air quality standards may result in these health effects (EPA 2019d). Similar to O₃, the elderly and those with preexisting heart and lung diseases are at greater risk to the harmful effects of PM exposure. Children are also at increased risk because they breathe faster than adults, and therefore inhale more air per pound of body weight and tend to spend more time outdoors. The CAAQS and NAAQS for PM are set to protect these sensitive populations and define the number of particles that can be present in outdoor air without threatening the health of infants, children, or the elderly (CARB 2015). The CAAQS and NAAQS for PM are shown in Table 4.2-4.

Depending on their compositions, both PM₁₀ and PM_{2.5} can also affect water quality and acidity, deplete soil nutrients, damage sensitive forests and crops, affect ecosystem diversity, and contribute to acid rain (EPA 2019e).

- **Sulfur dioxide** is a product of fuel combustion. The predominant source of SO₂ emissions within the County is mobile source fuel combustion, primarily aircraft, ocean going vessels (OGVs), and on-road vehicles. In recent years emissions of SO₂ have been significantly reduced by the increasingly stringent controls placed on the sulfur content of fuels used in stationary sources and mobile sources. SO₂ is a precursor to fine PM formation in the form of sulfates, such as ammonium sulfate. Short-term exposure to SO₂ can aggravate the respiratory system, making breathing difficult. Controlled laboratory studies indicate that brief exposure (5 to 10 minutes)

of exercising asthmatics to an average SO₂ level of 0.4 ppm can result in increases in air resistance. Healthy adults do not show any symptoms to SO₂ at levels as high as 1 ppm, even after up to 3 hours of exposure. Based on the concentration needed to protect sensitive individuals (e.g., asthmatics), CARB and EPA have adopted the CAAQS and NAAQS for SO₂ (see Table 4.1-5) (SCAQMD 2017). In addition to public health impacts, SO₂ can also affect the environment by damaging foliage and decreasing plant growth (EPA 2019e).

- **Lead** is a soft metal that was previously added to gasoline and emitted to the environment through motor vehicle exhaust. Since lead was removed from gasoline, emissions have declined, and the primary source of emissions is now metal processing facilities and leaded aviation gasoline. Lead can also be resuspended into the air when contaminated soil or paints are disturbed. Lead emissions can be inhaled and ingested, leading to accumulation of lead particles in bone. Lead exposure can lead to cognitive function decrements, behavioral problems, kidney and heart disease, decreased immunity and red blood cell counts, and reproductive and developmental effects (CARB 2019b).

Health Effects of Criteria Air Pollutants

Criteria air pollutants are recognized to have a variety of health effects on humans. Research by CARB shows that exposure to high concentrations of air pollutants can trigger respiratory diseases—such as asthma, bronchitis, and other respiratory ailments—and cardiovascular diseases. A healthy person exposed to high concentrations of air pollutants may become nauseated or dizzy, may develop a headache or cough, or may experience eye irritation and/or a burning sensation in the chest. Ozone is a powerful irritant that attacks the respiratory system, leading to the damage of lung tissue. Inhaled PM, NO₂, and SO₂ can directly irritate the respiratory tract, constrict airways, and interfere with the mucous lining of the airways. Exposure to CO, when absorbed into the bloodstream, can endanger the hemoglobin, the oxygen-carrying protein in blood, by reducing the amount of oxygen that reaches the heart, brain, and other body tissues. When air pollutant levels are high, children, the elderly, and people with respiratory problems are advised to remain indoors. Outdoor exercise also is discouraged because strenuous activity may cause shortness of breath and chest pains. A brief summary of the criteria pollutants and their effects on human health and the environment is provided in Table 4.2-5.

Table 4.2-5. Health Effects Summary of the Major Criteria Air Pollutants

Pollutants	Sources	Primary Effects
Ozone (O ₃)	<ul style="list-style-type: none"> • Atmospheric reaction of organic gases with NO₂ in sunlight 	<ul style="list-style-type: none"> • Aggravation of respiratory and cardiovascular diseases • Irritation of eyes • Impairment of cardiopulmonary function • Plant leaf injury

Toxic Air Contaminants

TACs are pollutants that have no ambient standard but pose the potential to increase the risk of developing cancer or acute or chronic health risks. The most relevant TAC associated with the proposed project is diesel particulate matter (DPM), which was established as a TAC in 1998, while some of the chemicals in diesel exhaust, such as benzene and formaldehyde, had previously been identified as TACs and listed as carcinogens under either the State's Proposition 65 or Federal Hazardous Air Pollutants program. Diesel engines emit a complex mixture of air pollutants, including both gaseous and solid material. The solid material in diesel exhaust is known as DPM. More than 90 percent of DPM is less than 1 micrometer (µm) in diameter (about 1/70th the diameter of a human hair), and thus is a subset of PM10 (10 µm and smaller) and PM2.5 (2.5 µm and smaller) (CARB 2021b).

For TACs like DPM that are known or suspected carcinogens, CARB has consistently found that there are no levels or thresholds below which exposure is risk-free. Therefore, no NAAQS or CAAQS exist for TACs. Individual TACs vary greatly in the risks they present. At a given level of exposure, one TAC may pose a hazard that is many times greater than another. TACs are identified and their toxicity is studied by the California Office of Environmental Health Hazard Assessment (OEHHA). Adverse health effects of TACs can be carcinogenic (cancer-causing), short-term (acute)

noncarcinogenic, and long-term (chronic) noncarcinogenic. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders.

4.2.2.4 Background Air Quality and Health Risk

Regional Criteria Pollutant Inventory and Forecast

CARB compiles annual statewide emission inventories in its emission-related information database, the California Emission Inventory Development and Reporting System (CEIDARS). Emission projections for past and future years are generated using the California Emission Projection Analysis Model (CEPAM) to track progress meeting emission reduction goals and mandates. CEPAM utilizes the most current growth and emissions control data available (and agreed upon by the stakeholder agencies) to provide comprehensive emission projections for each year from 2000 to 2035. Emissions are projected by source (e.g., mobile, stationary, area) and sub-category (e.g., light duty automobiles, electricity, and consumer products). An inventory of the 2016 and future (2030 and 2035) regional projections for the SDAB is presented in Table 4.2-6. Emissions are summarized by general source category.

Table 4.2-6. Estimate of SDAB Emissions by Source (tons per day)

Emission Source	ROG	NO_x	CO	SO_x	PM₁₀	PM_{2.5}
2016

Note: Totals may not sum exactly due to rounding.

Regional Toxic Air Contaminants and Health Risk

Between 1990 and 2007, CARB monitored outdoor concentrations for various TACs at two sites in the SDAB: Chula Vista and El Cajon. Based on this information, CARB estimated the overall ambient risk from all pollutants in the SDAB at 607 chances per million, 420 chances per million of which

were attributed to DPM (CARB 2009). Note that DPM is not directly monitored because an accepted measurement method does not currently exist, but CARB estimated concentrations based on monitored PM10 data and the results from several studies on chemical speciation of ambient data (e.g., ratio of DPM to monitored PM10).

Local Criteria Pollutant Emissions Within the Proposed PMPU Area

As discussed in detail in Section 4.9, the proposed PMPU area comprises approximately 3,535 acres of water and 2,403 acres of land in and around the Bay and along the Imperial Beach oceanfront. Existing activities take place within the proposed PMPU area that generate criteria pollutant emissions and TACs. Each of the planning districts has a combination of unique emission sources, resulting in varying emission levels by planning district. For example, emission sources within PD4 include ocean-going vessels, refrigerated warehousing, locomotives, and shipyard activities, whereas emission sources within PD1 include motor vehicles, recreational boating slips and boat launches, and fishing vessels. A summary of general water and land uses and emission sources by planning district is given in Table 4.2-7.

Table 4.2-7. Water and Land Uses and Emissions Sources by Planning District

Planning District ¹	Water and Land Uses	Emission Sources and Types
PD1: Shelter Island	Hotels, restaurants, yacht- or marine-related businesses, fishing piers, boat launches	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC) • Building utilities (NO_x and VOC) • Recreational and fishing vessels (NO_x, VOC, and PM)
PD2: Harbor Island	Hotels, restaurants, yacht- or marine-related businesses, airport parking, auto repair facilities, rental car facilities, Harbor Police, District headquarters	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC) • Building utilities (NO_x and VOC) • Recreational vessels (NO_x, VOC, PM) • District-owned equipment and vessels (NO_x, VOC, and PM)
PD3: Embarcadero	Hotels, restaurants, retail, museum, marine-related businesses, fishing piers, Convention Center, public parks, cruise ship terminal, manufacturing	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC) • Building utilities (NO_x and VOC) • Recreational and fishing vessels (NO_x, VOC, PM) • Maritime (NO_x, VOC, and PM) • Manufacturing (air toxics, NO_x, VOC, and PM)
PD4: Working Waterfront	Industrial and refrigerated warehouses, open storage, rail, marine shipping, fishing piers, public parks, ship building and repair	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC) • Shipyard (air toxics and PM) • Maritime (NO_x, VOC, and PM) • Rail (NO_x, VOC, and PM) • Building utilities (NO_x and VOC)
PD7: South Bay	Open space wetland and natural vegetation, marshy habitat conservation area, salt evaporation ponds	<ul style="list-style-type: none"> • No emissions
PD8: Imperial Beach Oceanfront	Beach, public parks, open water	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC)

Planning District ¹	Water and Land Uses	Emission Sources and Types
PD9: Silver Strand	Beach, public parks, open water, hotel, restaurants, yacht- or marine-related businesses	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC) • Building utilities (NO_x and VOC) • Recreational and fishing vessels (NO_x, VOC, PM)
PD10: Coronado Bayfront	Hotels, restaurants, retail, public parks, ferry landing, golf course, yacht- or marine-related businesses	<ul style="list-style-type: none"> • Motor vehicles (NO_x and VOC) • Building utilities (NO_x and VOC) • Recreational vessels (NO_x, VOC, PM)

¹ Planning District 5 and PD6 are not a part of the proposed PMPU geographic boundary (See Chapters 2 and 3 – *Environmental Setting* and *Project Description*)

Table 4.2-8 summarizes the existing daily criteria pollutant emissions generated by maritime commerce activity, as shown in the 2016 Maritime Air Emissions Inventory (District 2018). Note that emissions in Table 4.2-8 include activity within all planning districts, including PD5 and PD6, and match the totals in the 2016 inventory document.

Table 4.2-8. Summary of Maritime Criteria Pollutant Emissions in the Proposed PMPU Area (tons per year)

Sector	VOC	CO	NO _x	PM10	PM2.5	DPM	SO ₂
Ocean-Going Vessels	20	32	323	8	7	6	15
Harbor Craft	29	183	235	8	8	8	<1

Freight Rail	2	8	30	1	1	1	1
On-Road Vehicles	3	12	51	<1	<1	<1	<1
Total Emissions	59	261	653	17	16	16	18

Source: 2016 Maritime Air Emissions Inventory (District 2018).

Note: Emissions include all planning districts, including those that are not a part of the PMPU geographic boundary. Totals may not sum exactly due to rounding. Emissions are as of calendar year 2016.

Local Diesel Particulate Matter Emissions Within the Proposed PMPU Area

Maritime emissions occur within District boundaries, within San Diego Bay, and outside of both the Bay and District boundaries. A summary of DPM emissions associated with maritime operations is shown in Table 4.2-9. DPM emissions are summarized for activities that occur at or near the terminals and activities that occur away from the terminals. DPM emissions are presented by planning district and are shown in pounds of DPM per year.

Sources of emissions within the District boundary and within the Bay include:

- OGV maneuvering and hoteling.
- Harbor craft activity within the harbor.
- All cargo handling equipment emissions.
- Heavy-duty truck idling and movement at the terminals, along with all new car offloading Locomotive switching.

Sources of emissions outside of the District boundary and the Bay include:

- OGV transit within and outside the vessel speed reduction (VSR) zone, along with OGV anchorage.
- Harbor craft activity outside of the harbor.
- Heavy-duty truck movements between the terminal gates and regional locations, along with all cruise ship terminal passenger car, shuttle, and bus activity.
- Locomotive line-haul between the terminals and the county line.

Table 4.2-9. Summary of Maritime Diesel Particulate Matter Pollutant Emissions by Planning District (pounds per year)

At Terminals and Within Bay						Away from Terminal and Bay				
Planning District	OGV ¹	CHC ²	CHE	Truck	Rail	OGV	CHC	CHE	Truck	Rail
PD1: Shelter Island	--	1,457	--	--	--	--	2,536	--	--	--
PD2: Harbor Island	--	316	--	--	--	--	106	--	--	--
PD3: Embarcadero	2,337	2,247	--	--	--	1,257	1,408	--	7	--
PD4: Working Waterfront	1,384	1,715	916	17	3	425	142	--	397	32
PD7: South Bay	--	316	--	--	--	--	106	--	--	--
PD8: Imperial Beach Oceanfront	--	316	--	--	--	--	106	--	--	--
PD9: Silver Strand	--	316	--	--	--	--	106	--	--	--
PD10: Coronado Bayfront	--	757	--	--	--	--	117	--	--	--
Total	7,225	10,643	1,036	20	595	5,019	4,903	--	527	1,881
Total by Area						19,519				
Total Overall						31,849				

Source: 2016 Maritime Air Emissions Inventory (District 2018).

Note: Totals may not sum exactly due to rounding. Emissions are as of calendar year 2016.

¹ Of the DPM shown for OGVs near the terminal and within the Bay, 78–79% is at-berth (hotel) and 21–22% is maneuvering within the harbor but away from the terminal.

² 100% of CHE activity is at the terminals.

OGV = ocean going vessels; CHC = commercial harbor craft; CHE = cargo handling equipment.

As shown, the majority of DPM emissions occur within the Bay and near the terminals, primarily due to commercial harbor craft activity, OGV hoteling at the terminals, OGV maneuvering within the Bay, and cargo handling equipment at the terminals. The only sources with a greater share outside of the terminal area are associated with truck and rail activity.

Local Health Risk near the Proposed PMPU Area

OEHHA maintains the California Communities Environmental Health Screening Tool (CalEnviroScreen), which provides a relative ranking of communities based on a selected group of environmental, health, demographic, and socioeconomic indicators. The resultant score is the relative pollution burden and vulnerabilities in one census tract compared to others; the score is not a measure of health risk. Each tract's score is then ranked relative to all areas in the state. Those areas with a high score and percentile have relatively high pollution burdens and population sensitivities; those areas with low score and percentile values have relatively lower pollution burdens and population sensitivities. Neighborhoods near PD4 represent some of the highest pollution burden rankings in the state, whereas neighborhoods near PD1 and PD10 represent some of the lowest pollution burden rankings. Thirty-eight communities in the San Diego region, including several adjacent to the proposed PMPU area, have been identified as disadvantaged and will be the target of cap-and-trade investment to improve public health, quality of life, and economic opportunity (Cal/EPA 2018).

While the results of CalEnviroScreen provide information on background pollution that allows the State to prioritize funding resources, the scoring results are not directly applicable to project-level or cumulative impact analyses required under the California Environmental Quality Act (CEQA) (Cal/EPA 2018). The information presented herein regarding CalEnviroScreen is for illustrative and informational purposes only.

The proposed PMPU area (collectively known in the Community Air Protection Program as the *Community of Portside Environmental Justice Neighborhoods* [Portside Community])² includes several census tracts with high ratings as part of the CalEnviroScreen 3.0. Rankings for the Community Air Protection Program are based on CalEnviroScreen 3.0, which was adopted in January 2017. An update to CalEnviroScreen (CalEnviroScreen 4.0) was released for public review in January 2021, and a new version with revisions was released in October 2021. The Portside Community includes four census tracts that are in the 98th percentile in the state and another eight that are in the 85th percentile. Over 50,000 residents live in this area and are subject to pollution exposure (SDAPCD 2016b). The Portside Community, along with other areas selected for monitoring throughout the state, will see additional new actions through potential regulations, focused incentive investments, enforceable agreements, and engagement with local land use authorities to reduce emissions and exposure to air pollution.

4.2.3 Laws, Regulations, Plans, and Policies

The air quality management agencies of direct importance in the proposed PMPU area are EPA, CARB, and SDAPCD. EPA has established Federal air quality standards for which CARB and SDAPCD have primary implementation responsibility. CARB and SDAPCD are also responsible for ensuring that State air quality standards are met. The following sections describe the laws, regulations, plans, and policies related to air quality.

² The Community of Portside Environmental Justice Neighborhoods includes Barrio Logan and portions of National City, Sherman Heights, and Logan Heights. This includes the following census tracts: 6073005000, 6073004900, 6073003902, 6073003601, 6073003901, 6073005100, 6073003603, 6073004000, 6073003502, 6073021900, 6073004700, and 6073011602.

4.2.3.1 International Regulations

International Maritime Organization International Convention for the Prevention of Pollution from Ships Annex VI

The International Maritime Organization (IMO) International Convention for the Prevention of Pollution from Ships (MARPOL) Annex VI, which came into force in May 2005, set new international NO_x emission limits on marine engines over 130 kilowatts (kW) installed on new vessels retroactive to the year 2000. In October 2008, IMO adopted amendments to international requirements under MARPOL Annex VI, which introduced NO_x emission standards for new engines and more stringent fuel quality requirements (DieselNet 2013, IMO 2008). The Annex VI North American Emission Control Area (ECA) requirements applicable to the plan include the following.

- Caps on the sulfur content of fuel as a measure to control sulfur oxide (SO_x) emissions and, indirectly, PM emissions. For ECAs, the sulfur limits were capped at 1.0 percent starting in 2012 and 0.1 percent starting in 2015.³ The analysis herein assumes full compliance with MARPOL Annex VI SO_x limits. The proposed PMPU area is within an ECA.
- NO_x engine emission rate limits for new engines. Tier I and Tier II limits effective 2000 and 2011 are global limits, whereas Tier III limits, effective in 2016, apply only in NO_x ECAs.

4.2.3.2 Federal

Federal Clean Air Act and National Ambient Air Quality Standards

The CAA was first enacted in 1963 and has been amended numerous times in subsequent years (1967, 1970, 1977, and 1990). The CAA establishes the NAAQS and specifies future dates for achieving compliance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for local areas not meeting those standards. The plans must include pollution control measures that demonstrate how the standards will be met. Because the Port of San Diego is within the SDAB, it is in an area designated as nonattainment for certain pollutants that are regulated under the CAA.

The 1990 amendments to the CAA identify specific emission-reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable progress toward attainment and incorporation of additional sanctions for failure to attain or meet interim milestones. The sections of the CAA that are most applicable to the plan are Title I (Nonattainment Provisions) and Title II (Mobile-Source Provisions).

Title I provisions were established with the goal of attaining the NAAQS for criteria pollutants. Table 4.2-10 shows the NAAQS currently in effect for each criteria pollutant. The NAAQS were amended in July 1997 to include an 8-hour standard for O₃ and adopt a standard for PM_{2.5}. The 8-hour O₃ NAAQS was further amended in October 2015.

³ The sulfur requirements in ECAs are 1.0% as of July 2010 and 0.1% starting in January 2015. North America was designated as an ECA in August 2012, and the sulfur requirements became applicable at the time of designation.

Table 4.2-10. Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	CAAQS¹	NAAQS²
Ozone (O ₃)	1 hour	0.09 ppm ³	--
	8 hour	0.070 ppm	0.070 ppm
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm
	8 hour	9.0 ppm	9 ppm
Nitrogen Dioxide (NO ₂)	1 hour	0.18 ppm	100 ppb
	Annual Arithmetic Mean	0.030 ppm	53 ppb
Sulfur Dioxide (SO ₂)	1 hour	0.25 ppm	75 ppb
	24 hour	0.04 ppm	0.14 ppm
Respirable Particulate Matter (PM ₁₀)	24 hour	50 µg/m ³	150 µg/m ³
	Annual Arithmetic Mean	20 µg/m ³	--
Fine Particulate Matter (PM _{2.5})	24 hour	--	35 µg/m ³
	Annual Arithmetic Mean	12 µg/m ³	12.0 µg/m ³
Sulfates	24 hour	25 µg/m ³	--
Lead (Pb)	30 day average	1.5 µg/m ³	--
	Calendar quarter	--	1.5 µg/m ³
	Rolling 3-Month Average	--	0.15 µg/m ³
Hydrogen Sulfide	1 hour	0.03 ppm	--
Vinyl Chloride	24 hour	0.01 ppm	--

Source: CARB 2016a.

¹ The CAAQS for O₃, CO, SO₂ (1-hour and 24-hour), NO₂, PM₁₀, and PM_{2.5} are values not to be exceeded. All other California standards shown are values not to be equaled or exceeded.

² The NAAQS, other than O₃ and those based on annual averages, are not to be exceeded more than once a year. The O₃ standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For PM_{2.5}, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, is equal to or less than the standard.

EPA Emission Standards

EPA has adopted regulations to limit emission from all sources of emissions. EPA regulates the emissions from mobile sources by setting standards for the specific pollutants being emitted. Emissions standards set limits on the amount of pollution a vehicle or engine can emit. Mobile source emission standards have been established for light-duty vehicles, trucks, and motorcycles; heavy duty trucks; and non-road engines, including aircraft, locomotives, marine vessels, and recreational engines and vehicles. The EPA has also established gasoline and diesel fuel standards (EPA 2017).

The following describes the emission standards for sources analyzed in this PEIR.

Large Marine Diesel Engines—Category 3 Engines

Category 3 engines have engine displacements per cylinder greater than 30 liters. Category 3 engines are propulsion engines on OGVs. To reduce emissions from these engines, EPA established 2003 Tier 1 NO_x standards for marine diesel engines above 30 liters per cylinder, and large Category

3 marine propulsion engines on U.S. flagged OGVs (40 Code of Federal Regulations [CFR] Parts 9 and 94) (68 *Federal Register* [FR] 9745–9789). The standards went into effect for new engines built in 2004 and later. Tier 1 limits were achieved by engine-based controls, without the need for exhaust gas after-treatment.

In December 2009, EPA adopted Tier 2 and Tier 3 emissions standards for newly built Category 3 engines installed on U.S. flagged vessels, as well as marine fuel sulfur limits. The Tier 2 and 3 engines standards and fuel limits are equivalent to the amendments to MARPOL Annex VI. Tier 2 NO_x standards for newly built engines applied beginning in 2011 and require the use of engine-based controls, such as engine timing, engine cooling, and advanced electronic controls. Tier 3 standards began in 2016 in ECAs and are met with the use of high-efficiency emission control technology, such as selective catalytic reduction. The Tier 2 standards are anticipated to result in a 15–25 percent NO_x reduction below the Tier 1 levels; Tier 3 standards are expected to achieve NO_x reductions 80 percent below the Tier 1 levels (DieselNet 2013). In addition to the Tier 2 and Tier 3 NO_x standards, the final regulation established standards for hydrocarbons and CO.

Locomotives

To reduce emissions from switch and line-haul locomotives, EPA established a series of increasingly strict emission standards for new or remanufactured locomotive engines (63 FR 18997–19084). Tier 0 standards, effective as of 2000, applied to engines manufactured or remanufactured from 1973 to 2001. Tier 1 standards applied to engines manufactured/remanufactured from 2002 to 2004. Tier 2 standards applied to engines manufactured/remanufactured after 2004.

In 2008, EPA strengthened the Tier 0 through 2 standards to apply to existing locomotives and introduced more stringent Tier 3 and 4 emission requirements (73 FR 88 25098–25352). Tier 3 standards, met by engine design methods, were phased in between 2011 and 2014. Tier 4 standards, which are expected to require exhaust gas after-treatment technologies, became effective starting in 2015 (DieselNet 2015).

Non-Road Diesel Engines

To reduce emissions from non-road diesel equipment, EPA established a series of increasingly strict emission standards for new non-road diesel engines. Tier 1 standards were phased in on newly manufactured equipment from 1996 through 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in on newly manufactured equipment from 2001 through 2006. Tier 3 standards were phased in on newly manufactured equipment from 2006 through 2008. Tier 4 standards, which require advanced emission control technology to attain them, were phased in between 2008 and 2015.

Non-Road Diesel Fuel Rule

With this rule, EPA set sulfur limitations for non-road diesel fuel, including large recreational vessels, locomotives, and harbor craft that frequent the Port of San Diego. This rule affects the diesel-powered recreational and excursion vessels that visit the proposed PMPU area. Under this rule, the diesel fuel was limited to 500 ppm starting June 1, 2007, and further limited to 15 ppm sulfur content (ultra-low-sulfur diesel) starting January 1, 2010, for non-road fuel, and June 2012 for marine fuels (EPA 2004).

On-Road Diesel Fuel Rule

In December 2000, EPA signed the Heavy-Duty Highway Rule, which reduces emissions from on-road, heavy-duty diesel trucks by establishing a series of increasingly strict emission standards for new engines. Manufacturers were required to produce new diesel vehicles that meet PM and NO_x emission standards beginning with model year 2007 with the phase-in period being between 2007 and 2010. The phase-in was based on a percent-of-sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010 (EPA 2000).

Corporate Average Fuel Economy Standards

The Corporate Average Fuel Economy Standards (CAFE) were first enacted in 1975 to improve the average fuel economy of cars and light duty trucks.

On August 2, 2018, the National Highway Traffic Safety Administrative (NHTSA) and EPA proposed to amend the fuel efficiency standards for passenger cars and light trucks and establish new standards covering model years 2021 through 2026 by maintaining the current model year 2020 standards through 2026 (Safer Affordable Fuel-Efficient [SAFE] Vehicles Rule). On September 19, 2019, EPA and NHTSA issued a final action on the One National Program Rule, which is consider Part One of the SAFE Vehicles Rule and a precursor to the proposed fuel efficiency standards. The One National Program Rule enables EPA/NHTSA to provide nationwide uniform fuel economy and greenhouse gas (GHG) vehicle standards, specifically by (1) clarifying that Federal law preempts state and local tailpipe GHG standards, (2) affirming NHTSA's statutory authority to set nationally applicable fuel economy standards, and (3) withdrawing California's CAA preemption waiver to set State-specific standards.

EPA and NHTSA published their decisions to withdraw California's waiver and finalize regulatory text related to the preemption on September 27, 2019 (84 FR 51310). California, 22 other states, the District of Columbia, and two cities filed suit against Part One of the SAFE Vehicles Rule on September 20, 2019 (*California et al. v. United States Department of Transportation et al.*, 1:19-cv-02826, U.S. District Court for the District of Columbia). On October 28, 2019, the Union of Concerned Scientists, Environmental Defense Fund (EDF), and other groups filed a protective petition for review after the Federal government sought to transfer the suit to the D.C. Circuit (*Union of Concerned Scientists v. National Highway Traffic Safety Administration*). Opening briefs for the petition are currently scheduled to be completed on November 23, 2020. The lawsuit filed by California and others is stayed pending resolution of the petition.

EPA and NHTSA published final rules to amend and establish national CO₂ and fuel economy standards on April 30, 2020 (Part Two of the SAFE Vehicles Rule) (85 FR 24174). The revised rule changes the national fuel economy standards for light duty vehicles from 50.4 mpg to 40.5 mpg in future years. This new rule rolls back California fuel efficiency standards for on-road passenger vehicles. California and 22 other states are currently challenging this new rule in the court system, and it is probable that the State will be successful in its legal challenges, for the reasons outlined in the State's lawsuit⁴ and on the CARB website (CARB 2021b). In August 2021, NHTSA and EPA proposed to revise the fuel economy and GHG emissions standards for passenger cars and light

⁴ *State of California et al. v. Chao et al.* (Case 1:19-cv-02826) available at: https://oag.ca.gov/system/files/attachments/press_releases/California%20v.%20Chao%20complaint%20%280000002%29.pdf

trucks for Model Years 2023–2026, and a Draft Supplemental Environmental Impact Statement was released for public review that month. Additionally, NHTSA and EPA will begin work to develop fuel economy standards for passenger cars and light duty trucks for model years 2027–2030, as well as heavy-duty fuel efficiency standards beginning as early as model year 2027 (NHTSA 2021a, NHTSA 2021b).

Federal Hazardous Air Pollutant Regulations

The 1990 Amendments to the CAA included a provision to address air toxics and hazardous air pollutants (HAPs). Under Title III of the CAA, EPA establishes and enforces National Emission Standards for Hazardous Air Pollutants (NESHAPs), which are nationally uniform standards oriented toward controlling particular HAPs. Section 112(b) of the CAA identifies 189 “Air Toxics” (HAPs, since modified to 187 pollutants), directs EPA to identify sources of the HAPs, and establishes a 10-year time period for EPA to issue technology-based emissions standards for each source category. Emission standards have been developed for all of the stationary source categories under 40 CFR 63. Title III of the CAA provides for a second phase under which EPA is to assess residual risk after the implementation of the first phase of standards and impose new standards, when appropriate, to protect public health.

In 2011, EPA identified nine compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers or contributors and non-cancer hazard contributors from the National Air Toxics Assessment (EPA 2018). These significant contributors include 1,3-butadiene, acetaldehyde, acrolein, benzene, DPM, ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter. While the Federal Highway Administration (FHWA) considers these the priority mobile source air toxics, the list is subject to change and may be adjusted in consideration of future EPA rules (FHWA 2016).

4.2.3.3 State

Clean Air Act

The California CAA, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. The CAAQS incorporate additional standards for most of the criteria pollutants and set standards for other pollutants recognized by the State. In general, the California standards are more health protective than the corresponding NAAQS. California has also set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. Table 4.2-10 shows the CAAQS currently in effect for each criteria pollutant.

CARB and local air districts bear responsibility for achieving California’s air quality standards, which are to be achieved through district-level air quality management plans that would be incorporated into the SIP. In California, EPA has delegated authority to prepare SIPs to CARB, which, in turn, has delegated that authority to individual air districts. CARB traditionally has established State air quality standards, maintaining oversight authority in air quality planning, developing programs for reducing emissions from motor vehicles, developing air emission inventories, collecting air quality and meteorological data, and approving SIPs.

The California CAA substantially adds to the authority and responsibilities of air districts. The California CAA designates air districts as lead air quality planning agencies, requires air districts to prepare air quality plans, and grants air districts authority to implement transportation control

measures. The California CAA also emphasizes the control of “indirect and area-wide sources” of air pollutant emissions. The California CAA gives local air pollution control districts explicit authority to regulate indirect sources of air pollution and to establish traffic control measures.

Toxic Air Contaminants Regulations

Tanner Air Toxics Act and Air Toxics Hot Spots Information and Assessment Act

California regulates TACs primarily through the Tanner Air Toxics Act (Assembly Bill [AB] 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588). The Toxic Air Contaminant Identification and Control Act (AB 1807) created California’s program to reduce exposure to air toxics. The Air Toxics “Hot Spots” Information and Assessment Act (AB 2588) supplements the AB 1807 program by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks. In August 1998, CARB identified particulate emissions from diesel-fueled engines as TACs. In September 2000, CARB approved a comprehensive diesel risk reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. As an ongoing process, CARB reviews air contaminants and identifies those that are classified as TACs. CARB also continues to establish new programs and regulations for the control of TACs, including DPM, as appropriate. Among the programs and strategies CARB has developed to reduce diesel emissions for various sources, many are applicable to sources that are present at the Port, including off-road sources (cargo-handling equipment, locomotives, construction equipment), on-road trucks (drayage trucks), and marine vessels (harbor craft, OGVs, and shore power).

Senate Bill 535 and Assembly Bill 1550

Senate Bill (SB) 535, signed into law in 2012, requires the California Environmental Protection Agency (Cal/EPA) to identify disadvantaged communities based on geographic, socioeconomic, public health, and environmental hazard criteria. It also requires that the investment plan developed and submitted to the Legislature pursuant to AB 1550 allocate no less than 25 percent of available proceeds from the carbon auctions held under AB 32 to projects that will benefit these disadvantaged communities. At least 10 percent of the available funds from these auctions must be directly invested in such communities. Because CalEnviroScreen has been developed to identify areas disproportionately affected by pollution and those areas whose populations are socioeconomically disadvantaged, it is well suited for the purposes described by SB 535 (Cal/EPA 2017).

Assembly Bill 617

AB 617, signed into law in 2017, established the Community Air Protection Program (CAPP), which requires new community-focused and community-driven action to reduce air pollution and improve public health in communities that experience disproportionate burdens from exposure to air pollutants. Communities identified for monitoring include the Portside Environmental Justice Neighborhoods of Barrio Logan as well as portions of National City, Sherman Heights, and Logan Heights. The SDAPCD will implement the CAPP in San Diego County, which will eventually lead to additional pollution monitoring and additional requirements through the following: accelerated installation of pollution controls on industrial sources like oil refineries, cement plants, and glass manufacturers; expanded air quality monitoring within communities; increased penalties for violations of emissions control limits; and greater transparency and improved public access to air

quality and emissions data through enhanced online web tools (SDAPCD 2016b). The AB 617 Steering Committee includes local stakeholders, technical and scientific experts, and members of local industry. In December 2019, CARB selected the Portside Community⁵ for a Community Emissions Reduction Program (CERP). The purpose of the CERP is to focus and accelerate new actions that go beyond existing State and regional programs to provide direct reductions in air pollution emissions and exposure within Portside communities. The CERP was presented in two phases. Phase I includes actions that have been fully developed and supported by all jurisdictions or organizations that have an implementation role. The Phase I Draft CERP was released in September 2020. The Phase II CERP was finalized by SDAPCD in July 2021, and includes 11 goals and 39 actions to achieve these emission reductions. Goals include reducing TAC emissions in the community, supporting electric freight truck infrastructure and upgrades, quantifying health risk from port and non-port activities, establishing health risk reduction goals, and implementing actions to achieve those goals (SDAPCD 2021b). The Portside Community's CERP was adopted by CARB's governing board in October 2021 (CARB 2021c). See a more detailed discussion of the CERP for the Portside communities under Section 4.2.3.4, *Local*, below

Diesel Fuel Regulation

With this rule, CARB set sulfur limitations for diesel fuel sold in California for use in on- and off-road motor vehicles (13 California Code of Regulations [CCR] 2281–2285, 17 CCR 93114). Under the rule, diesel fuel used in motor vehicles except harbor craft and intrastate locomotives has been limited to 500 ppm sulfur since 1993. The sulfur limit was reduced to 15 ppm on September 1, 2006. A Federal diesel rule similarly limited sulfur content nationwide to 15 ppm by October 15, 2006.

CARB Agreements with Class I Freight Railroads

1998 South Coast Locomotive Emissions Agreement

In 1998, CARB, Class I freight railroads operating in the SCAB (BNSF and Union Pacific Railroad [UP]), and EPA signed the 1998 Memorandum of Understanding (MOU), agreeing to a locomotive fleet average emissions program. The 1998 MOU required that, by 2010, the Class I freight railroad fleet of locomotives in the SCAB achieve average emissions equivalent to the NO_x emission standard established by EPA for Tier 2 locomotives (5.5 grams per brake horsepower-hour). BNSF and UP must continue to comply with the Tier 2 locomotive fleet average from 2010 to 2030. The MOU applies to both line-haul (freight) and switch locomotives operated by the railroads (CARB 1998). This MOU also provides emission reductions at the Port of San Diego because all trains arrive from and depart to the SCAB. As of 2014, BNSF's NO_x emission level is 5.2 grams per brake horsepower-hour, which is better than the MOU requirement.

2005 Railroad Statewide Agreement

In 2005, CARB, Class I freight railroads operating in the SCAB, and EPA signed the 2005 MOU agreeing to several program elements intended to reduce the emission impacts of railyard operations on local communities. The 2005 MOU includes a locomotive idling-reduction program, early introduction of lower-sulfur diesel fuel in interstate locomotives, and a visible emission

⁵ The Portside Community includes the neighborhoods of Barrio Logan, Logan Heights, and Sherman Heights in the City of San Diego, and West National City within National City.

reduction and repair program. The 2005 agreement also required a number of efforts to gather information and assess advanced technologies to further reduce locomotive and railyard emissions in the future, including the preparation of emission inventories and health risk assessments at the 17 major railyards in the state (including San Diego Railyard), community and air district involvement, evaluation and development of measures to further reduce impacts on local communities, and ongoing efforts to evaluate and assess advanced control technologies (CARB 2005b).

CARB Measures to Reduce Emissions from Goods Movement Activities

The majority of rules and regulations adopted to reduce emissions from goods movement have been focused on reducing the direct human health effects of emissions (e.g., localized sources of PM₁₀ and PM_{2.5}) as well as to attain air quality standards (e.g., reduce NO_x to meet O₃ NAAQS).

Emission Reduction Plan for Ports and Goods Movement in California

In April 2006, CARB approved the Emission Reduction Plan for Ports and Goods Movement in California (CARB 2006). This plan proposes measures that would reduce emissions from the main sources associated with port cargo-handling activities, including ships, harbor craft, terminal equipment, trucks, and locomotives. This effort was a step in implementing the Goods Movement Action Plan developed by the California Business, Transportation, and Housing Agency and Cal/EPA. The final Goods Movement Action Plan was released on January 11, 2007, and includes measures to address the various layers of the goods movement system throughout the state such as freeways, rail, and ports. The primary goal of the Goods Movement Action Plan is to reduce community exposure to air pollution and to meet Federal air quality standards for O₃ and PM_{2.5}. Most activities and regulations implemented at the State level to reduce emissions from activities related to goods movement can be traced to the Goods Movement Action Plan. Since its adoption, the State has adopted various regulations to reduce emissions and community exposure to air pollution, including but not limited to those reductions discussed below.

Airborne Toxic Control Measure for Diesel-Fueled Transport Refrigeration Units, Generator Sets, and Facilities Where Transport Refrigeration Units Operate

In 2011, CARB amended the 2004 rule designed to reduce the DPM emissions from in-use Transport Refrigeration Units (TRUs) and TRU generator set engines (13 CCR 2477). Under the rule, TRU engines are required to meet in-use performance standards by installing the required level of verified diesel emission control strategy or using an alternative technology. Compliance may also be maintained by replacing the engine with a cleaner new or rebuilt engine.

The in-use performance standards have two levels of stringency (Low Emission and Ultra Low Emission in-use performance standards) that are phased in per the compliance schedule set forth in the rule.

Regulations for Fuel Sulfur and Other Operational Requirements for OGVs Within California Waters and 24 Nautical Miles of the California Baseline

In July 2008, CARB approved the Regulation for Fuel Sulfur and Other Operational Requirements for Ocean-Going Vessels within California Waters and 24 Nautical Miles of the California Baseline (13 CCR 2299.2). These regulations have required ship main engines, auxiliary engines, and

auxiliary boilers operating in California waters since July 2009 to either use marine diesel oil with a maximum sulfur content of 0.5 percent or marine gas oil with a maximum sulfur content of 1.5 percent. By August 1, 2012, these source activities were required to meet a marine diesel oil limit of 0.5 percent or marine gas oil limit of 1.0 percent. By January 1, 2012, these source activities were required to meet a marine diesel or gas oil sulfur limit of 0.1 percent, which is now in effect.

Regulation to Reduce Emissions from Diesel Auxiliary Engines on OGVs While at Berth at a California Port

In December 2007, CARB adopted this regulation to reduce emissions from diesel auxiliary engines on OGVs while at berth for container, passenger cruise, and refrigerated cargo vessels (17 CCR 93118.3). The regulation requires that auxiliary diesel engines on OGVs (while at berth for container, passenger cruise, and refrigerator cargo vessels) be shut down for specified percentages of a fleet's visits and also for the fleet's at-berth auxiliary engine power generation to be reduced by the same percentages. Vessels can either plug into the electrical grid (i.e., shore power, otherwise known as cold-ironing or alternative maritime power) or use an alternative emission control device. The law sets compliance percentages that phase in over time. By 2014, vessel operators were required to shut down their auxiliary engines at berth for 50 percent of the fleet's vessel visits and also reduce their onboard auxiliary engine power generation by 50 percent. The specified percentages increased to 70 percent in 2017 and will increase to 80 percent in 2020. Vessel operators can also choose an emissions reduction equivalency alternative; the regulation requires a 10 percent reduction in OGV hoteling emissions starting in 2010, increasing in stringency to an 80 percent reduction by 2020 (CARB 2007). Note that in developing the at-berth regulation, CARB weighed three main factors in evaluating a vessel category: the frequency which a vessel visited a port, the time a vessel stays in port, and the power usage while docked. Based on these criteria, the at-berth regulation affects only container ships, passenger ships, and refrigerated-cargo ships at Los Angeles, Long Beach, Oakland, San Diego, San Francisco, and Hueneme (CARB 2013a). As noted, this regulation does not apply to auto carrier, roll-on/roll-off (RoRo), bulk carrier, or general cargo vessels.

In August 2020, CARB amended the regulation to extend the at-berth requirement to auto carriers, and RoRo vessels in 2025, tanker ships that visit the Ports of Los Angeles and Long Beach starting in 2025, and tanker ships that visit all other ports in 2027, while removing various exceptions that previously applied to container ships, refrigerated cargo ships, and passenger ships. Bulk and general cargo ships remain exempt.

Mobile Cargo-Handling Equipment at Ports and Intermodal Rail Yards

In December 2005, CARB approved the Regulation for Mobile Cargo-Handling Equipment at Ports and Intermodal Rail Yards (13 CCR 2479) designed to use best available control technology (BACT) to reduce diesel PM and NO_x emissions from mobile cargo-handling equipment at ports and intermodal rail yards. Since January 1, 2007, the regulation has imposed emission performance standards on new and in-use terminal equipment that vary by equipment type. The regulation also includes recordkeeping and reporting requirements.

In March 2018, CARB staff announced a plan to amend the regulation yet again to transition cargo handling equipment (CHE) to zero emissions by developing a regulation to minimize emissions and community health impacts. CARB staff plans to bring the amendment to its Board in 2022 with implementation to begin in 2026.

Commercial Harbor Craft Regulation

The Commercial Harbor Craft (CHC) regulation was adopted in 2007 to reduce emissions from diesel engines operating within 24 miles of the California coast (Regulated California Waters). The rule was amended in 2010 and will be fully implemented by 2022. The rule includes regulations for CHC vessels including ferries, tugboats, towboats, excursion vessels, crew and supply vessels, pilot vessels, work boats, and commercial and charter fishing boats (CARB 2020a).

Emission Standards and Test Procedures for Large Spark Ignition Engine Forklifts and Other Industrial Equipment

Since 2007, CARB has promulgated more stringent emissions standards for hydrocarbons and NO_x combined emissions and test procedures. The engine emission standards and test procedures were implemented in two phases. The first phase was implemented for engines built between January 2007 and December 2009. The second, more stringent, phase was implemented for engines built starting in January 2010. The regulation was amended in 2010, establishing fleet average emissions requirements for existing engines.

California Drayage Truck Regulation

CARB adopted the drayage truck regulation in December 2007 to modernize the class 8 drayage truck fleet (trucks with a Gross Vehicle Weight Rating [GVWR] greater than 33,000 pounds) in use at California's ports. Emergency vehicles and yard trucks are exempted from this regulation. The regulatory objective is to be achieved in two phases. By December 31, 2009, pre-1994 model year engines were to be retired or replaced with 1994 and newer model year engines. In addition, all drayage trucks with 1994 to 2003 model year engines were required to achieve an 85 percent PM emission reduction through the use of an CARB-approved Level 3 verified diesel emission control strategy. By December 31, 2013, all trucks operating at California ports must have complied with the 2007 and newer on-road heavy-duty engine standards.

In December 2010, CARB amended the regulation to include Class 7 drayage trucks with a GVWR between 26,000 and 33,001 pounds. CARB further expanded the definition of drayage trucks to include dry-offs, those non-compliant trucks that may not directly come to the ports to pick up/drop off cargo but that engage in moving cargo destined to or originating from port facilities and to/from near-port facilities or railyards (CARB 2013b).

On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation—Truck and Bus Regulation

In December 2011, CARB amended the existing 2008 Statewide Truck and Bus Regulation to modernize in-use heavy-duty vehicles operating throughout the state. Under this regulation, existing heavy-duty trucks are required to be replaced with trucks meeting the latest NO_x and PM BACT, or be retrofitted to meet these levels.

Trucks with a GVWR less than 26,000 pounds (most construction trucks) are required to replace engines with 2010 or newer engines, or equivalent, by January 2023. Trucks with a GVWR greater than 26,000 pounds (most drayage trucks) must meet PM BACT and upgrade to a 2010 or newer model year emissions equivalent engine pursuant to the compliance schedule set forth by the rule. By January 1, 2023, all model year 2007 class 8 drayage trucks are required to meet NO_x and PM BACT (i.e., EPA 2010 and newer standards) (CARB 2011).

On-Road Heavy-Duty Diesel Vehicle Idling Emission Reduction Regulation

CARB adopted this airborne toxic control measure (ATCM) in 2005 to limit diesel-fueled commercial motor vehicle idling. This regulation states that diesel vehicles with GVWR greater than 10,000 pounds shall not idle the vehicle's diesel-powered primary or auxiliary power system for greater than 5 minutes at any location (13 CCR 1956.8 and 2485). This regulation applies to all trucks used that visit the Port.

Sustainable Freight Action Plan

The Sustainable Freight Action Plan (Sustainable Freight Action Plan or Action Plan) provides an integrated action plan that establishes clear targets to improve freight efficiency, transition to zero-emission technologies, and increase the competitiveness of California's freight system. The Action Plan was developed by several State agencies and is a recommendation document that integrates investments, policies, and programs across several State agencies to help realize a singular vision for California's freight transport system. This Action Plan provides a recommendation on a high-level vision and broad direction to the Governor to consider for State agencies to utilize when developing specific investments, policies, and programs related to the freight transport system that serves California's transportation, environmental, and economic interest. Furthermore, the CARB 2017 Scoping Plan incorporates potential actions from the Action Plan that provide GHG emissions reduction benefits (CARB 2016b).

CARB is working on various strategies to improve freight efficiency and transition to zero-emission technologies, and increase competitiveness of California's freight system. The Action Plan will also identify State policies, programs, and investments to achieve these targets. The plan will be informed by existing State agency strategies, including the California Freight Mobility Plan, Sustainable Freight Pathways to Zero and Near-Zero Emissions Discussion Document, and Integrated Energy Policy Report, as well as broad stakeholder input. The Sustainable Freight: Pathways to Zero and Near-Zero Emissions Discussion Document sets out CARB's vision of a clean freight system, together with the immediate and near-term steps that CARB will take to support use of zero and near-zero emission technology to improve air quality and reduce health risk associated with goods movement.

Tractor-Trailer Greenhouse Gas Regulation

CARB approved the Tractor-Trailer Greenhouse Gas Regulation to reduce GHG emissions by requiring the use of aerodynamic tractors and trailers that are also equipped with low rolling resistance tires. The regulation applies to certain Class 8 tractors manufactured for use in California and is harmonized with the parallel EPA and NHTSA Phase 1 heavy-duty truck standards. CARB amended the Tractor-Trailer Greenhouse Gas Regulation in 2016 to align with EPA and NHTSA Phase 2 heavy-duty truck standards.

Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck Regulation in June 2020 to accelerate a large-scale transition of zero-emission medium- and heavy-duty vehicles. The regulation requires the sale of zero-emission medium- and heavy-duty vehicles as an increasing percentage of total annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55 percent of Class 2b–3 truck sales, 75 percent of Class 4–8 straight truck sales, and 40 percent of

truck tractor sales. Large employers including retailers, manufacturers, brokers, and others are required to report information about shipments and shuttle services to better ensure that fleets purchase available zero-emission trucks.

Executive Order N-79-20

Under Executive Order (EO) N-79-20, 100 percent of in-state sales of new passenger cars and trucks are to be zero-emission by 2035; 100 percent of in-state sales of medium- and heavy-duty trucks and buses are to be zero-emission by 2045 for all operations, where feasible, and by 2035 for drayage trucks; and 100 percent of off-road vehicles and equipment sales are to be zero-emission by 2035 where feasible. EO N-79-20 directs CARB to partner with the Governor's Office of Business and Economic Development and other agencies to develop a Zero-Emissions Vehicle Market Development Strategy, which was released in February 2021 (Governor's Office of Business and Economic Development 2021).

Fuel Economy Standards

Pavley I and II

AB 1493 (known as Pavley I) provided the nation's first GHG standards for automobiles. AB 1493 required CARB to adopt vehicle standards that will lower GHG emissions from new light-duty automobiles to the maximum extent feasible beginning in 2009. Additional strengthening of the Pavley standards (referred to previously as Pavley II and now referred to as the Advanced Clean Cars [ACC] measure) was adopted for vehicle model years 2017–2025 in 2012.

The SAFE Vehicle Rule Part One (discussed above) revokes California's authority to set its own GHG emissions standards and establish zero-emission vehicle (ZEV) mandates in California, which affects some of the underlying assumptions in CARB's EMFAC models. CARB staff has developed guidance and adjustment factors to apply that needs to be applied to EMFAC emissions outputs to adjust for the revised (reduced) ZEV sales in future years and associated increase in emissions.

Low Carbon Fuel Standard

The Low Carbon Fuel Standard (LCFS) mandates a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In September 2018, the LCFS regulation was amended to increase the statewide goal to a 20 percent reduction in carbon intensity of California's transportation fuels by at least by 2030. Note that while the LCFS regulation was amended and extended to ensure compliance with the 2030 Scoping Plan, CARB ultimately adopted a more stringent target (20 percent reduction in carbon intensity by 2030) than assumed in the 2030 Scoping Plan (18 percent reduction in carbon intensity by 2030). Therefore, future updates to the Scoping Plan are likely to include the more stringent version of the LCFS that was adopted by CARB. Note that the majority of the emissions benefits due to the LCFS come from the production cycle (upstream emissions) of the fuel rather than the combustion cycle (tailpipe).

Electric Vehicles

Zero-Emission Vehicle Program

The ZEV program is part of CARB's ACC package of coordinated standards that controls smog-causing pollutants and GHG emissions of passenger vehicles in California.

The program requires the largest automotive manufacturers (referred to as OEMs) to manufacture and deliver for sale in California a sufficient number of ZEV credit-producing vehicles (battery electric, plug-in hybrid electric, and fuel cell electric vehicles) such that each OEM attains specific ZEV credit and minimum ZEV floor percentages depending on the average of their overall annual in-state vehicle (passenger car and light-duty trucks) sales over a preceding 3-year period. The requisite ZEV credit and minimum ZEV floor percentages ramp up gradually through model year 2025.

Executive Order B-48-18

EO B-48-18 set targets of 200 hydrogen fueling stations and 250,000 electric vehicle (EV) chargers to support 1.5 million ZEVs by 2025, and put California on a path to 5 million ZEVs by 2030.

4.2.3.4 Local

San Diego Unified Port District Plans and Programs

The current Port Master Plan (PMP) is the governing land use document for physical development within the District; however, there are also other District programs that apply to air quality, and the District's Climate Action Plan has co-benefits to air quality.

The District adopted a Clean Air Program in 2007 with the goal of reducing air pollution from Port-related operations. In June 2019, the Board of Port Commissioners (Board) adopted Resolution No. 2019-084, which authorizes staff to update the District's 2007 Clean Air Program to align with the AB 617 Program, as well as other local and State initiatives that are designed to improve air quality. The resolution also directs staff to develop District-related plans, projects, and strategies to improve air quality in advance of project funding and to collaborate with partner agencies, tenants, and stakeholders to improve regional air quality.

The District installed California's first shore power system for passenger ships at the B Street Cruise Terminal in 2010, 4 years ahead of CARB's At-Berth Regulation. In 2014, the District installed shore power at the Tenth Avenue Marine Terminal (TAMT) to service refrigerated container vessels.

On April 13, 2021, the Board allocated funding to expand existing shore power capabilities at the CST to provide shore power to two cruise vessels simultaneously while at berth. This action will enable essentially all cruise ships that visit the Port to use shore power beginning on January 1, 2023, in accordance with CARB's updated At-Berth Regulation.

In addition, CARB's updated At-Berth Regulation requires RoRo vessels to use shore power beginning in 2025, and to submit a terminal compliance plan that explains how the terminal plans to comply with the updated At-Berth Regulation in December 2021. The District is currently working with Pasha Automotive (the terminal operator at the National City Marine Terminal) to complete the terminal compliance plan, as required by CARB.

Maritime Clean Air Strategy

The Maritime Clean Air Strategy (MCAS) is a strategic planning document, identifying goals and objectives that are consistent with the Board's and District's vision of health equity and a clean, sustainable, and modern seaport. The MCAS is intended to guide future decision-making at the District's marine terminals and shipyards and to provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. The MCAS assumes that certain conditions and advancements will be in place in support of the successful deployment of zero emission technologies and to meet the MCAS' long-term goals, including technological capability, deployment of necessary infrastructure, adequate resources for necessary capital expenditures, commercial availability of zero-emission vehicles and equipment, and an adequate number of trained personnel to service and maintain zero-emission vehicles and equipment.

The MCAS identifies a vision of *Health Equity for All*, sets an ambitious overarching goal of 100% Zero Emissions Trucks and Cargo Handling Equipment by 2030, and includes shorter term goals and objectives (through 2030). To reach the vision and overarching goal, ~~The~~ MCAS identifies ways of reducing emissions for the seven maritime-related emission sources (cargo handling equipment, commercial harbor craft, shipyards, heavy-duty trucks, Port fleet, OGVs, and rail) as well as three additional stakeholder priorities (community enrichment, public health, and enabling actions).

The underling intent of the MCAS is to reduce air pollutants and improve air quality in and around the working waterfront and the /portside communities. Along with the ambitious overarching goal of 100% Zero Emissions Trucks and Cargo Handling Equipment by 2030, the MCAS includes goals for harbor craft (transitioning ferries and assist tugs to zero or near-emission technologies), the Port's fleet (transition motor vehicles beginning in 2022, beginning transition of emergency vehicles and equipment [forklifts and lawn maintenance equipment] to zero emissions, and seek opportunities to advance lower emitting solutions for marine vessels), and OGVs (expand vessel speed reduction and shore power).

The MCAS includes two short-term goals for 2030 and complementary long-term goals. Short term goals for 2030 include the following:

- **Long-Term Goal for Trucks:** In advance of the State's goals identified in Executive Order No. N-79-20, attain 100 percent zero-emission truck trips by 2030 for all trucks that call to the Port's two marine cargo terminals.
- **Long-Term Goal for Cargo Handling Equipment:** In advance of the State's goals identified in Executive Order No. N-79-20, the transition of diesel cargo handling equipment to 100 percent zero-emission equipment by 2030.

Long-term goals include the following:

- **Long-Term Goal for Harbor Craft:** Tugboat-related DPM emissions identified in the District's Emissions Inventory (2019) will be reduced by half by transitioning to zero-emission/near-zero-emission technologies and/or other lower-emitting engines or alternative fuels.
- **Long-Term Goal for Port Fleet:** Transition Port-owned fleet of vehicles and equipment to zero-emission/near-zero-emission technologies in manner that meets operational needs and reduces emissions, as outlined below:

- Beginning in 2022, transition light-, medium-, and heavy-duty vehicles to zero-emission vehicles.
- Transition emergency vehicles to alternative fuels, including hybrid, electric, and/or low carbon fuels.
- Convert equipment, such as forklifts and lawn maintenance equipment, to zero-emissions equipment.
- Seek opportunities to advance lower-emitting solutions for marine vessels.
- **Long-Term Goal for Ocean-Going Vessels:** Equip marine terminals with shore power and/or an alternative technology to reduce ocean-going vessel emissions for ships that call to the Port.

The MCAS is intended to keep the District ~~ahead in front of~~ and ~~go beyond~~ State regulations. The MCAS will serve as a living document and ~~the District staff will periodically~~ regularly report to the Board, ~~including comprehensive updates every 2 years~~. The measures in the MCAS may change over time, based on Board direction or as technology improvements occur.

The draft revised MCAS was released for public review in August 2021, and ~~it was~~ adopted by the District ~~Board~~ in October 2021. The goals and objectives of the MCAS are aspirational, non-binding and to be pursued through a variety of means – both known and unknown, and subject to feasibility and technological advances. The MCAS identifies aspirational goals to reduce baseline air emissions that negatively impact air quality from the operation of maritime businesses; primarily the Ports two marine cargo terminals (TAMT and NCMT). Therefore, the goals and objectives of the MCAS specifically target the reduction of DPM from the main sources of emissions from Maritime operations: Heavy-duty Trucks, Rail, Cargo Handling Equipment, Harbor Craft, the Port's vehicle fleet and equipment, and Ocean-going Vessels.

Additionally, as the MCAS is a strategy plan, implementation of the MCAS is subject to future Board actions, as well as regular check-ins on a variety of topics including feasibility of implementation. The MCAS assumes the following conditions and advancements will be in place in support of the successful deployment of zero emission technologies at the Port of San Diego and to meet the MCAS' long-term goals:

- Capability: The state of technology meets the load, daily mileage, and hours of operations requirements, including cargo movements within the Port's marine cargo terminals, and ZEV Class 8 trucks will be in place for cargo transported to and from the Port's marine cargo terminals.
- Infrastructure: Zero emission infrastructure will be deployed and in place both within and outside of the San Diego region, with convenient charging locations and efficient charging capability.
- Capital Expenditures: Procurement costs of zero emission vehicles and equipment will continue to be offset by grants, subsidies, and other financing mechanisms to help achieve parity with traditionally powered vehicles and equipment. Additionally, it assumes technologies and markets will continue to mature.
- Commercial Availability: Commercial availability of vehicles and equipment will have increased, particularly with specialized equipment such as electric top handlers and auto carrier trucks.

- Education and Training: There will be an adequate number of trained service personnel to repair and maintain zero emission equipment and vehicles to ensure that there is no undue disruption of cargo and maritime operations.

While the MCAS focuses on advancing near-term objectives that will help accelerate the deployment of zero and near-zero emission technologies, the MCAS envisions these advancements being in place to support successful implementation of the MCAS goals and there will be contributions from other parties.

In alignment with its Vision Statement - “Health Equity for All” - the MCAS is intended to guide future Port District decision-making and “provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS.” The MCAS also recognizes that various means may be employed or pursued by the Port District to reduce emissions (including the adoption of regulatory standards, purchase of equipment, or strategic partnerships). Accordingly, an individual project does not necessarily impede or obstruct achievement of the MCAS’s goals or the ability of the Port District to consider, approve, and implement projects and/or initiatives toward achievement of the MCAS goals and objectives. The MCAS also explains, for instance, that it “is also anticipated that technological advances will result in additional options for implementation toward achievement of near-term goals and objectives.” To that end, the MCAS represents a strategy to be pursued by the District, through a variety of future means, measures, projects, and initiatives.⁶ As such, the MCAS goals and measures are crafted as to-be-implemented, if feasible and through future binding actions, by the District, but not necessarily on a project-by-project basis (i.e., see preparation of transition plans, coordination with stakeholders, working with the SDAPCD and CARB, and other measures). Nevertheless, to provide full informational disclosure and public participation, the Final PEIR, Appendix J, includes an analysis of whether the proposed project would conflict with, or obstruct, implementation of the MCAS⁷.

The goals and strategies will guide the District’s investments in zero-emissions technology and electrification and will allow the District to help tenants and terminal operators prioritize replacements over time. As noted in the MCAS document, the MCAS is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. The MCAS focuses on maritime and shipyard activities. Consistent with CEQA, any applicable future project undergoing environmental review will analyze the project’s potentially significant impacts against applicable thresholds, including whether that project will conflict with or obstruct implementation of an applicable air quality plan. Measures from both the MCAS and potentially the CERP will be applicable to new projects as they arise.

San Diego Air Pollution Control District Plans, Rules, and Regulations

Local air pollution control districts have the primary responsibility for the development and implementation of rules and regulations designed to attain the NAAQS and CAAQS, as well as the

⁶The MCAS defines “strategy” as a “generic term that encompasses plans, projects, programs, partnership, and various other efforts and initiatives that will help achieve a goal.”

⁷The 2018 update to the State CEQA Guidelines makes clear that analysis of a project’s consistency with applicable plans should not just be on conflicts with the plan but ***whether a conflict could result in a significant physical impact***. The conflict itself is not an impact. Again, the proposed project does not conflict with the MCAS (or the CERP).

permitting of new or modified sources, development of air quality management plans, and adoption and enforcement of air pollution regulations. SDAPCD is the local agency responsible for the administration and enforcement of air quality regulations in San Diego County.

Regional Air Quality Strategy and State Implementation Plan

CARB, SDAPCD, and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plan for attainment and maintenance of the ambient air quality standards in the SDAB. As discussed in Section 4.2.2.2, *Air Quality Conditions*, air quality has improved for a number of criteria pollutants over the previous decades despite increases in population and associated vehicle trips. San Diego County is currently in nonattainment for O₃ under the NAAQS and for O₃, PM₁₀, and PM_{2.5} under the CAAQS.

The San Diego Regional Air Quality Strategy (RAQS) outlines SDAPCD's plans and control measures designed to attain and maintain the State standards, while San Diego's portions of the SIP are designed to attain and maintain Federal standards. The RAQS was initially adopted in 1991 and is updated on a triennial basis. The RAQS was updated in 1995, 1998, 2001, 2004, 2009, and most recently in December 2016 (SDAPCD 2016b). The RAQS does not currently address the State air quality standards for PM₁₀ or PM_{2.5}. SDAPCD has also developed the air basin's input to the SIP, which is required under the Federal CAA for areas that are out of attainment of air quality standards. The most recent Federal plan is the 2020 Plan for Attaining the National Ozone Standards (2020 SIP), while the previous plan was the 2016 Plan for Attaining the National Ozone Standards (2016 SIP). Both the RAQS and SIPs demonstrate the effectiveness of CARB measures (mainly for mobile sources) and SDAPCD's plans and control measures (mainly for stationary and area-wide sources) for attaining the O₃ NAAQS (SDAPCD 2020b). For the 8-hour O₃ standard, the 2016 SIP outlines SDAPCD's portion of the SIP, and also outlines plans and control measures designed to attain and maintain the 8-hour O₃ NAAQS (2008 standard). The 2020 SIP outlines plans and control measures designed to attain and maintain the 8-hour O₃ NAAQS (2008 and 2015 standards). As of October 2021, the 2020 SIP is awaiting EPA approval and remains in draft form.

RAQS and SIP Reduction Measures

Both the RAQS and SIP include various control measures to reduce VOC and NO_x emissions. The RAQS and SIP include measures to reduce emissions from stationary, area, and mobile sources. Stationary and area source measures include vapor recovery, solvents, turbines, boilers, and commercial and residential water heaters.

Mobile source programs include Incentive Programs, an Indirect Source Program, and coordination with SANDAG on implementing Transportation Control Measures.

Incentive Programs

Mobile source incentive programs relevant to the District include the following:

- Carl Moyer Memorial Air Quality Attainment Program
- Voucher Incentive Program
- Proposition 1B Goods Movement Emission Reduction Program
- Vehicle Registration Fund Program

- American Recovery and Reinvestment Act Funding for the National Clean Diesel
- Funding Assistance Program
- Air Quality Power Generation Mitigation Fund

Indirect Source Program

The SDAPCD's Indirect Source Program consists of ongoing outreach and assistance to local governments, land developers, citizen groups, and non-profit organizations to promote emission reduction strategies. Indirect Source Program activities have included: (1) ongoing technical assistance to SANDAG on programs to encourage smart growth, (2) regional Climate Action Plan technical assistance, (3) workshop and presentation assistance to promote walkable neighborhoods, and (4) smart growth and alternative transportation fact sheets.

Transportation Control Measures

The RAQS includes the following Transportation Control Measures from SANDAG's previous Regional Transportation Plan (RTP): (1) transit improvements, (2) vanpools, (3) High-Occupancy Vehicle (HOV) lanes, (4) park-and-ride facilities, (5) bicycle facilities, and (6) traffic signal improvements. These measures reduce motor vehicle travel within the region.

SDAPCD Rules and Regulations

SDAPCD is responsible for establishing and enforcing local air quality rules and regulations that address the requirements of Federal and State air quality laws. Projects implementing the proposed PMPU may be subject to the following SDAPCD rules, and others, during construction.

- **Regulation 2, Rule 20.2—New Source Review Non-Major Stationary Sources:** establishes Air Quality Impact Analysis (AQIA) Trigger Levels, which set emission limits for non-major new or modified stationary sources.
- **Regulation 2, Rule 20.3—New Source Review Major Stationary Sources and Prevention of Significant Deterioration Stationary Sources:** establishes AQIA Trigger Levels, which set emission limits for major new or modified stationary sources or Prevention of Significant Deterioration stationary sources. Major sources are defined as those that emit 100 tons per year of PM₁₀, SO_x, CO, and lead; and 50 tons per year of NO_x and VOC in Federal ozone nonattainment areas.
- **Rule 50—Visible Emissions:** establishes limits for the opacity of emissions within the SDAPCD. The proposed PMPU is subject to Rule 50(d)(1) and (6) and should not exceed the visible emission limitation.
- **Rule 51—Nuisance:** prohibits emissions that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; endanger the comfort, repose, health, or safety of any such persons or the public; or cause injury or damage to business or property.
- **Rule 52—Particulate Matter:** establishes limits for the discharge of any particulate matter from nonstationary sources.
- **Rule 54—Dust and Fumes:** establishes limits for the amount of dust or fumes discharged into the atmosphere in any 1 hour.

- **Rule 55—Fugitive Dust Control:** sets restrictions on visible fugitive dust from construction and demolition projects. This includes use of track-out grates or gravel beds at each egress point, wheel-washing at each egress during muddy conditions, soil binders, chemical soil stabilizers, geotextiles, mulching, or seeding; and for outbound transport trucks: using secured tarps or cargo covering, watering, or treating of transported material.
- **Rule 67—Architectural Coatings:** establishes limits to the VOC content for coatings applied within the SDAPCD.
- **Rule 67.7—Cutback and Emulsified Asphalts:** establishes general provisions and limits to the VOC content for asphalt materials applied within the SDAPCD.
- **Rule 69.2—Industrial and Commercial Boilers, Process Heaters and Steam Generators:** establishes emissions testing and standards for boilers with a heat input rating of 5 million British thermal units (BTU) per hour or more.
- **Regulation 8, Rules 1200–1210:** establishes rules and procedures governing new, relocated, or modified emission units that may increase emissions of one or more TAC. While the project is not necessarily subject to the requirements of this regulation, the risk assessment guidelines and procedures published as part of this regulation are used in the health risk assessment herein. SDAPCD is currently working on draft amendments to Rule 1210.

Community Emissions Reduction Plan

The Portside Communities’⁸ Community Emissions Reduction Plan (CERP) Phase II was adopted by the SDAPCD on July 16, 2021, and by CARB on October 14, 2021 (CARB 2021d). The CERP itself notes that it “is a plan for action to reduce air pollutant emissions and community exposure to those emissions in the Portside Community.” The CERP contains detailed information and strategies that are intended to reduce both air pollution emissions and community exposure to air pollution in the Community of Portside Environmental Justice Neighborhoods (Portside Community).

The goals in the CERP are aspirational and are intended to guide the community members, businesses, organizations, and government agencies partnering in the implementation of this CERP to support health and environmental justice in the Portside Community. While there might not be a clear path to reach some of these goals, the goals identify the direction in which the community wants to go to achieve emission reductions beyond regulatory requirements. As technology evolves and data continues to be collected, the goals in the CERP may be adjusted (SDAPCD 2021c).

The CERP was presented in two phases. Phase I includes actions that have been fully developed and supported by all jurisdictions or organizations that have an implementation role. The Phase I Draft CERP was released in September 2020. The Phase II CERP ~~was finalized by SDAPCD in July 2021 and~~ includes 11 goals and 39 actions to achieve these emission reductions. Goals include reducing TAC emissions in the community, supporting electric freight truck infrastructure and upgrades, quantifying health risk from Port and non-Port activities, establishing health risk reduction goals,

⁸The Portside Environmental Justice Neighborhoods (Portside Community) generally includes Barrio Logan, Logan Heights and Sherman Heights in the City of San Diego and West National City in the City of National City. More specifically, it includes the following 12 census tracts: 6073005000, 6073004900, 6073003902, 6073003601, 6073003901, 6073005100, 6073003603, 6073004000, 6073003502, 6073021900, 6073004700, and 6073011602.

and implementing actions to achieve those goals (SDAPCD 2021c). ~~The Portside Community's CERP was approved by CARB's governing board in October 2021 (CARB 2021d).~~

At its core, the CERP is a plan for action to reduce air pollutant emissions and community exposure to those emissions in the Portside Community. The CERP's proposed actions define a path to further reduce air pollution from sources in the community under the following eight categories:

1. Outreach and Community Engagement
2. Incentives
3. Rule Development
4. Enforcement
5. Heavy-Duty Trucks
6. Land Use
7. Working Waterfront Activities (Port, Navy, Shipyards)
8. Advocacy Measures

Within the CERP, each action is to be carried-out based on a set of strategies, goals, and timelines. The entity (e.g., government agency or organization) responsible for the actions is also identified.

Although the District's participation in the CERP and its implementation is important, a significant majority of the CERP's goals and actions, as enumerated, are not applicable to the District (or proposed to be implemented by the District). For instance, a substantial component of the CERP is premised on future regulatory or policy action by the SDAPCD (and CARB) and expanding and evolving its enforcement program to increase compliance rates, increase outreach efforts, and maximize compliance (see Chapters 5 and 6 of the CERP).⁹ To provide full public disclosure and informed participation, the entire CERP Goals and Actions, including the ten Action items that the Port District participates in, are analyzed to evaluate if the PMPU would conflict with or obstruct implementation of the CERP (see footnote 7, above).

4.2.4 Project Impact Analysis

4.2.4.1 Methodology

Air quality impacts associated with construction and operation of the proposed PMPU were assessed and quantified (where applicable) using industry standard and accepted software tools, techniques, and emission factors. A summary of the methodology is provided below. A full list of assumptions and emission calculations can be found in Appendix C. The methodology used to estimate air quality emissions discussed below is the same that was used to estimate GHG emissions, as described in Section 4.6, *Greenhouse Gas Emissions*.

⁹In fact, consistent with the CERP, on November 4, 2021, the SDAPCD updated Rule 1210 to lower the health risk threshold from 100 per million to 10 per million.

Construction

Proposed land uses that could be developed under the proposed PMPU would generate construction-related criteria pollutant and TAC emissions from mobile and stationary construction equipment exhaust, employee and haul truck vehicle exhaust, dust from land clearing, other construction activities, and application of architectural coatings. However, the specific size, location, and construction techniques and scheduling that would be utilized for each individual development project occurring from implementation of the proposed PMPU is not currently known. With an anticipated buildout year of 2050, development of the various land uses associated with the proposed PMPU would occur over an extended period and would depend on factors such as local economic conditions, market demand, and other financing considerations.

Although the proposed PMPU would not directly result in construction activities, future development projects that are proposed, consistent with the proposed PMPU, would include construction activities. Therefore, construction activities are a probable indirect consequence of the proposed PMPU's implementation. In order to evaluate probable future construction activities, it is assumed that construction activities are likely to occur periodically through 2050. Moreover, construction activities could be more concentrated in certain years and timeframes.

For purposes of this analysis, total increase in waterside and landside development that could be constructed under the proposed PMPU was modeled to estimate the potential air quality impacts. The construction analysis assumes that development under the proposed PMPU would be constructed over a 25-year period between 2025 and 2050. Total baywide waterside and landside development projections are presented in Table 4.2-11.

Landside Construction

Landside emissions were modeled in CalEEMod (Version 2020.4.0) and are based on CalEEMod default phasing schedule, equipment mix, equipment hours per day, delivery trips, worker trips, grading and paving acreage, trip lengths, and amount of surfaces painted for the sum of all development assumptions for the land use square footage in Table 4.2-11.

Emissions are based on the CalEEMod default VOC content limit of 250 grams per liter for non-residential interior and exterior coatings. The analysis includes CARB's criteria pollutant adjustment factors for gasoline light-duty vehicles to account for the SAFE Vehicle Rule (CARB 2019a).

Consequently, this analysis is considered conservative, as it is likely that the Federal government and California will retain the ability to set more stringent fuel efficiency standards, as discussed in Section 4.2.3, *Laws, Regulations, Plans, and Policies*. The methods used to estimate criteria pollutant emissions by source are described below. Refer to Appendix C for more information on the modeling methods and modeling outputs.

Note that the construction analysis is based on a construction schedule that begins in 2025. In the event that construction of future PMPU-related development occurs at a date later than assumed herein, emissions are likely to be lower than the emissions presented in the analysis below due to the fact that emissions on per unit basis (e.g., per horsepower hour, per vehicle mile traveled) decrease over time, particularly due to regulations that reduce emissions and improve fuel economy over time.

Table 4.2-11. Construction Water and Land Use Assumptions

Water and Land Use	Total Growth¹
Recreational Boating (slips)	485
Commercial Fishing (slips)	65
Hotel (rooms)	3,910
Retail/Restaurant (square feet)	339,489
Convention/Meeting Space (square feet)	342,000

Source: Compiled by ICF based on Development Projections provided by the District (see Appendix C).

¹ Does not include development within PD5 and PD6.

Waterside Construction

Installation of waterside features would involve various equipment pieces, such as tugboats, pushboats, small support boats, cranes, and pumps. Waterside development projections are presented in Table 4.2-11. The types and numbers of equipment and construction schedule are based on the recent marina work, which included installation of 23 new slips over a 6- to 9-month period. Over the assumed 25-year construction period, construction of the 550 new slips (the sum of 485 recreational boating and 65 commercial fishing slips) as part of the proposed PMPU averages out to approximately 22 slips per year. Therefore, for purposes of analysis, it was assumed that one waterside project equal to the size of this representative project (23 slips) would be constructed in a given year.

Slip construction would include the use of barge-based equipment to install docks, tugs to bring barges to and from the staging area, skiffs to push docks around, and a push boat. In addition, there is a potential to use barges to store or deliver material or equipment for the landside construction.

The maximum day of slip construction assumes the crane and jet pump are active at the project site, while the skiffs arrive from the staging area and move docks around, and the push boat arrives from the staging area and maneuvers the barge. Barge placement and removal is not expected to overlap with daily marina construction activities.

Operation

Criteria pollutant and TAC emissions at the Port include tenant facilities (e.g., hotels, marinas, boatyards), maritime activity (e.g., the movement of goods and people associated with marine terminal operations), and District operations (e.g., District-owned building and outdoor energy consumption and fleet activity). Emissions sources include on-road activity related to passenger car and freight vehicle exhaust; off-road activity related to freight movement and industrial activities (e.g., boatyards, shipyards); off-road boating emissions related to recreational boating, commercial fishing, sport/charter fishing, excursions, and ferries; electricity and natural gas consumption associated with building energy and providing maritime shore power; and other utility uses, such as water consumption, and waste and wastewater generation associated with land uses (e.g., hotels).

Under the proposed PMPU, new proposed policies that affect all water and land uses baywide would be implemented through proposed elements, and allowable water and land uses would be modified. Buildout of the proposed PMPU is likely to change, and in some cases increase, activity associated with these emission sources.

Analysis Years

The proposed PMPU is designed to guide the use and development of District Tidelines through the horizon year of 2050. Development of the various water and land uses associated with the proposed PMPU would occur over an extended period and would depend on factors such as economic conditions, market demand, and other financing considerations, with an assumed buildout of all land use changes by 2050. Additionally, as discussed in detail in Section 4.6 of this PEIR, the GHG analysis considers impacts and mitigation for the year 2030, which is the next statewide GHG milestone target after the proposed PMPU's start (or certification of this PEIR). It would be speculative to attempt to approximate the exact amount of development (e.g., new hotel rooms, new commercial area developed) that would occur by 2030. However, to provide an analysis of conditions in 2030, this analysis considers activity and emission profiles (e.g., regulatory standards, discussed in more detail below) that could be in place by 2030. As mentioned, buildout of all land use changes is assumed to be 2050. As explained below, the 2030 analysis is based on the level of activity and land use change assumed to occur by 2030. In most cases, this 2030 activity estimate is based on the assumption that land uses, development, and associated activity change linearly over time between existing and buildout conditions. This is the case for all development and acreage changes. Activity assumptions for TAMT are based on the improvements and throughput assumed in the certified *Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR* (TAMT EIR, December 2016), which assumes full buildout and throughput in 2035. The proposed PMPU does not propose any changes to the cargo throughput or improvements for TAMT in comparison to what was previously approved. For purposes of this analysis, the throughput at full buildout was conservatively assumed to occur by 2030 and to be the same as analyzed in the TAMT EIR.

A summary of new land use development assumed at full buildout of the proposed PMPU in 2050 and in 2030, relative to existing conditions, is shown in Table 4.2-12. The methods involved for each source type (e.g., motor vehicles, electricity) are described following the tables. The development assumptions for 2030 and 2050 are not additive; the total for 2030 represents the new development assumed by 2030 relative to existing conditions, while the total for 2050 represents the new development assumed by 2050 relative to existing conditions.

The proposed PMPU accounts for development at full buildout, which is assumed to be 2050. To estimate the amount of development that may occur by 2030, it was assumed that development would increase linearly through 2050. Thus, the amount of development in place by 2030 is assumed to be approximately 41 percent of full buildout—based on the number of years between the air inventory baseline year (2016) and full buildout (2050) (34 years), and the number of years between the air inventory baseline year (2016) and 2030 (14 years) (i.e., $14/34 \approx 41\%$). This scaling method applies to both boat slips and land use development (hotel rooms, retail/restaurant area, and meeting and convention center space).

Table 4.2-12. New Development Assumed for the Proposed PMPU at Full Buildout and in 2030

Planning District	2050			2030		
	Hotel Rooms	Retail/ Restaurant (sf)	Convention/ Meeting Space (sf)	Hotel Rooms	Retail/ Restaurant (sf)	Convention/ Meeting Space (sf)
PD1: Shelter Island	--	--	--	--	--	--
PD2: Harbor Island	3,060	239,500	77,000	1,255	98,195	31,570
PD3: Embarcadero	850	81,989	265,000	349	33,615	108,650
PD4: Working Waterfront	--	--	--	--	--	--
PD7: South Bay	--	--	--	--	--	--
PD8: Imperial Beach Oceanfront	--	18,000	--	--	7,380	--
PD9: Silver Strand	--	--	--	--	--	--
PD10: Coronado Bayfront	--	--	--	--	--	--
Total	3,910	339,489	342,000	1,604	139,190	140,220

sf = building square feet. Development assumptions for both years are relative to existing conditions.

Motor Vehicles

Air quality impacts from motor vehicles associated with the proposed PMPU were evaluated using the EMFAC2021 emissions model (version 1.0.1) and traffic data provided by the traffic engineers (Appendix C). The net change in daily vehicle miles traveled (VMT) and trips were provided for each planning district under full buildout conditions. The net change in daily VMT and trips for 2030 is 41 percent of the net change by 2050, based on the number of years between baseline (2016) and full buildout (34 years), and the number of years between baseline (2016) and 2030 (14 years) (i.e., $14/34 \approx 41\%$). Vehicle trip information used to generate mobile source emission estimates is taken from Chen Ryan (2021) and is summarized in Table 4.2-13 (also see Appendix D). The mobile source emission factors (grams per mile and grams per trip) were estimated with EMFAC2021 based on all vehicle and fuel types at aggregated speeds for the vehicle fleet operating within San Diego County for each analysis year. Fugitive PM10 and PM2.5 dust from travel on paved roads was estimated using regionally specific emission factors from CARB's *Miscellaneous Process Methodology 7.9, Entrained Road Travel, Paved Road Dust* (CARB 2021e) and added to the EMFAC2021 emission factors for PM10 and PM2.5. Criteria pollutant emissions from vehicle movement were calculated by multiplying the VMT estimates by the appropriate emission factors, and emissions from vehicle movement were added to process emissions (i.e., emission from vehicle starts, running losses, etc.), which were calculated by multiplying the daily trips by the appropriate "per trip" emission factor. The analysis also includes adjustment factors to account for the SAFE Vehicle Rule Part One and the Final SAFE Rule (CARB 2019d, 2020b), which are embedded in EMFAC2021. Inclusion of the SAFE Vehicle Rule adjustment factors is conservative in that a repeal is likely.

Table 4.2-13. Vehicle Miles Traveled Estimates with Implementation of the Proposed PMPU at Full Buildout and by 2030

Planning District	New Daily VMT	
	2050	2030
PD1: Shelter Island	1,292	530
PD2: Harbor Island	40,710	16,691
PD3: Embarcadero	16,540	6,782
PD4: Working Waterfront	0	0
PD7: South Bay	0	0
PD8: Imperial Beach Oceanfront	1,664	682
PD9: Silver Strand	492	202
PD10: Coronado Bayfront	2,004	822
Total	62,703	25,709

Source: Adapted from VMT tables in Section 4.14 of this PEIR, as well as Chen Ryan 2021 (Appendix D). Also includes VMT estimates for boating slips not included in the traffic analysis.

Land Use Development Area and Energy Sources

Operational area and energy emissions were estimated under 2030 and 2050 development conditions using CalEEMod, version 2020.4.0. The change in area source (e.g., coatings, consumer products) and energy source emissions from implementation of the proposed PMPU was quantified based on the change in land uses associated with buildout of the proposed PMPU, which is provided in Table 4.2-12. Modeling was based on CalEEMod default values and assumptions for square footage and energy consumption for each land use type (Trinity Consultants 2021).

Commercial Fishing and Recreational Boating

Emissions associated with fishing and boating activity would change over time if additional slips and berthing areas are added. A summary of each of these activity types is provided below.

- Commercial fishing includes those vessels that carry crew to fishing areas both within and outside 24 nautical miles of the Port. Commercial fishing vessels are harbored at commercial fishing areas at Shelter Island (PD1) and Tuna Harbor (in PD3).
- Recreational boating, including non-commercial boats and harbor craft, is a boating activity solely for personal enjoyment and includes a variety of gasoline- and diesel-powered vessels. San Diego Bay has numerous marinas and yacht clubs, as well as four public boat launch ramps. Recreational boating occurs at various planning districts, including PD1, PD2, PD3, PD9, and PD10.

A summary of commercial fishing emissions estimates from the 2016 maritime air emissions inventory is provided in Table 4.2-14. Note that the emissions shown are for all planning districts, even those excluded from the proposed PMPU analysis herein.

Table 4.2-14. Summary of 2016 Maritime Criteria Pollutant Emissions for Commercial Fishing (tons per year)

Sector	ROG	CO	NO _x	PM ₁₀	PM _{2.5}	DPM	SO ₂
Commercial Fishing	2	14	18	1	1	1	<1

Source: District 2018.

Emission estimates for all baywide activities related for commercial fishing were assigned to each planning district based on the number of current slips within each planning district. Existing slip counts by slip type are as follows, including areas excluded from this PMPU analysis:

- Commercial Fishing: 228 slips, based on 123 slips within PD1 and 105 slips within PD2.

A summary of the change in fishing and boating slips associated with PMPU buildout is provided in Table 4.2-15. As shown, there would be an increase in both commercial fishing and recreational boating slips as part of the proposed PMPU. There would be no increase in sport/charter commercial fishing.

Emissions for commercial fishing were estimated based on commercial fishing sector emissions in the 2016 maritime air emissions inventory, assuming that each new boat would result in emissions that are equal to existing boats. Emissions per existing boat were estimated based on 2016 commercial fishing emissions divided by the number of fishing vessels in the 2016 emissions inventory (to create a per boat, or per slip, emission rate). Emissions associated with the new boats were estimated by multiplying the number of new boats by the emissions estimates for each existing boat for each pollutant type.

Emissions for recreational boating were estimated using CARB documentation on emission factors and annual boating activity. Activity for both analysis years (2030 and 2050) was based on the assumption that each new boating slip would be occupied by a boat that would be active 5 hours per day, based on the average of all boating activity in CARB's Pleasure Craft Model documentation (CARB 2014). Emission rates on a per-hour basis were calculated based on average annual emissions from all recreational boats operating in the San Diego region divided by the operating hours for all recreational boats in both 2030 and 2050 in the Pleasure Craft Model.

Table 4.2-15. Change in Boating Slips Assumed at Full PMPU Buildout (2050) and by 2030

Planning District	2050		2030	
	Commercial Fishing	Recreational Boating	Commercial Fishing	Recreational Boating

Tenth Avenue Marine Terminal

The TAMT EIR evaluated impacts from buildout of the TAMT Redevelopment Plan through 2035. The analysis of the proposed PMPU evaluates activities baywide through 2050. While the proposed PMPU does not propose any changes to the cargo throughput or improvements assumed in the TAMT Redevelopment Plan, and this PEIR does not re-analyze buildout of the TAMT Redevelopment Plan, it does include a discussion of the potential air quality effects between 2035 and 2050.

Correlation of Criteria Pollutants to Potential Human Health Consequences

CEQA requires an EIR to consider the potential health consequences associated with a project's long-term impacts on air quality, if feasible. An EIR should relate the expected adverse air quality impacts to likely health consequences or explain in meaningful detail why it is not feasible at the time the EIR was prepared to provide such an analysis, so that the public may make informed decisions regarding the costs and benefits of the project. The thresholds presented in Table 4.2-16 consider existing air quality concentrations and attainment or nonattainment designations under the NAAQS and CAAQS. The NAAQS and CAAQS are informed by a wide range of scientific evidence that demonstrates there are known safe concentrations of criteria pollutants. While recognizing that air quality is a cumulative problem, SDAPCD considers projects that generate criteria pollutant and O₃ precursor emissions below these thresholds to be minor in nature and would not adversely affect air quality because the health-protective NAAQS or CAAQS would not be exceeded. Regional emissions generated by development under the proposed PMPU could increase photochemical reactions and the formation of tropospheric O₃ and secondary PM, which, at certain concentrations, could lead to increased incidence of health consequences. Although these health effects are associated with O₃ and particulate pollution, the effects are a result of cumulative and regional emissions. As such, for a project with a relatively small contribution of emissions, that project's incremental contribution cannot be traced to specific health outcomes on a regional scale, and, from a technical perspective, a quantitative correlation of project-generated regional criteria pollutant emissions to specific human health impacts is not feasible. Similarly, there are no publicly available models that can precisely correlate localized CO, PM, and SO₂ emissions to health consequences. Refer to discussion in the section below and to Appendix C for additional information.

Regional Criteria Pollutants (Ozone Precursors and Regional PM)

Adverse health effects induced by regional criteria pollutant emissions generated by future development under the proposed PMPU (ozone precursors and PM) are highly dependent on a multitude of interconnected variables (e.g., cumulative concentrations, local meteorology and atmospheric conditions, the number and character of exposed individuals [e.g., age, gender]). For these reasons, ozone precursors (VOC and NO_x) contribute to the formation of groundborne ozone on a regional scale, where emissions of VOC and NO_x generated in one area may not equate to a specific ozone concentration in that same area. Similarly, some types of particulate pollutant may be transported over long-distances or formed through atmospheric reactions. As such, the magnitude and locations of specific health effects from exposure to increased ozone or regional PM concentrations are the product of emissions generated by numerous sources throughout a region, as opposed to a single individual project.

Models and tools have been developed to correlate regional criteria pollutant emissions to potential community health impacts. There are models capable of quantifying ozone and secondary PM formation and associated health effects, and these tools were developed to support regional planning and policy analysis and have limited sensitivity to small changes in criteria pollutant concentrations induced by individual projects. Therefore, translating project-generated criteria pollutants to the locations where specific health effects could occur or estimating the resultant number of additional days of nonattainment cannot be performed with a high degree of accuracy for relatively small projects (i.e., defined as emitting 10 tons/year of NO_x or VOC by the South Coast Air Quality Management District [SCAQMD 2015]). The analysis here is conservative in that it assumes

full buildout of all development associated with the proposed PMPU (all hotels, passenger vehicle, recreational boats, commercial fishing) operating on the same day.

Technical limitations of existing models to correlate project-level regional emissions to specific health consequences are recognized by air quality management districts throughout the state, including the San Joaquin Valley Air Pollution Control District (SJVAPCD) and SCAQMD. SJVAPCD (2015) acknowledges that while health risk assessments for localized air toxics, such as DPM, are commonly prepared, “it is not feasible to conduct a similar analysis for criteria air pollutants because currently available computer modeling tools are not equipped for this task.” SCAQMD reaches a similar conclusion, stating that “it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels”¹⁰ (SCAQMD 2015).

4.2.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining significance of impacts associated with air quality resulting from the proposed PMPU. The determination of whether an air quality impact would be significant is based on the thresholds described below and the professional judgment of the District as Lead Agency based on the evidence in the administrative record.

Impacts are considered significant if the proposed project would result in any of the following.

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the PMPU region is nonattainment under an applicable Federal or State ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Supplemental Thresholds

The following section summarizes the significance thresholds established by the County of San Diego; presents substantial evidence regarding the basis upon which they were developed; and describes how they are used to determine whether project construction and operational emissions would result in a significant impact within the context of (1) interfering with or impeding attainment of CAAQS and NAAQS or (2) causing or contributing to increased risks to human health.

Consistency with the Applicable Air Quality Plan

SDAPCD is required, pursuant to the NAAQS and CAAQS, to reduce emissions of criteria pollutants for which the county and air basin are in nonattainment. The most recent air quality attainment plans are the 2020 O₃ attainment plan, adopted in 2020 and designed to attain the NAAQS for O₃, and the 2016 RAQS, adopted in 2016 and designed to attain the CAAQS for O₃. The RAQS and SIP project future emissions and determine the strategies necessary for the reduction of stationary

¹⁰ For example, SCAQMD’s analysis of their 2012 Air Quality Attainment Plan showed that modeled NO_x and VOC reductions of 432 and 187 tons per day, respectively, only reduced ozone levels by 9 ppb. Analysis of SCAQMD’s Rule 1315 showed that emissions of NO_x and VOC of 6,620 and 89,180 pounds per day, respectively, contributed to 20 premature deaths per year and 89,947 school absences (SCAQMD 2015).

source emissions through regulatory controls. The RAQS and SIP rely on the cumulative emission projections and control measures outlined in the SIP. CARB mobile source emission projections and SANDAG growth projections are based on population and vehicle trends and land use plans developed by the region's cities and by the County of San Diego.

Project or plan consistency with the RAQS and SIP can be determined by considering if the future development that would occur with the proposed PMPU's implementation would be consistent with the growth anticipated by SANDAG's growth projections, which were used in the formulation of the RAQS and SIP. If the growth was included, then the proposed PMPU would be consistent with the RAQS and SIP. If the growth was not included in SANDAG's growth projections (i.e., greater than anticipated in the projections), the PMPU would not be considered consistent with the RAQS and SIP and would potentially result in a significant impact on air quality.

Moreover, if the proposed PMPU is consistent with the overarching goals (i.e., to reduce emissions and attain NAAQS and CAAQS) and strategies (i.e., measures implemented to reduce emissions), then it would be consistent with the RAQS and SIP.

Regional Pollutant Thresholds and Health Risks

Regional Thresholds for SDAB Attainment of State and Federal Ambient Air Quality Standards

As previously indicated, the CEQA Guidelines state that the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the significance determination of whether a project would violate or impede attainment of air quality standards. Attainment status for each pollutant is assigned for the entire air basin. In San Diego, the SDAB is defined as "all of San Diego County" (see 17 CCR 60110). Therefore, the current attainment status for the entire San Diego region, which includes nonattainment status for ozone NAAQS and ozone CAAQS, PM10 CAAQS, and PM2.5 CAAQS, applies to the entire county.

The District does not currently have specific CEQA thresholds of significance for air quality and health risk.¹¹ Although SDAPCD has not developed specific thresholds of significance to evaluate construction and operational impacts within CEQA documents, SDAPCD's Regulation II, Rules 20.2 and 20.3 (new source review for non-major and major stationary sources, respectively), outline AQIA Trigger Levels for criteria pollutants for new or modified sources. Based on SDAPCD's AQIA Trigger Levels, as well as EPA rulemaking and CEQA thresholds adopted by the SCAQMD, the County of San Diego has established screening-level thresholds (SLTs) to assist lead agencies in determining the significance of project-level air quality impacts within the county. Although SDAPCD does not have VOC or PM2.5 AQIA Trigger Levels, the County has adopted a PM2.5 SLT based on EPA's "Proposed Rule to Implement the Fine Particle National Ambient Air Quality Standards" published on September 8, 2005, which is also consistent with SCAQMD's Air Quality Significance Thresholds (SCAQMD 2019), and a VOC SLT based on the threshold of significance for VOCs from the SCAQMD for the Coachella Valley (SCAQMD 1993). Emissions in excess of thresholds shown in Table 4.2-16 would be expected to have a significant impact on air quality because an exceedance of the thresholds is anticipated to contribute to CAAQS and NAAQS violations in the county under existing and cumulative conditions.

¹¹ The District is currently in the process of drafting CEQA thresholds of significance for all resources, including air quality. Until these thresholds are adopted, the District may continue to rely on established regional thresholds, which are based on substantial evidence summarized herein.

The County's SLTs are based on SDAPCD AQIA Trigger Levels, and these AQIA Trigger Levels are based on emissions levels identified under the New Source Review (NSR) program, which is a permitting program established by Congress as part of the CAA Amendments of 1990 to ensure that air quality is not significantly degraded by new or modified sources of emissions. The NSR program requires that stationary sources receive permits before construction begins and/or the use of equipment. By permitting large stationary sources, the NSR program ensures that new emissions would not slow regional progress toward attaining the NAAQS. SDAPCD implements the NSR program through Rules 20.2 and 20.3, and has concluded that the stationary pollutants described under the NSR program are equally significant as those pollutants generated with land use projects. SDAPCD's Trigger Levels were set as the total emission thresholds associated with the NSR program to help attain and maintain the NAAQS from new and modified non-major stationary sources.¹² SDAPCD's Trigger Levels take into account the region's attainment status, emission profile, inventory, and projections, and represent levels above which project-generated emissions could affect SDAPCD's and SANDAG's commitment to attain the State and Federal standards in the region. Consistent with Section 15064.7(c) of the State CEQA Guidelines,¹³ the evidence in support of the air quality thresholds shown in Table 4.2-16 is deemed appropriate for their use in this analysis and in this location within the greater SDAB.

Table 4.2-16. Air Quality Thresholds

Air Contaminant	Emission Rate		
	(pounds per hour)	(pounds per day) ¹	(tons per year)
Respirable Particulate Matter (PM ₁₀)	--	100	15
Fine Particulate Matter (PM _{2.5}) ²	--	55	10
Nitrogen Oxides (NO _x)	25	250	40
Sulfur Oxides (SO _x)	25	250	40
Carbon Monoxide (CO)	100	550	100
Lead (Pb) ³	--	3.2	0.6
Volatile Organic Compounds (VOC) ⁴	--	75	13.7 ⁵

Source: SDAPCD Regulation II, Rule 20.2, County of San Diego 2007.

¹ According to the County of San Diego, the daily thresholds are most appropriate when assessing impacts from standard construction and operational emissions. Therefore, daily thresholds are used to evaluate project significance, while hourly and annual thresholds are provided for informational purposes only.

² Based on EPA's "Proposed Rule to Implement the Fine Particle National Ambient Air Quality Standards" published September 8, 2005, and also SCAQMD's Air Quality Significance Thresholds (SCAQMD 2015). Rule 20.2 was amended in 2018 to include PM_{2.5} AQIA of 67 pounds per day. However, as 55 pounds per day is lower (and more restrictive), 55 pounds per day, as recommended by the County and used elsewhere throughout the region, is used here.

³ Lead and lead compounds.

⁴ County SLTs for VOCs were originally based on the threshold of significance for VOCs from SCAQMD for the Coachella Valley. The terms VOC and ROG are used interchangeably, although VOC is used in this document because the County uses the term VOC.

⁵ 13.7 tons per year threshold is based on 75 pounds per day multiplied by 365 days per year and divided by 2,000 pounds per ton.

¹² San Diego Air Pollution Control District, Rule 20.2, Table 20.2-1, hereby incorporated by reference: https://www.sandiegocounty.gov/content/dam/sdc/apcd/PDF/Rules_and_Regulations/Permits/APCD_R20-2.pdf.

¹³ "When adopting (or using) thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

Project emissions below the NAAQS or CAAQS would not have significant health impacts because the standards are set to be protective of human health. Conversely, project emissions above the standards would potentially have significant health impacts because the NAAQS and CAAQS are set to be protective of human health and are designed to prevent impacts on health and the environment. An air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment (CARB 2021a). At the Federal level, Section 109(b) of the CAA directs EPA to establish standards to be protective of public health with an adequate margin of safety. To derive these standards, EPA reviews data from integrated science assessments and risk/exposure assessments to determine the ambient pollutant concentrations at which human health impacts occur, then reduces these concentrations to establish a margin of safety (EPA 2018).

Health-Based Thresholds for Project-Generated Pollutants of Human Health Concern

The thresholds presented in Table 4.2-16 consider existing air quality concentrations and attainment or nonattainment designations under the health-based NAAQS and CAAQS. While recognizing that air quality is cumulative problem, air districts typically consider projects that generate criteria pollutant and ozone precursor emissions below these thresholds to be minor in nature and would not adversely affect air quality such that the NAAQS or CAAQS would be exceeded. Emissions generated by development under the proposed PMPU could increase photochemical reactions and the formation of tropospheric ozone and secondary PM, which at certain concentrations could lead to increased incidence of specific health consequences. Although these health effects are associated with ozone and particulate pollution, the effects are a result of cumulative and regional emissions. As such, a project's incremental contribution cannot be traced to specific health outcomes on a regional scale, and a quantitative correlation of project-generated regional criteria pollutant emissions to specific human health impacts is therefore not included in this analysis. It is foreseeable that unmitigated construction- and operational-generated emissions of ozone precursors and PM in excess of SDAPCD thresholds could contribute to cumulative and regional health impacts of exposure to ozone and PM discussed in Section 4.2.2.3, *Pollutants of Concern*. In such cases, all feasible mitigation is applied.

Localized Project-Generated Criteria Pollutants (CO) and Air Toxics (DPM) Thresholds and Health risks

Localized pollutants generated by a project are deposited and potentially affect population near the emissions source. Because these pollutants dissipate with distance, emissions from individual projects can result in direct and material health impacts on adjacent or nearby sensitive receptors. Models and thresholds are readily available to quantify these potential health effects associated with CO and DPM and evaluate their significance (CAPCOA 2009, OEHHA 2015, CARB 2000). Locally adopted thresholds and analysis procedures for the localized pollutants of concern associated with the proposed PMPU (CO, DPM, and naturally occurring asbestos) are identified below.

Localized Carbon Monoxide Concentrations

The significance of localized impacts under CEQA depends on whether ambient CO levels in the vicinity of a project are above or below CAAQS and NAAQS. The applicable CAAQS and NAAQS for CO are as follows:

- CAAQS and NAAQS 1-hour CO standards of 20 and 35 ppm, respectively.
- CAAQS and NAAQS 8-hour CO standards of 9.0 and 9 ppm, respectively.

Ambient CO levels in the entire San Diego region are below the NAAQS and CAAQS, and the region is in attainment. Projects that do not generate CO concentrations in excess of the health-based NAAQS and CAAQS would not contribute a significant level of CO such that localized air quality and human health would be substantially degraded.

Localized Diesel Particulate Matter Concentrations

DPM is a form of localized PM (see above for a detailed discussion) that is generated by diesel equipment and vehicle exhaust. DPM has been identified as a TAC by CARB and is particularly concerning because long-term exposure can lead to cancer, birth defects, and damage to the brain and nervous system. The County of San Diego has adopted incremental cancer and hazard thresholds to evaluate receptor exposure to DPM emissions, which are adapted from SDAPCD Regulation XII, Rule 1200 (SDAPCD n.d.). Projects that would result in exposure to TACs resulting in a maximum incremental cancer risk (MICR) greater than 1 in 1 million without application of Toxics BACTs, MICR greater than 10 in 1 million with application of Toxics BACTs, or a chronic and acute non-cancer health hazard index greater than 1.0 would be deemed as having a significant impact related to health risks from DPM exposure. Because various Toxics BACTs are in place at the Port—including CARB rules on vessels, shore power, and drayage trucks—the MICR of 10 in 1 million is utilized herein.

Asbestos-Containing Materials

There are no quantitative thresholds related to receptor exposure to asbestos. However, SDAPCD Rule 40 requires the demolition or renovation of asbestos-containing building materials to comply with the limitations of NESHAP regulations as listed in the Code of Federal Regulations (SDAPCD 2020b). See Section 4.7, *Hazards and Hazardous Materials*, for an analysis of impacts related to asbestos.

4.2.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies would have the potential to avoid or reduce impacts associated with air quality and health risk and are considered in the impact analysis that follows.

ECO Policy 3.1.1 Permittees shall implement programs and activities that reduce exposure to toxic air contaminants and criteria air pollutants in and adjacent to Tidelands.

ECO Policy 3.1.2 Permittees shall implement clean air action measures, which may include:

- a. Efficient buildings design features;
- b. Vehicles, vessels, and advanced technologies powered by alternative fuels or electric powered;
- c. Parking management programs;
- d. Alternative transportation programs;
- e. Energy efficient lighting; and
- f. Native tree planting and landscaping.

ECO Policy 3.1.3 In cooperation with regional, state, and federal agencies, the District shall advance maritime clean air strategies to help improve local air quality.

ECO Policy 3.1.4 Permittees shall implement infrastructure and clean vessel technologies, for both in-transit and while at-berth, such as advancing alternative fuels and expansion of marine terminal electrification, when applicable.

ECO Policy 3.1.5 The District shall explore financing programs in coordination with regional, State, and Federal partners to implement recommended clean air measures.

SR Policy 3.1.1 The District shall periodically update ~~the District's CAP~~ its climate action goals and targets to ensure alignment with this Plan and with the District and State goals and targets for greenhouse gas emissions and shall start ~~the CAP's to~~ update these goals and targets no later than two years of the effectiveness of the certification of this Plan, and may periodically update ~~the District's CAP~~ them thereafter.

SR Policy 3.1.2 The District shall participate in research and continue to conduct monitoring that supplements its knowledge of projected coastal climate impacts and potential strategies to adapt to these impacts.

SR Policy 3.1.3 Permittees of development shall deploy renewable energy technology to improve energy reliability and economic resilience, where feasible.

SR Policy 3.1.4 The District shall explore innovative carbon sequestration potential with partner agencies within the region to offset GHG emissions.

SR Policy 3.1.5 The District shall continue to coordinate with Tidelands' tenants and adjacent local businesses to reduce resource consumption and promote sustainable operations.

SR Policy 3.1.6 The District shall promote the innovative use of "green" design for new or retrofitted Tidelands' buildings, structures, and facilities.

EJ Policy 3.1.1 The District shall work to reduce the cumulative health burdens on neighboring communities, especially disadvantaged communities, in developing, adopting, implementing, and enforcing environmental laws, regulations, and policies.

EJ Policy 3.1.2 The District shall collaborate with adjacent jurisdictions, occupants, tenants, permittees, and community stakeholders to provide transition zone areas adjacent to Tidelands between maritime industrial, commercial, and residential uses as well as other sensitive receptors in ~~Portside Communities adjacent disadvantaged communities.~~

EJ Policy 3.1.4 Maritime industrial development that is sited abutting a Portside community shall incorporate industrial site design standards that consider the health and environmental quality of the Portside community, such as, but not limited to, truck route signage, setbacks from property lines, greening buffer, parking requirements, ingress/egress points, noise and light screening, air emission dispersion, and interior air quality for employees.

EJ Policy 3.2.1 The District and its tenants shall participate in community air quality monitoring, such as supporting ongoing monitoring efforts that incorporate community involvement, and develop maritime clean air strategies to reduce criteria pollutant emissions from industrial and maritime sources, especially near the Portside communities.

EJ Policy 3.2.2 Maritime development shall transition to clean, modern, and operationally efficient marine terminal facilities and working waterfront businesses based on feasibility and best available science.

EJ Policy 3.2.3 Through CDPs issued by the District, permittees shall pursue electrification of marine terminal and working waterfront operations, including drayage trucks, prioritizing the

facilities adjacent to Portside Communities, to reduce reliance on fossil fuels from mobile and portable sources, in alignment with related State and District goals.

EJ Policy 3.2.4 Support actions and measures taken by tenants and occupants on Tidelands that improve environmental conditions and advance long term sustainability.

ECON Policy 2.3.2 The District and permittees shall coordinate the investment in improvements to marine terminal and maritime industrial operations that improve functionality and efficiency through modernization of terminal infrastructure and equipment, including electrification that supports optimization of cargo movement and reduces emissions.

Mobility Policy 1.1.8 The District shall coordinate with agencies that have transportation authority, and with adjacent jurisdictions and permittees, to plan shared mobility infrastructure in support of the safe movement of people and/or goods. Specific transit improvements included in this Plan are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

Mobility Policy 1.1.9 The District shall coordinate with agencies that have transportation authority to explore opportunities to expand accessible transit service to Tidelands. Specific transit improvements included in this Plan are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

Mobility Policy 1.1.10 The District shall provide areas for transit stops and transit lanes for expanded transit opportunities on Tidelands and explore a means for financing expanded transit opportunities with agencies that have transportation authority. Specific transit improvements included in this Plan are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

Mobility Policy 1.1.11 The District shall require certain development, as applicable, to develop and comply with project-specific Transportation Demand Management (TDM) guidelines ~~and require development to comply with such guidelines,~~ with the intent to reduce dependence on single-occupancy vehicles and reduce vehicle miles traveled to, and from, and within Tidelands the proposed development site. ~~All proposed development shall also be required to provide a project-specific TDM program in accordance with the District's guidelines.~~

Mobility Policy 1.1.13 Shared or personal motorized mobility devices, except for those required for Americans with Disabilities Act purposes, shall not be permitted on facilities on which pedestrians are intended to travel, such as sidewalks, promenades, multi-use pathways (without a dedicated bicycle area), nature trails, and walkways.

Mobility Policy 1.1.14 The District shall coordinate with agencies that have transportation authority to enhance coastal connectivity and access throughout Tidelands, particularly at mobility hub locations.

Mobility Policy 1.1.16 Through CDPs issued by the District, permittees shall advance as part of development the implementation of zero-emission mobility options, when feasible, and near-zero-emission passenger-related mobility options and supportive infrastructure improvements for the movement of people in alignment with District sustainability and maritime clean air strategies.

Mobility Policy 1.1.17 The District may expand the summer shuttle service (Big Bay Shuttle) that operates along Harbor Drive, establishing year-round connections between Shelter Island and the Convention Center, as a mobility priority (refer to Figure 3.2.4, Bayfront Circulator).

Mobility Policy 1.1.18 Development, adjacent to the bayfront circulator route as shown in Figure 3.2.4, Bayfront Circulator, shall provide hubs or stops to support operation of the bayfront circulator.

Mobility Policy 1.1.19 The District shall prepare a curbside management program that will provide strategies and guidelines for the use of curb space along corridors fronted by predominantly commercial uses.

Mobility Policy 1.1.20 Development shall implement curbside management strategies in accordance with the District's curbside management program, once established.

Mobility Policy 1.1.21 The District—independently or in collaboration with other agencies with transportation authority and adjacent jurisdictions and permittees—may identify additional waterside or landside access opportunities in the future to enhance the mobility network for the movement of people.

Mobility Objective 1.2 Implement a series of interconnecting mobility hubs throughout Tidelands.

Mobility Policy 1.2.1 The District shall require the planning, designing, and implementation of a network of mobility hubs (Regional, Local Gateway, and Connector) that provide the opportunity for users to change from one mode of travel to another (refer to Chapter 5, Planning Districts, Coastal Access Mobility maps, for mobility hub locations and specifications and Chapter 4, Baywide development standards, for the associated criteria of the development for each type of mobility hub). This requirement shall apply to all subdistricts and commensurate with development intensity in accordance with WLU Goal 7 (Chapter 3.1, Water and Land Use Element) and Mobility Policy 1.2.2).

Mobility Policy 1.2.2 Permittees of development shall contribute to the creation of mobility hubs through funding or construction, as shown in Chapter 5, Planning Districts, coastal access mobility maps.

Mobility Policy 1.2.3 Mobility hubs shall connect to water-based access points throughout the Bay, where feasible.

Mobility Policy 1.2.4 The District shall encourage the development of mobility hubs rather than surface parking to provide proximate connections to the water and Tidelands, where feasible.

Mobility Policy 1.2.5 The District shall coordinate with adjacent jurisdictions to add wayfinding signage that identifies coastal access opportunities on Tidelands, including public walkways, docks and piers, beaches, and other public areas and amenities.

Mobility Policy 1.2.6 Development shall provide and maintain legible wayfinding signage located in easily viewable areas in accordance with Chapter 4, Baywide Development Standards, and Chapter 5, Planning Districts, including any development standards within the applicable planning district or subdistrict.

Mobility Policy 1.2.7 The District shall require, in coordination with permittees of development, the planning, designing, and implementation of a comprehensive, nondigital wayfinding signage system to guide visitors to and throughout Tidelands.

Mobility Policy 2.1.2 The District shall encourage the development of versatile infrastructure that can adapt to future needs and support multiple modes of travel for the transfer of freight between waterside and landside uses.

Mobility Policy 2.1.4 The District shall require, where feasible, efficient and sustainable dockside operations for oceangoing vessels and freight-related harbor craft.

Mobility Policy 2.1.5 The District shall seek investment and grant opportunities for infrastructure, equipment, and technologies that enable the District's marine terminals to efficiently and sustainably transfer goods between waterside and landside.

Mobility Policy 2.1.6 The District shall collaborate with public and private entities to invest in terminal infrastructure that supports the optimization of cargo movement, cargo laydown areas, cargo handling equipment, and gate operations directly related to maritime cargo.

Mobility Policy 2.2.1 Through CDPs issued by the District, permittees shall plan, design, and implement improvements to the mobility network that provide opportunities for efficient and sustainable goods movement. These improvements shall be developed in accordance with Chapter 5, *Planning Districts*, including any development standards within the applicable planning district or subdistrict.

Mobility Policy 2.2.2 Through CDPs issued by the District, permittees shall advance as part of development the implementation of zero-emission, when feasible, and near-zero-emission goods movement mobility options and maritime equipment, and supportive infrastructure improvements, in alignment with District sustainability and maritime clean air strategies.

Mobility Policy 2.2.3 The District shall engage with stakeholders, such as railway companies, trucking companies, cargo and freight shipping lines, and service providers, to identify and implement feasible sustainable freight strategies in accordance with the District's environmental and operational strategies, plans, and regulations, as well as the State's sustainability objectives.

Mobility Policy 2.2.4 The District shall engage with railroad operators and agencies that have transportation authority to maintain, enhance, and expand access between the cargo terminals and the regional freight infrastructure.

Mobility Policy 2.2.5 The District, in coordination with permittees of development, tenants, and adjacent jurisdictions, and regional transportation agencies, shall maintain and develop improvements to linkages between the marine terminals and landside networks, including but not limited to roadways, rail, and pipelines, to enable efficient movement of goods along those networks and to support the working waterfront.

Mobility Policy 2.2.6 The District and permittees shall optimize off-terminal land-based freight networks to maintain, enhance, and expand the vitality of the working waterfront.

Mobility Policy 2.2.7 In coordination with operators and stakeholders, the District shall plan for improvements to railroad corridors, such as spurs, rail storage facilities, switching facilities, and suitable rail trackage within the working waterfront, both on dock and near dock, to better interface the movement of cargo between ship and land carriers.

Mobility Policy 2.2.8 Through CDPs issued by the District, permittees shall advance as part of development the implementation of zero-emission, when feasible, and near-zero emission

technologies and supportive infrastructure improvements for freight-related oceangoing vessels and harbor craft in alignment with District sustainability and maritime clean air strategies.

Mobility Policy 2.2.9 The District shall coordinate with its tenants and the cities of National City or San Diego to enhance access and connectivity between the Tenth Avenue and National City marine terminals, on both the waterside and landside, to allow for the convenient transfer of goods. Specific improvements to enhance the connectivity between terminals are outlined in Chapter 5, Planning Districts, including any planned improvements within the applicable planning district or subdistrict.

Mobility Policy 3.1.1 The District shall engage with the U.S. military, local, regional, and State agencies with transportation authority to:

- a. Identify and document the transportation facilities located on Tidelands that either are part of the STRAHNET or provide a critical connection to strategic facilities located on or adjacent to Tidelands;
- b. Ensure that the critical components of the District's transportation network are available and maintained to meet the goals and standards of the STRAHNET; and
- c. Ensure that the identified critical transportation facilities located on Tidelands are clear of permanent obstructions that would prohibit or slow the movement of military use when needed for Department of Defense activities.

Mobility Policy 3.1.2 The District shall engage with the U.S. military, local, regional, and State agencies with transportation authority to coordinate the maintenance of facilities that connect to the region's STRACNET rail corridor.

Mobility Policy 3.2.1 The District shall engage with the U.S. military to identify and ensure the effectiveness of critical assets for military use, such as marine terminals, rail facilities, and docks and piers, that may be needed in times of emergency while allowing day-to-day access to strategic assets.

Mobility Policy 3.2.2 The District shall plan and maintain its transportation network so that it has the capacity to evacuate operations located on terminals in a manner and timeframe consistent with the U.S. military's needs consistent with requirements under the Strategic Port designation.

4.2.4.4 Project Impacts and Mitigation Measures

Threshold 1: Conflict with or obstruct implementation of the applicable air quality plan?

Impact Analysis

Impacts of Water and Land Uses

Implementation of the proposed PMPU could conflict with an applicable air quality plans if it is inconsistent with the growth projections assumed or if it would conflict with the overarching goals and strategies in the RAQS and SIP. Implementation of the PMPU also would conflict with an applicable air quality plan if it would conflict with or obstruct implementation of the goals and objectives of the MCAS or CERP actions.

RAQS and SIP: Growth Consistency Assessment

There are a variety of land uses within the proposed PMPU area, including both water- and land-dependent uses that span several jurisdictions. Table 4.2-12 summarizes the new development assumed within each planning district. As shown, implementation of the proposed PMPU would result in increases in hotel rooms, retail and restaurant uses, as well as convention center and meeting space. Table 4.2-15 summarizes the waterside development assumptions (new boating and fishing slips) within each planning district. As shown in Table 4.2-15, implementation of the proposed PMPU would result in increased opportunities for recreational boating and commercial fishing due to increased available recreational boating and commercial fishing slips. As discussed above in Section 4.2.4.1, *Methodology*, increases in future development allowed under the PMPU would result in related changes in vehicle use (average daily trips and VMT) and recreational boating and fishing activity.

Progress toward attainment of the NAAQS and CAAQS is based on emissions budgets identified in the RAQS and SIP. An emissions budget identifies the emissions level necessary for meeting emission reduction milestones, attainment, or maintenance demonstrations. This budget considers existing conditions, planned growth based on SANDAG's growth projections (which include District growth), and air quality control measures implemented by SDAPCD. The RAQS and SIP utilize SANDAG growth forecasts and CARB mobile source forecasts to develop emissions reduction measures necessary for attaining the NAAQS and CAAQS. The SANDAG model used for projecting population, housing, and job growth in the county considers the demographic, economic, and land use data from all relevant planning documents, including the existing PMP. Accordingly, because the proposed PMPU plans for development beyond that which is contemplated in the PMP, SANDAG's growth forecasts do not account for the proposed changes in water and land use contemplated as part of the proposed PMPU. It is worth noting that SANDAG notes in its growth forecast that growth between 2030 and 2050 includes alternatives that may, in some cases, reach beyond existing adopted plans (SANDAG 2013). However, it is unclear what SANDAG assumed beyond 2030 for the District. As such, because the RAQS and SIP are based on SANDAG's growth projections, and these growth projections are based on the existing PMP, the proposed PMPU would be inconsistent with the RAQS and applicable portions of the SIP (**Impact AQ-1**). Mitigation measure **MM-AQ-1** is required to ensure that projected PMPU growth is used to update SANDAG's growth projections, thus informing the air quality strategies contained within the RAQS and SIP with the new development assumptions.

RAQS and SIP: ~~Consistency with~~ Conflict with or Obstruct Goals and Strategies

As discussed above, if the proposed PMPU is consistent with the overarching goals (i.e., to reduce emissions and attain NAAQS and CAAQS) and strategies (i.e., measures implemented to reduce emissions) of applicable air quality plans, then it would be consistent with applicable air quality plans. The 2016 RAQS and both the 2020 and 2016 SIPs contain numerous goals and strategies to reduce emissions, primarily VOC and NO_x emissions, within the county. The strategies and measures in these plans that are relevant to the proposed PMPU address emissions sources such as solid waste, on-road vehicles, general industrial, marine industrial, coatings, and manufacturing. As the authority on local air quality, the SDAPCD is responsible for establishing and enforcing local air quality rules and regulations that address the requirements of Federal and State air quality laws within the SDAB. As such, the proposed PMPU would be subject to, and consistent with, the relevant SDAPCD rules during future construction and operation within the proposed PMPU area. In addition, several incentive programs are presented in the SDAPCD plans as means to achieving attainment

within the SDAB. These programs include State- and Federally funded grant programs that target emissions from on-road, medium- and heavy-duty diesel engines, general goods movement, marine, and off-road equipment sources.

SDAPCD has implemented 13 Transportation Control Measures (TCMs) (SDAPCD 2020). These include transit and traffic flow improvements, ridesharing, HOV lanes, pedestrian-only streets, and limits on extended vehicle idling. SANDAG and other State and local transportation agencies implement these TCMs. The proposed PMPU does not include any elements that would conflict with or impede successful implementation of these TCMs. These TCMs are focused on reducing passenger car vehicle trips and congestion relief. Rather, the proposed PMPU would be consistent with these TCMs by promoting coordination with transportation agencies to plan, operate, maintain, and improve the regional mobility infrastructure for the movement of people and goods (Mobility Policy 1.1.8), expanding accessible transit service to Tidelands (Mobility Policy 1.1.9), and exploring financing options for transit expansion (Mobility Policy 1.1.10). The proposed PMPU also discusses specific transit improvements in Chapter 5, *Planning Districts*, including any planned improvements within the applicable planning district or subdistrict. These include, but are not limited to, a mobility hub in the North Embarcadero Subdistrict of PD3 and a dedicated transit lane for the bayfront circulator route along Harbor Drive in the South Embarcadero Subdistrict of PD3. In addition, the District would develop TDM guidelines and require development to comply with such guidelines, with the intent to reduce dependence on single-occupancy vehicles and reduce VMT to, from, and within Tidelands (Mobility Policy 1.1.11). Thus, the proposed PMPU is consistent with the goals and strategies in the RAQS and SIP.

MCAS: Conflict with or Obstruct Goals and Strategies

As discussed in Section 4.2.3.4, the MCAS focuses on maritime and shipyard activities and includes various emission reduction goals and strategies to achieve those goals. Most of the strategies in the MCAS go beyond regulatory requirements and are intended to achieve emission reductions at the District's two cargo terminals, the cruise ship terminal, along the entire Working Waterfront and with the District's fleet of vehicles, equipment, and marine vessels. The goals and strategies will guide the District's investments in zero emissions technology and electrification and allow the District to help tenants and terminal operators prioritize replacements over time.

As noted in the MCAS, the MCAS is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. Consistent with CEQA, any applicable future project undergoing environmental review will be required to analyze the project's potentially significant impacts against applicable thresholds, including, whether the project will conflict with or obstruct implementation of an applicable air quality plan. An analysis of whether the PMPU conflicts with or obstructs implementation of the MCAS is provided in Appendix J to the Final PEIR. This analysis shows that the PMPU will not obstruct implementation of or conflict with the MCAS. Rather, the PMPU policies align with and support implementation of the MCAS.

CERP: Conflict with or Obstruct Goals and Actions

As discussed in Section 4.2.3.4, the District continues to work with stakeholders and SDAPCD on the AB 617 Portside Steering Committee to help advance near-term emission reduction strategies identified in the AB 617 CERP for port-related operations and activities. The CERP focuses on strategies to monitor air pollution and to develop and implement strategies to reduce emissions and health impacts in communities most impacted by air pollution. Given the District's location and

operations, many of the strategies are aimed at goods movement and industrial operations on the waterfront, and include strategies to fund the transition to zero-emission trucks and equipment.

While the focus is on reducing pollution that directly contributes to the health burden in the adjacent communities, these strategies are aimed at reducing all emission types Port-wide. CERP strategies have not been quantified because all the details regarding implementation have not yet been finalized, and the actions in the CERP are being implemented regardless of the proposed PMPU. The Phase II Final CERP includes emission reduction strategies related to heavy duty trucks and Working Waterfront activities associated with the Port, Navy, and shipyards. Chapter 7 of the CERP identifies additional strategies to reduce diesel emissions from cargo handling equipment, ships at berth, truck electrification, and portable air compressors that are used at the Port's three major shipyards. These specific emission reduction measures are aspirational in nature and will not be required by CARB or SDAPCD and will not be quantified because long-term implementation cannot be guaranteed. However, participation on the AB 617 CERP Steering Commission is ongoing. As stated above regarding the MCAS consistency analysis, consistent with CEQA, any applicable future project undergoing environmental review will analyze that project's potentially significant impacts against applicable thresholds, including, whether the project will conflict with or obstruct implementation of the applicable air quality plan. A CERP consistency analysis is provided in Appendix J to the Final PEIR. This analysis shows that the PMPU will not obstruct implementation of or conflict with the CERP. Rather, the PMPU policies align with and support implementation of the CERP.

As discussed in PEIR, Chapter 3, *Project Description*, there are three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to conflicts with applicable air quality plans (**Impact-AQ-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above, with minor differences associated with the Waterfront Destination Park, some increase in Recreation Open Space and Commercial Recreation uses, and a decrease in roadway acreage from the closure of the portion of North Harbor Drive. However, these differences would not result in growth or activities that differ from those analyzed above for the proposed PMPU. In fact, closure of this portion of North Harbor Drive would promote goals and strategies being implemented by SDAPCD to reduce emissions from motor vehicles, as it would promote pedestrian walking, bicycling, and pedicab circulation. Even though these differences would not result in growth or activities that differ

from those analyzed above for the proposed PMPU, the growth associated with Option 1 would have the potential to conflict with air quality plans, as it was not accounted for in the RAQS and SIP, which would be considered a significant impact (**Impact-AQ-1**).

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to conflicts with applicable air quality plans (**Impact-AQ-1**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above, with minor differences associated from the additional Recreation Open Space along with the expansion of the Lane Field Setback Park. However, these differences would not result in growth or activities that differ from those analyzed above for the proposed PMPU. Still, growth associated with Option 2 would have the potential to conflict with air quality plans, as it was not accounted for in the RAQS and SIP, which would be considered a significant impact (**Impact-AQ-1**).

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact related to conflicts with applicable air quality plans (**Impact-AQ-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of construction activities described above, with minor differences associated with realignment of North Harbor Drive and an increase in Recreation Open Space. However, these differences would not result in growth or activities that differ from those analyzed above for the proposed PMPU. Still, growth associated with Option 3 would have the potential to conflict with air quality plans, as it was not accounted for in the RAQS and SIP, which would be considered a significant impact (**Impact-AQ-1**).

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to conflicting with or obstructing implementation of an applicable air quality plan. Rather, the proposed PMPU policies listed in Section 4.2.4.3, Policies that May Avoid or Reduce Impacts, would reduce potential impacts related to compliance with applicable air quality plans by implementing programs and activities that reduce exposure to toxic air contaminants and criteria air pollutants (ECO Policy 3.1.1); implementing clean air action measures to reduce emissions, such as efficient buildings design features and promoting the use of alternative fuels or electric powered vehicles and vessels (ECO Policy 3.1.2); cooperating with regional, State, and Federal agencies to advance maritime clean air strategies to help improve local air quality (ECO Policy 3.1.3); implementing infrastructure and clean vessel technologies, for both while in transit and at berth (ECO Policy 3.1.4); and exploring financing programs in coordination with regional, State, and Federal partners to implement recommended clean air measures (ECO Policy 3.1.5). Moreover, various Mobility policies would expand and support transit improvements (Mobility Policy 1.1.8, Mobility Policy 1.1.9, and Mobility Policy 1.1.10), while Mobility Policy 1.1.11 states that the District shall require

certain development to develop and comply with project-specific TDM guidelines, which is consistent with trip-reductions measures in the RAQS and SIP. These policies would help reduce the cumulative basin-wide burden of emissions and help ensure consistency with the goals and strategies in the RAQS and SIP.

Impact Determination and Mitigation

Implementation of the proposed PMPU would conflict with or obstruct implementation of an applicable air quality plan.

Significant Impacts

Impact-AQ-1: New Land Use Designations Not Accounted for in the RAQS and SIP. The proposed PMPU would redesignate various water and land uses that could increase activity within the Tidelands. As these land use changes were not known at the time the RAQS and SIP were last updated, this would result in a conflict with the applicable State and regional air quality plans because the proposed land uses and the intensities proposed are not included in RAQS and SIP growth projections.

Mitigation Measures

For **Impact-AQ-1**:

MM-AQ-1: Update the RAQS and SIP with New Growth Projections. Within ~~6 months~~ thirty days of certification approval of the proposed PMPU, the District shall provide SANDAG with amended growth assumptions and changes to water and land use designations associated with the proposed PMPU. The District shall coordinate with SANDAG and the SDAPCD to ensure the RAQS and SIP are updated as part of the next soonest revision cycle to reflect the updated growth assumptions of the proposed PMPU.

Level of Significance After Mitigation

Implementation of the proposed PMPU would change designations and increase development within the proposed PMPU area relative to the existing PMP. The proposed changes would have the potential to be inconsistent with the growth anticipated by the current PMP that was used in the formulation of the RAQS and SIP, resulting in a significant direct impact related to conflicting with air quality plans. Implementation of **MM-AQ-1** will ensure the proposed PMPU is consistent with the RAQS and SIP, and the proposed PMPU would no longer be inconsistent. Because the law ~~this~~ presumes that SANDAG and SDAPCD will perform their official duties to update the RAQS and SIP, implementation of the proposed PMPU policies and standards and **MM-AQ-1** would reduce **Impact-AQ-1** to a level below significance. Therefore, **Impact-AQ-1** would be less than significant after mitigation.

Threshold 2: Result in a cumulatively considerable net increase of any criteria pollutant for which the PMPU region is nonattainment under an applicable Federal or State ambient air quality standard?

Impact Analysis

Impacts of Water and Land Uses

As a result of past and present projects, the SDAB is currently in nonattainment for O₃ under the NAAQS, and for O₃, PM₁₀, and PM_{2.5} under the CAAQS (see Section 4.2.5, *Cumulative Impact Analysis*). Implementation of the proposed PMPU could result in construction and operational activities that may result in air quality emissions, including O₃ precursors (VOC and NO_x), PM₁₀, and PM_{2.5}. The construction- and operations-related air quality impacts are discussed below.

Construction

The proposed PMPU serves as a long-term planning blueprint for future development within eight of the District's ten planning districts. Approval of the plan would not include approval of any specific development project, including, without limitation, the construction of any buildings, infrastructure, or boat slips. However, future construction activities would result from future development projects that meet the water and land use designation requirements and abide by the policies and standards set forth by the proposed PMPU. Specifically, buildout of the proposed PMPU would potentially include the construction of new hotels and lower cost accommodations; restaurants and entertainment venues; park space and promenades; retail, convention, and meeting space; office space; and other uses. In-water development could include additional vessel activity associated with more slips and docks with waterside uses that include anchorage, commercial fishing berthing, industrial and deep-water berthing, marine services berthing, navigation corridors, recreational berthing, and sportfishing berthing facilities.

Although implementation of the proposed project would increase the construction activity in the proposed PMPU planning area, the buildout of the proposed PMPU would take place over a long-range timeframe and construction activities would occur periodically throughout that timeframe. Construction of landside uses would result in emissions from construction equipment exhaust, haul and delivery trucks, and worker vehicles; fugitive dust from demolition, site grading, and general surface disturbance; and fugitive ROG from architectural coatings and paving. Construction of waterside uses such as to construct additional slips, docks, and moorings would include use of in-water equipment such as tugboats, survey vessels, skiffs, and other types of equipment to remove, move, and install waterside features. Construction emissions for individual projects would be temporary and the total duration would vary from project to project. Construction emissions can vary substantially from day to day depending on the level of activity, the specific type of operation, and, for dust, prevailing weather conditions.

Table 4.2-17 presents the estimated construction emissions from implementation of the proposed PMPU assuming all development is averaged over the life of the proposed PMPU (i.e., through 2050). The construction emissions estimates compare maximum daily emissions, assuming overlapping waterside and landside activities, to relevant thresholds for ROG, NO_x, CO, SO_x, PM₁₀, and PM_{2.5}. DPM emissions, a subset of PM₁₀ and PM_{2.5}, are presented for informational purposes as there is no mass emissions threshold for DPM emissions. The estimates in Table 4.2-17 are representative of

worst-case conditions that could occur during overlapping construction activities. Overlapping construction activities on the worst-case day would not occur every day over the life of the proposed PMPU. Instead, construction emissions would occur intermittently and average daily emissions would be less than shown here.

Table 4.2-17. Construction Emission Estimates Associated with All Development Through 2050—Unmitigated (pounds per day)

Phase	ROG	NO _x	CO	SO _x	PM10	PM2.5	DPM
Demolition	4	59	29	<1	35	7	2
Site Preparation	3	33	20	<1	21	12	2
Grading	3	35	29	<1	11	5	1
Building Construction	10	63	87	1	29	9	1
Paving	1	5	16	<1	<1	<1	<1
Architectural Coating	653	1	9	<1	4	1	<1
Waterside Construction	17	112	248	<1	6	5	6
Maximum Daily	692	308	437	1	107	39	11
<i>Thresholds</i>	75	250	550	250	100	55	--
Exceed?	Yes	Yes	No	No	Yes	No	--

Source: Appendix C.

Note: Emissions may not sum exactly due to rounding. Assumes CalEEMod default for all development and that all waterside and landside phases would occur concurrently.

As shown in Table 4.2-17, construction of the proposed PMPU could result an exceedance of thresholds for ROG, NO_x, and PM10. The majority of ROG during construction would be due to architectural coatings. The majority of NO_x emissions would be due to equipment associated with waterside construction, which is assumed to involve numerous in-water and landside construction pieces, such as tugboats, pushboats, small support boats, and cranes, as well as the numerous worker and delivery trips associated with the building construction phase. Each marina expansion project is assumed to take an average of 3 months, and it is assumed that only one such project could occur at a time based on historical data of past marina expansion projects. The majority of PM10 emissions would be due to dust generated during demolition, site preparation, and grading activities, as well as paved road dust from material hauling and deliveries. Additionally, the CalEEMod default assumptions for worker and delivery trips are based on the square footage of building construction per day. Also, note that construction emissions would primarily occur in PD2 and PD3, as they would likely experience see the most development as part of the proposed PMPU.

The quantitative modeling in Table 4.2-18 above estimates construction emissions associated with full buildout of future development allowed under the PMPU. However, the proposed PMPU is a long-range plan and does not include a specific buildout schedule. Thus, the exact types and sizes of future development would be driven by market conditions, and construction of future land use developments would occur intermittently throughout the course of the buildout period. Although the timing and intensity of future development projects are not known at this time, implementation of the proposed PMPU would result in construction of multiple and concurrent projects that could generate criteria pollutant emissions on a daily basis that exceed thresholds and are considered significant as shown in Table 4.2-17.

Therefore, potential construction impacts are considered significant, and mitigation is required (**Impact AQ-2**).

Mitigation measures **MM-AQ-2** through **MM-AQ-9** will mitigate construction impacts associated with buildout of the proposed PMPU. The construction mitigation measures and their effects of on emissions are summarized below.

- **MM-AQ-2** requires construction best practices, including maintaining construction equipment in proper working condition, minimizing idling time, and promoting measures to reduce construction worker commute trips. These measures would reduce all emission types and, although emission reductions cannot be quantified, they are likely to be small in scale.
- **MM-AQ-3** requires all off-road equipment to use renewable diesel and meet Tier 4 emissions standards, depending on when construction occurs. These measures would reduce all emission types. Although the emission reductions would be potentially substantial, it is not possible to quantify them at this time given that specific construction timing and fleet mix are unknown. However, Tier 4 equipment reduces ROG emissions 7–12 percent and NO_x and PM emissions 89–95 percent relative to Tier 3 standards in construction equipment. Furthermore, this measure requires the use of zero or near-zero emission equipment as it becomes commercially available over the life of the proposed PMPU.
- **MM-AQ-4** is required to reduce fugitive dust emissions. This measure would go beyond Rule 55 and reduce fugitive PM₁₀ and PM_{2.5} emissions typically associated with earthmoving activities, demolition activities, travel on paved and unpaved roads, and storage piles. Fugitive dust control measures, such as watering construction areas every 3 hours, can reduce fugitive PM₁₀ and PM_{2.5} emissions by approximately 61 percent.
- **MM-AQ-5** is required to reduce ROG emissions from architectural coatings. ROG emissions from architectural coatings are based on the amount of paint applied on a daily basis and the ROG/VOC content of that paint. The unmitigated analysis assumes compliance with SDACPD Rule 67.0. Using paints with a VOC content below that required by Rule 67.0 reduces ROG/VOC emissions and related impacts, and using no-VOC paints can eliminate ROG emissions from the architectural coatings phase entirely. This mitigation measure goes beyond Rule 67.0 and requires all future projects to use low VOC paints (75 grams per liter), and, if a certain amount of painting would occur on a daily basis, to use lower VOC paints (10 grams per liter or lower) to ensure VOC emissions from all activities remain below SDAPCD thresholds.
- **MM-AQ-6** requires all harbor craft or dredgers used to construct new slips to use renewable diesel and meet Tier 3 or 4 emissions standards, or use zero-emission equipment, depending on when construction occurs and the availability of equipment. These measures would reduce all emission types. Although the emission reductions would be substantial, it is not possible to quantify them given that specific construction timing and fleet mix are unknown. Fully electric harbor craft emit no tailpipe emissions, eliminating all ROG, NO_x, and PM emissions. As fully electric harbor craft become more prevalent, their use during construction activities will increase.
- **MM-AQ-7** is related to **MM-AQ-6** in that this measure obligates the District to track the rollout of zero or near-zero (i.e., hybrid) harbor craft both within San Diego Bay and within nearby ports. Zero or near-zero (i.e., hybrid) harbor craft substantially reduce (or eliminate) all ROG, NO_x, and PM emissions. Their use over time will increase as new zero or near-zero technologies and models become available within the Bay and nearby.

- **MM-AQ-8** requires future project proponents to document and track activities and emissions to ensure that projects do not exceed daily thresholds individually or in combination with other projects being implemented as part of the proposed PMPU. These measures require reporting to the District and changes to the overall construction schedule if emissions would exceed thresholds.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction impact related to criteria pollutant emissions (**Impact-AQ-2**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. Pollutant emissions associated with reconfiguring and closing of North Harbor Drive, construction of a Waterfront Destination Park, and other improvements to open space would be similar to those in the analysis above. However, it is possible that implementation of Option 1 could result in construction that individually, or occurring concurrently with other projects associated with the proposed PMPU, could generate criteria pollutant emissions on a daily basis that exceed thresholds. Therefore, potential construction impacts associated with Option 1 are significant (**Impact-AQ-2**). Mitigation measures **MM-AQ-2** through **MM-AQ-8** are required to mitigate construction impacts associated with buildout of Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction impact related to criteria pollutant emissions (**Impact-AQ-2**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. Pollutant emissions associated with constructing additional

Recreation Open Space and the expansion of the Lane Field Setback Park would be similar to those in the analysis above. However, it is possible that implementation of Option 2 could result in construction that individually, or occurring concurrently with other projects associated with the proposed PMPU, could generate criteria pollutant emissions on a daily basis that exceed thresholds. Therefore, potential construction impacts associated with Option 2 are significant (**Impact-AQ-2**). Mitigation measures **MM-AQ-2** through **MM-AQ-8** are required to mitigate construction impacts associated with buildout of Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction impact related to criteria pollutant emissions (**Impact-AQ-2**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 3 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. Pollutant emissions associated with construction associated with the realignment of North Harbor Drive and the additional recreational open space would be similar to those in the analysis above. However, it is possible that implementation of Option 3 could result in construction that individually, or occurring concurrently with other projects associated with the proposed PMPU, could generate criteria pollutant emissions on a daily basis that exceed thresholds. Therefore, potential construction impacts associated with Option 3 are significant (**Impact-AQ-2**). Mitigation measures **MM-AQ-2** through **MM-AQ-8** are required to mitigate construction impacts associated with buildout of Option 3.

Operation

The net change in criteria pollutant emissions relative to existing conditions is presented for assumed conditions in both 2030 and 2050 at the daily time scale. Development assumptions are presented in Table 4.2-12 and Table 4.2-13 in Section 4.2.4.1. A summary of emission tables and associated impacts follows.

- Table 4.2-18 summarizes the net change in criteria pollutant emissions in 2030 at the daily time scale. As shown, emissions are anticipated to exceed relevant thresholds for ROG (**Impact-AQ-3**).
- Table 4.2-19 summarizes the net change in criteria pollutant emissions in 2050 at the daily time scale. As shown, emissions are anticipated to exceed relevant thresholds for ROG and CO (**Impact-AQ-3**).

The contribution to these exceedances differs by pollutant. Source contributions for both the 2030 and 2050 analysis years are as follows prior to mitigation:

- For both 2030 and 2050, area sources (e.g., coatings, consumer products) are the biggest source of ROG, which exceeds the ROG threshold by itself. Recreational boating is the next largest source of ROG emissions.
- The majority (73%) of CO emissions in 2050 (no exceedance in 2030) are associated with recreational boating, followed by energy (12%) and mobile sources (12%).

- The PM₁₀, PM_{2.5}, and SO_x thresholds are not exceeded in either year.

The increase in ROG and CO emissions would exceed thresholds. Therefore, **Impact-AQ-3** would be significant.

Table 4.2-18. Estimated Net New Daily Emissions Baywide in 2030 Associated with PMPU Buildout—Unmitigated (pounds per day)

Source: ICF Emissions Modeling (Appendix C).

Note: Sectors or sources that individually exceed thresholds are shown in underline.

The net change in criteria pollutant emissions by planning district relative to existing conditions is presented in Table 4.2-20 for 2030 and Table 4.2-21 for 2050. As shown, the change in emissions would primarily occur in PD2 and PD3, as they would potentially see the most change in activity as part of the proposed PMPU.

Land use development could increase over time due to the proposed PMPU, resulting in an increase in emissions in PD2, PD3, and PD8. While emissions on a per unit or activity basis (e.g., per vehicle mile traveled) decrease over time as vehicles and vessels become more efficient, emissions would,

for the most part, still increase because the increase in activity would outweigh the decrease in emissions on a per-activity basis.

The increase in recreational boating and commercial fishing slips would increase emissions over time in PD1, PD2, PD3, PD9, and PD10 due to the proposed PMPU. For both commercial fishing and recreational boating, the increase in emissions is due solely to the increase in activity. There are currently no regulations in place to reduce emissions from commercial fishing, sport fishing, and recreational boating. However, as of 2021, the existing CARB Commercial Harbor Craft rule (CARB 2008) exempts various harbor craft from the rule, including, but not limited to, commercial fishing, sport fishing (called charter fishing in all of CARB's rulemaking), work boats, and pilot vessels. CARB's most recent Proposed Concepts for Commercial Harbor Craft proposed extending the rule to sport fishing, commercial fishing, work boats, and pilot vessels (CARB 2020a). This rule would require all in-use sport fishing vessels (or commercial passenger fishing vessels) to be equipped with Tier 4 engines by 2030 at the latest, and all commercial fishing vessels to be equipped with Tier 2 engines between 2030 and 2032. While this rule is expected to be considered in November 2021, considered by the CARB board in early 2022, and take effect in 2023 (CARB 2019c), because it is currently in draft form, the associated emissions reductions are not quantified.

CARB is also working on a recreational marine vessel regulation to limit ROG and NO_x emissions from marine engines. CARB set standards for evaporative emissions in 2015, but the exhaust emissions standards have not been changed since 2009. As part of this rulemaking effort, CARB is currently working on a draft rule and is expected to adopt this regulation in 2026 or 2027 (CARB 2020c). While not immediate, emissions from recreational boats are likely to be much lower than assumed herein as this new regulation is implemented and new vessels are built to comply with more stringent emissions standards. Similar to the fishing fleet, because this rule is currently in draft form, the associated emissions reductions are not quantified.

Note that the increase in operations associated with PMPU buildout would not occur immediately and all at once, but would instead occur incrementally over time as regional air quality improves and regulations to reduce emissions from Port-related sources take effect.

As noted, **Impact-AQ-3** would be significant. Mitigation measures **MM-AQ-9** through **MM-AQ-12** are proposed to mitigate operational impacts associated with buildout of the proposed PMPU. The proposed operational mitigation measures and their effect on emissions are summarized below.

- MM-AQ-9** requires all tenants to implement sustainability measures in building design ~~through 2030~~, **MM-AQ-10a** requires all new hotels constructed prior to 2030 to use electric energy only, with the exception for kitchens and cooking activities, and **MM-AQ-10b** requires all development to be carbon neutral after 2030. These measures will reduce emissions from new development by reducing energy and water consumption and waste generation. The push for carbon neutral design will increase over time and become a standard practice during the life of the proposed PMPU. This measure has been quantified and assumes that, in 2030, new hotel uses only consume natural gas associated with cooking, which reduces natural gas consumption from new hotels 90 percent, or reduces emissions equivalent to this reduction through implementation of other strategies. Beyond 2030, it is assumed that all new development will be carbon-neutral and will not increase natural gas consumption beyond that assumed in 2030.
- MM-AQ-11** ~~requires the District to develop and implement an EV charging program, and to require~~ future development to incorporate EV charging into project design. Installing EV chargers is a supplemental measure in that it does not directly reduce emissions itself, but instead supports local, regional, and statewide efforts to increase usage of zero emission electric vehicles. While the emission reductions associated with this measure have not been quantified in the mitigated emissions analysis because details (e.g., location, usage per day) have not yet been developed, it is estimated that achieving a possible addition of up to the 4212 publicly accessible chargers ~~in by~~ 2030 could reduce new VMT ~~1-22.3~~ percent and achieving a possible addition of up to the 50730 publicly accessible chargers ~~in by~~ 2050 could reduce emissions associated with mobile sources by ~~0.741.4~~ percent, assuming all new vehicle trips have access to these chargers (i.e., they are in high-traffic areas) and assuming four vehicles access each charger on a daily basis (CARB 2019a, NREL 2014). While the estimated emission reductions are shown here, the emission reductions have not been applied to the mitigated emissions analysis.

- **MM-AQ-12** requires marina operators to install dockside electrical infrastructure for boats to plug into when docked. CARB notes that there are opportunities to electrify many recreation boats, specifically small outboard engines (less than 19 kilowatts). Many of these options are drop-in ready. The marina operators will provide charging infrastructure at marinas and will promote public awareness. This measure will reduce all emission types, particularly ROG and CO emissions associated with recreational boating ~~exhaust emissions and evaporative losses~~. This measure has not been quantified because the specifics have not yet been developed.

~~The District is engaged in other efforts that will help to reduce emissions from the proposed PMPU that have not reached the stage where they are sufficiently specific to be recommended as mitigation measures at this time. If these measures are completed and adopted in the future, they may be considered in the site-specific analysis of future development allowed under the proposed PMPU. These measures are described below.~~

~~The District continues to work with stakeholders and SDAPCD on the AB 617 Portside Steering Committee to help advance near-term emission reduction strategies identified in the AB 617 CERP for port-related operations and activities. The CERP focuses on strategies to monitor air pollution and to develop and implement strategies to reduce emissions and health impacts in communities most impacted by air pollution. Given the Port's location and operations, many of the strategies are aimed at goods movement and industrial operations on the waterfront, and include strategies to fund the transition to zero-emission trucks and equipment. While the focus is on reducing pollution that directly contributes to the health burden in the adjacent communities, these strategies are aimed at reducing all emission types Port-wide. CERP strategies have not been quantified because all the details regarding implementation have not yet been finalized, and the actions in the CERP are being implemented regardless of the proposed PMPU. The Phase II Final CERP includes emission reduction strategies related to heavy-duty trucks and Working Waterfront activities associated with the Port, Navy, and shipyards. Chapter 7 of the CERP identifies additional strategies to reduce diesel emissions from cargo handling equipment, ships at berth, truck electrification, and portable air compressors that are used at the Port's three major shipyards. These specific emission reduction measures are aspirational in nature and will not be required by CARB or SDAPCD and will not be quantified because long-term implementation cannot be guaranteed. However, ongoing participation on the AB 617 CERP Steering Commission is ongoing because it is a feasible, short-term measure that may help reduce air quality impacts associated with the Working Waterfront~~

~~As discussed in Section 4.2.3.4, the MCAS includes various emission reduction goals and strategies to achieve those goals, although the goals are not mandatory as feasibility may not be achievable. Most of the strategies in the MCAS go beyond regulatory requirements, and may achieve emission reductions at the two cargo terminals; at the cruise ship terminal; along the entire Working Waterfront; and with the District's fleet of vehicles, equipment, and marine vessels. The Draft Revised Draft MCAS was released for public review in August 2021 and was adopted by the District Board of Port Commissioners in October 2021. The goals and strategies will guide the District's investments in zero-emissions technology and electrification and allow the District to help tenants and terminal operators prioritize replacements over time. As noted in the MCAS document, the MCAS is intended to guide future decision-making and provide a planning framework for potential future actions that may be implemented to achieve the goals and objectives identified in the MCAS. The MCAS focuses on maritime and shipyard activities. Measures from both the MCAS and potentially the CERP will be applicable to new projects as they arise.~~

Tenth Avenue Marine Terminal

Since the TAMT EIR was adopted in late 2016, several regulations have been adopted, which would apply to future development under the TAMT Redevelopment Plan and will reduce emissions at TAMT long-term.

In June 2020, CARB adopted the Advanced Clean Truck Regulation, which promotes zero-emission technology penetration with sales requirements for medium- and heavy-duty truck manufacturers. In August 2020, CARB expanded the At-Berth Regulation to other vessels, although the impact on TAMT may be small given that container ships were already covered and TAMT rarely if ever sees the types of vessels that were added (Ro/Ro, auto carriers, tankers). In September 2020, Governor Newsom signed EO N-79-20, which establishes various zero-emission goals, including a goal that 100 percent of new passenger car and trucks sales be zero-emission by 2035, all drayage trucks be zero-emission by 2035, all off-road equipment be zero-emission where feasible by 2035, and the remainder of medium- and heavy-duty vehicles be zero-emission where feasible by 2045. Under EO N-79-20, CARB is tasked to work with State agencies to develop regulations to achieve these goals, while accounting for technological feasibility and cost effectiveness. While the goals under EO N-79-20 are not law, it is likely that CARB will adopt rules per this EO in the coming years (CARB 2020c).

These regulations will affect emissions from TAMT in several ways. In particular, the emission estimates in the TAMT EIR, associated with buildout of TAMT Redevelopment Plan in 2035, are likely overestimated in that regulations to reduce emissions from vessels and trucks, considered in the TAMT EIR, do not incorporate the newly adopted rules that will substantially reduce emissions. Over the long-term, emissions from some sources, such as trucks, may effectively be zero, which was not assumed in the TAMT EIR.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant operational impact related to criteria pollutant emissions (**Impact-AQ-3**). This significant impact would still occur within PD3 under Option 1, as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1 would not include new uses that generate substantial emissions, and pollutant emissions associated with a Waterfront Destination Park and other improvements to open space would be similar to those in the analysis above. Option 1 could generate criteria pollutant emissions on a

daily basis that exceed thresholds. Therefore, operational impacts associated with Option 1 are significant (**Impact-AQ-3**).

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant operational impact related to criteria pollutant emissions (**Impact-AQ-3**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include new uses that generate substantial emissions, and pollutant emissions associated with operation of additional Recreation Open Space and the expansion of the Lane Field Setback Park would be similar to those in the analysis above. Option 2 could generate criteria pollutant emissions on a daily basis that exceed thresholds. Therefore, operational impacts associated with Option 2 are significant (**Impact-AQ-3**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant operational impact related to criteria pollutant emissions (**Impact-AQ-3**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 3 would fall within the range of scenarios analyzed above. Option 3 would not include new uses that generate substantial emissions, and pollutant emissions associated with the additional recreational open space would be similar to those in the analysis above. Option 3 could generate criteria pollutant emissions on a daily basis that exceed thresholds. Therefore, operational impacts associated with Option 3 are significant (**Impact-AQ-3**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to a cumulatively considerable net increase of criteria pollutants for which the PMPU region is classified as nonattainment under an applicable Federal or State ambient air quality standard. Rather, the proposed PMPU policies listed in Section 4.2.4.3 would reduce potential impacts related to increases in criteria pollutants by implementing clean air action measures to reduce emissions, such as efficient buildings design features and promoting the use of alternative fuels or electric powered vehicles and vessels (ECO Policy 3.1.2), encouraging and facilitating deployment of net zero carbon emission projects and technologies (SR Policy 3.1.2), deploying renewable energy technology, and pursuing various strategies to reduce emissions (SR Policy 3.1.1 and SR Policy 3.1.3), and increasing the efficiency of cargo movements (ECON Policy 2.3.2).

Impact Determination and Mitigation

Implementation of the proposed PMPU would result in a cumulatively considerable net increase of criteria pollutants for which the project region is in nonattainment under an applicable Federal or State ambient air quality standard.

Significant Impacts

Impact-AQ-2: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction. Project emissions during construction activities, before mitigation, would exceed thresholds for ROG, NO_x, and ~~CO~~PM₁₀. Specific construction details (such as project design, location, timing, phasing, and overlapping of possible construction projects that would be implemented over the life of the proposed PMPU) are not known at this time, but the emissions analysis demonstrates the potential for construction emissions to exceed thresholds. As a result, the proposed PMPU would have a significant impact on air quality because future development allowed under the proposed PMPU may result in a cumulatively considerable net increase in criteria pollutants for which the proposed PMPU region is in nonattainment under Federal or State regulations.

Impact-AQ-3: Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations. Project emissions during operations, before mitigation, would exceed thresholds for VOC ~~and~~ NO_x, CO, PM₁₀, and PM_{2.5}. As a result, the proposed PMPU would have a significant impact on air quality because future development allowed under the proposed PMPU may result in a cumulatively considerable net increase in criteria pollutants for which the proposed PMPU region is in nonattainment under Federal or State regulations.

Mitigation Measures

For **Impact-AQ-2:**

MM-AQ-2: Implement Best Management Practices During Construction of all Future PMPU-Consistent Projects. A project proponent shall implement, ~~or require implementation by its construction contractor(s),~~ the following measures during construction ~~and project operations,~~ subject to verification by the District.

- ~~The All-~~ project proponents shall limit all construction equipment, drayage, and delivery truck idling times by shutting down equipment when not in use and reducing the maximum idling time to less than 3 minutes. The project proponent shall install clear signage regarding the limitation on idling time at the delivery driveway and loading areas, if applicable, ~~and shall submit annual reports of violators to the District.~~ This measure shall be enforced by the ~~on-site construction supervisor, hotel, restaurant, and marina supervisors;~~ and Violations shall be reported to the District and project proponents with ~~more than one or more violations shall may at the discretion of the California Air Resources Board~~ be subject to penalties pursuant to California airborne toxics control measure 13 CCR 2485. ~~The project proponent shall submit evidence of the use of diesel emission reduction measures to the District's Planning and Green Port Department through annual reporting, with the first report due 1 year from the date of project completion and each subsequent report due exactly 1 year after, noting all violations with relevant identifying information of the vehicles and drivers in violation of these measures.~~

- The project proponent shall verify that all construction equipment used on-site is maintained and properly tuned in accordance with manufacturers' specifications. Prior to the commencement of construction ~~and operations~~ activities using diesel-powered vehicles or equipment, the project proponent shall verify that all vehicles and equipment have been checked by a certified mechanic or a mechanic experienced with such equipment, and determined to be running in proper condition prior to admittance onto the project site delivery driveway and loading areas. The project proponent shall submit a report by the certified mechanic or a mechanic experienced with such equipment, of the condition of the construction vehicles and equipment to the District's ~~Planning and Green Port Department~~ during the operation phase prior to commencement of their use.
- The project proponent shall submit evidence of the use of diesel emission reduction measures, including truck idling time violations, to the District through regular reporting, with the first report due thirty days from the date of commencement of construction and each subsequent report due exactly 30 days thereafter, until construction is completed, noting all violations with relevant identifying information of the vehicles and drivers in violation of these measures.

MM-AQ-3: Implement Diesel Emission-Reduction Measures During Construction of All Future PMPU-Consistent Projects.

To reduce ROG, NO_x, and PM₁₀ CO emissions during construction of future development under the proposed PMPU, the project proponent shall implement ~~or require implementation by its construction contractor(s)~~ the following measures during construction of the project, and shall provide verification to the District, prior to ~~the issuance of a building permit~~ commencement of construction activities. Prior to the commencement of future construction activities, ~~for any discretionary project—where the definition of discretionary project meets the definition of the State CEQA Guidelines, and such project is allowed by the PMPU water and land use designations, such as new hotel rooms, restaurant/retail square footage, or boat slips—the project proponent for that project shall~~ submit a list of equipment to be used and the equipment's specifications (model year, engine tier, horsepower) to the District's ~~Development Services Department~~ to ensure the construction equipment ~~list~~ is consistent with the following requirements. No changes shall be made to the list of equipment without the District's prior approval. Within 30 days after the completion of ~~After~~ construction, the project proponent/operator and/or its contractor(s) shall provide written evidence to the District that the construction was consistent with the following requirements.

- For all construction activities, equip all off-road diesel equipment engines over 25 horsepower with EPA Tier 4 or cleaner engines unless Tier 4 construction equipment is not commercially available (defined below) within ~~50-100~~ miles of the project site. The project proponent shall submit written evidence to the District prior to commencement of construction activities that Tier 4 or cleaner equipment shall be used, or that Tier 4 or cleaner equipment is not available for use during the entire duration of that project's construction period beyond 2025. The provided evidence shall include details of the project proponent's effort to secure Tier 4 or cleaner equipment, including suppliers contacted and their responses, subject to the District's concurrence.
- Use renewable diesel fuel in all heavy-duty off-road diesel-fueled equipment. Renewable diesel fuel must meet the most recent ASTM D975 specification for Ultra Low Sulfur Diesel

and have a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum diesel fuels sold in California.

- Use zero or near-zero emissions equipment in lieu of diesel- or gasoline-powered equipment where such zero or near-zero equipment is commercially available, ~~within 50 miles of the project site.~~ Commercially available means available within 100 miles, for purchase or lease by the project proponent or any contractors that may be retained by the project proponent.
- Use diesel particulate filters (or the equivalent) if permitted under manufacturer's guidelines for on-road and off-road diesel equipment.

MM-AQ-4: Implement Fugitive Dust Control During Construction of All PMPU-Consistent Projects. During construction of ~~a future any discretionary project, where the definition of discretionary project meets the definition of the State CEQA Guidelines, and such project is allowed by the PMPU water and land use designations, such as new hotel rooms, restaurant/retail square footage, or boat slips~~ the project proponent shall implement the following dust control measures that go beyond SDAPCD Rule 55. The project proponent shall submit evidence of its compliance with the following the use of fugitive dust reduction measures to the District, within 90 days after the completion of construction.

- Water the grading areas, if any, at a minimum of three times daily to minimize fugitive dust.
- Stabilize graded areas, if any, immediately after grading, to minimize fugitive dust.
- Apply chemical stabilizer or pave the last 100 feet of internal travel path within the construction site prior to public road entry.
- Install wheel washers adjacent to a paved apron prior to vehicle entry on public roads.
- Remove any visible track-out into traveled public streets within 30 minutes of occurrence.
- Wet wash the construction access point at the end of each workday if any vehicle travel on unpaved surfaces has occurred.
- Provide sufficient perimeter erosion control to prevent washout of silty material onto public roads.
- Cover haul trucks or maintain at least 12 inches of freeboard to reduce blow-off during hauling.
- Suspend all soil disturbance and travel on unpaved surfaces if winds exceed 25 mph.
- Cover/water onsite stockpiles of excavated material.
- Enforce a 15-mph speed limit on unpaved surfaces.
- Sweep up any dirt and debris spilled onto paved surfaces immediately to reduce resuspension of particulate matter caused by vehicle movement. Clean approach routes to construction sites daily for construction-related dirt in dry weather.
- Hydroseed, landscape, or develop as quickly as possible all disturbed areas and as directed by the District and/or SDAPCD to reduce dust generation.

Should non-compliance with any of the measures listed above occur, the project proponent shall correct the violation immediately and shall notify the District within five days from the day the violation occurred.

MM-AQ-5: Use Low-VOC Interior and Exterior Coatings During Construction of All PMPU-Consistent Projects. To reduce VOC emissions from painting activities during construction, the project proponents/~~operator and/or its contractor(s) that uses coatings~~ shall use low-VOC coatings for all surfaces that go beyond the requirements of SDAPCD Rule 67.0. If architectural coatings (painting) of any single component or multiple components would exceed 10,000 square feet per day, then each project component active on that day shall use coatings with a VOC content of 10 grams per liter or less for all surfaces to be painted. If architectural coatings (painting) of any single component or multiple components would be below 10,000 square feet per day, then each component shall use coatings with a VOC content of 75 grams per liter or less. Prior to the commencement of construction activities of any project component, the project proponent shall submit a list of coatings to be used, their respective VOC content, and a summary of surface area to be painted to the District's ~~Development Services Department~~. ~~The District shall conduct inspections during construction as needed to verify the use of low-VOC coatings.~~ Within 30 days, the project proponent shall submit final evidence of compliance with this mitigation measure to the District for final verification and recordkeeping.

MM-AQ-6: Use Modern Harbor Craft and Dredgers During Construction Activities. Prior to commencement of waterside construction, the project proponent shall ensure that any harbor craft, including but not limited to tugboats, pusher tugs, tow boats, work boats, crew and supply boats, and dredgers for use during ~~the duration of~~ any in-water work shall meet the following criteria:

- For all construction activities through 2025, ensure all equipment is Tier 3 or better (cleaner).
- For all construction activities after 2025, ensure all equipment is alternatively fueled or electrically powered. If alternatively fueled or electrically powered equipment that emits less emission than Tier 4 or better (cleaner) is not commercially available (defined in MM-AQ-3), then the project proponent shall ensure all equipment is Tier 4 or better.
- Use renewable diesel fuel in all heavy-duty off-road diesel-fueled equipment. Renewable diesel must meet the most recent ASTM D975 specification for Ultra Low Sulfur Diesel and have a carbon intensity no greater than 50 percent of diesel with the lowest carbon intensity among petroleum diesel fuels sold in California.

If clean harbor craft and dredgers are not available within 200 miles of the project site for the duration of all dredging activities, the project proponent shall prioritize use of equipment that is maintained and properly tuned in accordance with manufacturers' specifications. The project proponent shall document and submit evidence to the District's ~~Development Services Department~~ prior to commencement of waterside construction activities that tugboats, survey vessels, and dredgers meeting the above tiering requirements or better standards are not available for use during the duration of all in-water activities, which shall be subject to the District's concurrence and approval. Regardless of the equipment used, the project proponent shall verify that all equipment has been checked by a mechanic experienced with such equipment and determined to be running in proper condition prior to admittance into the construction area. The project proponent shall submit a report prepared by the mechanic

experienced with such equipment of the condition of the construction and operations vehicles and equipment to the District's Development Services Department prior to commencement of their use.

MM-AQ-7: Conduct an Annual Technology Review for Construction- and Operation-related Activities. To promote the use of new emission control technologies during future construction- and operation-related activities, the District will perform an Periodic Annual Technology Review, commencing one year after the certification of the PMPU and continuing annually thereafter. The Periodic Annual Technology Review shall include a review of technological advancements in the form of alternative-fuel or zero emissions construction equipment, vessels, or trucks.

If the Periodic Annual Technology Review identifies new technology that will be equally or more effective in reducing emissions compared to default construction equipment, vessels, and trucks, and the District determines that use of the technology is feasible within the meaning of PRC section 21061.1, the District shall require the use of such technology as a condition of any subsequent discretionary approval issued by the District.

MM-AQ-8: Project-Level Environmental Reviews. ~~If a project-level environmental review of a future development project allowed under the PMPU is required, would have the potential to result in significant impacts that were not identified and mitigated in the PMPU PEIR and a project-level environmental review is required, then~~ the District shall ~~prepare or cause require the preparation of the project proponent to prepare~~ an air quality technical report that analyzes all phases of project construction and operations, ~~and determine whether emissions would exceed SDAPCD thresholds.~~ If a project's air quality technical report determines that construction or operations emissions exceed the SDAPCD threshold(s), the project proponent shall be required to implement site-specific mitigation measures to avoid or reduce emissions to SDAPCD thresholds. Where mitigation measures are required, the District shall identify these measures in the project-level environmental document and include them in a mitigation monitoring and reporting program (MMRP) for the individual development project.

For **Impact-AQ-3:**

MM-AQ-9: Incorporate Sustainability Measures in All Development through 2030. Project proponents shall incorporate into project design for new project components various efficiency and sustainability measures to reduce emissions from energy, water, and solid waste. The following measures shall apply in all planning districts through 2030 in the PMPU area.

Energy

- Incorporate energy efficiency design features that exceed 2019-applicable Title 24 California Building Energy Efficiency Standards by 20 percent, or comply with any updates to Title 24 Building Energy Efficiency Standards. Measures that may be implemented include, but are not limited to:
 - Use only fluorescent, light-emitting diode (LED), compact fluorescent lamp (CFL), or the most energy-efficient lighting that meets required lighting standards and is commercially available. This measure also requires replacement of existing lighting on the project site if not already highly energy efficient.

- Install occupancy sensors for vending machines, if any, in new buildings at the project site.
- Implement onsite renewable energy (e.g., a photovoltaic system) to new buildings, unless the District determines the system cannot be built in light of structural and ~~operational~~ technological constraints.
- Install co-generation systems (i.e., combined heat and power systems) in new buildings, unless the District determines the system cannot be built because of structural or technological constraints of the future project as evidenced by an engineering study conducted prior to issuance of a Coastal Development Permit paid for by the project applicant if deemed feasible by the District.
- Use high-performance glazing with a low solar heat gain coefficient value that reduces the amount of solar heat allowed into the building.
- Install increased insulation with an R value of 49 or better.
- Install cool roofs with an R value of 30 or better.
- Use sun shading devices in parking lots and asphalted common areas.
- Install high-efficiency heating, ventilating, and air condition systems and controls.
- Install programmable thermostats.
- Install Energy Star rated appliances.
- Install exterior electrical outlets to facilitate use of electric landscaping equipment.

Water

- Reduce indoor water consumption by 20 percent lower than baseline buildings (defined by Leadership in Energy and Environmental Design [LEED] as indoor water use after meeting Energy Policy Act of 1992 fixture performance requirements) through use of low-flow fixtures in all bathrooms.
- Install low-water plantings and drip irrigation, and minimize domestic water demand on the system for landscaping purposes. Use recycled or grey water for landscaping, if available.

Waste

- Comply with AB 341 and the relevant jurisdiction's recycling ordinances, and include recycling at least 50 percent of solid waste. Compliance with relevant jurisdiction's construction and demolition waste requirements shall be mandatory and shall include recycling at least 65 percent of all construction and demolition debris. This measure shall be applied during construction and operation of a project.
- Ensure that all commercial, restaurant, and retail uses implement recycling, composting of food waste and other organics, and the use of reusable products instead of disposal of products thus diverting solid waste from the landfill stream.

Mobile Sources

- Ensure that each project ~~component~~ implements a Transportation Demand Management plan that incentivizes, to the extent allowed by law, voluntary implementation of employer

commuting measures, such as carpooling, transit subsidies, and vanpools to reduce worker trips and parking demand, ~~as described in which is consistent with~~ **MM-TRA-3.**

- Ensure that bicycle parking is included in new building construction or renovation of buildings. The number of spaces will be at a minimum 5 percent of new automobile parking spaces.
- Telecommuting shall be considered consistent with **MM-TRA-3.**

Carbon Sequestration and Land Use

- Within the Commercial Recreation and Recreation Open Space land use designations, the project proponent shall install trees and shrub planters throughout the project area, as part of the landscape plan. Within other land use designations, the project proponent shall install tree and shrub planters along the street frontage and adjacent to any perimeter that abuts sensitive land uses.

MM-AQ-10a: Require All New Hotels to Use Only Electric Energy Reduce Natural Gas Prior to 2030 and All New Development to be Carbon Neutral After 2030. ~~For a~~ All new hotel projects constructed prior to 2030, the District shall require all new hotel projects to forbid the use of natural gas usage shall use only electricity (i.e., no natural gas) for hotel energy needs, except for cooking and kitchen uses, or achieve equivalent reductions through other energy or emission reduction strategy.

MM-AQ-10b: Require All Future New Development to be Carbon Neutral After 2030. ~~For~~ all new development Future projects that would be constructed after 2030, the District shall require all development to meet the State's Zero Net Energy (ZNE) standards, if ZNE is adopted. Applicability (i.e., types of projects that that are targeted by the State's ZNE standards) will be set by the State. If by 2030, no ZNE standard has been adopted by the State, the District shall require all project proponents to construct ZNE buildings unless the District determines that District determines that such construction cannot occur in light of structural and technological constraints of the particular proposed future project as evidenced by an engineering study conducted prior to issuance of a Coastal Development Permit paid for by the project applicant, or submit written documentation as to why ZNE standards cannot be complied with. Moreover, the District shall encourage project developers to construct all electric buildings. The project proponent shall document and submit evidence to the District's Development Services Department prior to commencement of construction activities.

MM-AQ-11: Install EV Charging Infrastructure. The District has a goal of installing a minimum of 1) 399 Level 2 chargers and 22 DC Fast chargers by 2030, and 2) 476 Level 2 chargers and 31 DC Fast chargers by 2050 to reduce air and GHG emissions. This goal is based on recommendations in the CSE EV Infrastructure Scoping Study and is a forecast of the number of anticipated parking spaces that would potentially be required by 2030 and 2050, respectively, as a result of development assumptions used in the impact analysis. This measure applies to both District projects and tenant projects.

- ~~The~~ Prior to the commencement of project operations, a project proponent shall install provide electric vehicle (EV) charging stations ready parking spaces, at a rate that is consistent with the CalGreen Code, which presently is of a minimum of six ten percent of the total required new parking spaces for a project. The number of electric vehicle charging stations required shall be rounded up to the nearest whole number (e.g., 1.5 EV parking

spaces would equate to 2 full EV parking spaces, whereas 1.4 EV parking spaces would equate to 1 EV parking space)., as part of any new building construction or renovation of buildings. The District shall install, or cause the installation of, EV charging infrastructure on Tidelands. These installations shall at minimum include, but not be limited to: 1) 400 Level 2 chargers and 22 DC Fast chargers, by 2030; and 2) Installation of 500 Level 2 chargers and 30 DC Fast chargers, by 2050. This is based on recommendations in the CSE EV Infrastructure Scoping Study.

MM-AQ-12: Advance Recreational Boat Electrification. Prior to the commencement of project operations, ~~The~~ project proponent of site-specific development that proposes to add recreational boat slips shall install a 240-volt electrical outlet at each new slip.

Level of Significance After Mitigation

Impact-AQ-2 would be reduced to less than significant after implementation of **MM-AQ-2** through **MM-AQ-8**. Mitigation would reduce VOC, NO_x, and PM₁₀ emissions below thresholds. Specifically, **MM-AQ-3** requires the use of Tier 4 equipment for all development allowed under the proposed PMPU, which would reduce ROG and NO_x, and all emission types associated with construction equipment exhaust. ~~Further, ROG emissions are due mostly to architectural coating (painting) during construction of new landside development.~~ **MM-AQ-4** requires dust control methods to reduce fugitive PM₁₀ and PM_{2.5} dust associated with earthmoving activities, demolition activities, and storage piles. ~~Further, ROG emissions are due mostly to architectural coating (painting) during construction of new landside development.~~ **MM-AQ-5** requires the use of low-VOC coatings (75 grams per liter [g/L]) for all construction projects, and for projects that include enough painting to exceed thresholds, super compliant (10 g/L) coatings are required. **MM-AQ-8** requires new development projects to identify ways to reduce impacts during the environmental review process. This would ensure that large phases do not overlap. For the proposed PMPU, ensuring that waterside construction phases do not overlap would ensure that activities associated with future development allowed under the proposed PMPU would be below the applicable significance thresholds after mitigation. As such, construction of the proposed project would not violate an air quality standard or contribute substantially to an existing or projected air quality standard. Therefore, when combined with contributions of nonattainment pollutant emissions of past, present, and probable future projects, the proposed project's contribution of nonattainment pollutants would be less than cumulatively considerable during construction.

Similarly, mitigation measures **MM-AQ-2** through **MM-AQ-8** would reduce impacts related to construction air quality associated with Options 1, 2, and 3. Therefore, construction under any of the three options would not result in a cumulatively considerable net increase of a criteria pollutant for which the project region is nonattainment under an applicable Federal or State ambient air quality standard, and would be considered less than significant following mitigation.

As shown in Tables 4.2-24 and 4.2-25, operational emissions of ROG would remain above thresholds in 2030 and operational emissions of ROG and CO would remain above thresholds in 2050 after implementation of **MM-AQ-9** through **MM-AQ-12**. This increase in ROG is due primarily to an increase in emissions from area sources (e.g., coatings, consumer products), while this increase in CO emissions is associated with fuel combustion due to the increase in recreational boating activity. As such, operation of future development allowed under the proposed PMPU would result in a cumulatively considerable net increase of criteria pollutants for which the project region is

nonattainment under an applicable Federal or State ambient air quality standard during operation. **Impact-AQ-3** would be considered significant and unavoidable.

Similarly, **MM-AQ-9** through **MM-AQ-12** would reduce impacts related to operational air quality associated with the proposed PMPU, if any of the Options 1, 2, and 3 were included with the proposed PMPU. However, impacts would remain significant. Therefore, **Impact-AQ-3** of the proposed PMPU, with the inclusion of one option, or a combination of options, would result in a cumulatively considerable net increase of criteria pollutants for which the project region is nonattainment under an applicable Federal or State ambient air quality standard. **Impact-AQ-3** would be considered significant and unavoidable.

Table 4.2-22. Construction Emission Estimates Associated with All Development—Mitigated (pounds per day)

Phase	ROG	NO _x	CO	SO _x	PM10	PM2.5	DPM

Threshold 3: Expose sensitive receptors to substantial pollutant concentrations?

Impact Analysis

Impacts of Water and Land Uses

The discussion of pollutant concentrations associated with diesel particulate matter, carbon monoxide hotspots and criteria pollutants, during both the construction and operation of future development allowed under the proposed PMPU, is provided below.

Sensitive receptors are defined as locations where pollutant-sensitive members of the population may reside or where the presence of air pollutant emissions could adversely affect use of the land, and typically include residential areas, hospitals, daycare facilities, elder-care facilities, elementary schools, and parks. There are no residential uses within the tidelands, but the tidelands border residential uses throughout. There are recreational (park) uses within tidelands, which are considered sensitive receptors.

Diesel Particulate Matter

DPM, which is classified as a carcinogenic TAC by CARB, is the primary exhaust pollutant of concern with regard to health risks to sensitive receptors. Diesel-powered vehicles, equipment, and vessels that operate throughout the proposed PMPU area would emit DPM that could potentially expose nearby sensitive receptors to pollutant concentrations. Prolonged exposure to DPM can increase the risk of cardiovascular, cardiopulmonary, and respiratory disease, and lung cancer. Consistent with CARB rulemaking, the discussion below focuses on DPM (CARB 2018b).

Construction

Construction of future development allowed under the proposed PMPU would be sporadic and take place periodically over an approximately 30-year timeframe throughout the entire PMPU area. While this timeframe is similar to the assumed 30- or 70-year exposure period typically used to estimate lifetime cancer risks, construction in any single location would be short term and much less

than the 30- or 70-year exposure period typically used to estimate lifetime cancer risks. Typical construction projects result in minimal DPM emission-related health effects, as construction is temporary and transient in nature. However, some construction projects, such as larger infrastructure projects or high-rise hotels, particularly those with substantial earthwork, may result in elevated emissions and associated pollutant concentrations, especially if construction occurs near existing residential, school, or other sensitive uses. However, such projects would be short-term in nature, and any associated emissions and pollutant concentrations would be temporary and much less than the 30- or 70-year exposure period typically used to estimate lifetime cancer risks.

Although specific details needed to assess construction-related emissions at individual locations are not available at this time, construction DPM levels associated with future buildout are expected to be minimal. Construction at any single site would be short term and transitory, result in minimal emissions, and occur at distances not expected to expose sensitive receptor locations to substantial pollutant concentrations. As such, impacts from the emission of DPM during construction would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant construction impact related to exposing nearby sensitive receptors to pollutant concentrations. This impact would be similar within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. DPM emissions associated with reconfiguring and closing of North Harbor Drive, construction of a Waterfront Destination Park, and other improvements to open space would be similar to those in the analysis above. There are recreational (park) sensitive receptors within PD3, and there are residential uses immediately adjacent (across Pacific Highway). Regardless, construction of Option 1 would not expose these sensitive uses to substantial DPM concentrations and increased health risk. Therefore, potential construction impacts associated with Option 1 are less than significant. This would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant construction impact related to exposing nearby sensitive receptors to pollutant concentrations. This impact would be similar within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. DPM emissions associated with constructing additional Recreation Open Space and the expansion of the Lane Field Setback Park would be similar to those in the analysis above. There are recreational (park) sensitive receptors within PD3, and there are residential uses immediately adjacent (across Pacific Highway). Regardless, construction of Option 2 would not result in construction that expose these sensitive uses to substantial DPM concentrations and increased health risk. Therefore, potential construction impacts associated with Option 2 are less than significant. This would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant construction impact related to exposing nearby sensitive receptors to pollutant concentrations. This impact would be similar within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 3 would fall within the range of scenarios analyzed above. Option 3 would not include substantial building replacement, demolition, building demolition or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. There are recreational (park) sensitive receptors within PD3, and there are residential uses immediately adjacent (across Pacific Highway). Regardless, construction of Option 3 would not result in construction that expose these sensitive uses to substantial DPM concentrations and increased health risk. Therefore, potential construction impacts associated with Option 3 are less than significant. This would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Operations

Operation of future development allowed under the proposed PMPU would increase activities that may expose sensitive receptors to substantial pollutant concentrations. The net change in annual DPM emissions due to new development relative to existing conditions by emission source is presented in Table 4.2-25. A summary of DPM emissions associated with new development by planning district is presented in Table 4.2-26. A summary of DPM emissions associated with existing maritime operations by planning district is shown above in Table 4.2-9.

The majority of new DPM emission sources shown in Table 4.2-25 occur in diffuse locations that are away from sensitive receptors. For instance, all emissions related to new land use development (mobile, area, and energy sources) occur throughout the entire PMPU area. Additionally, fishing and boating activity occurs throughout the entire Bay as well as outside of the Bay, with only minimal emissions occurring near the slips or in-harbor berthing areas. Emissions from these uses would be

temporary and transitory and occur at distances not expected to expose sensitive receptor locations to substantial pollutant concentrations. Onsite truck idling would be minimal for future uses, limited to a maximum of 5 minutes per truck at any one location, consistent with CARB's Heavy-Duty Idling Reduction Program, while truck activity would be limited to infrequent deliveries to supply materials for proposed waterside and landside uses (e.g., new hotel rooms, new commercial areas).

DPM emissions associated with future development allowed under the proposed PMPU would be minor. For comparison purposes, the emissions in Tables 4.2-25 and 4.2-26 are minor compared to those from existing maritime uses, shown in Table 4.2-9. Thus, the increase in DPM emissions baywide is minor.

The predominant wind direction within the proposed PMPU area is west to west-northwest, with infrequent daytime calm winds (approximately 5% of the time at both Chula Vista and Lindbergh Field stations). Daytime winds (which average 5.1 mph at Chula Vista and 7.6 mph at Lindbergh Field stations) will potentially disperse pollutants away from the nearest residential and recreational receptors. The proposed PMPU may also create a nuisance for nearby visitors during hours of construction and operations, as diesel trucks could create occasional exposure to exhaust, but this would be minimal. As such, impacts from the emission of DPM during operations would be less than significant.

Carbon Monoxide Hotspots

Additional traffic created by future development allowed under the proposed PMPU would have the potential to create CO hot spots at nearby roadways and intersections. To provide a conservative analysis, CO concentrations were modeled to estimate pollutant concentrations at the most congested roadway in the PMPU area: North Harbor Drive at Winship Lane. Full buildout volumes were provided by the traffic engineers (Appendix D). This analysis is based on the Harbor Drive at Winship Lane intersection at full buildout volumes, and assumes existing year (2016) emission rates remain consistent over time. Background CO concentrations were taken from the San Diego–Beardsley Street Station, which monitored CO through 2016. Background CO concentrations are well below NAAQS and CAAQS.

Table 4.2-27 presents the results of the CO hot-spot modeling and indicates that implementation of the proposed PMPU would not violate the State or Federal 1- or 8-hour CO standards at full buildout. Consequently, the impact of traffic conditions from the proposed PMPU on ambient CO levels is considered less than significant. Note that the CO hot-spot modeling used a set of conservative assumptions that assumed all traffic in the peak hour would operate at slow speeds under worst-case meteorological conditions. Actual concentrations are likely to be much lower.

Table 4.2-27. Modeled CO Concentrations (parts per million)

Roadway	1-Hour	8-Hour
Background Concentration from Beardsley Street Station	2.6	1.9
PMPU Contribution at Harbor Drive and Winship Lane	2.6	1.8
Total Concentration at Harbor Drive and Winship Lane	5.2	3.7
Threshold (NAAQS/CAAQS)	35/20	9/9.0
Exceed Threshold?	No	No

Source: Appendix C.

Criteria Pollutants

ROG and NO_x emissions can result in the formation of ozone. Ozone poses a higher risk to those who already suffer from respiratory diseases (e.g., asthma), children, older adults, and people who are active outdoor. Exposure to ozone at certain concentrations can make breathing more difficult, cause shortness of breath and coughing, inflame and damage the airways, aggregate lung diseases, increase the frequency of asthma attacks, and cause chronic obstructive pulmonary disease. Studies show associations between short-term ozone exposure and non-accidental mortality, including deaths from respiratory issues. The primary adverse health effect associated with CO is interference with normal oxygen transfer to the blood, which may result in tissue oxygen deprivation. Exposure to CO at concentrations above the CAAQS or NAAQS (see Table 4.2-4) can also cause fatigue, headaches, confusion, dizziness, and chest pain. Numerous studies have linked PM exposure to premature death in people with preexisting heart or lung disease. Other symptoms of exposure may include nonfatal heart attacks, irregular heartbeat, aggravated asthma, decreased lung function, and increased respiratory symptoms. DPM is a subset of PM₁₀ and PM_{2.5} and is a known carcinogen.

As discussed above, SDAPCD has developed region-specific CEQA thresholds of significance for use in consideration of existing air quality concentrations and attainment designations under the NAAQS and CAAQS. The NAAQS and CAAQS are informed by a wide range of scientific evidence regarding safe

concentrations of criteria pollutants. Recognizing that air quality is a cumulative problem, SDAPCD- and County-recommended thresholds typically consider projects that generate criteria pollutants and ozone precursor emissions that are below the thresholds to be minor in nature. Such projects would not adversely affect air quality or exceed the NAAQS or CAAQS. As described under Threshold 2, construction of development associated with PMPU buildout may generate ROG, NO_x, or PM₁₀ in excess of SDAPCD- and County-recommended numeric thresholds over the life of the PMPU if a number of development projects occur concurrently. Moreover, buildout of the proposed PMPU may result in emissions of ROG, NO_x, and PM₁₀ emissions in excess of thresholds before mitigation. Mitigation Measures **MM-AQ-2** through **MM-AQ-8** would ensure that emissions during construction would be minimized. As such, construction of development under the proposed PMPU would not be expected to contribute a significant level of air pollution that would degrade regional air quality within the SDAB.

In terms of analyzing project-related emissions, the air quality thresholds utilized herein applied to the proposed PMPU (see Table 4.2-22) are based on EPA's NSR program, which sets standards consistent with the NAAQS. However, existing models have limited sensitivity to small changes in criteria pollutant concentrations and, as such, translating project-generated criteria pollutants to specific health effects would not produce meaningful information, as project-related emissions are unlikely to show up in any regional model. In other words, increases in regional air pollution from project-generated ROG and NO_x would have no effect on specific human health outcomes that could be attributed to specific project emissions. Other criteria pollutant emissions, including CO, PM₁₀, and PM_{2.5}, generally affect air quality on a localized scale.

Health effects related to localized pollutants are the product of localized sources and emissions generated by numerous sources throughout a region. Certain air quality models, particularly dispersion models, could translate project-generated localized pollutants to specific localized health effects, such as nearby exposure to DPM, but these models have limited ability to translate project-generated pollutants to specific regional health effects.

As shown in Tables 4.2-17 through 4.2-24, construction and operation of the proposed PMPU would result in emissions of criteria air pollutants that would be above significance thresholds before mitigation. Because the SDAPCD- and County-recommended thresholds (see Table 4.2-16) serve as health-based thresholds for ROG and NO_x, construction and operation of future development under the proposed PMPU may result in adverse health effects (e.g., respiratory issues) associated with criteria pollutant emissions.

Moreover, construction and operation of future development under the proposed PMPU would not result in adverse health effects on the nearby populations associated with localized PM exhaust, as implementation of the proposed project would result in emissions of localized pollutants (PM₁₀ and PM_{2.5}) far below thresholds. However, the operation of the future development allowed under the proposed PMPU may result in adverse health effects (e.g., fatigue, headaches, confusion, dizziness, and chest pain) on the nearby populations associated with localized CO, due solely to CO emissions from fuel combustion in recreational boats, motor vehicles, natural gas combustion, and commercial fishing vessels, as implementation of the future development would result in emissions of CO above thresholds. Consequently, the health-related impacts of the localized criteria air pollutant emissions generated during the construction (**Impact-AQ-4**) and operation (**Impact-AQ-5**) of future development are considered significant.

Mitigation measures **MM-AQ-2** through **MM-AQ-8** are proposed to reduce emissions of all criteria pollutants, as well as DPM during construction (**Impact-AQ-4**). Mitigation measures **MM-AQ-9** through **MM-AQ-12** are proposed to reduce emissions of all criteria pollutants as well as DPM during operations (**Impact-AQ-5**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction and operational impacts related to exposing nearby sensitive receptors to pollutant concentrations (**Impact-AQ-4** and **Impact-AQ-5**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1 would not include new uses that generate substantial emissions, and Option 1 would not change the operational assumptions analyzed above. Pollutant emissions associated with reconfiguring and closing of North Harbor Drive, construction of a Waterfront Destination Park, and other improvements to open space would be similar to those in the analysis above but could place sensitive recreational (park) receptors in different locations within PD3. This option would not change the location of residential uses adjacent to PD3. Potential operational impacts associated with Option 1 are significant (**Impact-AQ-5**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction and operational impacts related to exposing nearby sensitive receptors to pollutant concentrations (**Impact-AQ-4** and **Impact-AQ-5**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include new uses that generate substantial emissions, and Option 2 would not change the operational assumptions analyzed above. Pollutant emissions associated with additional Recreation Open Space and the expansion of the Lane Field Setback Park would be similar to the

analysis above but could place sensitive recreational (park) receptors in different locations within PD3. This option would not change the location of residential uses adjacent to PD3. Potential operational impacts associated with Option 2 are significant (**Impact-AQ-5**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction and operational impacts related to exposing nearby sensitive receptors to pollutant concentrations (**Impact-AQ-4** and **Impact-AQ-5**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would include the same water and land uses for PD3 analyzed above. Operations that would occur for Option 3 would fall within the range of scenarios analyzed above. Option 3 would not include new uses that generate substantial emissions, and Option 3 would not change the operational assumptions analyzed above. Pollutant emissions associated with realignment of North Harbor Drive and the additional recreational open space would be similar to the analysis above but could place sensitive recreational (park) receptors in different locations within PD3. This option would not change the location of residential uses adjacent to PD3. Potential operational impacts associated with Option 3 are significant (**Impact-AQ-5**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to exposure of sensitive receptors to substantial pollutant concentrations. Rather, the proposed PMPU policies listed in Section 4.2.4.3 would reduce potential impacts related to exposure of sensitive receptors to substantial pollutant concentrations by implementing programs and activities that reduce toxic air contaminants (ECO Policy 3.1.1); working to reduce the cumulative health burdens on neighboring communities, especially disadvantaged communities (EJ Policy 3.1.1); ~~and collaborating with adjacent jurisdictions, occupants, tenants, permittees, and community stakeholders to provide transition zone areas adjacent to Tidelands between maritime industrial, commercial, and residential uses as well as other sensitive receptors in Portside communities adjacent disadvantaged communities (EJ Policy 3.1.2); and incorporating industrial site design standards that consider the health and environmental quality of the adjacent Portside Community for any maritime industrial development that is sited abutting a Portside Community (EJ Policy 3.1.4).~~ Moreover, other improvements to reduce emissions from all sources at the waterfront (ECO Policy 3.1.2, ECO Policy 3.1.3, ECO Policy 3.1.4, ECON Policy 2.3.2, SR Policy 3.1.2) would act to reduce exposure of sensitive receptors to substantial pollutant concentrations.

Impact Determination and Mitigation

Implementation of future development allowed under the proposed PMPU would expose sensitive receptors to substantial pollutant concentrations.

Significant Impacts

Impact-AQ-4: Health Effects During PMPU Buildout Construction from ROG and NO_x

Emissions. Project-related emissions during construction could contribute a significant level of air pollution from ROG and NO_x within the SDAB. Specific construction details (such as timing, phasing, and overlapping of possible construction projects implemented over the life of the proposed PMPU) are not known at this time and emissions could exceed relevant thresholds that have been set by SDAPCD to attain the NAAQS and CAAQS, the purpose of which is to provide for the protection of public health.

Impact-AQ-5: Health Effects During PMPU Buildout Operations from ROG, NO_x, and CO.

Project-related emissions during operations could contribute a significant level of air pollution from ROG, NO_x, and CO within the SDAB. Implementation of the proposed PMPU could exceed relevant thresholds that have been set by SDAPCD to attain the NAAQS and CAAQS, the purpose of which is to provide for the protection of public health.

Mitigation Measures

For Impact-AQ-4:

Implement **MM-AQ-2** through **MM-AQ-8**, as described under Threshold 2.

For Impact-AQ-5:

Implement **MM-AQ-9** through **MM-AQ-12**, as described under Threshold 2.

Level of Significance After Mitigation

Impact-AQ-4 would be reduced to less than significant after implementation of **MM-AQ-2** through **MM-AQ-8**. While the proposed timing, intensity, and duration of the construction of future development allowed under the proposed PMPU are not yet known, proposed mitigation would ensure that emissions during construction would be reduced to a level below thresholds that were adopted for the purpose protecting of public health. **Impact-AQ-4** would be considered less than significant following mitigation.

Impact-AQ-5 would remain significant after implementation of **MM-AQ-9** through **MM-AQ-12**. Mitigation would reduce emissions, but at full buildout, emissions could remain in excess of thresholds that were adopted for the purpose protecting of public health. **Impact-AQ-5** would be considered significant and unavoidable.

Threshold 4: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Impact Analysis

Impacts of Water and Land Uses

Although other emission types, such as odors, rarely cause any physical harm, they can be unpleasant and affect certain members of the public. These effects include distress that may often generate

citizen complaints to local governments and air districts. Any project with the potential to frequently expose the public to emissions, such as odors, would be deemed as having a significant impact.

According to CARB's *Air Quality and Land Use Handbook*, land uses associated with odor complaints typically include sewage treatment plants, landfills, recycling facilities, and manufacturing (CARB 2005a). Odor impacts on residential areas and other sensitive receptors, such as hospitals, daycare centers, and schools, warrant the closest scrutiny, but consideration should also be given to other land uses where people may congregate, such as recreational facilities, work sites, and commercial areas.

The proposed PMPU would not authorize the development of any of the land uses associated with odor complaints. Potential odor emitters during construction activities could include diesel exhaust, asphalt paving, and architectural coatings. However, construction-related activities near existing receptors would be temporary in nature, and construction activities would not result in nuisance odors that would violate SDAPCD Rule 51. Potential odor emitters during operations would include exhaust from motor vehicles, offroad equipment, and vessel activity. However, odor impacts would be limited to the circulation routes, parking areas, and areas immediately adjacent to activities that produce emissions (such as construction, motor vehicles, vessels). Although such brief exhaust odors may be considered adverse, they would not affect a substantial number of people, and any odor-related impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to odors. Option 1 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 1 would fall within the range of scenarios analyzed above. Option 1 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. Odor-related impacts associated with reconfiguring and closing of North Harbor Drive, construction of a Waterfront Destination Park, and other improvements to open space would be similar to those in the analysis above. Option 1 would not include development of any of the land uses associated with odor complaints. None of the proposed changes would introduce new odor emitters, and all construction would abide by SDAPCD Rule 51. Similarly, any odor impacts would be limited to the circulation routes, parking areas, and areas immediately adjacent to activities that produce emissions (such as construction, motor vehicles, vessels). While such brief exhaust odors may be considered adverse, they would not affect a substantial number of people, and any odor-related impacts would be less than significant. Therefore, impacts related to Option 1 would be less than

significant, and implementation of Option 1 would not result in any additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to odors. Option 2 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 2 would fall within the range of scenarios analyzed above. Option 2 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. Option 2 would not include development of any of the land uses associated with odor complaints. None of the proposed changes would introduce new odor emitters, and all construction would abide by SDAPCD Rule 51. Similarly, any odor impacts would be limited to the circulation routes, parking areas, and areas immediately adjacent to activities that produce emissions (such as construction, motor vehicles, vessels). While such brief exhaust odors may be considered adverse, they would not affect a substantial number of people, and any odor-related impacts would be less than significant. Therefore, impacts related to Option 2 would be less than significant, and implementation of Option 2 would not result in any additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact related to odors. Option 3 would include the same water and land uses for PD3 analyzed above. The types of construction that would occur for Option 3 would fall within the range of scenarios analyzed above. Option 3 would not include substantial building replacement, demolition, or construction, or waterside improvements that would require substantial equipment usage beyond what was assumed above. Option 3 would not include development of any of the land uses associated with odor complaints. None of the proposed changes would introduce new odor emitters and all construction would abide by SDAPCD Rule 51. Similarly, any odor impacts would be limited to the circulation routes, parking areas, and areas immediately adjacent to activities that produce emissions (such as construction, motor vehicles, vessels). While such brief exhaust odors may be considered adverse, they would not affect a substantial number of people, and any odor-related impacts would be less than significant. Therefore, impacts related to Option 3 would be less than significant, and implementation of Option 3 would not result in any additional or more severe impact than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts related to emissions (such as those leading to odors) adversely affecting a substantial number of people. Rather, the proposed PMPU policies listed in Section 4.2.4.3 would reduce potential impacts related emissions (such as those leading to odors) adversely affecting a substantial number of people by implementing programs and activities that reduce all emissions (ECO Policy 3.1.1); and collaborating with adjacent jurisdictions, occupants, tenants, permittees, and community stakeholders to provide transition zone areas adjacent to Tidelands between maritime industrial, commercial, and residential uses as well as other sensitive receptors in adjacent disadvantaged communities ~~Portside~~

Communities (EJ Policy 3.1.2); and incorporating industrial site design standards that consider the health and environmental quality of the adjacent Portside Community for any maritime industrial development that is sited abutting a Portside Community (EJ Policy 3.1.4). Proposed PMPU policies that would reduce emissions, and community exposure to DPM and emissions would reduce potential impacts related to emissions (such as those leading to odors) adversely affecting a substantial number of people.

Impact Determination and Mitigation

Implementation of future development allowed under the proposed PMPU, as well as with inclusion of Options 1, 2 and 3, would not result in emissions (such as those leading to odors) adversely affecting a substantial number of people.

4.2.5 Cumulative Impact Analysis

Potential cumulative air quality impacts would result when cumulative projects' pollutant emissions would combine to degrade air quality conditions to below acceptable levels. This could occur on a local level, such as through increases in vehicle emissions at congested intersections, or at sensitive receptor locations due to concurrent construction activities; at a regional level, such as the potential impact of multiple past, present, and probable future projects on O₃ within the SDAB; or globally, such as the potential impact of GHG emissions on global climate change (see Section 4.6).

The County of San Diego thresholds for cumulative air quality impacts are utilized for the analysis of the impacts of construction and operations of development under the proposed PMPU.

Cumulatively considerable net increases during the construction phase would typically happen if two or more projects near each other are simultaneously constructed. The following thresholds are used to determine the cumulatively considerable net increase in emissions during the construction phase.

- A project that has a significant direct impact on air quality with regard to emissions of PM₁₀, PM_{2.5}, NO_x, and/or VOCs (i.e., an exceedance of values indicated in Table 4.2-16) would also have a cumulatively considerable net increase.
- In the event that direct impacts from a project are less than significant, a project may still make a cumulatively considerable contribution to a cumulative impact on air quality if the emissions of concern from the project, in combination with the emissions of concern from other probable future projects within the proximity relevant to the pollutants of concern, are in excess of direct air quality impact thresholds.

The following thresholds are used to determine the cumulatively considerable net increase in emissions during the operation phase.

- A project that does not conform to the RAQS and/or has a significant direct impact on air quality with regard to operational emissions of PM₁₀, PM_{2.5}, NO_x, and/or VOCs (i.e., an exceedance of values indicated in Table 4.2-16) would also have a significant cumulatively considerable net increase.
- Projects that generate CO concentrations in excess of the health-based NAAQS and CAAQS would result in a cumulatively considerable net increase in CO concentrations.

- A project would result in a significant direct impact on health risk by resulting in incremental risk greater than 10 in 1 million for cancer or hazard index greater than 1.0 for chronic and acute non-cancer health would also have a significant cumulatively considerable net increase in health risk.

4.2.5.1 Geographic Scope

The SDAB, which covers 4,260 square miles of Southern California and is contiguous with San Diego County, represents the cumulative geographic scope for air quality impacts related to consistency with air quality plans and air quality threshold levels because plans and thresholds are established at the air basin-wide level to attain air quality standards that are assigned for the entire air basin, which in this case is the entire county. Cumulative impacts on sensitive receptors and odors are considered at a more localized level due to the more limited area of dispersion, and include the surrounding neighborhoods and areas close to the source of the emission and odor sources, respectively.

4.2.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Air quality has improved for a number of criteria pollutants over the previous decades despite increases in population and associated vehicle trips. San Diego County has come into attainment for several criteria pollutants despite more stringent standards and population increases. The county is currently designated as an attainment area for CO, NO₂, Pb, SO₂, and sulfates. The SDAB has not violated the annual NAAQS for NO₂ since 1978 and has not violated the 1-hour CAAQS for NO₂ since 1988; it has never recorded violations of the SO₂ standard. Federal standards for Pb have not been exceeded since 1980, and State standards for Pb have not been exceeded since 1987. The SDAB was once a nonattainment area for CO, but has not violated the CO standard since 1990.

Past projects within the SDAB have involved the emissions of ozone precursors (ROG or VOC and NO_x), PM₁₀, and PM_{2.5}, resulting in nonattainment status for 8-hour ozone under the NAAQS and nonattainment status for ozone, PM₁₀, and PM_{2.5} under the CAAQS. Therefore, the emissions of concern within the SDAB are ozone precursors (ROG and NO_x), PM₁₀, and PM_{2.5}.

The nonattainment status for the entire county is a consequence of past and present projects, plans, and programs, and is subject to continued nonattainment status by the cumulative contribution of probable future projects, plans, and programs within the county, including growth projected by SANDAG as well as those additional plans and programs shown in Table 2-2 of Chapter 2, *Environmental Setting*. Each of these plans and programs would potentially make a cumulatively considerable contribution to the nonattainment status of regional and local air quality conditions.

Localized air quality conditions are influenced by a variety of sources, and guidance from several lead agencies, including the Bay Area Air Quality Management District (2017) and CARB (2005), recommend analyzing the localized effects of emissions from sources within 1,000 feet of proposed new emission sources or proposed new receptor locations. All of the present and probable future projects implemented by SANDAG and those plans and programs listed in Table 2-2 could result in construction and operational emissions that could contribute to cumulative impacts on local and regional air quality.

Construction of one or more of these plans and programs would potentially overlap with the construction of PMPU-related uses, which would occur intermittently through the 2050 timeframe. Specifically, the cumulative plans and programs that would potentially make a cumulatively considerable contribution of air emissions include the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR (TAMT EIR, December 2016) and the B Street Cruise Ship Terminal Interior Improvements by Port of San Diego at B Street Pier.

The TAMT EIR proposes a variety of infrastructure investments to be undertaken over the long term in order to increase the terminal's capabilities and capacity. The increase in cargo throughput would increase activity from emissions sources, such as OGVs, harbor craft, trucks, and terminal equipment, and includes a variety of mitigation measures to reduce emissions over the life of the Redevelopment Plan. Construction of the various investments will occur sporadically through 2035.

Additionally, while the B Street Cruise Ship Terminal Interior Improvements by Port of San Diego at B Street Pier project would involve interior improvements at the existing cruise ship terminal, the project would not result in an increase in cruise ship calls or related activity associated with the operation of the cruise ship terminal. Construction of the B Street Cruise Ship Terminal Interior Improvements by Port of San Diego at B Street Pier project is expected to occur in 2023 and last approximately 12 months.

However, because past and present projects have resulted in the current nonattainment status for ozone (ROG and NO_x), PM₁₀, and PM_{2.5}, and probable future plans and programs would continue to contribute to the nonattainment status and potentially affect sensitive receptors, impacts related to the cumulative contribution of nonattainment pollutants (ozone precursors, PM₁₀, and PM_{2.5}) and the exposure of sensitive receptors to substantial pollutant concentrations would be considered cumulatively significant.

4.2.5.3 Project Contribution

As discussed under Threshold 1 above, the proposed PMPU introduces numerous changes in water and land uses that would increase development within the PMPU area. As such, the proposed PMPU would change land use designations that were previously considered in the PMP and subsequently in the RAQS and SIP. The RAQS and SIP are designed to bring the SDAB into attainment with the State and Federal ozone standards. As the proposed new uses were not originally anticipated in the growth projections for the RAQS and SIP inventories, buildout associated with the proposed PMPU could exceed that estimated for the existing PMP (**Impact-C-AQ-1**).

Implementation of **MM-AQ-1** will ultimately ensure that the proposed PMPU is consistent with the RAQS and SIP. Thus, with mitigation, the project would not result in a cumulatively considerable contribution to a significant cumulative impact with respect to consistency with air quality plans following mitigation.

As discussed under Threshold 2, while the timing, location, and intensity of individual construction projects are not known, emissions modeling demonstrates that construction emissions could potentially exceed thresholds during concurrent construction activity (**Impact-C-AQ-2**). With **MM-AQ-2** through **MM-AQ-8**, construction-related emissions would be reduced below thresholds. Accordingly, with mitigation, the proposed project's incremental contribution from construction emissions would be less than cumulatively considerable following mitigation.

Also, as discussed under Threshold 2, operations-related emissions associated with the full PMPU buildout would be above threshold levels for ROG and CO before mitigation (**Impact-C-AQ-3**). With implementation of mitigation measures **MM-AQ-9** through **MM-AQ-12**, operations-related emissions would remain above all threshold levels. Accordingly, the proposed PMPU's incremental contribution from operational emissions would be cumulatively considerable even after the implementation of all feasible mitigation.

As discussed under Threshold 3 above, construction of the proposed PMPU would not result in health risks at sensitive receptor locations in excess of incremental risk thresholds due to limited and dispersed nature of construction activities over the life of the proposed PMPU. Construction-related health risk would not be cumulatively considerable.

As also discussed under Threshold 3, operation of the proposed PMPU would not result in CO hot-spots at congested roadways within the proposed PMPU area. Background CO concentrations are well below Federal and State standards, and the proposed PMPU's contribution, combined with background traffic volumes and emission concentrations, would be well below thresholds. Consequently, the proposed PMPU's incremental contribution to cumulative CO impacts would not be cumulatively considerable.

Also, as discussed under Threshold 3, construction of the proposed PMPU could result in emission exceedances that could contribute to adverse health effects (**Impact-C-AQ-4**). With implementation of **MM-AQ-2** through **MM-AQ-8**, construction-related emissions would be reduced to below threshold levels. Thus, with mitigation, the contribution to adverse health effects during construction would not be cumulatively considerable following mitigation. However, operation of the proposed PMPU would result in emission exceedances that could contribute to adverse health effects (**Impact-C-AQ-5**). With implementation of **MM-AQ-9** through **MM-AQ-12**, operation-related emissions would remain above all threshold levels. Accordingly, the proposed PMPU's incremental contribution towards adverse health effects would be cumulatively considerable even after the implementation of all feasible mitigation.

4.2.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's incremental contribution to cumulative air quality and health risk impacts would be cumulatively considerable prior to mitigation. The potential cumulatively considerable impacts are as follows.

Impact-C-AQ-1. New Land Use Designations Not Accounted for in the RAQS and SIP. The proposed PMPU would redesignate various water and land uses that could increase activity within the Tidelands. These uses were not known at the time the RAQS and SIP were last updated, thus resulting in a conflict because the proposed land uses and the intensities proposed are not included in RAQS and SIP growth projections.

Impact-C-AQ-2 Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Construction. The proposed PMPU emissions during construction activities, before mitigation, would result in a cumulatively considerable contribution to a significant cumulative impact with respect to a net increase in criteria pollutants for which the region is nonattainment under an applicable Federal or State ambient air quality standard.

Impact-C-AQ-3 Emissions in Excess of Criteria Pollutant Thresholds During PMPU Buildout Operations. The proposed PMPU emissions during operations, before mitigation, would result in a

cumulatively considerable contribution to a significant cumulative impact with respect to a net increase in criteria pollutants for which the region is nonattainment under an applicable Federal or State ambient air quality standard.

Impact-C-AQ-4 Health Effects During PMPU Buildout Construction from ROG and NO_x Emissions. The proposed PMPU emissions during construction activities, before mitigation, could contribute a cumulatively significant level of air pollution by exceeding relevant thresholds that have been set by SDAPCD to attain the NAAQS and CAAQS, the purpose of which is to provide for the protection of public health.

Impact-C-AQ-5 Health Effects During PMPU Buildout Operations from ROG, NO_x, and CO. The proposed PMPU emissions during operational activities, before mitigation, could contribute a cumulatively significant level of air pollution by exceeding relevant thresholds that have been set by SDAPCD to attain the NAAQS and CAAQS, the purpose of which is to provide for the protection of public health.

Mitigation Measures

For **Impact-C-AQ-1:**

Implement **MM-AQ-1**, as described under Threshold 1 above.

For **Impact-C-AQ-2:**

Implement **MM-AQ-2** through **MM-AQ-8**, as described under Threshold 2 above.

For **Impact-C-AQ-3:**

Implement **MM-AQ-9** through **MM-AQ-12**, as described under Threshold 2 above.

For **Impact-C-AQ-4:**

Implement **MM-AQ-2** through **MM-AQ-8**, as described under Threshold 2 above.

For **Impact-C-AQ-5:**

Implement **MM-AQ-9** through **MM-AQ-12**, as described under Threshold 2 above.

Level of Significance After Mitigation

With implementation of **MM-AQ-1**, the proposed project's inconsistency with the RAQS and SIP (**Impact-C-AQ-1**) would be rectified and would be less than cumulatively considerable. With implementation of **MM-AQ-2** through **MM-AQ-8**, the proposed project's contribution to cumulative air quality exceedances (**Impact-C-AQ-2**) and regional health effects (**Impact-C-AQ-4**) during construction would be reduced to a level considered less than cumulatively considerable. However, while implementation of **MM-AQ-9** through **MM-AQ-12** would reduce the proposed project's contribution to cumulative air quality exceedances (**Impact-C-AQ-3**) and regional health effects (**Impact-C-AQ-5**) during operations, the proposed project's contribution to regional health effects associated with criteria pollutants would remain cumulatively considerable.

This page was intentionally left blank.

Section 4.3

Biological Resources

4.3.1 Overview

This section describes the existing conditions and laws and regulations for biological resources, and analyzes the proposed Port Master Plan Update's (PMPU's) potential to: (1) have a substantial adverse effect, either directly or through habitat modifications, on any candidate, sensitive, or special-status species; (2) have a substantial adverse effect on any riparian habitat or other sensitive natural community; (3) have a substantial adverse effect on State or Federally protected wetlands through direct removal, filling, hydrological interruption, or other means; (4) substantially interfere with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites; and (5) conflict with applicable local policies or ordinances protecting biological resources or with the provisions of an applicable adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

Terrestrial biology and marine biology analyses were conducted for the proposed PMPU. The terrestrial biology analysis was conducted by ICF and included a desktop review of available databases and reconnaissance survey. The results of the terrestrial biology desktop review and survey are incorporated into this section by reference. In addition, Marine Taxonomic Services performed desktop review of available databases and information to identify marine resources within the proposed PMPU area, the results of which are summarized in this section.

Table 4.3-1 summarizes the significant impacts and mitigation measures (MMs) discussed in detail in Section 4.3.4.4, *Project Impacts and Mitigation Measures*.

Table 4.3-1. Summary of Significant Biological Resources Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-BIO-1: In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species Such as California Least Tern and California Brown Pelican	All planning districts	MM-BIO-1: Implement Construction Measures to Avoid or Reduce Noise Impacts on that May Affect <u>Foraging Behavior of</u> California Least Tern and Other Sensitive Fish Foraging Avian Species	Less than Significant	MM-BIO-1 would require evaluation of construction noise and location relative to <u>on</u> sensitive avian species by a qualified biologist. If noise cannot be reduced to remove the potential for impacts, construction monitoring during the nesting season by a qualified biological monitor is required.

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
				The monitor will have the ability to reduce or temporarily stop noise-producing activities if those activities are assessed to disrupt foraging by California least tern or other protected piscivorous species such as brown pelican. Impact-BIO-1 would be reduced to less than significant.
Impact-BIO-2: Construction Noise Impacts on Nesting Behavior of Marine-Dependent Species Protected Under the Migratory Bird Treaty Act and California Fish and Game Code	All planning districts	MM-BIO-2: Implement Construction Noise Measures to Avoid or Reduce Noise Impacts on <u>Nesting California Least Tern and Other Sensitive Nesting Marine-Dependent Avian Species</u> .	Less than Significant	MM-BIO-2 would require preconstruction nest surveys, nest monitoring, sound and visual barriers, and avoidance if nests are detected within 500 feet of a construction site to avoid significant impacts on nesting birds.
Impact-BIO-3: In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fish <u>Species</u>	All planning districts	MM-BIO-3: Implement a Marine Mammal, Green Sea Turtle, and Fishes Monitoring Program During Pile Installation Activities.	Less than Significant	MM-BIO-3 would reduce impacts from pile-driving by halting in-water pile driving activities until species have left the construction area.
Impact-BIO-4: Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species	All planning districts	MM-BIO-4: Implement Construction Measures to Eliminate Water Quality Impairment Impacts on California Least Tern, Other Sensitive Fish Foraging Avian Species, and Eelgrass.	Less than Significant	MM-BIO-4 would implement training and construction BMP measures to avoid impacts related to water quality. Construction measures included in MM-WQ-1, MM-WQ-2, and MM-WQ-3 would

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
to Locate Prey and Could Disrupt Eelgrass Productivity		Implement the following mitigation measures, as described in Section 4.8, <i>Hydrology and Water Quality</i> : MM-WQ-1 , Monitoring Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance MM-WQ-2 : Implement Best Management Practices During Construction-Related Sediment Disturbance MM-WQ-3 : Apply Silt Curtains During Construction-Related Sediment Disturbance.		reduce water quality impacts to less than significant.
Impact-BIO-5: Potential Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code	All planning districts	MM-BIO-5: Avoid Nesting Season for Birds or Conduct Preconstruction Nest Surveys	Less than Significant	MM-BIO-5 would require that all vegetation removal, demolition, and construction would occur outside of nesting season (February 15 to August 31) or if not feasible additional performance standards would apply, avoiding the potential of a significant impact.
Impact-BIO-6: Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat Through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment	All planning districts	MM-BIO-6: Develop a Shellfish Aquaculture Mitigation Plan <u>Program</u> in Coordination with the Appropriate Resource Agencies and the District to Minimize the Potential for Degraded Essential	Less than Significant	MM-BIO-6 would require future project proponents to develop a Shellfish Aquaculture Mitigation Plan <u>Program</u> to address managed species. Impacts

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
		Fish Habitat and Potential Benthic Impacts		would be reduced to less than significant.
Impact-BIO-7: Permanent and Long-Term Overwater Coverage from Introduction of New Structures	All planning districts	MM-BIO-7: Implement Overwater Coverage Mitigation in Coordination with the Appropriate Resource Agencies and the District to Compensate for Loss of Open Water Habitat	Less than Significant	MM-BIO-7 would require consultation with the appropriate resource agencies to ensure the specified mitigation, which could be equal to or greater than specified in MM-BIO-7 , would reduce project-related impacts to less than significant.
Impact-BIO-8: Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in Their Nesting Habitats	All planning districts	MM-BIO-8: Implement Raptor Perching Deterrent Measures on New Structures	Less than Significant	MM-BIO-8 would require installation of features to minimize the use of new structures, such as buildings, and pilings by avian predators. Impacts would be reduced to less-than-significant levels on new future buildings constructed.
Impact-BIO-9: Bird Strikes Resulting from Use of Reflective Materials	All planning districts	MM-BIO-9: Implement Bird Strike Reduction Measures on New Structures	Less than Significant	MM-BIO-9 would reduce bird strikes by requiring design that incorporates <i>Bird-Friendly Building Design</i> and would be approved by the District.
Impact-BIO-10: Temporary Water Quality and Sedimentation Impacts on Eelgrass Beds During Project Construction	All planning districts	MM-BIO-10: Implement Eelgrass Mitigation and Monitoring in Compliance with the California Eelgrass Mitigation Policy	Less than Significant	MM-BIO-10 surveys would confirm if any eelgrass impacts occurred, if so, then mitigation would be implemented to reduce impacts to less than significant.
Impact-BIO-11: Permanent Overwater Shading of Eelgrass	All planning districts	MM-BIO-10	Less than Significant	MM-BIO-10 would mitigate for the loss of eelgrass by meeting specific performance

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Beds by Newly Constructed Structures				standards specified in the <u>California Eelgrass Mitigation Policy</u> (CEMP). MM-BIO-10 . Impacts would be less than significant.
Impact-BIO-12: Direct Loss of Eelgrass from Dredging Activities	All planning districts	MM-BIO-10	Less than Significant	MM-BIO-10 would mitigate for the loss of eelgrass by meeting specific performance standards specified in MM-BIO-10 . Impacts would be less than significant.
Impact-BIO-13: Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters	All planning districts	MM-BIO-11: Implement Measures that Improve Water Quality, Enhance Habitat, Restore Habitat, or Purchase Credits in a Mitigation Bank	Less than Significant	MM-BIO-11 would require mitigation to improve water quality, enhance habitat, restore habitat, or provide funds to a mitigation bank. Impacts would be reduced to less than significant.
Impact-BIO-14: Reduction in the Ecological Value of Benthic Communities from Increased Depths Created by Dredging Activities	All planning districts	MM-BIO-10 and MM-BIO-11	Less than Significant	MM-BIO-10 and MM-BIO-11 would ensure the ecological value of benthic communities are not adversely impacted <u>over the long-term</u> either through onsite mitigation specified in MM-BIO-10 or through offsite requirements set by MM-BIO-11 .
Impact-BIO-15 Potential for Future Projects to Result in a Conflict with the Integrated Natural Resources Management Plan	All planning districts	MM-BIO-1 through MM-BIO-11		MM-BIO-1 through MM-BIO-11 would reduce impacts on biological resources to reduce future conflict with the Integrated Natural Resources Management Plan. Impacts would be less than significant.

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-BIO-1: Cumulative Impacts of In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species Such as California Least Tern and California Brown Pelican	All planning districts	Implement MM-BIO-1	Less than Cumulatively Significant	MM-BIO-1 would require evaluation of construction noise and location relative to sensitive avian species by a qualified biologist. If noise cannot be reduced to remove the potential for impact, construction monitoring during the nesting season by a qualified biological monitor is required. The monitor will have the ability to reduce or temporarily stop noise producing activities if those activities are assessed to disrupt foraging by California least tern or other protected piscivorous species such as brown pelican. Impact-C-BIO-1 would be reduced to less than significant.
Impact-C-BIO-2: Cumulative Impacts of Construction Noise Impacts on Nesting Behavior of Marine-Dependent Species Protected Under the Migratory Bird Treaty Act and California Fish and Game Code	All planning districts	Implement MM-BIO-2	Less than Cumulatively Significant	MM-BIO-2 would require a preconstruction survey, monitoring, sound and visual barriers, and avoidance if nests are detected within 500 feet of a construction site.
Impact-C-BIO-3: Cumulative In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine	All planning districts	Implement MM-BIO-3	Less than Cumulatively Significant	MM-BIO-3 would reduce impacts from pile-driving by halting in-water pile driving activities until species have left the construction area.

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Mammals, Green Sea Turtles, and Fishes				
Impact-C-BIO-4: Cumulative Impacts of Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity	All planning districts	MM-BIO-4	Less than Cumulatively Significant	MM-BIO-4 would implement training and construction BMP measures. Impacts would be reduced to less than significant.
Impact-C-BIO-5: Cumulative Impacts of Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code	All planning districts	MM-BIO-5	Less than Cumulatively Significant	MM-BIO-5 would require all vegetation removal, demolition, and construction would occur outside of nesting season (February 15 to August 31). If it is not feasible for activities to occur outside the nesting season, work may occur within the nesting season upon approval from the District, and suitable mitigation measures such as nesting bird surveys and no-disturbance buffers if nests are detected. Impacts would be reduced to less than significant.
Impact-C-BIO-6: Cumulative Impacts of Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat through Reduction of Available Plankton and Organic Particles and	All planning districts	MM-BIO-6	Less than Cumulatively Significant	MM-BIO-6 would require future project proponents to develop a Shellfish Aquaculture Mitigation Plan program to address managed species. Impacts

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Changes to the Benthic Environment				would be reduced to less than significant.
Impact-C-BIO-7: Cumulative Impacts of Permanent and Long-Term Overwater Coverage from Introduction of New Structures	All planning districts	MM-BIO-7	Less than Cumulatively Significant	MM-BIO-7 would require mitigation for increases in overwater coverage per the CWA. Impacts would be reduced to less-than-significant levels.
Impact-C-BIO-8: Cumulative Impacts of Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in their Nesting Habitats	All planning districts	MM-BIO-8	Less than Cumulatively Significant	MM-BIO-8 would require installation of features to minimize the use of new structures such as buildings and pilings by avian predators. Impacts would be reduced to less than significant on future buildings constructed.
Impact-C-BIO-9: Cumulative Impacts of Bird Strikes Resulting from Use of Reflective Materials	All planning districts	MM-BIO-9	Less than Cumulatively Significant	MM-BIO-9 would reduce bird strikes by requiring design that incorporates <i>Bird-Friendly Building Design</i> and approval by the District. Impacts would be reduced to less than significant.
Impact-C-BIO-10: Cumulative Impacts of Temporary Water Quality and Sedimentation Impacts on Eelgrass Beds During Project Construction	All planning districts	MM-BIO-4 and MM-BIO-10	Less than Cumulatively Significant	MM-BIO-4 would implement training and construction BMP measures. Impacts would be reduced to less than significant. MM-BIO-10 surveys would confirm if any eelgrass impacts occurred, if so, then mitigation would be implemented. Impacts would be less than significant.

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-BIO-11: Cumulative Impacts of Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures	All planning districts	MM-BIO-4 and MM-BIO-10	Less than Cumulatively Significant	MM-BIO-4 would implement training and construction BMP measures. Impacts would be reduced to less than significant. MM-BIO-10 surveys would confirm if any eelgrass impacts occurred, if so, then mitigation would be implemented. Impacts would be less than significant.
Impact-C-BIO-12: Cumulative Impacts of Direct Loss of Eelgrass from Dredging Activities	All planning districts	MM-BIO-10 and MM-BIO-11	Less than Cumulatively Significant	MM-BIO-10 surveys would confirm if any eelgrass impacts occurred, if so, then mitigation would be implemented. Impacts would be less than significant.
Impact-C-BIO-13: Cumulative Impacts of Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters	All planning districts	MM-BIO-10 and MM-BIO-11	Less than Cumulatively Significant	MM-BIO-10 surveys would confirm if any eelgrass impacts occurred, if so, then mitigation would be implemented. Impacts would be less than significant. MM-BIO-11 would require mitigation to improve water quality, enhance habitat, restore habitat, or provide funds to a mitigation bank. Impacts would be reduced to less than significant.

Summary of Significant Impact(s)	Applicable Planning District(s)*	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-C-BIO-14: Cumulative Impacts of Reduction in the Ecological Value of Benthic Communities from Increased Depths Created by Dredging Activities	All planning districts	Implement MM-BIO-10 and MM-BIO-11	Less than Cumulatively Significant	MM-BIO-11 would ensure the ecological value of benthic communities are not adversely impacted either through onsite mitigation specified in MM-BIO-10 or through offsite requirements set by MM-BIO-11 .
Impact-C- BIO-15: Cumulative Impacts of Future Projects to Result in a Conflict with the Integrated Natural Resources Management Plan	All planning districts	MM-BIO-1 through MM-BIO-11	Less than Cumulatively Significant	MM-BIO-1 through MM-BIO-11 would reduce impacts on biological resources to reduce future conflict with the Integrated Natural Resources Management Plan and San Diego Bay National Wildlife Refuge Comprehensive Conservation Plan. Impacts would be less than significant.

4.3.2 Existing Conditions

4.3.2.1 San Diego Bay Setting

The proposed PMPU area includes portions of the San Diego Bay within the following planning districts (PDs): PD1, PD2, PD3, PD4, a portion of PD7, and PD9 and PD10. San Diego Bay is a nearly enclosed, naturally formed embayment. The Bay was formed from the alluvial floodplains of the Otay, Sweetwater, and San Diego Rivers, and was historically shallow. The redirection and channelization of the San Diego River beginning in the 1940s along with multiple dredging and channel-deepening projects, which have resulted in deep waters in the northern and central portions of the Bay (with deepest waters of 59 feet occurring at the mouth of the Bay), transitioning to shallow waters (less than 3 feet) at the southern end of the Bay (U.S. Navy and District 2013). The San Diego Bay Integrated Natural Resources Management Plan (INRMP), jointly prepared by the U.S. Navy and the San Diego Unified Port District (District), divides the Bay into multiple habitat definitions based on depth including: deep subtidal (< -20 feet mean lower-low water [MLLW]), moderately deep subtidal (-12 to -20 feet MLLW), shallow subtidal (-2.2 to -12 feet MLLW), and intertidal (-2.2 to +7.8 feet MLLW) (Figures 4.3-1 through 4.3-8). Currently, deep subtidal and

moderately deep subtidal waters account for more than 50 percent of total Bay surface area (U.S. Navy 2013). In contrast, shallow subtidal habitat accounts for approximately 28 percent of Bay surface area, primarily in south San Diego Bay. Intertidal habitat currently accounts for only 7 percent of the Bay surface area.

The habitats of San Diego Bay are reflective of water depth and presence or absence of shoreline structures. More than 70 percent of the shoreline (45.4 miles out of a total 64.4 miles) of San Diego Bay is currently armored (U.S. Navy 2013). Armoring is primarily rock riprap, but also includes vertical bulkhead walls, boat launch ramps, earthen dikes, and wharves. Additionally, there are over 130 acres of surface structures (e.g., piers, docks) within the Bay that currently shade intertidal and subtidal waters. The majority of the lands in the northern and central portions of the Bay are developed with a mix of commercial, recreational, and military uses.

South San Diego Bay has less shoreline development relative to the northern and central portions of the Bay. As such, much of the shoreline is “soft” and composed of native sand and mud substrate. The common south Bay associated habitats include southern coastal salt marsh, intertidal, mudflats, salt flats, and southern coastal foredune, as shown on Figure 4.3-5 and 4.3-7.

The dominant vegetated subtidal habitat in San Diego Bay is common eelgrass (*Zostera marina*) (Merkel & Associates, Inc. 2014). The most recent baywide eelgrass survey, completed in 2020, found 2,598 acres of eelgrass (represented by two species, common eelgrass and Pacific eelgrass [*Zostera pacifica*]). This accounts for approximately 17 percent of the eelgrass present in California (NAVFACSW 2021). The majority of eelgrass present in San Diego Bay occurs in the southern portion of the Bay due to the predominantly shallow nature of the south Bay.

Salt marshes currently cover approximately 800 acres of the Bay, with most of this habitat composed of a network of marshes that form a non-contiguous patchwork in the south Bay, much of which is outside of, but adjacent to the proposed PMPU area (Figure 4.3-5). The marine habitats of San Diego Bay currently support several sensitive avian species, marine mammals, and reptiles. Habitats and sensitive species within the proposed PMPU area and its surroundings are described further below.

4.3.2.2 Coastal Imperial Beach Setting

The coastal Imperial Beach setting encompasses the beach and nearshore coastal waters (i.e., the Pacific Ocean) adjacent to and surrounding Imperial Beach Pier. Within this area, the open coastal shoreline consists of high usage sand beach from north to south and urban developed land to the east. (Figure 4.3-6). Approximately one half-mile to the south of the Pier-end and inland from the shore is the northern Oneonta Slough portion of the Tijuana River Estuary managed by the U.S. Fish & Wildlife Service (USFWS). This portion of the estuary is inland of a linear residential neighborhood along Seacoast Drive. The remaining environment away from the shoreline is urban developed lands.

A coastal environment supporting non-persistent kelp beds, sand, and cobble-bottom environments is offshore of the Imperial Beach Pier (Merkel & Associates, Inc. et al. 2004; Merkel & Associates, Inc. 2011b, SANDAG 2002). The majority of this offshore environment supports unvegetated soft-bottom habitat of a principally sandy nature. Cobble beds are present near the Imperial Beach Pier and are intermittently sanded over, unvegetated, or support poorly developed kelp canopy as described further in this section. In addition, the soft-bottom habitat in this area supports shell hash and gravel.

4.3.2.3 Bay Habitats

The District's jurisdiction covers a large area encompassing different portions of San Diego Bay and consists of 10 planning districts. However, the proposed PMPU only covers eight of these, excluding PD5, PD6, and a portion of PD7, as described further in Chapter 2, *Environmental Setting*. Bay habitats present within the proposed PMPU area are depicted on Figure 4.3-1 through 4.3-5, 4.3-7 and 4.3-8 while those present within each planning district are described in Section 4.3.2.7, *Planning District Settings*. The land cover types, habitats, and any occurrence or potential occurrence of sensitive plant and wildlife species within the proposed PMPU area as well as adjacent Bay areas are summarized below.

Subtidal Unvegetated Soft Bottom

The INRMP differentiates between shallow and deep subtidal habitat based on the biological values of these habitats (U.S. Navy 2013). Deep and moderately deep habitats maintain similar biological functions, while shallow habitat has the potential to support greater primary productivity and overall greater diversity of habitats and ecological communities. Within the Bay, unvegetated soft-bottom habitat consists of sand, soft muds, and silt. Loose rubble is often found overlying the soft sediment along the edge of the hard shoreline revetments.

Typical invertebrate species that inhabit these areas include burrowing bivalves (*Chione* spp., *Macoma nasuta*), the amphipod (*Grandidierella japonica*), bay ghost shrimp (*Neotrypaea* spp.), burrowing anemones (*Harenactis attenuata*), sabellid worms (Family Sabellidae), and tube-dwelling anemones (Family Cerianthidae). Other species typical of other non-vegetated areas of Southern California bays and harbors include sponges (Phylum Porifera), nudibranchs (Order Nudibranchia) and nemanax (*Nemanax inermis*), sea hare (*Aplysia californica*), and bivalves including the invasive, nonnative Asian mussel (*Musculista senhousia*). Fish species typical of soft-bottom habitat include round stingray (*Urolophus halleri*), the invasive, nonnative yellowfin goby (*Acanthogobius flavimanus*) and additional goby species (Family Gobiidae), barred sand bass and spotted sand bass (*Paralabrax nebulifer* and *P. maculatofasciatus*), specklefin midshipman (*Porichthys myriaster*), diamond turbot (*Pleuronichthys guttulatus*), and Pacific staghorn sculpin (*Leptocottus armatus*).

Subtidal Vegetated Habitat

The vegetated, shallow subtidal habitat of San Diego Bay is dominated by eelgrass (Merkel & Associates 2014). Additionally, small amounts of widgeon grass (*Ruppia maritima*) occur in the warmer, shallow flats of south San Diego Bay. The baywide eelgrass survey completed in 2020 indicated 2,598 acres of eelgrass is present within the Bay (NAVFACSW and POSD 2020). Vegetated subtidal habitats are an essential component of Southern California's coastal marine environment. Eelgrass beds function as important habitat for a variety of invertebrate, fish, and avian species. For many species, eelgrass beds are an essential biological habitat component for at least a portion of their life cycles, providing resting and feeding sites along the Pacific Flyway for avian species, and nursery sites for numerous species of fish. Eelgrass beds may be interspersed with red algae such as *Gracilaria verrucosa* and green algae, including *Ulva* spp. Typical fish species associated with eelgrass include pipefish (*Syngnathus* spp.), kelpfish (Family Clinidae), and surfperch (Family Embiotocidae).

Open Bay

The water column represents the largest habitat of San Diego Bay and the nearshore coastal area. This habitat is dominated by schooling fish species including topsmelt, northern anchovy (*Engraulis mordax*), and deepbody anchovy (*Anchoa compressa*). Pacific mackerel (*Scomber japonicus*) is common within San Diego Bay. The occurrence of these species in open water is important to several species of piscivorous birds including pelicans, terns, loons, grebes, cormorants, and mergansers. These fish also provide an important forage base for numerous species of marine mammals.

Intertidal/Shallow Subtidal Riprap

As previously stated, an estimated 70 percent of the shoreline of San Diego Bay is armored, primarily with rock riprap, to form a sloped revetment. Typical species observed along riprap include native oyster (*Ostrea lurida*), nonnative Pacific oyster (*Crassostrea gigas*), barnacles (*Balanus* spp.), mussels (*Mytilus* spp.), tubed serpulid worms (Family Serpulidae), and tunicates such as *Styela plicata*. Crevices support cryptic fish such as bay blenny, and invertebrates that include spiny lobster (*Panulirus interruptus*), rock crab (*Cancer* spp.), and shore crabs (*Pachygrapsus crassipes* and *Hemigrapsus oregonensis*). Riprap supports a variety of algal species including *Egregia menziesii*, *Ulva* spp., *Ceramium* spp., *Dictyota* spp., *Laurencia* spp., and *Enteromorpha* spp. (Davis et al. 2002). Invasive algae include *Sargassum* spp. and *Undaria pinnatifida*. Fish species typically found along subtidal portions of riprap are abundant and vary from the mouth of the Bay, which has more oceanic conditions, to protected marinas in the central and southern portions of the Bay. Species include opaleye (*Girella nigricans*), senoritas (*Oxyjulus californica*), garibaldi (*Hypsypops rubicundus*), rockfish (*Sebastes* spp.), spotted sand bass, and giant kelpfish (*Heterostichus rostratus*). Other structure-associated fish species likely to occur along this habitat include salema (*Xenistius californiensis*), juvenile black croaker (*Cheilotrema saturnum*), sargo (*Anisotremus davidsonii*), barred sand bass, and black surfperch (*Embiotoca jacksoni*) (U.S. Navy 2013).

Intertidal Flats

This habitat includes mudflats, that occur intertidally, typically along the unarmored shorelines of south San Diego Bay. Intertidal mudflats also occur in narrow bands along riprap shorelines in quiescent areas and marinas of the Bay. This habitat provides an interface with open waters of the Bay, bringing tidal exchange to adjacent marshlands and serving as outlets for stormwater runoff, nutrients, and sediment supply to the Bay. Intertidal flats are dominated by invertebrates that inhabit the sediments, providing a low-tide foraging area for shorebirds. As tides rise, the flats become forage habitat for fish, dabbling waterfowl, and piscivorous birds. Common avian species along intertidal flats include sandpipers (*Calidris* spp.), willet (*Tringa semipalmata*), marbled godwit (*Limosa fedoa*), dowitchers (*Limnodromus* spp.), plovers (Family Charadriidae), eared grebe (*Podiceps nigricollis*), and scaup (*Aythya* spp.). Fish species that forage on tidal flats during high tides include mullet (*Mugil cephalus*), California halibut (*Paralichthys californicus*), and bat ray (*Myliobatis californica*).

Sandy Beach and Dunes

This habitat includes coastal and bay sand beach and dune environments that are located along narrow fringes between subtidal and supratidal habitats within areas of higher wave energy. The sandy beach and dune habitat within the proposed PMPU area is most prominent along the Imperial

Beach shoreline and is heavily utilized by the public. Planning District 9 contains bayside dune habitat, which provides suitable nesting and roosting environments for sensitive avian species and suitable habitat for sensitive vegetation and plant species (Figure 4.3-5 and 4.3-7).

Marshes

Coastal salt marsh habitat primarily occurs in south San Diego Bay, as a series of noncontiguous remnants of once broader estuarine environments and restored wetlands. This fragmentation, along with channelization and redirection of rivers and creeks that historically drained into marshlands, and the threat of sea level rise, puts the remaining marshes at risk of decline. Many of the marshes in south San Diego Bay occur along unarmored shorelines and exist in areas and planning districts that are not described under the proposed PMPU. However, there are minor amounts of salt marsh vegetation within two planning districts (Figures 4.3-5 and 4.3-7): PD7 and, to a smaller extent, PD9. Shorebirds and other species may depend on resources across multiple marshes such that the system of marshes across San Diego Bay may work to strengthen the value of overall ecosystem functions and the value of small pockets of salt marsh habitat that exist in PD9 and PD7.

Marsh habitat provides important biological, water quality, and shoreline protection functions. Coastal salt marsh habitat is dominated by salt-tolerant vegetation including pickleweed (*Sarcocornia* and *Salicornia* spp.) and cordgrass (*Spartina foliosa*) that provides foraging habitat for numerous birds and nesting habitat for several sensitive avian species, particularly the Federally and State-listed light-footed Ridgway's rail (*Rallus obsoletus levipes*) and the State-listed Belding's savannah sparrow (*Passerculus sandwichensis beldingi*).

Upland Transition and Upland Areas

As mentioned previously, the majority of shoreline within San Diego Bay is armored. However, upland transition areas, particularly along unarmored shorelines, provide important foraging, roosting, and nesting habitat for birds. Among the most important upland transitional areas are sand dunes and beaches adjacent to, and protected by, intertidal flats and marshes in (PD7, PD9, and PD10) and to a lesser extent small pockets of transitional habitat located at seaplane landing (in PD9) and PD 1 (Kellogg Beach)(PD1). Sand dunes and beaches could provide suitable nesting habitat for sensitive avian species such as the California least tern (*Sternula antillarum*) and western snowy plover (*Charadrius nivosus nivosus*). Other upland and transitional habitats adjacent to baylands include coastal sage scrub (PD7 and PD9), created bay fills around the periphery of the tidal flats in the southern end of the Bay (PD10), and along the Bay-side edges of the Silver Strand (PD9).

Urban/Developed

The urban/developed landscape is the predominant habitat for the terrestrial environs within many of the proposed planning districts. Urban developed landscapes are mostly composed of manicured lawns, ornamental landscaped vegetation, sidewalks, pavement, and buildings. While this setting is not ideal habitat for most wildlife species, a number of common bird species including, but not limited to, red-tailed hawk (*Buteo jamaicensis*), house finch (*Haemorhous mexicanus*), mourning dove (*Zenaida macroura*), house sparrow (*Passer domesticus*), American crow (*Corvus brachyrhynchos*), and Anna's hummingbird (*Calypte anna*) can be found in these settings. Light poles and towers within parking lots on Tidelands and mature trees closer to San Diego Bay provide nesting habitat for piscivorous species like the osprey (*Pandion haliaetus* – on light towers), black-

crowned night heron (*Nycticorax nycticorax*), snowy egret (*Egretta thula*), and great blue heron (*Ardea herodias*).

4.3.2.4 Wetlands and Sensitive Habitats

Wetlands, as defined by the U.S. Army Corps of Engineers (USACE), are present as minor amounts of coastal salt marsh as noted above. Freshwater, brackish marsh, and riparian scrub does not occur within areas described under the proposed PMPU.

Eelgrass is a rooted aquatic plant that inhabits shallow, soft-bottom habitats in quiet waters of bays and estuaries as well as sheltered coastal areas. It can form dense beds that provide substrate, food, and shelter for a variety of marine organisms. The majority of eelgrass beds in the Bay are found from -4 to -6.5 feet MLLW or shallower and typically in water less than 20 feet deep, with light availability being the primary limiting factor for distribution and growth. Eelgrass beds occur in all planning districts in the proposed PMPU area within the Bay (Figures 4.3-1 through 4.3-8); however, the majority of eelgrass is found in the southern portion of the Bay, not within the proposed PMPU area. Eelgrass beds are not found in the open coastal waters off Imperial Beach. Eelgrass beds are considered “special aquatic sites” under the Clean Water Act (CWA). Pursuant to the Magnuson-Stevens Fishery Conservation and Management Act, eelgrass is designated as Essential Fish Habitat for various Federally managed fish species within the Pacific Coast Groundfish and Pacific Coast Salmon Fisheries Management Plans (PFMC 2008). Eelgrass is also considered a habitat area of particular concern for various species within the Pacific Coast Groundfish Fisheries Management Plan. Similar to marshes, eelgrass provides for important functions such as nutrient transformation, shoreline protection, carbon sequestration, and sediment stabilization.

4.3.2.5 Wildlife Corridors, Migration Routes, and Nurseries

~~There are few proposed PMPU planning districts that are generally not continuous around the Bay, with the other PDs, such as National City (PD5), Chula Vista (6); and therefore, the PMPU area does not provide a continuous source of wildlife corridors for terrestrial species that move through the region. However, the presence of undeveloped shorelines and the various salt marshes around the Bay do help connect species across local regions where they occur. For instance, S-wildlife species may such as coyote and bobcat can use riparian, salt marsh, and beaches as corridors, as long as there is to move with minor human disturbance where these areas exist and provide connections across the larger landscape.~~

The open waters of the Bay as well as the southern portions of the Bay provide stopover habitat for migrating waterfowl and shorebirds. San Diego Bay and the Imperial Beach shoreline, like all of California, are located within the Pacific Flyway. This important migration route is used by multiple avian species to connect breeding and wintering habitats. Whale species such as the humpback whale and California gray whale have migratory routes that occur along the California coast. Whales typically do not enter the Bay, but California gray whales are often observed in nearshore waters close to the coastline.

Although less well understood than other migratory species, Eastern Pacific green sea turtles are residents of south Bay. Green sea turtle individuals have been tracked between the Bay and known nesting sites in Mexico. This indicates that the Bay provides important habitat for these individuals within the larger context of their life cycle.

The Bay provides nursery habitat for many species of fish and invertebrates that ~~then~~ leave the Bay during adult life stages. Many species, such as California halibut and spiny lobster, find refuge as juveniles within eelgrass habitat. Multiple bird species nest in habitats found within the Bay and adjacent habitats. Species such as Belding's savannah sparrow, California least tern, western snowy plover, and Ridgway's rail are all special-status species that nest in open spaces on beaches or within salt marsh habitats found within the Bay.

4.3.2.6 Special-Status Species

Special-status species are those plants or animals that have been officially listed, proposed for listing, or are candidates for listing as threatened or endangered under provisions of the Federal Endangered Species Act (ESA) and the California Endangered Species Act (CESA), protected under the Marine Mammal Protection Act (MMPA), as well as any animal species listed as a species of special concern or fully protected by the State, and plants listed on the California Rare Plant Ranking. Sensitive species also include species listed by local or regional jurisdictions.

Reconnaissance Survey Results

On April 19, 2017, ICF biologists performed a reconnaissance level survey for terrestrial habitat types, and terrestrial sensitive plants and wildlife at each planning district. The reconnaissance survey was conducted by driving and walking throughout the PMPU planning districts, noting existing habitat conditions to identify suitable habitat for terrestrial sensitive plants and wildlife. Figures 4.3-1 through 4.3-8 provide baseline habitat mapping for each planning district and Figures 4.3-9 through 4.3-16 show Federally and State-listed wildlife and sensitive plant species observations during the reconnaissance survey, as well as documented occurrences from California Natural Diversity Database (CNDDB) (2021), and U.S. Fish and Wildlife Service (USFWS) critical habitat for each of the planning districts. Tables 4.3-3 and 4.3-4 provide the potential to occur within each planning district for listed special-status plant and wildlife species drawn from database analysis and observations made during the reconnaissance survey. It should be noted that no reconnaissance surveys were completed for marine flora or fauna. The terrestrial plant and animal species observed during the reconnaissance level survey are documented in Table 4.3-2.

Table 4.3-2. Site Reconnaissance Species Observed within the Planning Districts

Common Name	Scientific Name	Sensitivity Status
Plants		
Red sand-verbena	<i>Abronia maritima</i>	California Rare Plant Rank 4.2
Beach sand-verbena	<i>Abronia umbellata</i> var. <i>umbellata</i>	--
Spanish-clover	<i>Acmispon americanus</i> var. <i>americanus</i>	--

Sensitivity Status Key

Federal: Federal Endangered Species Act (ESA)

Threatened or Endangered

State: California Endangered Species Act (CESA)

Threatened or Endangered

Federal

FE – listed as endangered under the Federal Endangered Species Act.

FT – listed as threatened under the Federal Endangered Species Act.

Decimal notations:

1 – Seriously endangered in California.

2 – Fairly endangered in California.

3 – Not very endangered in California.

State

CNPS: California Native Plant Society Rare Plant Rank (CRPR):

1B: Considered rare, threatened, or endangered in California and elsewhere

2: Plants rare, threatened, or endangered in California, but more common elsewhere

3: Plants for which we need more information – review list.

4: Plants of limited distribution a watch list.

Sensitive Plant Species Database Results

Terrestrial

The potential presence of sensitive plant species within each of the planning districts was determined by reviewing the CNDDDB and California Native Plant Society (CNPS) database, and by requesting an official threatened and endangered species list from the USFWS Information, Planning, and Consultation System (IPAC). The CNDDDB record search for sensitive terrestrial plant species was conducted for nine quads centered on the United States Geological Survey (USGS) National City, California 7.5 quadrangle map. The CNPS search was performed for the National City, Point Loma, and Imperial Beach 7.5 quadrangle maps. Due to the varying topography occurring within the three quadrangle maps, the search was further refined to only include species with habitat requirements within 0 and 20 feet elevation, which would exclude plants that may occur in habitats that are not present within the planning districts. The USFWS list of threatened and endangered species was generated by creating a polygon for each of the planning districts through the IPAC web application tool. This search criteria yielded 44 sensitive plant species. From this list it was determined that 21 sensitive plant species have potential to occur, of which 2 were observed within the boundaries of the planning districts during the reconnaissance level field surveys. A full description of these species and their potential to occur is presented in Table 4.3-3. Note that potential for all special-status plant species is limited to PD7 and PD9 of the proposed PMPU area.

Table 4.3-3. Sensitive Plant Species with Potential to Occur Within the Proposed PMPU Planning Area

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
Red sand-verbena (<i>Abronia maritima</i>)	CRPR 4.2	Perennial herb. Coastal dunes; 0–100 m (0–328 ft). Blooming period: February–November.	Yes	Present	Several individuals of red sand-verbena were detected within the boundary of PD9.
Nuttall's lotus (<i>Acmispon prostrates</i>)	CRPR 1B.1	Annual herb. Coastal dunes and sandy coastal scrub; 0–10 m (0–32 ft). Blooming period: March–July.	No	High	Several individuals of Nuttall's lotus were detected adjacent to PD9 but outside the boundary.
Aphanisma (<i>Aphanisma blitoides</i>)	CRPR 1B.2	Annual herb. Sandy soils in coastal bluff scrub, coastal dunes, and coastal scrub; 1–305 m (3–1,000 ft). Blooming period: March–June.	No	Moderate	Suitable dune habitat is present in PD9, but no current records for this species occur in the vicinity of PD9.
Coastal dunes milk-vetch (<i>Astragalus tener</i> var. <i>titi</i>)	FE, SE, CRPR 1B.1	Annual herb. Often in vernal mesic areas in sandy coastal bluff scrub, coastal dunes, and mesic coastal prairie; 1–50 m (3–164 ft). Blooming period: March–May.	No	Moderate	Suitable dune habitat is present in PD9, but no current records of this species occur in the vicinity of PD9.
Coulter's saltbush (<i>Atriplex coulteri</i>)	CRPR 1B.2	Perennial herb. Alkaline or clay soils in coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland; 3–460 m (9–1,509 ft). Blooming period: March–October.	No	Low	Marginally suitable soils are present in PD9.
South coast saltscale (<i>Atriplex pacifica</i>)	CRPR 1B.2	Annual herb. Coastal bluff scrub, coastal dunes, coastal scrub, playas; 0–140 m (0–459 ft). Blooming period: March–October.	No	Moderate	Suitable dune habitat is present in PD9, but no current records of this species occur in the vicinity of PD9.
Lewis' evening-primrose (<i>Camissoniopsis lewisii</i>)	CRPR 3	Annual herb. Sandy or clay soils in coastal bluff scrub, cismontane woodland, coastal dunes, coastal scrub, and valley and foothill grassland; 0–300 m (0–984 ft). Blooming period: March–June.	No	High	Suitable dune habitat is present in PD9, and there are documented occurrences in the vicinity of PD9.

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
Orcutt's pincushion (<i>Chaenactis glabriuscula</i> var. <i>orcuttiana</i>)	CRPR 1B.1	Annual herb. Sandy soils in coastal bluff scrub and coastal dunes; 0–100 m (0–328 ft). Blooming period: January–August.	No	High	Suitable dune habitat is present in PD9, and there are documented occurrences in the vicinity of PD9.
Salt marsh bird's-beak (<i>Chloropyron maritimum</i> ssp. <i>maritimum</i>)	FE, SE, CRPR 1B.2	Hemiparasitic annual herb. Coastal dunes and coastal salt marshes and swamps; 0–30 m (0–98 ft). Blooming period: May–October.	No	High	Suitable dune habitat is present in PD9, and suitable coastal marsh habitat is present in PD7 for this species. Documented occurrences of this species are recorded from the vicinity of both planning districts.
Palmer's frankenia (<i>Frankenia palmeri</i>)	CRPR 2B.1	Perennial herb. Coastal dunes, coastal salt marshes and swamps, playas; 0–10 m (0–32 ft). Blooming period: May–July.	No	High	Suitable dune habitat is present in PD9, and suitable coastal marsh habitat is present in PD7 for this species. Documented occurrences of this species are recorded from the vicinity of both planning districts.
Beach goldenaster (<i>Heterotheca sessiliflora</i> ssp. <i>Sessiliflora</i>)	CRPR 1B.1	Perennial herb. Coastal chaparral, coastal dunes, and coastal scrub; 0–1,225 m (0–4,018 ft). Blooming period: March–December.	No	High	Suitable dune habitat is present in PD9 and suitable coastal scrub is present in PD7 for this species. Documented occurrences of this species are recorded from the vicinity of both planning districts.
Vernal barley (<i>Hordeum intercedens</i>)	CRPR 3.2	Annual herb. Coastal dunes, coastal scrub, saline flats and depressions in valley and foothill grassland, and vernal pools; 5–1,000 m (16–3,280 ft). Blooming period: March–June	No	High	Suitable dune habitat is present in PD9, and there are documented occurrences in the vicinity of PD9.
Decumbent goldenbush (<i>Isocoma menziesii</i> var. <i>decumbens</i>)	CRPR 1B.2	Perennial shrub. Chaparral and in sandy coastal scrub, dunes, often in sandy disturbed areas; 10–135 m (33–443 ft). Blooming period: April–November.	No	Moderate	Suitable dune habitat is present in PD9, but no documented records of this species occur in the vicinity of PD9.

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
Southwestern spiny rush (<i>Juncus acutus</i> ssp. <i>leopoldii</i>)	CRPR 4.2	Perennial rhizomatous herb. Mesic soils in coastal dunes, alkaline seeps in meadows and seeps, and coastal salt marshes and swamps; 3–900 m (9–2,953 ft). Blooming period: May–June.	No	High	Suitable dune habitat is present in PD9, and suitable coastal marsh habitat is present in PD7 for this species. Documented occurrences of this species are recorded from the vicinity of both planning districts.
California box thorn (<i>Lycium californicum</i>)	CRPR 4.2	Perennial shrub. Coastal bluff scrub and coastal scrub; 5–150 m (16–492 ft). Blooming period: December–August.	No	High	Suitable coastal sage habitat is present in PD7 and PD9, and California box-thorn was observed in the close vicinity of PD9.
Coast woolly-heads (<i>Nemacaulis denudata</i> var. <i>denudata</i>)	CRPR 1B.2	Annual herb. Coastal dunes; 0–100 m (0–328 ft). Blooming period: April–September.	Yes	Present	Several individuals of coast woolly-heads were detected within the boundary of PD9.
Slender cottonheads (<i>Nemacaulis denudata</i> var. <i>gracilis</i>)	CRPR 2B.2	Annual herb. Coastal dunes, desert dunes, and Sonoran desert scrub; -50–400 m (164–1,312 ft). Blooming period: March–May.	No	Moderate	Suitable dune habitat is present in PD9, but no current records of this species exist in the vicinity of PD9.
Short-lobed broomrape (<i>Orobanche parishii</i> ssp. <i>brachyloba</i>)	CRPR 4.2	Parasitic perennial herb. Sandy coastal bluff scrub, coastal dunes, and coastal scrub; 3–305 m (9–1,000 ft). Blooming period: April–October.	No	Moderate	Suitable dune habitat is present in PD9, but there area no current records of this species occurring in the vicinity of PD9.
Brand's star phacelia (<i>Phacelia stellaris</i>)	CRPR 1B.1	Annual herb. Coastal dunes and sandy sites within coastal scrub; 1–400 m (3–1,312 ft). Blooming period: March–June.	No	High	Suitable dune habitat is present in PD9, and there are known occurrences in the vicinity of PD9.

Common Name (<i>Scientific Name</i>)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
estuary seablite (<i>Suaeda esteroa</i>)	CRPR 1B.2	Perennial herb. Coastal salt marshes and swamps; 0–5 m (0–16 ft). Blooming period: May–January.	No	High	Suitable coastal marsh habitat is present in PD7, and a known occurrence is in the vicinity of PD7.

Sensitive Plant Species Descriptions

Terrestrial

The following section provides a brief description of the terrestrial plant species that were observed during the reconnaissance surveys or have a high likelihood to occur within one or more of the planning districts based on the database search results. Species with a moderate or low potential to occur are listed in Table 4.3-3 above. The species discussion does not exclude the potential for other rare plants to occur within the planning districts.

Red Sand-Verbena (*Abronia maritima*)

This perennial spreading herb is found near beaches and coastal dune settings and stands less than 5 inches in height. The species is tolerant of saline environments, and can be found at elevations between 0 and 328 feet. Suitable habitat occurs in undisturbed dune and sandy beach settings, which occur primarily in the south bay. The red sand-verbena is not listed under the ESA or CESA; however, it has a California Rare Plant Rank (CRPR) of 4.2, which indicates the plant has a limited distribution in California and is considered fairly endangered. The species was observed during the reconnaissance surveys within PD9 (Figure 4-3-15), where the dune habitat has little to no disturbance present. The beach and dune areas that occur in PD8 do not support sensitive vegetation species due to the frequent disturbances present.

Lewis' Evening Primrose (*Camissoniopsis lewisii*)

Lewis' evening primrose is a small annual herb with yellow flowers that blooms between March and June, and can be found in coastal habitats such as dunes, beaches, and coastal scrub. This species has a CRPR rank of 3, which indicates further research is required to assess threats and population size; however, it meets many of the definitions under CESA to become listed. The species was not observed in the field during the reconnaissance surveys; however, there is a high potential in the dune habitat present within PD9. The last confirmed detection of Lewis's evening primrose was in 2013. Dune/beach habitat present within PD8 does not have a high likelihood to contain this species due to the heavily disturbed nature of the beach and dunes.

Orcutt's Pincushion (*Chaenactis glabriuscula* var. *orcuttiana*)

Orcutt's pincushion is an annual herb that produces a small yellow flower. This species prefers sandy soils along coastal bluffs and dunes, and flowers between January and August. Orcutt's pincushion has a CRPR rank of 1B.1, which indicates it is rare, threatened, or endangered in California and elsewhere, and is considered seriously threatened in California, with over 80 percent of occurrences threatened or with a high degree and immediacy of threat. The species was not observed during the reconnaissance surveys; however, undisturbed dune habitat in PD9 provides high quality habitat for the species to occur. The species is unlikely to be found in dune and beach habitat in other planning districts because those habitats are heavily disturbed with invasive species and frequent human visitation.

Salt Marsh Bird's-Beak (*Chloropyron maritimum* ssp. *maritimum*)

Salt marsh bird's-beak is a hemiparasitic annual herb in the broomrape family. The species can be found in coastal dunes, salt marshes, and wetlands. This species is both Federally and State listed as

endangered, and has a CRPR ranking of 1B.2, indicating that it is rare, threatened, or endangered in California and elsewhere, and moderately threatened in California, with 20–80 percent of occurrences threatened or with a moderate degree and immediacy of threat. Salt marsh bird's beak was not observed during reconnaissance surveys; however, there is high quality suitable habitat within PD9.

Palmer's Frankenia (*Frankenia palmeri*)

Palmer's frankenia is a perennial herb that blooms between May and July and occurs along coastal strand, coastal salt marsh, alkali sink, and wetland riparian vegetation communities. The species is most likely to be found in salt-marsh, dune, playa, and coastal habitats. Palmer's frankenia has a CRPR rank of 2B.1, indicating that it is rare, threatened, or endangered in California but more common elsewhere, and seriously threatened in California with over 80 percent of occurrences threatened with a high degree and immediacy of threat. There is a high likelihood for occurrence of Palmer's frankenia due to the presence of suitable habitat for this species in PD9. However, the species was not detected during reconnaissance surveys.

Beach Goldenaster (*Heterotheca sessiliflora* ssp. *sessiliflora*)

Beach goldenaster is a perennial herb which blooms from May through December and produces a yellow flower. It can be found in coastal dunes, coastal scrub, and coastal chaparral settings. The species has a CRPR ranking of 1B.1, which indicates it is rare, threatened, or endangered in California and elsewhere, and is considered seriously threatened in California, with over 80 percent of occurrences threatened or with a high degree and immediacy of threat. However, it is not listed under the ESA or CESA at this time. The dune habitat within PD9 contains the highest likelihood for the species to occur; however, it may also occur in other planning districts where there is undisturbed beach and dune habitat.

Vernal Barley (*Hordeum intercedens*)

Vernal barley is an annual herb that can be found within coastal dunes, saline flats, valley depressions, grasslands, and vernal pools. Vernal barley rarity status is ranked 3.2 under CRPR. This indicates that additional information is needed to accurately estimate threats to the species; however, it is considered fairly endangered in California. This species was not observed during the reconnaissance surveys, but there is high potential for it to occur within PD9 due to the high-quality dune and salt flat habitat present.

Southwestern Spiny Rush (*Juncus acutus* ssp. *leopoldii*)

Southwestern spiny rush is a perennial rhizomatous herb that blooms between May and June, and can be found in alkaline seeps in meadows, wetlands, coastal salt marsh, and coastal dunes. The species has a CRPR rank of 4.2, indicating its distribution in California is limited, and the plant is considered fairly endangered in California. Suitable dune habitat is present in PD9, and salt marsh habitat is present in PD 7. This species was not observed during the reconnaissance surveys.

California Box Thorn (*Lycium californicum*)

California boxthorn is a shrub commonly found in coastal sage scrub communities and blooms between March and August. California box thorn has a CRPR rank of 4.2, indicating that the plant has a limited distribution in California and is considered fairly endangered. While coastal sage scrub is

not a dominant vegetation community within the planning districts, the species was observed within the vicinity of PD9 but outside the PMPU area during the reconnaissance surveys.

Estuary Seablite (*Suaeda esteroa*)

Estuary seablite is a perennial herb that occurs within coastal marsh habitat. This species has a CRPR ranking of 1B.2, indicating that it is rare, threatened, or endangered in California and elsewhere, and is considered moderately threatened in California, with many occurrences threatened by coastal development and recreational activities. There is a high potential for the plant to occur within the coastal marsh habitat found in PD7. This species was not observed during the reconnaissance surveys.

Coastal Woolly-Heads (*Nemacaulis denudata* var. *denudata*)

Coastal woolly-heads is an annual herb that occurs within dune habitat. This species has a CRPR ranking of 1B.2, indicating that it is rare, threatened, or endangered in California and elsewhere, and is considered moderately threatened in California, with many occurrences threatened by coastal development, trampling from foot traffic, and nonnative plants. There is a high potential for the plant to occur within the dune habitat found in PD9, and several individuals of coastal woolly-heads were observed during reconnaissance survey on the western border of PD9 (Figure 4-3-15).

Brand's Star Phacelia (*Phacelia stellaris*)

Brand's star phacelia is an annual herb that is found in coastal dunes and coastal sage scrub habitat. Blooming period is between March and June. Brand's star phacelia has a CRPR rank of 1B.1, which indicates it is rare, threatened, or endangered in California and elsewhere, and is considered seriously threatened in California, with over 80 percent of occurrences threatened or with a high degree and immediacy of threat. Brand's star phacelia was not observed during reconnaissance surveys; however, there is high quality suitable habitat within PD9.

Marine

Eelgrass (*Zostera marina* and *Zostera pacifica*)

Eelgrass is a marine plant that provides predation refuge and serves as an important food source for a diverse group of marine species. Seagrasses, including eelgrass beds, reduce wave and current action, thus reducing erosion by stabilizing sediment. Eelgrass also improves water quality by trapping suspended particulates and generates oxygen for the marine environment during daylight hours. Although eelgrass is not a threatened or endangered species, it is considered essential fish habitat and a Habitat Area of Particular Concern (HAPC) under the Magnuson-Stevens Fishery Management and Conservation Act (MSA), the Federal legislation that protects waters and substrates necessary for fish spawning, breeding, feeding, or growth to maturity. Because of its designation as a HAPC and its notable contributions to ecological processes, it is also protected under the Clean Water Act and is managed by the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) in California through adherence to the California Eelgrass Mitigation Policy (NOAA 2014).

There were 2,598 acres of eelgrass mapped as part of a baywide survey in 2020 (NAVFACSW and District 2020). Given the abundance of eelgrass within San Diego Bay, its preferred habitat in shallow water, and its designation as HAPC, the District and District tenants are required to mitigate

for impacts to eelgrass associated with infrastructure improvements and dredging projects that lead to loss of eelgrass acreage.

Kelp

Kelp refers to a group of brown algae (Phylum Phaeophyta) in the order Laminariales. The complexity of kelps produces a highly structured habitat that is one of the most productive coastal marine habitats of the eastern Pacific kelp forests. In Southern California, the dominant canopy forming kelp forest species is the giant kelp (*Macrocystis pyrifera*). Kelp height and structure provide important foraging and shelter habitat for commercial and recreationally important marine species including spiny lobster (*Panulirus interruptus*), white seabass (*Atractoscion nobilis*), and yellowtail (*Seriola lalandi*). Detached kelp often floats offshore into pelagic waters and provides valuable habitat for small fish species, which commonly aggregate around floating debris for shelter. Kelp habitat does not exist in San Diego Bay, but can occur on cobble substrate offshore of Imperial Beach.

Similar to the seagrasses, kelp forests are recognized as a HAPC by NOAA NMFS and are essential fish habitat for multiple managed fish species that are present in the Pacific Ocean offshore of Southern California. Thus, any project that threatens to impact kelp forest productivity or cover will require modification or mitigation measures to ensure ecological processes are maintained.

Sensitive Wildlife Database Results

The potential presence of sensitive terrestrial wildlife species within each planning district was determined by reviewing the CNDDDB database and requesting an official threatened and endangered species list from USFWS IPAC. A CNDDDB record search for special-status terrestrial wildlife species was conducted for the nine quadrangle maps centered around the National City 7.5 minute quadrangle map (CDFW 2017). The USFWS list of threatened and endangered species was generated by creating a polygon for each planning district through the IPAC web application tool. Based on the results of the field reconnaissance and desktop survey, it was determined that 32 sensitive wildlife species have potential to occur in one or multiple planning districts. A full description of these species and their potential to occur within the planning area is presented in Table 4.3-4.

The desktop analysis for sensitive marine species included review of marine mammals in Southern California. Two primary sources were used to determine marine mammal species present and their likelihood to occur in nearshore coastal waters (relative to PD8) or within PMPU planning districts within San Diego Bay. The first resource implemented multiple aerial marine mammal surveys over Southern California coastal waters between 2008 and 2013 (Jefferson et al. 2014). The second resource utilized was the *Monitoring Report for Fuel Pier Replacement Project (P-151) at Naval Base Point Loma* (NAVFACSW 2016). This report provided results from comprehensive marine mammal monitoring performed during the construction of a fuel pier at Naval Base Point Loma. In addition to providing observational reports, the document reviews the marine mammals that were anticipated to be observed and for which an incidental harassment authorization was obtained from NOAA NMFS.

Table 4.3-4. Sensitive Wildlife Species with Potential to Occur Within the Proposed PMPU Area

Common Name (<i>Scientific Name</i>)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
Invertebrates					
White abalone	FE	Rocky subtidal from 50 to 180 feet ranging from Point Conception, California to Punta Abreojos, Baja California.		Low	Portions of PD8 have rocky substrate that could support white abalone; critical habitat is not designated for this species.
Reptiles					
Silvery legless lizard (<i>Anniella pulchra pulchra</i>)	CSC	Dry, loose sandy soils, from inland foothills to coastal sand dunes.	No	Moderate	Suitable dune habitat present in PD9.
Eastern Pacific green sea turtle (<i>Chelonia mydas</i>)	FT	Typically occurs within southern San Diego Bay within or adjacent to the shallow eelgrass beds. Individuals may enter or leave the Bay and can be found between San Diego and Mexico.	No	High	Green sea turtles may periodically occur throughout San Diego Bay, but spend a majority of the time within south San Diego Bay.
Birds					
Western snowy plover (<i>Charadrius nivosus</i> ssp. <i>nivosus</i>)	FT	Requires open, relatively flat areas with little or no vegetation, including undisturbed beaches, salt flats, playas, dredge spoils, levees, and river bars. Winter distribution is more coastal, and may include sewage treatment ponds and agricultural wastewater sites.	No	Breeding: Very Low Foraging: High	Western snowy plovers are known to forage throughout wetlands and mudflats in San Diego Bay.
Clark's marsh wren (<i>Cistothorus palustris clarkae</i>)	CSC	Restricted to freshwater and brackish marshes dominated with cattails and bulrushes.	No	Breeding: Moderate Foraging: Moderate	PD7 and PD9 provide suitable nesting and foraging habitat.

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
American peregrine falcon (<i>Falco peregrines anatum</i>)	FP	Occurs along coast; breeds in woodland, forest, and coastal habitats. Riparian areas important year-round habitats.	No	Breeding: None Foraging: Moderate	Suitable foraging habitat is present within the planning districts due to species presence in urban areas.
Gull-billed tern (<i>Gelochelidon nilotica</i>)	CSC	Nesting habitat consists of bare islets of fine clay soils.	No	Breeding: High Foraging: High	CNDDDB records in PD2, PD3, and PD9. Suitable nesting habitat occurs in PD7 and PD9. However, the salt works of south San Diego Bay is the only known site for this species in San Diego County. Known to forage throughout San Diego Bay.
Loggerhead shrike (<i>Lanius ludovicianus</i>)	CSC	Breeds and forages in open habitats interspersed with shrubs and small trees, including disturbed habitats.	No	Breeding: Moderate Foraging: Moderate	Uncommon to San Diego Bay. Suitable upland habitat occurs within PD7 and PD9.
Least bittern (<i>Ixobrychus exilis</i>)	CSC	Freshwater or brackish marshes with tall emergent vegetation.	No	Breeding: Moderate Foraging: Moderate	Suitable aquatic habitat occurs within PD7 and PD9.
Belding's Savannah sparrow (<i>Passerunculus sandwichensis beldingi</i>)	SE	Resident species that is restricted to coastal marshes dominated by pickleweed. It is known to occur within five general areas of coastal San Diego County.	No	Breeding: High Foraging: High	Suitable coastal marsh within PD7. May also occur in suitable nesting habitat in PD9.
American white pelican (<i>Pelecanus erythrorhynchos</i>)	CSC	Historically, nested at large lakes throughout California; the only breeding colonies in the state occur at lower Klamath National Wildlife Refuge, Siskiyou County, and at Clear Lake, Modoc County. Frequents	No	Breeding: None Foraging: Low	The species is not known to nest within any of the planning districts. May occasionally forage within San Diego Bay.

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
		freshwater lakes with islands for breeding; inhabits river sloughs, freshwater marshes, salt ponds, and coastal bays during the rest of the year.			
California brown pelican (<i>Pelcanus occidentalis californicus</i>)	FP	Nesting typically occurs on islands on ground or within shrubs. Commonly observed foraging throughout San Diego Bay and near coastal areas for schooling fish species like anchovy, sardine, and mackerel.	Yes	Breeding: None Foraging: High	Pelicans are commonly found throughout San Diego Bay. Foraging potential is high anywhere schooling fish species can be found. Birds also commonly associate with fishing boats as recreational fisherman discard bait.
Cassin's auklet (<i>Ptychoramphus aleuticus</i>)	CSC	Nests on islands off the California coast. Nests are earthen burrows excavated by adults, rocky crevices, cracks under buildings, or larger caves. Forages in open waters for small fish and crustaceans.	No	Breeding: None Foraging: Low	The species is not known to nest within any of the planning districts. May occasionally forage within San Diego Bay.
Ridgways rail (<i>Rallus longirostris levipes</i>)	FE/SE, FP	Freshwater and brackish emergent wetlands, coastal wetlands.	No	Breeding: High Foraging: High	May occur in suitable nesting habitat in PD9.
Black skimmer (<i>Rynchops niger</i>)	CSC	Colony of permanent residents on the south end of San Diego Bay. Nests on gravel bars and sandy beaches; forages in shallow, calm waters.	No	Breeding: High Foraging: High	PD7 and PD9 provide known and suitable nesting habitat. Known to forage throughout San Diego Bay.
California least tern (<i>Sterna antillarum browni</i>)	FE/SE, FP	Nests on beaches and managed nesting sites; forages in shallow estuaries, lagoons, and along marine shores.	Yes	Breeding: Very Low Foraging: High	Known to forage throughout San Diego Bay.

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
Mammals					
Blue whale (<i>Balaenoptera musculus</i>)	FE	Blue whales are the largest animal on Earth and are most commonly found off the Southern California coast in summer months. They utilize baleen to filter krill, fish, squid, and other small organisms for food.	No	Very Low	May be observed in nearshore coastal waters off PD8. Highly unlikely in San Diego Bay.
Fin whale (<i>Balaenoptera physalus</i>)	FE	Fin whales utilize baleen to filter krill, fish, squid, and other marine life for foraging. The Fin whale is the second largest mammal on Earth.	No	Very Low	May be observed in nearshore coastal waters off PD8. Highly unlikely in San Diego Bay.
Humpback whale (<i>Megaptera novaengliae</i>)	FT (Mexico DPS)/FE (Central America DPS)	The humpback whale is a large baleen whale that is well known for its breaching behavior. There are two distinct population segments (DPS), the Mexico DPS, and Central American DPS, both of which utilize the waters off of Southern California for foraging.	No	Low	May be observed in nearshore waters off PD8. Highly unlikely in San Diego Bay.
Orca (<i>Orcinus orca</i>)	FE (Southern Resident DPS)	Orca is a large toothed whale in the dolphin family (Delphinidae). They commonly prey on fish and mammals, and studies suggest that certain populations specialize in hunting certain prey over other species. The Southern Resident DPS occurs off the coast of California, and targets chinook salmon as one of its primary food sources.	No	Very Low	May be observed in nearshore coastal waters off PD8. Unlikely in San Diego Bay.
Sperm whale (<i>Physeter microcephalus</i>)	FE	Sperm whales are the largest toothed whale and are known to dive to great depths in order to forage on prey, most notably, giant squid.	No	Very Low	May be observed in nearshore coastal waters off PD8. Unlikely in San Diego Bay.

Common Name (<i>Scientific Name</i>)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
California gray whale (<i>Eschrichtius robustus</i>)	MMPA	California gray whales migrate in fall from cooler northern Pacific feeding areas to embayments in Baja California, Mexico, for mating and calving. They return north in late winter/early spring.	No	Low	They may occasionally occur close enough to shore such that migrating animals pass through PD8. Gray whales occasionally enter the Bay accidentally while migrating.
California sea lion (<i>Zalophus californianus</i>)	MMPA	California sea lions haul out on natural (e.g., beaches) and human-made structures, bait barge, forage, raft, and mill throughout the entirety of the Bay. They typically forage offshore and have breeding rookeries on the Channel Islands.	No	High	They are common in the north Bay, central Bay, and offshore waters with high potential to occur in PD1, PD2, PD3, PD4, PD8, and PD10. They have moderate potential to occur in southern PD9.
Harbor seal (<i>Phoca vitulina</i>)	MMPA	Common haul out areas include the exposed ocean side of the Point Loma Peninsula, along shore south of Ballast Point, and a portion of the docks at Naval Base Point Loma. The exposed coast of the Point Loma Peninsula represents one of two mainland rookery sites in San Diego County. Pacific harbor seals and their pups have been documented in San Diego Bay, typically at the northern end of the Bay nearest Ballast Point.	No	High	Animals transiting along the coast will occasionally move through PD8. Given proximity to haul out sites and rookeries, animals may be seen swimming at PD1. They have a low potential to occur in all other planning districts.
Common dolphin (<i>Delphinus</i> spp.)	MMPA	Common dolphins have a widespread distribution and are often observed in Southern California nearshore environments. In the Bay, they are often observed in the north Bay from the San Diego Bay entrance to approximately Harbor Island.	No	Moderate	Animals in offshore waters often come close to shore and can be expected to transit through PD8. Within the Bay they are most likely to be observed in the main entrance channel with low potential

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
					to occur in P1 and PD2. Potential occurrence in all other planning districts is very low.
Bottlenose dolphin (<i>Tursiops truncatus</i>)	MMPA	Bottlenose dolphins have a widespread distribution and are often observed in Southern California nearshore environments. In the Bay, they are often observed in the north Bay from the San Diego Bay entrance to approximately Harbor Island.	No	Moderate	Animals in offshore waters often come close to shore and can be expected to transit through PD8. Within the Bay they are most likely to be observed in the main entrance channel with low potential to occur in PD1 and PD2. Potential occurrence in all other planning districts is very low.
Pacific white-sided dolphin (<i>Lagenorhynchus obliquidens</i>)		Pacific white-sided dolphin occur in the north Pacific and travel in groups of variable size.	No	Low	They have been documented in low numbers with minor occurrences in the north Bay entrance channel such that probability of occurrence in PD1 and PD2 is low, generally in the entrance channel. The likelihood of occurrence in PD3, PD4, PD7, PD9, and PD10, where open ocean is less accessible, is very low. They have a moderate potential to be observed in nearshore coastal waters off PD8 as they transit along the coast looking for prey.

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
Risso's dolphin (<i>Grampus griseus</i>)	MMPA	Risso's dolphin is a large dolphin species found in tropical and temperate oceans worldwide.	No	Very Low	May be observed in nearshore coastal waters off PD8. Highly unlikely in San Diego Bay.
Bryde's whale (<i>Balaenoptera brydei</i>)	MMPA	Bryde's whale is a large baleen whale that occurs worldwide in tropical, sub-tropical waters, and warm temperate waters. They have been observed in the Southern California Bight.	No	Very Low	Very low potential to be observed in nearshore coastal waters off PD8. Highly unlikely in San Diego Bay.
Minke whale (<i>Balaenoptera acutorostrata</i>)	MMPA	Minke whale are the smallest of the rorquals, which include blue, Bryde's, sei, and fin whales. They are widespread and generally found around the globe in the northern hemisphere. They occur in tropical to polar waters.	No	Very Low	May be observed in nearshore coastal waters off PD8. Highly unlikely in San Diego Bay.
Cuvier's beaked whale (<i>Ziphius cavirostris</i>)	MMPA	Cuvier's beaked whale occur worldwide with the exception of the polar regions. They dive deep for food and generally occur in offshore waters.	No	Very Low	May be observed in nearshore coastal waters off PD8. Likelihood is very low due to preference for deep offshore waters. Highly unlikely in San Diego Bay.
Northern right whale dolphin (<i>Lissodelphis borealis</i>)	MMPA	Northern right whale dolphins lack a dorsal fin and occur in large numbers in the north Pacific. They generally occur in deep offshore waters.	No	Very Low	May be observed in nearshore coastal waters off PD8. Likelihood is very low due to preference for deep offshore waters. Highly unlikely in San Diego Bay.
Dall's porpoise (<i>Phocoenoides dalli</i>)	MMPA	Dall's porpoise is a common north Pacific dolphin species and is likely the fastest swimming dolphin	No	Low	May be observed in nearshore coastal waters

Common Name (Scientific Name)	Sensitivity Code and Status	Habitat Preference/Requirements	Verified On Site (Yes/No)	Potential to Occur	Rationale
		species. Their black and white color is often confused with that of orcas.			off PD8. Highly unlikely in San Diego Bay.
Fishes					
Steelhead (Southern California Distinct Population Segment) (<i>Oncorhynchus mykiss irideus</i>)	FE	Steelhead are the same species as rainbow trout but with an anadromous life cycle. The Southern California DPS occurs from the Santa Maria River to the Mexico Border.	No	Very Low	Sweetwater River is within the Southern California DPS critical habitat. There are rainbow trout with native coastal steelhead genetics that are landlocked above dams and culverts within Sweetwater River. Marine fish could transit the Bay and the lower portions of the river. Recovery efforts may also re-establish populations in the future.

m = meters; ft = feet; km = kilometers

Status:

Federal

FE – listed as endangered under the Federal Endangered Species Act.

FT – listed as threatened under the Federal Endangered Species Act.

MMPA – fully protected under the Marine Mammal Protection Act.

State

SE - listed as endangered under the California Endangered Species Act.

ST – listed as threatened under the California Endangered Species Act.

FP – fully protected species in California.

CSC – species of special concern in California.

Fish habitat and habitat areas of particular concern as managed under the MSA are discussed in this Program Environmental Impact Report (PEIR). The managed fish species with potential to occur in San Diego Bay are listed in the Coastal Pelagic Species Fishery Management Plan as amended (Pacific Fishery Management Council 2019); Pacific Coast Groundfish Fishery Management Plan for the California, Oregon, and Washington Groundfish Fishery as amended (Pacific Fishery Management Council 2020); and Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species as amended (Pacific Fishery Management Council 2018). These documents are incorporated by reference and are available for review at the weblinks provided in Chapter 9, *References*, of this PEIR.

Sensitive Wildlife Species Descriptions

Terrestrial

California Least Tern (*Sternula antillarum browni*)

The California least tern nests along the west coast of North America, from Baja California, Mexico, north to the San Francisco Bay area. California least terns are seasonal residents of San Diego Bay, typically arriving in mid- to late-April to nest at several colonies adjacent to the Bay and are generally present through mid-August, with September 15 marking the end of the season. California least terns may have two waves of nesting during this time period (Massey and Atwood 1981). They establish nesting colonies on sandy open space with little vegetation. Along the shores of San Diego Bay and south of the Imperial Beach Oceanfront, California least terns nest at multiple sites outside the planning districts discussed in this PEIR. California least terns actively forage for fish in the waters adjacent to nesting colonies and throughout San Diego Bay; foraging also occurs in open ocean waters and along the nearshore waters adjacent to beaches of Silver Strand and Imperial Beach.

Western Snowy Plover (*Charadrius alexandrinus nivosus*)

The western snowy plover is a sparrow-sized, white and tan colored shorebird with dark patches on either side of the neck, behind the eyes, and on the forehead. The coastal western snowy plover population is defined as those individuals that nest adjacent to or near tidal waters and includes all nesting colonies on the mainland coast, peninsulas, offshore islands, adjacent bays, and estuaries. The breeding range of the coastal population of the western snowy plover extends along coastal beaches from the southern portion of Washington State to southern Baja California, Mexico. The recognized breeding season of the western snowy plover normally extends from March 1 through September 15. In California, earliest nesting is sometimes observed in the first week of March, with nesting typically observed by the third week of March. Peak initiation of nesting is observed mid-April through mid-June (USFWS 2007). Western snowy plover nest along similar sandy flats and dunes as California least tern.

Ridgway's Rail (*Rallus longirostris levipes*)

Ridgway's rail is a resident in coastal wetlands in Southern California and northern Baja California, Mexico. The species is threatened primarily by loss and degradation of the freshwater, brackish, and salt marsh habitat in which it breeds. The largest population of this species occurs in the Tijuana River National Estuarine Research Reserve. The core breeding season for Ridgway's rails in San

Diego Bay has been reported to be mid-February through mid-June and into July (Vissman pers. comm.).

Belding's Savannah Sparrow (*Passerunculus sandwichensis beldingi*)

Belding's Savannah sparrow ranges along the Southern California coast from Santa Barbara County (Goleta Slough) in the north into Baja California, Mexico (near El Rosario) in the south. The species is unique in that it is a year-round resident of salt marshes and is reliant upon this habitat to meet all of its life cycle requirements. The species is threatened by loss and degradation of the salt marsh habitat in which it lives and breeds.

Black Skimmer (*Rynchops niger*)

Black skimmer breeds along the coast from San Francisco Bay south to San Diego Bay. The species requires large areas of bare earth sufficiently isolated from terrestrial predators and other disturbances (Shuford and Gardali 2008). The species is threatened by loss and degradation of suitable nesting habitat.

Gull-billed Tern (*Gelochelidon nilotica*)

Gull-billed tern breeds along the coast of the Salton Sea and along the south San Diego Bay. The species nests on isolated portion of earthen levees with sparse vegetation (Shuford and Gardali 2008). The species is threatened by loss and degradation of suitable nesting habitat.

Marine

Eastern Pacific Green Sea Turtle (*Chelonia mydas*)

The Eastern Pacific green sea turtle has been documented in San Diego Bay dating back to the 1800s (Stinson 1984). Green sea turtles in the Bay represent a local foraging population, commonly feeding on eelgrass, algae, and invertebrates. The thermal discharge from the former South Bay Power Plant was generally believed to attract green sea turtles. The warm water effluent associated with the once-through cooling of the power plant created a warm water environment that researchers attributed to the abundance of green sea turtles in south San Diego Bay (Stinson 1984; McDonald et al. 1994; Duke Energy South Bay, LLC 2004). The decommissioning of the South Bay Power Plant has also been attributed to an increased number of more northern observations (Seminoff quoted in Brody 2013). Green sea turtle home ranges within San Diego Bay increased in size following the closure of the South Bay Power Plant; however, home ranges have remained predominantly south of Sweetwater River (SPAWAR & NAVFAC 2016). This is likely due in part to the long residence time of south San Diego Bay waters, which tend to be warmer than the rest of the Bay regardless of the presence of additional thermal input.

The green sea turtle foraging population, as well as other regional foraging populations, is part of the Mexican breeding population (Eguchi et al. 2010). The nesting sites for the green sea turtle foraging population may include the Revillagigedo Islands, Tres Maria Islands, and mainland Mexico (Dutton 2003 as cited in Eguchi et al. 2010). Turtles have been tracked between the south Bay and the Revillagigedo Islands (SPAWAR & NAVFAC 2016). The potential to observe turtles in more northern portions of San Diego Bay and in offshore environments increases in summer months with warmer water.

Marine Mammals – Pinnipeds

Pinnipeds are flipper-footed marine mammals that spend a portion of their time out of the water. Pinnipeds typically spend a portion of their day on dry land resting, sleeping, mating (in season), and giving birth (in season), a behavior called *hauling out*. Choice of haul out sites is likely related to ease of access, proximity to food resources, protection from waves, and protection from predators. Pinnipeds are documented to occupy natural settings: sandy beaches, rocky beaches, boulder beaches, rocks and pinnacles, mud flats, reefs, fallen trees, and rock shelves. California sea lion (*Zalophus californianus*) and occasionally Pacific harbor seal (*Phoca vitulina*) occupy human-made structures (e.g., docks, buoys, landings, breakwaters, boats, bait barges, and fish ladders). Potential disturbance occurs when these haul out locations overlap with urbanized areas.

In San Diego Bay, both California sea lion and Pacific harbor seal haul out on natural (e.g., beaches) and human-made structures, and forage, raft, and mill throughout the entirety of the Bay. California sea lion and harbor seal are not typically found in the same haul out locations. The California sea lion is able to haul out on steep, rocky habitat because it can rotate its pelvis to use all four limbs to walk. Harbor seal cannot rotate the pelvis and must move on land by undulating the body (NPS 2016).

Within San Diego Bay, California sea lion is the dominant and most numerous pinniped observed, whereas harbor seal is more elusive and found in lower numbers. California sea lion haul out in large numbers at the two bait barges that are located near the entrance to San Diego Bay in Point Loma. They also haul out individually or in small groups on buoys, docks, and boats throughout San Diego Bay but are most prevalent in northern portions of the Bay. In addition to the animals that haul out on the buoys, docks, and boats, California sea lion rest in moderate numbers on the rock riprap that forms Zuniga Jetty at the entrance to San Diego Bay (Merkel & Associates 2008).

On the exposed ocean side of the Point Loma Peninsula, harbor seals have established one of two mainland hauling and rookery sites in San Diego County. As a result, Pacific harbor seals and their pups have been documented in San Diego Bay, mostly at the northern end of the Bay near Ballast Point. The harbor seals use a portion of the docks in a restricted area adjacent to the Naval Base Point Loma Submarine docking station to haul out. In addition, harbor seals have been observed to haul out along the shore south of Ballast Point (NAVFACSW 2014).

Other pinnipeds seen in the Bay include northern elephant seal (*Mirounga angustirostris*) and Steller sea lion (*Eumetopias jubatus*). These are rare sightings, and, in the case of elephant seals, they are typically undernourished juveniles that strand on the shore within the Bay. Steller sea lions have been recorded hauled out on the bait barge and navy docks, and swimming in the Bay (NAVFACSW 2015).

Marine Mammals – Cetaceans

Cetaceans are a group of marine mammals that consists of whales, dolphins, and porpoises. A Southern California Bight aerial survey of marine mammals was performed over 5 years between 2008 and 2013 and identified the cetaceans provided in Table 4.3-5 (Jefferson et al. 2014). Of the cetaceans identified, only the short-beaked common dolphin, long-beaked common dolphin, Risso's dolphin, bottlenose dolphin, fin whale, and gray whale were observed often enough to generate a population estimate within the Southern California Bight.

Table 4.3-5. Southern California Bight Aerial Marine Mammal Survey Results (2008–2013)

Common Name	Scientific Name	Mean Population Estimate	
		Warm Season	Cold Season
Short-beaked common dolphin	<i>Delphinus delphis</i>	8,520 (CV=54%)	15,955 (CV=51%)
Long-beaked common dolphin	<i>Delphinus capensis</i>	3,314 (CV=54%)	6,440 (51%)
Risso's dolphin	<i>Grampus griseus</i>	1,450 (CV=66%)	993 (CV=51%)
Bottlenose dolphin	<i>Tursiops truncatus</i>	496 (CV=87%)	290 (CV=61%)
Fin whale (E)	<i>Balaenoptera physalus</i>	137 (CV=49%)	140 (CV=33%)
Gray whale	<i>Eschrichtius robustus</i>	6 (CV=13%)	221 (CV=53%)
Blue whale (E)	<i>Balaenoptera musculus</i>	Too few sightings to estimate	
Bryde's whale	<i>Balaenoptera brydei</i>	Too few sightings to estimate	
Minke whale	<i>Balaenoptera acutorostrata</i>	Too few sightings to estimate	
Humpback whale (T/E) ¹	<i>Megaptera novaeangliae</i>	Too few sightings to estimate	
Sperm whale (E)	<i>Physeter macrocephalus</i>	Too few sightings to estimate	
Cuvier's beaked whale	<i>Ziphius cavirostris</i>	Too few sightings to estimate	
Orca (E) ²	<i>Orcinus orca</i>	Too few sightings to estimate	
Pacific white-sided dolphin	<i>Lagenorhynchus obliquidens</i>	Too few sightings to estimate	
Northern right whale dolphin	<i>Lissodelphis borealis</i>	Too few sightings to estimate	
Dall's porpoise	<i>Phocoenoides dalli</i>	Too few sightings to estimate	

E= endangered; T = threatened; CV = Coefficient of Variation

¹ Mexico DPS (Threatened), Central American DPS (Endangered)

² Southern Resident DPS Endangered

The U.S. Navy identified the same six commonly identified species from Table 4.3-5, as well as the Pacific white-sided dolphin, as having potential to occur in San Diego Bay (NAVFACSW 2016). The U.S. Navy obtained an incidental harassment authorization and identified all possible species with potential to occur at the fuel pier (P-151) project area at Naval Base Point Loma.

Common and bottlenose dolphins have widespread distributions and are often observed in Southern California nearshore environments. They are also often observed in the north Bay from the San Diego Bay entrance to approximately Harbor Island (Mooney personal observation on multiple occasions 2020-2023); also see NAVFACSW 2016). Animals are often observed either swimming alongshore or bow-riding vessels entering and leaving the Bay.

California gray whales are commonly observed along the California coast and are often observed close to shore. The gray whale performs annual migrations from cooler northern Pacific feeding areas to embayments in Baja California, Mexico, for mating and calving. Gray whales migrate south along the San Diego coast in fall and early winter and can be observed on their northbound migration in later winter and early spring. Animals have been occasionally observed entering San Diego Bay (Mooney personal observation; NAVFACSW 2016); these rare events are likely accidental. Other whale species are found in the Southern California Bight, as noted in Table 4.3-5, but occur less frequently and many are typically observed farther offshore. However, they all have the potential to be occasionally observed from PD8.

4.3.2.7 Planning District Settings

The following describes the biological resources setting for each of the planning districts. Each description includes habitats present and potential sensitive species that may occur within the planning district.

Planning District 1: Shelter Island

The terrestrial portion of PD1 is devoid of natural vegetation communities and contains very little open space and habitat for native vegetation and wildlife. Habitats include upland, sandy beaches, and urban/developed. Open space within the planning district is limited to parks with ornamental trees, rock rip-rap, and small beach areas. Due to the routine landscaping and frequent human visitation, there is no potential for sensitive vegetation species to occur within PD1. Buildings and palm trees provide low potential for roosting habitat for sensitive species. Potential nesting habitat for special-status bird species and birds protected under the Migratory Bird Treaty Act (MBTA) occur within trees and shrubs. Nearshore open water habitat provides foraging habitat for bird species, such as California least tern, California brown pelican, osprey, and other species that prey on fish.

The marine biology of PD1 is influenced by its proximity to open ocean water. The first 3 to 4 miles within the entrance of the Bay can be described as the “Marine Region” (NAVFACSW and District 2013). This designation represents the proximity and exchange of open ocean water with northern San Diego Bay. The close connection between PD1 and open ocean waters means that conditions are favorable for some coastal aquatic species. For instance, fish species such as garibaldi (*Hypsypops rubicundus*) can be found in association with rock, such as riprap, in PD1 (Mooney personal observation). Garibaldi is a coastal fish species typically found in rocky coastal waters and kelp forests. The planning district also supports more complex algal species on rocks and dock floats relative to other areas within San Diego Bay. However, the dominant kelp species on dock floats in PD1 is the exotic alga, wakame (*Undaria pinnatifida*). The presence of these species indicates the oceanic influence within the Marine Region and PD1 in general.

The marine habitats within PD1 generally include sandy beaches and shallow subtidal, rocky (riprap) intertidal, vertical headwall intertidal and subtidal, boat launch ramp, intertidal and subtidal portions of pilings, subtidal portions of docks, mudflats, and soft-bottom generally composed of mud. Hard structures such as rocky riprap, concrete piles, and concrete walls generally support species similar to nearby rocky habitats. These include barnacles (*Balanus glandula* and *Chthamulus* sp.), limpets, oysters (*Ostrea lurida*), and spiny lobster (*Panulirus interruptus*).

The primary biologically important habitat associated with the soft-bottom in PD1 and throughout San Diego Bay is eelgrass. Eelgrass beds grow to greater depths in PD1 relative to southern portions of San Diego Bay due to the oceanic influence within the Marine Region and the improved water clarity and quality that results from regular tidal exchange. Soft bottom sandy beaches occur at Kellogg Beach (opposite of Harbor Police dock) and Shoreline Park.

Planning District 2: Harbor Island

Open space associated with PD2 is composed of landscaped parks and rock riprap within the intertidal zone. Trees and buildings may provide low potential roosting habitat for sensitive species. Ornamental trees within the park area offer potential nesting habitat for sensitive bird species and

birds protected under the MBTA, and nearshore open water habitat provides foraging potential for piscivorous bird species. The San Diego International Airport, which is outside the proposed PMPU area discussed in this PEIR, contains an annual breeding colony of California least tern, which forages in the Bay. Peregrine falcon, among other raptor species, have also been observed preying on California least tern at the airport (Patton 2015).

The marine portion of PD2 includes the waters immediately around Harbor Island and extends from the western end of Harbor Island to the eastern edge of Convair Lagoon. The marine biology of PD2 is influenced by its proximity to open ocean water. Like PD1, PD2 is within the Marine Region of San Diego Bay (NAVFACSW and District 2013); this planning district receives substantial tidal exchange with lower residence times than more interior areas of the Bay.

Most of the shoreline within PD2 consists of rock riprap revetment. This provides hard substrate for attachment by intertidal and subtidal invertebrates and algae. There is a small beach area available to the public via Spanish Landing Park. The revetment in PD2 supports hard-bottom intertidal organisms. Occasional barnacles (*Balanus glandula* and *Chthamulus* sp.), limpets, oysters (*Ostrea lurida*), and the green alga *Ulva intestinalis* were observed during a recent survey of the shoreline adjacent to the Harbor Island West Marina (MTS 82018). The tow of the revetment had sparse occurrence of the invasive alga *Sargassum muticum*, and spiny lobster (*Panulirus interruptus*) was observed in crevices. In addition to lobster, the voids between rocks provide shelter for small fish and crabs.

Planning District 2 is generally shallow with no deep subtidal habitat. The shallow water allows for substantial eelgrass cover. Eelgrass growth is notable along the long stretch of shallow water habitat adjacent to Spanish Landing Park in the west basin between Harbor Island West and the park. This area provides a large expanse of shallow water habitat that is not covered by dock structures and is therefore more likely to support persistent stands of eelgrass. Eelgrass is also persistent along the 1-mile stretch on the south/Bay side of Harbor Island. There is also substantial eelgrass cover in Convair Lagoon, which is a shallow cove at the eastern end of PD2 that was capped as part of a sediment remediation project. Similar to PD1, the location of PD2 within the Marine Region means water clarity is generally greater than more southerly portions of the Bay, and therefore, eelgrass grows to greater depths in these areas.

Planning District 3: Embarcadero

The majority of the habitat within PD3 is urban/developed with landscaped lawns and ornamental trees. Buildings and palm trees on site provide low potential for sensitive species roosting within the planning district, but other large trees provide potential nesting habitat for birds protected under the MBTA and Fish and Game Code. There is potential foraging for raptors, including peregrine falcon, due to the high volume of prey species that utilize the terrestrial habitat, as well as piscivorous birds such as osprey, California least tern, and California brown pelican, which use adjacent open water areas for foraging and periodically rest along riprap or on near-water structures.

The marine portion of PD3 is composed of the shoreline, basins, and marinas along the Downtown waterfront and are influenced by a combination of dredging and tidal exchange. The narrow width of the Bay toward the southern end of PD3 leads to shallow water habitats along the shore, quickly giving way to deep water. Therefore, much of the shoreline areas along the navigation channel are steeply sloped. Additionally, in the south, the narrowing of San Diego Bay leads to significant tidal

currents. Basins such as the Laurel Street mooring and the former Campbell Shipyard are dredged deeper than many of the nearby recreational marinas. The increased depth results in less light and therefore lower occurrence of primary producers such as eelgrass.

Most of the marine portion of the planning district is composed of mud bottom that is typical of much of the non-vegetated portions of San Diego Bay. A survey at Fifth Avenue Landing Marina (MTS 2017) found that common motile invertebrates included California aglaja (*Navanax inermis*), cloudy bubble snails (*Bulla gouldiana*), and lobster. Lobster were generally associated with human-made structures (e.g., concrete, rock, tires). Common fish species over unvegetated bottom include round stingrays (*Urobatis hutchingsi*), diamond turbot (*Hypsopsetta uttula*), California halibut (*Paralichthys californicus*), barred sand bass (*Paralabrax nebulifer*), and spotted sand bass (*P. maculatofaciatus*). Signs of burrowing invertebrates are numerous within the mud bottom, and the tube-dwelling anemone (*Pachycerianthus fibriatus*) is common.

Most of the eelgrass that occurs in PD3 is present in narrow beds along the shoreline and over a 1.5-acre shallow water habitat site at the former Campbell Shipyard, which was constructed to support eelgrass as part of a remediation project and create a bank for excess eelgrass beyond the mitigation requirements.

Planning District 4: Working Waterfront

This planning district contains urban/developed and upland habitats with minimal open space occurring in Cesar Chavez Park, which is landscaped. Due to the high amount of human visitation and landscaping, PD4 does not contain habitat for sensitive plant species. Trees and human-made structures within the park provide potential nesting habitat for birds protected under the MBTA and Fish and Game Code.

The marine portion of PD4 includes the waters immediately adjacent to the shore between the Tenth Avenue Marine Terminal (TAMT) and Chollas Creek. The primary uses along the waterfront are industrial with three shipyards located between TAMT and Chollas Creek.

The wharves around the TAMT are dredged to -41 feet MLLW, and the vertical seawall quickly gives way to deep subtidal habitat as a result. The shipyards to the south generally have shallow and gradually deepening bottom, moving away from shore for the first 200 to 300 feet, and then quickly deepen to dredged depths of 40 feet or more. The shoreline within PD4 is a mixture of rock riprap revetment and concrete seawall. This provides hard substrate for attachment by intertidal and subtidal invertebrates and algae. Planning District 4 supports notably fewer hard-bottom intertidal organisms relative to more northern planning districts. However, lobster are abundant and associated with pilings and revetment. They are also notably large, which is likely due to inaccessibility by the public (Mooney personal observation). The numerous piers likely attract fish such as pile perch and other structure-associated species. The mooring dolphins within the shipyards have been observed to attract white seabass during past environmental surveys (Mooney personal observation).

Eelgrass is less abundant in PD4 compared to other planning districts due to dredged depths and reduced area of shallow water. The shallow water bench along the shoreline does support eelgrass where it is not shaded by piers or other structures.

Planning District 7: South Bay

Habitat types present in PD7 include intertidal flats, salt flats, coastal saltmarsh, and open water. Public use of these areas would be infrequent, and there is a high likelihood that both sensitive plants and wildlife species occur within this planning district. Although CNDDDB results and reconnaissance surveys did not indicate the presence of sensitive plant species, the available marsh habitat and limited disturbance give PD7 a high likelihood that sensitive species may occur. Sensitive wildlife species such as Belding's Savannah sparrow, California least tern, and western snowy plover have a high potential to occur within the planning district.

The low intertidal areas below the intertidal flats generally support substantial amounts of eelgrass. Additionally, the eelgrass extends to the shallow subtidal as well. There are no moderately deep or deep subtidal areas in PD7. The water area supports schooling fish such as slough anchovy, northern anchovy, and topsmelt. These fish species generally occur as juveniles (Mooney personal observation). Round stingray is abundant as well.

Planning District 8: Imperial Beach Oceanfront

This planning district includes two parks, which contain landscaped lawns and a number of trees. There is little to no potential for any sensitive plants or wildlife due to the predominance of disturbed habitat; however, birds protected under the MBTA and Fish and Game Code may nest in some of the trees within the planning district.

The northwest portion of PD8 supports intermittent stands of giant kelp. The seafloor along Imperial Beach is generally a mixture of sand over cobble and small boulders. Because of the size of the rocks, they are subject to movement during storms. This is particularly true when species such as giant kelp colonize the substrate. Kelp makes the boulders more buoyant such that they can be transported or moved, which can result in kelp damage. This process, along with sand movement during storm events, drives the intermittent nature of kelp beds in the planning district. This is the only planning district that does not contain eelgrass.

Compared to the other planning districts, PD8 has the highest potential for observing marine mammals. Given that this planning district contains open coastal water, it is possible that all of the marine mammals identified in Table 4.3-5 could be observed. However, sightings of most species would be rare.

Planning District 9: Silver Strand

Habitats present include coastal saltmarsh, intertidal flats, upland transition, upland, urban/developed, and coastal dune. The planning district contains dune habitat for sensitive plant species. ICF biologists observed red-sand verbena (*Abronia maritima*), Nuttall's lotus (*Acmispon prostrates*), and short-lobed broomrape (*Orobancha parishii* ssp. *brachyloba*) during reconnaissance surveys. This planning district also has a high potential for other dune species that were not observed in the field during the reconnaissance level survey.

The water area within PD9 is generally shallow and supports significant eelgrass beds in the shallow waters along the northern and southern shorelines. In the central portion of the planning district, the channels within the Coronado Cays (which are developed with shoreline residences, a resort, and boat slips) support eelgrass beds along the seawall where shading and water quality does not restrict growth.

Planning District 10: Coronado Bayfront

This planning district contains urban/developed, sandy beach, upland, and upland transition habitats, all of which are heavily disturbed. As such, sensitive plants and wildlife are unlikely to occur within PD10, although there are suitable trees and structures present within the golf course and park areas, which bird species may find suitable for nesting and roosting.

The intertidal shoreline is a mixture of seawall, sandy beach, and riprap. The riprap is often at mid- to high-intertidal elevations with sandy beach or mudflat at the toe of the riprap. As such, the riprap generally supports modest numbers of oyster and barnacles with various crab species finding refuge amongst the crevices in the riprap. The sand and mud intertidal habitat support multiple species of shorebirds that utilize the low intertidal to forage when the tide is out.

Eelgrass is abundant in the shallow subtidal areas within PD10. Eelgrass can be found fringing the shoreline in Glorietta Bay and also extends farther into San Diego Bay on the shallow bench that extends off of Coronado Tidelands Park just north of the Coronado Bridge. There are also shallow areas of eelgrass habitat towards the mouth of San Diego Bay that are divided to the north and south by the Coronado Bridge. Eelgrass is also abundant along the First Avenue shoreline. Beyond the vegetated areas, the bottom is generally muddy and supports the common fishes and invertebrates associated with most of the Bay.

4.3.3 Laws, Regulations, Plans, and Policies

4.3.3.1 Federal

Coastal Zone Management Act of 1972

The U.S. Congress recognized the importance of meeting the challenge of continued growth in the coastal zone by passing the Coastal Zone Management Act in 1972. The act, administered by NOAA's Office of Ocean and Coastal Resource Management, provides for management of the nation's coastal resources and balances economic development with environmental conservation.

The Coastal Zone Management Act outlines two national programs. The National Coastal Zone Management Program includes 34 coastal programs that aim to balance competing water and land issues in the coastal zone. The National Estuarine Research Reserve System creates field laboratories that provide a greater understanding of estuaries and how humans affect them. The overall program objectives of the act are to "preserve, protect, develop, and where possible, to restore or enhance the resources of the nation's coastal zone."

The Coastal Zone Management Act ensures that development projects in coastal areas are designed and sited in a manner that is consistent with coastal zone land uses, maximizes public health and safety, and ensures that biological resources (e.g., wetlands, estuaries, beaches, and fish and wildlife and their habitat) within the coastal zone are protected. The California Coastal Commission enforces the Coastal Zone Management Act by certifying that any proposed project is consistent with the California Coastal Act of 1976 (as amended). The enforceable policies of the Coastal Zone Management Act are found in Chapter 3 of the California Coastal Act, which is discussed further in Section 4.3.3.2, *State*, below.

Rivers and Harbors Act (Section 10)

Pursuant to Section 10 of the Rivers and Harbors Act, the U.S. Army Corps of Engineers (USACE) is authorized to regulate any activity within or over any navigable water of the United States. Rivers and Harbors Act Section 10 jurisdiction is defined as “those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use, to transport interstate or foreign commerce” (33 Code of Federal Regulations 322). The San Diego Bay and coastal waters within the proposed PMPU area are considered traditional navigable water regulated under Section 10 of the Rivers and Harbors Act; therefore, any future work activities proposed within or over any navigable waters would require Section 10 compliance and coordination with USACE.

Endangered Species Act of 1973

Species listed as endangered and/or threatened by the USFWS are protected under Section 9 of the Federal ESA, which forbids any person to “take” an endangered or threatened species. Take is defined in Section 3 of the act as “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.” The U.S. Supreme Court ruled in 1995 that the term “harm” includes destruction or modification of habitat. Sections 7 and 10 of the Act may authorize “incidental take” for an otherwise lawful activity (a development project, for example) if it is determined that the activity would not jeopardize survival or recovery of the species. Section 7 applies to projects where a Federally listed species is present and there is a Federal nexus, such as a Federal CWA Section 404 permit (e.g., impacts on waters of the United States [WoUS]) that is required. Section 10, requiring an incidental take permit, applies when a Federally listed species is present, but there is no Federal nexus.

Magnuson-Stevens Fishery Management and Conservation Act, as amended 1996 (Public Law 104-267)

Federal agencies must consult with NOAA Fisheries on actions that may adversely affect essential fish habitat (EFH). EFH is defined as those “waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity.” NOAA Fisheries encourages streamlining the consultation process using review procedures under the National Environmental Policy Act, Fish and Wildlife Coordination Act, the CWA, and/or the Federal ESA provided that documents meet requirements for EFH assessments under Section 600.920(g). EFH assessments must include (1) a description of the proposed action, (2) an analysis of effects, including cumulative effects, (3) the Federal agency’s views regarding the effects of the action on EFH, and (4) proposed mitigation, if applicable.

Marine Mammal Protection Act of 1972

The Marine Mammal Protection Act (MMPA) of 1972 prohibits, with certain exceptions, the take of marine mammals in U.S. waters and by U.S. citizens on the high seas, and the importation of marine mammals and marine mammal products into the United States. Congress passed the MMPA based on the following findings and policies: (1) some marine mammal species or stocks may be in danger of extinction or depletion as a result of human activities, (2) these species or stocks must not be permitted to fall below their optimum sustainable population level (depleted), (3) measures should be taken to replenish these species or stocks, (4) there is inadequate knowledge of the ecology and population dynamics, and (5) marine mammals have proven to be resources of great international significance.

The MMPA was amended substantially in 1994 to provide for: (1) certain exceptions to the take prohibitions, such as for Alaska Native subsistence, and for permits and authorizations for scientific research; (2) a program to authorize and control the taking of marine mammals incidental to commercial fishing operations; (3) preparation of stock assessments for all marine mammal stocks in waters under U.S. jurisdiction; and (4) studies of pinniped-fishery interactions. Additionally, under the 1994 amendments to the MMPA, harassment is statutorily defined as any act of pursuit, torment, or annoyance that:

- Has the potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or
- Has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavior patterns, including, but not limited to migration, breathing, nursing, breeding, feeding, or sheltering but which does not have the potential to injure a marine mammal or marine mammal stock in the wild (Level B harassment).

NOAA Fisheries and USFWS administer the MMPA. The proposed PMPU must be analyzed to ensure that marine mammals protected under the MMPA would not be harassed or injured as a result of future activities in or adjacent to San Diego Bay. Any future project activities that may result in Level A or B harassment, injury, or mortality would require consultation with NOAA Fisheries and USFWS under the MMPA.

Migratory Bird Treaty Act

The MBTA was enacted in 1918 to prohibit the killing or transport of native migratory birds, or any part, nest, or egg of any such bird, unless allowed by another regulation adopted in accordance with the MBTA. A list of migratory bird species that are protected by the MBTA is maintained by USFWS, which regulates most aspects of the taking, possession, transportation, sale, purchase, barter, exportation, and importation of migratory birds. Under the MBTA, “take” means to kill, directly harm, or destroy individuals, eggs, or nests or to otherwise cause failure of an ongoing nesting effort. USFWS does not issue permits for “incidental take” of migratory birds that results from otherwise lawful activities such as construction or development projects.

Clean Water Act

The Federal Water Pollution Control Act Amendments of 1972, commonly known as the Clean Water Act (33 United States Code [USC] 1251–1376), as amended by the Water Quality Act of 1987, is the major Federal legislation governing water quality. The purpose of the CWA is to “restore and maintain the chemical, physical, and biological integrity of the nation’s waters.” Discharges into WoUS are regulated under CWA Section 404. WoUS include: (1) all navigable waters (including all waters subject to the ebb and flow of the tide); (2) all interstate waters and wetlands; (3) all other waters, such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sand flats, wetlands, sloughs, or natural ponds; (4) all impoundments of waters mentioned above; (5) all tributaries to waters mentioned above; (6) the territorial seas; and (7) all wetlands adjacent to waters mentioned above. Important applicable sections of the CWA are discussed below.

- **Section 401** requires an applicant for any Federal permit that proposes an activity that may result in a discharge into WoUS (as defined by the navigable water protection rule) to obtain certification from the State that the discharge will comply with other provisions of the CWA. Certification is provided by the respective Regional Water Quality Control Board (RWQCB).

A Section 401 certification from the San Diego RWQCB would be required for future projects if a Section 404 permit and/or Rivers and Harbor Act (Section 10) permit are required.

- **Section 404** provides for USACE issuance of permits for discharge of dredged or fill material into WoUS by Permits typically include conditions to minimize impacts on water quality. Common conditions include: (1) USACE review and approval of sediment quality analysis before dredging; (2) a detailed pre- and post-construction monitoring plan that includes disposal site monitoring; and (3) requiring compensation for loss of WoUS.

California Eelgrass Mitigation Policy

The National Marine Fisheries Service (NMFS) is an office of the NOAA and is responsible for the stewardship of the nation's ocean resources and their habitat. NMFS developed the California Eelgrass Mitigation Policy (CEMP) in order to establish and support a goal of protecting eelgrass and its habitat functions (NMFS 2014). The CEMP includes guidance on defining eelgrass habitat, surveying, mapping, assessing impacts, avoiding and minimizing impacts on eelgrass, and mitigation options. Avoidance and minimization measures included within the CEMP relate to turbidity, shading, circulation, and nutrient and sediment loading impacts. Mitigation options include comprehensive management plans, in-kind mitigation, mitigation banks and in-lieu-fee programs, and out-of-kind mitigation.

NMFS has provided this policy to other State and Federal agencies, including the California Department of Fish and Wildlife (CDFW), as guidance for handling project-related impacts on eelgrass habitat.

Caulerpa Control Protocol

In April 2021, NOAA Fisheries was notified of an invasive algae species discovered in Newport Bay, California. The algae, which is native to Florida and other subtropical and tropical locales, is scientifically known as *Caulerpa prolifera*. This is the first positive identification of *Caulerpa prolifera* on the U.S. West Coast, and is closely related to the previously eradicated *Caulerpa taxifolia*, which was previously discovered in southern California and determined to be successfully eradicated in 2006.

NOAA Fisheries believes any species of *Caulerpa* that is allowed to establish and spread within coastal areas may adversely impact local fisheries and disrupt seagrass communities important to protected species. It can grow quickly, choking out native seaweed and potentially harming marine life through lost habitat. During the previous *Caulerpa taxifolia* eradication process, the Southern California *Caulerpa* Action Team (SCCAT) was formed. This team was made up of federal, state, and local governmental agencies, scientists, consultants, and local stakeholders. NOAA Fisheries worked to reactivate the SCCAT and has been collaborating with SCCAT members to quickly identify the extent of the algae's infestation in Newport Bay. The SCCAT believed immediate action should be taken to eradicate the species, and developed the Newport Bay Rapid Response Eradication Plan (Eradication Plan). Eradication and survey efforts, consistent with the Eradication Plan, have been initiated and are ongoing.

The SCCAT developed the *Caulerpa* Control Protocol to detect existing infestations and avoid the spread of these invasive species to other systems. NOAA Fisheries and CDFW serve as the lead Federal and State agencies, respectively, for administering the *Caulerpa* Control Protocol. It outlines the certification, survey, and reporting guidelines required when surveying for all *Caulerpa* species

in California nearshore coastal and enclosed bays, estuaries, and harbors from Morro Bay to the U.S./Mexican border. These guidelines apply to any bottom disturbing activities (e.g., pile driving, dredging, etc.) as those have the potential to fragment and spread Caulerpa. NOAA Fisheries and CDFW use the Caulerpa Control Protocol, in partnership with other resource and permitting agencies, as an important tool for conserving sensitive marine ecosystems, including eelgrass beds and other benthic habitats, and the important functions they provide.

4.3.3.2 State

California Coastal Act of 1976

The California Coastal Act of 1976 recognizes California ports, harbors, and coastline beaches as primary economic and coastal resources and as essential elements of the national maritime industry. Decisions to undertake specific development projects, where feasible, are to be based on consideration of alternative locations and designs in order to minimize any adverse environmental impacts. The California Coastal Act is implemented by the California Coastal Commission (CCC). The District's currently adopted PMP was certified by CCC on January 21, 1981, and subsequently amended. The proposed PMPU involves an update to the PMP and will require certification from CCC. Upon certification of the proposed PMPU, the District would be authorized to issue Coastal Development Permits for projects within its permitting jurisdiction.

California Endangered Species Act; Fully Protected Species

The CESA establishes the policy of the State to conserve, protect, restore, and enhance threatened or endangered species and their habitats. The CESA mandates that State agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy. For projects that affect both a State- and Federally listed species, compliance with the Federal ESA will satisfy the CESA if the CDFW determines that the Federal incidental take authorization is consistent with the CESA under California Fish and Game Code Section 2080.1. For projects that would result in a take of a State-only listed species, the project proponent must apply for a take permit under Section 2081(b).

Also, California Fish and Game Code Sections 3511, 4700, 5050, and 5515 prohibit take or possession of fully protected species. Incidental take of fully protected species may be authorized only under an approved Natural Communities Conservation Plan (NCCP).

California Fish and Game Code

Other sections of the California Fish and Game Code establish the Fish and Game Commission, as authorized by Article IV, Section 20, of the Constitution of the State of California. The Fish and Game Commission is responsible, under the provisions of Sections 200–221, for regulating the take of fish and game, not including the taking, processing, or use of fish, mollusks, crustaceans, kelp, or other aquatic plants for commercial purposes. However, the Fish and Game Commission does regulate aspects of commercial fishing, including fish reduction; shellfish cultivation; take of herring, lobster, sea urchins, and abalone; kelp leases; leases of State water bottoms for oyster allotments; aquaculture operations; and other activities. These resource protection responsibilities involve the setting of recreational and commercial fishing seasons, bag and size limits, and methods and areas of take, as well as prescribe the terms and conditions under which permits or licenses may be issued or

revoked by CDFW. The Fish and Game Commission also oversees the establishment of wildlife areas and ecological reserves and regulates their use and sets policy for CDFW.

Sections 3503, 3503.5, 3505, 3800, and 3801.6 of the Fish and Game Code protect all native birds, birds of prey, and all nongame birds, including their eggs and nests, that are not already listed as fully protected and that are naturally present within the state. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptors (e.g., hawks, owls, eagles, falcons), including their nests or eggs.

CDFW is the lead State agency that manages native fish, wildlife, plant species, and natural communities for their ecological value and their benefits to people. CDFW oversees the management of marine species through several programs, some in coordination with NMFS and other agencies.

The CEMP is administered by NMFS and CDFW. The effects of a project on any surrounding eelgrass beds and any compensatory mitigation would be addressed under the CEMP.

Marine Life Protection Act

The Marine Life Protection Act of 1999 directs the state to redesign California's system of marine protected areas (MPAs) to function as a network in order to: increase coherence and effectiveness in protecting the state's marine life and habitats, marine ecosystems, and marine natural heritage, as well as to improve recreational, educational and study opportunities provided by marine ecosystems subject to minimal human disturbance. For the purposes of MPA planning, a public-private partnership commonly referred to as the MLPA Initiative was established, and the state was split into five distinct regions (four coastal and the San Francisco Bay) each of which had its own MPA planning process. All four coastal regions have completed these individual planning processes. As a result, the coastal portion of California's MPA network is now in effect statewide. Options for a planning process in the fifth and final region, the San Francisco Bay, have been developed for consideration at a future date.

Marine Life Management Act

The Marine Life Management Act (MLMA), which became law on January 1, 1999. The MLMA applies not only to fish and shellfish taken by commercial and recreational fishermen, but to all marine wildlife. The MLMA shifts the burden of proof toward demonstrating that fisheries and other activities are sustainable. Greater management authority was delegated to the Fish and Game Commission and the California Department of Fish and Wildlife. Instead of focusing on single fisheries management, the MLMA requires an ecosystem perspective including the whole environment. The MLMA strongly emphasizes science-based management developed with the help of all those interested in California's marine resources.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act is the California equivalent of the Federal CWA. It provides for statewide coordination of water quality regulations through the establishment of the State Water Resources Control Board (SWRCB) and nine separate RWQCBs that oversee water quality on a day-to-day basis at the regional/local level. The RWQCB regulates actions that would involve "discharging waste, or proposing to discharge waste, within any region that could affect the water of the state" (Water Code Section 13260(a)), pursuant to provisions of the Porter-Cologne Act.

Waters of the State (WoS) are defined as “any surface water or groundwater, including saline waters, within the boundaries of the state” (Water Code Section 13050 (e)).

The RWQCB also regulates WoS under Section 401 of the CWA, which requires states to certify that Federally-authorized activities comply with State water quality standards. A Water Quality Certification or a waiver must be obtained from the RWQCB if an activity requiring a Section 404 permit would affect WoS. In addition, pursuant to the Porter-Cologne Water Quality Control Act, the RWQCB issues waste discharge requirements for discharges to WoS for fill of wetlands and other waters that are not regulated by Section 404 of the Federal CWA.

Proposed projects must be analyzed to determine if they will result in discharges to WoS. Discharges subject to Section 404 regulation may require a Section 401 certification, and other discharges to WoS may require waste discharge requirements.

California Marine Invasive Species Act

The California Marine Invasive Species Act of 2003 renewed and expanded on the Ballast Water Management for Control of Nonindigenous Species Act of 1999 to address the threats posed by the introduction of nonindigenous species. The law charged the California State Lands Commission with oversight and administration of the State’s program to prevent or minimize the release of nonindigenous species from vessels that are 300 gross registered tons and above. To advance this goal, the commission’s Marine Invasive Species Program uses an inclusive, multi-faceted approach to develop sound, science-based policies in consultation with technical experts and stakeholders; track and analyze ballast water and vessel biofouling management practices of the California commercial fleet; enforce laws and regulations to prevent introductions; and facilitate outreach to promote information exchange among scientists, legislators, regulators, and other stakeholders.

Both the U.S. Coast Guard (Ballast Water Management) and Environmental Protection Agency (EPA) (Vessel General Permit) regulate ballast water discharges, and both agencies currently require ballast water exchange for most vessels operating in U.S. waters. In addition, California requires ballast water exchange on coastwise voyages (e.g., between Los Angeles and Oakland). However, at present, the discharge standards in California are more stringent than Federal regulations. In accordance with governing statutes and regulations, vessels have four options to comply with California’s performance standards: (1) retention of all ballast water on board, (2) use of potable water as an alternative ballast water management method, (3) discharge to a shore-based ballast water reception and treatment facility, and (4) treatment of all ballast prior to discharge by a shipboard ballast water treatment system. Performance standards for ballast water discharge are: (1) no detectable living organisms greater than 50 microns in minimum dimension, (2) fewer than 0.01 living organism per milliliter of organisms 10–50 microns in minimum dimension, and (3) multiple standards for bacteria and viruses. The performance standards for vessels with ballast water capacities of 1,500–5,000 metric tons became applicable in 2016, while standards for vessels with capacities of fewer than 1,500 metric tons and greater than 5,000 metric tons will apply in 2018.

CDFG Division 3, Chapter 3.5 §2300

All species of the genus *Caulerpa* are regulated in the state of California under CDFG Division 3, Chapter 3.5 §2300. No person shall sell, possess, import, transport, transfer, release alive in the state, or give away without consideration the salt water algae of the *Caulerpa* species: *taxifolia*.

cupressoides, mexicana, sertularioides, floridana, ashmeadii, racemosa, verticillata, and scapelliformis.

Assembly Bill 1334

It is now illegal to possess, sell, or transport *Caulerpa taxifolia* in California. Signed into law in 2001, the Assembly Bill 1334 (Harman), prohibits the possession, sale, and transport of *Caulerpa taxifolia* throughout California. This bill also establishes the same restrictions on several other species of the genus *Caulerpa* that are similar in appearance and are believed to be potentially invasive.

4.3.3.3 Local

San Diego Bay Integrated Natural Resources Management Plan

The San Diego Bay INRMP is a long-term strategy sponsored by two of the major managers of San Diego Bay: the U.S. Navy and the District. Its intent is to provide direction for the good stewardship that natural resources require while also supporting the ability of the Navy and District to meet their missions and continue functioning within the Bay. The core strategies of the plan are to (1) manage and restore habitats, populations, and ecosystem processes; (2) plan and coordinate projects and activities so that they are compatible with natural resources; (3) improve information sharing, coordination, and dissemination; (4) conduct research and long-term monitoring that supports decision-making; and (5) put in place a Stakeholder's Committee and Focus Subcommittees for collaborative, ecosystem-based problem-solving in pursuit of the goal and objectives.

The San Diego Bay INRMP also includes objectives related to the eradication of invasive species in the Bay. Specifically, Objective 4.4.1 calls for the minimization of the harmful ecological, economic, and human health impacts of aquatic invasive species in San Diego Bay. The primary sources of invasive species within San Diego Bay are ballast water and hull fouling (See Section 2.6.7.3 of the INRMP). Table 2-47 of the INRMP lists the invasive marine species found in San Diego Bay.

The proposed PMPU specifically references many District environmental initiatives including the INRMP under the Ecology Element. Other examples of District environmental programs and initiatives include the (1) Jurisdictional Runoff Management Program, (2) Regional Harbor Monitoring Program, (3) Copper Reduction Program, (4) Marine Clean Harbor Strategy, (5) Transboundary Pollution Resolution, and (6) Climate Action Plan. Each of these initiatives aims to provide for a cleaner Bay and ocean, as well as to manage the Bay and ocean to protect terrestrial and marine biological resources. This highlights the District's focus on maintaining and improving habitats, resources, and ecosystem processes. In many cases, District's policies and initiatives act in concert with the understanding of San Diego Bay resources in the INRMP to ensure protection of natural resources and prevention of impacts associated with development under the proposed PMPU.

Port of San Diego Environmental Mitigation Property (BPC Policy No. 735)

Board of Port Commissioners (BPC) Policy 735 establishes a policy for the allocation of environmental mitigation property within District Tidelands. Environmental mitigation property refers to land, water area, natural or constructed habitats, credit for the removal of shading over open water, or other assets, held in trust by the District and that could be used to offset the environmental impacts of projects. The District recognizes the demand for mitigation property

within Tidelands for capital development projects and major maintenance pursuant to the District's land-use obligation (as defined in Section 4 of the San Diego Unified Port District Act). The District also recognizes that the demand for environmental mitigation property for non-District funded projects is increasing. It is the policy of the District that property suitable for mitigation, which is held in trust by the District, will be retained for District-funded capital development and major maintenance projects. Due to the limited area of mitigation property available to the District, each project requiring mitigation shall be evaluated through an administrative procedure as described in BPC Policy No. 735 to ensure that environmental mitigation property is only used for the most appropriate project. Further, unused mitigation land and new mitigation opportunities on District Tidelands that are not encumbered by a project will be under the control of the District and will be added to the District's accounting of available mitigation property. New mitigation land or credits will be managed in accordance with the District's administrative policy for use of District Environmental Mitigation Property.

4.3.4 Project Impact Analysis

4.3.4.1 Methodology

A search of CDFW's CNDDDB, CNPS database, and USFWS IPAC was conducted on March 30, 2017, to determine the potential for sensitive plant and wildlife species to occur within the vicinity of each planning district. The search was conducted using a 9-quad species search centered on the USGS National City, California 7.5 quadrangle map (CDFW 2017) and the USGS Point Loma, California 7.5 quadrangle map, and a polygon encompassing each planning district was created using the USFWS IPAC web application tool (USFWS). A total of 44 sensitive plant species and 31 sensitive wildlife species were reviewed for their potential to occur within the proposed PMPU area.

On April 19, 2017, ICF biologists performed a terrestrial reconnaissance level survey of each planning district. The reconnaissance survey was conducted by driving and walking throughout the planning districts, noting existing habitat conditions to identify suitable habitat for sensitive terrestrial plants and wildlife and the potential for such species to occur within each planning district. Survey efforts were more focused in specific areas within planning districts where habitat was suitable and species observations have been documented.

The desktop analysis for sensitive marine species included review of sources documenting marine mammals in Southern California. The two primary sources used to determine marine mammal species present and their likelihood to occur in nearshore coastal waters or within San Diego Bay include Jefferson et al. (2014) and NAVFACSW (2016). The occurrence of marine bird species was evaluated through review of baywide avian surveys (TDI 2009, 2011). Bay habitat data and eelgrass occurrence was determined through review of the INRMP (U.S. Navy and Port 2013), the 2017 baywide eelgrass inventory (NAVFACSW and Port 2017), and the 2020 baywide eelgrass inventory (NAVFACSW 2021).

4.3.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of biological resources impacts resulting from the proposed PMPU. The determination of whether a biological resources impact would be significant is

based on the thresholds described below and the professional judgment of the District as Lead Agency supported by the recommendations of qualified personnel at ICF and MTS, all of which is based on the evidence in the administrative record.

Impacts are considered significant if the proposed PMPU would result in any of the following.

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW and USFWS.
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW, NMFS, or USFWS.
3. Have a substantial adverse effect on State or Federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
4. Result in substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites.
5. Conflict with any applicable local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, or with the provisions of an applicable adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

Underwater Noise Criteria

Noise and its potential effects on humans are discussed in Section 4.10, *Noise and Vibration*. The types of activities associated with future development projects that would generate loud noise are described in Tables 4.10-14 and 4.10-18. However, in addition to the potential effects on humans, noise may also impact wildlife. Activities such as pile driving have the potential to create adverse noise impacts on marine wildlife. Significance criteria related to fish, marine mammals, and green sea turtles are described below. For definition of noise terms and concepts, please see Section 4.10.

Fish

On June 12, 2008, NOAA's National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service, California, Oregon, and Washington Departments of Transportation, California Department of Fish and Game and the U.S. Federal Highway Administration agreed in principle to interim criteria to protect fish from pile driving activities (Table 4.3-6).

Table 4.3-6 Fish Impact Criteria

<u>Interim Criteria for Injury</u>	<u>Sound Levels Agreed in Principle</u>
<u>Peak</u>	<u>206 dB (for all size of fish)</u>
<u>Cumulative Sound Exposure Level (SEL)</u>	<u>187 dB for fish size of 2 grams or greater</u> <u>183 dB for fish size of less than 2 grams</u>

The adopted criteria listed in Table 4.3-6 are for pulse-type sounds (e.g., pile driving) and do not address sound from vibratory driving. The Sound Exposure Level (SEL) criteria are not applied to vibratory driving sounds.

Marine Mammals

Table 4.3-7 below outlines the currently adopted Level A and Level B criteria (see Marine Mammal Protection Act of 1972 in Section 4.3.3.1). The U.S. Navy has conducted ambient underwater sound measurements within the Bay that characterize the sound environment at 129.2 dB (NAVFAC SW 2020). For continuous sounds, NMFS Northwest Region has provided guidance for reporting root mean square (RMS) sound pressure levels.

Table 4.3-7 Adopted Underwater Acoustic Criteria for Marine Mammals

<u>Species</u>	<u>Underwater Noise Thresholds (dB)</u>				
	<u>Vibratory Pile Driving Disturbance Threshold (Level B Harassment)</u>	<u>Impact Pile Driving Disturbance Threshold (Level B Harassment)</u>	<u>Marine Mammal Hearing Group (see Table 4.3-8)</u>	<u>PTS SEL_{cum} Threshold</u>	
				<u>Peak – dB</u> <u>SEL_{cum} – dB</u>	
				<u>Impulsive (Impact Pile Driving)</u>	<u>Non-Impulsive (Vibratory Pile Driving)</u>
<u>Cetaceans</u>	<u>120 dB RMS (or ambient if higher)*</u>	<u>160 dB RMS</u>	<u>Low Frequency</u>	<u>219dB Peak</u> <u>183 dB SEL_{cum}</u>	<u>199 dB</u> <u>SEL_{cum}</u>
			<u>Mid Frequency</u>	<u>230 dB Peak</u> <u>185 dB SEL_{cum}</u>	<u>198 dB</u> <u>SEL_{cum}</u>
			<u>High Frequency</u>	<u>202 dB Peak</u> <u>155 dB SEL_{cum}</u>	<u>173 dB</u> <u>SEL_{cum}</u>
<u>Pinnipeds</u>	<u>120 dB RMS (or ambient if higher)*</u>	<u>160 dB RMS</u>	<u>Phocid</u>	<u>218 dB Peak</u> <u>185 dB SEL_{cum}</u>	<u>201 dB</u> <u>SEL_{cum}</u>
			<u>Otariid</u>	<u>232dB Peak</u> <u>203 dB SEL_{cum}</u>	<u>219 dB</u> <u>SEL_{cum}</u>

*Threshold is 120 dB or ambient level, whichever is highest. Ambient levels were measured by the U.S. Navy at 129.2 dB in the San Diego Bay.

Table 4.3-8. Definition of Marine Mammal Hearing Group

<u>Marine Mammal Hearing Group</u>	
<u>Functional Hearing Group</u>	<u>Functional Hearing Range</u>
<u>Low Frequency Cetaceans – gray whales</u>	<u>7 Hz to 35 kHz</u>
<u>Mid Frequency Cetaceans – dolphins, toothed whales, beaked whales, bottlenose whales</u>	<u>150 Hz to 160 kHz</u>
<u>High Frequency Cetaceans – true porpoises, <i>kogia</i>, river dolphins, cehalorhynchid, <i>lagenorhynchus cruciger</i> & <i>L. australis</i></u>	<u>275 Hz to 160 kHz</u>
<u>Phocid Pinnipeds – true seals, including harbor seals</u>	<u>50 Hz to 86 kHz</u>
<u>Otariid Pinnipeds – sea lions and fur seals</u>	<u>60 Hz to 39 kHz</u>

Green Sea Turtles

For sea turtles, the Navy established a threshold for injury from vibratory pile driving and impact driving at 190 dB RMS. Behavioral effects thresholds were noted to be more complex to establish than injury, as there is limited data on turtle behavioral response to sound. Turtles exhibit a low frequency hearing range, typically below 2 kHz. As a result, the potential for behavioral response to sound is further limited to sounds at both elevated intensity and low frequency. While there are no widely adopted behavioral thresholds for sound impacts to turtles, Table 4.3-9 includes RMS criteria for Green Sea Turtles.

Table 4.3-9. Adopted Underwater Acoustic Criteria for Green Sea Turtles

<u>Level of Effect</u>	<u>Underwater Noise Thresholds (dB re: 1µPa)</u>	
	<u>Vibratory Pile Driving Disturbance Threshold</u>	<u>Impact Pile Driving Disturbance</u>
<u>Adaptive action trigger for impulsive noise exposure</u>	--	<u>160 dB RMS</u>
<u>Potential harassment take from exposure</u>	--	<u>166 dB RMS</u>

4.3.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policies are intended to reduce or avoid impacts on biological resources and are considered in the impact analysis that follows.

WLU Policy 5.1.2 Intertidal and Conservation Open Space use designations shall be enhanced, restored, and protected as further described in ECO Goal 1 (Chapter 3.3, Ecology Element).

ECO Policy 1.1.2 The District shall prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or federally listed coastal species.

ECO Policy 1.1.3 Future development adjacent to conservation areas and other sensitive habitats shall:

- a. Be coordinated, sited, and designed to avoid impacts where feasible or where legally required; if avoiding impacts is not feasible, or avoidance is not legally required, mitigate impacts in the following order of preference:
 1. On-site;
 2. In a mitigation bank;
 3. In the same ecoregion with the Bay;
 4. Elsewhere in the Bay; or
 5. In the same watershed of the Coastal Zone;
- b. Require biological monitoring as determined by the District and/or the wildlife agencies; and
- c. When affecting disturbed sensitive habitat areas, restoration or enhancement must occur to the greatest extent feasible.

ECO Policy 1.1.5 Landside development shall establish and maintain ecological buffers of 100 feet between the landside development and a saltmarsh wetland to preserve and protect the wetland habitat for the anticipated life of the development. The precise width of the buffer is to be based on the location, type of habitat, and quality of habitat. Exceptions to the width of ecological buffers are as follows:

- a. A reduced buffer to a minimum of 50 feet may be allowed pursuant to a site-specific analysis in coordination with the wildlife agencies. The site-specific analysis may include evaluation of current habitat that is degraded, nonfunctioning, of poor quality; located immediately adjacent to existing development; or
- b. An ecological buffer shall not be required for wetland areas in an urbanized area if such buffer would cause displacement or removal of existing development.

ECO Policy 1.1.8 Development shall integrate drought-tolerant species native to the San Diego County coastal zone as a part of landscaped areas.

ECO Policy 1.1.9 Planting of invasive plant species shall be prohibited in landscaped areas. Development that contains landscaped areas with existing invasive species shall not continue to maintain these invasive species and shall prepare a plan to remove the invasive species.

ECO Policy 1.1.10 Development above the water or adjacent to sensitive habitat areas should use ecologically sensitive lighting that is shielded and directed away from the water or sensitive habitat areas, sensor activated, and of the lowest possible color temperature that also meets public safety requirements.

ECO Policy 1.1.11 The District shall encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems, and to reduce stormwater pollution to the Bay.

ECO Policy 1.1.12 Science-based management practices shall be used on Tidelands to guide water, sediment, and natural resource decisions.

ECO Policy 1.1.13 The District shall identify locations throughout the Bay that could support habitat enhancement, restoration, creation, and protection to benefit sensitive habitats and State and federally listed species. After specific locations are identified, the District shall:

- a. Explore opportunities for specific restoration, creation, enhancement, and mitigation banking projects in these areas; and
- b. Coordinate with resource agencies and regulatory agencies to permit projects that provide multiple benefits to Tideland areas.

ECO Policy 1.1.14 Strive to achieve a net increase of wetland habitat acreage throughout the Bay from baseline conditions throughout the Bay from certification of this Plan.

ECO Policy 1.1.15 The District shall identify various ecological opportunity areas within water use designations that have shallow subtidal or intertidal habitat that may benefit from additional restoration or enhancement, or additional nature-based shoreline solutions including shoreline stabilization. (refer to Figure 3.3.2 *Ecological Opportunity Areas* for an identification of approximate locations for initial ecological opportunity areas).

ECO Policy 1.1.16 The District shall provide information to the public about the water quality risks associated with invasive species and about measures to avoid and reduce the spread of invasive species.

ECO Policy 1.1.17 The District shall prioritize the use of nature-based solutions composed of natural or sustainable materials that increase shoreline biodiversity and coastal resiliency, including but not limited to living shorelines and wetland and coastal habitat restoration, where feasible and applicable.

ECO Policy 1.1.18 Coastal flooding Adaptation strategies or other natural resource management practices shall be implemented to protect coastal habitats and ecosystem function under a range of future sea level rise and climate change scenarios.

ECO Policy 1.1.19 Support creative and innovative solutions to improve the resiliency of the Bay's marine ecosystems and the biodiversity within Tidelands.

ECO Policy 1.1.20 Restoration of historic losses of natural habitat acreages may be, to the extent feasible, part of the sea level rise adaptation and mitigation strategies.

ECO Policy 1.1.21 The District shall maximize habitat connectivity and continuity for intertidal and subtidal habitats within the Bay particularly for those areas that provide habitat and nursery areas for estuarine and marine species.

ECO Policy 1.1.22 The District shall strive to conserve and enhance intertidal and subtidal habitat in an effort to reduce fragmentation, improve habitat functionality and create a connected network of intertidal and subtidal habitat throughout Tidelands.

ECO Policy 1.1.23 The District shall pursue opportunities to create, preserve, enhance or restore intertidal and subtidal habitats in areas that have historically been impacted by development.

ECO Policy 1.2.1. In cooperation with regional, State, and federal resource agencies, the District shall develop a mitigation credit program, subject to agency approval, to improve habitat quality and compensate for unavoidable wetland losses through the protection, restoration, and creation, ~~and enhancement~~ of wetland habitats as follows:

- a. The mitigation credit program may consist of the creation of, or use of mitigation banks, in-lieu fee programs, eelgrass mitigation areas or other mitigation offset measures on Tidelands. With respect to future and existing mitigation credits, use of credits shall be given priority in the order listed below for the following types of development:
 1. District led and initiated development on Tidelands;
 2. Coastal-dependent development on Tidelands by a third-party applicant;
 3. Coastal development on Tidelands that provides a public benefit; or
 4. Other development.

Credits derived from restoring ~~or enhancing~~ tidally influenced habitat shall first be used to mitigate impacts on tidally influenced waters or wetlands, ~~whenever~~ feasible.

- b. As part of the application process to use such credits, third-party applicants must demonstrate that they have used good-faith efforts to minimize development impacts, and, to the extent feasible, mitigate within the same development site. After demonstration of a mitigation need, applicants shall pay a fee for use of credits as established by the District. District approval is required for the right to use any of the credits.

ECO Policy 2.1.4 Aquaculture, as interpreted by the California Department of Fish and Wildlife, is encouraged in Tidelands areas using species and sustainable practices in accordance with California Department of Fish and Wildlife processes and that do not degrade surrounding natural resources and minimize substantial environmental impacts. Future aquaculture operations may be subject to additional regulatory requirements, such as project- or site-specific monitoring and reporting.

ECO Policy 2.1.5 The District shall continue to conduct, or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay.

ECO Policy 4.1.1 The District shall establish and continue partnerships and collaboration with key agencies and stakeholders, including the U.S. Navy and U.S. Fish and Wildlife Service refuges, adjacent disadvantaged communities, relevant indigenous communities and tribes to enhance conservation, protection, and restoration of natural resources in and around the Bay and Tidelands. These partnerships may include combining resources and identifying complementary programming and policies to be implemented to improve the ecology of the Bay.

ECO Policy 4.1.2 The District shall coordinate watershed planning, pollution prevention, and stormwater program implementation with other partner agencies and jurisdictions.

ECO Policy 4.1.3 The District shall ~~pursue~~ establish and continue partnerships with regulatory agencies, research institutions, private parties, and nongovernmental organizations (NGOs) to improve water quality in the Bay and promote public awareness and understanding of water quality issues.

ECO Policy 4.1.4 The District shall engage with regulatory agencies on coastal resiliency measures to address potential future environmental stressors, such as seawater intrusion, habitat conversion, and ocean acidification.

ECO Policy 4.2.1 The District shall establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources and how to protect them.

4.3.4.4 Project Impacts and Mitigation Measures

Threshold 1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW and USFWS?

Impact Analysis

Impacts of Water and Land Uses

As described under Section 4.3.3, *Laws, Regulations, Plans, and Policies*, there are numerous Federal, State, and local laws, regulations, plans, and policies that help reduce impacts on candidate, sensitive, or special-status species from development projects. These would apply to any future site-specific projects proposed consistent with the PMPU. Such laws, regulations, policies, and plans include the following.

- **The Federal Endangered Species Act** forbids any person to “take” an endangered or threatened species. Take is defined in Section 3 of the act as “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.” The U.S. Supreme Court ruled in 1995 that the term “harm” includes destruction or modification of habitat.
- **The Migratory Bird Treaty Act** prohibits the killing or transport of native migratory birds, or any part, nest, or egg of any such bird.
- **The Federal Water Pollution Control Act Amendments of 1972**, commonly known as the CWA (33 USC 1251–1376), as amended by the Water Quality Act of 1987, is the major Federal legislation governing water quality. The purpose of the CWA is to “restore and maintain the chemical, physical, and biological integrity of the nation’s waters.” Diminished water quality can impact some species identified as a candidate, sensitive, or special-status species.
- **The Marine Mammal Protection Act (MMPA)** of 1972 with amendments in 1994 prohibits and establishes definitions relative to harassment of marine mammals.
- **The California Endangered Species Act (CESA)** establishes the policy of the State to conserve, protect, restore, and enhance threatened or endangered species and their habitat. CESA mandates that State agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy.
- **The Porter-Cologne Water Quality Control Act** provides for statewide coordination of water quality regulations through the establishment of the State Water Resources Control Board (SWRCB) and nine separate RWQCBs that oversee water quality on a day-to-day basis at the regional/local level.
- **The California Fish and Game Code** regulates the take of fish and game. The California Department of Fish and Wildlife also designates some species as protected regardless of State or Federal endangered species listing status.

Construction

Approval of the plan would not directly result in any specific construction project, including the construction of any buildings or infrastructure. Future development ~~included within~~ contemplated for the planned improvements ~~and planning districts’ Visions~~, as well as future development that is consistent with the goals, objectives, ~~and policies~~, visions, and water and land uses of the proposed PMPU, ~~including the applicable water and land uses of the proposed PMPU~~, will occur over the 2050 planning horizon. As an example, buildout of the proposed PMPU may include the construction of new hotels and lower cost accommodations; restaurants and entertainment venues; park space and promenades; retail, convention, and meeting space; office space; and other uses that either are water dependent or help to enhance the waterfront experience. In-water uses could include aquaculture, marine technology, additional vessel activity associated with more slips, and docks with waterside uses that include anchorage, commercial fishing berthing, industrial and deep-water berthing, marine services berthing, navigation corridors, recreational berthing, sportfishing berthing facilities, and mitigation banks. Although implementation of the proposed PMPU would increase the construction activity in the proposed PMPU area, the buildout of the proposed PMPU would take place over a 30-year timeframe, and construction activities would occur periodically throughout that period.

Marine Resources

In general, construction activities from implementation of the proposed PMPU would potentially cause construction-induced noise, increases in turbidity and sediment disturbance, and release of particulates and chemicals of concern into U.S. or State waters. A discussion of each of these potential construction-related impacts is provided below.

Construction-Induced Noise Impacts on Marine Resources

The demolition and construction necessary for future development projects could result in construction-induced noise impacts that could alter the behavior of protected species. These impacts could occur from overwater construction activities such as hammering, drilling, operation of heavy construction equipment, or unloading building materials. Construction-induced noise impacts from in-water construction activities such as pile driving, dredging, and pile removal could disrupt the foraging behavior of the California least tern if construction occurs during the California least tern nesting season. Other sensitive fish-foraging avian species such as brown pelican can similarly be impacted. Therefore, impacts are considered significant (**Impact-BIO-1**). Construction noise can also impact species protected under the MBTA and California Fish and Game Code. For instance, marine-dependent avian species such as the black-crowned night heron nest in trees near shore where their nesting activities could be disturbed by both landside and overwater construction noise. Disturbance can cause nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success. Therefore, construction-induced noise impacts on protected marine-dependent species are considered significant (**Impact-BIO-2**).

Furthermore, in-water construction activities associated with future site-specific projects could generate enough underwater noise to physically injure marine mammals, sea turtles, and fishes during construction, by the use of an impact hammer or vibratory pile driving.

When a pile driving hammer strikes a pile, a pulse is created that propagates through the pile and radiates sound into the water, the ground, and the air. Sound pressure pulse as a function of time is referred to as the waveform. In terms of acoustics, these sounds are described by the peak pressure, the root-mean-square pressure (RMS), and the sound exposure level (SEL). The peak pressure is the highest absolute value of the measured waveform and can be a negative or positive pressure peak.

SEL is an acoustic metric that provides an indication of the amount of acoustical energy contained in a sound event. For pile driving, the typical event can be one pile driving pulse or many pulses such as pile driving for one pile or for one day of pile driving. Typically, SEL is measured for a single strike and a cumulative condition. The cumulative SEL associated with the driving of a pile can be estimated using the single strike SEL value and the number of pile strikes.

Any noise-related impacts would be dependent on the type of activity being performed and the biology of the considered species. In-water impact hammering or vibratory pile driving activity by comparison could potentially generate enough underwater noise to injure (Level A Harassment) or alter behavior (Level B Harassment) for marine mammals, green sea turtles, and fishes (See Tables 4.3-6, 4.3-7, and 4.3-9 for related noise criteria). Impacts are therefore considered significant (**Impact-BIO-3**).

Construction Noise Mitigation Measures for Marine Resources

Mitigation measures for reducing noise-related impacts on foraging California least tern and other sensitive fish feeding avian predators during the nesting season (**Impact-BIO-1**) include

construction monitoring during the nesting season from April 1 to September 15 by a qualified biological monitor, and evaluation of construction noise and location relative to sensitive avian species by a qualified biologist (**MM-BIO-1**). Based on the evaluation of the disturbance(s), the monitor will have the ability to reduce or temporarily stop noise-producing activities if those activities are assessed to impact, or otherwise alter, the foraging behavior of sensitive avian species, during the nesting season. Implementation of **MM-BIO-1** would reduce impacts on foraging California least terns and other sensitive fish feeding avian predators during the nesting season to less than significant. Mitigation measure **MM-BIO-1** achieves this by minimizing the effects of noise-producing activities that could alter foraging behavior.

Disturbance of sensitive nesting marine-dependent avian species (**Impact-BIO-2**) can be minimized by ensuring that nesting bird behavior is not modified during construction activities that generate loud noises or vibrations. The District would require future project proponents to retain a qualified biologist who would perform a nesting bird survey within 500 feet of the noise-generating activity, 1 week prior to the start of construction that utilizes heavy equipment. If nests are found, the project proponent would delineate an exclusion zone around the nest, and perform a survey once per week during construction until use of heavy equipment ceases (**MM-BIO-2**). If noise levels are determined to be 10 A-weighted decibels (dBA) or greater above ambient background noise levels within the vicinity of an active nest by a qualified biologist, sound barriers to reduce the noise to less than a 10 A weighted dBA, with a minimum sound transmission class (STC) rating of 28 would be placed between the noise-generating activity and the nest to reduce noise levels. Distance from the nest would be determined by the qualified biologist based on the species nesting and the noise acceptability exhibited by the birds. If noise effects cannot be minimized, construction would be altered to the extent necessary to ensure that impacts on the nesting species are negligible in a manner determined by the District and based on the opinion of the qualified biologist and/or guidelines and standards established by a District-approved project-specific nesting bird plan. Implementation of **MM-BIO-2** would reduce impacts on nesting avian species to less than significant by implementing the aforementioned measures to minimize noise impacts on active nests.

Potential impacts on marine mammals, fishes, and green sea turtles (**Impact-BIO-3**) can be minimized by implementing the various measures required under **MM-BIO-3**. This mitigation measure requires monitoring of hauled out marine mammals whenever noise-generating activities are in excess of 90 decibels (dB) root mean square (RMS) for harbor seals and 100 dB RMS for non-harbor seals (sea lions) at the haul out locations or if the haul out is within 500 feet of the noise source. These criteria are established by NOAA NMFS as noise levels for Level B harassment (behavior alteration) of marine mammals when those mammals are hauled out. Protecting marine mammals against Level B harassment when hauled-out also ensures protection against Level A harassment (injury). If marine mammals are hauled out within the zone where sound thresholds are exceeded, then the biological monitor will notify the contractor to halt or alter the noise-generating activity such that construction noise is at or below 90dB RMS or 100 dB RMS for harbor seals and non-harbor seals, respectively.

For future site-specific development projects that generate in-water noise such as pile driving, the biological monitor will monitor for marine mammals within isopleth distances calculated to be within the range of sound thresholds established by NOAA NMFS for Level A and Level B harassment of marine mammals (NMFS 2018). Like monitoring for hauled-out animals, the biological monitor will have the authority to halt or modify work based on animal observations relative to monitored isopleths. Green sea turtles will be monitored using the maximum calculated isopleth for Level B

harassment of marine mammals, typically 500 feet; there is no specific guidance for sea turtles, but they are often monitored alongside marine mammals to ensure their protection.

In addition, future site-specific development projects where impact and/or vibratory pile driving occur would utilize a soft start for pile driving. This generally means performing three pile strikes at reduced (approximately 50%) force, then waiting 30 seconds. This is repeated three times before starting pile driving at full force. This measure provides time for marine mammals, green sea turtles, and fishes to disperse from the sound source area in the event the sound is a source of stress for the animal. Moreover, MM-BIO-3 would include monitoring for signs of harm to fish from pile driving activities, consistent with the interim criteria to protect fish from pile driving activities (Table 4.3-6) with the authority to stop work if signs of harm to fish are observed including breaking the surface. Therefore, implementation of **MM-BIO-3** would reduce impacts to less than significant.

Construction Water Quality Impacts on Marine Resources

Construction activities associated with future projects consistent with the proposed PMPU could increase levels of turbidity in waters within the Bay in the absence of regulations. Increases in turbidity as the result of landside construction and demolition activities could be generated by exposed soils entering WoUS during rainfall events. In general, increased turbidity could limit the ability of California least terns and other sensitive fish-foraging avian species to locate prey. Additionally, construction activities for future development projects would also potentially result in impacts on protected species by the inadvertent introduction of pollutants such as fuel, oil, and/or other industrial and mechanical fluids into WoUS, either from construction equipment, landside construction vehicles, or construction vessels, ~~and from partially completed overwater structures.~~

The above potential construction-related stormwater impacts would be less than significant given compliance with regulations that require and manage the implementation of best management practices (BMPs) during construction. The District's Jurisdictional Runoff Management Program outlines the required minimum BMPs for all construction projects within the District's jurisdiction. Construction activities proposed consistent with the proposed PMPU that would disturb more than 1 acre of land would be required to comply with the Construction General Permit, which would require development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) by a Qualified SWPPP Developer. The SWPPP would identify what construction BMPs would be implemented in order to protect stormwater runoff and include a monitoring plan for measuring BMP effectiveness. BMPs are required to be inspected regularly by a Qualified SWPPP Practitioner to ensure BMPs are performing as anticipated. For projects that are not subject to the Construction General Permit (i.e., under 1 acre of land disturbance), PMPU construction activities would still need to comply with the District's Jurisdictional Runoff Management Program (JRMP), which requires preparation of a Construction BMP Plan. Under either the SWPPP or Construction BMP Plan, a variety of construction BMPs would be required to be implemented throughout the various construction phases to protect water quality.

At a minimum, BMPs would include practices to minimize the contact of construction materials, equipment, and maintenance supplies (e.g., fuels, lubricants, paints, solvents, adhesives) with stormwater. The construction SWPPP or Construction BMP Plan would specify properly designed, centralized storage areas that keep these materials away from rain and associated runoff. When grading is conducted during the rainy season, the primary BMPs selected would focus on erosion control (i.e., keeping sediment in place) and then on sediment control (i.e., keeping sediment on site). Measures would include a range of stormwater control BMPs for example, installing erosion

control such as silt fences, staked fiber rolls, and geofabric to prevent silt runoff to storm drains or waterways. Topsoil and backfill would be stockpiled, protected, and replaced at the conclusion of construction activities. Disturbed soil would be revegetated as soon as possible with the appropriate selection and schedule for turf, plants, and other landscaping vegetation. Compliance with these regulatory requirements would ensure that this potential impact would be less than significant. Please see Section 4.8, *Hydrology and Water Quality*, for more details.

Temporary increases in turbidity could also result from waterside construction activities that involve bottom sediment disturbance. This could occur during activities such as pile driving, pile removal, dredging, incidentally-accidentally during vessel contact with bottom substrate, and by propeller wash in shallow water (see **Impact-WQ-1** in Section 4.8, for a discussion of water quality impacts from turbidity). Pile driving, pile removal, and dredging are regulated under the Clean Water Act (CWA). As such, a Section 404 permit would be required from the USACE for any fill or dredging activities and the RWQCB would review the project for compliance with the CWA before issuing a Section 401 certification. The certification would include a list of mandatory conditions related to water quality.

In general, however, increased turbidity could limit the ability of California least terns and other sensitive fish-foraging avian species to locate prey. Additionally, disruption to eelgrass can occur due to increased turbidity. Prolonged increases in turbidity can reduce primary productivity associated with eelgrass because the turbid water prevents sunlight from reaching this primary producer and sensitive species. These impacts are considered significant (**Impact-BIO-4**).

As discussed in Section 4.3.3.2, the California Marine Invasive Species Act of 2003 renewed and expanded on the Ballast Water Management for Control of Nonindigenous Species Act of 1999 to address the threats posed by the introduction of nonindigenous species. The law charged the California State Lands Commission with oversight and administration of the State's program to prevent or minimize the release of nonindigenous species from vessels that are 300 gross registered tons and above. To advance this goal, the commission's Marine Invasive Species Program uses an inclusive, multi-faceted approach to develop sound, science-based policies in consultation with technical experts and stakeholders; track and analyze ballast water and vessel biofouling management practices of the California commercial fleet; enforce laws and regulations to prevent introductions; and facilitate outreach to promote information exchange among scientists, legislators, regulators, and other stakeholders.

Both the U.S. Coast Guard (Ballast Water Management) and Environmental Protection Agency (EPA) (Vessel General Permit) regulate ballast water discharges, and both agencies currently require ballast water exchange for most vessels operating in U.S. waters. In addition, California requires ballast water exchange on coastwise voyages (e.g., between Los Angeles and Oakland). However, at present, the discharge standards in California are more stringent than Federal regulations. In accordance with governing statutes and regulations, vessels have four options to comply with California's performance standards: (1) retention of all ballast water on board, (2) use of potable water as an alternative ballast water management method, (3) discharge to a shore-based ballast water reception and treatment facility, and (4) treatment of all ballast prior to discharge by a shipboard ballast water treatment system. Performance standards for ballast water discharge are: (1) no detectable living organisms greater than 50 microns in minimum dimension, (2) fewer than 0.01 living organism per milliliter of organisms 10–50 microns in minimum dimension, and (3) multiple standards for bacteria and viruses. The performance standards for vessels with ballast water capacities of 1,500–5,000 metric tons became applicable in 2016, while standards for vessels

with capacities of fewer than 1,500 metric tons and greater than 5,000 metric tons became applicable in 2018.

~~Landside Construction Water Quality Mitigation Measures for Marine Resources~~

Construction water quality mitigation measures provide means to limit turbidity, nutrient, and pollution impacts during project construction events. Mechanisms generally include being responsive to spill events, maintaining barriers to prevent the spread of spills, and implementing mechanisms to control the flow of contaminated runoff into the Bay.

Impacts associated with turbidity increases in the Bay from landside runoff (**Impact-BIO-4**) can be reduced by controlling water contact with exposed soils and maintaining clean worksites (**MM-BIO-4**). Stockpiles of soils to be removed or stored for use on a given jobsite would be covered with impermeable barriers and held down with gravel bags to prevent rainwater from washing exposed soils into the Bay. Exposed landscape soils would utilize straw wattles as necessary to prevent erosion and transport of soils into the Bay. Finally, jobsites would be swept daily to remove soil and particulates from impermeable surfaces so that those materials do not enter the storm drain system. Implementation of **MM-BIO-4** would reduce impacts to less than significant.

Turbidity generated by in-water construction activities (**Impact-BIO-4**) can be reduced by implementing various measures required under **MM-BIO-4**. These include contractor education and implementation of BMPs during in-water construction. Vessel operators would be instructed regarding the impacts of propeller wash with regards to the movement of sediment and suspension of fine particulates; this will allow vessel operators to adjust operations when possible in ways that lessen impact. All vessels would be required to use depth sounders or mapping with tidal heights that are routinely checked to ensure vessels are positioned to avoid shallow water areas. Finally, when construction involves necessary bottom disturbance such as dredging or pile driving, silt curtains would be in place around the activity to limit the spread of any turbidity generated during the bottom-disturbing activity. In addition to **MM-BIO-4**, implementation of **MM-WQ-1** through **MM-WQ-3**, as described in Section 4.8, would also address potential water quality impacts on marine resources by requiring monitoring of turbidity, implementation of BMPs, and application of silt curtains during construction-related sediment disturbance. As such, implementation of **MM-BIO-4** and **MM-WQ-1** through **MM-WQ-3** would reduce impacts to less than significant. Potential impacts associated with turbidity and bottom disturbance that might reduce the extent of eelgrass habitat are identified under Threshold 2 (refer to **Impact-BIO-10**) and the associated mitigation measures are provided as **MM-BIO-10**.

Construction Overwater Cover Impacts on Marine Resources

In-water construction activities associated with the installation of new, overwater berthing structures (i.e., vessel slips) for recreational and commercial vessels, along with the potential future implementation construction of PMPU allowable uses, such as Marine Technology, that would result in temporary overwater coverage. Temporary overwater cover from barges and other construction vessels during waterside construction of future projects could temporarily impact California least tern and other fish-foraging species by limiting available open water area for foraging. While temporary, this impact would be significant in cases where vessels cover productive nearshore waters for extended periods of time (i.e., greater than 30 days) (see **Impact-BIO-7** as discussed under *Operation* below).

Construction Overwater Cover Mitigation Measures for Marine Resources

Construction-related overwater cover impacts can be reduced if vessels, equipment, and structures are not left staged for prolonged periods of time (**MM-BIO-7**). Any barges with equipment or supplies would not be left anchored at a jobsite for more than 30 days, unless they are actively engaged in construction and required to maintain a specific position during that construction. In cases where floating structures, such as docks are to be installed, the new dock structures would only be ~~deliver~~ installed to the construction site once the old docks have been removed and the piles are installed. ~~Dock structures would not be staged and maintained overwater while waiting to be installed.~~ Similarly, removed dock structures would be taken away from the project site for disposal within 1 week of removal. Implementation of **MM-BIO-7** would reduce impacts to less than significant.

Terrestrial Resources

As discussed in Section 4.3.2.6, *Special-Status Species*, and shown in Table 4.3-3, several sensitive terrestrial plant and wildlife species have the potential to occur within the proposed PMPU area based on habitat and potential foraging opportunities. Several sensitive plant species were identified as either occurring or having potential to occur within the dune habitat in PD9. However, no landside development under the proposed PMPU would occur within PD9 that could impact the planning district's dune habitat. Therefore, potential impacts on sensitive plants from future PMPU-related construction activities would be less than significant.

The California least tern is both a Federally and State-listed endangered species under the ESA and CESA, respectively. Western snowy plover, Ridgway's rail, gull-billed tern, black skimmer, and Belding's savanna sparrow are protected under the MBTA, the ESA, and/or CESA. Future construction projects have the potential to impact ~~nesting~~ the behavior of these species during the nesting season from the generation of noise, dust, or nighttime lighting from construction activity, which could impede the use of breeding sites during the general avian nesting season (February 15 through August 31). Therefore, potential impacts on nesting opportunities for these species from future PMPU-related construction activities would be significant (**Impact-BIO-5**).

Additionally, a number of common avian species that are protected under the MBTA and California Fish and Game Code, have the potential to nest in existing trees and shrubs or on existing human-made structures (e.g., roofs, rafters) throughout the proposed PMPU area. The MBTA prohibits the take of nearly all native bird nests. Under the MBTA, "take" means to kill, destroy, or directly harm individuals, eggs, or nests. Similar provisions within the California Fish and Game Code (Sections 3503 and 3503.5) protect all nesting native birds and all non-game birds that occur naturally in the state (Section 3800). Removal of existing trees, demolition of existing structures, and construction activities in all planning districts in the proposed PMPU area could result in significant direct impacts on active nests or indirect impacts through construction noise, dust, or nighttime lighting (**Impact-BIO-5**). Mitigation measure **MM-BIO-5** requires implementation of measures such as BMPs, preconstruction nesting bird surveys, and the establishment of no-disturbance buffers should active nests be detected. Implementation of **MM-BIO-5** would reduce potential impacts on nesting birds (**Impact-BIO-5**) to less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, *Project Description*, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine and terrestrial species (**Impact-BIO-1** through **Impact-BIO-5**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Because Option 1 would involve landside construction activities involving hammering, drilling, operation of heavy construction equipment, or unloading building materials, construction-induced noise impacts from landside construction activity could impact species protected under the MBTA and California Fish and Game Code. For instance, avian species such as the black-crowned night heron nest in trees near shore, and a number of common avian species protected under the MBTA and California Fish and Game Code nest in existing trees and shrubs or on existing human-made structures (e.g., roofs, rafters), where their nesting activities could be disturbed by construction noise. Disturbance can cause nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success. Therefore, impacts are considered significant (**Impact-BIO-2**). In addition, species that are protected under the MBTA and California Fish and Game Code have the potential to be impacted by the removal of existing trees, demolition of existing structures, and construction activities under Option 1, and these construction activities could be considered significant direct impacts on active nests or indirect impacts through construction noise, dust, or nighttime lighting (**Impact-BIO-5**). However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Options 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine and terrestrial species (**Impact-BIO-1** through **Impact-BIO-5**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would involve landside construction activities involving hammering, drilling, operation of heavy construction equipment, or unloading building materials; and construction-induced noise impacts from landside construction activity. Construction noise can impact species protected under the MBTA and California Fish and Game Code. For instance, marine dependent avian species such as the black-crowned night heron nest in trees near shore where their nesting activities could be disturbed by construction noise. Disturbance can cause nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success. Therefore, impacts are considered significant (**Impact-BIO-2**). In addition, a number of common avian

species that are protected under MBTA and California Fish and Game Code have the potential to nest in existing trees and shrubs or on existing human-made structures (e.g., roofs, rafters) throughout the proposed PMPU area, including PD3. Similar provisions within the California Fish and Game Code (Sections 3503 and 3503.5) protect all nesting native birds and all non-game birds that occur naturally in the state (Section 3800). Removal of existing trees, demolition of existing structures, and construction activities under Option 2 could result in significant direct impacts on active nests or indirect impacts through construction noise, dust, or nighttime lighting, and are considered a significant impact (**Impact-BIO-5**). However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine and terrestrial species (**Impact-BIO-1** through **Impact-BIO-5**). These significant impacts would still occur within PD3 under Option 3, as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would involve landside construction activities involving hammering, drilling, operation of heavy construction equipment, or unloading building materials; and construction-induced noise impacts from landside construction activity could impact species protected under the MBTA and California Fish and Game Code. For instance, marine dependent avian species, such as the black-crowned night heron, nest in trees near shore where their nesting activities could be disturbed by construction noise. Disturbance can cause nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success. Therefore, impacts are considered significant (**Impact-BIO-2**). In addition, a number of common avian species such as mourning dove, house finch, and black phoebe, which are protected under MBTA and California Fish and Game Code, have the potential to nest in existing trees and shrubs or on existing human-made structures (e.g., roofs, rafters) throughout the proposed PMPU area, including PD3. Similar provisions within the California Fish and Game Code (Sections 3503 and 3503.5) protect all nesting native birds and all non-game birds that occur naturally in the state (Section 3800). Removal of existing trees, demolition of existing structures, and construction activities under Option 3 are considered significant direct impacts on active nests or indirect impacts through construction noise, dust, or nighttime lighting (**Impact-BIO-5**). However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Option 3.

Operation

Buildout of the proposed PMPU would result in the future development of visitor-serving uses such as hotels, restaurants, and retail, in addition to marine technology. While several planning districts would experience little to no growth or new development, PD2 and PD3 are proposed to allow substantial development, and thus would have the potential to result in impacts on terrestrial and marine biological resources. In-water activity would increase as a result of additional recreational slips in PD2, PD3, PD9, and PD10, and commercial slips would increase in PD3. The proposed PMPU could lead to future development that would result in operational activities both on land and in the water. These operational impacts are described below.

Marine Resources

Operational impacts on marine resources could include the entry of harmful chemicals into WoUS, increases in turbidity from runoff, nutrient loading of marine waters from fertilizers used to maintain landscape vegetation, overwater cover impacts from permanent overwater structures, and increased susceptibility of protected avian species to predation from raptors and other large predatory birds. A discussion of each of these potential operation-related impacts is provided below.

Operational Water Quality Impacts on Marine Resources

Operation of future development could result in the introduction of pollutants such as fuel and oil from vessels and vehicles, and/or other industrial and mechanical fluids, as well as fertilizers used for landscaping. These pollutants could enter WoUS directly or indirectly through subsequent rainfall events. Once introduced to the Bay they could then enter the food chain and ultimately be ingested by fish and invertebrates preyed upon by protected species. Fertilizers can cause plankton blooms and increase the risk for both toxic algal blooms and eutrophic conditions that could suffocate marine fish and invertebrates.

The implementation of permanent BMPs would reduce water quality impacts associated with operation of landside and marina development to less than significant. Future development allowed under the proposed PMPU would be required to comply with the District's Stormwater Management and Discharge Control Ordinance (i.e., Article 10) and the JRMP, which include specific requirements for all development and redevelopment activities. Minimum BMPs consistent with the District *BMP Design Manual* require the use of site design BMPs and source control BMPs for all projects. The District's Article 10 also specifically requires pollutant control BMPs for all Priority Development Projects (PDPs), which includes projects falling under the proposed PMPU. Any project considered a PDP would be required to implement pollutant control BMPs, following the hierarchy described in the District's *BMP Design Manual* (retention, partial retention with biofiltration, biofiltration, or flow-through with participation in an Alternative Compliance Program). Stormwater pollutant control BMPs are engineered facilities that are designed to retain (i.e., intercept, store, infiltrate, evaporate, and evapotranspire), biofilter, and/or provide flow-through treatment of stormwater runoff generated on the project site. Additionally, a post-construction Stormwater Quality Management Plan (SWQMP) must be prepared for all projects to identify the project-specific site design and source control BMPs (all projects) and pollutant control BMPs (for PDPs). All future proposed new marina development projects are required to have vessel pump out facilities to protect water quality. Compliance with these regulatory requirements would ensure that this potential impact would be less than significant. Please see Section 4.8 for more details.

Aquaculture within the proposed PMPU area allows for the cultivation of shellfish and seaweed. Aquaculture, particularly shellfish and seaweed aquaculture, offer multiple co-benefits, such as fisheries enhancement, ecosystem restoration, bioremediation, carbon sequestration, mitigation banking, and habitat enhancement and otherwise improving water quality by removing particulates and increasing ecosystem productivity. Notably, shellfish aquaculture has been shown to perform a similar ecological function as other structured habitats such as eelgrass, generating increased benthic and epibenthic invertebrate abundance (Hosack et al. 2006), an ecological benefit that is also recognized by the NMFS (2016).

However, if viewed in the context of available fish habitat and forage, shellfish operations compete with natural populations of fish and invertebrates that consume plankton and organic particles and limit foraging opportunities for coastal pelagic fish species. For example, Pacific sardine and

northern anchovy feed on the same small planktonic organisms that shellfish would feed on. Therefore, the introduction of shellfish for the purpose of aquaculture could impact essential fish habitat and associated managed species through the potential reduction of foraging opportunities. Additionally, benthic impacts of shellfish aquaculture can result from the presence of gear and equipment, shell debris, and the accumulation of pseudofeces or fouling organisms due to natural processes and dependent upon culture methods. Collectively, these impacts are considered significant (**Impact-BIO-6**). To mitigate this potential impact, **MM-BIO-6** requires future project proponents to develop and implement a Shellfish Aquaculture Mitigation Plan ~~program~~ that includes specific requirements for addressing potential impacts on essential fish habitat and benthic communities from shellfish aquaculture operations. Implementation of **MM-BIO-6** would reduce **Impact-BIO-6** to less than significant.

Operational Overwater Cover and Shading Impacts on Marine Resources

The operational impacts associated with overwater cover could be introduced by future site-specific projects consistent with the proposed PMPU. Shading of water area can be introduced by structures on-shore, dependent upon proximity, size, and solar aspect. The installation and use of overwater structures would result in a permanent reduction of potential open water foraging habitat for California least tern and other sensitive fish-foraging species. The overwater coverage also leads to lower eelgrass productivity due to shading if the overwater coverage is above eelgrass. Similarly, structures on shore that increase shading of water area could lower eelgrass productivity where eelgrass is shaded. The effect would increase as the structure gets closer to the water and as the height of the structure increases. Additionally, solar aspect would influence the level of impact. Structures that face the sun to the south with water to the north would result in a greater temporal or seasonal impact from shading. The shading of eelgrass can have impacts at multiple levels. Shading may directly reduce the areal extent of eelgrass and or the density of eelgrass beds. Secondly, the loss of eelgrass production can impact organisms that use the eelgrass for shelter or food. The effect extends to organisms at higher feeding levels that may not directly utilize eelgrass but that feed on the animals that utilize eelgrass as a resource. The lost eelgrass productivity affects all higher trophic levels due to the lost production of organic carbon. These impacts are considered significant (**Impact-BIO-7**). Shading impacts on marine habitats that include eelgrass are discussed under Threshold 2 (**Impact-BIO-11**) and mitigation measures for eelgrass habitat impacts are also provided under Threshold 2 in **MM-BIO-10**.

Operational Overwater Cover Mitigation Measures for Marine Resources

Overwater cover from permanent structures can be mitigated in-kind if feasible, or out-of-kind if in-kind options are not available. Mitigation measure **MM-BIO-7** includes a variety of suitable options for mitigating impacts associated with **Impact-BIO-7**. These options can be implemented either individually or in combination, as may be required through consultation with applicable resource agencies during permitting processes, including but not limited to, NMFS, CDFW, USFWS, RWQCB, and/or USACE, to offset impacts from permanent overwater coverage. In-kind options include removal of existing overwater coverage at a 1:1 mitigation ratio at other locations in San Diego Bay to offset overwater coverage for any future project consistent with the proposed PMPU, and/or withdrawal of credits from the District's shading credit program in accordance with BPC Policy 735, if approved by the District and resource agencies. Out-of-kind mitigation measures include creation or restoration of wetlands at a 1:1 ratio or eelgrass habitat at a ~~1:2:1~~ mitigation ratio specified in the CEMP to improve fisheries and associated wildlife beneficial uses in consultation with regulatory agencies identified above, and/or contribution to a ~~suitable in-lieu fee program, or an approved~~

mitigation bank or suitable in-lieu fee program. Implementation of **MM-BIO-7** would reduce potential permanent overwater coverage impacts (**Impact-BIO-7**) to less than significant. Mitigation measures for overwater coverage and shading impacts on eelgrass and other marine habitats are addressed under Threshold 2.

Operational Structural Impacts on Marine Resources

Future development projects under the proposed PMPU that would lead to increasing the susceptibility of protected avian species to predation from raptors and other large predatory birds include the addition of large landside structures such as hotels, ~~restaurants, and retail~~, or the addition of nearshore berthing structures. The addition of these structures could inadvertently create permanent additional perches for raptors and other large predatory birds that prey on other marine-based protected species. The San Diego International Airport, which is adjacent to PD2, supports an annual breeding colony of California least tern. Peregrine falcons and other raptor species have been observed preying on California least terns at the airport (Patton 2015). Furthermore, the coastal dune and saltmarsh habitats characteristic of PD9 and PD7, respectively, are habitat types known to be used by Ridgeway's rail, western snowy plover, and Belding's savannah sparrow. Therefore, any future development proposed within 100 feet of these areas, whether occurring on land or over the water, could indirectly impact protected avian species, which is considered a significant impact (**Impact-BIO-8**).

Operational Structural Mitigation Measures for Marine Resources

Impacts associated with addition of new permanent perches that could be used by raptors or other large predatory birds (**Impact-BIO-8**) can be mitigated by installing features to minimize the use of new structures such as buildings, light poles, fences, and pilings by avian predators of sensitive species. For structures built close to the habitat of sensitive species, perch deterrents would be installed to prevent raptors and other predatory birds from perching, thereby reducing predatory pressure on sensitive species (**MM-BIO-8**). Implementation of **MM-BIO-8** would reduce **Impact-BIO-8** to less than significant.

Terrestrial Resources

Bird strikes to windows of buildings have been documented as major sources of avian fatalities (Klem et al. 2009). Collisions with glass windows claim the lives of hundreds of millions of birds each year in the United States (Sheppard and Phillips 2015). In particular, highly reflective windows that are opposite vegetation appear to confuse avian species and prevent adequate avoidance behavior to limit fatalities (Klem et al. 2009). The best predictor of strike rates is the density of birds in the vicinity of the glass, which in turn is likely a factor influenced by the presence or availability of water, vegetation, and/or bird feeders (Klem 2008). In general, many studies have concluded that the majority of bird strikes on buildings occur during the day and involve both migrant and resident avian species hitting reflective plate glass windows.

Future activities under the proposed PMPU that could result in increased bird strike potential include construction of new hotels and meeting space, restaurants, and retail in PD2 and PD3. The use of reflective building and glass finishes may confuse birds in flight, leading to an increase in strikes, which is considered a significant impact on avian species protected under the MBTA and sensitive and listed species protected under ESA and CESA (**Impact-BIO-9**). Implementation of **MM-BIO-9** would reduce this impact to less than significant by requiring that final building design

incorporate design strategies recommended by the *Bird-Friendly Building Design* and approved by the District.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operation-related impacts on sensitive marine and terrestrial species (**Impact-BIO-6** through **Impact-BIO-9**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities under Option 1 would only involve landside activities and would not involve any overwater coverage or shading. The new Waterfront Destination Park that could be developed under Option 1 could include new structures, such as restrooms. However, it is anticipated that these structures would be minimal in size and would greatly reduce features that could create permanent additional perches for raptors or other large predatory birds or involve the use of reflective building and glass finishes that may confuse birds in flight, leading to an increase in strikes. Moreover, Option 1 does not include any in-water components, and therefore, would not result in any operational impacts on sensitive marine species. Therefore, impacts associated with operation of Option 1 would be less than significant.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operation-related impacts on sensitive marine and terrestrial species (**Impact-BIO-6** through **Impact-BIO-9**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities under Option 2 would only involve landside activities and would not involve any overwater coverage or shading. The new park space that could be developed under Option 2 could include new structures such as restrooms. However, it is anticipated that these structures would be minimal in size and would not contain features that could create permanent additional perches for raptors or other large predatory birds or involve the use of reflective building and glass finishes that may confuse birds in flight, leading to an increase in strikes. Moreover, Option 2 does not include any in-water components, and therefore, would not result in any operational impacts on sensitive marine species. Therefore, impacts associated with operation of Option 2 would be less than significant.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operation-related impacts on sensitive marine and terrestrial species (**Impact-BIO-6** through **Impact-BIO-9**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational activities under Option 3 would only involve landside activities and would not involve any overwater coverage or shading. The new park space that could be developed under Option 2 could involve structures such as restrooms. However, it is anticipated that these structures would be minimal in size and would not contain features that could create permanent additional perches for raptors or other large predatory birds or involve the use of reflective building and glass finishes that may confuse birds in flight, leading to an increase in strikes. Moreover, Option 3 does not include any in-water components, and therefore would not result in any operational impacts on sensitive marine species. Therefore, impacts associated with operation of Option 3 would be less than significant.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts that would have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, ~~or by CDFW and USFWS~~. Rather, the proposed policies are intended to reduce and minimize impacts on biological resources. For instance, the District will enhance, restore, and protect Intertidal and Conservation Open Space use designations (WLU Policy 5.1.2); maintain marine resources in alignment with Section 30230 of the California Coastal Act (ECO Policy 1.1.1); prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or Federally listed coastal species (ECO Policy 1.1.2); coordinate, site, and design future development adjacent to conservation areas and other sensitive habitats to avoid impacts where feasible or legally required (ECO Policy 1.1.3); conduct development in coastal waters pursuant to Section 30233 of the California Coastal Act (ECO Policy 1.1.4); for landside development, establish and maintain ecological buffers between the landside development and saltmarsh wetland to preserve and protect the wetland habitat for the anticipated life of the development (ECO Policy 1.1.5); limit development within wetland buffers to minor passive recreational uses or other improvements deemed necessary to protect the habitat, and located the development in portions of the buffer farthest from the habitat (ECO Policy 1.1.6); prohibit planting of invasive species in landscaped areas and prepare a plan to remove invasive species from development that has existing invasive species (ECO Policy 1.1.9); use ecologically sensitive lighting that is shielded and directed away from the water or sensitive habitat areas, sensor activated, and of the lowest possible color temperature that also meets public safety requirements where development occurs above the water or adjacent to sensitive habitat areas (ECO Policy 1.1.10); encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems and to reduce stormwater pollution to the Bay (ECO Policy 1.1.11); identify locations throughout the Bay that could support habitat enhancement, restoration, creation, and protection to benefit sensitive habitats and State and Federally listed species (ECO Policy 1.1.13); strive to achieve a net increase of wetland habitat acreage ~~from baseline conditions~~ throughout the Bay from certification of this Plan (ECO Policy 1.1.14); identify various ecological opportunity areas within water use designations that have

shallow subtidal or intertidal habitat that may benefit from additional restoration or enhancement, or additional nature-based shoreline solutions including shoreline stabilization (ECO Policy 1.1.15); provide information to the public about the water quality risks associated with invasive species and about measures to avoid and reduce the spread of invasive species (ECO Policy 1.1.16); support creative and innovative solutions to improve the resiliency of the Bay's marine ecosystems and the biodiversity within Tidelands (ECO Policy 1.1.19); ~~restore~~ restoration of historic losses of natural habitat acreages may be, to the extent feasible, part of the sea level rise adaptation and mitigation strategies (ECO Policy 1.1.20); pursue opportunities to create, preserve, enhance or restore inter and subtidal habitats in areas that have historically been impacted by development (ECO Policy 1.1.23); continue to conduct or require permittees ~~and tenants~~ to conduct, long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay (ECO Policy 2.1.5); establish and continue partnerships and collaboration with key agencies and stakeholders to enhance conservation, protection, and restoration of natural resources in and around the Bay and Tidelands (ECO Policy 4.1.1); and establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources and how to protect them (ECO Policy 4.2.1).

Impact Determination and Mitigation

Implementation of the proposed PMPU would have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, ~~or by CDFW and USFWS.~~

Significant Impacts

Impact-BIO-1: In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species Such as California Least Tern and California Brown Pelican. In-water construction-induced noise impacts from ~~overwater~~ construction activities such as pile driving could disrupt the foraging behavior of the California least tern if construction occurs during the California least tern nesting season, as well as other sensitive fish-foraging avian species such as California brown pelican. This impact would be significant.

Impact-BIO-2: Construction Noise Impacts on Nesting Behavior of Marine-Dependent Species Protected Under the Migratory Bird Treaty Act and California Fish and Game Code.

Construction-induced noise impacts from landside and ~~over in-~~water construction activities can disturb nesting marine dependent bird species protected under the MBTA and California Fish and Game Code. Disturbance can lead to nest abandonment or altered behavior that results in lowered nesting success. This impact would be potentially significant.

Impact-BIO-3: In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fishes. In-water pile driving activities could generate enough underwater noise to physically injure marine mammals, green sea turtles, and fishes should impact hammer or vibratory pile driving occur during construction. Any noise-related impacts would be dependent on the type of activity being performed, the proximity of the activity to marine waters, and the biology of the considered species. In-water impact hammer or vibratory pile driving activity by comparison could potentially generate enough underwater noise to injure (Level A Harassment) or alter behavior (Level B Harassment) for marine mammals, green sea turtles, and fishes. This impact would be significant.

Impact-BIO-4: Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity.

In-water construction activities can suspend sediment that results in water quality and turbidity impacts that limit the ability of fish foraging avian species to locate prey and disrupts eelgrass productivity. Additionally, incidental vessel contact with bottom substrate and vessel propeller wash within shallow areas could result in increased turbidity. This impact would be significant.

Impact-BIO-5: Potential Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code. Removal of existing trees and demolition of existing structures, as well as generation of noise, dust, or nighttime lighting from construction activity, could impede the use of breeding sites during the general avian nesting season (February 15 through August 31). The disturbance or destruction of an occupied nest would be considered a significant impact.

Impact-BIO-6: Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat Through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment.

Aquaculture within the proposed PMPU area allows for the cultivation of shellfish and seaweed. If viewed in the context of available fish habitat and forage, shellfish operations compete with natural populations of fish and invertebrates that consume plankton and organic particles and limit foraging opportunities for coastal pelagic fish species. Additionally, benthic impacts of shellfish aquaculture can result from the presence of gear and equipment, shell debris, and the accumulation of pseudofeces or fouling organisms due to natural processes and dependent upon culture methods. Collectively, these impacts are considered significant.

Impact-BIO-7: Permanent and Long-Term Overwater Coverage from Introduction of New Structures.

The introduction of newly constructed berthing structures for commercial and recreational vessels, ~~and vessels using berthing structures,~~ would result in a permanent increase in overwater coverage. In addition, the introduction of large construction-related structures for prolonged periods of time may result in long-term overwater coverage impacts. The overwater coverage in each of these cases would result in a permanent reduction of potential open water foraging habitat for California least tern and other sensitive fish-foraging species. The overwater coverage also leads to lower primary productivity due to shading. The managed and sensitive species of eelgrass would be impacted in areas where overwater coverage shades eelgrass. ~~This lost productivity impacts all higher trophic levels due to the lost production of organic carbon.~~ Primary productivity is impacted any time eelgrass is shaded. In the case of landside structures the level of impact is more variable, and the impact will increase with taller structures and with structures that are closer to the water. Structures with a southern aspect (water to north of structure) will have a greater impact relative to structures with other aspects. This impact would be significant.

Impact-BIO-8: Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in Their Nesting Habitats.

Future development projects under the proposed PMPU that would lead to increasing the susceptibility of protected avian species to predation from raptors and other large predatory birds include the addition of landside structures such as hotels, ~~restaurants, and retail,~~ or the addition of nearshore berthing structures. The addition of these structures could inadvertently create permanent additional perches for raptors and other large predatory birds that prey on other marine-based protected species. This impact would be significant.

Impact-BIO-9: Bird Strikes Resulting from Use of Reflective Materials. Use of reflective building and glass finishes may confuse birds in flight, leading to an increase in strikes. Future activities under the proposed PMPU that could result in increased bird strike potential include construction of new hotels and meeting space, ~~restaurants, and retail~~ in PD2 and PD3, if the future new buildings would not be surrounded by existing buildings that are taller. The increased potential for bird strikes would be a significant impact on avian species protected under the MBTA and sensitive and listed species protected under ESA and/or CESA. This impact would be significant.

Mitigation Measures

For **Impact-BIO-1:**

MM-BIO-1: Implement Construction Measures to Avoid or Reduce Noise Impacts ~~on that May Affect Foraging Behavior of California Least Tern and Other Sensitive Fish Foraging Avian Species.~~ For future development projects that the District determines have the potential to disturb foraging behavior of California least tern and other sensitive fish foraging avian species due to in-water construction activities (e.g., pile driving), the project proponent shall retain a qualified biologist, approved by the District, to monitor onsite construction activities. The qualified biologist must have at least four years of university training in marine biology or a related science and/or have at least three years of demonstrated field experience monitoring sensitive species in the Southern California marine environment. A qualified biologist with more than 10 years of experience monitoring for sensitive marine species in Southern California shall oversee the monitoring work. The project proponent shall take specific actions, as approved by the District, to reduce or temporarily stop noise-producing activities if the qualified biologist identifies that the activities are impacting the foraging behavior of sensitive avian species. ~~From April 1, or when the California least terns first appear in the Bay, until the California least terns have left the bay or September 15th.~~ These actions shall include, but not be limited to, the following:

- For all pile driving activities performed during the ~~California least tern~~ nesting season ~~of sensitive fish foraging avian species~~, a qualified biologist shall be on site observing for foraging ~~California least tern sensitive avian species~~.
- If any ~~California least terns sensitive avian species~~ are observed, the qualified biologist shall have the authority to halt or modify pile driving activity to ensure foraging behavior is not altered by construction. Work modifications that may limit pile driving noise impacts may include:
 - Reducing the intensity of pile driving.
 - Placing sound dampening panels on pile driving equipment.
 - Restricting pile driving to periods when sensitive avian species are not present.
 - A project that is within 500 feet of a California least tern nesting colony shall be required to conduct preconstruction nest surveys, nest monitoring, and implement sound and visual barriers (See MM-BIO-2).
- A biological monitor shall be on-site during any construction activities that would occur within foraging habitat to ensure no sensitive species are agitated, killed, or injured.

- For all pile driving projects that may impact ~~any other~~ sensitive nesting avian species (including California least terns), refer to **MM-BIO-2**.
- For in-water activities that may result in increased turbidity that would potentially temporarily obscure foraging habitat, refer to **MM-BIO-4**.
- For proposed activities and development features that may result in increased shading of foraging habitat, refer to **MM-BIO-7**.

For **Impact-BIO-2**:

MM-BIO-2: Implement Construction Noise Measures to Avoid or Reduce Noise Impacts on Nesting California Least Tern and Other Sensitive Nesting Marine-Dependent Avian Species.

For future development projects that the District determines have the potential to disturb sensitive nesting marine dependent avian species, the project proponent shall ensure that nesting bird behavior is not modified during construction activities that generate noises above ambient conditions. The project proponent shall implement the following measures during construction:

- During the nesting season for sensitive avian species with the potential to occur at the construction site, ~~t~~The project proponent shall retain a qualified biologist as defined in MM-BIO-1, approved by the District, to perform a nesting bird survey within 500 feet of the noise-generating activity 1 week prior to the start of construction utilizing heavy equipment, ~~and, i~~ If nests are found, the qualified biologist shall perform a survey once per week during construction until use of noise-generating heavy equipment ceases. Specific criteria for California least terns are included at the end of this mitigation measure.
- The project proponent shall submit the survey to the District for review and approval of the survey and the buffer area, defined below, if any, prior to the commencement of these activities at the project site.
- ~~The nesting bird survey area shall include the entire limits of disturbance plus a 300-foot buffer for non-raptors and a 500-foot buffer for raptors to ensure indirect impacts would be avoided.~~ The nesting surveys shall consist of a thorough inspection of the project area by a qualified biologist(s). The survey shall occur between sunrise and 12:00 p.m., when birds are most active. ~~If no active nests are detected during these surveys, t~~The qualified biologist(s) shall prepare and submit to the District a letter report documenting the results of the survey. If there is a delay of more than 7 days between when the nesting bird survey is performed and construction activities begin, the qualified biologist shall resurvey to confirm that no new nests have been established.
- If the survey confirms nesting ~~within 300 feet of the disturbance footprint for non-raptors or within 500 feet for raptors~~, the project proponent shall establish a no-disturbance buffer around each nest site to avoid disturbance or destruction of the nest until after the nesting season or a qualified biologist determines that the nest is no longer active. The size and constraints of the no-disturbance buffer shall be determined by the qualified biologist and included in the letter report documenting the survey results, ~~at the time of discovery, but shall not be greater than 300 feet for non-raptors and 500 feet for raptors. In addition, if the qualified biologist(s) prepares any subsequent reports, the reports shall be submitted to the District.~~

- The qualified biologist shall establish a baseline ambient sound level by measuring ambient sound levels during the time of day that work is expected to occur. The monitoring distance from the nest shall be chosen to determine the noise levels present at the nest without causing to not disturbance to the sensitive species.
- If noise-generating activities are within ~~300 feet for non-raptors and~~ 500 feet for raptors and the sensitive species behavior is modified due to noise, the qualified biologist shall monitor noise levels daily, during construction activities, at a distance that would prevent the disturbance of the relevant species. Sound levels at nest sites shall not exceed 10 dBA above ambient levels. This monitoring shall occur until the nest is no longer active.
- If sensitive avian species begin nesting within ~~300 feet for non-raptors and~~ 500 feet for raptors of noise-generating construction and the species behavior is modified, the qualified biologist shall establish a baseline ambient sound level by measuring sound levels at a distance without disturbing the species during a representative construction day. The qualified biologist shall monitor those nests daily during construction activities, until after the nesting season or a qualified biologist determines that the nest is no longer active. If the monitoring shows sound levels more than 10 dBA above the baseline ambient levels (representative construction noise included), and the species behavior is modified, the qualified biologist shall have the authority to halt or modify construction activity to ensure the behavior of sensitive nesting avian species is not altered by construction noise.
- If the above noted sound thresholds are exceeded, the project proponent shall implement actions recommended by the qualified biologist and approved by the District to reduce sound levels to within thresholds. ~~Example actions to reduce noise include installation of noise barriers with a minimum STC rating of 28, place noise attenuation dampers on equipment, replace or retrofit noisy equipment to reduce noise, stage work to reduce the hourly average equivalent sound level (L_{eq}), and relocate noise-generating activities.~~
- If the qualified biologist determines that noise cannot be attenuated, noise-generating activities must cease until such time that adequate noise attenuation is achieved, or nesting is complete.
- For California least terns specifically:
 - Pile driving shall be conducted outside of the California least tern nesting season (September 16th to March 31st).
 - If the nesting season cannot be avoided and the project is within 500 feet of a nest, then California least tern preconstruction nest surveys, nest monitoring, and sound and visual barriers shall be implemented prior to the beginning of construction activities, subject to District approval, which may include consultation with CDFW and USFWS where appropriate, including as part of any required permit application by the project proponent.
 - When construction activities will occur within 500 feet of suitable California least tern nesting habitat, a qualified biologist shall conduct surveys prior to activity initiation.
 - If a nest is detected, a 500-foot buffer shall remain in place until the nest has fledged or is no longer active. No loud construction activities shall occur within the buffer.
 - The qualified biologist shall remain on-site during all construction activities that occur within, or adjacent to, suitable nesting habitat for California least tern during the nesting

season to ensure compliance with the 500-foot buffer and to modify or stop work in accordance with this mitigation measure.

For **Impact-BIO-3:**

MM-BIO-3: Implement a Marine Mammal, Green Sea Turtle, and Fishes Monitoring Program During Pile Installation Activities. Prior to commencement of construction activities involving in-water impact hammer pile installation or vibratory pile installation or removal, the project proponent shall retain a qualified biologist as defined in MM-BIO-1, who shall conduct preconstruction surveys to identify the presence of sensitive marine species (i.e., marine mammals, green sea turtles, and fishes) and during construction monitoring the qualified biologist will have the ability to stop work. ~~Prepare a marine mammal, green sea turtle, and fishes monitoring program for implementation. Additionally, the project proponent shall submit the monitoring program to the District for approval 60 days prior to commencing construction involving in-water pile activities and shall.~~ This measure includes the following requirements within the monitoring program:

- For a period of 15 minutes prior to the start of in-water pile-driving construction, a qualified biologist, retained by the project proponent and approved by the District, shall monitor an impact radius around the active pile installation areas to ensure that ~~special-status sensitive marine species (i.e., marine mammals, green sea turtles, fish, special-status aquatic birds)~~ special-status sensitive marine species (i.e., marine mammals, green sea turtles, fish, special-status aquatic birds) are not present. ~~The qualified biologist must meet the minimum requirements as defined by the NOAA's Guidance for Developing a Marine Mammal Monitoring Plan (2017).~~ The impact radius shall be established by determining the largest zone of influence associated with in-water construction activities occurring that workday.
- The project proponent shall not start work if the qualified biologist observes any sensitive marine special-status species prior to starting pile installation.
- In-water pile driving shall begin with soft starts in accordance with Section 4.5 of the District's *Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District* (District 2019), gradually increasing the force of the pile driving.
- The qualified biologist shall monitor for special-status aquatic avian species (e.g., California least tern, California Brown Pelican), marine mammals, and green sea turtles and fishes within appropriate zones of influence during all pile installation activities in order to identify when any ~~special-status of these wildlife~~ species are approaching or within the appropriate zone of influence, and by coordinating with construction crews to halt pile driving until the species have left this area.
- In-water sound level monitoring for fishes shall be conducted if the project-specific in-water noise analysis determines that anticipated Sound Exposure Levels (SELs) exceed acceptable levels described in the Interim Criteria for Injury to Fish (see Table 4.3-6 of the PEIR). If SELs would be exceeded, then a qualified marine biologist shall monitor pile driving activities and shall have the authority to stop in-water pile installation if harm to fish is observed.
- To reduce in-water sound levels during pile driving, all piles shall be driven with a vibratory hammer or other less impactful forms of pile driving where feasible (feasibility shall include not conflicting with MM-WQ-1, MM-WQ-2, and MM-WQ-3). If an impact hammer is required, additional sound attenuation, such as wood cushion block, isolation casing, and/or an air bubble curtain shall be required if determined necessary by the monitoring biologist.

For **Impact-BIO-4**:

MM-BIO-4: Implement Construction Measures to Eliminate Water Quality Impairment Impacts on California Least Tern, Other Sensitive Fish Foraging Avian Species, and Eelgrass. During all in-water construction activities that would disturb sediment, the project proponent shall implement the following construction measures in accordance with applicable Federal, State, and local regulations, including CWA Sections 401 and 404, Rivers and Harbors Act Section 10, the NPDES permit, and Stormwater Management and Discharge Control Ordinance:

- The project proponent shall implement contractor education for vessel operations. Vessel operators shall be trained that any contact with the bottom from the vessel, barges, anchors, or spuds can suspend sediment that results in water quality and turbidity impacts that limit the ability of fish foraging avian species to locate prey and disrupt eelgrass productivity. Additionally, vessel operators shall be instructed to minimize activities that direct propeller wash toward shallow areas with substrates that can be suspended and result in increased turbidity.
- The project proponent shall deploy a turbidity curtain around the pile driving or other sediment-disturbing activity areas to restrict the visible surface turbidity plume to the area of construction. The turbidity curtain shall consist of a hanging ballast-weighted curtain with a surface float line and shall extend from the surface into the water column without disturbing the bottom based on the lowest tidal elevation and swing of the curtain within the water column. The turbidity curtain shall meet the specifications for design, installation, use, performance, and/or modification outlined in the District's *Best Management Practices and Environmental Standards for Overwater Structural Repair and Maintenance Activities for Existing Port Facilities Conducted by the San Diego Unified Port District* (District 2019). The goal of this measure is to minimize the area in which visibility of prey by California least terns and other sensitive fish foraging avian species (e.g., California brown pelican) is obstructed.
- The project proponent shall follow all regulatory requirements to minimize ~~impacts on the reduction in~~ water quality in San Diego Bay. Construction of future development would include preparation and implementation of either a SWPPP in accordance the SWRCB Construction General Permit or a Construction BMP Plan in accordance with the District's JRPMP, and compliance with appropriate regulatory permits (as applicable), including the CWA Section 401 Water Quality Certification, CWA Section 404 permit, and Rivers and Harbors Act Section 10 permit. A full explanation of these requirements can be found in Section 4.8. In addition, future projects that propose in-water construction will be required to obtain applicable permits from federal and state agencies, including but not limited to USACE (Section 404 of the CWA, Section 10 of the Rivers and Harbor Act), RWQCB (Section 401 of the CWA), and reviewing agencies including NOAA, USFWS, and CDFW. Any applicable permits must be obtained prior to the commencement of in-water construction. In addition, consistent with the USACE/RWQCB permit requirements, projects that would disturb sediment must submit a Caulerpa survey as part of the permitting process. The survey must be consistent with the Caulerpa Control Protocol developed and maintained jointly by NOAA and CDFW.
- If impacts on eelgrass due to water quality occur and cannot be mitigated through contractor education and deployment of silt curtains, the project proponent shall implement mitigation measures for losses to eelgrass in accordance the CEMP and with **MM-BIO-10**.

- The project proponent shall implement **MM-WQ-1**, Monitoring Turbidity and Constituents of Concern During Construction-Related Sediment Disturbance; **MM-WQ-2**, Implement Best Management Practices During Construction-Related Sediment Disturbance; and **MM-WQ-3**, Apply Silt Curtains During Construction-Related Sediment Disturbance, as described in Section 4.8, *Hydrology and Water Quality*.

For **Impact-BIO-5**:

MM-BIO-5: Avoid Nesting Season for Birds or Conduct Preconstruction Nest Surveys. To ensure compliance with the ESA and/or CESA, MBTA and similar provisions under Sections 3503 and 3503.5 of the California Fish and Game Code, the project proponent shall conduct all vegetation removal (e.g., ornamental trees), demolition of existing structures, and construction activities between September 1 and February 14 (i.e., outside of the general avian nesting season). If the District determines that such avoidance is not feasible, the project proponent shall implement the following:

- The project proponent shall retain a qualified biologist as defined in MM-BIO-1, who shall conduct a focused nesting bird survey within potential nesting habitat 1 week prior to the start of vegetation removal, demolition of existing structures, and/or construction activities. The project proponent shall submit the survey to the District for review and approval of ~~the survey and~~ the buffer area, defined below, if any, prior to the commencement of these activities at the project site.
- The nesting bird survey area shall include the entire limits of disturbance plus ~~a 300-foot buffer for non-raptors and~~ a 500-foot buffer ~~for raptors~~ to ensure indirect impacts would be avoided. The nesting surveys shall consist of a thorough inspection of the project area by a qualified biologist(s). The survey shall occur between sunrise and 12:00 p.m., when birds are most active. If no active nests are detected during these surveys, the qualified biologist(s) shall prepare and submit to the District a letter report documenting the results of the survey. If there is a delay of more than 7 days between when the nesting bird survey is performed and construction activities begin, the qualified biologist shall resurvey to confirm that no new nests have been established.
- If the survey confirms nesting ~~within 300 feet of the disturbance footprint for non-raptors or within 500 feet for raptors~~, the project proponent shall establish a no-disturbance buffer around each nest site to avoid disturbance or destruction of the nest until after the nesting season or a qualified biologist determines that the nest is no longer active. The size and constraints of the no-disturbance buffer shall be determined by the qualified biologist, at the time of discovery, but shall not be greater than ~~300 feet for non-raptors and 500 feet for raptors~~. In addition, if the qualified biologist(s) prepares any subsequent reports, the reports shall be submitted to the District for review.

For **Impact-BIO-6**:

MM-BIO-6: Develop a Shellfish Aquaculture Mitigation Plan ~~Program~~ in Coordination with the Appropriate Resource Agencies and the District to Minimize the Potential for Degraded Essential Fish Habitat and Potential Benthic Impacts. Prior to the District's approval of ~~any~~ future aquaculture operation involving shellfish, the project proponent shall prepare and submit to the District for approval a Shellfish Aquaculture Mitigation ~~Program~~ Plan. The project proponent shall prepare the Shellfish Aquaculture Mitigation ~~plan~~ Program in

coordination with the appropriate regulatory and resource agencies, as well as the District, and shall implement the program during project design and operation of the future shellfish aquaculture facility. The removal of organic particles and plankton from the water column, the associated impacts on essential fish habitat, and the potential for benthic impacts shall be mitigated through implementation of the following as part of the Shellfish Aquaculture Mitigation Program.

Mitigation for Impacts on Essential Fish Habitat:

- The project proponent shall prepare a mitigation plan that shall use best available science to evaluate the size of the aquaculture facility, the filtration rates and biomass of the cultured species, the mean phytoplankton biomass and production, and the tidal flushing rates of the facility location to determine potential impacts on organic particulate matter food resources. The mitigation plan shall include:
 - An adaptive management strategy that accommodates cultivated shellfish density as necessary without significantly affecting food resources available to other organisms in the Bay.

Mitigation for Benthic Impacts:

- The project proponent shall prepare a mitigation plan that evaluates various benthic impacts as affected by the species, and culture methods utilized, the size of the aquaculture facility, accumulation of materials such as pseudofeces, shell debris, and gear. The mitigation plan shall contain the following elements:
 - A monitoring plan that evaluates the seabed beneath and adjacent to the facility to monitor for bacterial mats, sediment hypoxia, benthic infauna, or other indicators of ecosystem health.
 - An adaptive management strategy that responds to negative indicators of benthic health as described in the monitoring plan to appropriately reduce the cultivated shellfish density, as necessary. Site-specific BMPs are to be developed and implemented during construction and operation of the aquaculture facility to lessen or eliminate potential benthic impacts.

For Impact-BIO-7:

MM-BIO-7: Implement Overwater Coverage Mitigation in Coordination with the Appropriate Resource Agencies and the District to Compensate for Loss of Open Water Habitat. ~~For Prior to approval of a future development~~ projects that may result in the loss of open water habitat or shading, the project proponent shall implement the following:

1. During site-specific environmental review and as required by applicable laws and regulations, the project proponent shall consult with the appropriate resource agencies, including but not limited to, NMFS, CDFW, USFWS, RWQCB, and/or USACE, regarding mitigation of impacts associated with loss of beneficial uses from overwater coverage, loss of open water habitat function, and shading. The project proponent shall secure all applicable permits for the mitigation of overwater coverage prior to commencement of waterside construction. One or more of the appropriate resource agencies may require additional or greater mitigation than specified under options 2.A, 2.B, 2.C, and 2.D of this mitigation measure (see below).

2. For impacts that the District determines are significant, a project proponent shall implement one of the following mitigation options, or a combination thereof. These options provide the minimum mitigation for overwater coverage impacts and/or shading impacts. One or more of the appropriate resource agencies may require additional or greater mitigation than specified in this mitigation measure.
 - A. Remove an amount of existing overwater coverage within San Diego Bay that is equivalent to the proposed project's net increase in overwater coverage. This would replace the area affected by a future project at a 1:1 mitigation ratio, subject to the District's review and approval.
 - B. Restore or create an amount of wetland or eelgrass habitat within San Diego Bay equivalent to the proposed project's net increase in overwater coverage at a suitable location within San Diego Bay, at a 1:1 ratio for wetlands and a ~~1.2:1~~ ratio for eelgrass consistent with the CEMP, which would offset the net increase in overwater coverage by improving the habitat structure and primary productivity at the restoration site. The restoration or creation of wetland or eelgrass habitat shall require the project proponent to prepare a mitigation plan for the District's review and approval. The mitigation plan at a minimum shall include a description of the restoration site, mitigation requirements, planting plan (e.g., transplant sites, donor sites, reference site), restoration methods (e.g., plant collection or purchase, transplant units), timing of the restoration work, and a monitoring program to include a mitigation success criteria. The mitigation project shall secure all applicable permits and all applicable District Real Estate agreements for the mitigation site prior to commencement of construction. Additionally, all fill materials proposed for discharge into San Diego Bay for the development of the mitigation site shall meet the requirements of the USACE's *Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S. – Testing Manual (Inland Testing Manual)*.
 - C. If a suitable mitigation bank within the Coastal Zone that is not yet available becomes available in the future, prior to construction of the proposed project, the project proponent shall purchase saltmarsh wetland or overwater coverage credits to offset the net increase in overwater coverage.
 - D. Subject to the Board of Port Commissioners' approval and findings, the project proponent may purchase an amount of credits from the District's shading credit program established pursuant to BPC Policy 735, ~~at a fair market value~~, equivalent to that of the project's final shading total (i.e., to the satisfaction of the appropriate resource agencies).
 - E. For projects where landside structures cause shading of eelgrass, the project proponent shall conduct a shading analysis reviewed by a qualified biologist to determine the time and amount of shading for all eelgrass areas impacted by the shading for the District's review to determine the anticipated impacts on eelgrass. If the shading analysis determines that impacts will occur, then mitigation for the loss of eelgrass will be conducted per the CEMP at a ~~1.2:1~~ mitigation ratio based on the amount of impacted eelgrass.

- F. For overwater coverage, a qualified biologist as defined in MM-BIO-1, shall conduct eelgrass surveys per the CEMP to determine potential impacts on eelgrass from construction.
- If pre- versus post-construction eelgrass surveys determine that overwater structures will shade and impact eelgrass, then mitigation for the loss of eelgrass will be conducted pursuant to the CEMP ~~at a 1:2:1~~ mitigation ratio based on the amount of impacted eelgrass.

For Impact-BIO-8:

MM-BIO-8: Implement Raptor Perching Deterrent Measures on New Structures. Prior to the District's approval of a future development project, the project proponent shall retain a qualified biologist as defined in MM-BIO-1, approved by the District and familiar with local sensitive species, to review the project plans for the following:

1. Proximity of the proposed structure (i.e., within 500 feet) to sensitive avian nesting, loafing, or foraging habitat.
2. Potential for the proposed structure to act as a perch for raptors that may prey on any nearby sensitive avian species.

In the event that the qualified biologist identifies that both of the above conditions exist, the project proponent shall implement one or more of the following mitigation measures to mitigate the impact, as determined by the District.

- Install avian perching deterrents such as spikes on top of structures that can act as perches, such as pilings, building ledges, posts, fences, lights and ornaments.
- Redesign structures and features of structures to prevent perching such as by use of pointed or uneven surfaces and recessing lights and ornaments that protrude from structures.

For Impact-BIO-9:

MM-BIO-9: Implement Bird Strikes Reduction Measures on New Structures. Prior to the District's approval of a future development project proposing the use of reflective surfaces and/or glass finishes, building plans shall be reviewed by a qualified biologist as defined in MM-BIO-1, familiar with avian species, retained by the project proponent and approved by the District, to verify that the proposed building has incorporated specific design strategies that qualify for Leadership in Energy and Environmental Design (LEED) credits, as described in the American Bird Conservancy's *Bird-Friendly Building Design* (Sheppard and Phillips 2015) or an equivalent guide to avoid or reduce the potential for bird strikes. Final building design must demonstrate to the satisfaction of the qualified biologist and the District, ~~as well as be confirmed by USFWS and/or CDFW, that design strategies, in accordance with the *Bird-Friendly Building Design*, have been incorporated and approved by the District.~~ Design measures shall include, but not be limited to, the following:

- Building Façade and Site Structures
 - Develop a building façade and site design that are visible as physical barriers to birds.
- Incorporate elements like windows, netting, screens, grilles, shutters, and exterior shades to preclude collisions.

- Incorporate materials that have a low threat potential based on the Bird Collision Threat Rating and the Bird Collision Threat Rating Calculation Spreadsheet to achieve a maximum total building Bird Collision Threat Rating of 15 or less.
 - Least Threat Potential: Opaque Surface
- Exterior Lighting
 - Fixtures not necessary for safety, entrances, and circulation shall be automatically shut off from midnight until 6:00 a.m.
 - Lighting is to be shaded and face down with a minimum spread to avoid lighting off site.
 - Exterior luminaires must meet these requirements for all exterior luminaires located inside project boundary based on the following:
 - Photometric characteristics of each luminaire shall be mounted in the same orientation and tilt as specified in the project design; and
 - The project shall be classified under one lighting zone using the lighting zones definitions provided in the *Illuminating Engineering Society and International Dark Sky Association (IES/IDA) Model Lighting Ordinance (MLO) User Guide* (2011).
- Performance Monitoring Plan
 - The project proponent shall develop a ~~3-year post-construction~~ monitoring plan to routinely monitor the effectiveness of the building and site design in preventing bird collisions, for a minimum of 18 months after implementing mitigation efforts and for at least two peak collision seasons (often the fall in urban areas), consistent with *Bird-Friendly Building Design*. The post-construction monitoring plan shall include methods to identify and document locations where repeated bird strikes occur, the number of collisions, the date, the approximate time, and features that may be contributing to collisions. The post-construction monitoring plan shall list potential design solutions and provide a process for voluntary corrective action.
 - The project proponent shall provide an annual performance monitoring report demonstrating which design strategies have been incorporated and the results of performance monitoring for review and approval by the District.

Level of Significance After Mitigation

Implementation of **MM-BIO-1** would reduce potential noise-related impacts on foraging California least tern and other sensitive avian species during the nesting season (**Impact-BIO-1**) to less than significant by requiring construction monitoring during the nesting season by a qualified biological monitor. The monitor would have the ability to reduce or temporarily stop noise producing construction activities if those activities were believed to impact or otherwise alter the foraging behavior of California least terns during the nesting season.

Impacts associated with disturbance of nesting avian species (**Impact-BIO-2**), including other sensitive fish feeding avian predators, would be reduced to less than significant by **MM-BIO-2**, which requires preconstruction surveys and buffer zones, if nests are detected, and noise monitoring to ensure that noise levels do not exceed 10 dBA above ambient levels. In the event noise exceedances occur or disruption of nesting behavior is observed, **MM-BIO-2** requires construction modifications, including for example buffers and lastly sound barriers with a minimum STC rating of

28 to be placed between the noise-generating activity and the nest until the noise levels do not exceed 10 dBA above ambient levels.

Implementation of **MM-BIO-3** would reduce impacts from pile-driving activities on marine mammals, green sea turtles, and fishes (**Impact-BIO-3**) to less-than-significant levels by identifying when the species are approaching or within the designated isopleth for Level B harassment and halting in-water pile driving activities until the species has left the construction area.

Implementation of **MM-BIO-4** would reduce impacts associated with **Impact-BIO-4** to less than significant levels by requiring implementation of contractor education and construction measures, such as silt curtains, which will facilitate continued underwater foraging, in accordance with regulations. The measures would also prevent water quality impacts on eelgrass in areas surrounding the activity.

Mitigation measure **MM-BIO-5** would reduce **Impact-BIO-5** during construction activities to less-than-significant levels by requiring all vegetation removal, demolition of existing structures, and construction activities to occur outside of the nesting season (February 15 to August 31), if feasible, as well as the implementation of measures such as preconstruction nesting bird surveys and the establishment of no-disturbance buffers should active nests be detected. Mitigation measure **MM-BIO-5** would require that all vegetation removal, demolition, and construction occur outside of the nesting season. If it is not feasible for these activities to occur outside the breeding season, work may occur within the nesting breeding season upon approval from the District, with suitable mitigation such as nesting bird surveys and implementing no-disturbance buffers if nests are detected.

Implementation of **MM-BIO-6** would reduce **Impact-BIO-6** to less than significant by requiring future project proponents to develop and implement a Shellfish Aquaculture Mitigation Program that includes specific requirements for addressing potential impacts on managed fish species, essential fish habitat, and benthic communities from shellfish aquaculture operations.

Implementation of **MM-BIO-7** would reduce **Impact-BIO-7** to less-than-significant levels by requiring implementation of any of the following mitigation options or combination, for no net increase in overwater coverage per the CWA: removing overwater coverage in San Diego Bay, restoring or creating eelgrass habitat at a suitable mitigation site of equivalent size and value within San Diego Bay, purchasing credits from a suitable mitigation bank, and/or purchasing credits from the District's shading credit program. Although **MM-BIO-7** would reduce **Impact-BIO-7** to less-than-significant levels, implementation of this mitigation measure would have the potential to result in secondary effects. The removal of overwater coverage could involve demolition of existing piers or other structures within San Diego Bay, which would potentially result in short-term water quality impacts if water quality protection measures were not implemented. However, adherence to regulatory permit requirements associated with Rivers and Harbors Act Section 10 and CWA Sections 401 and 404 would ensure that implementation of this mitigation measure would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade existing water quality. Additionally, it is anticipated that criteria pollutant and greenhouse gas emissions generated by **MM-BIO-7** would be minimal and temporary, and would primarily be associated with construction activities, if any such activities are associated with the mitigation option implemented. Consequently, the overall secondary effects of implementing **MM-BIO-7** would be less than significant.

Impacts associated with addition of new permanent perches that could be used by raptors or other large predatory birds (**Impact-BIO-8**) can be reduced to less than significant by **MM-BIO-8**, which requires installation of features to minimize the use of new structures such as buildings, fences, and pilings by avian predators of sensitive species. For structures built within 500 feet of sensitive species habitat, perch deterrents would be installed to prevent raptors and other predatory birds from perching, thereby reducing predatory pressure on sensitive species.

Implementation of **MM-BIO-9** would reduce impacts from reflective surfaces resulting in bird strikes (**Impact-BIO-9**) to less-than-significant levels by requiring that final building design meet design strategies and performance standards of the *Bird-Friendly Building Design*, and be approved by the District, incorporating strategies to minimize the threat to avian species.

Threshold 2: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW, NMFS, or USFWS?

Impact Analysis

Impacts of Water and Land Uses

As described under Section 4.3.3, there are numerous Federal, State, and local laws, regulations, policies, and plans that help reduce impacts on sensitive natural communities from future development projects. They would apply to any future development projects proposed consistent with the PMPU, and include the following:

- **California Eelgrass Mitigation Policy** establishes and supports a goal of protecting eelgrass and its habitat functions. The CEMP includes guidance on defining eelgrass habitat, surveying, mapping, assessing impacts, avoiding and minimizing impacts on eelgrass, and mitigation options. Avoidance and minimization measures included within the CEMP relate to turbidity, shading, circulation, and nutrient and sediment loading impacts. Mitigation options in the CEMP include comprehensive management plans, in-kind mitigation, mitigation banks and in-lieu-fee programs, and out-of-kind mitigation.
- **The Magnuson-Stevens Fishery Management and Conservation Act** is Federal legislation that protects waters and substrates necessary for fish spawning, breeding, feeding, or growth to maturity. Fishery management councils formed under the act designate HAPC that provide notable contributions to ecological processes.

Construction

Marine Resources

Eelgrass beds are both the primary biologically important habitat associated with submerged soft-bottom substrate in San Diego Bay and are managed by NMFS as EFH. In addition, the Magnuson-Stevens Fishery Management and Conservation Act designates HAPC that provide notable contributions to ecological processes. Eastern Pacific HAPC that occur in the planning districts include estuaries (e.g., Otay River), canopy kelp (e.g., Imperial Beach), eelgrass (most planning districts), and rocky reefs. Rocky reefs occur off Imperial Beach, and artificial substrates within San Diego Bay, such as artificial reefs, can be viewed as a surrogate for rocky reef habitat.

Construction of future projects proposed under the PMPU would have the potential to have a substantial adverse effect on sensitive marine habitats such as eelgrass and other sensitive communities that are identified in local or regional plans, policies, or regulations. These future PMPU-related activities may include the construction of new commercial or recreational facilities, installation of new, overwater berthing structures (i.e., boat slips) for recreational and commercial vessels, and construction of new aquaculture or marine technology facilities. Construction-related impacts would only occur during actual construction.

Construction-related impacts that could result from these potential future activities include increased turbidity from support vessels, equipment, and installation of structures. The construction of overwater berthing structures and aquaculture facilities would require in-water construction activities. The operation of vessels over shallow water during construction can decrease light to the bay floor by increasing turbidity from propeller wash or direct contact with the Bay floor. Suspended particles reduce water clarity and can reduce the light reaching plant and algae cells. When suspended particles settle on primary producers such as periphyton, macroalgae, and eelgrass, they can further continue to prevent light from reaching the plant cells. Additionally, any contact where eelgrass occurs could directly dislodge and remove eelgrass and other vegetation. These construction-related impacts are considered significant (**Impact-BIO-10**).

The measures to reduce construction turbidity impacts on eelgrass beds are the same as those proposed under **MM-BIO-4**. Also, impacts associated with reduced growth and cover of eelgrass or direct removal of eelgrass during construction would be mitigated by mitigation measures identified under **MM-BIO-10**. In addition, construction monitoring for eelgrass would occur in accordance with the CEMP (NMFS 2014) (**MM-BIO-10**). The surveys would monitor for eelgrass before and after construction at both the construction site and a suitable reference area. Implementation of **MM-BIO-4** and **MM-BIO-10** would reduce potential temporary water quality, eelgrass shading, or direct removal impacts on eelgrass (**Impact-BIO-10**) to less than significant.

Terrestrial Resources

As described in Section 4.3.2.3, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portions of the proposed PMPU area where future development could occur. Therefore, no construction-related impacts on sensitive terrestrial or riparian habitats would occur.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine habitat (**Impact-BIO-10**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would only involve landside improvements associated with the new Waterfront Destination Park that could be developed under this option. As discussed in the analysis above, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portions of the proposed PMPU area where future development under Option 1 could occur. Therefore, no construction-related impacts on sensitive terrestrial or riparian habitats would occur under Option 1. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 1, and no mitigation would be required.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine habitat (**Impact-BIO-10**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would only involve landside improvements associated with the expanded Lane Field Setback Park that could be developed under this option. As discussed in the analysis above, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portions of the proposed PMPU area where future development under Option 2 could occur. Therefore, no construction-related impacts on sensitive terrestrial or riparian habitats would occur under Option 2. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 2, and no mitigation would be required.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine habitat (**Impact-BIO-10**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would only involve landside improvements associated with new park space that could be developed under this option. As discussed in the analysis above, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portions of the proposed PMPU area where future development under Option 3 could occur. Therefore, no construction-related impacts on sensitive terrestrial or riparian habitats would occur under Option 3. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 3, and no mitigation would be required.

Operation***Marine Resources***

Operational impacts on marine resources would potentially include permanent overwater shading of eelgrass beds by newly built permanent overwater structures (e.g., piers, docks), and potentially

from newly built landside structures, depending on the height and locations of those structures relative to San Diego Bay and any protected eelgrass beds. The construction of new overwater berthing and/or aquaculture facilities over existing eelgrass beds would result in permanent impacts on EFH, and overwater shading from these structures would prevent sunlight from reaching eelgrass beds below. The construction of landside structures such as new hotels, restaurants, and retail could also induce permanent shading impacts on eelgrass beds, depending on whether the shadow cast by the new structure(s) would fall over existing eelgrass. The expansion of existing buildings could also potentially cause over-shading, especially if the expansion would be added vertically to the building, with new floors being built on top of existing buildings. This would increase the overall extent of the shadow cast by existing buildings, thereby potentially increasing shading of water.

Ultimately, any future development project that causes shading over eelgrass beds would impact eelgrass by reducing the photosynthetic production during the growing season (March to October), and therefore plant production. When reduced to the point below that necessary to sustain the plant, eelgrass beds will die back. This outcome is generally certain for structures that fall directly above eelgrass beds with most if not all eelgrass lost. In some instances, minor amounts of eelgrass can still survive directly beneath structures; however, this would only occur when there are adequate periods with enough light beneath the structure to reach eelgrass beds. Impacts associated with landside structures are more difficult to predict as the shading varies more over the course of a day as the shadow moves with the passing day and season. In such cases, the potential for eelgrass to persist or recruit to a shaded area is dependent upon the average light regime across days and seasons. Because of the uncertainty regarding the height and other characteristics of future development projects that may be adjacent to San Diego Bay and eelgrass beds, permanent eelgrass shading impacts are considered significant (**Impact-BIO-11**).

To reduce eelgrass impacts, **MM-BIO-10** would be implemented prior to any future development project that has the potential to cause permanent eelgrass shading impacts (**Impact-BIO-11**). This mitigation measure includes all mitigation and monitoring requirements in accordance with the CEMP (NMFS 2014). Implementation of **MM-BIO-10** would reduce these impacts to less than significant.

Terrestrial Resources

As described in Section 4.3.2.3, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portion of the proposed PMPU area where future development could occur. Therefore, no operation-related impacts on sensitive terrestrial or riparian habitats would occur.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant operation-related impact on sensitive marine habitat (**Impact-BIO-11**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 1 would only involve landside improvements associated with the new Waterfront Destination Park that could be developed under this option. As described in Section 4.3.2.3, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portion of the proposed PMPU area where future development under Option 1 could occur. Therefore, no operation-related impacts on sensitive terrestrial or riparian habitats would occur under Option 1, and mitigation would not be required for Option 1. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 1, and no mitigation would be required.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant operation-related impact on sensitive marine habitat (**Impact-BIO-11**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would only involve landside improvements associated with the expanded Lane Field Setback Park that could be developed under this option. As described in Section 4.3.2.3, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portion of the proposed PMPU area where future development under Option 2 could occur. Therefore, no operation-related impacts on sensitive terrestrial or riparian habitats would occur under Option 2. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 2, and no mitigation would be required.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant operation-related impact on sensitive marine habitat (**Impact-BIO-11**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 could involve improvements associated with new park space that could be developed under this option. As described in Section 4.3.2.3, no sensitive terrestrial vegetation communities or riparian habitat is present within the landside portion of the proposed PMPU area where future development under Option 3 could occur. Therefore, no operation-related impacts on sensitive terrestrial or riparian habitats would occur, and mitigation would not be required for Option 3. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 3, and no mitigation would be required.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts that would have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, ~~or by CDFW, NMFS, or USFWS~~. Rather,

the proposed policies are intended to reduce or avoid impacts on sensitive natural communities. For instance, the District will enhance and protect Intertidal and Conservation Open Space use designations (WLU Policy 5.1.2); prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or Federally listed coastal species (ECO Policy 1.1.2); coordinate, site, and design future development adjacent to conservation areas and other sensitive habitats to avoid impacts where feasible or legally required (ECO Policy 1.1.3); establish and maintain ecological buffers adjacent to wetland and nearshore sensitive habitats to preserve and protect these environmentally sensitive areas (ECO Policy 1.1.5); prohibit planting of invasive species and prepare a plan to remove invasive species from development that has existing invasive species (ECO Policy 1.1.9); encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems and to reduce stormwater pollution to the Bay (ECO Policy 1.1.11); identify locations throughout the Bay that could support habitat enhancement, restoration, and protection to benefit sensitive habitats and State and Federally listed species (ECO Policy 1.1.13); identify various ecological opportunity areas within water use designations that have shallow subtidal or intertidal habitat that may benefit from additional nature-based shoreline solutions including shoreline stabilization (ECO Policy 1.1.15); support creative and innovative solutions to improve the resiliency of the Bay's marine ecosystems and the biodiversity within Tidelands (ECO Policy 1.1.19); pursue opportunities to create, preserve, enhance or restore intertidal and subtidal habitats in areas that have historically been impacted by development (ECO Policy 1.1.23); develop a mitigation credit program to improve habitat quality and compensate for unavoidable wetland losses through the protection, restoration, and ~~creation, and enhancement~~ of wetland habitats (ECO Policy 1.2.1); continue to conduct or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay (ECO Policy 2.1.5); establish and continue partnerships and collaboration with key agencies and stakeholders to enhance conservation, protection, and restoration of natural resources in and around the Bay and Tidelands (ECO Policy 4.1.1); ~~pursue~~ establish and continue partnerships with regulatory agencies, research institutions, private parties, and NGOs to improve water quality in the Bay and promote public awareness and understanding of water quality issues (ECO Policy 4.1.3); and establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources and how to protect them (ECO Policy 4.2.1).

Impact Determination and Mitigation

Implementation of the proposed PMPU would have a substantial adverse effect on a sensitive natural community identified in local or regional plans, policies, regulations or by CDFW, NMFS, or USFWS.

Significant Impacts

Impact-BIO-10: Temporary Water Quality and Sedimentation Impacts on Eelgrass Beds During Project Construction. The construction of overwater berthing structures and aquaculture facilities would require in-water construction activities such as pile driving, equipment storage, and barge and other construction vessel operations. These activities would induce temporary water quality impacts in instances where measures provided under **MM-BIO-4** could not prevent impacts on eelgrass beds.

Impact-BIO-11: Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures. Operational impacts on marine resources would potentially include permanent

overwater shading of eelgrass beds by newly built permanent overwater structures (e.g., piers, docks), and potentially from newly built landside structures, depending on the height and locations of those structures relative to San Diego Bay and any eelgrass beds. Any future development project that causes shading over eelgrass beds would impact eelgrass by reducing the photosynthetic production and therefore plant production. Because of the uncertainty regarding the height and other characteristics of future development projects that may be adjacent to San Diego Bay and eelgrass beds, permanent eelgrass shading impacts are considered significant.

Mitigation Measures

For **Impact-BIO-10**:

MM-BIO-10: Implement Eelgrass Mitigation and Monitoring in Compliance with the California Eelgrass Mitigation Policy. To reduce eelgrass shading or other permanent impacts during construction and operation of future development allowed under the proposed PMPU, the project proponent shall implement the following measures prior to the commencement of any future development project that has the potential to cause temporary or permanent eelgrass impacts, as determined by the District during project-specific environmental review. All mitigation and monitoring requirements shall be performed in accordance with the CEMP (NMFS 2014).

- The project proponent shall retain a qualified biologist as defined in MM-BIO-1, approved by the District, to conduct a preconstruction eelgrass survey during the project planning phase prior to commencement of construction activities. Surveys for eelgrass will be conducted during eelgrass growing season (March–October), and results will be valid for 60 days, unless completed in September or October; if completed in September or October, results will be valid until resumption of next growing season. The project proponent shall provide the preconstruction eelgrass survey to the District and the NMFS as well as regulatory points of contact for agencies that will be required to provide project permits such as the CDFW, CCC, USACE, and San Diego RWQCB.
- If the results of project planning (e.g., proposed overwater structures or shading analysis) identify potential impacts on eelgrass, the project proponent shall consult with the NMFS, CCC, USACE, RWQCB, and the District to determine appropriate mitigation to achieve the ~~1:2:1~~ eelgrass mitigation ratio specified in the CEMP. A qualified biologist shall then prepare an eelgrass mitigation plan for the District’s review and approval. The qualified biologist shall also submit the plan to the NMFS for review and consultation. The eelgrass mitigation plan shall identify the potential extent of eelgrass impact; the means, methods, and location to mitigate for impacts; and mitigation success criteria; and shall provide a monitoring schedule to monitor for mitigation success.
- Projects may reference a baywide eelgrass survey for planning purposes (i.e., during environmental review), and are required to conduct a preconstruction survey within 30 days of initiating construction per the CEMP.
- The qualified biologist shall also prepare and submit to the District, NMFS, and other pertinent agencies a post-construction eelgrass survey. The post-construction survey shall be conducted within 30 days of completion of construction. If construction ends during the non-growing season (November 1 to February 28), the monitoring shall be delayed until the resumption of the growing season. The post-construction survey shall document the extent of eelgrass impacts following project completion.

- For projects with anticipated long-term impacts on eelgrass where the extent of impact cannot be determined immediately following construction, the qualified biologist shall also perform at least 2 years of annual post-construction eelgrass surveys. The results of the surveys shall be submitted to the District and NMFS ~~other pertinent agencies~~ for review. These annual surveys shall evaluate if any longer-term or operational impacts were caused to eelgrass and the benthic community. Specifically, the surveys shall be designed to evaluate potential shading, vessel movements or/any other potential impacts.
- The project proponent shall commence implementation of the eelgrass mitigation in accordance with the eelgrass mitigation plan within 135 days of any impacts on eelgrass identified in the post-construction survey report(s).
- The project proponent shall implement mitigation performance monitoring at 0, 12, 24, 36, 48, and 60 months as required by the CEMP and consistent with the eelgrass mitigation plan after completing eelgrass transplanting or restoration as specified in the eelgrass mitigation plan. All performance standards shall be in accordance with the CEMP.
- In the event that impacts on eelgrass are detected during the 2-year post-construction period, the project proponent shall provide additional mitigation for eelgrass impacts by transplanting eelgrass at a suitable restoration site at a ratio identified in the CEMP of 1.2:1. ~~Conservative mitigation planning can avoid this additional mitigation through planning for long term impacts and providing eelgrass transplantation prior to monitoring and evaluation of all impacts.~~

In addition, implement **MM-BIO-4**, as described under Threshold 1.

For **Impact-BIO-11**:

Implement **MM-BIO-10**, as described above.

Level of Significance After Mitigation

Implementation of **MM-BIO-10** would reduce potential temporary or permanent eelgrass impacts (**Impact-BIO-10 and Impact-BIO-11**) to less than significant by requiring implementation of various construction measures to reduce turbidity ~~and construction~~; limiting the staging time of construction vessels and equipment, ~~and structures~~; and mitigating any loss of eelgrass habitat at a ratio of 1.2:1 as prescribed ~~in monitoring~~ in accordance with the California Eelgrass Mitigation Policy (**MM-BIO-10**). The surveys would monitor for eelgrass before and after construction at both the construction site and a suitable reference area, and, in the event impacts on eelgrass are detected, **MM-BIO-10** requires consultation with the appropriate resource agencies to determine appropriate mitigation to achieve the ~~1.2:1~~ eelgrass mitigation ratio specified in the CEMP. In addition, **MM-BIO-10** would reduce impacts from permanent eelgrass shading (**Impact-BIO-11**) to less than significant for similar reasons.

Threshold 3: Have a substantial adverse effect on State or Federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Impact Analysis

Impacts of Water and Land Uses

As described under Section 4.3.3, there are numerous Federal, State, and local laws, regulations, policies, and plans that help reduce impacts on State or Federally protected wetlands from future development projects. They would apply to any future development projects proposed consistent with the PMPU, and include the following.

- **Section 404 of the CWA** regulates the discharge or dredging in WoUS. An individual permit from the USACE is required for any discharge of dredged or fill material into WoUS. In cases within minimal adverse effects, the USACE can authorize projects under the general permit process as long as the activity meets criteria established under a given general permit.
- **Section 10 of the Rivers and Harbors Act**, also administered by the USACE, requires USACE permits for structures within or over any navigable WoUS.
- **Section 401 of the CWA** requires a project proponent to obtain a water quality certification prior to obtaining any permit from a Federal agency. The purpose of the certification is to ensure the activity complies with all applicable water quality standards.
- **The Porter Cologne Water Quality Act** requires the RWQCB to issue waste discharge requirements for discharges to WoS for fill of wetlands and other waters that are not regulated by Section 404 of the Federal CWA. In addition, the RWQCB also regulates WoS under Section 401 of the CWA, which requires states to certify that Federally-authorized activities comply with State water quality standards. A Water Quality Certification or a waiver must be obtained from the RWQCB if an activity requiring a Section 404 permit would affect WoS.
- **Article 4 of the California Coastal Act** requires the maintenance and enhancement of marine resources and provides that, “special protection shall be given to areas and species of special biological or economic significance.” Additionally, it specifies that biological productivity of coastal waters, streams, wetlands, estuaries, and lakes be maintained and restored by minimizing adverse effects of wastewater, runoff, groundwater depletion, surface flow interference and encouraging maintenance of vegetation buffer areas and minimizing alteration of streams. The California Coastal Act, Article 4 also provides guidelines for permitting diking, filling, or dredging of open coastal waters, wetlands, estuaries, and lakes.

Construction

Construction of future projects proposed under the proposed PMPU that would have the potential to have a substantial adverse effect on State or Federally protected wetlands and waters ~~(including, but not limited to, marsh, coastal, etc.)~~ through direct removal, filling, and hydrological interruption, include the installation of new, overwater berthing structures (i.e., docks, piers and wharves) for recreational and commercial vessels, as well as the construction of new aquaculture facilities. The impacts associated with overwater coverage from future projects that could be constructed consistent with the water and land uses allowed under the proposed PMPU are analyzed under Threshold 2 and are significant (**Impact-BIO-7**). As discussed under Threshold 2, **MM-BIO-7** would

reduce the impact to less than significant. This impact would apply only to coastal waters as there are no construction activities that could occur under the proposed PMPU that would result in adverse effects on protected wetlands. Future PMPU-related activities with potential to impact coastal waters would be regulated under Sections 401 and 404 of the CWA and Section 10 of the Rivers and Harbors Act.

While no specific dredging activities are proposed in the PMPU, it is possible that some berthing facilities would require maintenance dredging or dredging to either allow clearance for vessels using the slips or to ensure safe navigation for vessels calling on the facilities. In the event that dredging is proposed to support future projects that could be constructed consistent with the water and land uses allowed under the proposed PMPU, construction-related impacts could include incidental contact of construction vessels with the bottom of the Bay or eelgrass beds. During dredging, the bottom contact and removal of sediment can cause increases in turbidity. These significant impacts were previously described for other PMPU-related construction activities (refer to **Impact-BIO-4** and **Impact-BIO-10**). As such, **MM-BIO-4** and **MM-BIO-10** would similarly reduce these impacts to less than significant.

Finally, any construction activities that would involve dredging or fill of underwater habitat could directly impact eelgrass, if present, within the footprint of these activities. Dredging areas with habitat containing eelgrass beds would uproot existing eelgrass. Fill of submerged habitats would entirely cover all eelgrass, if present, which would be considered a significant impact (**Impact-BIO-12**). Although the cause of impacts varies among dredging, filling, and shading, the overall impact (i.e., loss of eelgrass) can be mitigated to less-than-significant levels through implementation of **MM-BIO-10**.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options as it pertains to Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine habitat (**Impact-BIO-4**, **Impact-BIO-10**, and **Impact-BIO-12**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

As discussed in the analysis above, projects that would have the potential to have a substantial adverse effect on State or Federally protected wetlands and waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) through direct removal, filling, and hydrological interruption include the installation of new, overwater berthing structures (i.e., docks) for recreational and

commercial vessels, as well as the construction of new aquaculture facilities, or any projects that require dredging. Option 1 would not involve any in-water work and would not include any of these types of projects or activities. Therefore, impacts on State or Federally protected wetlands would be less than significant under Option 1. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 1, and no mitigation would be required.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine habitat (**Impact-BIO-4, Impact-BIO-10, and Impact-BIO-12**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

As discussed in the analysis above, projects that would have the potential to have a substantial adverse effect on State or Federally protected wetlands and waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) through direct removal, filling, and hydrological interruption include the installation of new, overwater berthing structures (i.e., docks) for recreational and commercial vessels, as well as the construction of new aquaculture facilities, or any projects that require dredging. Option 2 would not involve any in-water work and would not include any of these types of projects or activities. Therefore, impacts on State or Federally protected wetlands would be less than significant under Option 2. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 2, and no mitigation would be required.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on sensitive marine habitat (**Impact-BIO-4, Impact-BIO-10, and Impact-BIO-12**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

As discussed in the analysis above, projects that would have the potential to have a substantial adverse effect on State or Federally protected wetlands and waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) through direct removal, filling, and hydrological interruption include the installation of new, overwater berthing structures (i.e., boat slips) for recreational and commercial vessels, as well as the construction of new aquaculture facilities, or any projects that require dredging. Option 3 would not involve any in-water work and would not include any of these types of project or activities. Therefore, impacts on State or Federally protected wetlands would be less than significant under Option 3. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 3, and no mitigation would be required.

Operation

Operational impacts on State or Federally protected wetlands or waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) include permanent alteration of Bay water hydrodynamics as a result of newly installed pile clusters. Hydrodynamic impacts associated with structures can result

in alterations to currents that cause redistribution of sediment or in some cases stagnation of water and reduced water quality and sediment quality due to deposition. This can lead to direct loss of species that live within or on sediments, impacts on species through smothering or sedimentation ~~over feeding structures~~, or impacts on species due to degraded water quality. This impact is considered significant (**Impact-BIO-13**). Hydrodynamic impacts cannot be directly mitigated unless the proposed structure is moved to an entirely different location where hydrodynamics would not be anticipated to be significantly altered. It is possible that removing similar structures in another location can improve hydrodynamics at the alternate location, but, given varying conditions across the Bay, it is difficult to assess losses at one site with gains at another. Moreover, what constitutes an improvement at one location may be a detriment at another. Therefore, the impacts associated with altered hydrodynamics would be offset by appropriate out-of-kind mitigation. Mitigation measures that improve water quality, enhance and restore habitat, or purchase of credits at an approved mitigation bank established for similar measures would all be suitable (**MM-BIO-11**). Implementation of **MM-BIO-11** would reduce this impact to less than significant.

Finally, any ongoing dredging of underwater habitat would temporarily lower the ecological value of benthic communities. Studies indicate that the benthic community returns to preconstruction populations within 6 months of dredging. Deepening the Bay means reducing the amount of light available at the bottom because light attenuates rapidly through the water. In turn this means reduced microphytobenthos productivity. Microphytobenthos are single-celled primary producers such as diatoms, cyanobacteria, and green algae that live on or just within soft sediments. Reducing this productivity may lead to reduced secondary productivity of the various invertebrates that live on and within the sediment, resulting in a significant impact (**Impact-BIO-14**). ~~Temporary impacts due to lowered benthic productivity from increasing dredged depths (**Impact-BIO-14**) would be offset-addressed through by creation of shallow water habitat to increase the value of benthic habitat at another location required under (MM-BIO-10) or through the same measures noted under MM-BIO-11, which would ensure any long-term impact on the benthic communities is avoided.~~ Implementation of either of these options would reduce **Impact-BIO-14** to less than significant.

Additionally, the construction of new landside structures, along with potential increases in other impermeable surfaces has the potential to alter the current hydrological regime of existing stormwater drainages and outfalls. Increased flow through existing storm drains and addition of outfalls leading into San Diego Bay could mean increased erosion of submerged bottom and habitats such as eelgrass beds in the absence of regulations. However, future development allowed under the proposed PMPU would be required to comply with the District's Stormwater Management and Discharge Control Ordinance (i.e., Article 10) and the JRMP, which include specific requirements for all development and redevelopment activities. Minimum BMPs consistent with the District *BMP Design Manual* require the use of site design BMPs and source control BMPs for all projects. The District's Article 10 also specifically requires pollutant control BMPs for all PDPs, which includes projects falling under the proposed PMPU. Any project considered a PDP would be required to implement pollutant control BMPs, following the hierarchy described in the District's *BMP Design Manual* (retention, partial retention with biofiltration, biofiltration, or flow-through with participation in an Alternative Compliance Program). Stormwater pollutant control BMPs are engineered facilities that are designed to retain (i.e., intercept, store, infiltrate, evaporate, and evapotranspire), biofilter, and/or provide flow-through treatment of stormwater runoff generated on the project site. Additionally, a post-construction SWQMP must be prepared for all projects to identify the project-specific site design and source control BMPs (all projects) and pollutant control

BMPs (for PDPs). Compliance with these regulatory requirements would ensure that this potential impact would be less than significant. Please see Section 4.8, Hydrology and Water Quality, for more details.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options as it pertains to Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operation-related impacts on sensitive marine habitat (**Impact-BIO-13** and **Impact-BIO-14**). These significant impacts would still occur within PD3 under Option 1, as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational impacts on State or Federally protected wetlands or waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) include permanent alteration of Bay water hydrodynamics as a result of newly installed piling clusters, ~~altered depths~~, and other permanent structures in the water such as dock floats and aquaculture pens. Option 1 would not involve any in-water work or include any of these activities, and impacts would be less than significant. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 1 and no mitigation would be required.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operation-related impacts on sensitive marine habitat (**Impact-BIO-13** and **Impact-BIO-14**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational impacts on State or Federally protected wetlands or waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) include permanent alteration of Bay water hydrodynamics as a result of newly installed piling clusters, ~~altered depths~~, and other permanent structures in the water such as dock floats and aquaculture pens. Option 2 would not involve any in-water work or include any of these activities, and impacts would be less than significant. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 2, and no mitigation would be required.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant operation-related impacts on sensitive marine habitat (**Impact-BIO-13** and **Impact-BIO-14**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Operational impacts on State or Federally protected wetlands or waters (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) include permanent alteration of Bay water hydrodynamics as a result of newly installed piling clusters, ~~altered depths~~, and other permanent structures in the water such as dock floats and aquaculture pens. Option 3 would not involve any in-water work or include any of these activities, and impacts would be less than significant. As such, the impacts identified above for the proposed PMPU would not occur within the boundaries of Option 3, and no mitigation would be required.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts that would have a substantial adverse effect on State or Federally protected wetlands (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) through direct removal, filling, hydrological interruption, or other means. Rather, the proposed policies are intended to reduce and minimize impacts on wetlands. For instance, the District will enhance and protect Intertidal and Conservation Open Space use designations (WLU Policy 5.1.2); prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or Federally listed coastal species (ECO Policy 1.1.2); coordinate, site, and design future development adjacent to conservation areas and other sensitive habitats to avoid impacts where feasible or legally required (ECO Policy 1.1.3); establish and maintain ecological buffers adjacent to wetland and nearshore sensitive habitats to preserve and protect these environmentally sensitive areas (ECO Policy 1.1.5); prohibit planting of invasive species and prepare a plan to remove invasive species from development that has existing invasive species (ECO Policy 1.1.9); encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems and to reduce stormwater pollution to the Bay (ECO Policy 1.1.11); identify locations throughout the Bay that could support habitat enhancement, restoration, creation, and protection to benefit sensitive habitats and State and Federally listed species (ECO Policy 1.1.13); identify various ecological opportunity areas within water use designations that have shallow subtidal or intertidal habitat that may benefit from additional restoration or enhancement, or additional nature-based shoreline solutions including shoreline stabilization (ECO Policy 1.1.15); support creative and innovative solutions to improve the resiliency of the Bay's marine ecosystems and the biodiversity within Tidelands (ECO Policy 1.1.19); pursue opportunities to create, preserve, enhance or restore intertidal and subtidal habitats in areas that have historically been impacted by development (ECO Policy 1.1.23); develop a mitigation credit program to improve habitat quality and compensate for unavoidable wetland losses through the protection, restoration, and creation, and enhancement of wetland habitats (ECO Policy 1.2.1); conduct, or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay (ECO Policy 2.1.5); establish and continue partnerships and collaboration with key agencies and stakeholders to enhance conservation, protection, and restoration of natural resources in and around the Bay and Tidelands (ECO Policy 4.1.1); establish and continue pursue partnerships with regulatory agencies, research institutions, private parties, and NGOs to improve water quality in the Bay and promote

public awareness and understanding of water quality issues (ECO Policy 4.1.3); and establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources and how to protect them (ECO Policy 4.2.1).

Impact Determination and Mitigation

Implementation of the proposed PMPU would have a substantial adverse effect on State or Federally protected wetlands (~~including, but not limited to, marsh, vernal pool, coastal, etc.~~) through direct removal, filling, hydrological interruption, or other means.

Significant Impacts

Impact-BIO-4 and **Impact-BIO-10**, as previously described under Thresholds 1 and 2, respectively.

Impact-BIO-12: Direct Loss of Eelgrass from Dredging Activities. Any construction activities that would involve dredging or fill of underwater habitat could directly impact eelgrass if present within the footprint of these activities. Dredging bottom habitat containing eelgrass beds would uproot existing eelgrass. Fill of submerged habitats would entirely cover all eelgrass if present, which would be considered a significant impact.

Impact-BIO-13: Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters. Newly installed pile clusters could result in permanent alteration of Bay water hydrodynamics, which would be considered a significant impact.

Impact-BIO-14: Reduction in the Ecological Value of Benthic Communities from Increased Depths Created by Dredging Activities. Ongoing dredging of underwater habitat would temporarily lower the ecological value of benthic communities and would potentially lead to long-term impacts, which would be considered a significant impact.

Mitigation Measures

For **Impact-BIO-4**:

Implement **MM-BIO-4**, as described above under Threshold 1.

For **Impact-BIO-10**:

Implement **MM-BIO-10**, as described above under Threshold 2.

For **Impact-BIO-12**:

Implement **MM-BIO-10**, as described under Threshold 2.

For **Impact-BIO-13**:

MM-BIO-11: Implement Measures that Improve Water Quality, Enhance Habitat, Restore Habitat, or Purchase Credits in a Mitigation Bank. The project proponent shall implement the following:

1. As required by applicable law or regulation, the project proponent shall obtain permits from the RWQCB and USACE to meet requirements under Sections 401 and 404 of the CWA and Section 10 of the RHA. Appropriate mitigation measures such as those described below shall be developed through consultation with the appropriate resource agencies, including but

not limited to, NMFS, CDFW, USFWS, RWQCB, and/or USACE. The mitigation measure(s) shall be described in permit applications filed with the RWQCB and USACE such that they can be incorporated as permit conditions to be implemented by the project proponent. One or more of the appropriate resource agencies may require additional or greater mitigation than specified under options 2.A, 2.B, 2.C, and 2.D of this mitigation measure.

2. Prior to the commencement of construction activities, the project proponent shall implement one of the following mitigation options, or a combination thereof. The below options provide the minimum mitigation for structural fill impacts associated with altered hydrodynamics.
 - A. Remove an amount of existing fill, such as pilings, equivalent to the proposed project's net increase in fill from structures placed within San Diego Bay, which would replace the area affected by the proposed project at a 1:1 mitigation ratio, subject to the District's review and approval.
 - B. Restore or create an amount of wetland or eelgrass habitat equivalent to the proposed project's net increase in fill or fill associated impacts at a suitable location within San Diego Bay at a 1:1 ratio for wetlands and ~~a 1.2:1 ratio for eelgrass~~ consistent with the California Eelgrass Mitigation Policy, which would offset the net increase in fill by improving ~~eelgrass~~ the habitat structure and primary productivity. The restoration or creation of wetland or eelgrass habitat shall require the project proponent to retain a qualified biologist to prepare and submit a mitigation plan for the District's review and approval, which shall include a description of the restoration site, mitigation requirements, planting plan (e.g., transplant sites, donor sites, reference site), restoration methods (e.g., plant collection or purchase, transplant units), timing of the restoration work, and a monitoring program (e.g., establishment of monitoring and mitigation success criteria). The project proponent shall obtain all applicable permits and all applicable District Real Estate agreements for the mitigation site prior to commencement of construction. Additionally, all fill materials proposed for discharge into San Diego Bay for the development of the mitigation site shall meet the requirements of the USACE' *Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S. – Testing Manual (Inland Testing Manual)*.
 - C. If a suitable mitigation bank within the Coastal Zone that is not yet available, becomes available in the future, prior to construction of the proposed project, the project proponent shall purchase saltmarsh wetland or overwater coverage credits at a 1:1 mitigation ratio to offset the proposed project's net increase in fill. ~~The District shall balance the impacts of the fill against the benefits provided by the mitigation bank to determine the appropriate credit purchase required.~~
 - D. Subject to the Board of Port Commissioners' approval and findings, the project proponent may purchase credits from the District's shading credits ~~program established pursuant to BPC Policy 735 at a fair market value.~~ The District shall determine the equivalency of fill impact and shading credit by comparing the ecological and hydrological losses associated with the fill to the increased value of ecosystem productivity achieved through reduced shading.

For Impact-BIO-14:

Implement **MM-BIO-10**, as described under Threshold 2, and **MM-BIO-11**, as described above.

Level of Significance After Mitigation

Implementation of **MM-BIO-10** would reduce **Impact-BIO-12** to less than significant by requiring implementation of various construction measures to reduce turbidity and construction monitoring in accordance with the CEMP. Eelgrass surveys before and after construction at both the construction site and a suitable reference area, to determine impacts on eelgrass, would be required, and, in the event impacts on eelgrass are detected, **MM-BIO-10** requires the project proponent to implement appropriate mitigation procedures to achieve the ~~1:2:1~~ eelgrass mitigation ratio specified in the CEMP.

Additionally, implementation of **MM-BIO-11** would reduce **Impact-BIO-13** to less than significant by requiring appropriate out-of-kind mitigation as determined by the applicable resource agency(s). Mitigation measures that improve water quality, enhance habitat, restore habitat, or purchase credits in a mitigation bank established for similar measures would all provide suitable mitigation.

Lastly, long-term impacts due to temporary lowered benthic productivity from increasing dredged depths (**Impact-BIO-14**) would be avoided ~~offset~~ by creation of shallow water habitat ~~to increase the value of benthic habitat at another location (MM-BIO-11 or) or improving onsite (MM-BIO-10).~~ Implementation of either of these ~~options~~ mitigation measures would reduce **Impact-BIO-14** to less than significant.

Threshold 4: Result in substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites?

Impact Analysis

Impacts of Water and Land Uses

As described under Section 4.3.3, there are Federal, State, and local laws, regulations, policies, and plans that help reduce impacts related to substantial interference with movement of migratory species or wildlife corridors or impedance of the use of native wildlife nursery sites from future development projects. They would apply to any future development projects proposed consistent with the PMPU. Such laws, regulations, policies, and plans include the CEMP, which is summarized above under Threshold 2.

Marine Resources

The waterside portions of the proposed PMPU areas contain eelgrass as well as the potential occurrence for protected marine wildlife species such as green sea turtles and several marine mammals. Eelgrass is also a nursery area for many commercially and recreationally important finfish and shellfish (Heck et al. 2003). While the various potential marina developments and landside developments have the potential to impact eelgrass, open water habitat, and special-status wildlife species (see Thresholds 1 through 3 above), potential future uses allowed under the proposed PMPU are typical for San Diego Bay, and the habitat types and species are all common throughout much of the bay. The waterside portions of the planning districts within San Diego Bay do provide resources necessary to support resident and migratory species that spend a portion of their lifecycle within San Diego Bay. These habitats, such as shallow water, eelgrass, and wetlands

~~marshes~~, provide refuge and forage for numerous species. Impacts on these habitats and the native and migratory marine species they support would be similar to **Impact-BIO-3, Impact-BIO-4, Impact-BIO-6, Impact-BIO-7, Impact-BIO-10, Impact-BIO-11, Impact-BIO-12, Impact-BIO-13, and Impact-BIO-14** described under Thresholds 1 through 3 above. Implementation of **MM-BIO-3** would reduce impacts from pile-driving activities on marine mammals, green sea turtles, and fishes to less-than-significant levels by identifying when the species are approaching or within the designated isopleth for Level B harassment and halting in-water pile driving activities until the species has left the construction area. In addition, implementation of **MM-BIO-4, MM-BIO-6, MM-BIO-7, MM-BIO-10, and MM-BIO-11** would reduce impacts related to increased overwater coverage, temporary and permanent impacts on eelgrass habitat, alteration of Bay hydrodynamics, and a temporary reduction in ecological value of benthic communities to less than significant. As such, these mitigation measures would provide protections for these habitats and the sensitive species that inhabit San Diego Bay. Given the lack of obstructions to movement of any native resident or migratory fish, marine mammal, green sea turtle, or other wildlife species and the protections afforded through mitigation measures relative to impacts noted above, impacts would be less than significant after mitigation. Therefore, construction and operation of future PMPU-related projects would not substantially interfere with the movement of any native resident or migratory fish, marine mammal, green sea turtle, or other marine wildlife species, nor would future development allowed under the proposed PMPU interfere with established native resident or migratory wildlife corridors for marine resources.

Terrestrial Resources

Though the landside portion of the proposed PMPU area is predominately urban/developed and vegetation is predominately landscaped ornamental species, the PMPU areas do occur along the Pacific Coast Flyway, which is a major migratory ~~bird route for migrating birds along the Pacific coast~~. San Diego Bay is an important stopover area and provides feeding grounds for birds during their migration. The Bay also provides important nesting grounds for several special-status birds. Impacts on migratory birds would be similar to **Impact-BIO-1, Impact-BIO-2, Impact-BIO-4, Impact-BIO-5, Impact-BIO-8, and Impact-BIO-9** described under Threshold 1 and are significant.

Implementation of **MM-BIO-1, MM-BIO-2, MM-BIO-4, and MM-BIO-5** would reduce impacts on foraging and nesting birds during construction activities to less-than-significant levels by avoiding and minimizing disturbance during the bird nesting season through preconstruction surveys and buffer zones to protect active nests. Implementation of **MM-BIO-8** would reduce impacts associated with the addition of new permanent perches that could be used by raptors or other large predatory birds to less-than-significant levels. Mitigation measure **MM-BIO-8** also requires installation of features to minimize the use of new structures such as buildings, fences, and pilings by avian predators of sensitive species. For structures built within 500 feet of sensitive species habitat, perch deterrents would be installed to prevent raptors and other predatory birds from perching, thereby reducing predatory pressure on sensitive species. Implementation of **MM-BIO-9** would reduce potential impacts on migrating birds due to bird strikes to less-than-significant levels by requiring the incorporation of design strategies ~~and performance standards~~ to enable birds to avoid structures. Therefore, potential impacts associated with the movement of any native resident or terrestrial wildlife species or with established native resident or migratory wildlife corridors for terrestrial species, or impedance of the use of native wildlife nursery sites would be less than significant after mitigation.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites (**Impact-BIO-1** through **Impact-BIO-14**). These significant impacts would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction and operational activities under Option 1 would only involve landside improvements and would not involve any in-water work. As such, the impacts on marine resources identified above for the proposed PMPU would not occur within the boundaries of Option 1. Though the landside portion of PD3 is predominately urban/developed and vegetation is predominately landscaped ornamental species, the planning district does occur along the Pacific Coast Flyway, which is a major migratory bird route ~~for migrating birds along the Pacific coast~~. San Diego Bay is an important stopover area and provides feeding grounds for birds during their migration. The Bay also provides important nesting grounds for several special-status birds. Therefore, construction and operation of Option 1 could result in significant impacts as identified in **Impact-BIO-2** and **Impact-BIO-5**. However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Option 1. In addition, it is anticipated that any new structures developed under Option 1 (e.g., restrooms) would be minimal in size and would not contain features that involve the use of reflective building and glass finishes that may confuse birds in flight, leading to an increase in strikes. As such, this significant impact of the proposed PMPU would not occur within the boundaries of Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites (**Impact-BIO-1** through **Impact-BIO-14**). These significant impacts would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction and operational activities under Option 2 would only involve landside improvements and would not involve any in-water work. As such, the impacts on marine resources identified above for the proposed PMPU would not occur within the boundaries of Option 2. Though the landside portion of PD3 is predominately urban/developed and vegetation is predominately landscaped ornamental species, the planning district does occur along the Pacific Coast Flyway, which is a major bird migratory route ~~for migrating birds along the Pacific coast~~. The San Diego Bay is an important stopover area and provides feeding grounds for birds during their migration. The Bay also provides important nesting grounds for several special-status birds. Therefore, construction and operation of Option 2 could result in significant impacts as identified in **Impact-BIO-2** and **Impact-BIO-5**. However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Option 2. In addition, it is anticipated that any new structures developed under Option 2 (e.g., restrooms) would be minimal in size and would not contain features that involve the use of reflective building and glass finishes that may confuse birds in flight, leading to an increase in strikes. As such, this significant impact of the proposed PMPU would not occur within the boundaries of Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impacts related to substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites (**Impact-BIO-1** through **Impact-BIO-14**). These significant impacts would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Construction and operational activities under Option 3 would only involve landside improvements and would not involve any in-water work. As such, the impacts on marine resources identified above for the proposed PMPU would not occur within the boundaries of Option 3. Though the landside portion of PD3 is predominately urban/developed and vegetation is predominately landscaped ornamental species, the planning district does occur along the Pacific Coast Flyway, which is a major bird migratory route ~~for migrating birds along the Pacific coast~~. The San Diego Bay is an important stopover area and provides feeding grounds for birds during their migration. The Bay also provides important nesting grounds for several special-status birds. Therefore, construction and operation of Option 3 could result in significant impacts as identified in **Impact-BIO-2** and **Impact-BIO-5**. However, these would not be additional or more severe impacts than buildout of the proposed PMPU without Option 3. In addition, it is anticipated that any new structures developed under Option 3 (e.g., restrooms) would be minimal in size and would not contain features that involve the use of reflective building and glass finishes that may confuse birds in flight, leading to an increase in strikes. As such, this significant impact of the proposed PMPU would not occur within the boundaries of Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in impacts associated with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites.

Impact Determination and Mitigation

Implementation of the proposed PMPU would not result in substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites with mitigation.

Significant Impacts

Impact-BIO-1: In-Water Construction-Induced Noise Impacts Disrupting Foraging Behavior of Sensitive Avian Species Such as California Least Tern and California Brown Pelican, as described under Threshold 1.

Impact-BIO-2: Construction Noise Impacts on Nesting Behavior of Marine-Dependent Species Protected under the Migratory Bird Treaty Act and California Fish and Game Code, as described under Threshold 1.

Impact-BIO-3: In-Water Pile Driving Activity Could Generate Noise Levels that Could Injure (Level A Harassment) or Alter the Behavior of (Level B Harassment) Marine Mammals, Green Sea Turtles, and Fishes, as described under Threshold 1.

Impact-BIO-4: Increased Water Turbidity from Disturbance of Submerged Sediments During In-Water Construction Would Limit the Ability of Protected Fish-Foraging Avian Species to Locate Prey and Could Disrupt Eelgrass Productivity, as described under Threshold 1.

Impact-BIO-5: Potential Disturbance or Destruction of Nests Protected by the ESA and/or CESA, Migratory Bird Treaty Act, and California Fish and Game Code, as described under Threshold 1.

Impact-BIO-6: Aquaculture-Raised Shellfish Could Impact Essential Fish Habitat Through Reduction of Available Plankton and Organic Particles and Changes to the Benthic Environment, as described under Threshold 1.

Impact-BIO-7: Permanent and Long-Term Overwater Coverage from Introduction of New Structures, as described under Threshold 1.

Impact-BIO-8: Raptors and Other Large Predatory Birds Using Newly Constructed Structures as Perches to Hunt Protected Avian Species in their Nesting Habitats, as described under Threshold 1.

Impact-BIO-9: Bird Strikes Resulting from Use of Reflective Materials, as described under Threshold 1.

Impact-BIO-10: Temporary Water Quality and Sedimentation Impacts on Eelgrass Beds During Project Construction, as described under Threshold 2.

Impact-BIO-11: Permanent Overwater Shading of Eelgrass Beds by Newly Constructed Structures, as described under Threshold 2.

Impact-BIO-12: Direct Loss of Eelgrass from Dredging Activities, as described under Threshold 3.

Impact-BIO-13: Permanent Alteration of Bay Water Hydrodynamics due to the Placement of Pile Clusters, as described under Threshold 3.

Impact-BIO-14: Reduction in the Ecological Value of Benthic Communities from Increased Depths Created by Dredging Activities, as described under Threshold 3.

Mitigation Measures

For **Impact-BIO-1**:

Implement **MM-BIO-1**, as described above under Threshold 1.

For **Impact-BIO-2**:

Implement **MM-BIO-2**, as described above under Threshold 1.

For **Impact-BIO-3**:

Implement **MM-BIO-3**, as described above under Threshold 1.

For **Impact-BIO-4**:

Implement **MM-BIO-4**, as described above under Threshold 1.

For **Impact-BIO-5**:

Implement **MM-BIO-5**, as described above under Threshold 1.

For **Impact-BIO-6**:

Implement **MM-BIO-6**, as described above under Threshold 1.

For **Impact-BIO-7**:

Implement **MM-BIO-7**, as described above under Threshold 1.

For **Impact-BIO-9**:

Implement **MM-BIO-9**, as described above under Threshold 1.

For **Impact-BIO-10**:

Implement **MM-BIO-4** and **MM-BIO-10**, as described above under Thresholds 1 and 2, respectively.

For **Impact-BIO-11**:

Implement **MM-BIO-10**, as described above under Threshold 2.

For **Impact-BIO-12**:

Implement **MM-BIO-10**, as described above under Threshold 2.

For **Impact-BIO-13**:

Implement **MM-BIO-11**, as described above under Threshold 3.

For **Impact-BIO-14**:

Implement **MM-BIO-10** or **MM-BIO-11**, as described above under Threshold 3.

Significance After Mitigation

Implementation of **MM-BIO-3** would reduce impacts from pile-driving activities on marine mammals, green sea turtles, and fishes (**Impact-BIO-3**) to less-than-significant levels by identifying when the species are approaching or within the designated isopleth for Level B harassment and halting in-water pile driving activities until the species has left the construction area.

Implementation of **MM-BIO-6** would reduce **Impact-BIO-6** to less than significant by requiring future project proponents to develop and implement a Shellfish Aquaculture Mitigation Program that includes specific requirements for addressing potential impacts on managed fish species, essential fish habitat, and benthic communities from shellfish aquaculture operations. In addition, implementation of **MM-BIO-4**, **MM-BIO-7**, and **MM-BIO-10** would reduce impacts related to increased overwater coverage (**Impact-BIO-7**), temporary and permanent impacts on eelgrass habitat (**Impact-BIO-10**, **Impact-BIO-11**, **Impact-BIO-12**), and alteration of Bay hydrodynamics (**Impact-BIO-13**) to less than significant. Long-term impacts due to temporary lowered benthic productivity from increasing dredged depths (**Impact-BIO-14**) would be avoided offset by creation of shallow water habitat to increase the value of benthic habitat at another location required under (**MM-BIO-11**) or improving onsite (**MM-BIO-10**).

Implementation of **MM-BIO-1**, **MM-BIO-2**, **MM-BIO-4**, and **MM-BIO-5** would reduce impacts on foraging and nesting birds during construction activities (**Impact-BIO-1**, **Impact-BIO-2**, **Impact-BIO-4**, and **Impact-BIO-5**) to less-than-significant levels by avoiding or minimizing disturbance during the bird nesting season through preconstruction surveys and buffer zones to protect active nests. Impacts associated with addition of new permanent perches that could be used by raptors or other large predatory birds (**Impact-BIO-8**) can be reduced to less than significant by **MM-BIO-8**. Implementation of **MM-BIO-9** would reduce potential impacts on migrating birds due to bird strikes (**Impact-BIO-9**) to less-than-significant levels by requiring that final building design meet design strategies with the *Bird-Friendly Building Design* and be approved by the District, by incorporating strategies to minimize the threat to avian species. Therefore, potential impacts associated with the movement of any native resident or terrestrial wildlife species or with established native resident or migratory wildlife corridors for terrestrial species, or impedance of the use of native wildlife nursery sites would be less than significant.

Threshold 5: Conflict with any applicable local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance or with the provisions of an applicable adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?

Impact Analysis

Impacts of Water and Land Uses

The applicable habitat conservation or natural community conservation plans, as well as local land use plans, policies, ordinances, or regulations adopted for the purpose of protecting biological resources, include the San Diego Bay INRMP (District and U.S. Navy 2013) ~~and San Diego Bay National Wildlife Refuge Comprehensive Conservation Plan (USFWS 2006)~~. The District's collaboration and maintenance of strong working relationships and partnerships with the U.S. Navy and USFWS demonstrates a shared goal of protecting Tidelands and the Bay environment.

The District and the U.S. Navy Southwest Division jointly maintain and implement the INRMP as a long-term collaborative strategy for managing INRMP, and are the primary means by which the U.S. Navy and the District jointly plan natural resources work in San Diego Bay. The INRMP does not carry regulatory authority, but rather is a guide to better, more cost-effective decisions by those involved with the Bay. It includes objectives and policy recommendations to guide planning, management, conservation, restoration, and enhancement of the Bay ecosystems.

The INRMP catalogues the plant and animal species around the Bay and identifies habitat types with the purpose of ensuring the long-term health, recovery, and protection of San Diego Bay's ecosystem in concert with economic, Naval, recreational, navigational, and fisheries needs. The overall goal of the INRMP is to provide direction for the good stewardship that natural resources require, while supporting the ability of the Navy and District to achieve their missions and continue functioning within San Diego Bay.

The INRMP identifies ecosystem management strategies for the Bay's natural resource values viewed in a whole-ecosystem context, and seeks opportunities to better institutionalize the guiding principles of ecosystem management for San Diego Bay. These strategies consist of the following:

- Maintain and improve the sustainability and native biodiversity of ecosystems.
- Administer with consideration of ecological units and time frames.
- Support sustainable human activities.
- Develop priorities and reconcile conflicts.
- Develop coordinated approaches to ecosystem health through partnerships.
- Rely on the best science and data available.
- Use benchmarks to monitor and evaluate outcomes.
- Apply adaptive management.

The goals, objectives, and policies of the proposed PMPU do not conflict with the INRMP objectives related to conservation and enhancement, nor with the management strategies detailed in the plans. In fact, those objectives and policies strongly support the preservation and proper management of biological resources on Tidelands. The District is responsible for, and committed to, safeguarding its natural resources and the public's access to nature, which is further highlighted in the Ecology Element of the proposed PMPU. The goals, objectives, and policies of the Ecology Element seek to enhance, conserve, and restore natural resources and foster a healthy environment by avoiding development in environmentally sensitive areas and promoting ways to improve existing natural resources within the Tidelands. More specifically, the goals and objectives support the following conservation approaches:

- Requirements for future development adjacent to or otherwise near environmentally sensitive areas.
- Protection, restoration, and conservation of biologically diverse resources.
- Pollution prevention and improving the quality of the land, water, and air.
- Enhanced collaboration with local partners on shared priorities.

Moreover, there are several specific policies within the proposed PMPU that would reduce and minimize impacts related to biological resources, consistent with the overall intent of the INRMP.

For instance, the District will establish and continue collaboration with key agencies and stakeholders, including the U.S. Navy and USFWS, and adjacent disadvantaged communities, relevant indigenous communities and tribes, and other stakeholders to enhance conservation, protection, and restoration of natural resources in and around the Bay and Tidelands (ECO Policy 4.1.1). Additionally, the District will enhance and protect Intertidal and Conservation Open Space use designations (WLU Policy 5.1.2); prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or Federally listed coastal species (ECO Policy 1.1.2); coordinate, site, and design future development adjacent to conservation areas and other sensitive habitats to avoid impacts where feasible or legally required (ECO Policy 1.1.3); establish and maintain ecological buffers between landside development and saltmarsh wetland to preserve and protect the wetland habitat for the anticipated life of the development (ECO Policy 1.1.5); prohibit planting of invasive species and prepare a plan to remove invasive species from development that has existing invasive species (ECO Policy 1.1.9); use ecologically sensitive lighting that is shielded and directed away from the water or sensitive habitat areas, sensor activated, and of the lowest possible color temperature that also meets public safety requirements where development occurs above the water or adjacent to sensitive habitat areas (ECO Policy 1.1.10); encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems and to reduce stormwater pollution to the Bay (ECO Policy 1.1.11); identify locations throughout the Bay that could support habitat enhancement, restoration, and protection to benefit sensitive habitats and State and Federally listed species (ECO Policy 1.1.13); identify various ecological opportunity areas within water use designations that have shallow subtidal or intertidal habitat that may benefit from additional restoration or enhancement, or additional nature-based shoreline solutions including shoreline stabilization (ECO Policy 1.1.15); provide information to the public about the water quality risks associated with invasive species and about measures to avoid and reduce the spread of invasive species (ECO Policy 1.1.16); support creative and innovative solutions to improve the resiliency of the Bay's marine ecosystems and the biodiversity within Tidelands (ECO Policy 1.1.19); pursue opportunities to create, preserve, enhance or restore intertidal or subtidal habitats in areas that have historically been impacted by development (ECO Policy 1.1.23); continue to conduct, or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay (ECO Policy 2.1.5); and establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources and how to protect them (ECO Policy 4.2.1). These policies align with the goals and objectives of the INRMP and demonstrate that the District, through the proposed PMPU's goals, objectives, and policies, is committed to the long-term preservation, enhancement, and rehabilitation of the ecology of the Bay. As such, the proposed PMPU would be consistent with the overall intent of the INRMP to protect biological resources in and around San Diego Bay.

However, as discussed in Thresholds 1 through 4 above, future development that could occur under the proposed PMPU would have the potential to result in significant impacts on biological resources prior to mitigation. Because future development under the proposed PMPU would result in potential short-term impacts on terrestrial and marine biological resources during construction, and the timing, location, and design specifications for future development under the proposed PMPU are not yet known, it cannot be determined with certainty that future development would not conflict with the INRMP, even though development would need to be consistent with the policies of the proposed PMPU. Any significant biological resource impacts from future development are considered a significant impact under this threshold because they would potentially result in a conflict with the INRMP (**Impact-BIO-15**). Implementation of **MM-BIO-1** through **MM-BIO-11**, which are provided

under the Thresholds 1 through 4 above, would avoid, minimize, and compensate for biological resources impacts of future development that could occur under the proposed PMPU. These mitigation measures, which address both construction and operational impacts of future development, would preclude conflicts with the INRMP because significant biological resources impacts would be avoided. Therefore, the proposed PMPU would not conflict with applicable local policies or ordinances protecting biological resources, and impacts would be less than significant after mitigation is incorporated.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the environmental effects of each of these options as it pertains to Threshold 5.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Navy Pier

As discussed above, implementation of the proposed PMPU, within PD3, would result in significant impact related to conflicts with applicable local policies or ordinances protecting biological resources that apply to the proposed PMPU (**Impact-BIO-15**). This significant impact would still occur within PD3 with inclusion of Option 1, as a result of the same reasonably future development that could still occur outside of the option boundary within PD3.

Option 1 would not conflict with the INRMP objectives related to conservation and enhancement, nor with the management strategies detailed in the plan. There are no characteristics associated with Option 1 that would conflict with the INRMP. Therefore, Option 1 would not conflict with local policies or ordinances protecting biological resources, and impacts would be less than significant.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impact related to conflicts with applicable local policies or ordinances protecting biological resources (**Impact-BIO-15**). This significant impact would still occur within PD3, with the inclusion of Option 2, as a result of the same future development that could still occur outside of the Option boundary within PD3.

Implementation of Option 2 would not conflict with the INRMP objectives related to conservation and enhancement, nor with the management strategies detailed in the plans. There are no characteristics associated with Option 2 that would conflict with the INRMP. Therefore, Option 2 would not conflict with local policies or ordinances protecting biological resources, and impacts would be less than significant.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant impact related to conflicts with applicable local policies or ordinances protecting biological resources (**Impact-BIO-15**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 3 would not conflict with the INRMP objectives related to conservation and enhancement, nor with the management strategies detailed in the plans. There are no characteristics associated with Option 3 that would conflict with the INRMP. Therefore, Option 3 would not conflict with local policies or ordinances protecting biological resources, and impacts would be less than significant after mitigation.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in conflicts with applicable local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance or with the provisions of an applicable adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan. Rather, the proposed policies are intended to reduce and minimize impacts related to biological protection regulations, such as the INRMP. For instance, the District will establish and continue partnerships and collaboration with key agencies and stakeholders, including the U.S. Navy and USFWS, adjacent disadvantaged communities, relevant indigenous communities and tribes, and other stakeholders to enhance conservation, protection, and restoration of natural resources in and around the Bay and Tidelands (ECO Policy 4.1.1). Additionally, the District will enhance and protect Intertidal and Conservation Open Space use designations (WLU Policy 5.1.2); prioritize and pursue opportunities for the protection, conservation, creation, restoration, and enhancement of sensitive habitats and State or Federally listed coastal species (ECO Policy 1.1.2); coordinate, site, and design future development adjacent to conservation areas and other sensitive habitats to avoid impacts where feasible or legally required (ECO Policy 1.1.3); establish and maintain ecological buffers between landside development and saltmarsh wetland to preserve and protect the wetland habitat for the anticipated life of the development (ECO Policy 1.1.5); prohibit planting of invasive species and prepare a plan to remove invasive species from development that has existing invasive species (ECO Policy 1.1.9); use ecologically sensitive lighting that is shielded and directed away from the water or sensitive habitat areas, sensor activated, and of the lowest possible color temperature that also meets public safety requirements where development occurs above the water or adjacent to sensitive habitat areas (ECO Policy 1.1.10); encourage the use of biologically engineered stormwater solutions to prevent degradation of coastal wetlands and marine ecosystems and to reduce stormwater pollution to the Bay (ECO Policy 1.1.11); identify locations throughout the Bay that could support habitat enhancement, restoration, creation, and protection to benefit sensitive habitats and State and Federally listed species (ECO Policy 1.1.13); identify various ecological opportunity areas within water use designations that have shallow subtidal or intertidal habitat that may benefit from additional restoration or enhancement, or additional nature-based shoreline solutions including shoreline stabilization (ECO Policy 1.1.15); provide information to the public about the water quality risks associated with invasive species and about measures to avoid and reduce the spread of invasive species (ECO Policy 1.1.16); support creative and innovative solutions to improve the resiliency of the Bay's marine ecosystems and the biodiversity within Tidelands (ECO Policy 1.1.19); pursue opportunities to create, preserve, enhance or restore intertidal and subtidal

habitats in areas that have historically been impacted by development (ECO Policy 1.1.23); continue to conduct, or require permittees to conduct, the long-term monitoring of water, sediment, eelgrass, birds, and marine life in the Bay (ECO Policy 2.1.5); and establish and continue environmental education programs to increase public understanding and appreciation of Tidelands' and the Bay's natural resources and how to protect them (ECO Policy 4.2.1).

Impact Determination and Mitigation

Implementation of the proposed PMPU would have the potential (through the implementation of future projects) to conflict with applicable local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance or with the provisions of an applicable adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

Significant Impacts

Impact-BIO-15: Potential for Future Projects to Result in a Conflict with the Integrated Natural Resources Management Plan. The PMPU provides the general policy framework for future projects to abide with and has several policies that are intended to protect the environment and the natural resources within the Tidelands. While the proposed PMPU goals, objectives, and policies are not in conflict with the INRMP, it cannot be determined at the programmatic level of analysis contained with this PEIR exactly where and how future projects, consistent with the proposed PMPU, would be implemented. This includes considerations such as the exact location and siting of development projects and related activities such as material laydown and construction staging areas in relation to natural resources and environmentally sensitive areas. Because significant impacts on biological resources were identified under Thresholds 1 through 4, implementation of the proposed PMPU would have the potential to conflict with the INRMP.

Mitigation Measures

For **Impact-BIO-15**:

- Implement **MM-BIO-1**, as described above under Threshold 1.
- Implement **MM-BIO-2**, as described above under Threshold 1.
- Implement **MM-BIO-3**, as described above under Threshold 1.
- Implement **MM-BIO-4**, as described above under Threshold 1.
- Implement **MM-BIO-5**, as described above under Threshold 1.
- Implement **MM-BIO-6**, as described above under Threshold 1.
- Implement **MM-BIO-7**, as described above under Threshold 1.
- Implement **MM-BIO-8**, as described above under Threshold 1.
- Implement **MM-BIO-9**, as described above under Threshold 1.
- Implement **MM-BIO-10**, as described above under Threshold 2.
- Implement **MM-BIO-11**, as described above under Threshold 3.

Level of Significance After Mitigation

Implementation of **MM-BIO-1** through **MM-BIO-11**, as described under Thresholds 1 through 4, would reduce the potential for any future conflict with the INRMP as a result of the implementation of future projects, consistent with the proposed PMPU, to less than significant. This would be accomplished by mitigating all potential impacts on biological resources from future projects, as analyzed under Thresholds 1 through 4, to less-than-significant levels. Because the goals, objectives, and policies of the proposed PMPU would not conflict with the INRMP and mitigation measures would ensure future projects would not result in any significant impacts on biological and natural resources covered by these plans, **Impact-BIO-15** would be reduced to less than significant.

4.3.5 Cumulative Impact Analysis

A significant cumulative impact on biological resources would occur if the proposed PMPU would contribute to impacts related to sensitive plant or wildlife species, sensitive habitat/natural communities, Federal and State protected wetlands, wildlife movement corridors, or conflicts with applicable local policies or ordinances or applicable adopted habitat conservation plans or natural community conservation plans.

4.3.5.1 Geographic Scope

The geographic area for cumulative terrestrial biological resources impacts to which the proposed PMPU may contribute includes all habitats adjacent to, or otherwise linked to, San Diego Bay. The geographic area for cumulative marine biological resources impacts includes San Diego Bay in its entirety. Past, present, and probable future plans and programs that could contribute to cumulative impacts on terrestrial and aquatic biological resources include those listed in Table 2-2 in Chapter 2 that would allow for waterfront development projects with grading, paving, landscaping, road, and building construction on undeveloped land or otherwise with habitat present, as well as redevelopment projects and in-water development. Marine organisms could be directly affected by construction and/or operation activities in or along the water, including dredging, filling, and wharf demolition/construction. Untreated runoff from construction or operation activities on land into harbor waters via storm drains or sheet runoff also has the potential to contribute to cumulative impacts.

4.3.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Past development projects have changed the land in and around San Diego Bay and surrounding Downtown area, as well as the Imperial Beach Oceanfront, from a natural and undeveloped setting to a highly urbanized setting with military, residential, commercial, industrial, and recreational uses. The areas surrounding the Bay and the Imperial Beach Oceanfront continue to see an increase in urban density and intensity from recent past and present projects, and probable future projects are expected to continue the area's urbanization. In addition, past development projects, along with present and probable future development projects associated with the plans and programs identified in Table 2-2, have included and continue to include development at or near the waterfront that has cumulatively contributed to direct and indirect impacts on habitat and species of the Bay. Consequently, the vast majority of sensitive habitat that once existed along the bayfront, particularly

in the northern and central portions of the Bay, is no longer present. However, there are still areas in the southern portion of the Bay that contain ~~undeveloped~~ wetlands and sensitive habitat. These areas include Sweetwater River, Otay River, Chula Vista Wildlife Reserve, and South San Diego Bay National Wildlife Refuge, ~~and Telegraph Creek.~~

Present and probable future projects would be required to be consistent with the Chula Vista Bayfront Master Plan Natural Resources Management Plan (for future projects along the Chula Vista Bayfront), and the District's and U.S. Navy's INRMP, which identify important sensitive species and habitats in San Diego and in San Diego Bay targeted for preservation. Moreover, present and future projects also would comply with requirements of the Federal and State ESA, MBTA, and MMPA, which contain regulations for the take of any listed species, migratory birds, and marine mammals, and would require that present and probable future projects avoid and/or mitigate potential impacts on these species.

Present and probable future projects do have the potential to further degrade water quality within the geographic scope for cumulative impacts and thus the existing marine habitat. However, specific regulations such as the Stormwater Municipal Permit and the Industrial General Permit are in place that would minimize continued degradation of the existing marine habitat. For example, projects over 1 acre in size are required to prepare and implement a SWPPP, while projects smaller than 1 acre are still required to comply with the applicable water quality regulations and the District's JRMP, depending on the jurisdiction in which the project would be located. The SWPPPs would identify short-term, project-specific BMPs for each project to minimize pollutants and/or sediments traveling via runoff, and long-term BMPs would be implemented based on the required Water Quality Control Plans using a combination of site design BMPs, source control BMPs, and treatment control BMPs. Implementation of both construction and operational BMPs would minimize harm to marine habitat from water runoff.

Moreover, construction of present and probable future projects that involve in-water work such as pile driving have the potential to cause hydroacoustic impacts on fish, green sea turtle, and marine mammals as well as airborne noise impacts on marine mammal species. However, all present and probable future projects would be required to mitigate for these impacts, which could include measures such as surveying for the presence of marine special-status species and monitoring programs to reduce potential impacts during in-water construction.

In addition, marinas, piers, and other structures currently exist throughout San Diego Bay, and recreational, commercial, and industrial boating activities currently occur. Past, present, and probable future projects have increased, and could continue to increase, the overwater coverage throughout the Bay, and could also affect the Bay's water quality, disturb sensitive marine species during pile driving activities, and reduce eelgrass habitat. The increase in overwater coverage reduces the available open water habitat that is used for foraging by fish-eating avian species. Construction activities, accidental spills, bilge pump discharges, and other activities associated with recreational, commercial, and industrial boating uses can contaminate or reduce the clarity of the water in the Bay, which would inhibit the ability of fish-eating avian species such as California least tern to identify prey for foraging. However, all present and probable future projects would be required to mitigate for these impacts, which could entail the implementation of mitigation measures based on an approved mitigation ratios ~~determined by applicable resource agencies,~~ ensuring compliance with CWA Sections 401 and 404 and Rivers and Harbors Act Section 10, or implementing requirements such as bilge pump discharge limitations and spill control plans.

Nevertheless, given the historical loss of sensitive habitat and species that once existed throughout San Diego Bay, cumulative biological resource impacts from past, present, and probable future development projects within the cumulative study area are significant.

4.3.5.3 Project Contribution

Future development allowed under the proposed PMPU would consist of construction and operational activities in both terrestrial and marine environments. Construction-related impacts on marine resources that could occur from future projects consistent with the proposed PMPU would include construction-induced noise impacts, increases in turbidity, and release of particulates and chemicals of concern into U.S. or State waters. Construction-induced noise impacts from landside construction activity and overwater construction activities such as pile driving could disrupt the foraging behavior of California least tern and other sensitive fish-foraging avian species, which, when combined with past, present, and probable future projects, would result in a cumulatively considerable impact (**Impact-C-BIO-1**). Construction noise can also impact marine-dependent species protected under the MBTA and California Fish and Game Code by causing nesting birds to abandon nest sites or alter nesting behavior in ways that lower nesting success, resulting in a cumulatively considerable impact (**Impact-C-BIO-2**). Furthermore, in-water construction activities associated with new vessel slips, and other uses listed in the proposed PMPU Water and Land Use Tables, could generate enough underwater noise to physically injure marine mammals, sea turtles, and fishes. This is particularly true if that construction requires the use of impact hammers or vibratory pile driving, resulting in a cumulatively considerable impact (**Impact-C-BIO-3**). However, the implementation of **MM-BIO-1** through **MM-BIO-3** would reduce the proposed PMPU's contribution to these impacts to less than cumulatively considerable. In-water construction activities that involve bottom sediment disturbance would also potentially result in temporary increases in turbidity, which could limit the ability of California least terns and other sensitive fish-foraging avian species to locate prey. Additionally, disruption to eelgrass can occur due to increased turbidity. Prolonged increases in turbidity can reduce primary productivity associated with eelgrass because the turbid water prevents sunlight from reaching this primary producer and sensitive species. These impacts would be cumulatively significant (**Impact-C-BIO-4**). However, the proposed PMPU's contribution to this impact would be reduced to less than cumulatively considerable with implementation of **MM-BIO-4**, which requires implementation of various construction measures to reduce turbidity and its effects on foraging.

Regarding terrestrial resources, future construction projects under the PMPU have the potential to impact both sensitive species and common avian species protected under the MBTA, California Fish and Game Code, the ESA, and/or CESA during the nesting season from the generation of noise, dust, or nighttime lighting from construction activity, which could impede the use of breeding sites during the avian nesting season, resulting in a significant impact (**Impact-C-BIO-5**). The proposed PMPU's contribution to the impacts on nesting birds would be reduced to less than cumulatively considerable with implementation of **MM-BIO-5**, which requires all projects involving vegetation removal or demolition of existing structures to implement measures such as preconstruction nesting bird surveys and the establishment of no-disturbance buffers should active nests be detected.

In addition, the introduction of shellfish for aquaculture would impact essential fish habitat and associated managed species through the potential reduction of foraging opportunities. Shellfish aquaculture would result in benthic impacts from the presence of gear and equipment, shell debris,

and the accumulation of pseudofeces or fouling organisms due to natural processes and dependent upon culture methods (**Impact-C-BIO-6**). The proposed PMPU's contribution to these impacts would be reduced to less than cumulatively considerable with the implementation **MM-BIO-6**.

The possible addition of overwater structures would result in operational impacts, such as increased overwater coverage, which can impact foraging opportunities for sensitive fish-foraging species and lowered primary productivity due to shading, which can also impact primary productivity of eelgrass. Similarly, structures on shore that increase shading of water area will lower eelgrass productivity where eelgrass is shaded. These impacts would be cumulatively considerable (**Impact-C-BIO-7**). However, overwater coverage from permanent structures can be mitigated in-kind if feasible, or out-of-kind, if in-kind options are not available, as required by **MM-BIO-7**.

Implementation of **MM-BIO-7** would reduce the proposed PMPU's contribution to this impact to less than cumulatively considerable. The addition of landside and waterside structures could also result in operational impacts by inadvertently creating permanent additional perches for raptors and other large predatory birds that prey on other marine-based protected species, resulting in a cumulatively considerable impact (**Impact-C-BIO-8**). Impacts associated with the addition of new permanent perches that could be used by raptors or other large predatory birds can be mitigated by installing perch deterrents to prevent raptors and other predatory birds from perching, thereby reducing predatory pressure on sensitive species (**MM-BIO-8**). Implementation of **MM-BIO-8** would reduce the proposed PMPU's contribution to this impact to less than cumulatively considerable.

Future PMPU-related development of new landside structures involving the use of reflective building and glass finishes could result in increased bird strike potential if the new buildings would not be surrounded by existing buildings that are taller, which, when combined with development of new high-rise structures from past, present, and probable future projects, would result in a cumulatively considerable impact (**Impact-C-BIO-9**). Implementation of **MM-BIO-9** would reduce the proposed PMPU's contribution to this impact to less-than-cumulatively considerable by requiring that final building design meet design strategies consistent with the *Bird-Friendly Building Design* and approved by the District, by incorporating strategies to minimize the threat to avian species to achieve a maximum total building Bird Collision Threat Rating of 15 or less.

Construction and operation of future projects consistent with the PMPU would have the potential to have a substantial adverse effect on sensitive marine habitats, such as eelgrass and other sensitive communities that are identified in local or regional plans, policies, or regulations, resulting in a cumulatively considerable impact (**Impact-C-BIO-10** and **Impact-C-BIO-11**). Implementation of mitigation measures **MM-BIO-4** and **MM-BIO-10** would reduce the proposed PMPU's contribution to impacts from temporary increases in turbidity from support vessels, equipment, and installation of structures during construction or direct removal (**Impact-C-BIO-10**) to less than cumulatively considerable, while **MM-BIO-10** would reduce the proposed PMPU's contribution to impacts from permanent eelgrass shading (**Impact-C-BIO-11**) to less than cumulatively considerable. In-water construction and operational activities could also impact State or Federally protected wetlands or waters through dredging or fill of underwater habitat (**Impact-C-BIO-12**), permanent alteration of Bay hydrodynamics (**Impact-C-BIO-13**), and reduction in ecological value of benthic communities from ongoing dredging (**Impact-C-BIO-14**). When combined with in-water construction and operational activities of past, present, and probable future projects, these impacts would be cumulatively significant. The proposed PMPU's contribution to these impacts would be reduced to less than cumulatively considerable with implementation of **MM-BIO-10** and **MM-BIO-11**. Lastly, because future development under the proposed PMPU would result in potentially significant impacts on biological resources, as analyzed in Thresholds 1 through 4, implementation of the

proposed PMPU would have the potential to conflict with the INRMP. When combined with development associated with past, present, and probable future projects, these impacts would be cumulatively significant (**Impact-C-BIO-15**). However, the proposed PMPU's contribution to this impact would be reduced to less than cumulatively considerable with the implementation of **MM-BIO-1** through **MM-BIO-11**.

While future landside and waterside development associated with the proposed PMPU would result in significant cumulative impacts on terrestrial and marine resources prior to mitigation, the proposed PMPU's contribution to all impacts would be reduced to less than cumulatively considerable with the implementation of mitigation measures, as described above. In addition, present and probable future projects would also be required to comply with applicable Federal, State and local regulations, including, but not limited to, CWA Sections 401 and 404, Rivers and Harbors Act Section 10, applicable NPDES and other permits, the District's Stormwater Management and Discharge Ordinance, and the California Eelgrass Mitigation Policy, and their permitting and mitigation requirements. Therefore, the contribution of the proposed PMPU to cumulative biological resources impacts would be less than cumulatively considerable after mitigation.

4.3.5.4 Cumulative Impact Determination and Mitigation

The proposed PMPU's incremental contribution to cumulative biological resources impacts would not be cumulatively considerable after mitigation.

This page was intentionally left blank.

Section 4.4

Cultural Resources and Tribal Cultural Resources

4.4.1 Overview

This section describes the existing conditions and applicable laws and regulations for cultural resources and tribal cultural resources (TCRs), followed by an analysis of the potential impacts on cultural resources and TCRs that could result from implementation of the proposed Port Master Plan Update (PMPU). Cultural resources include archaeological resources, ethnographic resources, and elements of the historic-era built environment (architectural resources). TCRs are defined as “sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a tribe,” which are either “included in or determined to be eligible for inclusion in the California Historic Register” or “included in a local register of historical resources” (Public Resources Code [PRC] Section 21074), or are determined by a California Environmental Quality Act (CEQA) lead agency, based on its discretion and substantial evidence, that a resource is a tribal cultural resource based on the criteria used to determine whether a historical resource is eligible for listing in the California Register of Historical Resources (CRHR) set forth in PRC Section 5024.1(c). For the purposes of this Program Environmental Impact Report (PEIR), impacts on cultural resources would be significant if implementation of the proposed PMPU would: (1) cause a substantial adverse change in the significance of a historical or archaeological resource, (2) disturb human remains, or (3) cause a substantial adverse change in the significance of a TCR.

Table 4.4-1 summarizes the significant impacts and mitigation measures (MMs) discussed in Section 4.4.4.4, *Project Impacts and Mitigation Measures*.

Table 4.4-1. Summary of Significant Cultural Resources and Tribal Cultural Resources Impacts and Mitigation Measures

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact CUL-1: Future Construction Activities within the Proposed PMPU Area May Adversely Impact Current and Future Significant Historical Resources	All planning districts	MM-CUL-1: Conduct a Historical Resource Assessment	Significant and Unavoidable	MM-CUL-1 would not eliminate the potential for development in the proposed PMPU area to result in demolition or other adverse change in the significance of a current or future historical resource.
Impact-OPT3-CUL-1: Future Construction Activities Associated with Option 3 May Adversely Impact Current and Future Significant Historical Resources	PD3	MM-CUL-1 , as described above	Significant and Unavoidable	MM-CUL-1 would not eliminate the potential for development in the are proposed under Option 3 to result in demolition or other adverse change in the significance of a current or future historical resource.

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Within North Embarcadero				
Impact CUL-2: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Archaeological Resources that are Historical Resources or Unique Archaeological Resources	All planning districts	MM-CUL-2: Conduct an Archaeological Resource	Significant and Unavoidable	MM-CUL-2 would reduce potentially significant impacts on archaeological resources through measures such as project redesign, data recovery, construction monitoring, and procedures to address unanticipated discoveries. However, this mitigation measure would not eliminate the potential for future development to cause a substantial adverse change in the significance of an archaeological resource.
Impact-CUL-3: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Tribal Cultural Resources	All planning districts	Implement MM-CUL-2 , as described above. Implement MM-CUL-3: Require Standard Mitigation Measures for Impacts on TCRs	Significant and Unavoidable	MM-CUL-2 would reduce potentially significant impacts on TCRs through measures such as project redesign, data recovery, construction monitoring, and procedures to address unanticipated discoveries. MM-CUL-3 , in the absence of agreement on mitigation measures to TCRs, would ensure that potentially significant impacts on TCRs are avoided through standard mitigation measures set forth in PCR Section 21084.3. However, both mitigation measures would not eliminate the potential for future development to cause a substantial adverse change in the significance of a TCR.
Impact-C-CUL-1: Future Construction Activities Within the Proposed PMPU Area Could Result in a Cumulatively Considerable	All planning districts	Implement MM-CUL-1 , as described above.	Significant and Unavoidable	MM-CUL-1 would not eliminate the potential for development in the proposed PMPU area to result in a cumulatively considerable contribution to the loss or alteration of

Summary of Significant Impact(s)	Applicable Planning District(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Contribution to Adverse Impacts on Significant Historical Resources				historical built environment resources.
Impact-C-CUL-2: Future Ground-Disturbing Activities Within the Proposed PMPU Area Could Result in a Cumulatively Considerable Contribution to Adverse Impacts on Archaeological Resources that are Historical Resources or Unique Archaeological Resources	All planning districts	Implement MM-CUL-2 , as described above.	Significant and Unavoidable	MM-CUL-2 would reduce the cumulatively considerable contribution to impacts on archaeological resources from future development in the proposed PMPU area through measures such as project redesign, data recovery, construction monitoring, and procedures to address unanticipated discoveries. However, this mitigation measure would not reduce cumulatively considerable impacts below a level of significance.
Impact-C-CUL-3: Future Ground-Disturbing Activities Within the Proposed PMPU Area Could Result in a Cumulatively Considerable Contribution to Adverse Impacts on Tribal Cultural Resources	All planning districts	Implement MM-CUL-2 and MM-CUL-3 , as described above.	Significant and Unavoidable	MM-CUL-2 would help ensure that future development in the proposed PMPU area would not result in a cumulatively considerable contribution to impacts on TCRs through measures such as project redesign, data recovery, construction monitoring, and procedures to address unanticipated discoveries. MM-CUL-3 , in the absence of agreement on mitigation measures to TCRs, would help ensure that potentially significant impacts on TCRs are avoided through standard mitigation measures set forth in PCR Section 21084.3. However, these mitigation measures would not reduce cumulatively considerable impacts below a level of significance.

4.4.2 Existing Conditions

4.4.2.1 Prehistoric Background

The following outlines the known prehistoric cultural traditions of the region. The approximately 10,000 years of documented prehistory of the San Diego region has often been divided into three periods: Early Period (San Dieguito tradition/complex), Archaic Period (Milling Stone Horizon, Encinitas tradition, and La Jolla/Pauma complex), and Late Prehistoric Period (Cuyamaca and San Luis Rey complexes).

Early Period Complexes

The Early Period encompasses the earliest documented human habitation in the region. The San Dieguito complex is the earliest reliably dated occupation of the area. The assemblage of artifacts associated with the San Dieguito complex has been studied and elaborated upon extensively (Rogers 1939, 1945, 1966; Warren and True 1961; Warren 1967, 1987). The complex correlates with Wallace's (1955) "Early Man Horizon," and Warren subsequently defined a broader San Dieguito tradition (1968). The Harris Site (CA-SDI-149/316/4935B) is located along the San Dieguito River, and the earliest component of the site is characteristic of the San Dieguito complex (Warren 1966, 1967; Warren and True 1961). Artifacts from the lower levels of the site include leaf-shaped knives, ovoid bifaces, flake tools, choppers, core and pebble hammerstones, several types of scrapers, crescents, and short-bladed shouldered points (Warren and True 1961; Warren 1966, 1967). Little evidence for the San Dieguito complex/Early Man Horizon has been discovered north of San Diego County.

Some researchers interpret the San Dieguito complex as having a primarily, but not exclusively, hunting subsistence orientation (Warren 1967, 1968, 1987; Warren et al. 1998). Others see a more diversified San Dieguito subsistence system as possibly ancestral to, or as a developmental stage for, the subsequent, predominantly gathering-oriented complex denoted as the La Jolla/Pauma complex (cf. Bull 1983; Ezell 1987; Gallegos 1985, 1987, 1991; Koerper et al. 1991).

Archaic Period Complexes

In the southern coastal region of California, the Archaic Period dates from circa 8,600 years before present (BP) to circa 1,300 BP (Warren et al. 1998). The La Jolla/Pauma complex has been identified from the content of archaeological site assemblages dating to this period. These assemblages occur at a range of coastal and inland sites and appear to indicate that a relatively stable and sedentary hunting and gathering complex, possibly associated with one people, was present in the coastal and immediately inland areas of San Diego County for more than 7,000 years. La Jolla/Pauma complex sites are considered to be part of Warren's (1968) Encinitas tradition and Wallace's (1955) Milling Stone Horizon. The inland or Pauma complex aspect of this culture lacks shellfish remains, but is otherwise similar to the La Jolla complex and may, therefore, simply represent a non-coastal expression of the La Jolla complex (True 1958; True and Beemer 1982). The content of these site assemblages is characterized by manos and metates, shell middens, terrestrial and marine mammal remains, burials, rock features, cobble-based tools at coastal sites, and increased hunting equipment and quarry-based tools at inland sites. Artifact assemblages can also include bone tools, doughnut stones, discoidals, stone balls, plummets, biface points/knives, Elko-eared dart points, and beads made of stone, bone, and shell. Beginning at approximately 5,500 BP and continuing during the latter half of the Archaic Period, evidence of hunting and the gathering and processing of acorns

gradually increases through time. The evidence in the archaeological record consists of artifacts such as dart points and the mortar and pestle, which are essentially absent during the early Archaic Period. The initial and subsequent increasing use of these technologies during the middle and late Archaic Period constitutes a major transition in how the prehistoric populations interacted with their environment in the southern coastal region. The period of this shift, from circa 4,000 to 1,300 BP, has been designated as the Final Archaic Period (Warren et al. 1998).

Late Prehistoric Period Complexes

In the San Diego area, the Late Prehistoric Period has been described as a time characterized by an increased number of sites and “many technological innovations, and new patterns in material culture and belief systems” (McDonald and Eighmey cited in ICF International 2015). This characterization aptly describes the period for the entire San Diego County area. Changes in tool and ornament types, burial practices, and site location choices from those documented for the earlier periods are well documented in the archaeological record and are described below.

As with the earlier periods, archaeologists have defined distinctive complexes for the Late Prehistoric Period prehistoric cultures of the area. Two complexes have been defined for the protohistoric occupants of the area. One, designated as San Luis Rey, is identified in southern Orange, western Riverside, and northern San Diego Counties; the other, Cuyamaca, is identified in southern San Diego County (Meighan 1954; True 1966, 1970). The San Luis Rey complex is believed to be the progenitor of the Shoshonean-speaking peoples (Luiseño/Juaneño culture) living in the area at the time of historic contact in northern San Diego County (referred to as San Luis Rey of Shoshonean origin) (cf. Koerper 1979). Those of southern San Diego County (Cuyamaca, Yuman), are believed to be the ancestors of the Hokan-speaking Diegueño or Kumeyaay (Ipai/Tipai) occupying southern San Diego County at contact. The demarcation line between the San Luis Rey complex and the Cuyamaca complex is believed to be near the historic separation of the tribal territories of the Luiseño/Juaneño and Diegueño. It is highly unlikely, however, that the boundary remained static over time. During Late Prehistoric times, the entire PMPU area would have been within the area commonly associated with the archaeologically defined Diegueño or Kumeyaay (Ipai/Tipai) complex.

Hearths documented at southern San Diego County sites are often clay lined, yet this type of hearth is not found in the northern county sites. The Luiseño/Juaneño of southern Orange and northern San Diego counties appear to have primarily practiced cremation (Kroeber 1925), but may also have occasionally buried the dead by inhumation. The use of special burial urns for cremations, however, was apparently not commonly practiced.

4.4.2.2 Ethnographic Background

The Kumeyaay who inhabited the southern part of San Diego County, western and central Imperial County, and northern Baja California were the direct descendants of the early Yuman-speaking hunter-gatherers of the Late Prehistoric Period. The Kumeyaay appear to have had considerable variability in their level of social organization and settlement. They were organized patrilineal, patrilocal lineages that claimed prescribed territories but did not own the resources in general. The Kumeyaay occupied bipolar villages during the year and would occupy residential bases in the foothills/mountains during the summer and the lower elevations in the winter, with numerous campsites throughout as they exploited seasonally available resources. Acorns were the most important staple of their diet, as indicated by the presence of numerous large habitation sites near abundant oaks and bedrock suitable for milling. Grass seeds, sages, berries, wild greens, and fruits

were eaten. Houses were usually only built for the winter and were conical structures covered with tule bundles or willow and had excavated floors and central hearths. Houses and campsites are believed to have been relatively dispersed with no formal layout or discrete boundaries for structures or campsites. Both pottery and basketry were utilized in addition to stone tools. Religious activities were practiced with the assistance of shaman and a cimul (Carrico 2008, Luomala 1978).

The arrival of Spanish missionaries and soldiers in 1769 began a period of Euro-American exploration and settlement that would forever alter the Kumeyaay way of life. Dual military outposts of the Presidio de San Diego and Mission San Diego de Alcalá were established at Old Town near the village of Cosoy. The Mission system used Native American labor to build a footing for greater European settlement and introduced horses, cattle, agriculture, and new construction materials, methods, and styles. In 1774, the mission was moved 5 miles east, nearer to the Kumeyaay village of Nipaguay in Mission Valley. The Kumeyaay were generally resistant to Spanish attempts to coerce them into the Euro-American culture, but the change in location of the mission enabled the priests to gain more converts. As the Spanish gained influence many of the Kumeyaay became resentful, and this culminated in the sacking and burning of the mission in 1775 (Carrico 2008).

Mexico won its independence from Spain in 1821, and the missions were secularized in 1834. While most Spanish laws and institutions remained intact, the mission lands were divided, and large tracts of land (referred to as ranchos) were given to individuals and families. Cattle ranching and other agricultural activities were the focus of the economy (McGinnis and Baksh 2008). During the Mexican period, the Pueblo of San Diego (including the present planning area) was established on some 48,000 acres of the ex-mission lands, and many of the Kumeyaay who lived near the pueblo center and mission were dispersed as they were deprived of their land (City of San Diego 2001). As the new owners took possession of the ranchos, most Native Americans retreated away from the settlements while a few provided menial labor on the ranchos. However, because of the low population of Euro-Americans, the Kumeyaay were able to maintain a strong degree of autonomy outside of the rancho system (Shipek 1987).

The Mexican period ended when Mexico ceded nearly half of its land, including California, to the United States after the cessation of the war between the two countries in 1848. Soon after, gold was discovered in California and the tremendous influx of Americans and people of many nations quickly drowned out much of the Hispanic cultural influences. The further division of land by the U.S. government and squatting by white settlers deprived Native Americans of their traditional lands and resources (McGinnis and Baksh 2008). After the Civil War ended in 1865 San Diego County saw a huge increase in the number of settlers seeking land, and Native Americans were continually marginalized and forced off their land onto land that was not suitable for subsistence. By the 1870s the situation was very desperate for the Native Americans of San Diego County, and the U.S. government was slow to act. It was not until 1875 that ten reservations were finally established in San Diego County (Shipek 1987).

Native American Use of the Tidelands

San Diego's coastal environment contained a large number of accessible ecological niches. San Diego Bay, rivers, and associated lagoons contained fish and shellfish that were consumed since the Archaic period circa 9,000 years ago (Eigenmann 1892). Archaic archaeological sites are predominantly coastal and include habitation sites, shell dumps, quarries, lithic scatters, and milling stations (Gallegos 1992:205). Archaeological data from the edge of San Diego Bay confirms that the Archaic or La Jollan people relied heavily on local coastal resources including plants, fish, and

shellfish, with occasional hunting (Christenson 1992:217–218). Archaeological excavations have produced large numbers of fish and shellfish, bone fishing tools, and limited amounts of terrestrial fauna except for a few sites (Gallegos and Kyle 1988).

Environmental changes occurred during the past 9,000 years in San Diego County that resulted in the rise and eventual stabilization of the level of the sea in the area (Gallegos 1992:212). The sea level rise drowned local coastal valleys and created rich shellfish habitats, while the subsequent stabilization around 3,500 years ago created siltation in the coastal lagoons. This reduced shellfish habitat and caused the depopulation and partial human abandonment of certain coastal lagoon sites. San Diego Bay was the only coastal estuary that did not silt in, thereby continuously providing shellfish and fish along with sea and land mammals (Gallegos and Kyle 1988:ii–iii).

Archaeological remains at the two large coastal sites of Ystagua (Sorrento Valley) and Rinconada (Pacific Beach) show consumption of a wide variety of marine fish, sea mammals, and shellfish (Christenson 1992). Terrestrial resources consumed near the coast included mule deer, sea otter, sea lion, mountain lion, kit fox, harbor seal, crab, bird, reptile, rabbit, rodents, acorns, grass seeds, and other vegetal resources (Christenson 1992, Gallegos 1992:212). Consumed species of shellfish included *Protothaca*, *Chiton*, *Chione*, *Ostrea*, *Tegula*, *Crucibulum*, *Mytilus*, *Saxidomus*, *Argopecten*, and *Astraea* (Gallegos 1992:212).

The rocky coast kelp areas, tidal areas, and sloughs were accessed for fish species including sheephead, smoothhound, shovelnosed guitarfish, bat ray, and pile surfperch (Gallegos and Kyle 1988:ii). California sheephead was most likely caught in kelp beds off of Point Loma using boats and fishing implements, while the presence of sardines suggests the use of netting. Stone tools were acquired from local beach cobbles for the purpose of producing large flakes to use as cutting and scraping tools (Gallegos 1992:212).

The Late Prehistoric Yumans, the ancestors of the Kumeyaay, migrated to the coast from the inland desert around 1,300 years ago, and continued to consume primarily terrestrial resources, such as acorns and rabbits, with marginal use of coastal resources (Christenson 1992:217). Ethnographic data indicates that people lived in coastal areas at the time of European contact, but provide little specific information about them or their activities. Drucker's (1937) Cultural Element Distribution discusses fishing with scoop nets and using tule balsa boats to travel far offshore to catch fish (Englehardt 1920). Luomala (1978) states that coastal bands ate fish caught with hooks, nets, bows, and other tools. These ethnographic data confirm Kumeyaay use of coastal resources, although supplemental to their main terrestrial economy.

Overall, the Archaic period more heavily utilized coastal resources while shifts in environment and population in the Late Prehistoric period relied more on terrestrial resources.

4.4.2.3 Historic Background

San Diego Harbor, the City Port Department, and the San Diego Unified Port District

Nineteenth Century

Although San Diego's population and development remained centered in Old Town north of the harbor and Tidelands during the first half of the nineteenth century, both spread south during the second half of the century. During the first half of the century, Native Americans made use of the

marshy Tidelands south of Old Town, but European colonists, Hispanic settlers, and American newcomers did not frequent these areas. During the 1850s, William Heath Davis failed in his attempt to promote “New Town San Diego” on land near Punta de los Muertos at today’s Downtown harbor front. In 1867, Alonzo Horton purchased 800 nearby acres and created a second New Town San Diego. By 1870 it had 2,300 residents and a growing number of hotels, warehouses, and industrial and residential buildings. During the early 1880s, construction of the California Southern Railroad, a subsidiary of the Atchison, Topeka and Santa Fe Railway (Santa Fe), between National City and San Bernardino to the north provided San Diego with its first transcontinental railroad connection. Railroad development contributed to a boom-to-bust cycle of real estate speculation and population growth followed by falling land prices and population decline across Southern California (ICF International 2016:15–16).

The boom led to the establishment of several communities around the Tidelands of San Diego Harbor. Frank Kimball, who led the effort to bring the long-distance railroad line to San Diego along with his brother Warren, created the settlement that became National City. The San Diego Land and Town Company promoted land sales both in National City, which was incorporated in 1887, and in the area to the south that became the agricultural community of Chula Vista, which was not formally incorporated until 1911. Across the harbor from San Diego, Elisha Babcock’s and Hampton Story’s Coronado Beach Company began selling lots in 1886, and the iconic Hotel Del Coronado was completed in 1888. Two years later, Coronado residents voted to incorporate. By then the Coronado Belt Line Railroad provided service from San Diego south through National City and Chula Vista, around the southern Bay, and north to the new seaside resort city. Although not incorporated until 1956, Imperial Beach was created as South San Diego Beach by real estate developer R. R. Morrison in 1887. George Chaffey acquired some of Morrison’s land for subdivision and began promoting it as a summertime coastal resort for residents of Imperial Valley (City of Chula Vista et al. 1986:6–7, 49; Coronado Historical Association 2017; City of Imperial Beach 2017; McDrew 1922:380–381, 383, 392; Pourade 1964:210–211).

By the height of the land boom in the late 1880s, San Diego had six privately developed wharfs located between G Street and Commercial Street. The City of San Diego constructed no major wharfs until the twentieth century. In 1891, the War Department improved the navigation channel north of Ballast Point. At that time San Diego had limited industrial activity, and its exports were largely limited to hinterland agricultural products and sand and rock mined at Ballast Point. At the end of the decade, the Zuniga Jetty was built south from the west end of North Island at the harbor entrance (Harbor Department 1948:65; Irwin 1970:11–12; Sanborn Map Company 1888).

Twentieth Century through World War II

San Diego Bay was developed into a modern harbor during the first half of the twentieth century. Although San Diego lagged behind other California ports in export shipping, the natural advantages of its harbor attracted economically transformative military development as well as important waterfront industrial, commercial, and civic development.

Municipal involvement in the development of San Diego Harbor began in the 1910s. In 1911, the State of California instituted a policy of handing over control of Tidelands to local governments that agreed to invest at least \$1,000,000 in Tideland improvements. As a result, San Diego voters approved \$1,000,000 and \$400,000 bond issues for harbor improvements in 1912 and 1914, respectively. In May 1919, the City of San Diego’s first mayor-appointed Harbor Commission and Port Director began managing the Tidelands within the city limits. The State granted local Tidelands

to National City in 1917, to Coronado in 1923, and to Chula Vista in 1925. (ICF International 2016:16, Reupsch 1970a:2–3, District 1974:2–3.)

In preparation for construction of the first municipal wharf, the City of San Diego arranged for dredging of a 30-foot-wide channel from the shoreline near the west end of D Street (today's Broadway Street) to the harbor's main channel. Eventually known as the Broadway Pier, this municipal wharf was completed in early 1916 along with a 2,675-foot bulkhead and a 60-acre expanse of hydraulic fill that included Harbor Drive. In 1926 the City completed construction of a second municipal pier, the B Street Pier. Also known as the Embarcadero Piers, the Broadway and B Street Pier structures do not retain their original headhouses and warehouses today. Completed in 1919, John D. Spreckels' San Diego and Arizona (SD&A) Railroad, which was later renamed the San Diego and Arizona Eastern (SD&AE) Railway, provided the city with a railroad connection to the agriculturally rich Imperial Valley. However, the railroad did not substantially increase exports from San Diego Harbor. Imports dominated the harbor's trade through the 1920s, though they declined dramatically during the Great Depression of the 1930s, and by the end of that decade, San Diego's commercial shipping volume ranked 23rd of the 24 West Coast ports (ICF International 2016:16–18).

Federal military investment led the way in shaping San Diego harbor and generating local economic growth during the first half of the twentieth century. Lobbying efforts by Congressman William Kettner and other local officials and business representatives convinced the Navy to invest heavily in San Diego. Citizens voted to lease or deed extensive Tideland acreage for Naval development. During 1916–1917, the first West Coast Marine Corps Advance Base, the Naval Hospital, and Rockwell Field (later the North Island Naval Air Station) were established in San Diego. After World War I, Navy planners became convinced that Japan posed the greatest immediate threat to U.S. interests and committed to moving half of the nation's fleet to the West Coast. San Diego became the home of the Pacific Destroyer Force. By the mid-1920s, the Federal government had completed or begun developing the Destroyer Base (today's Naval Base San Diego), the Naval Training Station, the Eleventh Naval District Supply Center, the Marine Corps Recruit Base, the Naval Radio Station, the Fleet Fuel Depot, the U.S. Coast Guard Base, and Fort Rosecrans. In conjunction with the Navy's plans for increased harbor dredging to accommodate aircraft carriers, San Diego voters approved a \$650,000 bond in 1928 to develop the first phase of the airport north of the Embarcadero Piers that would become Lindbergh Field, which would provide for new aircraft research and development nurtured by Naval aviation needs (Harbor Department, City of San Diego [Harbor Department] 1948:50–51, ICF International 2016:19, District 1974:2–3).

Economic and population growth driven largely by military investment fostered industrial, commercial, and civic development along the San Diego waterfront. A thriving commercial fishing industry took shape during these decades in San Diego harbor along with a recreational sport fishing culture. Supporting Tideland canneries, the fishing industry focused largely on tuna production but also included lobster, shrimp, and sardine production. Fishing boosted demand for vessels, which was met by a flourishing boat and shipbuilding industry centered at Tideland facilities around 28th Street. Along the largely industrial waterfront extending from the Naval Supply Center near the Embarcadero Piers southeast to 28th Street, Tideland acreage was also occupied by steel and iron manufacturers, lumber and other building material yards, oil facilities, and other industrial operations. During the Great Depression years of the 1930s and World War II, Federal public works agencies such as the Civil Works Administration (CWA) and Works Progress Administration (WPA) helped finance harbor improvements such as channel dredging, Tideland fill to expand the waterfront, and development of wharfs and mole piers. Funded by the WPA and designed by noteworthy San Diego architects William Templeton Johnson, Richard S. Requa, Louis J.

Gill, and Samuel Hamill, the original San Diego Civic Center (now the County Administration Center) was completed at a waterfront site north of Ash Street facing Harbor Drive in 1938 (City of San Diego 2007:29–30; Harbor Department 1948:26–28, 32–40, 70–78).

Post-World War II

This subsection briefly addresses major events in Tideland planning, management and development. More detailed historical background discussion pertaining to the PMPU area is provided below.

During the post-World War II decades of the historic period, the City of San Diego undertook to make its harbor a more competitive commercial shipping port. Its new Port Director, John Bate, spearheaded this effort as well as the creation of the Unified Port District, which provided for integrated planning and management of the Tidelands within the Cities of Chula Vista, Coronado, Imperial Beach, National City, and San Diego. Established harbor-related enterprises such as commercial fishing, canning, sport fishing, and shipbuilding endured to different degrees after World War II. During this period, recreation and tourism became increasingly important elements of harbor planning and development.

Although the 1908 city plan created for San Diego by renowned city planner John Nolen—and updated by Nolen in 1926—was never implemented, as historian Richard Pourade notes, post-war harbor development under Director Bate, “made a concession to the [Nolen] Plan, and to the lure of recreational attractions, by dividing the waterfront for three uses.” While industry would be concentrated largely at the waterfront from Market Street south to National City, Tidelands from Market Street “north to a point just beyond the City-County Administration building were assigned to commerce, with commercial piers extending out from in front of the Administration building ... Between the commercial piers and the Coast Guard Station was to be a small protected harbor for the commercial fishing fleet.” Commercial fishing was also concentrated at the G Street Mole, constructed in 1944. “Recreation,” explains Pourade, “was to be assigned to the lee side of Point Loma, behind the two sheltering arms of a narrow island-like area which had been built up with sand from dredging operations and connected to the mainland by a causeway.” (Reupsch 1970a:5; Pourade 1977:80–81 [quoted], 82, 111–112.)

The narrow island described by Pourade was one of two major new land masses created through placement of dredged material from channel deepening efforts and developed into important new recreational resources. Completed in 1950, Shelter Island was the product of channel dredging for the yacht basin at the harbor side of Point Loma, which produced fill used to expand an existing shoal into a 300-foot-wide and over 1-mile-long landmass connected to Point Loma by a causeway. Mocked by skeptics as “Bate’s Folly,” Shelter Island and the fishing facilities, marinas, yacht clubs, hotels, restaurants, and other commercial enterprises developed there would become important elements of San Diego’s harbor economy and recreational culture. In 1961, dredging to deepen the channel from the harbor entrance to North Island aircraft carrier facilities provided spoil used to create Harbor Island south of Lindbergh Field. Beginning in the late 1960s, Harbor Island would be developed with hotels, restaurants, and other recreational facilities. Shelter Island and Harbor Island would support a growing local tourism economy nurtured by development of new facilities at Lindbergh Field, which enabled the airport to accommodate increases in the number of annual travelers from 390,427 in 1952, to 1,900,000 in 1965–1966, to 4,441,619 in 1974. (Gross 1983: A-14, ICF International 2016:24, District 1974:4; Reupsch 1970a: 8–9.)

Director Bate’s efforts to increase the volume of trade and waterborne shipping through the harbor led to the creation of major new port facilities beginning in 1958. Voter-approved bonds funded the

development of the Tenth Avenue Marine Terminal (TAMT), which opened for business with two large transit sheds in 1958. Whereas the old Embarcadero Piers had 240,190 feet of storage space, by 1964 additional construction had equipped the TAMT with approximately 1,000,000 square feet of storage space and a state-of-the-art bulk loader system. At that time the newly formed Unified Port District announced plans for development of a Twenty-Fourth Street Marine Terminal at Tidelands in National City. Voters approved the new terminal with passage of Proposition J, and construction began in 1968. The new terminal would become known as the National City Marine Terminal and would eventually be expanded into a modern container-handling facility. (ICF International 2016:22–23, 24–25; District 1974:6–7.)

The concept of a San Diego Unified Port District (District) encompassing all the harbor-fronting municipalities had been suggested in 1956 by then California Attorney General and subsequent Governor Edmund G. “Pat” Brown. Bate embraced and promoted the concept. For harbor-front municipalities other than the City of San Diego, unification offered a way to benefit from Tideland development without excessive taxation. The State Legislature and local voters approved the new special district in 1962. Although a lawsuit filed by the City of Coronado kept it from appointing a commissioner until 1964, the District began operations in 1963. The agency’s management structure included a Port Director, a position occupied by Bate for several years, the Director’s staff, and the Board of Port Commissioners (Board), the District governing body formed of seven commissioners appointed by municipalities with Tideland assets along the Bay. The City of San Diego received three commission seats, and the Cities of Chula Vista, Coronado, Imperial Beach, and National City each received one seat. The District administration was organized into three departments: Marine Terminals, Airport, and Property Management. These departments were supported by the District’s Departments of Personnel, Financial Services, Community Relations, Public Works, and Harbor Police. In 1965 the District’s administrative offices were relocated from the former Harbor Department headquarters at Harbor Drive and Ash to the former Consolidated Vultee Aircraft building on Pacific Highway. The following year, Don Nay succeeded Bate as Port Director. (ICF International 2016:24, District 1974:5, Reupsch 1970b:3.)

Into the 1970s and subsequent decades, recreation and tourism grew in importance both as elements of the District’s purview and as factors in the San Diego economy. In 1972, the redeveloped Broadway Pier was opened as a maritime park and cruise ship facility. On Harbor Island and District lands between the TAMT and the Broadway Pier, developers constructed an increasing number of hotels, and the District developed new parks, public streetscapes, and commercial spaces. The District also created new marina facilities at Chula Vista and National City. In 1982 the District initiated a policy in which 0.37% of annual gross revenue would be invested in public art for Tideland properties. The District installed the first public artwork under this policy, a sculpture entitled “Morning” by renowned San Diego sculptor Donal Hord, in 1983 at North Embarcadero Marina Park. In 1989 the District completed the San Diego Convention Center, which would later be expanded to nearly double its original size. (Frost 2002:6-15, District 1974:7.)

Today the Port of San Diego is the fourth largest California port. The District continues to manage the National City terminal, the TAMT, cruise ship terminals, and Tideland areas with industrial land uses. District-managed Tidelands also contain hotels, marinas, and parks. (District 2016:6.)

History of the Planning Districts

Planning District 1: Shelter Island

The Shelter Island Planning District (PD1) is located on the west side of San Diego Harbor, along the east shore of Point Loma. It includes Shelter Island and its causeway connecting to Point Loma, the America's Cup Harbor on the northeast side of the causeway (East Shelter Island), the Yacht Harbor and Qualtrough Street Mole southwest of the causeway (West Shelter Island), and surrounding marina-front Tidelands.

The first yacht club operated in PD1 was the San Diego Yacht Club, which in 1924 acquired a wharf and waiting room at Talbot Street that had served as a landing for the ferry running from the foot of Broadway to Point Loma. In 1934, dredging created a new anchorage area and generated material to fill 7.5 acres at the foot of Talbot Street. The Yacht Club leased the fill site and relocated its old clubhouse there from Coronado. (Reupsch 1970:3-4.)

Shelter Island was created in 1950. The Harbor Department dredged a new 400-foot-wide, 20-foot-deep channel to the 200-acre Point Loma yacht basin. The Harbor Department placed fill material from the dredging to create a 2,150-foot-long and 400-foot-wide causeway extending southwest from Byron Street. An existing shoal enlarged with fill to connect to the causeway created the so-called island, a 300-foot-wide land mass stretching over a mile in length and rising 14 feet above mean low tide. Promptly initiating infrastructure improvements to Shelter Island, the Harbor Department landscaped the site and planted it with palm trees, constructed streets and parking lots, and built a municipal pier and public boat launching ramp at the outboard or harbor-side portion of the island. The inboard, marina-side of the island was leased to private interests such as yacht clubs, hotels, restaurants, shops, marinas, and marine sales, repair, and rental businesses. In 1951, the Southwestern Yacht Club relocated from Harbor Drive to the Qualtrough Street Mole at the southern yacht basin on the inboard side of Shelter Island. The Harbor Department invested over \$2,000,000 in the creation of Shelter Island, including \$300,000 in dredging and fill work (District 1982:12-13; District 1974A:6).

Along with Mission Bay, Shelter Island became a focal point of Tiki Modern-style architecture (also known as Tiki-Polynesian or Atomic Tiki) and Polynesia-inspired popular culture in California during the 1950s and 1960s. Tiki Modern invoked the "south seas" locales experienced by Pacific-theater World War II veterans, as Hawaii was incorporated into the Union as the 50th state (1959). San Diego promoted itself as a tourist destination with a well-established culture of yachting, sport fishing, and other forms of coastal leisure activities. Beginning in 1953, construction of the first two privately developed leases on Shelter Island, the Kona Kai Club and Christian's Hut restaurant and bar (later Bali Hai), embodied Tiki Modern-style architecture design. Comprehensive planning and design review later ensured that Shelter Island development would continue this architectural style, which combined the traditional architectural forms of Pacific Islander cultures and Googie-Futurist architecture's boldly geometric roof shapes and expansive plate glass windows and doors. Examples of this style at Shelter Island include multiple commercial buildings along the causeway portion of Shelter Island Drive, Humphrey's Half Moon Inn and Suites (1959), Humphrey's by the Bay Restaurant (1964, originally the Tahitian), a portion of the Best Western Island Palms Hotel/Shelter Island Marina (1960, originally the Shelter Island Inn), and the Yokohama Friendship Bell pavilion. In 1958, the bell was presented by San Diego's Japanese "sister city," Yokohama, and is housed in a pavilion at the island's southwest traffic circle. The site was dedicated in December 1960. (City of San Diego 2007:64-65, *San Diego Union* 1953:46, District 1974:7, SOHO 2008:3-13, Reupsch n.d.:4, Save Our Heritage Organization [SOHO] 2008:2-3.)

Portions of the PD1 were improved between the late 1970s and the 1990s. In 1977, the District reconstructed the public boat ramp and installed a second public pier. In 1980, the eroding La Playa Beach west of the southwest end of Shelter Island was protected with a 370-foot stone groin and sand replenishment. By 1982 Shelter Island's southerly Yacht Harbor and the northerly Commercial Basin had over 2,700 boat slips. In 1983 the District invested \$2 million in improvements to Shelter Island that included new landscaping and pedestrian circulation paths. In recognition of San Diego's role as host to the America's Cup sailing competition in 1992 and 1995, the Commercial Basin was renamed America's Cup Harbor in April 1994. In early 1995, the District completed \$2.5 million in improvements to the America's Cup Harbor promenade. (Frost 2002:7; District 1982:13-14, 24-25.)

Planning District 2: Harbor Island

The Harbor Island Planning District (PD2) includes the San Diego International Airport (formerly Lindbergh Field), a portion of Pacific Highway at the east edge of the airport, and Tidelands south of the airport, lands along Harbor Drive, Harbor Island itself, and the island's West and East Marinas. As noted above, Lindbergh Field was created in 1928 and improved incrementally over time. The San Diego County Regional Airport Authority (SDCRAA) has assumed land use authority over SDIA, and accordingly, is not discussed in detail below. As explained in the Project Description, the District holds, in trust, the land under the SDIA, but does not regulate the activities of the SDIA Authority, including land use. Therefore, this section focuses mainly on Harbor Island, waterfront lands south of Harbor Drive, and the Pacific Coast Highway corridor within the planning district.

Extensive development associated with the aviation industry had occurred within what is now proposed as the Harbor Island Planning District south and north of the Lindbergh Field runway prior to the creation of Harbor Island. Consolidated Aircraft Plant No. 1 began operations along Pacific Highway north of the runway in 1935. Operated by Consolidated Aircraft and Consolidated Vultee Aircraft (Convair), and eventually acquired by the General Dynamics Corporation, the plant produced thousands of Consolidated B-24 Liberator bomber's and Catalina flying boats (Van Wormer 1996). In 1939, T. Claude Ryan established the Ryan Aeronautical Company south of the runway. Expanded over time, this aircraft manufacturing complex was operated by the Ryan Aeronautical Company until 1969, when Teledyne Inc. acquired the complex (Van Wormer 2006). Most of the buildings that formed these aviation industry complexes have been demolished. Between 1942 and 1944, the City of San Diego constructed Harbor Drive between Grape Street and Point Loma (Reupsch 1970a:5).

One notable building originally associated with the aviation industry, survives east of what is now proposed as the Harbor Island Drive and south Harbor Drive. Serving as the Harbor Police Headquarters today, the building was originally developed by the Institute of Aeronautical Sciences (IAS) in 1949, led at the time by Reuben Fleet, the head of Consolidated Aircraft and then president of the IAS. The Moderne style building was designed by renowned San Diego architect William Templeton Johnson (Jordan and McGinnis 2002:12). In 1965, the District vacated its offices at Ash Street and Harbor Drive and moved into the former Convair/General Dynamics headquarters at 3165 Pacific Highway, which it continues to occupy today (Reupsch 1970a:9).

The District began creation of Harbor Island in 1961, through the placement of fill material produced as a result of dredging of the main harbor channel, to accommodate aircraft carriers. In anticipation of marina development and commercial leases on Harbor Island, the District initiated development of Spanish Landing Park in 1967, along the southern edge of Harbor Drive, west of today's Harbor Island Drive. The park was named in honor of the Portola-Serra expedition of 1769, which landed near the park site and marked both the beginning of Spanish colonization in California

and the first European occupation of what would become San Diego. The original Spanish Landing site is commemorated within the park by a California Historical Landmark plaque. Developed in phases, the park encompassed 16.6 acres by 1976 (District 1974:6, Frost 2002:5).

By 1970, the District had leased most of the Island. The Ramada Inn of America (today's Sheraton San Diego) completed the first hotel on the island in 1969, and the Travelodge Harbor Island (today's Hilton) opened for business the following year. By 1974, Harbor Island had received a total of \$30 million worth of capital improvements, including multiple hotels, restaurants, and marina facilities providing over 1,000 boat slips. Opened in 1977, Cabrillo Isle Marina added 250 more slips (Frost 2002:3–5, District 1974:6).

Development of Harbor Island continued through the 1980s. Work began on a \$20 million addition to the Sheraton in 1980 that added 500 rooms. By 1982, Harbor Island had 1,600 boat slips. Completion of the Sunroad Marina at the Harbor Island's east basin added 540 more boat slips in 1987 (Frost 2002:6, 8; District 1982:18-19).

Planning District 3: Embarcadero

The proposed Embarcadero Planning District (PD3) has a longer history of development and redevelopment than any other Tideland planning district. It consists of leased properties and public facilities from Pacific Highway west to the Bay between Laurel Street and G Street, and leased properties and public facilities south and southwest of Harbor Drive from G Street to the TAMT. Containing the San Diego Convention Center, the County Administration Center (formerly the San Diego Civic Center), numerous hotels and commercial complexes, and multiple piers, parks, and marinas, the Embarcadero Planning District forms Downtown San Diego's tourist and recreation-oriented waterfront.

During the early twentieth century, the far northern portion of the planning district consisted of wharfs and waterfront industrial facilities that would later become home to one of San Diego's aircraft companies. By 1927, a former tuna cannery was converted by Ryan Airlines to an aircraft manufacturing facility that produced the airplane known as the *Spirit of Saint Louis*, flown by Charles Lindbergh to complete the first non-stop transatlantic flight. Remodeled during subsequent decades, the building became part of the Solar Aircraft Corporation (or formerly Prudden Aircraft) complex. Barely surviving the worst years of the Great Depression during the early 1930s, Solar Aircraft had 700 employees by 1940 and expanded during World War II. The company's production of heat-resistant metals for aviation ensured its continued growth after the war, and by the early 1960s had 1,800 employees (Pourade 1967:127, 167, 237; Pourade 1977:84, 196; URS Corporation 2009).

Throughout the first half of the twentieth century, the harbor front south and southeast of the Naval Supply Center consisted mainly of industrial operations, piers, and recreational facilities. During the 1920s and 1930s, the harbor front in this area was expanded through fill consisting of both dredge spoil and refuse deposited by municipal trash disposal facilities (City of San Diego 2013:21–23). The southeastern portion of the planning district was also home to the San Diego Rowing Club (SDRC), which constructed a clubhouse along the Pacific Steamship Company wharf in 1900. During the 1970s, fill activity extended harbor front land to and beyond the clubhouse. Operated as a Joe's Crab Shack restaurant today, the SDRC clubhouse is listed on the National Register of Historic Places (NRHP) and the City of San Diego's Register of Historical Resources (City of San Diego 2013:21–23; Seymour 2013).

The Federal government funded substantial development within the Embarcadero Planning District during the 1930s as part of the New Deal, the set of programs created by the presidential

administration of Franklin Delano Roosevelt to address the Great Depression. As mentioned above, the most significant built-environment resource created along the waterfront with New Deal assistance was the WPA-funded San Diego Civic Center (now the County Administration Center), completed in 1938. The WPA-funded a \$500,000 project to create Battery Park at the foot of Pacific Highway that involved reclamation of 25 acres of waterfront land and construction of several piers in 1938. Part of this area would later become Navy Field (no longer present). Also constructed on this reclaimed land in 1938–1939 with New Deal funding was the San Diego Police Headquarters, Jail and Courts complex, designed by master architects Charles and Edward Quayle and Albert O. Treganza. This Spanish Colonial Revival-style complex is listed on the NRHP. Pacific Highway was also improved at this time from Battery Park to the north beyond Lindbergh Field (Harbor Department 1948:75; May 1998; Reupsch 1970a:4).

Development continued in the same area of PD3 during the 1940s. Originally constructed in 1928, the Navy Pier at the Supply Center was lengthened to 1,000 feet. Today the *USS Midway*, the historic World War II aircraft carrier that houses the USS Midway Museum, is located on the south side of the pier. In 1944, the Harbor Department began construction of the G Street Mole Pier. Created with 64,000 cubic yards of material dredged by the Navy and 26,000 cubic yards of fill trucked to the site, this new mole pier was developed for the tuna and sportfishing industries. Three other tuna fleet piers were constructed at Grape Street in 1952. The G Street Mole Pier received additional improvements beginning in the 1970s. In 1978, the District constructed a \$1 million concrete pier extending southeast from the original G Street Mole structure. A 400-foot-long Fish Harbor Pier was constructed just north of today's Seaport Village in 1981. These two piers essentially converted the G Street Mole area into a sheltered marina. Additional piers were subsequently constructed within the marina. (District 1982:23, 30; Reupsch 1970a:5.)

Beginning in the 1960s, efforts to boost San Diego's tourism economy led to new development and long-term planning that began to reshape the waterfront within the proposed Embarcadero Planning District. In 1964 and 1967, respectively, a warehouse and the former Harbor Department offices were demolished to make way for construction of hotels. As noted above, the redeveloped Broadway Pier opened as a cruise ship terminal in 1972. That year the District revised the master plan for Embarcadero development. In June of the following year, the District opened the \$1.6 million Harbor Seafood Mart complex west of the Police Headquarters complex and south of the G Street Mole. In 1978–1979, the Harbor Drive corridor between the Seafood Mart and Broadway was beautified and improved with new streetlight fixtures, landscaping, and a bike path. (District 1974:7; District 1982:22, 26; Reupsch 1970a:9–10.)

The former industrial waterfront from the G Street Mole and the Harbor Seafood Mart southeast to the northwest end of the TAMT was also transformed during the latter 1970s. Begun in 1978, construction of the 11-acre Seaport Village complex south of the Harbor Seafood Mart was completed in 1980. The complex opened in June of that year accommodating 70 retail shops. "Recreating the California waterfront atmosphere" of the late nineteenth century, explains a history of the Port of San Diego, "the \$18 million dining, shopping and recreational theme park blends architectural styles of old Monterey, Victorian San Francisco and traditional Mexico" (District 1982:26–27).

Major redevelopment projects to the southeast of Seaport Village were also completed in 1980. Beginning in 1976, dredging of the main harbor channel provided fill material for creation of the North and South Embarcadero Marina Park peninsulas. The northern and southern peninsulas were completed in 1979 and 1980, respectively. The \$2.5 million southern park incorporated the NRHP-listed San Diego Rowing Club building and featured a fishing pier, basketball courts, pedestrian and

bicycle paths, and an exercise course. Landscaping for the two parks included over 400 trees (Frost 2002:5–6, District 1982:27–28).

During the 1980s, the District also initiated redevelopment of the Navy Field site immediately northeast of the northern marine basin formed by creation of the Embarcadero North and South Park peninsulas. The District acquired Navy Field in 1981 and arranged for Torrey Enterprises to construct a hotel there and develop marina facilities in the Embarcadero Marina North basin. Harbor Drive was rerouted to provide for development of a waterfront promenade west of the hotel site. In March 1984, the first curvilinear glass-skin tower of the Intercontinental Hotel complex opened at the former Navy Field site. Construction began on a second 700-room Hotel Intercontinental tower in July 1986. In 1987 the completed hotel complex became the Marriot Hotel and Marina, today's San Diego Marriot Marquis and Marina. The San Diego Police Headquarters, Jail and Courts complex closed that year and the Police Department moved into a new headquarters at Broadway and 14th Avenue. In 2008 Terramar Retail Centers signed a long-term lease for the old Police Headquarters property, which was listed in the NRHP in 1998, and rehabilitated it in accordance with the Secretary of the Interior Standards for the Treatment of Historic Properties. In 2013 the property opened for business as The Headquarters, a multi-tenant retail and dining center. (Frost 2002:7–9, District 1982:28, The Headquarters 2020.)

Less intensive development occurred in the northern portion of the planning district during the latter 1980s. In 1985, the District completed a \$6 million renovation of the crescent area at the waterfront near the Solar Turbines complex, from the U.S. Coast Guard Station to the Grape Street tuna fishing piers. The District also converted the B Street Pier into a second cruise ship terminal, dedicated in January 1986. In 1989, the Fish Market restaurant opened at the G Street Mole. (Frost 2002:8, 10.)

Established in 1948 and located at waterfront docks across Harbor Drive from the southern end of the County Administration Center, the San Diego Maritime Museum was, by the 1970s, home to two historic vessels currently listed on the NRHP: the *Star of India* and the ferryboat *Berkeley*. Originally named the *Euterpe*, the *Star of India* was constructed in 1863 and first sailed by Liverpool's Wakefield, Nash & Company. When listed on the NRHP in 1966, the *Star of India* held the title of the oldest operable iron-hulled sailing ship in the world. It was designated a California Historical Landmark in 1999. Constructed in 1898 by the Union Iron Works in San Francisco, the *Berkeley* operated as a ferryboat until 1958. Considered the best-preserved example of a double-ended propeller driven ferry in the United States, the *Berkeley* is listed on the NRHP and is a California Historical Landmark. Additionally, both the *Star of India* and the *Berkeley* have been designated National Historic Landmarks. (Delgado 1990:9, 13; Maritime Museum of San Diego 2017; Snell 1966:7.1.)

One of the most important San Diego developments of the latter twentieth century, the waterfront San Diego Convention Center was initiated in 1984 when the Board entered into an architectural contract with a team led by Arthur Erickson. The first phase of construction began in 1985. In 1987, Tutor Saliba and Perini Corporation won the contract for the second phase of construction. The \$165 million Convention Center opened in November 1989 and hosted its first event, the San Diego International Boat Show, beginning at the end of that month. In 1992, the 875-room Hyatt Regency (today's Manchester Grand Hyatt Hotel), opened immediately northeast of Seaport Village. In June 1998, a ground-breaking ceremony inaugurated construction of the Convention Center expansion. Completed in 2001, the expansion project nearly doubled the size of the facility. In 2002, the District authorized development of the Hilton San Diego Convention Center southeast of the Embarcadero Marina Park South and northwest of the TAMT. (Frost 2002:7–8, 10–11, 14–15.)

Planning District 4: Working Waterfront

The Working Waterfront Planning District (PD4) encompasses the TAMT facility, Cesar Chavez Park, and harbor front industrial facilities and properties from Cesar Chavez Parkway southeast to the area of 28th Street and Chollas Creek Channel.

The construction of the TAMT transformed a Tideland area that was home to multiple industrial operations during the first-half of the twentieth century. These included a San Diego incinerator and refuse disposal facility, a General Petroleum Corporation of California facility, the Benson Lumber complex, and various industrial enterprises related to fish processing, including the West Coast Crab & Lobster Company, the Southern Reduction Company, and the American Processing Company. Construction of the marine terminal began in 1956 with fill activity to create the terminal's mole wharf. The TAMT opened in 1958 with two transit sheds. By 1964, additional construction had equipped the TAMT with approximately 1,000,000 square feet of transit shed and warehouse storage space, a state-of-the-art bulk loader system, a molasses storage facility, and a fuel oil facility. During the 1970s, a silo complex and a tuna cannery (the latter is no longer present) were also developed at the TAMT (ICF 2016:25–36).

The waterfront southeast of the TAMT, between Cesar Chavez Parkway and Chollas Creek Channel, has a long history of industrial development. Prior to World War II, a concentration of industrial fish processing wharfs and factories took shape along the Bay frontage in the vicinity of today's San Diego-Coronado Bay Bridge. These included the Lower California Fisheries Company, International Packing Corporation, Sun Harbor Packaging Corporation, and Normandy Seafood Company. In 1941, the Kelco kelp production company, which had previously established operations near Crosby Street, developed a waterfront facility northwest of Sampson Street. In 1915 the San Diego Marine Construction Company developed a wharf and facilities for repairing and constructing marine vessels at the foot of Sampson Street. A wharf at the foot of 28th Street was home to the San Diego Yacht Club until it relocated to Point Loma. (Sanborn Map Company 1940a, 1940b; Tetra Tech Inc. 2016:8–9.)

Leading up to and during World War II, U.S. Naval and fishing industry demand for ship construction and repair services stimulated development of new industrial marine operations, as well as expansion of established operations in the area from Sampson Street southwest to 28th Street. The San Diego Marine Construction Company improved and expanded its facilities at Sampson Street. Wharf construction and fill provided for the dramatic expansion of industrial operations between Schley Street and 28th Street to form the harbor's main shipyards, which included marine vessel construction and repair facilities developed by the Lynch Shipbuilding Company, National Iron Works (later National Steel and Shipbuilding Company), and the Martinolich Shipbuilding Company. (Harbor Department 1948:26–28; Sanborn Map Company 1946a, 1946b.)

Shipbuilding facilities continued to grow and occupy more waterfront property after World War II, and the National Steel & Shipbuilding Company (NASSCO) became the largest. NASSCO was formed in 1949 when the National Iron Works acquired the Lynch Shipbuilding Company. The adjacent San Diego Marine Construction Company also grew and was acquired by Southwest Marine Construction Company in 1982. Southwest Marine operates today as BAE Systems San Diego Ship Repair, and NASSCO is owned by General Dynamics. (Colton 2007; Frost 2002:7; Tetra Tech Inc. 2016:8–10.)

The San Diego-Coronado Bay Bridge was constructed in 1969. Renowned San Diego-area architect Robert Mosher designed the bridge, which has been determined eligible for the NRHP. The San Diego-Coronado Bay Bridge is the world's lengthiest continuous box girder bridge. (San Diego Cultural Heritage Alliance 2017.)

By the time of the bridge's construction industrial development had completely dominated the bayfront, blocking Barrio Logan residents from access to the Bay. A long effort by neighborhood activists to secure bayfront recreational space for the community succeeded in the 1980s. The District provided 3 acres at the foot of Crosby Street for development of a park. Groundbreaking took place in 1987. Originally named Crosby Street Park, the facility was officially dedicated in 1992 and later expanded to 4 acres and equipped with a pier (Gorman 1992:B-1, B-9; Frost 2002:9). Eventually renamed for Cesar Chavez, the park today features a wall incorporating 11 tile panels displaying images of Barrio Logan history.

Planning District 7: South Bay

The South Bay Planning District (PD7) includes both water and land areas at the far south end of San Diego Bay.¹ The area surrounding the southern extension of PD7, and overlapping slightly with the southern tip of PD7, historically contained a portion of an expansive South Bay landscape of earthen embankments and salt ponds used to produce salt since the latter nineteenth century. A historically important San Diego-area industry, solar salt production dates to the 1870s, when the La Punta Salt Works first made use of South Bay salt ponds. Founded in 1902 by Graham Babcock, the Western Salt Company established operations south of the La Punta Salt Works. By 1918, the company was responsible for 5 percent of California's total salt production, and by 1932 it produced 10 percent of California's salt. The Western Salt Company Salt Works eventually encompassed 1,300 acres, including its processing plant south of Palomar Street in western Chula Vista. (Gustafson et al. 2001:1-2, 6-7.)

In 1999, the California State Lands Commission authorized the District's acquisition of 1,400 acres from the Western Salt Company. The District transferred this land to the U.S. Fish and Wildlife Service for restoration as a wetland preserve, the South Bay Unit of the San Diego National Wildlife Refuge-Complex, dedicated in June 1999. As part of this project, the Western Salt Company Salt Works were determined eligible for listing on the NRHP as a historic landscape. A Memorandum of Agreement stipulated mitigation for the adverse effect to be caused by the U.S. Fish and Wildlife Service's habitat restoration, which required altering the appearance and function of the Western Salt Company Ponds 10, 10A, and 11. The mitigation included preparation of Historic American Landscapes Survey (HALS) documentation and public interpretation of San Diego's solar salt industry. (Frost 2002:13, Gustafson et al. 2001:1-2.)

Planning District 8: Imperial Beach Oceanfront

The Imperial Beach Oceanfront Planning District (PD8) consists of two parking lots immediately east of Seacoast Drive; paved beach access streets and parking west of Seacoast Drive, Dunes Park, Imperial Beach Pier and Pier Plaza; and the beach from Carnation Avenue south to just beyond the southern terminus of Seacoast Drive.

The current Imperial Beach Pier was constructed in the early 1960s to replace an earlier pier destroyed by heavy surf during storms in 1949 and 1953. Financed by a local bond issue and funds from the California Wildlife Conservation Board, a new 1,200-foot pier with a "T"-shaped end was opened in November 1962. Winter storms in 1980, 1983, and 1986 brought severe damage to the pier. The current pier is the product of reconstruction completed in 1989. (South Bay Compass 2016.)

¹ Pond 20 is not within the proposed PMPU boundaries and is evaluated under a separate EIR (District 2020).

In June 1990, the State transferred 403 acres of oceanfront property in Imperial Beach to the District. On land just north of today's Pier South Resort, the District developed Dunes Park, which was officially opened in April 1995. The following year the District invested \$12 million in improvements to its Tideland property in Imperial Beach. Also that year, as part of the District's Public Arts Program, the "Ocean Riders" sculpture by the artist Wyland, was publicly unveiled at Dunes Park. In 1999, the Dempsey Holder Safety Center opened immediately south of Pier Plaza. In June 2000, the Tin Fish restaurant opened at the end of the Imperial Beach Pier. (Frost 2002:10, 12, 14.)

Planning District 9: Silver Strand

Situated in the southwest corner of San Diego Bay, the Silver Strand Planning District (PD9) consists of Bay waters and shoreline extending from Crown Cove to the southern end of the Coronado Cays. It includes both the Crown and Grand Caribe Islands and the causeways connecting those reclaimed land masses to the Coronado Cays.

In 1930, the State Parks Commission won voter approval of a bond issue that funded land acquisition and development of Silver Strand State Park. The New Deal-era Civilian Conservation Corps completed the first 8 acres of the Silver Strand State Park in 1936. The State Division of Highways began widening Highway 75 (Silver Strand Boulevard) into a divided four-lane highway, in 1955. (Schoenherr 2015.)

The Coronado Cays and the Crown and Grand Caribe Islands were developed beginning in 1968 by the Coronado Cays Corporation and Signal Properties. The development would occupy 228 acres of land on the east side of Highway 75 and 140 acres of adjacent Tidelands transformed by dredging and filling into a residential subdivision with marina channels and boat slips. Grand Caribe Island was developed during the 1970s. Crown Island remained undeveloped through the late 1980s. In 1991, however, the completed 440-room Loews Coronado Bay Resort opened on Crown Island. (Schoenherr 2015.)

Planning District 10: Coronado Bayfront

The Coronado Bayfront Planning District (PD10) consists of harbor-front land and near-shore waters stretching east from Alameda Boulevard and following the shoreline south to Glorietta Bay. This planning district is divided by the San Diego-Coronado Bay Bridge. South of the bridge, PD10 encompasses the Coronado Municipal Golf Course and the Glorietta Bay slips. North of the bridge, the planning district contains Coronado Tidelands Park, the Coronado Island Marriot Resort, the Coronado Ferry Landings and associated Marketplace complex, and the far northern portion of Centennial Park.

While occupying the Hotel Del Coronado Boathouse building, located outside the planning district, the Coronado Yacht Club built boat slips and arranged for Glorietta Bay to be dredged so that more of it could be used, and so that the club could host races and other events. The Yacht Club first leased its current property to the north of the Boathouse in 1946. In 1947 the Yacht Club acquired a government surplus building and relocated it to the leased property. The building has since served as the organization's clubhouse. Today the club has over 900 members and slip facilities that accommodate more than 270 yachts. (Coronado Yacht Club 2017.)

Occupying the shoreline from the northwest area of Glorietta Bay to the area south of the San Diego-Coronado Bay Bridge, the Coronado Golf Course dates to the 1950s. Closed during World War II, the Coronado Country Club was redeveloped into a residential tract, leaving the resort city without a golf course. Dredging of Glorietta Bay provided fill material to reclaim 137 acres of land for the golf course. Golf course architect Jack Daray suspended his retirement to design the \$100,000 facility.

The new course opened on December 19, 1957, and soon hosted the Hotel del Coronado Pro-Am Tournament. Expanded over the decades, the golf course's clubhouse was replaced with a new building in the late 1990s. (Coronado Historical Association 2017; Welcome to Coronado 2015.)

Existing development within PD10 north and northwest of the San Diego-Coronado Bay Bridge dates to the 1980s and later. Marking the 100th anniversary of Coronado's founding, Centennial Park was opened by the City of Coronado in 1986, at the site of the original Coronado Ferryboat Terminal, which operated until the completion of the bridge in 1969. In 1987, the District opened a new \$600,000 ferryboat landing and fishing pier near the foot of B Avenue. This facility was developed in conjunction with the \$7 million Ferry Landing Marketplace, which opened south of the landing facility in 1987. During the following year, the Le Meridien Hotel (today's Coronado Island Marriot Resort and Spa) opened east of the ferry landing. That year the District also completed the 22.5-acre Coronado Tidelands Park, the District's largest Tideland park, to the south of the hotel complex. (City of Coronado n.d., Frost 2002:9.)

4.4.2.4 Existing Cultural Resources

A record search was conducted by the South Coastal Information Center (SCIC) on April 24, 2017, to identify cultural resources within the proposed PMPU area and its quarter-mile buffer. The SCIC maintains the California Historical Resource Information System (CHRIS) database for San Diego County and keeps a record of all reported cultural resource studies and findings within the county. The record search revealed that 275 previously recorded cultural resources are located within a 0.25-mile buffer but outside of the proposed PMPU area. A total of 43 previously recorded cultural resources have been identified within the proposed PMPU area, of which 16 are archaeological resources and 27 are historical (or built environment) resources.

In addition, research was conducted to identify properties not documented in the record search results that are within the PMPU area and listed in the NRHP, the CRHR, or local historical resources registers. Cultural resources subject to significant impacts under CEQA are: (i) resources listed on the NRHP, the CRHR, or local register of historical resources registers; (ii) resources determined eligible for listing in the NRHP with concurrence by the State Historic Preservation Officer (SHPO); (iii) resources determined eligible for CRHR listing by a CEQA lead agency; and (iv) resources determined eligible for listing in a local register of historical resources by the local government that maintains the register. For discussion of the significance criteria and historical integrity considerations applied to determine NRHP and CRHR eligibility, see Section 4.4.3, *Laws, Regulations, Plans, and Policies*.

Sections below provide further detail regarding previously identified and evaluated cultural resources within PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10 and the potential that additional, yet-to-be identified or evaluated cultural resources could be present. The identified archaeological resources are listed below under *Archaeological Resources*, which also provides a prehistoric archaeological sensitivity analysis outlining the potential for encountering intact prehistoric archaeological resources in each of these planning districts. That is followed by *Historical Resources*, which lists the built environment resources within PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10 that have been evaluated for historical and architectural significance. That discussion also characterizes the potential for encountering built environment resources within each of these planning districts that could require evaluation at the project level, as the proposed PMPU is implemented through the year 2050.

Archaeological Resources

A record search conducted by the SCIC on April 24, 2017, identified 16 archaeological resources located within the proposed PMPU area. Out of the 16 resources, 6 were prehistoric, 9 were historic, and 1 contained both historic and prehistoric elements. The prehistoric sites consisted of middens, artifact scatter, or shell scatters, while the historic sites were mostly refuse deposits. Resources identified in each planning district are discussed below. The District cannot legally provide precise location information on these resources per State CEQA Guidelines Section 15120(d).

Known Archaeological Resources

The following describes the known archaeological resources present within the proposed PMPU area based on the results of the SCIC record search. It should be noted that it is not feasible to survey every parcel in the District in a programmatic analysis. The District contains hundreds of acres of water and land, and access to subsurface testing is not always available due to overlying structures and paved surfaces. Furthermore, project-specific/site-specific information is not currently known. Cultural resources assessments would be conducted prior to the approval of each future project.

Planning District 1: Shelter Island

The record search revealed that no archaeological resources have been recorded within PD1.

Planning District 2: Harbor Island

As shown in Table 4.4-2, a record search revealed that one archaeological resource (a prehistoric midden) has been recorded within PD2. Only a small portion of the site intersects with PD2, with most of the site outside of the PD2 boundary. In 2013, the archaeological resource was determined not eligible for listing in the NRHP with SHPO concurrence and also determined not eligible for listing in the CRHR by the San Diego Association of Governments (SANDAG).

Table 4.4-2. Previously Identified Archaeological Resources Within Planning District 2: Harbor Island

Resource ID	Time Period	Description	Eligibility/Listing	Status Code
P-37-000054	Prehistoric	Midden, possibly destroyed.	Determined ineligible for NRHP/CRHR listing	6Y

Notes: California Historical Resource Status Code 6Y: Determined ineligible for NRHP by consensus through Section 106 process—Not evaluated for CRHR or Local listing.

Planning District 3: Embarcadero

As shown in Table 4.4-3, the record search revealed that seven historic archaeological resources have been recorded within PD3. Four consist of historic refuse deposits or city dumps, and three consist of isolated historic artifacts (two boats and one bottle). All resources were identified during construction monitoring. Of particular note is Tidelands City Dump, a large historic-era trash dump located in former Tidelands with materials dating from the 1890s to 1930s. The site has never been formally evaluated for inclusion in the NRHP or CRHR; however, the site has been recommended as both significant and not significant by different archaeologists.

Table 4.4-3. Previously Identified Archaeological Resources Within Planning District 3: Embarcadero

Resource ID	Time Period	Description	Eligibility/Listing	Status Code
P-37-017104/ CA-SDI-15118	Historic	Tidelands City Dump	Unevaluated	7
P-37-028564/ CA-SDI-18377	Historic	Household and building refuse, possibly related to Tidelands City Dump. Located under 4 feet of fill.	Unevaluated	7
P-37-028565/ CA-SDI-18378	Historic	Household and building refuse, possibly related to Tidelands City Dump. Located under 6 feet of fill.	Unevaluated	7
P-37-028979/ CA-SDI-18584	Historic	Household refuse deposit located during construction. Artifacts were collected.	Unevaluated	7
P-37-033270	Historic	Wooden boat (dinghy) located during construction monitoring.	Ineligible for NRHP listing	6Z
P-37-033271	Historic	Isolated glass bottle located during construction monitoring.	Ineligible for NRHP listing	6Z
P-37-033896	Historic	Remains of boat found during construction monitoring.	Ineligible for NRHP listing	6Z

Notes: California Historical Resource Status Code 6Z: Found ineligible for NRHP, CRHR, or Local designation through survey evaluation.

California Historical Resource Status Code 7 – Not evaluated for NRHP or CRHR.

Planning District 4: Working Waterfront

As shown in Table 4.4-4, the record search indicated that one archaeological resource (P-37-00055) was recorded within PD4. The site record contains generalized information about the site location and artifacts (midden and shell scatter). However, as discussed in the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component FEIR, there exists the potential for subsurface resources in the eastern section of the TAMT subdistrict of PD4 due to the presence of an extensive prehistoric resource (CA-SDI-5931) previously identified to the east of the subdistrict.

Table 4.4-4. Previously Identified Archaeological Resources Within Planning District 4: Working Waterfront

Resource ID	Time Period	Description	Eligibility/Listing	Status Code
P-37-000055/ CA-SDI-55	Prehistoric	Midden and shell scatter.	Unevaluated	7
P-37-005931/ CA-SDI-5931	Prehistoric	Large artifact scatter including Native American burial.	Unevaluated	7

Notes:

California Historical Resource Status Code 7 – Not evaluated for NRHP or CRHR.

Planning District 7: South Bay

The record search revealed that no archaeological resources have been recorded within PD7.

Planning District 8: Imperial Beach Oceanfront

As shown in Table 4.4-5, the record search revealed that one archaeological resource was recorded within PD8. P-37-004641 consists of a prehistoric lithic and groundstone scatter recorded in 1972.

Table 4.4-5. Previously Identified Archaeological Resources Within Planning District 8: Imperial Beach Oceanfront

Resource ID	Time Period	Description	Eligibility/ Listing	Status Code
P-37-004641	Prehistoric	Artifact scatter with flakes and groundstone.	Unevaluated	7

Notes:

California Historical Resource Status Code 7 – Not evaluated for NRHP or CRHR.

Planning District 9: Silver Strand

As shown in Table 4.4-6, the record search indicated that two archaeological resources were recorded within PD9. One of the resources (P-37-019281) was recorded as a mix of historic and modern refuse found in fill, and the other (P-37-026498) consists of a historic and prehistoric artifact scatter.

Table 4.4-6. Previously Identified Archaeological Resources Within Planning District 9: Silver Strand

Resource ID	Time Period	Description	Eligibility/ Listing	Status Code
P-37-019281	Historic	Historic and modern refuse found in fill deposit and dating to the 1960s to 1970s.	Unevaluated	7
P-37-026498	Both	Prehistoric artifact scatter with lithics, shell, and hearth features as well as historic glass and faunal remains of unknown age.	Unevaluated	7

Notes:

California Historical Resource Status Code 7 – Not evaluated for NRHP or CRHR.

Planning District 10: Coronado Bayfront

As shown in Table 4.4-7, the record search indicated that two prehistoric resources (midden, and lithic and shell scatter) and one historic resource (trash dump, cement walkway and pier) are located within PD10.

Table 4.4-7. Previously Identified Archaeological Resources Within Planning District 10: Coronado Bayfront

Resource ID	Time Period	Description	Eligibility/ Listing	Status Code
P-37-000066	Prehistoric	Midden and shell scatter.	Unevaluated	7
P-37-009539/ CA-SDI-9539	Prehistoric	Lithic and shell scatter, possibly originated as fill material brought in during construction.	Unevaluated	7
P-37-028978/ CA-SDI-18583	Historic	Trash dump dating to between 1939 and 1948 and cement walkway and wood pier, all located beneath fill.	Unevaluated	7

Notes:

California Historical Resource Status Code 7 – Not evaluated for NRHP or CRHR.

Prehistoric Archaeological Sensitivity Model

Within the context of this PEIR, the term *archaeological sensitivity* is used to describe the potential for encountering intact prehistoric archaeological resources. Areas with high archaeological sensitivity would be considered to have increased potential for encountering intact prehistoric archaeological resources, whereas areas with low archaeological sensitivity would be considered to have decreased potential for encountering intact prehistoric archaeological resources.

This archaeological sensitivity analysis was developed using existing documentary sources and is intended to assist with characterizing the risk of encountering as-yet undocumented prehistoric archaeological resources. The purpose of performing an archaeological sensitivity analysis is to determine the risk of encountering as-yet undocumented archaeological resources to help guide decision-making relating to the need, and level of effort required, for future archaeological studies. Defining an area as having low archaeological sensitivity does not preclude it from containing intact archaeological resources but rather indicates that the likelihood of encountering such a resource is decreased relative to other areas.

As indicated above, this model only considers prehistoric archaeological sensitivity. Historical archaeological sensitivity is not limited to areas landward of the pre-development shoreline as historical archaeological sites could post-date anthropogenic filling in some instances, and is best considered via detailed historic map and documentary research. This research was already performed for the proposed PMPU and is summarized above under *History of the Planning Districts*.

Analytical Framework

This analysis uses landforms as the unit by which the current and past landscape is divided to reflect patterns of prehistoric accessibility and land use. Landforms are physical landscape features with discrete attributes such as shape, lithology, and stratigraphy. The age and environment in which a landform is created has a direct bearing on when it becomes accessible for human use, how humans interact with it once it becomes accessible, and how the material remains of these activities are preserved. Landforms are useful analytical units for considering the relationship between landscape history and human activities because each type has a unique set of physical attributes (e.g., age, depositional environment, stability, accessibility, resources) and can be recognized and contrasted at the macroscopic scale. Based on a review of geologic and U.S. Coast and Geodetic Survey maps of the study area vicinity, it is anticipated that it has been primarily shaped by coastal and anthropogenic processes, likely resulting in the formation of three common landform types: anthropogenic, tidal flats, and uplands. Descriptions of these landform types, their attributes, and archaeological sensitivity are presented below.

Anthropogenic

Human-induced (i.e., anthropogenic) modifications to the landscape result in the creation of new landforms that are anthropogenic, rather than natural, in origin. The study area was extensively filled during the early to middle twentieth century, with the most extensive filling occurring at the current location of Lindbergh Field between 1938 and 1942 and on Coronado Island between 1944 and 1945 (United States Department of Commerce 1938, 1942, 1944, 1945). Fill depths may range from a few feet up to 20 feet in depth (Ninyo & Moore 2020). Filling is used to raise the elevation of the ground surface and to provide structurally suitable materials for construction. The process of filling can bury the pre-development ground surface, which—when cutting has not removed deposits that retain archaeological potential—can bury archaeological resources, particularly in

coastal environments (e.g., Schneyder et al. 2010; Elder and Sparks 2011; Elder et al. 2015; Valentino 2015). Depending on the fill material's source of origin, it may contain accumulations of precontact, historical, and/or modern items that have been displaced from the location of their primary deposition. Such items would not be in primary depositional context and, therefore, would not represent intact archaeological deposits.

Tidal Flats

Within the context of this section of the PEIR, the term *tidal flats* is used to collectively refer to three landform types that have similar physical attributes, but differ in their position relative to the intertidal zone (i.e., the area that is above water during low tide and submerged during high tide). These landforms are salt marshes, intertidal flats, and subtidal flats. All three are relatively flat plains incised by sinuous or winding tidal channels. They form along coasts or in lagoons, estuaries, and embayments where the depositional effects of tidal action are the dominant landscape formation processes. Although all three types of low-energy intertidal landforms occur within or below the intertidal zone, they occur at different elevations within these zones. Salt marshes, for example, occur at the interface between the supratidal zone (i.e., the zone that extends above normal high tide, but is regularly splashed by waves and storm events) and the upper intertidal zone (i.e., the zone that is only submerged during the highest tides) in locations where soil, salinity, and nutrient content is ideal for the growth of salt-tolerant vegetation. Intertidal flats occur throughout the intertidal zone, while subtidal flats occur below the intertidal zone. Although all three are formed by the same processes, each can exhibit minor variations in sedimentary composition relative to each other. All three landforms are typically composed of finely laminated clays, silts, and fine sands; but salt marshes may contain a higher concentration of decomposed organics, and subtidal flats may contain a slightly higher concentration of coarser sediments (Reading and Collinson 1996).

Tidal flats have been forming within and in the vicinity of the study area during the period for which there is scientific consensus regarding the age of human occupation of North America (starting at the Pleistocene/Holocene transition—around 12,000 years ago) (Meltzer 2004; Erlandson et al. 2007); however, the conditions in which they form reduce their potential to contain archaeological deposits. For example, although salt marshes and intertidal flats are rich in floral and faunal resources, they are regularly inundated and cannot be used for habitation or for resource processing activities that require long periods of time, although salt marshes are typically inundated less frequently than intertidal flats. Because the ground surface associated with subtidal flats is permanently inundated, human activities would not have occurred directly on the surface. As a result of the limited ground surface accessibility for all three landforms, it is anticipated that any evidence of human use of the landscape would be limited to occasional isolated tools and intertidal resource capture facilities (i.e., nets and traps) associated with brief periods of resource collection.

Depending on the local topography prior to the sea level rise that occurred during the Holocene epoch, the formation of tidal flats may have buried landforms that were previously sub-aerially exposed earlier in the Holocene epoch. Therefore, although tidal flats may have limited potential to contain archaeological resources, it is possible that they may bury landforms with the potential to contain archaeological resources.

Uplands

Within the context of this section the PEIR, the term *uplands* is used to refer to any natural (i.e., non-anthropogenic) landforms located inland of the shoreline. Although uplands can be created via a wide range of processes, the uplands in the study area vicinity are composed of middle to late Pleistocene-

aged uplifted paralic (interbedded marine and continental) deposits and Holocene-aged alluvial deposits (Kennedy and Tan 2008). Depending on local resource availability, uplands are suitable for a wide range of land use activities, including resource collection, resource processing, and habitation. Especially in the San Diego region, these activities tended to have occurred near fresh waters sources (e.g., Christenson 1990; Robbins-Wade 1990) as there was no infrastructure to transport water other than by manually carrying it during the prehistoric period. Depending on the age of the uplands, anthropogenic landscape alteration can further influence the potential for encountering archaeological resources on uplands. For example, grading on Pleistocene-aged landforms is likely to remove any surfaces that may contain archaeological resources, whereas archaeological resources impacts on Holocene-aged landforms would depend on the thickness of the landform.

Methods

To consider archaeological sensitivity, historic shoreline data of the study area was collected and compared to the current shoreline. This was accomplished by obtaining digitized and georeferenced historical U.S. Coast and Geodetic Survey maps (Alden 1857) to trace the pre-development shoreline and then compare it to the current shoreline within the study area. To account for scale-induced mapping error, a 10-meter buffer was added to the seaward side of the pre-development shoreline. This was done to account for the potential maximum seaward extent of the pre-development shoreline. For those areas located landward of the pre-development shoreline, ICF archaeologists reviewed historic and recent topographic maps available at NETR Online (www.historicaerials.com) to consider whether these areas were filled.

Based on the information presented in the analytical framework and the local conditions identified by the methods above, all the study units were divided into two categories of archaeological sensitivity.

- **High Archaeological Sensitivity.** Areas located landward of the pre-development shoreline with evidence of filling. Such areas would have been accessible for a wide range of prehistoric land use activities and either minimally developed or protected from extensive disturbance because of the presence of fill.
- **Low Archaeological Sensitivity.** Areas located seaward of the pre-development shoreline or are Pleistocene-aged or older landforms that have been graded or extensively developed (but not filled). Seaward areas would have only been intermittently available for a small range of prehistoric land use activities. Pleistocene-aged or older landforms that have been graded or developed are likely to have extensively disturbed or removed ground surface that would have been associated with the period for which there is general consensus regarding the timing of human use of North America.

Findings

Review of the historic shoreline data revealed that only 0.50 percent (13.30 acres) of the total study area, distributed across PD1, PD2, PD3, PD4, PD7, PD8, PD9, and PD10, is located landward of the pre-development shoreline. Of these, four planning districts (PD1, PD3, PD4, and PD7) contain 100 percent (13.30 acres) of the landward area. All of the landward area has either been filled or has remained minimally developed and is therefore considered to have high archaeological sensitivity. The entirety of four planning districts—PD2, PD8, PD9, and PD10—are located seaward of the pre-development shoreline. Estimates relating to the depth of fill in areas where fill was identified could not be generated with the data that was available at the time of the completion of this analysis. However, general geotechnical analysis indicates fill can range from a few feet up to 20 feet in depth

(Ninyo & Moore 2020). Table 4.4-8 identifies all the planning district areas within the proposed PMPU and the proportion of each that fall landward of the pre-development shoreline. Detailed descriptions of the archaeological sensitivity of each planning district are provided below the table.

Table 4.4-8. Historic Shoreline Data for Landward and Seaward Acreage, and Total Acreage of Each Planning District Within the Study Area

Planning Districts	Landward Acres (%)	Seaward Acres (%)	Total Acreage
PD1: Shelter Island	0.33 (<.01%)	322.47 (>99.90%)	322.80
PD2: Harbor Island	0.0 (0%)	382.80 (100%)	382.80
PD3: Embarcadero	1.28 (<.01%)	455.70 (>99.90%)	456.98
PD4: Working Waterfront	10.29 (2.80%)	357.70 (97.20%)	367.99
PD7: South Bay	1.40 (0.66%)	210.50 (99.34%)	211.9
PD8: Imperial Beach Oceanfront	0.0 (0%)	404.17 (100.0%)	404.17
PD9: Silver Strand	0 (0%)	231.70 (100%)	231.70
PD10: Coronado Bayfront	0 (0%)	272.70 (100%)	272.70
Total	13.30 (0.50%)	2637.74 (99.50%)	2,651.04

Planning District 1: Shelter Island

Less than 1 percent (0.33 acres) of PD1 (approximately 323 acres) is located landward of the pre-development shoreline. No previously documented prehistoric archaeological sites are located within this planning district. The desktop-based archaeological sensitivity analysis of PD1 indicates that the entire planning district has low archaeological sensitivity.

Planning District 2: Harbor Island

None of PD2 (approximately 383 acres) is located landward of the pre-development shoreline. One prehistoric archaeological site was previously documented within this planning district (P-37-000054). This site, however, could not be relocated at its documented location and was determined not eligible for listing in the NRHP/CRHR and is not considered a unique archaeological resource. Given that nearly the entire planning district is located seaward of the pre-development shoreline and the site could not be relocated, it is plausible that the site location was either mis-plotted or that the site was mis-identified dredge spoils, which can occasionally contain concentrations of shell. Based on the factors discussed above, the entire planning district has low archaeological sensitivity.

Planning District 3: Embarcadero

Less than 1 percent (1.28 acres) of PD3 (approximately 457 acres) is located landward of the pre-development shoreline. No previously documented prehistoric archaeological sites are located within this planning district. The desktop-based archaeological sensitivity analysis of PD3 indicates that the entire planning district has low archaeological sensitivity.

Planning District 4: Working Waterfront

Just under 3 percent (10.29 acres) of PD4 (approximately 368 acres) is located landward of the pre-development shoreline. One previously documented prehistoric archaeological site (P-37-000055) is located within this planning district, landward of the pre-development shoreline in an area identified as having high sensitivity for prehistoric archaeological sites. Therefore, the landward portion of the

planning district (less than 1 percent) has high sensitivity for prehistoric archaeological sites while the seaward portion is considered to have low sensitivity for prehistoric archaeological sites.

Planning District 7: South Bay

Less than 1 percent (1.4 acres) of PD7 (approximately 212 acres) is landward of the pre-development shoreline. No previously documented prehistoric archaeological sites are located within this planning district. The desktop-based archaeological sensitivity analysis of PD7 indicates that the entire planning district has low archaeological sensitivity.

Planning District 8: Imperial Beach Oceanfront

None of PD8 (approximately 404 acres) is landward of the pre-development shoreline. One prehistoric archaeological site (P-37-004641) was previously documented at the easternmost edge of this planning district and is at the edge of the pre-development shoreline. A small portion is shown extending seaward of the pre-development shoreline. Overall, the desktop-based archaeological sensitivity analysis of PD8 indicates that the entire planning district has low archaeological sensitivity because the majority of the planning district is located seaward of the pre-development shoreline.

Planning District 9: Silver Strand

None of PD9 (approximately 232 acres) is landward of the pre-development shoreline. Despite this, a very small portion of one archaeological site (P-37-026498) is documented as being within the planning district. Overall, the desktop-based archaeological sensitivity analysis of PD9 indicates that the entire planning district has low archaeological sensitivity because the majority of the planning district is located seaward of the pre-development shoreline.

Planning District 10: Coronado Bayfront

None of PD10 (approximately 273 acres) is landward of the pre-development shoreline. Despite this, two archaeological sites (P-37-000066 and P-37-009539) are documented as being within the planning district. One of the sites (P-37-009539) appears to consist of imported and redeposited artifacts in fill material and, therefore, does not appear to be an intact archaeological site. The other (P-37-000066) contains limited information, and it is plausible that the site location was either mis-plotted or that the site was mis-identified dredge spoils, which can occasionally contain concentrations of shell. Based on the factors discussed above, the entire planning district has low archaeological sensitivity.

Historical Resources

This section identifies known built environment resources (intact buildings, structures, objects, and landscapes) within the eight planning districts. As outlined in Section 15064.5 of the State CEQA Guidelines, built environment resources that qualify as historical resources under CEQA include: any resource listed in the CRHR or determined eligible for listing in the CRHR by the State Historical Resources Commission (15064.5 [a] [1]); resources listed in local registers of historical resources as defined by Section 5020.1(k) of the PRC (15064.5 (a) (2)); resources identified as significant in a historical resources survey meeting the requirements of Section 5024.1(g) of the PRC (15064.5 [a] [2]); any resource determined by a CEQA lead agency to qualify as a historical resource provided the determination is supported by substantial evidence in light of the whole record (15064.5 [a] [3]). Any property listed in the NRHP is automatically listed in the CRHR, and therefore qualifies as a

historical resource under CEQA. Properties determined eligible for listing in the NRHP with concurrence by the SHPO are considered eligible for the CRHR, and therefore are considered to qualify as historical resources under CEQA. Federal, State, and local regulations involving historical resources are addressed in more detail below in Section 4.4.3, *Laws, Regulations, Plans, and Policies*.

A variety of sources were used to gather information on previously identified built environment resources within the eight planning districts that have been evaluated for historical significance as part of past actions not associated with the proposed PMPU. California Department of Parks and Recreation (DPR) forms for evaluated buildings, structures, and landscapes within the planning districts were compiled from the record search results. A qualified architectural historian performed desktop research to confirm the existence of built environment resources within the planning districts evaluated in DPR forms yielded by the record search, and to screen out DPR forms for buildings and structures that have been demolished. Record search results and desktop research were used to identify NRHP-listed properties and California Historical Landmarks within the planning districts. The local historical resource registers of the Cities of Coronado and San Diego were also consulted to identify locally designated historical resources within the planning districts. The City of Imperial Beach does not have a local register. Records search results and desktop research indicate that 28 previously identified built-environment resources within the proposed PMPU area have been evaluated for historical and architectural significance to determine their eligibility for NRHP, CRHR, or local listing. Nine of these built environment resources qualify as historical resources under CEQA because they are listed in the NRHP and/or the CRHR, they have been determined eligible for listing in the NRHP with SHPO concurrence (and are therefore eligible for CRHR listing), or they have been listed in a local register of historical resources. Nineteen of these previously identified built-environment resources within the proposed PMPU area have been evaluated and found ineligible for NRHP and/or CRHR listing. The only previously identified built environment resources in the proposed PMPU area considered historical resources throughout the 2050 lifespan of the proposed PMPU are those that remain listed in the NRHP, the CRHR, and local registers of historical resources. Previously identified built-environment resources determined eligible for NRHP listing with SHPO concurrence are likely to continue to qualify as historical resources under CEQA but may require reevaluation at the project level to determine if alterations have caused adverse changes in their significance. Previously identified built-environment resources that have been evaluated and found to be ineligible for NRHP or CRHR listing would require reevaluation at the project level if 10 or more years have passed since the original evaluation.

The subsections below identify the previously identified built-environment resources in each planning district and specify whether they currently qualify as historical resources under CEQA. The subsections also briefly characterize each planning district's projected historical resource sensitivity through the year 2050 (the planning horizon of the proposed PMPU), which serves to highlight areas that may need additional survey work in the future when a development, along with any related structure modifications or removal, is proposed. Without any projects proposed for development at this time, it is beyond the scope of this program-level analysis to perform site-specific evaluations. Site-specific surveys are appropriate once there is a better understanding of the areas that would be affected and how they would be affected (i.e., more details about a development proposal are known). Critically, this changes over time and structures that were not sufficiently old enough to warrant consideration during the preparation of this analysis may be at the time a development is proposed.

Planning District 1: Shelter Island

As shown in Table 4.4-9, the record search coupled with additional research identified one built environment resource within this planning district that has been evaluated and found not to qualify for CRHR listing.

Table 4.4-9. Previously Identified Built Environment Resources Within Planning District 1: Shelter Island

Resource	Location	Year Built	Currently Qualifies as a Historical Resource Under CEQA (Yes/No)	Status Code
Atkin-Moore Anchorage Building (P-37-036172)	2353 Shelter Island Drive, San Diego	1960	No	6Z

Notes: California Historical Resource Status Code 6Z: Found ineligible for NRHP, CRHR, or local designation through survey evaluation.

As noted above, Shelter Island was developed as a recreational and commercial built environment beginning in the 1950s. Into the 1960s, planning policy required that new buildings constructed at Shelter Island exhibit “South Seas” or Tiki-Modern design qualities. Most of the buildings within the planning district that retain Tiki-Modern style design attributes have reached the 50-year age threshold, at which built environment resources are typically considered potential historical resources. Buildings that have reached the 50-year age threshold require evaluation when future, site-specific projects subject to CEQA compliance stand to alter such resources. The Shelter Island Planning District also contains buildings, structures, and designed landscape spaces constructed after the 1960s that will reach the 50-year age mark between now and 2050. Identification of any buildings proposed for modification or future projects located adjacent to structures or buildings must determine if the structure is over 50 years or would be over 50 years old by the time a future project’s construction is initiated.

Planning District 2: Harbor Island

The record search and other research efforts identified four existing built environment resources within this planning district that have been evaluated, as shown in Table 4.4-10.

The Institute of Aeronautical Sciences Headquarters (today’s Harbor Police Headquarters) just south of Harbor Drive and east of Harbor Island Drive was found eligible for NRHP listing as part of a CEQA-only project not subject to SHPO concurrence. This property is an example of a resource that could require re-evaluation during the lifespan of the proposed PMPU at the project level should a proposed project stand to alter the property. The Spanish Landing Site, California Historical Landmark No 891, qualifies as a historical resource by virtue of its listing in the CRHR.

The San Diego International Airport (formerly Lindbergh Field) is not within the proposed PMPU area because it is within the land use jurisdiction of the SDCRAA. The Harbor Island Planning District focuses on the Pacific Highway and Harbor Drive corridors, and Harbor Island itself. As noted above, Harbor Island was created in the 1960s and developed beginning in the late 1960s. The island’s first hotel opened in 1969. Much of Harbor Island’s built environment dates to the 1970s and 1980s. Buildings, structures, and designed landscapes within the planning district under 50 years of age at present that stand to reach that age mark between now and 2050 are concentrated within Harbor Island, though such resources are also present along Pacific Highway.

Table 4.4-10. Previously Identified Built Environment Resources Within Planning District 2: Harbor Island

Resource	Location	Year Built	Currently Qualifies as a Historical Resource Under CEQA (Yes/No)	Status Code
Institute of Aeronautical Sciences Headquarters (Harbor Police Headquarters)	3380 North Harbor Drive, San Diego	1949	No	3S
South Overpass (Consolidated Aircraft Plant No. 1)	Pacific Highway at Port of San Diego Headquarters	Circa 1941	No	6Z
1411-1415 W. Palm Street	1411-1415 West Palm Street	Circa 1949	No	6Z
Spanish Landing Site, California Historical Landmark No. 891	Spanish Landing Park, North Harbor Boulevard, San Diego	NA	Yes	1CL, 5S1

Notes:

California Historical Resource Status Code 1CL: Automatically listed in the CRHR—includes State Historical Landmarks 770 and above and Points of Historical Interest nominated after December 1997 and recommended for listing by the State Historical Resources Commission.

California Historical Resource Status Code 3S: Appears eligible for NRHP as an individual property through survey evaluation (no SHPO concurrence—therefore, the property’s historical resource status under CEQA remains undetermined).

California Historical Resource Status Code 5S1: Individual property that is listed or designated locally (San Diego Historical Resources Register)

California Historical Resource Status Code 6Z: Found ineligible for NRHP, CRHR, or local designation through survey evaluation.

Planning District 3: Embarcadero

Forming the Downtown San Diego waterfront, the Embarcadero Planning District has more built environment resources that currently qualify as historical resources under CEQA than any of the other planning districts. Research identified five resources in PD3 that qualify as historical resources under CEQA by virtue of being listed on the NRHP. Three are buildings and complexes: the historic San Diego Civic Center (today’s County Administration Center); the City of San Diego Police Headquarters, Jail, and Courts (today’s Headquarters at Seaport); and the San Diego Rowing Club (today’s Joe’s Crab Shack). Although the historic San Diego Civic Center (County Administration Center) is located within PD3, the property is not part of the District’s jurisdiction. Two ocean vessels at the San Diego Maritime Museum are also listed on the NRHP: the *Star of India* and the *Berkeley*. Located at the west side of the Police Headquarters, California Historical Landmark No. 57 marking La Punto de Los Muertos has a status code of 7L, indicating that it needs reevaluation to determine if it is eligible for the CRHR. These eight resources are listed in Table 4.4-11.

In addition to resources constructed prior to 1970, the Embarcadero Planning District contains numerous buildings, structures, and designed landscapes constructed from the early 1970s through the 1990s that stand to reach the 50-year age mark by 2050. Indeed, much of the planning district’s built environment dates to those decades. Concentrations of development dating to those decades occur at the B Street Pier and nearby tourist-oriented facilities south of the County Administration Center and north of the Naval Supply Center, and the majority of PD3 from the Tuna Harbor at G Street to the southeast. In the latter area, built environment elements dating to the early 1970s through the

1990s include wharfs, restaurants, Seaport Village, multiple major hotel facilities, marinas, the Embarcadero Marina Park North and South Peninsula landscapes, and the Convention Center.

Table 4.4-11. Previously Identified Built Environment Resources Within Planning District 3: Embarcadero

Resource	Location	Year Built	Currently Qualifies as a Historical Resource Under CEQA (Yes/No)	Status Code
Atchison, Topeka & Santa Fe Railway (Burlington Northern & Santa Fe, P-37-024739)	Crossing at West Market Street, San Diego	1882–1883	No	6Y
Building 11, Solar Turbines Incorporated (P-37-030946)	2200 Pacific Highway, San Diego	Circa 1910s	No	6Z
San Diego Civic Center (County Administration Center)	1600 Pacific Highway, San Diego	1936–1938	Yes	1S
<i>Star of India</i>	San Diego Maritime Museum, 1492 North Harbor Drive, San Diego	1863	Yes	1S
<i>Berkeley</i>	San Diego Maritime Museum, 1492 North Harbor Drive, San Diego	1898	Yes	1S
City of San Diego Police Headquarters, Jail, and Courts (Headquarters at Seaport)	789 West Harbor Drive, San Diego	1938–1930	Yes	1S
La Punta de Los Muertos, California Historical Landmark No. 57	East Side of Pacific Highway South of North Harbor Drive	NA	No	7L
San Diego Rowing Club (Joe's Crab Shack)	525 East Harbor Drive, San Diego	1899	Yes	1S

Notes:

California Historical Resource Status Code 1S: Individual property listed in NRHP by the Keeper. Listed in CRHR.
 California Historical Resource Status Code 6Y: Determined ineligible for NRHP by consensus through Section 106 process—Not evaluated for CRHR or local listing.

California Historical Resource Status Code 6Z: Found ineligible for NRHP, CRHR, or local designation through survey evaluation.

California Historical Resource Status Code 7L: State Historical Landmarks 1-769 and Points of Historical Interest designated prior to January 1998—Needs to be reevaluated using current standards.

Planning District 4: Working Waterfront

The record search and other research efforts identified twelve existing built environment resources within PD4 that have been evaluated, as shown in Table 4.4-12.

Table 4.4-12. Previously Identified Built Environment Resources Within Planning District 4: Working Waterfront

Resource	Location	Year Built	Currently Qualifies as a Historical Resource Under CEQA (Yes/No)	Status Code
Atchison, Topeka & Santa Fe Railway (Burlington Northern & Santa Fe)	Area East of Tenth Avenue Marine Terminal, San Diego	1882–1883	No	6Z
Tenth Avenue Marine Terminal (TAMT) Potential Historic District	623 Switzer Street, San Diego	1957–1964	No	6Z
Transit Shed 1, TAMT	623 Switzer Street, San Diego	1957–1958	No	6Z
Transit Shed 2, TAMT	623 Switzer Street, San Diego	1957–1958	No	6Z
Bunker Fuel Complex, TAMT	623 Switzer Street, San Diego	1959	No	6Z
Molasses Tanks, TAMT	623 Switzer Street, San Diego	1963	No	6Z
Truck Scale Building, TAMT	623 Switzer Street, San Diego	1963	No	6Z
Bulk Loader, TAMT	623 Switzer Street, San Diego	1962	No	6Z
Warehouse B, TAMT	623 Switzer Street, San Diego	1962	No	6Z
Warehouse C, TAMT	623 Switzer Street, San Diego	1964	No	6Z
Railroad Lines, TAMT	623 Switzer Street, San Diego	1958–1964	No	6Z
Silo Complex, TAMT	623 Switzer Street, San Diego	1970	No	6Z
San Diego-Coronado Bay Bridge (Caltrans Bridge No. 57-0858; P-37-016282)	San Diego-Coronado Bay Bridge	1969	Yes	2S2

Notes:

California Historical Resource Status Code 2S2: Individual property determined eligible for NRHP by consensus through Section 106 process. Listed in the CRHR.

California Historical Resource Status Code 6Z: Found ineligible for NRHP, CRHR, or local designation through survey evaluation.

Of the 10 planning districts, the Working Waterfront Planning District is the most densely developed and the most thoroughly industrial in character. One resource within the planning district has been evaluated and found historically significant: the San Diego-Coronado Bay Bridge. The California Department of Transportation (Caltrans) has determined that the bridge is eligible for NRHP listing with SHPO concurrence. The District's TAMT complex occupies the majority of the planning district northwest of the San Diego-Coronado Bay Bridge. The TAMT built environment was evaluated in 2016 as part of the Tenth Avenue Marine Terminal Redevelopment Plan and Demolition and Initial Rail Component Project FEIR, which is incorporated into this PEIR by reference (District 2016). In 2016 the TAMT was determined ineligible for listing in the CRHR by the District and determined ineligible for listing in the NRHP by the United States Maritime Administration with SHPO concurrence. The planning district contains numerous built-environment resources of a

predominantly industrial character 50 years old or older, as well as resources that will reach the 50-year age threshold for as potential historical resources over the next 30 years.

Planning District 7: South Bay

As shown in Table 4.4-13, the record search coupled with additional research identified one built environment resource within this planning district that has been evaluated.

Table 4.4-13. Previously Identified Built Environment Resources Within Planning District 7: South Bay

Resource	Location	Year Built	Currently Qualifies as a Historical Resource Under CEQA (Yes/No)	Status Code
Western Salt Company Salt Works Landscape District	Southern end of San Diego Bay	1916–1949	Yes	2S2

Notes:

California Historical Resource Status Code 2S2: Individual property determined eligible for NRHP by a consensus through Section 106 process. Listed in CRHR.

A small portion of a historic landscape district that has been determined eligible for listing in the NRHP is located within this planning district: the Western Salt Company Salt Works. The landscape district consists of approximately 1,300 acres of salt ponds and other facilities. As noted above, mitigation in the form of HALS documentation and public interpretation was prepared in the early 2000s for the adverse effect on the resource caused by habitat restoration efforts that required alteration of the appearance and function of the Western Salt Company Ponds 10, 10A, and 11.

No other built environment resources are located within the South Bay Planning District.

Planning District 8: Imperial Beach Oceanfront

The record search and additional research identified no built environment resources within PD8 that have been evaluated for listing in the NRHP or CRHR. Imperial Beach does not have a preservation ordinance or local historical resource register. The planning district contains no built environment resources that are currently considered historical resources. One structure within the planning district, the Imperial Beach Pier, was constructed in 1960. However, the pier was severely damaged in the 1980s and reconstructed in 1989. The reconstructed pier will be 50 years old in 2039. Several other built environment resources within this planning district were developed in the 1980s and 1990s. Historic aerial photographs indicate that Pier Park was created in the 1980s. Dunes Park and the Dempsey Holder Safety Center date to the 1990s. These built environment elements will reach the 50-year age mark in the 2030s and 2040s,

Planning District 9: Silver Strand

The record search and additional research identified no built environment resources within PD9 that have been evaluated for listing in the NRHP, CRHR, or a local historical resources register. The planning district contains no built environment resources that are currently considered historical resources. No elements of PD9's built environment are currently 50 years of age or older. Grand Caribe Island at the central portion of the planning district was created in the early 1970s. Historic aerial photographs indicate that the building near the center of the island and the east end of Grand

Caribe Causeway was constructed in the 1970s, and that the building at the north end of the island, the Coronado Cays Yacht Club, dates to the early 1990s. Although Crown Island was created earlier, development did not occur there until the 1990s. The majority of the extant Crown Island built environment dates to that decade. Apart from the 1970s building on Grand Caribe Island, these built resources will not reach the 50-year age mark until the 2030s and 2040s.

Planning District 10: Coronado Bayfront

The record search and additional research identified no built resources in PD10 that have been evaluated for listing or listed on the NRHP or the CRHR. One resource consisting of a designed landscape and identified in Table 4.4-14, is listed on the Coronado Register of Historic Resources: Centennial Park, created in 1986. The park appears to be considered a historic site because it is the location of the original Coronado Ferryboat Terminal and includes a restored historic ticket booth at the southern portion of the property. Only the far northern portion of the park landscape is within the planning district.

Table 4.4-14. Previously Identified Built Environment Resources Within Planning District 10: Coronado Bayfront

Resource	Location	Year Built	Currently Qualifies as a Historical Resource Under CEQA (Yes/No)	Status Code
Centennial Park	1101 1 st Street, Coronado	1986	Yes	5S1

Notes:

California Historical Resource Status Code 1D: Contributor to a district or multiple resource property listed in the NRHP by the Keeper. Listed in the CRHR.

California Historical Resource Status Code 5S1: Individual property that is listed or designated locally (City of Coronado Register of Historical Resources).

One building within the Coronado Bayfront Planning District is 50 years of age or older: the Coronado Yacht Club's clubhouse, a repurposed military structure moved to its current location at the northwest shore of Glorietta Bay in 1947. Although the current clubhouse at the Coronado Golf Course dates to the 1990s and will not reach the 50-year age mark until the 2040s, the larger golf grounds created in the 1950s form a designed landscape that is over 50 years of age.

The majority of this planning district's built environment north of the San Diego-Coronado Bay Bridge dates to the 1980s and will reach the 50-year age mark in the 2030s. Buildings, complexes, and designed landscapes dating to the 1980s include the Ferry Landing Marketplace, the Coronado Island Marriot Resort and Spa, and Coronado Tidelands Park. Historic aerial photographs indicate that one building just east of the Ferry Landing Marketplace also dates to the 1980s.

Tribal Cultural Resources

Resources that are potential tribal cultural resources (TCRs) include sites, features, places, cultural landscapes, sacred places, and objects with cultural value to Native Americans for religious, spiritual, or traditional uses. These can encompass the sacred character of physical locations (mountain peaks, springs, and burial sites) or particular native plants, animals, or minerals that are gathered for use in traditional ritual activities. The locations or physical remains of villages, camps and activity areas, burials, rock art, rock features, and traditional hunting, gathering, or fishing sites may also constitute TCRs. TCRs tend to fall into distinctive categories that relate to cosmology or activities that took place. They are found throughout the region, but tend to be physical geographic landmarks or in areas close to a water source or resources (such as materials for tool making or

readily available food), and on flatter ground. TCRs can be found on the surface, or buried. Because the proposed PMPU area is highly developed, potential TCRs in the proposed PMPU area are likely to be archaeological sites representing the physical remains of past human activity. However, TCRs would be identified through the course of government-to-government consultation between the District and an Assembly Bill (AB) 52 consulting tribe.

On April 26, 2017, ICF requested a review of Sacred Lands files from the Native American Heritage Commission (NAHC). The NAHC responded on April 27, 2017, stating that the Sacred Lands file failed to indicate the presence of Native American cultural resources in the planning districts. The NAHC also provided a list of 12 Native American individuals or organizations that may have knowledge of cultural resources in the proposed PMPU area. On May 10, 2017, outreach letters were sent to all 12 individuals and organizations identified by the NAHC. One response has been received to date. A letter dated May 16, 2017, was received from the Viejas Band of Kumeyaay Indians, which included the tribe's standard response requesting the presence of a Kumeyaay Cultural Monitor during ground-disturbing activities and to be informed of new developments that result in inadvertent discovery of artifacts or human burials. All correspondence is included in Appendix E.

To date, no Native American tribes have contacted the District requesting to be notified of District projects under AB 52, and no Native American tribes have requested AB 52 consulting party status on the PEIR.

The record search conducted by the SCIC on April 24, 2017, to identify cultural resources within the proposed PMPU area and its 0.25-mile buffer identified six archaeological sites from the prehistoric period (two in PD2, one in PD8, one in PD9, and two in PD10) that have not been evaluated for listing in the CRHR or as a unique archaeological resource (see *Archaeological Resources* above). A prehistoric archaeological resources may be considered a TCR by one or more Native American tribes; however, none of these resources have been previously identified as TCRs.

4.4.3 Laws, Regulations, Plans, and Policies

4.4.3.1 Federal

National Historic Preservation Act Section 106

Section 106 of the NHPA and its implementing regulations (36 Code of Federal Regulations [CFR]) 800, as amended in 1999), require that Federal agencies and entities that they fund or license consider the effects of their actions on properties that are listed in the NRHP, or that may be eligible for such listing. To determine whether an undertaking could affect NRHP-eligible properties, cultural resources, including historical and architectural properties, must be inventoried and evaluated. Although compliance with Section 106 is the responsibility of the lead Federal agency, others can conduct the work necessary to comply.

The Section 106 review process consists of four steps.

1. Initiate the Section 106 process by establishing the undertaking, developing a plan for public involvement, and identifying other consulting parties.

2. Identify *historic properties* (resources that are eligible for inclusion in the NRHP) by determining the scope of efforts, identifying cultural resources in the area potentially affected by the project, and evaluating resources' eligibility for NRHP inclusion.
3. Assess adverse effects by applying the Section 106 criteria of adverse effect to identified historic properties.
4. Resolve adverse effects by consulting with the SHPO and other consulting agencies, including the Advisory Council on Historic Preservation if necessary, to develop an agreement that addresses the treatment of historic properties.

National Register of Historic Places

The NRHP is the nation's master inventory of known historic properties. It is administered by the National Park Service in conjunction with the SHPO. The NRHP includes listings of buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, State, or local level. The NRHP criteria and associated definitions are outlined in National Register Bulletin 15, *How to Apply the National Register Criteria for Evaluation* (U.S. Department of the Interior, National Park Service 1988). The following is a summary of Bulletin 15.

Resources (structures, sites, buildings, districts, and objects) more than 50 years of age can be listed in the NRHP provided they meet the evaluative criteria described below. However, properties less than 50 years of age that are of exceptional importance or are contributors² to a district, and that also meet the evaluative criteria, can be included in the NRHP as well.

The NRHP includes four criteria under which a structure, site, building, district, or object can be considered sufficiently significant for listing on the NRHP.

- A. Resources associated with events that have made a significant contribution to the broad patterns of history.
- B. Resources associated with the lives of persons significant in our past.
- C. Resources that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.
- D. Resources that have yielded or may likely yield information important in prehistory or history.

Resources can be listed individually in the NRHP or as contributors to a historic district.

When nominating a resource to the NRHP, one must evaluate and clearly state the significance of that resource to American history, architecture, archaeology, engineering, or culture. A resource can

² A *contributor* is a building, site, structure, or object that adds to the historic associations or historic architectural qualities for which a property is significant. The contributor was present during the period of significance, relates to the documented significance of the property, possesses historic integrity, provides important information about a period, or independently meets the NRHP criteria. A *non-contributor* does not add to the historic associations or historic architectural qualities because it was not present during the period of significance; has experienced alterations, disturbances, additions, or other changes; or does not independently meet the NRHP criteria.

be individually significant if it meets any of the above-stated criteria; only one criterion needs to be met for the eligibility of the resource to be considered.

A resource may be considered eligible for listing on the NRHP if it meets one or more of the above-stated criteria for significance and possesses integrity. Historic properties must retain their integrity to convey their significance. Although the evaluation of integrity is sometimes a subjective judgment, it must always be grounded in an understanding of the resource's physical features and how they relate to its significance. The NRHP recognizes seven aspects or qualities, listed below, that define integrity.

- **Location:** the place where the historic property was constructed or the place where the historic event occurred.
- **Design:** the combination of elements that create the form, plan, space, structure, and style of a property.
- **Setting:** the physical environment of a historic property.
- **Materials:** the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- **Workmanship:** the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- **Feeling:** a property's expression of the aesthetic or historic sense of a particular period of time.
- **Association:** the direct link between an important historic event or person and a historic property.

To retain historic integrity, a resource should possess several of the above-stated aspects. The retention of specific aspects of integrity is essential for a resource to convey its significance. When the integrity of a resource is being evaluated, the resource should also be considered in comparison to similar properties; such comparison may be important for determining physical features that are essential to reflect the significance of a historic context.

4.4.3.2 State

California Environmental Quality Act and Public Resources Code Section 5024.1 (California Register of Historical Resources)

CEQA requires public agencies to evaluate the implications of their project(s) on the environment and includes significant historical resources as part of the environment. According to CEQA, a project that causes a *substantial adverse change* in the significance of a *historical resource* or a *unique archaeological resource* has a significant effect on the environment (State CEQA Guidelines Section 15064.5, PRC Section 21083.2).

CEQA defines a substantial adverse change as follows.

- Physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired (State CEQA Guidelines Section 15064.5(b)(1)).

- Demolition or material alteration of the physical characteristics that convey the resource's historical significance and justify its designation as a *historical resource* (State CEQA Guidelines Section 15064.5(b)(2)(A)).

A historic resource is considered significant if it meets the definition of a historical resource or unique archaeological resource.

Historical Resources

The term historical resource includes but is not limited to any object, building, structure, site, area, place, record, or manuscript that is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California (PRC Section 5020.1(j)). Historical resources may be designated as such through several different processes.

1. Determination of eligibility by the State Historical Resources Commission (State CEQA Guidelines Section 15064.5(a)(1)).
2. Designation of "historical significance" by a lead agency if the resource meets the criteria for listing on the CRHR (State CEQA Guidelines Section 15064.5(a)(3)).
3. Official designation or recognition by a local government pursuant to local ordinance or resolution (PRC Section 5020.1(k)).
4. A local survey conducted pursuant to PRC Section 5024.1(g).
5. Listing in or eligibility for listing in the NRHP (PRC Section 5024.1(d)(1)).

The process for identifying historical resources is typically accomplished by applying the criteria for listing in the CRHR (California Code of Regulations [CCR], Title 14, Section 4852). The CRHR is very similar to the NRHP program. It was enacted in 1992, and its regulations became official January 1, 1998. The CRHR is administered by the Office of Historic Preservation and was established to serve as an authoritative guide to the State's significant historical and archaeological resources (PRC Section 5024.1). State law provides that in order for a property to be considered eligible for listing in the CRHR, it must be significant under any of the following four criteria, which parallel NRHP criteria.

1. The property is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. The property is associated with the lives of persons important in our past.
3. The property embodies the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master or possesses high artistic values.
4. The property has yielded, or may be likely to yield, information important in prehistory or history.

Built environment resources that qualify as *historical resources* are generally 50 years old or older, unless it can be demonstrated that sufficient time has passed to understand the significance of a resource less than 50 years old (14 CCR 11.5, Section 4852 [d] [2]).

To be considered a historical resource for the purposes of CEQA, the resource must also have *integrity*, which is the authenticity of a resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance.

Resources, therefore, must retain enough historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. Integrity is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. It must also be judged with reference to the particular criteria under which a resource is eligible for listing in the CRHR (14 CCR 4852(c)).

Resources listed in the NRHP are automatically included in the CRHR.

Unique Archaeological Resources

Additionally, if a project can be demonstrated to cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that resources cannot be left undisturbed, mitigation measures are required (PRC Section 21083.2(a), (b), and (c)). PRC Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Assembly Bill 52 (Chapter 532, Statute of 2014)

AB 52 (Chapter 532, Statutes of 2014) establishes a formal consultation process for California Native American tribes as part of CEQA and establishes that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment (PRC Section 21084.2). PRC Section 21074 defines tribal cultural resources as follows.

Sites, features, places, sacred places, and objects with cultural value to descendant communities or cultural landscapes defined in size and scope that are:

- Included in or eligible for listing in the CRHR; or,
- Included in a local register of historical resources.

A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1.

Sacred places can include Native American sanctified cemeteries, places of worship, religious or ceremonial sites, and sacred shrines. In addition, both unique and non-unique archaeological resources, as defined in PRC Section 21083.2, can be tribal cultural resources if they meet the criteria detailed above. The lead agency relies upon substantial evidence to make the determination that a resource qualifies as a tribal cultural resource when it is not already listed in the CRHR or a local register.

AB 52 defines a “California Native American Tribe” (Tribe) as a Native American tribe located in California that is on the contact list maintained by the NAHC (PRC Section 21073). Under AB 52, and per PRC Section 21083.3.1, formal consultation with Native American tribes is required prior to determining the level of environmental document if a tribe has requested to be informed by the lead agency of proposed projects and if the Tribe, upon receiving notice of the project, accepts the opportunity to consult within 30 days of receipt of the notice. Per PRC Section 21080.3.2, AB 52 also requires that consultation, if initiated, address project alternatives and mitigation measures for significant effects, if specifically requested by the Tribe. AB 52 states that consultation is considered concluded when either the parties agree to measures to mitigate or avoid a significant effect on tribal cultural resources, or when either the Tribe or the agency concludes that mutual agreement cannot be reached after making a reasonable, good-faith effort. Under AB 52, any mitigation measures recommended by the agency or agreed upon with the Tribe may be included in the final environmental document and in the adopted mitigation monitoring program if they were determined to avoid or lessen a significant impact on a tribal cultural resource. If the recommended measures are not included in the final environmental document, then the lead agency must consider the four mitigation methods described in PRC Section 21084.3(e). Any information submitted by a Tribe during the consultation process is considered confidential and is not subject to public review or disclosure. It will be published in a confidential appendix to the environmental document unless the Tribe consents to disclosure of all or some of the information to the public.

Health and Safety Code 7050.5/Public Resources Code 5097.9

Health and Safety Code 7050.5 addresses the protection of human remains discovered in any location other than a dedicated cemetery and makes it a misdemeanor for any person who knowingly mutilates or disinters, wantonly disturbs, or willfully removes any human remains in or from any location other than a dedicated cemetery without authority of law, except as provided in PRC Section 5097.99. It further states that in the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined that the remains are not subject to the provisions concerning investigation of the circumstances, manner, and cause of any death, and the recommendations concerning the treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in PRC Section 5097.98. If the coroner determines that the remains are not subject to his or her authority and if the coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, he or she shall contact the NAHC by telephone within 24 hours. Whenever the NAHC receives notification of a discovery of Native American human remains from the county coroner, it shall immediately notify those people it believes to be the Most Likely Descendants of the deceased Native American. The descendants may inspect the site of the discovery and make recommendations on the removal or reburial of the remains. Per PRC Section 5097.94, the NAHC has the ability to identify and catalog places of known graves and cemeteries of Native Americans, and may mediate discussions between landowners and known Native American descendants relating to the treatment and disposition of Native American burials, skeletal remains, and items associated with Native American burials.

California Government Code Section 6254 (r) and 6254.10

California Government Code Sections 6254(r) and 6254.10 of the California Public Records Act were enacted to protect archaeological sites from unauthorized excavation, looting, or vandalism. Section 6254(r) explicitly authorizes public agencies to withhold information from the public relating to “Native American graves, cemeteries, and sacred places maintained by the Native American Heritage Commission.” Section 6254.10 specifically exempts from disclosure requests for “records that relate to archaeological site information and reports, maintained by, or in the possession of the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the Native American Heritage Commission, another State agency, or a local agency, including the records that the agency obtains through a consultation process between a Native American tribe and a State or local agency.”

4.4.3.3 Local

The District has not adopted any ordinance or regulation regarding cultural resources within its jurisdiction. Where appropriate, the District may consider the ordinances and regulations of adjoining jurisdictions applicable to cultural resources.

4.4.4 Project Impact Analysis

4.4.4.1 Methodology

The analysis of potential impacts on cultural resources relied on several sources to establish baseline cultural resources data. A record search was conducted by SCIC on April 24, 2017, to identify cultural resources (archaeological and historical resources) within the planning districts and a 0.25-mile buffer. The NAHC provided the results of a sacred lands file search of the proposed PMPU area on April 26, 2017. On May 10, 2017, due diligence outreach letters were sent to interested Native American representatives identified by the NAHC requesting any information on or concerns about cultural resources in the proposed PMPU area. A prehistoric archaeological sensitivity analysis of the proposed PMPU area was developed to understand the potential for prehistoric archaeological sites to be located in each planning district. Local historical resource registers were reviewed to identify historical resources or unique archaeological resources, and laws and regulations were reviewed.

Pursuant to PRC Section 21080.3.1 (AB 52), California Native American tribes traditionally and culturally affiliated with the proposed PMPU area can request notification of projects in their traditional cultural territory. The District has not received a request for project notification from any local Native American tribes. Additionally, the District has not received a specific request from a tribe to consult on the proposed PMPU under AB 52. Therefore, the TCR impact analysis is based on the cultural resources records search and the NAHC Sacred Lands File search conducted for the Draft PEIR.

4.4.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of impacts associated with cultural resources or

TCRs resulting from implementation of the proposed PMPU. The determination of whether a cultural resources impact would be significant is based on the professional judgment of the District as Lead Agency supported by the recommendations of qualified personnel at ICF and is based on the evidence in the administrative record. The determination of whether a TCR impact would be significant is based on the professional judgment and discretion of the District as Lead Agency supported by substantial evidence thorough results of the NAHC Sacred Lands File Search and consultation with Native American tribes consulting under AB 52.

Impacts are considered significant if the project would result in any of the following.

1. Cause a substantial adverse change in the significance of a historical resource as defined by Section 15064.5 of the State CEQA Guidelines.
2. Cause a substantial adverse change in the significance of an archaeological resource as defined by Section 15064.5 of the State CEQA Guidelines.
3. Disturb any human remains, including those interred outside of formal cemeteries.
4. Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
 - a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or
 - b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Threshold Methodology

Impacts on historical resources are determined based on the sensitivity or significance of identified historical resources and the direct and indirect impacts that would result from future development that could occur under buildout of the proposed PMPU. If significant direct or indirect impacts would occur on significant historical resources or unique archaeological resources, mitigation measures would be required.

Criteria to determine the NRHP/CRHR significance of historical resources and unique archaeological resources are summarized in Section 4.4.3. Physical effects on historical resources typically include direct disturbance and/or destruction of a resource and occur during construction. Aesthetic effects on historical resources typically consist of indirect impacts, such as changes to the visual or auditory landscape. The demolition or substantial alteration of a historical resource would constitute a significant impact.

For archaeological resources, including unique archaeological resources and TCRs of an archaeological nature, potential impacts could occur for future development projects that result in disturbance and/or destruction of previously recorded and/or undiscovered archaeological resources. The disturbance and/or destruction of archaeological resources would be considered a significant impact only if the resources are either an historical resource or a unique archaeological

resource. Pursuant to State CEQA Guidelines Section 15064.5(c)(4), if an archaeological resource is neither a historical resource nor a unique archaeological resource, the effects of the project on the resource shall not be considered a significant effect on the environment and the EIR need only note both the resource and the project's effects on it.

Potentially significant impacts on TCRs include direct disturbance and/or destruction of historical resources or unique archaeological resources containing human remains that are identified as TCRs by a Native American consulting tribe and meet the criteria for listing in the CRHR or are determined by a lead agency to be a TCR, or indirect impacts on the visual or auditory landscape, such as the construction of a building that blocks the view of a TCR or use of operational equipment that consistently produces noise. Any direct or indirect impact on human remains or TCRs would be considered a significant impact.

4.4.4.3 Policies that May Avoid or Reduce Impacts

The following proposed PMPU policy would have the potential to avoid or reduce impacts associated with cultural resources and is considered in the impact analysis that follows.

WLU Policy 2.3.1. The District and its permittees shall support opportunities for strategic placement of interpretive informational signage and commemorative artifacts that convey Tideland's maritime and cultural history.

EJ Policy 2.2.2. Engage people from disadvantaged communities and relevant indigenous communities and tribes that may be impacted by upcoming activities or development on Tidelands to encourage meaningful participation in the District's planning and development decisions, including but not limited to participation in discussions to identify mitigation options for projects that may impact them.

4.4.4.4 Project Impacts and Mitigation Measures

Threshold 1: Cause a substantial adverse change in the significance of a historical resource as defined by Section 15064.5 of the State CEQA Guidelines?

Impact Analysis

Construction

The proposed PMPU serves as a long-term planning blueprint for future development on District Tidelands. The PMPU would not directly result in the construction of any specific development projects or improvements. Instead, the proposed PMPU would guide and allow, subject to issuance of Coastal Development Permits or California Coastal Act exclusions, future development within the proposed PMPU area. It would do so by proposing water and land use designations that would allow for various types of development that meet the requirements within each of the planning districts and are consistent with the policies, objectives, and standards set forth by the proposed PMPU.

A small portion of one known historical resource, the salt ponds of the former Western Salt Company Salt Works, is located in PD7. The resource was the subject of HALS mitigation in 2001 and has since been altered. Table 3-9 lists allowable primary and secondary uses within PD7. As shown, there are no primary or secondary water and land uses that would potentially alter the small

portion the resource within PD7. More generally, there is no future development planned in PD7 that could potentially cause a substantial adverse change in the significance of a known or yet-to-be identified historical resource.

Chapter 3, *Project Description*, lists the allowable primary and secondary water and land uses within PD1, PD2, PD3, PD4, PD8, PD9, and PD10. Chapter 3 also describes a future development scenario in these planning districts. PD2, PD3, PD4, and PD10 contain one or more known historical resources. The proposed PMPU does not plan for or authorize any specific development project that would cause a change in the known historical resources in PD2, PD3, PD4 and PD10. However, PD1, PD2, PD3, PD4, PD8, PD9, and PD10 all contain built resources that will reach the 50-year age benchmark for consideration as potential historical resources under CEQA within the next 35 years. Known and potential historical resources within PD1, PD2, PD3, PD4, PD8, PD9, and PD10 include buildings, structures, art objects, maritime vessels, historic districts, and cultural landscapes formed of multiple built resources (such as parks and other waterfront spaces). For these reasons, construction activities associated with the future development allowable under the primary and secondary water and land uses, visions, and planned improvements (which includes appealable projects) have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource within PD1, PD2, PD3, PD4, PD8, PD9, and PD10 resulting in demolition, destruction, relocation, or alteration of the resources or their immediate surroundings, which would be considered a significant impact (**Impact-CUL-1**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related impact on historical resources (**Impact-CUL-1**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

The Waterfront Destination Park that could be developed under Option 1 would be located along the esplanade near Navy Pier, between the Navy Broadway Complex and the waterfront. Development of a Waterfront Destination Park at this location would entail new construction in close or relatively close proximity to buildings or structures 50 years old or older that qualify as historical resources, or that have potential to qualify as historical resources subject to formal evaluation, if necessary, depending on project-level details. Therefore, construction activities associated with Option 1 could have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource, which is considered a significant impact (**Impact-CUL-1**).

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related impact on historical resources (**Impact-CUL-1**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Option 2 would not propose any changes to water or land uses that would result in any development of uses that would be different than those described above as it relates to historical resources. As a result, construction activities would generally be the same as those described above. The parcel bounded by North Harbor Drive, West Hawthorne Street, West Grape Street, and Pacific Highway, which would be converted to Recreation Open Space under Option 2, is a parking lot containing no buildings or structures with potential to be considered historical resources. However, buildings and structures over 50 years of age are present within the 205-foot setback from the east side of the present North Harbor Drive alignment between Hawthorne Street and the prolongation of B Street, including a fountain and other landscape features that contribute to the significance of the NRHP-listed County Administration Center. Therefore, construction activities associated with Option 2 have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource, which would be considered a significant impact (**Impact-CUL-1**).

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant construction-related impact on historical resources (**Impact-CUL-1**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

The additional properties include 1220 Pacific Highway (currently leased by the Navy) and the Wyndham San Diego Bayfront Hotel, both of which contain buildings 50 years old or older, and a small portion of the park between the County Administration Center (CAC) and North Harbor Drive. The CAC is listed on the NRHP, and the park contains a fountain and other landscape features that contribute to the property's significance. The analysis is programmatic at this time because no specific project is proposed and details are not yet known. However, changes to spatial relationships have the potential to cause a substantial adverse change in the significance of the CAC. There are three contributing features of the CAC: the Administration building, the Guardian of Water sculpture and fountain, and the landscaping. Specific project designs that would cause alteration or damage to the contributors, such as demolishing or relocating the sculpture/foundation or bringing Harbor Boulevard closer to the Administration Building, would be considered substantial adverse changes in the significance of the CAC.

Once specific project-level design is determined, specific impacts would be analyzed and appropriate mitigation measures would be developed. Such mitigation measures could include Historic American Buildings Survey (HABS)/Historic American Engineering Record (HABS/HAER) level documentation of the district as well as the contributing building and structure, Historic American Landscape Survey (HALS) documentation, relocation and/or rehabilitation plans for landscape elements, a pre-construction/post-construction survey, and construction monitoring plan. Recordation would need to be to National Park Service standards, and any rehabilitation would need to meet the Secretary of the Interior's Standards for Rehabilitation. All work would need to be conducted by persons meeting the Secretary of the

Interior's Professional Qualification Standards. Even then, however, mitigation may not lower this impact to less than significant.

Therefore, construction activities associated with Option 3 have the potential to cause substantial adverse change in the significance of a known or yet-to-be identified historical resource, which is considered a significant impact. This would be a more severe significant impact than buildout of the proposed PMPU without Option 3 (**Impact-OPT3-CUL-1**).

Operation

Activities associated with future development projects consistent with the proposed PMPU that have the potential to result in impacts on historical resources are limited to construction. Foreseeable operations associated with allowable primary and secondary water and land uses, and with development assumptions outlined in the tables specified above, do not have the potential to cause a substantial adverse change in the significance of a known or yet-to-be identified historical resource within all of the planning districts in the proposed PMPU area. To cause such a change, the operations would need to produce substantial changes in the setting of a historical resource apart from construction, and the setting would need to be a highly sensitive character-defining feature of the resource and its historical significance. It is possible for operations that introduce new levels of noise or nighttime light to the setting of a historical resource to have a significant impact if the setting is a character-defining feature without which the resource would have a diminished capacity to convey its significance. It is highly unlikely that any of the planning districts contain the types of historical resources that would prove sensitive to changes in setting from operations that substantially increase noise or nighttime light. More importantly, foreseeable planned improvements and allowable water and land uses would not dramatically change existing development patterns and water and land uses within the planning districts. For example, the kinds of large-scale noise-generating industrial shipyards present within PD4, Working Waterfront, would not be introduced to planning districts characterized by existing development and water and land uses oriented to recreation and retail. For these reasons, operations associated with the proposed PMPU are not anticipated to cause an adverse change in the significance of a historical resource. Additionally, future development under the proposed PMPU generally would require discretionary approval from the District (e.g., Coastal Development Permit) and would be subject to site-specific project-level CEQA review pursuant to State CEQA Guidelines Section 15168.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 1.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on historical resources during operation.

The types of development activities that have the potential to result in impacts on historical resources are limited to construction. To cause a substantial adverse change in the significance of a known or yet-to-be identified historical resource, the operations would need to produce substantial changes in the setting of a historical resource apart from construction, and the setting would need to be a highly sensitive character-defining feature of the resource and its historical significance. Operations under Option 1 would consist of routine maintenance and upkeep of the Waterfront Destination Park, similar to other existing parks on District Tidelands, and therefore would not involve any activities that would have the potential to cause a substantial adverse change in the significance of a historical resource. Similarly, none of the other components of Option 1, including the closure of North Harbor Drive from the prolongation of West G Street to Broadway and the corresponding removal of parking, would have the potential to impact historical resources during operation. Therefore, operational impacts under Option 1 would be less than significant, and operations under Option 1 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on historical resources during operation.

The types of development activities that have the potential to result in impacts on historical resources are limited to construction. To cause a substantial adverse change in the significance of a known or yet-to-be identified historical resource, the operations would need to produce substantial changes in the setting of a historical resource apart from construction, and the setting would need to be a highly sensitive character-defining feature of the resource and its historical significance. Operation of Option 2 would consist of routine maintenance and upkeep of the expanded Lane Field Setback Park, similar to other existing parks on District Tidelands, and therefore would not involve any activities that would have the potential to cause a substantial adverse change in the significance of a historical resource. Therefore, operational impacts under Option 2 would be less than significant, and operations under Option 2 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on historical resources during operation.

Operation of Option 3 would consist of routine maintenance and upkeep of the additional park space added under this option, similar to other existing parks on District Tidelands, and therefore would not involve any activities that would have the potential to cause a substantial adverse change in the significance of a historical resource. Therefore, operational impacts under Option 3 would be less than significant, and operations under Option 3 would not result in any additional or more severe impacts than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in substantial adverse change in the significance of a historical resource as defined by Section 15064.5 of the State CEQA Guidelines. WLU Policy 2.3.1 involves supporting the placement of interpretive signage and artifacts, which would not result in adverse physical impacts, but could be beneficial to the treatment of such resources should they occur. This policy is also consistent with **MM-CUL-1** where interpretation may be required in the event that impacts occur.

Impact Determination and Mitigation

Construction activities associated with future development allowed under the proposed PMPU have the potential to cause a substantial adverse change in the significance of a historical resource as defined by Section 15064.5 of the State CEQA Guidelines.

Significant Impacts

Impact-CUL-1: Future Construction Activities Within the Proposed PMPU Area May Adversely Impact Current and Future Significant Historical Resources. Future construction activities consistent with the proposed PMPU would have the potential to:

1. Demolish a historical resource.
2. Alter a historical resource such that it no longer retains sufficient historical integrity to convey significance.
3. Alter the setting of a historical resource for which the setting is an important character-defining feature that expresses the resource's significance.

Any one of these outcomes would be considered a significant impact on a historical resource.

Impact-OPT3-CUL-1: Future Construction Activities Associated with Option 3 May Adversely Impact Current and Future Significant Historical Resources Within North Embarcadero.

Future construction activities associated with Option 3 would have the potential to impact the County Administration Center (CAC), which is listed on the NRHP and the CRHR, as well as structures that are over or will be over 50 years old, by:

1. Demolishing contributing elements of a historical resource;
2. Altering a historical resource such that it may no longer retain sufficient historical integrity to convey significance;
3. Altering the setting of a historical resource for which the setting is an important character-defining feature that expresses the resource's significance.

Any one of these outcomes would be considered a significant impact on a historical resource.

Mitigation Measures

The mitigation measures below apply to **Impact-CUL-1** and **Impact-OPT3-CUL-1**.

MM-CUL-1: Conduct a Historical Resource Assessment. Prior to the approval of a future project ~~Concurrently with any application submitted to the District for development activity~~ that may cause a substantial adverse change, as defined in State CEQA Guidelines Section

15064.5(b)(1), in the significance of a historical resource, the project proponent shall be required to submit a historical resource assessment prepared by a Secretary of the Interior's (SOI) Standards-qualified architectural historian approved by the District. Development activities that could cause a substantial adverse change in the significance of a historical resource include those that would potentially demolish or diminish the historical integrity of a building or structure that is equal to or greater than 50 years old, or which will be equal to or greater than 50 years old at the time disturbance of the building or structure occurs. Additionally, built resources that have the potential to meet CRHR or NRHP criteria, even if less than 50 years old, shall be evaluated for significance by a qualified SOI-qualified architectural historian to determine if a historical resource assessment, as directed under this mitigation measure, is required.

In order to determine if there are one or more historical resources in a proposed project study area, the historical resource assessment shall be completed according to the following steps: (i) define an appropriate historical resources study area for the proposed project, (ii) survey and research the area to identify built resources known to qualify as historical resources under CEQA as a result of previous designation, and (iii) formally evaluate built resources not previously designated that could potentially qualify as historical resources under CEQA by applying the criteria for listing in the CRHR (14 CCR 4852). The study area shall account for potential direct and indirect impacts on historical resources, including alterations to the immediate setting of any historical resource that could cause an adverse change in the resource's significance. Based on the historical resource assessment and analysis of project activities, the District shall determine if any built environment resources qualifying as historical resources will be subject to potentially significant impacts from the project as defined by Section 15064.5(b)(1) of the State CEQA Guidelines. The District shall determine that a future project may have a significant impact on a historical resource if the proposed project:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR (State CEQA Guidelines Section 15064.5[b][2][A]), or
- Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to PRC Section 5024.1(g), unless the District reviews the effects of the project and establishes by a preponderance of evidence that the resource is not historically or culturally significant (State CEQA Guidelines Section 15064.5[b][2][B]), or
- Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR was determined by the District for purposes of CEQA (State CEQA Guidelines Section 15064.5[b][2][C]).

If the proposed project would directly or indirectly impact an historical resource, the District shall identify feasible mitigation measures ~~appropriate~~ to avoid, minimize, or otherwise substantially reduce significant impacts. Mitigation measures shall include one or more of the following, in the following order of preference:

1. **Avoidance.** The project proponent shall avoid demolition or materially altering the historical resource by avoidance measures, such as the following:

- Establish environmentally sensitive areas, including all or part of a historical resource depending on its spatial relationship to project activities, and arrange for them to be identified and protected by clearly defined barriers during construction to ensure avoidance.
- Conduct a construction condition assessment(s) or Historic Structure Report(s) of historical resources adjacent to construction to determine if those resources are at risk of being damaged, including a determination of tolerable levels of construction vibration and potential for damage.
- Redesign relevant portions of the proposed project to avoid destruction or damage to the historical resource.
- Design and implementation of stabilization measures to ensure that fragile built resources are not damaged by construction activities, and that any stabilization measures are implemented in accordance with SOI Standards for the Treatment of Historic Properties (USDI NPS 2020).
- Temporarily move built resources.

In implementing avoidance measures, the project proponent shall arrange for an SOI-qualified architectural historian or historic architect, approved by the District, to participate in preconstruction meetings and construction monitoring activities to ensure continuing adherence to avoidance measures.

2. **Alteration of Historical Resources in Accordance with SOI Standards.** If the District determines that a project cannot avoid a historical resource, the project proponent shall design the proposed project to comply with SOI Standards for the Treatment of Historic Properties (SOI Standards) and thereby avoid any impacts that could cause an adverse change in the significance of a historical resource (USDI NPS 2020). The project proponent shall retain an SOI-qualified architectural historian or historic architect (approved by the District) to identify the applicable SOI Standards, assist in the project design, review the design plans, and provide a written report to the District assessing the design plans' compliance with the applicable SOI Standards. The District shall review the report and confirm the design plans' compliance with the applicable SOI Standards. The project proponent shall adhere to the design plan approved by the District. This will ensure that alterations to the historical resource are implemented in accordance with the SOI Standards and that the historical resource retains sufficient character-defining features to express its historical significance.
3. **Relocation.** If the District determines that it would not be feasible to minimize significant impacts on a historical resource through avoidance or by designing the project to comply with the SOI Standards, the project proponent shall retain a District-approved, SOI-qualified historic architect or architectural historian to provide measures and oversight for the relocation of a significant historic building that would otherwise be demolished, altered, or subject to neglect and deterioration if the proposed project is implemented. The SOI-qualified professional shall prepare a historic building relocation plan at the project proponent's expense. The relocation plan shall identify the site where the resource would be relocated as well as all relevant permits required for the resource to be moved from its existing location and transported to the relocation site. The relocation plan shall identify the qualifications required of the building relocation company to ensure that relocation is

undertaken by a company experienced in moving historic buildings comparable to the building subject to potential significant impacts from the proposed project. The relocation plan shall ensure that the building will be moved without irreparable damage to the character-defining historic fabric of the building and shall specify protective measures for vulnerable character-defining features. The project proponent shall incorporate into construction specifications for the proposed project a requirement that the building relocation company and the construction contractor(s) use all feasible means to avoid damage to the historic building during its relocation, including, but not limited to, relocation methods and relocation activity routes, closures, and timing. The District shall review and provide final approval of the historic building relocation plan. The project proponent shall implement the relocation plan.

4. **Historical Resource Archival Documentation.** If the District determines that it would not be feasible to minimize significant impacts on a historical resource through avoidance, designing the project to comply with the SOI Standards, or relocation of the historical resource, archival documentation shall be prepared if the resource is the type of historical resource for which archival documentation would reduce the impact. Historical resources for which archival documentation can reduce an impact are generally those recognized as significant (i) for their architectural design or engineering qualities; (ii) for exemplifying the work of a master architect, builder, or engineer; or (iii) for embodying the distinctive characteristics of a type, period, or method of construction. The level of archival documentation shall be determined by the District based on the evidence in the record. The project proponent shall arrange for the preparation of archival documentation of the historical resource by an SOI-qualified architectural historian or historian and a professional photographer, approved by the District, at the project proponent's expense. The documentation shall consist of archival photography, written data (physical description and historical narrative), and, depending on the historical resource's level of significance, measured drawings to be distributed to one or more appropriate local repositories. Potentially appropriate repositories include the San Diego Public Library, the San Diego History Center, other local historical societies, the San Diego Maritime Museum, and local university library special collections. Archival documentation of historical resources shall be prepared in accordance with the National Parks Service's (NPS) guidelines for Historic American Buildings Survey (HABS) Historic American Landscape Survey (HALS) and Historic American Engineering Record (HAER) documentation. The level and degree of documentation shall be determined by the District and shall be commensurate with the size, extent, and level of the documented historical resource's significance. The District shall review and approve all archival documentation prepared as historical resource mitigation prior to its submittal to the chosen repository or repositories. The project proponent shall submit the District-approved archival documentation and confirm its receipt by the repository or repositories.
5. **Interpretation.** If it is not feasible to minimize significant impacts on a historical resource through avoidance, designing the project to comply with the SOI Standards, or relocation of the historical resource, as determined appropriate by the District the project proponent shall arrange for a District-approved SOI-qualified architectural historian or historian to prepare appropriate historical resource interpretive or educational media at the project proponent's expense. Historical resources for which interpretive or educational media would reduce the impact are generally those that have significance for (i) direct association with an event or pattern of events important to history, or (ii) for direct association with the

life of a historically significant individual. The type of interpretive or educational media shall be determined by the District based on the evidence in the record. The SOI-qualified preservation professional shall work with the District and the project proponent to determine the type of interpretive media that is appropriate for the impacted historical resource. Such interpretive or educational media may include displays in public spaces, print materials, or websites. Interpretive and educational media may incorporate written, photographic, and archival documentation (such as those compiled according to NPS HABS/HAER/HALS guidelines) oral history interviews, video, or animation to tell the story of the heritage represented by the impacted resource. At the expense of the project proponent, the District-approved SOI-qualified historic preservation professional shall prepare the chosen type of interpretive or educational media with District approval. The District shall review the interpretive or educational media prior to final approval. The project proponent shall be responsible for displaying or providing public access to the interpretive or educational media.

6. **Materials Salvage.** If it is not feasible to minimize significant impacts on a historical resource through avoidance, designing the project to comply with the SOI Standards, or relocation of the historical resource, and a historical resource is subject to complete or partial demolition from a proposed project, the project proponent shall arrange for salvage of historically important materials as deemed appropriate by the District. The project proponent shall arrange for a District-approved SOI-qualified historic preservation professional (historic architect or architectural historian in this case) to assess portions of the historical resource to be demolished to identify important salvageable materials. These may include materials that a historic preservation organization may be interested in using to restore an architecturally similar building, materials or objects that may be used in interpretive or educational media, or objects of interest to historical societies. The District-approved historic preservation professional shall prepare a materials salvage plan at the expense of the project proponent and shall coordinate with potentially interested preservation organizations and historical societies as deemed appropriate by the District and the project proponent. The District shall review and provide final approval of the materials salvage plan. The project proponent shall be responsible for implementation of the materials salvage plan.
7. **Requirement to Coordinate with Affected Agency.** Where a potential impact on a historical resource stemming from implementation of the PMPU may occur on an agency-owned property or on non-District land (e.g., County Administration Center and Waterfront Park), the District shall provide notice and coordinate with the applicable agency at least one year prior to planned construction.

The Historical Resource Assessment Plan will be subject to the District's review and approval and no development shall proceed until the Historical Resource Assessment plan is deemed acceptable to the District.

Level of Significance After Mitigation

Mitigation measure **MM-CUL-1** would reduce impacts on historical resources (**Impact-CUL-1**) by requiring future development projects to prepare a historical resources assessment that will identify any historical resources that may be subject to significant impacts. **MM-CUL-1** ensures implementation of appropriate mitigation measures such as avoidance and protection, altering historical resources in accordance with SOI Standards, relocation, archival documentation of

historical resources in accordance with HABS/HAER/HALS guidelines, interpretative or educational media, and materials salvage. Measures such as avoidance and protection, designing the project in accordance with SOI Standards, and/or relocation of the historical resource can mitigate impacts to a less-than-significant level. In some cases, it may prove necessary to implement one or more of those measures along with archival documentation, interpretive or educational media, and/or materials salvage to reduce impacts to a less-than-significant level. However, because the location, nature, scope, and effects of future development proposals are not known at this time, it is not possible to state with certainty that **MM-CUL-1** would avoid or reduce impacts to less than significant. Therefore, **Impact-CUL-1** and **Impact-OPT3-CUL-1** would be considered significant and unavoidable after mitigation.

Threshold 2: Cause a substantial adverse change in the significance of an archaeological resource as defined by Section 15064.5 of the State CEQA Guidelines?

Impact Analysis

As described in State CEQA Guidelines Section 15064.5(c) (1-4), during the review of a future development project that may impact an archaeological site, the District shall first determine whether the site is an historical resource. If an archaeological site does not meet the criteria for definition as an historical resource, the District shall then determine whether the site meets the definition of a unique archaeological resource. If the site is neither an historical resource nor a unique archaeological resource, then impacts on the resource would generally not be considered significant. If the archaeological site is an historical resource, and where impacts may occur to a historical resource, the District would consider mitigation in accordance with Section 15126.4(b) of the State CEQA Guidelines and mitigation measure **MM-CUL-2**. If an archaeological site is not a historical resource but meets the definition of a unique archaeological resource in Section 21083.2 of the Public Resources Code, the site would be treated in accordance with the provisions of Section 21083.2.

Construction

The record search results for all planning districts in the proposed PMPU area show that six prehistoric and nine historic period archaeological resources, as well as one resource consisting of prehistoric and historic period archaeological deposits, have been previously identified within the seven planning districts. One archaeological resource in PD2 and three in PD3 have been determined not eligible for listing in the NRHP/CRHR and are not unique archaeological resources; therefore, no further CEQA analysis is required for those resources. The remaining 12 archaeological resources (four in PD3, two in PD4, one in PD8, two in PD9, and three in PD10) have never been evaluated for listing in the CRHR; therefore, it is unknown if any of these resources meet the criteria for CRHR eligibility or if they meet the requirements of a unique archaeological resource. There are no future development projects in PD7 that could potentially cause a substantial adverse change in the significance of a known or yet-to-be identified archaeological resource.

As detailed above in Section 4.4.2, *Existing Conditions*, under *Archaeological Resources*, all but one of the planning districts, PD4, have low prehistoric archaeological sensitivity, primarily because the majority of the planning districts lack uplands, on the landward side of the shoreline, which would be suitable for a wide range of land use activities, including resource collection, resource processing, and habitation. However, archaeological resources have been reported in the planning districts

along the landward/seaward interface. Additionally, based on review of the archaeological sites records for sites within the planning districts, some site records are based on anecdotal information or information that lacks mapping; therefore, the locations of these resources would need to be verified at the project level.

Two planning districts contain areas of archaeological sensitivity indicated by previous discoveries. One of these, the former Tidelands City Dump (P-37-017104/CA-SDI-15118) at the southern portion of PD3, has historic archaeological sensitivity. The other is a prehistoric site (P-37-005931/CA-SDI-5931) that consists of a large artifact scatter and Native American burial at least partially located within the 10.29-acre area of high prehistoric sensitivity in PD4. Otherwise, PD4 has low prehistoric archaeological sensitivity. Apart from the 10.29-acre portion of PD4, the planning districts contain no other areas of high prehistoric archaeological sensitivity. Although PD3 has low prehistoric archaeological sensitivity, and PD4 has low archaeological sensitivity with the exception 10.29 acres, both have long histories of urban and industrial development that give them greater historic archaeological sensitivity than any of the other planning districts, particularly on the landward side of the pre-development shoreline in portions of PD3 and PD4. While one landward prehistoric archaeological site intersects with the edge of PD2, the planning district is composed of fill from the 1960s. Other than the boundary of the planning district that intersects with landward portions of the predevelopment shoreline, the archaeological sensitivity of PD2 is low. Although it is unlikely that significant subsurface archaeological deposits are present within the proposed PMPU area, it is not possible to rule out the presence of such resources in those planning districts.

For these reasons, construction activity associated with future development allowed under the proposed PMPU has the potential to cause substantial adverse change in the significance of a known or yet-to-be identified prehistoric or historic archaeological resource within all planning districts in the proposed PMPU area; therefore, impacts are considered significant (**Impact-CUL-2**).

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be an increase in Commercial Recreation and

Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact on archaeological resources during construction of future development (**Impact-CUL-2**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

PD3 has low prehistoric archaeological sensitivity, but has a long history of urban and industrial development, and there are four previously recorded but unevaluated historic period archaeological sites in the planning district, which increases the potential for historic archaeological sensitivity, particularly the landward side of the pre-development shoreline. Construction of a Waterfront Destination Park under Option 1 would involve landside ground-disturbing activities that could cause a substantial adverse change in the significance of known or yet-to-be identified prehistoric or historic archaeological resources, which would be considered a significant impact (**Impact-CUL-2**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact on archaeological resources during construction of future development (**Impact-CUL-2**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

As noted, PD3 has low prehistoric archaeological sensitivity, but has a long history of urban and industrial development, and there are four previously recorded but unevaluated historic period archaeological sites in the planning district, which increases the potential for historic archaeological sensitivity, particularly the landward side of the pre-development shoreline. Option 2 would not propose any changes to water or land uses that would result in any development of uses that would be different than those described above as it relates to historical resources. As a result, construction activities would generally be the same as those described above. Therefore, ground-disturbing construction activities associated with Option 2 would also have the potential to cause substantial adverse change in significance of a known or yet-to-be identified prehistoric or historic archaeological resources, which would be considered a significant impact (**Impact-CUL-2**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a significant impact on archaeological resources during construction of future development (**Impact-CUL-2**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

As noted, PD3 has low prehistoric archaeological sensitivity, but it has a long history of urban and industrial development, and there are four previously recorded but unevaluated historic period archaeological sites in the planning district, which increases the potential for historic archaeological sensitivity, particularly the landward side of the pre-development shoreline. Option 3 would not propose any changes to water or land uses that would result in any development of uses that would be different than those described above as it relates to historical resources. As a result, construction activities would generally be the same as those described above. Ground-disturbing construction activities for this option would be required for the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, as well as any new park space. Therefore, ground-disturbing construction associated with Option 3 would also have the potential to cause substantial adverse change in significance of a known or yet-to-be identified prehistoric or historic archaeological resources, which would be considered a significant impact (**Impact-CUL-2**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Operation

Only ground-disturbing construction activities facilitated by the proposed PMPU have the potential to result in impacts on archaeological resources. Foreseeable operations associated with development of water and land uses are not expected to include ground disturbances and therefore do not have the potential to cause a substantial adverse change in the significance of a known or yet-to-be identified archaeological resource within the proposed PMPU area. Impacts would be less than significant.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 2.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and

certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on archaeological resources associated with operation of future development.

Also, as noted, only ground-disturbing construction activities have the potential to result in impacts on archaeological resources. As such, operation of a Waterfront Destination Park under Option 1 would not cause a substantial adverse change in the significance of a known or yet-to-be identified archaeological resource. Therefore, operational impacts under Option 1 would be less than significant, and operations under Option 1 would not result in any additional or more severe impacts on archaeological resources than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on archaeological resources associated with operation of future development.

Also, as noted, only ground-disturbing construction activities have the potential to result in impacts on archaeological resources. As such, operation of the expanded Lane Field Setback Park under Option 2 would not cause a substantial adverse change in the significance of a known or yet-to-be identified archaeological resource. Therefore, operational impacts under Option 2 would be less than significant, and operations under Option 2 would not result in any additional or more severe impacts on archaeological resources than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on archaeological resources associated with operation of future development.

Also, as noted, only ground-disturbing construction activities have the potential to result in impacts on archaeological resources. As such, operation of additional park space added under Option 3 would not cause a substantial adverse change in the significance of a known or yet-to-be identified archaeological resource. Therefore, operational impacts under Option 3 would be less than significant, and operations under Option 3 would not result in any additional or more severe impacts on archaeological resources than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in substantial adverse change in the significance of an archaeological resource as defined by Section 15064.5 of the State CEQA Guidelines. WLU Policy 2.3.1 involves supporting the placement of interpretive signage and artifacts, which would not result in adverse physical impacts, but could be beneficial to the

treatment of such resources should they occur. This policy is also consistent with mitigation measure **MM-CUL-2** where treatment may be required in the event that impacts occur.

Impact Determination and Mitigation

Ground-disturbing activities associated with construction of future development projects allowable under the proposed PMPU have the potential to cause a substantial adverse change in the significance of an archaeological resource that is a historical resource as defined by Section 15064.5(a) of the State CEQA Guidelines, or qualifies as a unique archaeological resource under PRC 20183.2(g).

Significant Impacts

Impact-CUL-2: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Archaeological Resources that are Historical Resources or Unique Archaeological Resources. Ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to damage or destroy archaeological resources that are historical resources (as defined in State CEQA Guidelines Section 15064.5(a)) or qualify as a unique archaeological resource (as defined in PRC Section 20183.2(g)), which would be considered a significant impact.

Mitigation Measures

For **Impact-CUL-2**:

MM-CUL-2: Conduct an Archaeological Resource Assessment. Prior to any approval of a future discretionary project (as defined by the State CEQA Guidelines Section 15357) with ground-disturbing activities that may affect an archaeological site, the project proponent shall retain an SOI-qualified archaeologist to prepare an Archaeological Resources Assessment (ARA), which shall be submitted to the District for its review and approval. The ARA is a preliminary inquiry into the potential for archaeological resources being present on site and will assist the District in determining if a future project may or may not have an effect on archaeological sites that are historical resources or unique archaeological resources, per State CEQA Guidelines Section 15064.5(c)(1-4) and PRC Section 21083.2(g).

In order to determine if there are one or more archaeological historical resources or unique archaeological resources in a proposed project, the ARA shall be completed according to the following steps:

1. **Desktop Analysis.** The ARA shall define an appropriate archaeological study area for the proposed project, and research the study area to determine its sensitivity for subsurface archaeological resources. Research shall include but is not limited to reviewing the prehistoric archaeological sensitivity analysis under Archaeological Resources in Section 4.4.2 of the PMPU PEIR, a records search, and a review of historic maps such as Sanborn fire insurance maps, ~~and~~ U.S. Geological Survey (USGS) topographic maps, and Tax Factor 1928-1929 aerial photos. The ARA shall make recommendations regarding the need for further archaeological studies to be completed. If the ARA shows to the District's satisfaction that the study area consists entirely of fully developed fill with no undisturbed land, or entirely of land with little or no potential for subsurface prehistoric or historic archaeological resources preserved within depositional context, no field survey, additional study, or measures for protecting archaeological resources that are historical resources, or qualify as

a unique archaeological resource, would be necessary. A brief ARA memo shall serve as documentation of the findings.

Based on the information and recommendations provided in the ARA memo, if further archaeological studies are required, the project proponent shall take one or more of the following sequential actions, which are determined by the District to be necessary to avoid or reduce the proposed project's impacts on archaeological resources that are historical resources, or qualify as a unique archaeological resource, to a level below significance:

2. **Archaeological Survey.** If the ARA finds that the study area contains previously identified prehistoric or historic archaeological resources preserved in depositional context, undeveloped land with undisturbed or minimally disturbed surface soils, or historic archaeological resource potential based on historic map research, the project proponent will retain an SOI-qualified archaeologist (approved by the District) to conduct a preconstruction archaeological resources field survey of the project area.
3. **Archaeological Testing and Evaluation.** If the District determines that the resource cannot be avoided through project design, the SOI-qualified archaeologist retained by the project proponent shall implement an evaluative subsurface testing program to determine the resource boundaries within the project area, assess the site's eligibility for listing in the NRHP and CRHR, or for its potential to be a unique archaeological resource, and assess the integrity of the resource, all subject to verification and approval from the District. The testing and evaluation program shall be used to determine whether the site is a historical resource or unique archaeological resource. The SOI-qualified archaeologist shall prepare an Archaeological Survey Evaluation Report (ASER) at the conclusion of the field survey and evaluative subsurface testing program. The ASER will conform with the California Office of Historic Preservation (OHP) recommended contents and format for cultural resources reports. The report shall be submitted to the District for review and, upon the District's determination that the report is satisfactory, shall be deposited at the SCIC.

If the District determines the site is not a historical resource or a unique archaeological resource, the effects of the project on the resource shall not be considered a significant effect on the environment and need not be considered further in the CEQA process, per State CEQA Guidelines Section 15064.5(c)(4). If the archaeological site is a historical resource, and where impacts may occur to a historical resource, the District would require one or more of the following measures in **MM-CUL-12**. If an archaeological site is not a historical resource but meets the definition of a unique archaeological resource in Section 21083.2 of the PRC, the site shall be treated in accordance with the provisions of Section 21083.2. The time and cost limitations described in PRC Section 21083.2 (c-f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.

4. **Preservation in Place.** Preservation in place is the preferred manner of mitigating impacts on archaeological historical resources and unique archaeological resources. If the District determines the site is a historical resource or unique archaeological resource, and the project can be designed to avoid the historical resource or unique archaeological resource, preservation in place may be accomplished by, but not limited to: planning construction to avoid the resource; incorporating sites within parks, greenspace, or open space; covering the site with chemically stable soil prior to construction; or deeding the site into

a permanent conservation easement, per State CEQA Guidelines Section 15126.4(b)(3)(A) – (B) and PRC Section 21083.2(b).

5. **Archaeological Data Recovery.** If the District determines the site is a historical resource, preservation in place is not possible, and data recovery is the only feasible mitigation, an archaeological Data Recovery Plan (DRP) will be designed to record and remove scientifically important data that would otherwise be destroyed through construction-related ground disturbance, per State CEQA Guidelines 15126.4(b)(3)(C). The DRP and data recovery fieldwork will be completed prior to the start of project construction. After the archaeological data recovery fieldwork is complete, the SOI-qualified archaeologist retained by the project proponent shall prepare an archaeological data recovery report (DRR). The report will conform with the California Office of Historic Preservation (OHP) recommended contents and format for cultural resources reports. The report shall be submitted to the District for review and, upon the District's determination that the report is satisfactory, shall be deposited at the SCIC. Any artifacts collected during data recovery will be curated at the San Diego Archaeological Center, at the project proponent's expense. Per State CEQA Guidelines Section 15126.4(b)(3)(D), if the District determines that testing or studies already completed have adequately recovered the scientifically important information from and about the archaeological or historical resource, data recovery will not be required, provided that the determination is documented and that the studies are deposited with the SCIC.
6. **Archaeological Construction Monitoring.** In the event the District determines that archaeological construction monitoring is necessary in order to mitigate the potential for project construction (including geotechnical borings) to impact as-yet unknown archaeological resources, then the project proponent shall retain an SOI-qualified archaeologist, approved by District. ~~At its discretion~~ Depending on whether a TCR is present, as defined by PRC Section 21074, the District may require request a Native American monitor also be present during ground-disturbing construction activities. The District may utilize a monitor qualified to monitor both archaeological and tribal cultural resources. During project-specific environmental review, the approved SOI-qualified archaeologist shall prepare and submit to the District for approval an Archaeological Monitoring and Discovery Plan (AMDP). The AMDP shall describe the project, archaeological sensitivity of and known archaeological resources in the project area, monitor qualifications, monitoring and discovery procedures, roles and responsibilities, and reporting. Upon completion of archaeological construction monitoring, a Final Monitoring Report (FMP) shall be prepared in conformance with the OHP's guidelines for the preparation of cultural resources management reports and will be deposited at the SCIC. Any diagnostic artifacts collected during archaeological construction monitoring will be curated at the San Diego Archaeological Center, at the project proponent's expense. If an artifact is determined to be a tribal cultural resource, the District shall consult with the applicable Native American tribes to determine the appropriate treatment of the artifact.
7. **Unanticipated Discovery Procedures.** For those projects where there is the potential for encountering unknown archaeological resources, if an unanticipated discovery of an archaeological resource occurs during construction of a project, construction-related ground disturbance would be diverted or temporarily halted until the SOI-qualified archaeologist and/or Native American monitor can assess if it is a historical resource, ~~or a unique archaeological resource, or has tribal cultural significance.~~ The District, based on information provided by the SOI-qualified archaeologist or Native American monitor (for tribal cultural

resources), would determine the significance of the discovered resources in accordance with this mitigation measure and ~~MM-CUL-2, MM-CUL-3~~, and per PRC 21083.2(i) and State CEQA Guidelines Section 15064.5(f). For archaeological resources, significance would be based on the results of evaluative archaeological testing completed by the SOI-qualified archaeologist and applying the criteria for listing in the CRHR, per State CEQA guidelines Section 15064.5(a)(1-4) and identifying unique archaeological resources per Section 21083.2 of the PRC. For tribal cultural resources, the significance would be based on the opinion of the Native American monitor, consistent with PRC Section 21074 related to a potential tribal cultural resource (See ~~MM-CUL-3~~). For cultural resources determined by the District to be a historical resource or a unique archaeological resource, the SOI-qualified archaeologist shall prepare a Research Design and Data Recovery Program (RDDRP), which shall mitigate impacts in accordance with this mitigation measure ~~MM-CUL-2~~ and State CEQA Guidelines Section 15126.4(b)(3) and Section 15064.5(f), and the project proponent would be required to retain an SOI-qualified archaeologist for continuous archaeological monitoring, until the completion of ground-disturbing construction activities in the vicinity of the unanticipated discovery.

Level of Significance After Mitigation

Mitigation measure **MM-CUL-2** would reduce impacts on archaeological historical resources or unique archaeological resources (**Impact-CUL-2**) by identifying potentially significant archaeological resources and determining if avoidance through project redesign prior to construction is feasible. In addition, where applicable, it would provide for implementation of an archaeological data recovery program designed to record and remove significant prehistoric or historic period archaeological deposits that would otherwise be destroyed through construction-related ground disturbance. Where applicable, it would provide for archaeological construction monitoring, including Native American monitoring if determined by the District, in areas of archaeological sensitivity to mitigate the potential for project construction to damage or destroy an archaeological historical resource or unique archaeological resource. Finally, it would establish the procedures to follow in the event an unanticipated discovery of an archaeological resource occurs during project construction. These measures would be implemented individually or in combination, as required by **MM-CUL-2**, to reduce impacts. However, because the location, nature, scope and effects of future development proposals are not known at this time, it is not possible to state with certainty that **MM-CUL-2** would avoid or reduce impacts to less than significant. Therefore, **Impact-CUL-2** would be considered significant and unavoidable after mitigation.

Threshold 3: Disturb human remains, including those interred outside of formal cemeteries?

Impact Analysis

Construction

There are many areas within San Diego County where prehistoric and historic period human remains have been uncovered during both archaeological investigations and grading activities. Therefore, the potential for the unanticipated encounter of human remains during construction activities is possible.

Six of the eight planning districts (PD1, PD2, PD7, PD8, PD9, PD10) have low archaeological sensitivity and, therefore, have a low potential to contain historic or prehistoric period human remains. In addition, there is no planned future development in PD7 that could potentially disturb human remains, including those outside of formal cemeteries. As such, there would be no potential to encounter human remains in PD7. Although it is unlikely that human remains are present in PD1, PD2, PD8, PD9, and PD10, it is not possible to rule out the presence of such resources in those planning districts. Two planning districts contain areas of archaeological sensitivity indicated by previous discoveries and may also have heightened potential for the presence of archaeological human remains. One is the former Tidelands City Dump (P-37-017104/CA-SDI-15118) at the southern portion of PD3. The other is a prehistoric site (P-37-005931/CA-SDI-5931) that consists of a large artifact scatter and Native American burial at least partially located within the 10.29-acre area of high prehistoric sensitivity in PD4. While the Native American burial is not located within PD4, its proximity to the planning district indicates there is a higher potential for additional Native American burials to be located within PD4.

For these reasons, future development associated with PMPU has the potential to disturb human remains, including those interred outside of formal cemeteries within all planning districts in the proposed PMPU area.

Health and Safety Code Section 7050.5 and State CEQA Guidelines Section 15064.5(e) describe the process to be followed in the event human remains are discovered during project implementation. In the event of discovery of human remains during ground-disturbing activities for future development projects, no further disturbance shall occur until the San Diego County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. The San Diego County Coroner must be notified of the find immediately. If the remains are determined by the coroner to be Native American, the coroner is responsible for contacting the Native American Heritage Commission (NAHC) within 24 hours. NAHC, pursuant to Section 5097.98, will immediately notify those persons it believes to be the Most Likely Descendent (MLD) of the deceased person so the MLD may inspect the burial site and make recommendations for treatment and/or disposition. The MLD shall complete the inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of the human remains and items associated with Native American burials. Per State CEQA Guidelines Section 15064.5(e)(2), the landowner or landowner's authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance if the NAHC is unable to identify a MLD or if the MLD failed to make a recommendation within 24 hours after being notified by the NAHC; if the descendent identified fails to make a recommendation; or if the landowner or their authorized representative rejects the recommendation of the descendent and mediation by the NAHC fails to provide measures acceptable to the landowner. Therefore, impacts associated with the disturbance of human remains would be less than significant because all future development allowed under the proposed PMPU would be required to comply with these laws and regulations.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on human remains associated with construction of future development.

Planning District 3 contains areas of archaeological sensitivity indicated by previous discoveries and may also have heightened potential for the presence of archaeological human remains. Construction of a Waterfront Destination Park under Option 1 would involve ground-disturbing activities that have the potential to disturb human remains, including those interred outside of formal cemeteries; however, compliance with the existing regulatory framework, including State CEQA Guidelines Section 15064.5(e), Health and Safety Code Section 7050.5, and PRC Section 5097.98 would ensure that impacts associated with the disturbance of human remains would be less than significant. Therefore, construction under Option 1 would not result in any additional or more severe impacts related to human remains than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on human remains associated with construction of future development.

PD3 contains areas of archaeological sensitivity indicated by previous discoveries and may also have heightened potential for the presence of archaeological human remains. Option 2 would not propose any changes to water or land uses that would result in any development of uses that would be different than those described above. As a result, construction activities would generally be the same as those described above. As such, ground-disturbing construction activities associated with Option 2 could also have the potential to disturb human remains, including those interred outside of formal cemeteries; however, compliance with the existing regulatory framework, including State CEQA Guidelines Section 15064.5(e), Health and Safety Code Section 7050.5, and PRC Section 5097.98 would ensure that impacts associated with the disturbance of human remains would be less than significant. Therefore, construction under Option 2 would not result in any additional or more severe impacts related to human remains than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on human remains associated with construction of future development.

PD3 contains areas of archaeological sensitivity indicated by previous discoveries and may also have heightened potential for the presence of archaeological human remains. Option 3 would not propose any changes to water or land uses that would result in any development of uses that would be different than those described above. As a result, construction activities would generally be the same as those described above. Ground-disturbing construction activities for this option would be required for the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, as well as any new park space. As such, ground-disturbing construction activities associated with Option 3 could also have the potential to disturb human remains, including those interred outside of formal cemeteries; however, compliance with the existing regulatory framework, including State CEQA Guidelines Section 15064.5(e), Health and Safety Code Section 7050.5, and PRC Section 5097.98 would ensure that impacts associated with the disturbance of human remains would be less than significant. Therefore, construction under Option 3 would not result in any additional or more severe impacts related to human remains than buildout of the proposed PMPU without Option 3.

Operation

Only ground-disturbing activities facilitated by the proposed PMPU have the potential to result in impacts on human remains, which are typically associated with construction. However, if operation of future development allowed under the proposed PMPU includes ground disturbances, those operations have the potential to disturb human remains, including those interred outside of formal cemeteries within all planning districts in the proposed PMPU area. In the event of a discovery of human remains, compliance with State CEQA Guidelines Section 15064.5(e), Health and Safety Code Section 7050.5, and PRC Section 5097.98 would be required. Therefore, impacts associated with the disturbance of human remains would be less than significant because all future development allowed under the proposed PMPU would be required to comply with these existing laws and regulations.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 3.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on human remains associated with operation of future development.

Also, as noted, only operational activities involving ground disturbance would have the potential to disturb human remains, including those interred outside of formal cemeteries. Operations under Option 1 would consist of routine maintenance and upkeep of the Waterfront Destination Park, similar to other existing parks on District Tidelands, and therefore would not include any

such activities. Therefore, impacts would be less than significant, and operations under Option 1 would not result in any additional or more severe impacts related to human remains than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on human remains associated with operation of future development.

Also, as noted, only operational activities involving ground disturbance would have the potential to disturb human remains, including those interred outside of formal cemeteries. Operations under Option 2 would consist of routine maintenance and upkeep of the expanded Lane Field Setback Park, similar to other existing parks on District Tidelands, and therefore would not include any such activities. Therefore, impacts would be less than significant, and operations under Option 2 would not result in any additional or more severe impacts related to human remains than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on human remains associated with operation of future development.

Also, as noted, only operational activities involving ground disturbance would have the potential to disturb human remains, including those interred outside of formal cemeteries. Operations under Option 3 would consist of routine maintenance and upkeep of the additional park space added under this option, similar to other existing parks on District Tidelands, and therefore would not include any such activities. Therefore, impacts would be less than significant, and operations under Option 3 would not result in any additional or more severe impacts related to human remains than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in the disturbance of human remains. No impacts would occur.

Impact Determination and Mitigation

Although construction activities associated with future development allowed under the proposed PMPU have the potential to disturb human remains, including those interred outside of formal cemeteries, compliance with applicable laws and regulations would avoid or reduce such impacts to a level below significance. Accordingly, impacts would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be less than significant.

Threshold 4: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or

b. a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Impact Analysis

Future development projects under the proposed PMPU, as projects subject to CEQA, must comply with the requirements of AB 52, including consultation with California Native American tribes (if one or more tribes have requested consultation) as each development project is proposed that may result in the identification of TCRs. As described in Section 4.4.2, *Existing Conditions*, the San Diego area has a long history of Native American occupation, and development activities pursuant to the implementation of the proposed PMPU have the potential to impact TCRs.

As discussed above, based on a records search conducted at the SCIC and a Sacred Lands File Search obtained from the NAHC, no TCRs that are listed in or eligible for listing in the CRHR or Sacred Lands file were identified on or within proximity to the proposed PMPU area. Moreover, no tribes have contacted the District to request notification of projects under AB 52; therefore, tribal consultation was not conducted, and no TCRs were identified as the result of an AB 52 consultation process.

Construction

Much of the proposed PMPU area consists of harbor waters or fill land that has been entirely developed with buildings, paving, or park landscape. As such, due to the nature of the proposed PMPU area, and the absence of recorded TCRs of an archaeological nature within the proposed PMPU area, it is unlikely that tribal cultural resources, as defined in PRC Section 21074, would be encountered during development that occurs under the proposed PMPU.

Impacts on potential TCRs of an archaeological nature would be the same as those described under Threshold 2. Future development allowed under the proposed PMPU has the potential to cause substantial adverse change in the significance of a yet-to-be identified TCR within all planning districts in the PMPU area during ground-disturbing construction activities; therefore, impacts are considered significant (**Impact-CUL-3**).

If no Native American tribes request consultation on future development projects falling under the proposed PMPU, and the District determines there is an archaeological historic resource or unique

archaeological resource, future project proponents would implement **MM-CUL-2**. If one or more Native American tribes requests project notifications and requests consultation on future development projects falling under the proposed PMPU, and the District determines there is a TCR (per subdivision (c) of PRC Section 5024.1) that could be affected by a project based on AB 52 tribal consultation, mitigation measures to avoid or mitigate a significant effect on TCRs would be developed during consultation and would be included in the final environmental document for that project. If the consulting tribe or the District concludes that mutual agreement cannot be reached after making a reasonable, good-faith effort, under AB 52, the lead agency may consider the four mitigation measures described in PRC Section 21084.3(e) (**MM-CUL-3**).

Impacts on Native American human remains that are potential TCRs would be the same as those described under Threshold 3. Health and Safety Code Section 7050.5 and State CEQA Guidelines Section 15064.5(e) describe the process to be followed in the event human remains are discovered during project implementation. In the event of discovery of human remains during ground-disturbing activities for future development projects, no further disturbance would occur until the San Diego County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. Impacts associated with the disturbance of human remains that are potential TCRs would be less than significant because all future development allowed under the proposed PMPU would be required to comply with these laws and regulations.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the construction-related effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Construction impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on TCRs (**Impact-CUL-3**). This significant impact would still occur within PD3 under Option 1 as a result of the same future development that could still occur outside of the option boundary within PD3.

Much of the proposed PMPU area, including PD3 where Option 1 is located, consists of harbor waters or fill land that has been entirely developed with buildings, paving, or park landscape. As such, it is not anticipated that TCRs, as defined in PRC Section 21074, would be encountered during development associated with Option 1. Even so, future development associated with Option 1 would have the potential to cause a substantial adverse change in the significance of a yet-to-be identified TCR within PD3 during ground-disturbing construction activities, which is considered a significant impact (**Impact-CUL-3**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on TCRs (**Impact-CUL-3**). This significant impact would still occur within PD3 under Option 2 as a result of the same future development that could still occur outside of the option boundary within PD3.

Much of the proposed PMPU area, including PD3 where Option 2 is located, consists of harbor waters or fill land that has been entirely developed with buildings, paving, or park landscape. As such, it is not anticipated that TCRs, as defined in PRC Section 21074, would be encountered during development associated with Option 2. Even so, future development associated with Option 2 would have the potential to cause a substantial adverse change in the significance of a yet-to-be identified TCR within PD3 during ground-disturbing construction activities, which is considered a significant impact (**Impact-CUL-3**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

As discussed above, implementation of the proposed PMPU, including within PD3, would result in significant construction impacts on TCRs (**Impact-CUL-3**). This significant impact would still occur within PD3 under Option 3 as a result of the same future development that could still occur outside of the option boundary within PD3.

Much of the proposed PMPU area, including PD3 where Option 3 is located, consists of harbor waters or fill land that has been entirely developed with buildings, paving, or park landscape. As such, it is not anticipated that TCRs, as defined in PRC Section 21074, would be encountered during development associated with Option 3. Even so, future development associated with Option 3 would have the potential to cause a substantial adverse change in the significance of a yet-to-be identified TCR within PD3 during ground-disturbing construction activities, which is considered a significant impact (**Impact-CUL-3**). However, this would not be an additional or more severe impact than buildout of the proposed PMPU without Option 3.

Operation

Similar to archaeological resources, only ground-disturbing activities associated with construction of future development projects allowable under the proposed PMPU have the potential to cause a substantial adverse change in the significance of a TCR, as defined in PRC Section 21074. Foreseeable operations associated with development of water and land uses are not expected to include ground disturbance, and therefore do not have the potential to cause a substantial adverse change in the significance of a TCR within the proposed PMPU area. Impacts would be less than significant.

Potential impacts on Native American human remains that are potential TCRs would be the same as those described under Threshold 3. As discussed under Threshold 3, impacts associated with the disturbance of human remains that are potential TCRs would be less than significant because all future development allowed under the proposed PMPU would be required to comply with these laws and regulations.

As discussed in PEIR, Chapter 3, *Project Description*, there are also three potential Options located within the North Embarcadero Subdistrict of PD3. The following subsection analyzes the operational effects of each of these options under Threshold 4.

Analysis of Options 1, 2, and 3

As discussed in Chapter 3, the Board may choose one or more of the three options within the North Embarcadero Subdistrict during its deliberations on whether to approve the proposed PMPU and certify this PEIR. A choice of one or more options by the Board could replace the proposed PMPU land uses, within the geographic boundaries of the options, with different or similar land uses. Figures 3-5, 3-6, and 3-7 illustrate the locations of the options. Operations impacts associated with each of the options are analyzed below.

Option 1: Waterfront Destination Park at Foot of Navy Pier

Option 1 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 1 include the closure of North Harbor Drive from the prolongation of West G Street to Broadway, as well as the construction and operation of a Waterfront Destination Park. The implementation of this option would result in the loss of existing parking along North Harbor Drive to accommodate the new Waterfront Destination Park. Under Option 1, there would be increase in Commercial Recreation and Recreation Open Space and a decrease in Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 1 is provided in Chapter 3.

As discussed above, the District anticipates that implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on TCRs associated with operation of future development.

Also, as noted, only operational activities involving ground disturbance have the potential to cause a substantial adverse change in the significance of a TCR. Operations under Option 1 would consist of routine maintenance and upkeep of the Waterfront Destination Park, similar to other existing parks on District Tidelands, and therefore would not include any such activities. Therefore, impacts would be less than significant, and operations under Option 1 would not result in any additional or more severe impacts related to TCRs than buildout of the proposed PMPU without Option 1.

Option 2: 205-Foot Setback East of North Harbor Drive

Option 2 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. Implementation of Option 2 would primarily result in additional Recreation Open Space compared to the proposed PMPU by establishing an average 205-foot setback adjacent to the east side of the present alignment of North Harbor Drive, running from Hawthorn Street to the prolongation of B Street, which is north of the Lane Field Setback Park. With the establishment of the 205-foot setback under Option 2, the existing Lane Field Setback Park would be contiguously expanded north. Under Option 2, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 2 is provided in Chapter 3.

As discussed above, the District anticipates that implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on TCRs associated with operation of future development.

Also, as noted, only operational activities involving ground disturbance have the potential to cause a substantial adverse change in the significance of a TCR. Operations under Option 2 would consist of routine maintenance and upkeep of the expanded Lane Field Setback Park, similar to other existing parks on District Tidelands, and therefore would not include any such activities. Therefore, impacts would be less than significant, and operations under Option 2 would not result in any additional or more severe impacts related to TCRs than buildout of the proposed PMPU without Option 2.

Option 3: 205-Foot Setback West of North Harbor Drive

Option 3 would include the same water and land uses for PD3 and would generally involve the same types of operational activities described above for the proposed PMPU, but in different acreages and configurations. The primary components of Option 3 include the realignment of North Harbor Drive to the east of its present location from Hawthorn Street to the prolongation of B Street, the establishment of a 205-foot setback to the immediate west of the realigned North Harbor Drive, and the addition of land from several properties. Under Option 3, there would be an increase in Recreation Open Space and a decrease in Commercial Recreation and Institutional/Roadway compared to the proposed PMPU. A detailed description of Option 3 is provided in Chapter 3.

As discussed above, The District anticipates that implementation of the proposed PMPU, including within PD3, would result in a less-than-significant impact on TCRs associated with operation of future development.

Also, as noted, only operational activities involving ground disturbance have the potential to cause a substantial adverse change in the significance of a TCR. Operations under Option 3 would consist of routine maintenance and upkeep of the additional park space added under this option, similar to other existing parks on District Tidelands, and therefore would not include any such activities. Therefore, impacts would be less than significant, and operations under Option 3 would not result in any additional or more severe impacts related to TCRs than buildout of the proposed PMPU without Option 3.

Impacts of Proposed PMPU Element Policies

Implementation of the proposed PMPU Element policies would not result in a substantial adverse change in the significance of a TCR as defined by PRC Section 21074. WLU Policy 2.3.1 involves supporting the placement of interpretive signage and artifacts, which would not result in adverse physical impacts, but could be beneficial to the treatment of such resources should they occur. This policy is also consistent with **MM-CUL-2** where treatment may be required in the event that impacts occur. Furthermore, EJ Policy 2.2.2 aims to engage people from relevant indigenous communities and tribes that may be impacted by upcoming activities or development on Tidelands, including but not limited to participation in discussions to identify mitigation options for projects that may impact them.

Impact Determination and Mitigation

Ground-disturbing activities associated with construction of future development projects allowable under the proposed PMPU have the potential to cause a substantial adverse change in the significance of a potential a tribal cultural resource, as defined in PRC Section 21074.

Significant Impacts

Impact-CUL-3: Future Ground-Disturbing Activities Within the Proposed PMPU Area May Adversely Impact Tribal Cultural Resources. Ground-disturbing activities associated with future development allowed under the proposed PMPU would have the potential to cause a substantial adverse change in the significance of a TCR, as defined in PRC Section 21074, which would be considered a significant impact.

Mitigation Measures

For **Impact-CUL-3**, the following mitigation measures shall be implemented:

Implement **MM-CUL-2: Conduct an Archaeological Resource Assessment**, as described under Threshold 2 above.

MM-CUL-3: Require Standard Mitigation Measures for Impacts on TCRs. If AB 52 tribal consultation occurs for a future development project under the proposed PMPU, and a tribe and the District cannot come to an agreement on mitigation measures, PRC Section 21084.3 lists examples of standard mitigation measures that the District may require, when feasible, to mitigate impacts on TCRs:

1. Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space to incorporate the resources with culturally appropriate protection and management criteria.
2. Treating the resource with culturally appropriate dignity and taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - a. Protecting the cultural character and integrity of the resource.
 - b. Protecting the traditional use of the resource.
 - c. Protecting the confidentiality of the resource.
3. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or using the resources or places.
4. Protecting the resource.

Level of Significance After Mitigation

Mitigation measure **MM-CUL-2** would reduce impacts on potential archaeological TCRs (**Impact-CUL-3**) by identifying potential TCRs, as defined in PRC Section 21074, and determining if avoidance through project redesign prior to construction is feasible. In addition, where applicable, it would provide for implementation of an archaeological data recovery program designed to record and remove significant prehistoric or historic period archaeological deposits that would otherwise be destroyed through construction-related ground disturbance. Where applicable, it would provide for archaeological construction monitoring, including Native American monitoring if determined by the District, in areas of archaeological sensitivity to mitigate the potential for project construction to damage or destroy TCRs. Finally, it would establish the procedures to follow in the event an unanticipated discovery of an archaeological resource occurs during project construction. These

measures would be implemented individually or in combination, as required by **MM-CUL-2**, to reduce impacts. Mitigation measure **MM-CUL-3** would reduce impacts through the consideration of mitigation measures for TCRs in the absence of consensus on mitigation resulting from tribal consultation. However, because the location, nature, scope, and effects of future development proposals are not known at this time, it is not possible to state with certainty that **MM-CUL-2** and **MM-CUL-3** would avoid or reduce impacts to less than significant. Therefore, **Impact-CUL-3** would be considered significant and unavoidable after mitigation.

4.4.5 Cumulative Impact Analysis

A significant cumulative impact on cultural resources would result if, when considered within the context of past, present, and probable future projects, the future, site-specific projects were to:

- (1) cause or contribute to impacts that would result in a substantial adverse change in the significance of a historical or archaeological resource; or
- (2) disturb any human remains.

4.4.5.1 Geographic Scope

The geographic scope for cumulative impacts associated with cultural resources and TCRs consists of areas that could be affected by the implementation of water and land use designations, PMPU policies, as well as areas affected by the implementation of other projects that include activities that could be directly or indirectly affect cultural resources and TCRs on the project site. In general, land use plans that would guide development within 1 mile of the proposed PMPU area were considered in this analysis to account for the prehistoric, ethnographic, and historic period landscape, of which cultural resources and TCRs are a part. One mile is sufficient to account for prehistoric and ethnographic bayfront-specific land uses as well as historic period waterfront-specific land uses. Projects on land that have the potential to modify and/or demolish structures potentially eligible for the CRHR have the potential to contribute to cumulative impacts on historical architectural resources. Projects involving ground disturbance of natural sediments or anthropogenic fill have the potential to contribute to cumulative impacts on archaeological resources, TCRs, or human remains.

4.4.5.2 Cumulative Effects From Past, Present, and Probable Future Projects

Table 2-2 in Chapter 2, *Environmental Setting*, includes past, present, and future plans and programs in the vicinity of the proposed PMPU area. Three plans and programs—the National City Bayfront Projects and Plan Amendments, the Chula Vista Bayfront Master Plan, and the Wetlands Mitigation Bank at Pond 20—are outside the PMPU planning area boundaries, are located within the District's jurisdiction and are within 0.25 mile of the proposed PMPU area. The other projects in Table 2-2 are plans either approved, or in preparation in adjacent jurisdictions, or occur within the PMPU planning area boundaries but are separate from the PMPU, such as Seaport San Diego (cumulative project #11), TAMT (cumulative project #12), and the B Street Cruise Ship Terminal (#13). The existing cultural resources for these latter projects are discussed in this chapter, under Section 4.4.2, *Environmental Setting*, as they fall within the boundaries of the PMPU planning area, but are not actions related to implementation of the PMPU.

~~Features of several of these plans may be within 1 mile of the proposed PMPU area. Present and probable future projects within the cumulative study area could encounter historical resources,~~

unique archaeological resources, TCRs, and human remains during construction activities. However, cultural resources and TCRs would be identified, evaluated and treated according to Federal, State, and local regulations during project development. For projects having the potential to significantly impact NRHP or CRHR cultural resources, mitigation measures carried out prior to and during construction would be required to reduce potential impacts. These projects, like the future, site-specific projects, are required to comply with all Federal, State, and local policies regarding cultural resources and TCRs, as described in Section 4.4.3, which would reduce potential loss of cultural resources and TCRs. Furthermore, National City General Plan Policy OS-8.8 requires cultural resource monitoring for all projects during ground-disturbing activities.

While individual projects mitigate the loss of historical resources through avoidance, preservation in place, archival documentation, salvage, interpretive programs, or alteration in accordance with SOI standards, the cumulative effect is a continued decrease in the number and variety of historical resources in the region. Therefore, the potential effect of cumulative projects on historical resources would be cumulatively significant.

For archaeological resources and TCRs, previous historical urban development without proper professional assessment and systematic collection of data, prior to the enactment of Federal, State, and local laws and regulations, has resulted in the loss of potentially significant scientific and cultural data. More recent development has been carried out under Federal, State, and local regulations, with mitigation of significant impacts on such resources. However, because archaeological resources, including archaeological historical resources and unique archaeological resources, and TCRs are non-renewable resources, the direct and indirect impacts of past, present, and future projects are cumulatively significant.

For human remains, existing laws and regulations—such as State CEQA Guidelines Section 15064.5, Health and Safety Code Section 7050.5, and PRC 5097.98—require past and present projects to treat human remains in a manner consistent with the proper protocol and treatments to minimize the disturbance of human remains and to appropriately treat any remains that are discovered. Probable future projects would be required to comply with these regulations. Implementation of these protocols and treatments would reduce the impacts of inadvertent discoveries of human remains to a less-than-significant level. Therefore, the potential effect of cumulative projects on human remains, would be cumulatively less than significant.

4.4.5.3 Project Contribution

Historical Resources

As discussed under Threshold 1, PD2, PD3, PD4, and PD10 contain historical resources that are listed or eligible for listing in a Federal, State, or local register. All of the planning districts contain built resources that will reach the 50-year age benchmark for consideration as potential historical resources under CEQA by 2050 (i.e., the proposed PMPU planning horizon). Therefore, construction associated with future projects allowed under the proposed PMPU could damage, alter, or demolish historical resources. Impacts might include, but are not limited to, demolition or material alteration of known historical structures; structural reuse requiring rehabilitation, restoration, reconstruction, and/or additions; or new construction or in-fill that has the potential to change the local landscape by modifying the setting of nearby historical resources. Potential impacts might also be associated with changes to previously unevaluated historical resources or resources that would achieve significance by 2050. These types of impacts would result in a substantial adverse change in the

significance of a historical resource. Therefore, future development projects allowed under the proposed PMPU would have the potential to result in a cumulatively considerable contribution to a significant cumulative impact on historical resources (**Impact-C-CUL-1**). Consequently, the proposed PMPU's contribution is considered cumulatively considerable/significant.

The District anticipates that future development allowed under the proposed PMPU would not result in any operations-related impacts on historical resources within the proposed PMPU area because ground disturbances or structural modifications, or vibration impacts are not expected to be significant during operations associated with the future development projects.
