1.1 Project Overview

The San Diego Unified Port District (District) is proposing (1) to adopt an ordinance establishing a District Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants, and (2) four proposed new fireworks display events that would be located adjacent to the National City and Chula Vista Bayfronts. These four proposed new fireworks display events are anticipated to require future discretionary actions by the District. Discretionary actions for fireworks display events that may require District approval include, but are not limited to, the following:

- Sponsorship agreement
- Special event permit
- Lease and lease amendment
- Tideland Use and Occupancy Permit
- Right of Entry Permit
- Coastal Act Categorical Determination of Exclusion
- Coastal Development Permit

Several existing fireworks display events that require a discretionary action by the District or are operated by the District's tenants occur throughout the year in San Diego Bay and the Imperial Beach Oceanfront. Within San Diego Bay, these existing fireworks display events include the annual Fourth of July Big Bay Boom and other fireworks display events associated with the San Diego Symphony's Summer Pops concert series, Our Lady of Rosary Church annual procession, the U.S.S. Midway Aircraft Carrier Museum (U.S.S. Midway Museum), and General Dynamics National Steel and Shipbuilding Company (NASSCO). Also within San Diego Bay, the Fireworks Show Over Glorietta Bay is an existing display whose fireworks organizers may seek to obtain funding from the District in the future, a request that would require a discretionary action by the District. The Fourth of July Imperial Beach Fireworks Show is an existing display that occurs along the Imperial Beach Oceanfront. All of these existing fireworks display events would be governed by the proposed ordinance. Additionally, the four proposed new fireworks display events that would occur adjacent to the National City and Chula Vista Bayfronts would also be governed by the proposed ordinance.

1.2 Certification of the Final EIR

The District is the Lead Agency, as defined under California Environmental Quality Act (CEQA) Guidelines Section 15050, because it has principal responsibility for carrying out and approving the proposed project. As Lead Agency, the District also has primary responsibility for complying with

CEQA. Therefore, the Board of Port Commissioners (Board), as the decision-making body of the District, is required to consider the information contained in the Final Environmental Impact Report (EIR) prior to approving the proposed project. Specifically, the Board must certify that:

- The Final EIR has been completed in compliance with CEQA;
- The Final EIR was presented to the decision-making body of the Lead Agency and the decision-making body reviewed and considered the information contained in the Final EIR prior to approving the project; and
- The Final EIR reflects the Lead Agency’s independent judgment and analysis.

Other agencies may use the information contained in this Final EIR when considering issuance or authorization of any other approvals for the project. The Final EIR, in compliance with Section 15132 of the State CEQA guidelines, includes Volumes I–III listed under Section 1.3 below.

1.3 Contents and Organization of the Final EIR

The content and format of this Final EIR is designed to meet the requirements of CEQA and the State CEQA Guidelines, Article 9, and specifically State CEQA Guidelines Section 15132. Table 1-1 summarizes the organization and content of the Final EIR.

The Draft EIR that was previously circulated for public review is an integral part of the Final EIR; both documents are intended to be used together. The Draft EIR was not reprinted; however, a CD copy of the Draft EIR is enclosed with this Final EIR and the Final EIR (including the Draft EIR) may also be viewed on the District’s website. A paper copy of the Draft EIR, including its appendices, is available at the District Clerk office at 3165 Pacific Highway, San Diego, CA 92101, during regular business hours, which are Monday through (every other) Friday, 8 a.m. to 5 p.m.

Table 1-1. Document Organization and CEQA Requirements

Location	Contents
VOLUME I	
Chapter 1 <i>Introduction</i>	Provides background on the proposed project, the requirements for a Final EIR and other related documents, and the organization of the Final EIR.
Chapter 2 <i>Executive Summary</i>	Briefly summarizes the proposed project; identifies each significant effect, with proposed mitigation measures and alternatives that would reduce or avoid that effect; identifies the areas of controversy known to the Lead Agency, including issues raised by agencies and the public; and summarizes the issues to be resolved, including the choice among alternatives and how to mitigate the significant effects (State CEQA Guidelines Section 15123).
Chapter 3 <i>Revisions to the Draft EIR</i>	Includes the revisions to the Draft EIR and its technical appendices (where appropriate), which were prepared in response to comments received during the public review period for the Draft EIR (State CEQA Guidelines Section 15132).

Location	Contents
Chapter 4 <i>Comments Received and District Responses</i>	Includes a list of agencies, organizations, and individuals that provided comments on the Draft EIR during the public review period as well as the distribution list that was used to circulate the Draft EIR. Each comment is assigned a comment number, which corresponds to a response (State CEQA Guidelines Section 15132).
Chapter MMRP <i>Mitigation Monitoring and Reporting Program</i>	The Mitigation Monitoring and Reporting Program (MMRP) for the project is included as a chapter of the Final EIR. The MMRP is presented in table format and identifies mitigation measures for the proposed project, the party responsible for implementing the mitigation measures, the timing of implementing the mitigation measures, and the monitoring and reporting procedures for each mitigation measure (State CEQA Guidelines Section 15097).
VOLUME II	
<i>Draft EIR</i>	Volume II of the Final EIR contains the Draft EIR that was previously circulated for public review. The Draft EIR contains all the contents described within CEQA and the State CEQA Guidelines, Article 9. The Draft EIR is included on the enclosed CD, as Volume II of the Final EIR. A hard copy is available at the District Clerk's office.
VOLUME III	
<i>Draft EIR Technical Appendices</i>	Volume III of the Final EIR consists of Appendices A through K of the Draft EIR. The appendices include additional background information and technical detail for several of the resource areas, as well as the Initial Study/Notice of Preparation and any comments received during the scoping process. The technical appendices to the Draft EIR are included on the enclosed CD, as Volume III of the Final EIR. A hard copy is available at the District Clerk's office.
Under Separate Cover	
<i>Findings of Fact and Statement of Overriding Considerations</i>	Provides findings on each significant impact and alternative, accompanied by a brief explanation of the rationale for each finding. The findings are supported by substantial evidence in the record (State CEQA Guidelines Section 15091). The statement of overriding considerations provides a written statement related to balancing, as applicable, the economic, legal, social, technological, or other benefits of a proposed project against its unavoidable environmental risks when determining whether to approve the project (State CEQA Guidelines Section 15093).

2.1 Project Overview

The proposed San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (herein referred to as the proposed project) consists of (1) an ordinance establishing a San Diego Unified Port District (District) Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur throughout the year in and around San Diego Bay and Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the District. Discretionary actions for fireworks display events that may require District approval include, but are not limited to, the following:

- Sponsorship agreement
- Special event permit
- Lease and lease amendment
- Tideland Use and Occupancy Permit
- Right of Entry Permit
- Coastal Act Categorical Determination of Exclusion
- Coastal Development Permit

Fireworks display events that require a discretionary action by the District or are operated by the District's tenants have been occurring on the Fourth of July and at other times throughout the year for more than a decade. The most prominent existing fireworks display events are the annual Fourth of July Big Bay Boom in San Diego Bay and the Fourth of July Imperial Beach Fireworks Show. Furthermore, the Fireworks Show Over Glorietta Bay is an existing display whose fireworks organizers may seek to obtain funding from the District in the future, which would require a discretionary action by the District. Existing fireworks display events that occur at other times throughout the year include those associated with the San Diego Symphony's Summer Pops concert series (multiple small displays) and the Our Lady of Rosary Church annual procession, along with the U.S.S. Midway Aircraft Carrier Museum (U.S.S. Midway Museum) (multiple small displays) and General Dynamics National Steel and Shipbuilding Company (NASSCO) displays. A description of the operational characteristics of each of these existing displays is provided in Tables 2-1 and 2-2 respectively, of Chapter 2, *Environmental Setting*, of the Draft Environmental Impact Report (EIR). These fireworks display events would be subject to the proposed ordinance. In addition, the four proposed new fireworks display events adjacent to the National City and Chula Vista Bayfronts are anticipated to require a future discretionary action by the District, as discussed further below.

2.1.1 Fireworks Display Event Locations

Existing Fireworks Display Events

Existing fireworks display events currently occur at several locations within San Diego Bay, a natural harbor and deep-water port in southern San Diego County, and the Imperial Beach Oceanfront. San Diego Bay is an active maritime environment that provides passage and berthing for numerous types of boats and vessels, including small recreational boats that moor at dock marinas and open anchorage marinas within the Bay, mid-sized vessels such as private yachts and harbor cruise boats, and large vessels that consist of naval ships, cruise ships, cargo ships, and shipping barges. Fireworks display events within San Diego Bay take place off Shelter Island, Harbor Island, Centre City Embarcadero (which includes North Embarcadero, Central Embarcadero, and South Embarcadero), and the NASSCO ship repair facility. In addition, fireworks display events take place along the Coronado Bayfront within Glorietta Bay (an inlet of San Diego Bay adjacent to Coronado Island) and the Imperial Beach Oceanfront. A list of existing fireworks display events that occur in and around San Diego Bay and the Pacific Ocean near Imperial Beach annually and a summary of the activity associated with them are provided in Tables 2-1 and 2-2, respectively, of Chapter 2, *Environmental Setting*, of the Draft EIR.

Proposed New Fireworks Display Events

There are currently no fireworks display events along the National City or Chula Vista Bayfronts. Along the National City Bayfront, it is anticipated that future fireworks display events would take place from a barge within view of Pepper Park because Pepper Park is the closest publicly accessible gathering space near the National City Bayfront that could have a partial view of the fireworks display event. Pepper Park is located along Tidelands Avenue in National City. The site is adjacent to the Sweetwater Channel, north of the Sweetwater Marsh Unit of the San Diego Bay National Wildlife Refuge, which includes Paradise Creek to the east and D Street Fill to the south, south of the National City Marine Terminal, east of San Diego Bay, and west of Pier 32 Marina. Interstate 5 (I-5) runs northeasterly approximately 0.4 mile from the park site boundary. Pepper Park site access is provided via Tidelands Avenue, which turns into Goesno Place as it approaches the park. One fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the Bay and within view of Pepper Park.

Along the Chula Vista Bayfront, it is anticipated that fireworks display events would take place from a barge within view of both the Chula Vista Bayside Park and the Chula Vista Bayfront Park. Bayside Park is a waterfront park accessed by Bayside Parkway. It is bounded to the north by a boatworks facility, to the south by a man-made inlet that contains marinas, to the east by a recreational vehicle park, and to the west by San Diego Bay. Bayfront Park is on the south side of the man-made inlet and is bounded to the south and west by San Diego Bay and to the east by the marinas of the man-made inlet as well as vacant land. The park is accessed by Marina Way. I-5 is approximately 0.5 mile to the east of the Chula Vista Bayfront. A total of three fireworks display events (including one on the Fourth of July) along the Chula Vista Bayfront area are allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan and are anticipated to involve the placement of a single, temporary barge in the Bay in the vicinity of the two parks.

Proposed new fireworks display events are described below in more detail in Section 2.1.3, *Project Operations*.

2.1.2 Proposed Ordinance

As stated above, the proposed project consists of an ordinance to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants. The proposed draft ordinance that was provided in the Draft EIR is included as Appendix D in Volume III. Revisions to the proposed draft ordinance are included in Chapter 3, *Errata and Revisions*, of the Final EIR. The proposed ordinance addresses the following:

- Permit procedures and requirements for the conduct of fireworks displays
- Compliance with applicable federal, state, and local laws and regulations governing fireworks, including, but not limited to:
 - Code of Federal Regulations
 - Clean Water Act
 - California Health and Safety Code
 - California Code of Regulations
 - California Environmental Quality Act (CEQA)
 - California Coastal Act
- Compliance with applicable federal, state, and local plans and permits governing fireworks, including, but not limited to:
 - San Diego Regional Water Quality Control Board's General Permit for Public Display of Fireworks (Order No. R9-2011-0022)
 - District's Climate Action Plan
 - District's Stormwater Management and Discharge Control Code
 - Integrated Natural Resources Management Plan
 - Chula Vista Bayfront Master Plan Natural Resources Management Plan
- Consistency with the features and characteristics of each individual fireworks display event analyzed in this Draft EIR, including, but not limited to:
 - Allowable launch site locations for individual displays
 - Total pounds of fireworks for individual displays
 - Allowable shell size(s) for individual displays
 - Frequency of individual displays
 - Duration of individual displays

Compliance with the applicable mitigation measures identified in the Mitigation, Monitoring, and Reporting Program for the proposed project.

2.1.3 Project Operations

In addition to the existing fireworks display events, the proposed ordinance would govern four proposed new fireworks display events, including three displays along the Chula Vista Bayfront as allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and one Fourth of July display along the National City Bayfront. The three proposed fireworks display events along the Chula Vista Bayfront include one Fourth of July display and two non-Fourth of July displays. It is anticipated that the District would consider annually whether or not to provide event sponsorship and/or issue a Special Event Permit, Right-of-Entry Permit, Tideland Use and Occupancy Permit, Coastal Development Permit, Coastal Act Categorical Determination of Exclusion, or other similar approval for these proposed new fireworks display events. These proposed new fireworks display events are anticipated to last approximately 3 to 10 minutes for non-Fourth of July displays and 15 to 20 minutes for Fourth of July displays, and the fireworks are anticipated to be launched from barges within San Diego Bay. These proposed new fireworks display events would also be governed by the proposed ordinance. The proposed new fireworks display events are identified in Table 2-1, below.

Table 2-1. Proposed New Fireworks Display Events Requiring a Future Discretionary Action by the District

Time of Year	Approximate Number of Fireworks Display Events	Location(s) of Fireworks Display Event	Approximate Duration of Each Fireworks Display Event	Approximate Shell Size
January–March	1	• Chula Vista ¹	3–10 minutes	2–8 inches
April–June	—	—	—	—
July–September	2	• Chula Vista ² • National City ²	15–20 minutes	3–8 inches
October–December	1	• Chula Vista ¹	3–10 minutes	2–8 inches
TOTAL³	4			

¹ Non-Fourth of July display (smaller display)
² Fourth of July display
³ Total includes three fireworks display events along the Chula Vista Bayfront, as allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan.

Table 2-2 summarizes the total pounds of fireworks estimated in this Draft EIR for each proposed new fireworks display event. Because the proposed ordinance would require consistency with the features and characteristics of each individual fireworks display event analyzed in this Final EIR, including, but not limited to, the total pounds of fireworks and durations for individual displays, the values provided in Table 2-2 represent the maximum allowable pounds of fireworks and durations for the proposed new displays along the Chula Vista and National City Bayfronts assumed in this Final EIR. If an existing fireworks display event identified in Chapter 2, *Environmental Setting*, of the Draft EIR is proposed to be modified in the future, a new additional fireworks display event is proposed that was not analyzed in this Final EIR, or any of the characteristics provided in Table 2-1 and Table 2-2 (e.g., magnitude and/or duration) of the four proposed new fireworks display events

are proposed to be modified, the fireworks display event will be subject to additional environmental review, pursuant to State CEQA Guidelines Section 15168(c).

Table 2-2. Summary of Activity Associated with the Proposed Fireworks Display Events

Fireworks Display Event	Day of Event	Number of Events	Pounds of Fireworks per Event	Pounds of Fireworks Annually	Number of Barges Used per Event
Chula Vista Bayfront ¹	Fourth of July plus two other shows	3	456 ¹ 114 ²	684	1
National City Bayfront ¹	Fourth of July	1	456 ¹	456	1

Source: District 2016

¹ The total pounds of fireworks display events in the Chula Vista Bayfront and National City Bayfront areas on the Fourth of July is anticipated to be 456 pounds, similar to the Fourth of July Imperial Beach Fireworks Show.

² The total pounds of non-Fourth of July fireworks events estimated by scaling the Fourth of July Imperial Beach Fireworks Show (20-minute event) by the number of minutes for each fireworks display event (assumed to average 5 minutes), which equals an estimated 114 pounds each.

Both existing and proposed new fireworks display events involve coordination between several agencies, organizations, and businesses, as detailed below. The definitions below pertain to terminology used in the description of fireworks display events in the following paragraphs and throughout this EIR.

- *Sponsor* generally refers to an individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency, or other legal entity, or the agent or employee thereof, that contributes funds, services, or other similar goods to a *fireworks organizer* in support of a fireworks display event. The District has historically been a *sponsor* of several of the fireworks display events described below.
- *Fireworks organizer* generally refers to the individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency, or other legal entity, or the agent or employee thereof, proposing to conduct a fireworks display event. The *fireworks organizer* is typically responsible for obtaining all required funding, entitlements, and approvals for a fireworks display event, as well as contracting with a *fireworks operator* to produce the fireworks display event. Historically, the District has entered into agreements with *fireworks organizers* in order to *sponsor* several of the fireworks display events described below.
- *Fireworks operator* generally refers to a State of California–licensed pyrotechnic operator who, by examination, experience, and training, has demonstrated the required skill and ability in the use and discharge of fireworks as authorized by the license granted. A *fireworks operator* is typically responsible for supplying, setting up, and detonating the pyrotechnic devices associated with a fireworks display event. The *fireworks operator* is also typically under contract with the *fireworks organizer* to produce the fireworks display event. Historically, the District has not had a direct relationship with the *fireworks operator*.

All existing and proposed new fireworks display events that either require a discretionary action by the District or that are operated by the District’s tenants would be subject to all applicable federal,

state, and local laws and regulations governing fireworks as well as any additional requirements set forth in the proposed ordinance.

2.2 Project Alternatives

Alternatives analyzed in Chapter 7, *Alternatives*, of the Draft EIR include the No Project Alternative, the Quiet Fireworks Display Events Alternative, and the No Salute Fireworks Alternative. Pursuant to CEQA, the EIR is required to identify the environmentally superior alternative. Although the No Project Alternative reduces the greatest number of significant impacts, CEQA requires that when the environmentally superior alternative is the No Project Alternative, another alternative should be identified. Therefore, as indicated in Table 7-2 of Chapter 7, *Alternatives to the Proposed Project*, of the Draft EIR, the Quiet Fireworks Display Event Alternative would be the environmentally superior alternative. Because it would involve the use of quieter fireworks, the Quiet Fireworks Display Event Alternative would reduce the amount of noise generated by the proposed new fireworks display events, and therefore would reduce significant and unavoidable noise impacts compared to the proposed project. Therefore, as documented throughout the alternatives section, impacts associated with other resources, such as light and glare, biological resources, and transportation, circulation, and parking, would also be reduced. However, the Quiet Fireworks Display Events Alternative would not meet the fundamental project objectives.

Table 2-3 below presents the impacts associated with the proposed project compared with the alternatives.

Table 2-3. Summary Impacts of Alternatives Relative to the Proposed Project

Environmental Resource	Proposed Project	No Project (Alt 1)	Quiet Fireworks Display Events (Alt 2)	No Salute Fireworks (Alt 3)
Aesthetics and Visual Resources	Less than Significant	-2	-1	0
Air Quality and Health Risk	Less than Significant w/Mitigation	-2	+1	0
Biological Resources	Less than Significant w/Mitigation	-1	-1	-1
Greenhouse Gas Emissions, Climate Change, and Energy Use	Less than Significant	-1	0	0
Hazards and Hazardous Materials	Less than Significant	-1	0	0
Hydrology and Water Quality	Significant and Unavoidable	-1	0	0
Land Use and Planning	Less than Significant	-1	0	0
Noise and Vibration	Significant and Unavoidable	-2	-2	-1
Public Services and Facilities	Less than Significant	-2	0	0
Transportation, Circulation, and Parking	Significant and Unavoidable	-2	-1	0
Other Impacts	Less than Significant/No Impact	0	0	0
Total:¹		-15	-4	-2

Legend:

-2 = Substantially Reduced

-1 = Reduced

0 = Similar

+1 = Greater

+2 = Substantially Greater

¹ Lowest score is environmentally superior

2.3 Impact Summary

The proposed project would result in significant project impacts related to air quality and health risk, biological resources, hydrology and water quality, noise and vibration, and transportation, circulation and parking. The project would contribute to cumulative impacts related to air quality and health risk, biological resources, and hydrology and water quality. Table 2-4 presents the significant impacts, the proposed mitigation measures, and the level of significance after mitigation.

Table 2-4. Project Impacts and Mitigation Measures

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.1 Aesthetics and Visual Resources				
Project Impacts				
New Source of Substantial Light or Glare	<i>Proposed New Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	Implementation of the proposed new fireworks display events would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	The effects of the proposed ordinance on existing fireworks display events would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.			
Cumulative Impacts				
The contribution of the proposed new fireworks display events and the proposed ordinance to cumulative aesthetics and visual resources impacts would not be cumulatively considerable.				
4.2 Air Quality and Health Risk				
Project Impacts				
Conflict with an Air Quality Management Plan	<i>Proposed New Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	Implementation of the proposed new fireworks display events would not conflict with or obstruct implementation of an applicable air quality plan.			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	The effects of the proposed ordinance on existing fireworks display events would not conflict with or obstruct			

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Violate Air Quality Standard	<p>implementation of an applicable air quality plan.</p> <p><i>Proposed New Fireworks Display Events</i></p> <p>Impact-AQ-1: Emissions in Excess of PM2.5 Thresholds During Combined National City Bayfront and Chula Vista Bayfront Fourth of July Fireworks Display Events. Project emissions generated when the new National City Bayfront and Chula Vista Bayfront Fourth of July fireworks display events occur at the same time, before mitigation, would exceed the daily San Diego County Significance Level Thresholds (SLTs) for particulate matter 2.5 microns or less in diameter (PM2.5). The contribution of project-related emissions is considered significant because the project emissions would exceed the daily threshold that has been set by the San Diego Air Pollution Control District (SDAPCD) to attain the PM2.5 National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS).</p>	PS	<p>MM-AQ-1: Limit the Size of Overlapping New Fireworks Display Events in Compliance with the Conditions of the Proposed Ordinance. 4.3 Biological Resources				
Project Impacts				
Candidate, Sensitive, or Special-Status Species	<p><i>Proposed New Fireworks Display Events</i></p> <p>Impact-BIO-1: Potential Direct Impact on Marine Reptiles from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to green sea turtles because the turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on green sea turtles from fireworks-generated trash and debris that enter the water may be significant.</p> <p>Impact-BIO-2: Potential Indirect Impacts on Marine Reptiles from Increased Human and Boating Activity. The increase in boat traffic, particularly nighttime and out-of-channel traffic, would increase the potential for propeller strikes, which may cause injury to or death of green sea turtles. Increased boating activities could cause the animals to temporarily depart the project area before, during, and after the time of the proposed new fireworks display events to avoid higher vessel traffic. The increase in activity may also affect the turtles' foraging habits in that individuals may spend more time underwater, swim at greater speeds, and alter other life history traits leading to greater energy expenditure. The introduction of</p>	PS	<p>MM-BIO-1: Implementation of Biological Resources-Related Conditions of the Proposed Ordinance for Direct Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(d) Fireworks Chemical Composition and Packaging.</p> <p>2. Packaging.</p> <p>A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all fireworks to be used in the event.</p> <p>B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.</p> <p>(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:</p> <p>1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety</p>	LS

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>human-generated trash could also cause injury to turtles if they mistakenly consume the waste, causing suffocation, starvation, or debilitation. These potential indirect impacts on marine reptiles may be significant.</p> <p>Impact-BIO-3: Potential Direct Impact on Avian Species from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to avian species because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on avian species from fireworks-generated trash and debris that enter the water may be significant.</p> <p>Impact-BIO-4: Potential Indirect Impacts on Special-Status Avian Species from Increased Human and Boating Activity. The proposed new fireworks display events have the potential to result in indirect impacts on special-status avian species, particularly California least tern and western snowy plover, as a result of increased foot traffic on sand dunes and beaches that can cause disturbance to nesting sites during and immediately after the proposed new fireworks display events. Additional indirect impacts potentially include increased trash associated with human use and noise associated with boating activity adjacent to nesting sites. The</p>		<p>issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.</p> <ol style="list-style-type: none"> 2. Fireworks shall be brought to the barge and loaded in their U.S. Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the fireworks launch area to contain debris. 3. Wires from the electric match placed in the Fireworks fuse shall be secured to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event. 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>introduction of human-generated trash could also cause injury to special-status birds because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. While many nesting sites for California least tern and western snowy plover in San Diego Bay are behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas may be significant.</p>		<p>No loose material shall be allowed on the barges during the fireworks display event.</p> <ol style="list-style-type: none"> 5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway. 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning. 7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment. 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal.</p> <p>9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.</p> <p>10. Within ten (10) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the weight of the fireworks trash and debris collected is less than fifty percent (50 percent) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<ul style="list-style-type: none"> (i) Compliance with San Diego Water Board General Permit. <ul style="list-style-type: none"> 1. Prior to the Executive Director’s issuance of a permit pursuant to this article, the Applicant shall demonstrate that it has applied for coverage and has been enrolled under the San Diego Water Board General Permit. 2. The Applicant shall comply with all applicable terms, conditions and Best Management Practices required by the San Diego Water Board General Permit, which shall be incorporated into and considered in the terms, conditions and Best Management Practices of any permit issued by the Executive Director pursuant to this article. 3. The Applicant shall submit to the District copies of all applications, plans, reports and other documentation required by the San Diego Water Board General Permit, including without limitation the Notice of Intent, Fireworks Best Management Practices Plan, Public Fireworks Display Log and the Public Display of Fireworks Post Event Report, within the time required for the submission of such reports to the San Diego Water Board. (j) Compliance with Other Required Permits: Prior to the Executive Director’s issuance of a Permit pursuant to this article, the Applicant shall demonstrate that it has obtained and shall comply with all other permits and approvals required by federal, state and local laws and regulations including, without limitation, such permits and approvals as are required by the United States Coast Guard, California Coastal Act, the District Code, including Article 10 (Stormwater

			<p>Management and Discharge Control), and the fire marshal of any city which has jurisdiction over all or any part of the activity allowed under said Permit.</p> <p>(k) Compliance with Laws: The Applicant shall comply with any and all applicable rules and regulations promulgated by the District, including without limitation the District Code, the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and with the laws, rules and regulations of the United States of America and the State of California, and of any department or agency thereof, and with the applicable ordinances, rules and regulations of any city which has jurisdiction over all or any part of the activity allowed under said Permit. The Applicant’s failure to comply with any applicable law, ordinance, rule or regulation shall be cause for immediate revocation of said permit and for the denial of applications for future Permits.</p> <p>MM-BIO-2: Implementation of Biological Resources–Related Conditions of the Proposed Ordinance for Indirect Impacts. The fireworks organizer and operator are required to comply with the following biological resources–related condition of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(e) Protection of Species and Habitat. The following conditions shall apply to fireworks display events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:</p> <ol style="list-style-type: none"> 3. Security. For fireworks display events with public viewing areas (i.e., parks, promenades, 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>publicly accessible piers, and other similar facilities) that occur within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays. In addition, the fireworks organizer shall provide security patrols of the water area to enforce the existing restrictions on access to unauthorized areas during such fireworks display events in the South Bay.</p> <p>4. Signage. For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half-mile of nesting colonies or habitat areas for federally or state-listed species, the fireworks organizer, in cooperation with the District, shall post temporary signage along primary access points to sensitive nesting colonies and habitat areas to identify safe viewing locations, to educate visitors on locations of sensitive wildlife habitats, to prevent viewers from trespassing into sensitive areas and to encourage appropriate viewing behavior.</p> <p>5. Education. Beginning not less than seven (7) days before fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall implement a public education program using daily announcements on social media, press</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to remind viewers of appropriate viewing behavior in and near sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).</p> <p>(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:</p> <p>11. For all Fourth of July fireworks display events and for Non-Fourth of July fireworks display events which are advertised to the public, the fireworks organizer shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.</p> <p>MM-BIO-4: Fireworks Biological Monitoring Plan. Not less than 30 days before any fireworks display event in the South Bay that would occur within 1 mile of sensitive avian nesting colonies, the fireworks organizer shall submit to the District an Avian Species Nesting Colony Monitoring Plan (Monitoring Plan). The Monitoring Plan shall be prepared by a qualified biologist and approved by the District in coordination with USFWS and CDFW. A qualified biologist is a person who, by reason of his or her knowledge of the natural sciences and the principles of wildlife biology,</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>acquired by education and experience. The Monitoring Plan shall identify the monitoring protocol that will be used to assess the effectiveness of mitigation measures MM-BIO-1 and MM-BIO-2 and shall, at a minimum, include the following:</p> <ol style="list-style-type: none"> 1. A literature review which refines the proposed methodology. 2. A list of target species identified for each individual event based on the season of the event, proximity of the event to nesting colonies, sensitivity of species, and capacity for the fireworks display event to cause species disturbance/effects. 3. Species behavior and noise data shall be collected at least 1 hour prior to, during, and 1 hour after the fireworks display event. 4. Documentation of the following data: <ol style="list-style-type: none"> a. Site location, name of monitor, date and time of observations b. Number of adults, nests, and chicks observed within one-half mile of spectator viewing areas c. Sources of stressors (e.g., light, noise, trespass, debris) d. Unauthorized access within nesting colonies e. Counts of illegal pyrotechnics <p>Within 30 days following the completion of the fireworks display event, the qualified biologist shall prepare a Monitoring Report for submittal to the District that details the findings of the monitoring results. This report shall include background/ introduction, methods, results, discussion, and recommendations sections. The District shall provide a copy of the report to the USFWS and CDFW and shall coordinate with these agencies regarding the results</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
and recommendations of the report. Based on the review of the reports for two consecutive years of monitoring, the District, in coordination with these agencies, shall determine whether continued monitoring is required.				
<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>				
	The effects of the proposed ordinance on existing fireworks display events would not have an adverse effect on candidate, sensitive, or special-status species.	LS	No mitigation is required.	N/A
Sensitive Natural Community/ Federally Protected Wetlands	<p data-bbox="432 662 873 691"><i>Proposed New Fireworks Display Events</i></p> <p data-bbox="432 703 884 1170">Impact-BIO-5: Potential Direct Impact on Sensitive Habitat and Wetlands from Fireworks-Generated Trash and Debris. The waste resulting from exploded fireworks shells could fall primarily into the waters of San Diego Bay. It is anticipated that some of this debris could sink to the bottom, and a smaller amount could wash onto adjacent beaches and shorelines. Direct impacts on sensitive habitats and federally protected wetlands of south San Diego Bay from fireworks-generated trash and debris that enter the water are considered significant.</p> <p data-bbox="432 1182 863 1390">Impact-BIO-6: Potential Direct Impact on Eelgrass Habitat from Fireworks Barges and Tugboat Activity. The positioning of fireworks barges along the Chula Vista Bayfront over the shallow flats could result in direct impacts on eelgrass habitat and</p>	PS	<p data-bbox="1094 703 1671 732">Implement MM-BIO-1, MM-BIO-2, and MM-BIO-4.</p> <p data-bbox="1094 773 1713 959">MM-BIO-3: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Direct Eelgrass Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.</p> <p data-bbox="1094 967 1629 997">Section X.07 – Permits – Conditions of Approval</p> <p data-bbox="1094 1005 1713 1403">(g) Eelgrass Avoidance and Mitigation. For fireworks display events with launching sites located in shallow water with the potential for eelgrass to occur, fireworks barges shall be held in place by tugboats and shall not require temporary moorings. To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds. Pre-event and post-event eelgrass surveys shall be completed to identify the distribution of eelgrass to assist tug operators and to assess any impacts to eelgrass that may occur. Through a pre-event training, tug operators shall be made aware of shallow eelgrass and instructed</p>	LS

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>its nursery habitat functions, particularly at low tides. Impacts could occur as a result of temporary grounding or settling of barges and tugboats on the bottom at low tide. Additional impacts could occur from propeller wash or propeller drag from tugboats during barge maneuvering. Tugboats have large propellers and high thrust capacity that could dredge up eelgrass in shallow waters, even if grounding does not occur. Potential direct impacts on eelgrass habitat are considered significant.</p> <p>Impact-BIO-7: Potential Indirect Impact on Sensitive Habitat and Wetlands from Increased Human and Boating Activity. Increased boat traffic could result in minor damage to eelgrass beds through unauthorized anchoring and/or propeller dragging. Additionally, visitors that view the proposed new fireworks display events from kayaks or personal watercraft could drag these watercraft onto shorelines adjacent to coastal salt marshes and inadvertently damage eelgrass or marsh habitat. The proposed new fireworks display events could attract crowds to the Silver Strand State Beach, some of whom may trespass into restricted beach areas that are utilized by sensitive avian species. Potential impacts on habitats include trampling of vegetation and an increase of human-generated trash and</p>		<p>not to use high thrust in the vicinity of eelgrass beds. If an unanticipated impact to eelgrass occurs, this impact shall be mitigated by replacing the eelgrass at a ratio determined by the California Eelgrass Mitigation Policy.</p>

Fireworks shall be brought to the barge and loaded in their U.S. Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the Fireworks launch area to contain debris.</p> <ol style="list-style-type: none"> 3. Wires from the electric match placed in the fireworks fuse shall be secured to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event. 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event. 5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway. 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<ol style="list-style-type: none"> 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning. 7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment. 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal. 9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.</p> <p>10. Within ten (10) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the Fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the dry weight of the fireworks trash and debris collected is less than fifty percent (50 percent) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.</p> <p>(i) Compliance with San Diego Water Board General Permit.</p> <ol style="list-style-type: none"> 1. Prior to the Executive Director's issuance of a permit pursuant to this article, the Applicant shall demonstrate that it has applied for coverage and has been enrolled under the San Diego Water Board General Permit. 2. The Applicant shall comply with all applicable terms, conditions and Best Management Practices required by the San Diego Water Board General Permit, which shall be

			Code, including Article 10 (Stormwater Management and Discharge Control), and the fire marshal of any city that has jurisdiction over all or any part of the activity allowed under said Permit.	
<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>				
	The effects of the proposed ordinance on existing fireworks display events would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.	LS	No mitigation is required.	N/A
Insufficient Parking	<i>Proposed New Fireworks Display Events</i>			
	Impact-TRA-2: Inadequate Parking Supply During Proposed New Fireworks Display Events. The proposed new fireworks display events have the potential to result in a temporary inadequate supply during the displays due to an increased demand on parking facilities serving the viewing locations. Potential impacts would be temporary, but are considered significant.	PS	Implement MM-TRA-1 .	SU
<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>				
	The effects of the proposed ordinance on existing fireworks display events would not result in an inadequate supply of parking.	LS	No mitigation is required.	N/A

Cumulative Impacts

The contribution of the proposed new fireworks display event and the proposed ordinance to cumulative transportation, circulation, and parking impacts would not be cumulatively considerable.

Notes: PS = Potentially significant; LS = Less than significant; SU = Significant and Unavoidable; N/A = Not applicable

2.4 Areas of Known Controversy/ Issues Raised by Agencies and the Public

Section 15123 of the State CEQA Guidelines requires the summary of an EIR to include areas of controversy known to the Lead Agency including issues raised by agencies and the public. The District circulated a Notice of Preparation (NOP) to solicit agency and public comments on the scope and content of the environmental analysis to be included in the Draft EIR beginning on August 7, 2015, and ending on September 8, 2015. The Initial Study/Environmental Checklist and NOP are included as Appendix A of the Draft EIR.

A total of seven comment letters were received during the NOP public review period. Comments received on the NOP primarily included concerns related air quality, biological resources, greenhouse gas emissions, hydrology and water quality, noise, and transportation and traffic. A summary of all comments received is included in Table 1-2 of Chapter 1, *Introduction*, of the Draft EIR, and all NOP comment letters are included in Appendix B of the Draft EIR.

A total of 10 comment letters were received during the Draft EIR public review period. Comments received on the Draft EIR included many similar concerns to those received during the NOP public review period. They included comments on air quality, biological resources, greenhouse gas emissions, hydrology and water quality, noise, and transportation and traffic. The comment letters and the District's responses are provided in Chapter 4, *Comments Received and District Responses*, of this Final EIR.

The Board of Port Commissioners will determine whether or not to adopt a Statement of Overriding Considerations for approval of the project identifying the benefits of the project that outweigh the significant and unavoidable impacts.

3.1 Introduction

This chapter reflects the modifications to the Draft EIR that may have resulted from comments received during the 45-day public review of the Draft EIR or that were required for purposes of clarification. These modifications do not alter the conclusions of the environmental analysis such that new significant environmental impacts have been identified, nor do they constitute significant new information. The modifications are provided by chapter and indicated with the page number from the Draft EIR. This chapter is intended to be used in conjunction with the analysis contained within the Draft EIR.

Additional text is shown as underlined and deleted text is shown in ~~striketrough~~.

Volumes II and III of this Final EIR include the Draft EIR and appendices, respectively.

3.2 EIR Chapter/Section Changes

3.2.1 Changes to *Executive Summary*

Page ES-2 and ES-3

There are currently no fireworks display events along the National City or Chula Vista Bayfronts. Along the National City Bayfront, it is anticipated that any future fireworks display events would take place within view of Pepper Park because Pepper Park is the closest publicly accessible gathering space near the National City Bayfront that would have a partial view of the fireworks. Pepper Park is located along Tidelands Avenue in National City. The site is adjacent to the Sweetwater Channel, north of the Sweetwater Marsh Unit of the San Diego Bay National Wildlife Refuge, which includes Paradise Creek to the east and D Street Fill to the south, south of the National City Marine Terminal, east of San Diego Bay, and west of Pier 32 Marina. Interstate 5 (I-5) runs northeasterly approximately 0.4 mile from the park site boundary. Pepper Park site access is provided via Tidelands Avenue, which turns into Goesno Place as it approaches the park. One fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the Bay and within view vicinity of Pepper Park.

ES-8 to ES-9

Alternative 2 – Quiet Fireworks Display Events Alternative

The Quiet Fireworks Display Events Alternative would require the proposed new fireworks display events along the National City and Chula Vista Bayfronts to be quiet fireworks display events that

would not exceed a noise limit of 120 A-weighted decibels (dBA).² For this type of fireworks display event, the pyrotechnicians design a fireworks package that relies on the quieter types of fireworks. These fireworks display events would eliminate the use of “salute,” ~~rocket, and mine~~ fireworks altogether (*salute* fireworks, also known as maroon fireworks, are fireworks designed to make a very loud bang, or “report,” and an intense flash of light), as well as any other fireworks that generate a loud report, and instead focus on rich color effects and tight visual choreography in order to garner similar entertainment value out of the display. Generally, fireworks used in quiet fireworks display events would include fountains, wheels, cakes (such as crossettes, comets, spinners or turbillions, colored stars, fish or bees, and falling leaves), Chinese lanterns, and lanceworks (United Kingdom Fireworks Review 2016). It is important to note that the use of these fireworks would create a quieter, but not a silent, fireworks display event. In addition, quiet fireworks display events would involve fireworks that are concentrated closer to the ground with fewer aerial shells being employed due to the loud noise that can occur during propulsion of an aerial shell. Therefore, while these fireworks display events would be in the same locations as those specified for the proposed project (as detailed in Chapter 3, *Project Description*), i.e., on barges, because quiet fireworks display events would rely on fireworks that cannot achieve the same heights or the same magnitude as traditional fireworks displays, they would not be as prominently visible and the viewing area would be smaller than that which exists for the proposed project. The Quiet Fireworks Display Events Alternative is intended to avoid or substantially lessen the significant noise impacts of the proposed project on nearby sensitive receptors.

Alternative 3 – No Salute Fireworks Alternative

Salute fireworks, which are fireworks specifically designed to create a loud bang and intense flash of light, are the loudest type of firework. The primary purpose of salute shells is to announce the beginning and end of the display and produce a loud, percussive effect. From a distance, these shells sound similar to cannon fire when detonated (NMFS 2006). While the noise level of these fireworks varies by type, a typical linear (unweighted) peak noise level directly below a 3-inch salute exploding at its normal altitude is 140 decibels (dB) (Journal of Pyrotechnics, Inc. 2012). The No Salute Fireworks Alternative would have the same characteristics as all of the fireworks display events that compose the proposed project, including the same total pounds of fireworks per event (as outlined in Table 3-2 in Chapter 3, *Project Description*), but would prohibit the use of salute fireworks (also known as maroon fireworks) and limit the noise produced by all fireworks during fireworks display events to a maximum of ~~140~~130 dB.³ ~~Rockets, mines, and a~~ All other firework types, including those described above under the Section 7.4.2.2, *Quiet Fireworks Display Event Alternative*, would be allowed as long as they do not exceed the ~~140~~130 dB noise limit. The No Salute Fireworks Alternative is intended to avoid or substantially lessen the significant noise impacts of the proposed project on sensitive receptors.

² 120 dBA maximum impulse sound pressure level due to the firework break(s), as measured at a horizontal distance of 15 meters from the ~~launch testing~~ point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.

³ ~~140~~130 dB linear (unweighted) peak sound pressure level due to the firework break(s), as measured at a horizontal distance of 15 meters from the launch point at a height of 1 meter above the ground, directly under the shell burst (break) occurring at its normal altitude, using a Type 1 sound measuring device with a free-field microphone ~~at a height of 1 meter above the ground~~.

4.3 Biological Resources				
Project Impacts				
Candidate, Sensitive, or Special-Status Species	<p><i>Proposed New Fireworks Display Events</i></p> <p>Impact-BIO-1: Potential Direct Impact on Marine Reptiles from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to green sea turtles because the turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on green sea turtles from fireworks-generated trash and debris that enter the water may be significant.</p> <p>Impact-BIO-2: Potential Indirect Impacts on Marine Reptiles from Increased Human and Boating Activity. The increase in boat traffic, particularly nighttime and out-of-channel traffic, would increase the potential for propeller strikes, which may cause injury to or death of green sea turtles. Increased boating activities could cause the animals to temporarily depart the project area before, during, and after the time of the proposed new fireworks display events to avoid higher vessel traffic. The increase in activity may also affect the turtles' foraging habits in that individuals may spend more time underwater, swim at greater speeds, and alter other life history traits leading to greater energy expenditure. The introduction of</p>	PS	<p>MM-BIO-1: Implementation of Biological Resources-Related Conditions of the Proposed Ordinance for Direct Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(d) Fireworks Chemical Composition and Packaging.</p> <p>2. Packaging.</p> <p>A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels <u>(excluding labels mandated by State or Federal laws)</u> from all fireworks to be used in the event.</p> <p>B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.</p> <p>(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:</p> <p>1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety</p>	LS

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>human-generated trash could also cause injury to turtles if they mistakenly consume the waste, causing suffocation, starvation, or debilitation. These potential indirect impacts on marine reptiles may be significant.</p> <p>Impact-BIO-3: Potential Direct Impact on Avian Species from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to avian species because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on avian species from fireworks-generated trash and debris that enter the water may be significant.</p> <p>Impact-BIO-4: Potential Indirect Impacts on Special-Status Avian Species from Increased Human and Boating Activity. The proposed new fireworks display events have the potential to result in indirect impacts on special-status avian species, particularly California least tern and western snowy plover, as a result of increased foot traffic on sand dunes and beaches that can cause disturbance to nesting sites during and immediately after the proposed new fireworks display events. Additional indirect impacts potentially include increased trash associated with human use and noise associated with boating activity adjacent to nesting sites. The</p>		<p>issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.</p> <ol style="list-style-type: none"> 2. Fireworks shall be brought to the barge and loaded in their California U.S. Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the fireworks launch area to contain debris. 3. Wires from the electric match placed in the fireworks fuse shall be <u>secured to avoid strain (such as wrapped around nails that are installed on the racks, tied to the racks, or tied to the mortar)</u> to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event. 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>introduction of human-generated trash could also cause injury to special-status birds because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. While many nesting sites for California least tern and western snowy plover in San Diego Bay are behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas may be significant.</p>		<p>barges during the fireworks display event.</p> <ol style="list-style-type: none"> 5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway. 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning. 7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment. 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove

Sensitive Natural Community/ Federally Protected Wetlands	<p><i>Proposed New Fireworks Display Events</i></p>			
	<p>Impact-BIO-5: Potential Direct Impact on Sensitive Habitat and Wetlands from Fireworks-Generated Trash and Debris. The waste resulting from exploded fireworks shells could fall primarily into the waters of San Diego Bay. It is anticipated that some of this debris could sink to the bottom, and a smaller amount could wash onto adjacent beaches and shorelines. Direct impacts on sensitive habitats and federally protected wetlands of south San Diego Bay from fireworks-generated trash and debris that enter the water are considered significant.</p> <p>Impact-BIO-6: Potential Direct Impact on Eelgrass Habitat from Fireworks Barges and Tugboat Activity. The positioning of fireworks barges along the Chula Vista Bayfront over the shallow flats could result in direct impacts on eelgrass habitat and its nursery habitat functions, particularly at low tides. Impacts could occur as a result of temporary</p>	PS	<p>Implement MM-BIO-1, and MM-BIO-2, and MM-BIO-4</p> <p>MM-BIO-3: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Direct Eelgrass Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(g) Eelgrass Avoidance and Mitigation. For fireworks display events with launching sites located in shallow water with the potential for eelgrass to occur, fireworks barges shall be held in place by tugboats and shall not require temporary moorings. To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds. Pre-event and post-event eelgrass surveys shall be completed to identify the distribution of eelgrass to assist tug operators and to assess any impacts to eelgrass that may occur. Through a pre-event training, tug operators shall be made aware of shallow eelgrass and instructed not to use high thrust in the vicinity of eelgrass beds. If an unanticipated impact to eelgrass occurs,</p>	LS

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>grounding or settling of barges and tugboats on the bottom at low tide. Additional impacts could occur from propeller wash or propeller drag from tugboats during barge maneuvering. Tugboats have large propellers and high thrust capacity that could dredge up eelgrass in shallow waters, even if grounding does not occur. Potential direct impacts on eelgrass habitat are considered significant.</p> <p>Impact-BIO-7: Potential Indirect Impact on Sensitive Habitat and Wetlands from Increased Human and Boating Activity. Increased boat traffic could result in minor damage to eelgrass beds through unauthorized anchoring and/or propeller dragging. Additionally, visitors that view the proposed new fireworks display events from kayaks or personal watercraft could drag these watercraft onto shorelines adjacent to coastal salt marshes and inadvertently damage eelgrass or marsh habitat. The proposed new fireworks display events could attract crowds to the Silver Strand State Beach, some of whom may trespass into restricted beach areas that are utilized by sensitive avian species. Potential impacts on habitats include trampling of vegetation and an increase of human-generated trash and litter. Indirect impacts on sensitive habitat and wetlands of south San Diego Bay would be significant.</p>		<p>this impact shall be mitigated by replacing the eelgrass at a ratio determined by the California Eelgrass Mitigation Policy.</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation

Temporary Increase in Ambient Noise Levels	standards established in the applicable city of Imperial Beach, Chula Vista, and National City municipal codes.		<p>MM-NOI-1: Implementation of Noise-Related Conditions of the Proposed Ordinance. The fireworks organizer and operator are required to comply with the following noise related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(e) Protection of Sensitive Species and Habitat. The following conditions shall apply to Fireworks Display Events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:</p> <ol style="list-style-type: none"> 1. Location. Fireworks display events shall be located not less than one (1) mile from any federally or state-listed avian species nesting colony unless the maximum size of shells used in the event is limited to eight (8) inches. 2. Salutes. Fireworks display events shall not use concussion type, non-color shells such as “salutes” or “reports” during the initial twenty-five percent (25 percent) of the duration of any display (e.g., within the first 5 minutes of a 20-minute display). 	SU
	<p><i>Proposed New Fireworks Display Events</i></p> <p>Impact NOI-1: Substantial Periodic or Temporary Increase in Ambient Noise Levels of the Proposed New Fireworks Display Events. For proposed new fireworks display events (both Fourth of July and non-Fourth of July events), these noise increases would occur at homes and the Grand Caribe Shoreline Park in the City of Coronado, west of the proposed National City and Chula Vista launch locations. Depending on the precise location of the proposed Chula Vista launch barge, substantial noise increases due to the proposed new Fourth of July fireworks display events may also occur at Loews Coronado Bay Resort. If the ultimate location of the launch barge for the proposed Chula Vista fireworks display event is closer to the Chula Vista Bayfront than was assumed in the analysis, then it is possible some significant impacts could also occur within the City of Chula Vista. Because the proposed new fireworks display events would occur at locations that do not currently have similar fireworks displays, the affected noise-sensitive receptors are not currently exposed to similar levels of fireworks noise and the impacts would be</p>			

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>significant. However, it is also noted that the impacts would be very infrequent (approximately three times per year) and would include the Fourth of July, which is a traditional nationwide event during which most people have a reasonable expectation and understanding that fireworks will occur.</p>

3.2.2 Changes to Chapter 2, *Environmental Setting*

Page 2-12 to 2-13

National City Bayfront

While there are currently no existing fireworks display events along the National City Bayfront, it is anticipated that any future fireworks display events would take place within view of Pepper Park because Pepper Park is the closest publicly accessible gathering space near the National City Bayfront ~~that would have a partial view of the fireworks~~. Pepper Park is located along Tidelands Avenue in National City. The site is adjacent to the Sweetwater Channel, north of the Sweetwater Marsh Unit of the San Diego Bay National Wildlife Refuge, which includes Paradise Creek to the east and D Street Fill to the south, south of the National City Marine Terminal, east of San Diego Bay, and west of Pier 32 Marina. Interstate 5 (I-5) runs northeasterly approximately 0.4 mile from the park site boundary. Pepper Park site access is provided via Tidelands Avenue, which turns into Goesno Place as it approaches the park. One fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the ~~Bay and within view~~ vicinity of Pepper Park.

3.2.3 Changes to Chapter 4, Section 4.3, *Biological Resources*

Page 4.3-4 to 4.3-5

Existing fireworks display events that require a discretionary action by the District or that are operated by the District's tenants occur within and/or adjacent to the District's jurisdiction, particularly in and around the waters of San Diego Bay and the Pacific Ocean near Imperial Beach. Within San Diego Bay, these displays generally occur on barges, flight decks, and/or piers off of Shelter Island, Harbor Island, North Embarcadero, Central Embarcadero, South Embarcadero, within the Glorietta Bay inlet, and within the NASSCO ship repair facility. Within the Pacific Ocean, an existing fireworks display event occurs on the Imperial Beach Pier just off the coast of Imperial Beach. The environmental setting for the entire San Diego Bay and coastal Imperial Beach has been included in the existing conditions to provide context for the following impact analysis. The impact analysis then focuses on the portions of the Bay (e.g., the south Bay) likely to be affected by the proposed new fireworks displays.

The sites for the proposed new fireworks display events are within and/or adjacent to the District's jurisdiction within San Diego Bay along the National City and Chula Vista Bayfronts. These proposed new displays are anticipated to occur on barges ~~and/or piers~~ within these locations. The biological impact analysis focuses on the various habitats, wildlife corridors, and wildlife present within San Diego Bay adjacent to and in the vicinity of the National City and Chula Vista Bayfront areas.

Page 4.3-7

Subtidal Vegetated Habitat

The vegetated, shallow subtidal habitat of San Diego Bay is dominated by eelgrass. Additionally, small amounts of widgeon grass (*Ruppia maritima*) occur in the warmer, shallow flats of south San

Diego Bay. The baywide survey completed in 2014 indicated 1,996 acres of eelgrass is present within the Bay (Merkel & Associates, Inc. 2014c). Vegetated subtidal habitats are an essential component of Southern California's coastal marine environment. Eelgrass beds function as important habitat for a variety of invertebrate, fish, and avian species. For many species, eelgrass beds are an essential biological habitat component for at least a portion of their life cycles, providing resting and feeding sites along the Pacific Flyway for avian species, and nursery sites for numerous species of fish. Seagrass beds may be interspersed with red algae such as *Gracilaria verrucosa* and green algae, such as *Ulva* spp. Typical fish species associated with seagrass include pipefish (*Syngnathus* spp.), kelpfish (Family Clinidae), and surfperch (Family Embiotocidae) as well as schooling fish such as topsmelt (*Atherinops affinis*) and anchovy (*Anchoa* spp.). In addition, eelgrass beds are considered to be an important foraging resource for the resident population of eastern Pacific green sea turtles, a threatened species under the Endangered Species Act.

Page 4.3-9

Upland Transition and Upland Areas

As mentioned previously, the majority of shoreline within San Diego Bay is armored. However, upland transition areas, particularly along unarmored shorelines, provide important foraging, roosting, and nesting habitat for birds. Among the most important upland transition areas are supratidal sand dunes and beaches adjacent to, and protected by, intertidal flats, ponds, and marshes. These areas provide nesting habitat for additional sensitive avian species. Among these are tens of thousands of nesting waterbirds that make use of isolated uplands along the Bay margin between March and September each year. Nesting predominantly occurs on the levees within the South Bay Salt Works, on the D Street Fill, and on portions of the Chula Vista Wildlife Reserve Island. As an indication of scale of the shorebird and seabird use, the San Diego Bay Refuge is estimated by the USFWS to have supported over 60,000 waterbird nests for 16 species during 2016. Other transitional habitats adjacent to baylands include coastal scrub (maritime succulent scrub and sage scrub), created bay fills, and river mouths (where coastal salt marsh transitions to brackish, and riparian habitats). Ruderal lands supporting grasslands and saline flats are also present along the coastal strand environment. This is particularly true in the area of the Naval Outlying Field antenna array north of Imperial Beach Pier.

Page 4.3-10

Wildlife Corridors

The study area does not provide any terrestrial movement corridors, and no marine mammal, reptile, or fish migratory corridors occur within it. However, some marine fish species, such as anchovy, sardine, and topsmelt, likely move into and out of the Bay for spawning, nursery, and foraging. The southern portions of the Bay, including the South San Diego Bay Unit of the San Diego Bay NWR, which includes the ~~and~~ South Bay Salt Ponds, provide stopover habitat for migrating waterfowl and shorebirds. San Diego Bay and the Imperial Beach shoreline, like all of California, is located within the Pacific Flyway. Several whale species migrate along the coast of California, including the California gray whale (*Eschrichtius robustus*). The peak northward migration of male gray whales occurs in mid-March, followed 2 months later by the second migration wave, which is composed of cows and calves. Whales typically do not occur within the immediate nearshore coastal waters of Imperial Beach or the adjacent Bay environment.

Page 4.3-11

Birds

Four avian species listed by USFWS and/or CDFW as federally or state-listed as endangered or threatened have a high potential to occur within San Diego Bay and the Imperial Beach Oceanfront. These include California least tern (*Sternula antillarum browni*), western snowy plover (*Charadrius alexandrinus nivosus*), light-footed Ridgway's rail, and Belding's Savannah sparrow.

The California least terns nests along the west coast of North America, from Baja California, Mexico, north to the San Francisco Bay area. California least terns are seasonal residents of San Diego Bay, typically arriving in mid- to late-April to nest at several colonies adjacent to San Diego Bay, and are generally present through August with September 15 marking the end of the season. California least terns can have two waves of nesting during this time period (CDFW 2016). California least terns establish nesting colonies on sandy soils with little vegetation. Along the shores of San Diego Bay and south of the Imperial Beach Oceanfront, California least terns nest at multiple sites (Figure 4.3-2), including the runway ovals at San Diego International Airport; the airfield tarmac at Naval Air Station (NAS) North Island; on Delta and Echo Beaches at Naval Amphibious Base Coronado (NAB Coronado), which are managed by the U.S. Navy; ~~on the D Street Fill~~; at the Chula Vista Wildlife Reserve, managed by the San Diego Regional Airport Authority and District; on the D Street Fill, jointly managed by the District and USFWS; along the South Bay Salt Works levees and in Pond 11, ~~which are managed by the District and USFWS~~; and along the beach of the Tijuana River National Estuarine Research Reserve south of the Imperial Beach Oceanfront.

Page 4.3-12 to 4.3-13

Nesting by avian species occurs in many segments of San Diego Bay, from the urbanized North Bay to the less developed South Bay. However, the ambient nighttime environments vary substantially across the north to south gradient. This is best illustrated by considering the sensitive avian nesting areas (Figure 4.3-2). Within the North Bay, California least terns nest within active airfield colonies in highly urbanized settings. These areas are exposed to nighttime safety lighting, active flashing airport lighting, automobile headlights and security patrol lighting, as well as substantial skyglow from the adjacent downtown area. Conversely, at the far southern end of the Bay, nesting areas are generally separated from intensive light- and activity-producing land uses by large expanses of undeveloped lands. These include the salt works, Navy lands, and open Bay waters. Adjacent developed land uses in the area of the South Bay are principally residential, daytime industrial, and single-story commercial that does not face the Bay. As a result, nesting areas in this environment experience less overall illumination, including both direct illumination and indirect skyglow, than areas in the North Bay. These areas are also subject to lower overall nighttime disturbance by human activities.

Within nesting habitats, the physical characteristics of the habitat can further alter the light and disturbance levels that birds are subjected to under ambient conditions. Ground-nesting birds that nest on open terrain such as least terns and snowy plovers and several other seabirds and shorebirds are more directly exposed to light environments and other disturbances than are birds that nest within or under cover of vegetation that reduces the overall illumination at nesting sites and reduces risk of disturbance by activities in the area. As a result, differences in ambient nighttime conditions of lighting and disturbance, as well as the extent of nest site cover, both affect the

potential extent of disturbance nesting birds may experience from additional activities such as fireworks display events.

Page 4.3-16

Table 4.3-2. Sensitive Wildlife Species with Potential to Occur within San Diego Bay and Imperial Beach Oceanfront

Common Name (<i>Scientific Name</i>)	Sensitivity Code & Status	Potential to Occur
Marine Reptiles		
Green Sea Turtle (<i>Chelonia mydas</i>)	FT	Low Potential <u>High Potential: Green sea turtles are year-round residents of San Diego Bay with the greatest occurrence being in the South Bay</u>
Birds		
Brant (<i>Branta bernicla</i>)	CDFW SSC	High Potential: Winters in south Bay along Chula Vista Bayfront
California Brown Pelican (<i>Pelecanus occidentalis californicus</i>)	CDFW FP	Moderate Potential: No nesting, roosts on rip rap, docks, pilings, etc.
Double-crested Cormorant (<i>Phalacrocorax auritus</i>)	CDFW WL	High Potential: Nests in South Bay Salt Works
Northern harrier (<i>Circus cyaneus</i>)	CDFW SSC	Moderate <u>High</u> Potential: Nests in marshes in south Bay
Osprey (<i>Pandion haliaetus</i>)	CDFW WL	High Potential: Nests at NAS North Island and the Chula Vista Wildlife Reserve
American peregrine falcon (<i>Falco peregrinus anatum</i>)	CDFW FP, FWS BCC	Low Potential: May nest along Bayfront
Light-footed Ridgway's rail (<i>Rallus obsoletus levipes</i>)	CDFW FP, FWS BCC, FE, SE	High Potential: Nests in marshes of south Bay
Western snowy plover (<i>Charadrius alexandrinus nivosus</i>)	FT	High Potential: Nests on sand flats of Bay
California Least tern (<i>Sternula antillarum browni</i>)*	FE, SE	High Potential: Nests on sand flats of Bay
Caspian tern (<i>Hydroprogne caspia</i>)	FWS BCC	High Potential: Nests in South Bay Salt Works
Black skimmer (<i>Rynchops niger</i>)	CDFW SSC	High Potential: Nests in South Bay Salt Works
Elegant tern (<i>Thalasseus elegans</i>)	CDFW WL	High Potential: Nests in South Bay Salt Works
Belding's Savannah sparrow (<i>Passerculus sandwichensis beldingi</i>)	SE	High Potential: Nests in marshes of south Bay and Tijuana Estuary
Mammals		
Pacific harbor seal (<i>Phoca vitulina richardsi</i>)	MMPA	Moderate Potential: Forages in north Bay and is uncommon in the south Bay
California sea lion (<i>Zalophus californianus californianus</i>)	MMPA	High Potential: Forages and loafs in the north Bay with uncommon occurrences in the south Bay
Coastal bottlenose dolphin (<i>Tursiops truncatus</i>)	MMPA	Moderate Potential: Uncommon forager in deep channels of the north Bay

Common Name (<i>Scientific Name</i>)	Sensitivity Code & Status	Potential to Occur
California gray whale (<i>Eschrichtius robustus</i>)	MMPA	Very Low Potential: Regular migrant in offshore waters, but uncommon in Bay and nearshore waters

Source: Appendix F

SE = state-listed as endangered; **FE** = federally listed as endangered; **FT** = federally listed as threatened; **CDFW SSC** = CDFW Species of Special Concern; **CDFW-FP** = CDFW Fully Protected Species; **CDFW-WL** = CDFW Watch List; **FWS-BCC** = USFWS Bird of Conservation Concern; **MMPA** = species protected by the Marine Mammal Protection Act

*Least terns are a migratory species found in the area from approximately April 1 through September 15 of each year.

Page 4.3-20

National Wildlife Refuge System Improvements Act of 1997

The National Wildlife Refuge System Improvements Act of 1997 amended the National Wildlife Refuge System Administration Act of 1966, and provides clear standards for management, use, planning, and growth of the National Wildlife Refuge System. The Improvement Act requires that each refuge be managed to fulfill the “wildlife first” mission of the National Wildlife Refuge System, as well as the specific purposes for which a refuge was established. In accordance with the Improvement Act, uses permitted on a National Wildlife Refuge must be determined to be an appropriate use and compatible with the mission of the National Wildlife Refuge System and Refuge purposes.

National Environmental Policy Act

The National Environmental Policy Act (NEPA) was enacted to: declare a national policy that will encourage productive and enjoyable harmony between man and his environment; to promote efforts that will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; to enrich the understanding of the ecological systems and natural resources important to the Nation; and to establish a Council on Environmental Quality (CEQ) (42 U.S. Code § 4321). NEPA established the CEQ within the Executive Office of the President to ensure that federal agencies meet their obligations under NEPA. CEQ oversees NEPA implementation, principally through issuing guidance and interpreting regulations that implement NEPA’s procedural requirements. CEQ also reviews and approves federal agency NEPA procedures, approves alternative arrangements for compliance with NEPA for emergencies, and helps to resolve disputes between federal agencies and with other governmental entities and members of the public.

Page 4.3-28

Birds

Several studies have observed the behavioral changes of sensitive avian species during fireworks display events. A literature review of these existing studies and research was conducted, with the results summarized below. Four avian species that are federally or state-listed as endangered or threatened by USFWS and/or CDFW have a high potential to occur within and adjacent to San Diego Bay. These include California least tern, western snowy plover, light-footed Ridgway’s rail, and Belding’s Savannah sparrow. The nesting sites-habitat of these four species are within audible and visual range of the proposed new fireworks display events and have the potential to be affected.

Nesting areas for listed species are illustrated in Figure 4.3-2. Other avian species that are potentially affected include California brown pelican and double-crested cormorant, as these species nest and/or roost in the Bay. Several additional species of seabirds including terns and black skimmer nest at sites that also support California least tern. As such, these species may be similarly affected by the proposed new fireworks display events.

Page 4.3-34 to Page 4.3-35

Indirect impacts on sensitive avian species can include disturbance associated with increased boat and foot traffic in the vicinity of nesting and roosting locations, as well as human-generated trash. Fireworks spectators may trespass onto closed avian nest sites or roosting areas in order to obtain private viewing locations. This presently occurs at a low level during intensive Bay use periods such as summer holidays and weekends. However, under typical evenings, the trespass onto colony nesting sites by the public is low, particularly at night and the extent of vessel traffic in some areas of the Bay where birds tend to raft is generally low and substantially reduced at night when rafting by birds is most common. During the proposed new fireworks display events, however, the likelihood of trespass into colony sites would increase and vessel traffic after dark and out of established channels would be expected to increase.

The study on NAB Coronado (Boylan and Nordstrom 2014) suggests that increased boat and foot traffic, trespass, and human-generated trash and debris during fireworks display events were possibly a greater threat to sensitive avian species than those associated with temporary noise and light disturbances from the fireworks themselves. Boylan and Nordstrom noted that illegal fireworks ignited immediately adjacent to nesting colonies, as well as increased foot traffic on sand dunes and beaches, caused the majority of disturbance to nesting California least tern during and immediately after fireworks display events. Additional indirect impacts could include increased trash associated with human use and noise associated with boating activity adjacent to nesting sites. The introduction of human-generated trash could also cause injury to sensitive birds because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. While many nesting sites for California least tern and western snowy plover in and around San Diego Bay are behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas may be significant (**Impact-BIO-4**). During fireworks display events, the Harbor Police Department currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, the Harbor Police Department would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. In addition, the proposed ordinance contains several requirements that would reduce potential impacts on the biological resources of San Diego Bay. Implementation of **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-2** would reduce potentially significant indirect impacts on avian species from human trespass, increased boat traffic, and human-generated trash and debris to less-than-significant levels.

Concerns for disturbance associated with vessel traffic extend beyond just nesting sites, but also extend to disruption of nighttime rafting activities of birds. Rafting birds may be displaced

temporarily by either increased vessel traffic in the vicinity of launch barges, or by the noise and light of the fireworks themselves. Increased boat traffic and fireworks displays would be expected to cause temporary displacement over short periods of time within areas that are centered on launch barges. This effect is substantially curtailed outside of the winter migratory period (November–February) due to an overall reduction in the number of birds rafting on the waters. Furthermore, rafting tends to be highest in waters of protected leeward environments or extreme shallows. Because vessel traffic and fireworks display event activities would be expected to be aggregated around launch barges that are proposed to be located further from shore as a result of nesting colony buffering distances, there is an expectation that the highest-density loafing areas would see little increase in vessel traffic disturbance. Any disturbance that is noted would be expected to result in birds on the water taking flight and moving away from the event areas. However, the extent of disturbance is expected to be relatively low, leading only to temporary, less-than-significant impacts on rafting birds.

Page 4.3-43 to 4.3-44

MM-BIO-1: Implementation of Biological Resources–Related Conditions of the Proposed Ordinance for Direct Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(d) Fireworks Chemical Composition and Packaging.

2. Packaging.

- A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all fireworks to be used in the event.
 - B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.
- (f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:
1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.
 2. Fireworks shall be brought to the barge and loaded in their ~~California~~ U.S. Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with

- openings no larger than $\frac{1}{4}$ inch, around the perimeter of the Fireworks launch area to contain debris.
3. Wires from the electric match placed in the fireworks fuse shall be secured to avoid strain (such as wrapped around nails that are ~~installed on the racks, tied to the racks, or tied to the mortar~~) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event.
 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event.
 5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway.
 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. fireworks operators shall photograph the barge prior to and after cleaning.
 7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment.
 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal.
 9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.
 10. Within ~~five-ten~~ (510) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the dry weight of the fireworks trash and debris collected is less than fifty percent (50%) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch

site used in the fireworks display event to participate in the next scheduled “Operation Clean Sweep” or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.

Page 4.3-46 to 4.3-47

MM-BIO-2: Implementation of Biological Resources–Related Conditions of the Proposed Ordinance for Indirect Impacts. The fireworks organizer and operator are required to comply with the following biological resources–related condition of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

- (e) Protection of Species and Habitat. The following conditions shall apply to fireworks display events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:
3. **Security.** For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays. In addition, the fireworks organizer shall provide security patrols of the water area to enforce the existing restrictions on access to unauthorized areas during such fireworks display events in the South Bay.
 4. **Signage.** For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half-mile of nesting colonies or habitat areas for federally or state-listed species, the fireworks organizer, in cooperation with the District, shall post temporary signage along primary access points to sensitive nesting colonies and habitat areas to identify safe viewing locations, to educate visitors on locations of sensitive wildlife habitats, to prevent viewers from trespassing into sensitive areas and to encourage appropriate viewing behavior.
 5. **Education.** Beginning not less than seven (7) days before fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall implement a public education program using daily announcements on social media, press releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to reminds viewers of appropriate viewing behavior in and near sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).
- (f) Best Management Practices. Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:

11. For all Fourth of July fireworks display events and for Non-Fourth of July fireworks display events which are advertised to the public, the fireworks ~~operator~~ organizer shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.

MM-BIO-4: Fireworks Biological Monitoring Plan. Not less than 30 days before any fireworks display event in the South Bay that would occur within 1 mile of sensitive avian nesting colonies, the fireworks organizer shall submit to the District an Avian Species Nesting Colony Monitoring Plan (Monitoring Plan). The Monitoring Plan shall be prepared by a qualified biologist and approved by the District in coordination with USFWS and CDFW. A qualified biologist is a person who, by reason of his or her knowledge of the natural sciences and the principles of wildlife biology, acquired by education and experience. The Monitoring Plan shall identify the monitoring protocol that will be used to assess the effectiveness of mitigation measures MM-BIO-1 and MM-BIO-2 and shall, at a minimum, include the following:

1. A literature review which refines the proposed methodology.
2. A list of target species identified for each individual event based on the season of the event, proximity of the event to nesting colonies, sensitivity of species, and capacity for the fireworks display event to cause species disturbance/effects.
3. Species behavior and noise data shall be collected at least 1 hour prior to, during, and 1 hour after the fireworks display event.
4. Documentation of the following data:
 - a. Site location, name of monitor, date and time of observations
 - b. Number of adults, nests, and chicks observed within one-half mile of spectator viewing areas
 - c. Sources of stressors (e.g., light, noise, trespass, debris)
 - d. Unauthorized access within nesting colonies
 - e. Counts of illegal pyrotechnics

Within 30 days following the completion of the fireworks display event, the qualified biologist shall prepare a Monitoring Report for submittal to the District that details the findings of the monitoring results. This report shall include background/introduction, methods, results, discussion, and recommendations sections. The District shall provide a copy of the report to the USFWS and CDFW and shall coordinate with these agencies regarding the results and recommendations of the report. Based on the review of the reports for two consecutive years of monitoring, the District, in coordination with these agencies, shall determine whether continued monitoring is required.

3.2.4 Changes to Chapter 4, Section 4.6, *Hydrology and Water Quality*

Page 4.6-33 to 4.6-34

MM-WQ-1: Implementation of Water Quality-Related Conditions of the Proposed Ordinance for Fireworks Debris. The fireworks organizer and operator are required to comply with the following water quality-related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(d) Fireworks Chemical Composition and Packaging.

1. Chemical Composition.

- B. All fireworks display events shall use alternative fireworks produced with pyrotechnic formulas which replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that such alternative fireworks are not commercially available.

2. Packaging.

- A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all fireworks to be used in the event.
- B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.
- (f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:
1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.
 2. Fireworks shall be brought to the barge and loaded in their ~~California~~ U.S. Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the fireworks launch area to contain debris.

3. Wires from the electric match placed in the fireworks fuse shall be secured to avoid strain (such as wrapped around nails that are ~~installed on the racks, tied to the racks, or tied to the mortar~~) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event.
4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event.
5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway.
6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning.
7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent Fireworks using hand held fishnets, pool skimmers, or other similar equipment.
8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal.
9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.
10. Within ~~five-ten~~ (510) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the dry weight of the fireworks trash and debris collected is less than fifty percent (50%) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar

year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.

MM-WQ-2: Implementation of Water Quality-Related Conditions of the Proposed Ordinance for Human-Generated Trash and Litter. The fireworks organizer and operator are required to comply with the following water quality-related condition of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:

11. For all Fourth of July fireworks display events and for Non-Fourth of July fireworks display events which are advertised to the public, the fireworks ~~operator~~ organizer shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.

3.2.5 Changes to Chapter 4, Section 4.8, *Noise and Vibration*

Page 4.8-24

Based on the assumed ambient noise levels in Table 4.8-13, for receptors within National City and Chula Vista (which both have the same assumed ambient noise levels), proposed new Fourth of July fireworks display events in National City and Chula Vista Bayfronts would generate a significant impact at any single-family homes (a 1-hour L_{eq} of 65 dBA or more) within 4,255 feet, a significant impact at any multi-family homes (a 1-hour L_{eq} of 70 dBA or more) within 2,765 feet, and a significant impact at any noise-sensitive commercial uses (a 1-hour L_{eq} of 75 dBA or more) within 1,730 feet (see Table 4.8-12). ~~Because~~ Based on the proposed launch barge location for the National City these Fourth of July fireworks display events ~~would be required to maintain a minimum buffer distance of 1 mile from nesting habitat for sensitive bird species as a condition of the proposed ordinance and required with the implementation of mitigation measure MM-NOI-1,~~ there would be no noise-sensitive receptors in National City or Chula Vista within 4,255 feet of ~~either the~~ the launch location, and impacts ~~from the National City display~~ would be less than significant in ~~these both National City and Chula Vista cities.~~ The proposed location of the Chula Vista launch barge is more than 2,765 feet from both the National City and Chula Vista shorelines, so there would be no significant impacts at multifamily homes or noise-sensitive commercial uses in these cities. Furthermore, there are no single-family homes within 4,255 feet of the proposed Chula Vista launch location. Therefore, impacts from the Chula Vista display would be less than significant in both National City and Chula Vista.

For receptors within the City of Coronado, the proposed new Fourth of July fireworks display events would generate a significant impact at any single-family homes (a 1-hour L_{eq} of 55 dBA or more) within 8,695 feet, a significant impact at any multi-family homes (a 1-hour L_{eq} of 60 dBA or more) within 6,230 feet, and a significant impact at any noise-sensitive commercial uses (a 1-hour L_{eq} of 70 dBA or more) within 2,765 feet (see Table 4.8-12). For both the National City and Chula Vista Fourth of July fireworks display events, these impact distances include many homes to the west in the City of Coronado. ~~For the Chula Vista Fourth of July fireworks display event, the impact distances would also include Grand Caribe Shoreline Park in the City of Coronado and, depending on the precise~~

~~location of the launch barge, could also include a hotel (Loews Coronado Bay Resort). Impacts at these receptors would be significant (Impact-NOI-1).~~

Page 4.8-25

For receptors within the City of Coronado, these fireworks display events would generate a significant impact at any single-family homes (a 1-hour L_{eq} of 55 dBA or more) within 5,640 feet, a significant impact at any multi-family homes (a 1-hour L_{eq} of 60 dBA or more) within 3,800 feet, and a significant impact at any noise-sensitive commercial uses (a 1-hour L_{eq} of 70 dBA or more) within 1,510 feet (see Table 4.8-12). Based on the assumed location of the launch barge, these impact distances include the Coronado Cays homes ~~and Grand Caribe Shoreline Park~~ to the west in the City of Coronado. Impacts at these receptors would be significant (**Impact-NOI-1**).

Significant impacts are not anticipated to extend to any other noise-sensitive land uses within Coronado or any other cities. It is noted, however, that if the ultimate location of the launch barge for the proposed fireworks display events is closer to the Chula Vista Bayfront than was assumed in the analysis (i.e., less than 1 mile from nesting ~~habitat~~ colonies for sensitive bird species) then it is possible some significant impacts could occur within the City of Chula Vista; these impacts would occur at any single-family homes, multi-family homes, or noise-sensitive commercial uses located within 2,440 feet, 1,510 feet, or 895 feet, respectively, of the launch barge location (**Impact-NOI-1**).

Page 4.8-26

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the proposed project (**Impact-NOI-1**). Potentially significant impact(s) include the following.

Impact NOI-1: Substantial Periodic or Temporary Increase in Ambient Noise Levels of the Proposed New Fireworks Display Events. For proposed new fireworks display events (both Fourth of July and non-Fourth of July events), these noise increases would occur at homes ~~and the Grand Caribe Shoreline Park~~ in the City of Coronado, west of the proposed National City and Chula Vista launch locations. ~~Depending on the precise location of the proposed Chula Vista launch barge, substantial noise increases due to the proposed new Fourth of July fireworks display events may also occur at Loews Coronado Bay Resort.~~ If the ultimate location of the launch barge for the proposed Chula Vista fireworks display event is closer to the Chula Vista Bayfront than was assumed in the analysis then it is possible some significant impacts could also occur within the City of Chula Vista. Because the proposed new fireworks display events would occur at locations that do not currently have similar fireworks displays, the affected noise-sensitive receptors are not currently exposed to similar levels of fireworks noise and the impacts would be significant. However, it is also noted that the impacts would be very infrequent (approximately three times per year) and would include the Fourth of July, which is a traditional nationwide event during which most people have a reasonable expectation and understanding that fireworks will occur.

3.2.6 Changes to Chapter 7, *Alternatives to the Proposed Project*

Page 7-6 to 7-7

Alternative 2 – Quiet Fireworks Display Events Alternative

The Quiet Fireworks Display Events Alternative would require the proposed new fireworks display events along the National City and Chula Vista Bayfronts to be quiet fireworks display events that would not exceed a noise limit of 120 A-weighted decibels (dBA).¹ For this type of fireworks display event, the pyrotechnicians design a fireworks package that relies on the quieter types of fireworks. These fireworks display events would eliminate the use of “salute,” ~~rocket, and mine~~ fireworks altogether (*salute* fireworks, also known as maroon fireworks, are fireworks designed to make a very loud bang, or “report,” and an intense flash of light), as well as any other fireworks that generate a loud report, and instead focus on rich color effects and tight visual choreography in order to garner similar entertainment value out of the display. Generally, fireworks used in quiet fireworks display events would include fountains, wheels, cakes (such as crossettes, comets, spinners or turbillions, colored stars, fish or bees, and falling leaves), Chinese lanterns, and lanceworks (United Kingdom Fireworks Review 2016). It is important to note that the use of these fireworks would create a quieter, but not a silent, fireworks display event. In addition, quiet fireworks display events would involve fireworks that are concentrated closer to the ground with fewer aerial shells being employed due to the loud noise that can occur during propulsion of an aerial shell. Therefore, while these fireworks display events would be in the same locations as those specified for the proposed project (as detailed in Chapter 3, *Project Description*), i.e., on barges, because quiet fireworks display events would rely on fireworks that cannot achieve the same heights or the same magnitude as traditional fireworks displays, they would not be as prominently visible and the viewing area would be smaller than that which exists for the proposed project. The Quiet Fireworks Display Events Alternative is intended to avoid or substantially lessen the significant noise impacts of the proposed project on nearby sensitive receptors.

Alternative 3 – No Salute Fireworks Alternative

Salute fireworks, which are fireworks specifically designed to create a loud bang and intense flash of light, are the loudest type of firework. The primary purpose of salute shells is to announce the beginning and end of the display and produce a loud, percussive effect. From a distance, these shells sound similar to cannon fire when detonated (NMFS 2006). While the noise level of these fireworks varies by type, a typical linear (unweighted) peak noise level directly below a 3-inch salute exploding at its normal altitude is 140 decibels (dB) (Journal of Pyrotechnics, Inc. 2012). The No Salute Fireworks Alternative would have the same characteristics as all of the fireworks display events that compose the proposed project, including the same total pounds of fireworks per event (as outlined in Table 3-2 in Chapter 3, *Project Description*), but would prohibit the use of salute fireworks (also known as maroon fireworks) and limit the noise produced by all fireworks during

¹ 120 dBA maximum impulse sound pressure level due to the firework break(s), as measured at a horizontal distance of 15 meters from the launch testing point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.

fireworks display events to a maximum of ~~140~~130 dB.² ~~Rockets, mines, and a~~ All other firework types, including those described above under the Section 7.4.2.2, *Quiet Fireworks Display Event Alternative*, would be allowed as long as they do not exceed the ~~140~~130 dB noise limit. The No Salute Fireworks Alternative is intended to avoid or substantially lessen the significant noise impacts of the proposed project on sensitive receptors.

Page 7-12

Biological Resources

Under the Quiet Fireworks Display Events Alternative, the proposed new fireworks display events would make use of quieter types of fireworks, which would be closer to ground level and involve smaller viewing areas. However, these displays would still take place on barges within San Diego Bay near the National City and Chula Vista Bayfronts. While viewership may be slightly decreased, this alternative would likely still result in a substantial number of visitors both at the landside and waterside viewing areas. Direct and indirect impacts on green sea turtles and avian species related to increased boating activity, eelgrass beds from barges and tugs, foot traffic on sensitive habitat areas, and generation of trash and debris by fireworks and visitors could still occur. This alternative would include adoption of an ordinance that includes post-show debris cleanup requirements and security, signage, and education measures, best management practices, eelgrass protection requirements, removal of fireworks packaging, and requirements for reducing the use of non-biodegradable fireworks components that would reduce impacts on these biological resources to less-than-significant levels. Furthermore, the proposed ordinance for this alternative would also include light and noise reduction measures for fireworks display events, which would further reduce disturbances to sensitive avian species from firework-generated light and noise by eliminating the use of salutes and other loud, rocket, and mine fireworks altogether. Therefore, similar to the proposed project but at a reduced level, this alternative would result in less-than-significant impacts on nesting species. As such, impacts on biological resources under the Quiet Fireworks Display Event Alternative would be less than the proposed project.

² ~~140~~130 dB linear (unweighted) peak sound pressure level due to the firework break(s), as measured at a horizontal distance of 15 meters from the launch point at a height of 1 meter above the ground, directly under the shell burst (break) occurring at its normal altitude, using a Type 1 sound measuring device with a free-field microphone at a height of 1 meter above the ground.

3.2.7 Figure Revisions

The figures on the following pages have been revised as a result of the relocation of the Chula Vista Bayfront launch site.

3.2.8 Changes to Appendix D, *Proposed Ordinance*

Revisions made to the proposed ordinance since public review of the Draft EIR are provided below.

ARTICLE __

FIREWORKS DISPLAY ORDINANCE

Section __.01 - TITLE

The title of this article shall be known as the “San Diego Unified Port District Fireworks Display Event Ordinance.”

Section __.02 - PURPOSE

The purpose of this article is to establish a defined set of requirements and procedures by which the District and users of the District tidelands may continue to enjoy fireworks displays in and around San Diego Bay and the Pacific Ocean near Imperial Beach. Further, it is the intent of this article to protect the health, safety and welfare of persons, property and the environment within the District’s jurisdiction and to comply with federal, state and local laws and regulations governing the handling, possession, storage, loading, staging, launching and detonating of fireworks.

Section __.03 - DEFINITIONS

For purposes of this article, certain words and phrases not otherwise defined in District Code section 0.03 shall be defined as follows, unless the context requires a different meaning:

“Alternative fireworks” means fireworks produced with new pyrotechnic formulas that replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters.

“Applicant” means a person who submits an application to the District for a permit pursuant to this article.

“Application” means the District’s written form to be submitted by a person requesting a permit pursuant to this article.

“Barge” means a water vessel from which fireworks are launched or detonated.

“Best Management Practices” or “BMPs” means schedules of activities, prohibitions of practices, pollution prevention and educational practices, maintenance procedures, tools and other management practices used to prevent or reduce the discharge of pollutants directly to receiving waters to the maximum extent practicable. BMPs may include any type of pollution prevention and pollution control measure that can help to achieve compliance with this article.

“District” means the San Diego Unified Port District.

“District General Counsel” means the General Counsel of the District or her/his designee.

“Executive Director” means the Executive Director (President/CEO) of the District or her/his designee.

“Fireworks” means any device containing chemical elements and chemical compounds capable of burning independently of the oxygen of the atmosphere and producing audible, visual, mechanical, or thermal effects which are useful as pyrotechnic devices or for entertainment, including aerial shells, low-level comet or multi-shot devices or ground-level displays. The term "fireworks" includes, but is not limited to, devices designated by the manufacturer as fireworks, torpedoes, skyrockets, roman candles, rockets, sparklers, party poppers, paper caps, chasers, fountains, smoke sparks, aerial bombs, and fireworks kits.

“Fireworks Display Event” means the handling, possession, storage, loading, staging, launching or detonating of fireworks on the land or waters within the District’s jurisdiction for viewing by the public or any group of persons exceeding twenty-five (25) in number.

“Fireworks Operator” means a pyrotechnic operator licensed by the State of California, who by examination, experience and training has demonstrated the required skill and ability in the use and discharge of fireworks as authorized by the license granted, and who is responsible for supplying, staging, launching or detonating the fireworks used in a fireworks display event.

“Fireworks Organizer” means a person who proposes to conduct a fireworks display event and who is responsible for obtaining the funding and approvals for a fireworks display event and for contracting with a fireworks operator to produce a fireworks display event.

“Fourth of July Fireworks Display Event” means a fireworks display event that occurs annually on the Fourth of July to express patriotism and civic pride and to celebrate the signing of the Declaration of Independence of the United States of America.

“Non-Fourth of July Fireworks Display Event” means a fireworks display event that occurs on a date other than the Fourth of July.

“Operation Clean Sweep” means the annual cleanup event sponsored by the San Diego Port Tenants Association and District, among others, where volunteers remove trash and debris from San Diego Bay.

“Permit” means the District-issued authorization for an applicant to conduct a fireworks display event pursuant to this article.

“Person” means an individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency or other legal entity, or the agent or employee thereof.

“Pounds” means the net explosive weight of fireworks.

“Salute” means an aerial shell as well as other pyrotechnic items whose primary effects are loud noise generated by detonation and flash of light.

“San Diego Bay Fourth of July Fireworks Display Event” means the annual fireworks display event which occurs on the Fourth of July at up to four (4) locations in northern San Diego Bay and is currently known as the “Big Bay Boom.” The San Diego Bay Fourth of July Fireworks Display Event will be referred to in this article as the Big Bay Boom.

“San Diego Water Board” means the California Regional Water Quality Control Board for the San Diego Region.

“San Diego Water Board General Permit” means California Regional Water Quality Control Board for the San Diego Region Order No. R9-2011-0022/NPDES No. CAG999002, General National Pollutant Discharge Elimination System (NPDES) Permit for Residual Firework Pollutant Waste Discharges to Waters of the United States, including any updates and amendments thereto.

“Sponsor” means a person who contributes funds, services, or other forms of assistance to a fireworks organizer in support of a fireworks display event.

Section __.04 - PROHIBITIONS

(a) It shall be unlawful for any Person to handle, possess, store, load, stage, launch or detonate Fireworks on land or water within District jurisdiction without first having obtained a Permit from the Executive Director as provided in this section. By signing said Permit, each Permit recipient acknowledges and agrees to comply with all of the applicable terms and conditions that may be specified in such Permit and this article.

(b) Any Person who receives a discretionary lease, permit, license or other entitlement for use or a contract, grant, subsidy, loan or other form of financial assistance from the District in connection with a Fireworks Display Event shall also obtain a Permit from the Executive Director as provided in this article. By signing said Permit, each Permit recipient acknowledges and agrees to comply with all of the applicable terms and conditions that may be specified in such Permit and this article.

Section __.05 - PERMITS - APPLICATION

Whenever the privilege of doing any of the acts hereinbefore enumerated in this article requires obtaining a Permit from the Executive Director, the following procedure shall be followed:

(a) An application for a Permit shall be filed with the District not less than sixty (60) days before the date on which the Fireworks Display Event is proposed to occur.

(b) The application shall be in writing, in a form approved by the District, and shall include, at minimum, the following information: the Person who proposes to handle, possess, store, load, stage, launch or detonate Fireworks, including if applicable the Fireworks Organizer, Fireworks Operator and Sponsor of the Fireworks Display Event; the date, time and duration of the proposed Fireworks Display Event; the location(s) of the proposed Fireworks Display Event, including the loading, staging and launching sites; the total number of pounds, shell sizes and types of Fireworks to be used; and the proposed event transportation and parking management plan for the Fireworks Display Event.

(c) The application shall include copies of the Applicant's Notice of Intent for coverage under the San Diego Water Board General Permit, the San Diego Water Board's Notice of Enrollment of the proposed Fireworks Display Event under said General Permit, and the Best Management Practices Plan approved by the San Diego Water Board for the proposed Fireworks Display Event.

(d) When the application is deemed complete, the Executive Director shall review the application and determine whether the proposed Fireworks Display Event complies with all of the requirements of section __ (Permit – Conditions of Approval) of this article. If the proposed Fireworks Display Event complies with all of the requirements of section __ (Permit – Conditions of Approval) of this article, the Executive Director shall issue a Permit.

(e) Each Permit issued shall state the date, time and location of the Fireworks Display Event for which it is issued, the name of the Person to whom it is issued and all mandatory conditions upon which the Permit is given.

(f) An application for a permit for a Fireworks Display Event at a location not identified in Section .7(a) of this article may be granted by the Executive Director provided that (i) environmental review for the proposed Fireworks Display Event has been completed and approved or certified by the District as required by the California Environmental Quality Act, Public Resources Code § 21000, et seq. prior to issuance of a permit and (ii) the applicant has obtained all other permits and approvals as required by law, including without limitation approvals and permits required under the California Coastal Act, Public Resources Code § 30000, et seq.

Section __.06 - PERMITS – PUBLIC NOTICE

(a) Within five (5) business days after the issuance of a Permit pursuant to this article, the Executive Director shall give public notice of the issuance of such Permit by posting a copy of the Permit on the District’s website.

Section __.07 - PERMITS - CONDITIONS OF APPROVAL

All permits issued by the Executive Director shall be subject to the following terms and conditions:

- (a) Location of Fireworks Display Events.
1. Fourth of July Fireworks Display Events shall occur only at the following locations:
 - A. Big Bay Boom, at up to four (4) locations in northern San Diego Bay;
 - B. Fourth of July Imperial Beach Fireworks, at one (1) location along the Imperial Beach Pier;
 - C. Fireworks Over Glorietta Bay, at one (1) location in Glorietta Bay;
 - D. Chula Vista Fourth of July, at one (1) location adjacent to the Chula Vista Bayfront; and
 - E. National City Fourth of July, at one (1) location adjacent to the National City Bayfront.
 2. Non-Fourth of July Fireworks Display Events shall occur only at the following locations:
 - A. National Steel and Shipbuilding Company (NASSCO) shipyard, not to exceed two (2) displays per year along NASSCO Pier 12;
 - B. U.S.S. Midway Museum, not to exceed twenty-three (23) displays per year on or adjacent to the U.S.S. Midway Museum;
 - C. San Diego Symphony Summer Pops Concerts, not to exceed twenty (20) displays per year adjacent to Embarcadero Marina Park South;

D. Our Lady of Rosary Church Annual procession, not to exceed one (1) display per year along Harbor Drive and at end of Grape Street Pier; and

E. Chula Vista Bayfront, not to exceed two (2) displays per year adjacent to the Chula Vista Bayfront.

(b) Duration of Fireworks Display Events.

1. Fourth of July Fireworks Display Events shall not exceed twenty (20) minutes in duration.
2. Non-Fourth of July Fireworks Display Events shall not exceed ten (10) minutes in duration.

(c) Size of Fireworks Display Events.

1. Fourth of July Fireworks Display Events:

A. Big Bay Boom, not to exceed a cumulative 5,342 pounds of fireworks with shell sizes not to exceed 10 inches;

B. Fourth of July Imperial Beach Fireworks, not to exceed 456 pounds of fireworks with shell sizes not to exceed 10 inches;

C. Fireworks Over Glorietta Bay, not to exceed 397 pounds of fireworks with shell sizes not to exceed 10 inches;

D. National City Fourth of July, not to exceed 400 pounds of fireworks with shell sizes not to exceed 8 inches; and

E. Chula Vista Fourth of July, not to exceed 400 pounds of fireworks with shell sizes not to exceed 8 inches.

2. Non-Fourth of July Fireworks Display Events:

A. NASSCO shipyard, not to exceed 281 pounds of fireworks per display with shell sizes not to exceed 6 inches, or a cumulative total of 439 pounds of fireworks per year;

B. U.S.S. Midway Museum, not to exceed 235 pounds of fireworks per display with shell sizes not to exceed 6 inches, or a cumulative total of 1,759 pounds of fireworks per year;

C. San Diego Symphony Summer Pops Concerts, not to exceed 95 pounds of fireworks per display with shell sizes not to exceed 6 inches, or a cumulative total of 1,498 pounds of fireworks per year;

D. Our Lady of Rosary Church Annual procession, not to exceed 18 pounds of fireworks with shell sizes not to exceed 6 inches; and

E. Chula Vista Bayfront, not to exceed 114 pounds of fireworks per display with shell sizes not to exceed 8 inches, or a cumulative total of 228 pounds of fireworks per year.

(d) Fireworks Chemical Composition and Packaging.

1. Chemical Composition.

A. The Big Bay Boom Fourth of July Fireworks Display Event shall use Fireworks which contain no more than 0.32% copper (Cu) per pound of explosive firework material, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that the total copper emissions from the proposed Big Bay Boom Fireworks Display Event will not exceed seventeen (17) pounds. Fireworks which do not conform to the foregoing requirement, but were lawfully purchased prior to the effective date of this article, may be used for a period of six months after the effective date of this article.

B. All Fireworks Display Events shall use Alternative Fireworks produced with pyrotechnic formulas which replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that such Alternative Fireworks are not commercially available.

2. Packaging.

A. Prior to commencement of a Fireworks Display Event, the Fireworks Operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all Fireworks to be used in the event.

B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.

(e) Protection of Sensitive Species and Habitat. The following conditions shall apply to Fireworks Display Events that occur between February 15 and September 15 (i.e., avian

breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:

1. Location. Fireworks Display Events shall be located not less than one (1) mile from any federally or state-listed avian species nesting colony unless the maximum size of shells used in the event is limited to eight (8) inches.

2. Salutes. Fireworks Display Events shall not use concussion type, non-color shells such as “salutes” or “reports” during the initial twenty-five percent (25%) of the duration of any display (e.g., within the first 5 minutes of a 20-minute display).

3. Security. For Fireworks Display Events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the Fireworks Organizer shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays. In addition, the fireworks organizer shall provide security patrols of the water area to enforce the existing restrictions on access to unauthorized areas during such fireworks display events in the South Bay.

4. Signage. For Fireworks Display Events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half-mile of nesting colonies or habitat areas for federally or state-listed species, the Fireworks Organizer, in cooperation with the District, shall post temporary signage along primary access points to sensitive nesting colonies and habitat areas to identify safe viewing locations, to educate visitors on locations of sensitive wildlife habitats, to prevent viewers from trespassing into sensitive areas and to encourage appropriate viewing behavior.

5. Education. Beginning not less than seven (7) days before Fireworks Display Events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the Fireworks Organizer shall implement a public education program using daily announcements on social media, press releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to reminds viewers of appropriate viewing behavior in and near sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).

(f) Best Management Practices. Fireworks Display Events shall implement the following BMPs for Fireworks Display Event preparation, discharge and clean-up:

1. Fireworks Display Events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.

2. Fireworks shall be brought to the barge and loaded in their ~~California~~-U.S. Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the Fireworks Display Event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the Fireworks Display Event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the Fireworks launch area to contain debris.

3. Wires from the electric match placed in the Fireworks fuse shall be ~~wrapped around nails that are installed~~ secured to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the Fireworks Display Event.

4. Once the Fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the Fireworks Display Event.

5. Following the Fireworks Display Event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the Fireworks Display Event, the Fireworks Operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the Fireworks, to prevent it from being discharged into the water while the barge is underway.

6. Upon return to the loading facility, the Fireworks Operator shall clean the barge of all Fireworks related material and shall photograph and properly dispose of all Fireworks trash and debris. Unexploded Fireworks and related components shall be collected and disposed of by the Fireworks Operator in accordance with all applicable regulations. Fireworks Operators shall photograph the barge prior to and after cleaning.

7. Following the Fireworks Display Event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the Fireworks

Organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent Fireworks using hand held fishnets, pool skimmers, or other similar equipment.

8. The morning after the Fireworks Display Event, the Fireworks Organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove Fireworks trash and debris. The Fireworks Organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal.

9. The morning after the Fireworks Display Event, the Fireworks Organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The Fireworks Organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.

10. Within ~~five-ten~~ (5-10) business days after a Fireworks Display Event, the Fireworks Organizer shall provide the Executive Director with the photographs and written evidence of the weight of the Fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the dry weight of the Fireworks trash and debris collected is less than fifty percent (50%) of the net weight of fireworks launched during the Fireworks Display Event, the Fireworks Organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the Fireworks Display Event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.

11. For all Fourth of July Fireworks Display Events and for Non-Fourth of July Fireworks Display Events which are advertised to the public, the Fireworks ~~Operator~~ Organizer shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.

(g) Eelgrass Avoidance and Mitigation. For Fireworks Display Events with launching sites located in shallow water with the potential for eelgrass to occur, fireworks barges shall be held in place by tugboats and shall not require temporary moorings. To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds. Pre-event and post-event eelgrass surveys shall be completed to identify the distribution of eelgrass to assist tug operators and to assess any impacts to eelgrass that may occur. Through a pre-event training, tug operators shall be made aware of shallow eelgrass and instructed not to use

high thrust in the vicinity of eelgrass beds. If an unanticipated impact to eelgrass occurs, this impact shall be mitigated by replacing the eelgrass at a ratio determined by the California Eelgrass Mitigation Policy.

(h) Event Transportation and Parking Management Plans. For all Fourth of July Fireworks Display Events and for Non-Fourth of July Fireworks Display Events which are advertised to the public, the Fireworks Organizer shall prepare and submit an event transportation and parking management plan (ETPMP) to the Executive Director for approval as part of the Application, which shall be designed to ensure safe and convenient access to public viewing areas while limiting conflicts between transportation modes and reducing impacts on surrounding transportation facilities to the maximum extent feasible. The ETPMP shall take into account anticipated attendance, existing transportation and parking facilities, and other concurrent public events in the surrounding areas, and shall include but is not limited to the following:

1. Transportation management strategies, including but not limited to, a public awareness program, traffic management and enforcement, incident management, and public transit and alternative modes of transportation management, which shall be implemented for the Fireworks Display Event; and

2. Parking management strategies, including but not limited to a public awareness program, coordination with parking vendors, off-site parking arrangements, designated areas for taxi and rideshare pick up/drop off, promotional programs with rideshare vendors, joint event ticketing programs with public transit agencies, and expanded shuttle operations.

(i) Compliance with San Diego Water Board General Permit.

1. Prior to the Executive Director's issuance of a permit pursuant to this article, the Applicant shall demonstrate that it has applied for coverage and has been enrolled under the San Diego Water Board General Permit.

2. The Applicant shall comply with all applicable terms, conditions and Best Management Practices required by the San Diego Water Board General Permit, which shall be incorporated into and considered in the terms, conditions and Best Management Practices of any permit issued by the Executive Director pursuant to this article.

3. The Applicant shall submit to the District copies of all applications, plans, reports and other documentation required by the San Diego Water Board General Permit, including without limitation the Notice of Intent, Fireworks Best Management Practices Plan, Public Fireworks Display Log and the Public Display of Fireworks Post Event Report, within the time required for the submission of such reports to the San Diego Water Board.

(j) Compliance with Other Required Permits: Prior to the Executive Director's issuance of a Permit pursuant to this article, the Applicant shall demonstrate that it has obtained and shall comply with all other permits and approvals required by federal, state and local laws and regulations including, without limitation, such permits and approvals as are required by the United States Coast Guard, California Coastal Act, the District Code, including Article 10 (Stormwater Management and Discharge Control), and the fire marshal of any city which has jurisdiction over all or any part of the activity allowed under said Permit.

(k) Compliance with Laws: The Applicant shall comply with any and all applicable rules and regulations promulgated by the District, including without limitation the District Code, the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and with the laws, rules and regulations of the United States of America and the State of California, and of any department or agency thereof, and with the applicable ordinances, rules and regulations of any city which has jurisdiction over all or any part of the activity allowed under said Permit. The Applicant's failure to comply with any applicable law, ordinance, rule or regulation shall be cause for immediate revocation of said permit and for the denial of applications for future Permits.

(l) Indemnity: The Applicant shall indemnify and hold harmless the District, its board, officers and employees, from any and all claim of loss, liability or damage arising out of the Fireworks Display Event, including but not limited to the issuance of the District Permit, or in connection with the handling, possession, storage, loading, staging, launching or detonating of Fireworks by the Applicant, its officers, employees, contractors, agents or other representatives, howsoever caused, whether such loss, liability or damage results, either directly or indirectly, from the acts, omissions or negligence of the Applicant, its officers, employees, contractors, agents or other representatives, in connection with the handling, possession, storage, loading, staging, launching or detonation of Fireworks pursuant to said Permit.

(m) Insurance: The Applicant shall file with the Executive Director, in a form approved by the District General Counsel, a policy of public liability and property damage insurance, in such amounts and form as the Executive Director may specify, indemnifying the District, its boards, officers and employees, as their interest may appear under the terms and conditions of said Permit. The Permit shall not become effective until after such policy of insurance has been received by the District.

(n) Performance Bond: ~~The Executive Director may require~~ For public Fireworks Display Events with over 500 spectators the Applicant ~~to~~ shall post a faithful performance bond, in a form approved by the District General Counsel, or in lieu thereof the equivalent in cash, in an amount sufficient in the opinion of the Executive Director to cover costs associated with the

Fireworks Display Event allowed under the permit, including without limitation the costs of providing security for the protection of sensitive species and habitat, and cleaning up and removing debris, rubbish and trash. The permit shall not become effective until after such faithful performance bond, or cash in lieu thereof, has been posted with and received by the District.

(o) Mitigation Measures: All permit applications shall be reviewed by the District for consistency with the Mitigation Monitoring and Reporting Program (MMRP) from the Final Environmental Impact Report for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project, as certified by the Board of Port Commissioners, and all applicable mitigation measures from the MMRP shall be identified as required conditions of the approved permit issued by the District.

Section __.8 – GENERAL PROVISIONS

(a) Preemption. The provisions of this article do not apply where any federal or state law regulates the handling, possession, storage, loading, staging, launching or detonating of Fireworks if the federal or state law preempts local regulation or the federal or state law is more restrictive.

(b) Severability. If any provision of this article or the application thereof to any person or circumstances is held invalid, such invalidity shall not affect other provisions or applications of this article which can be given effect without the invalid provisions or application, and to this end the provisions of this section are severable.

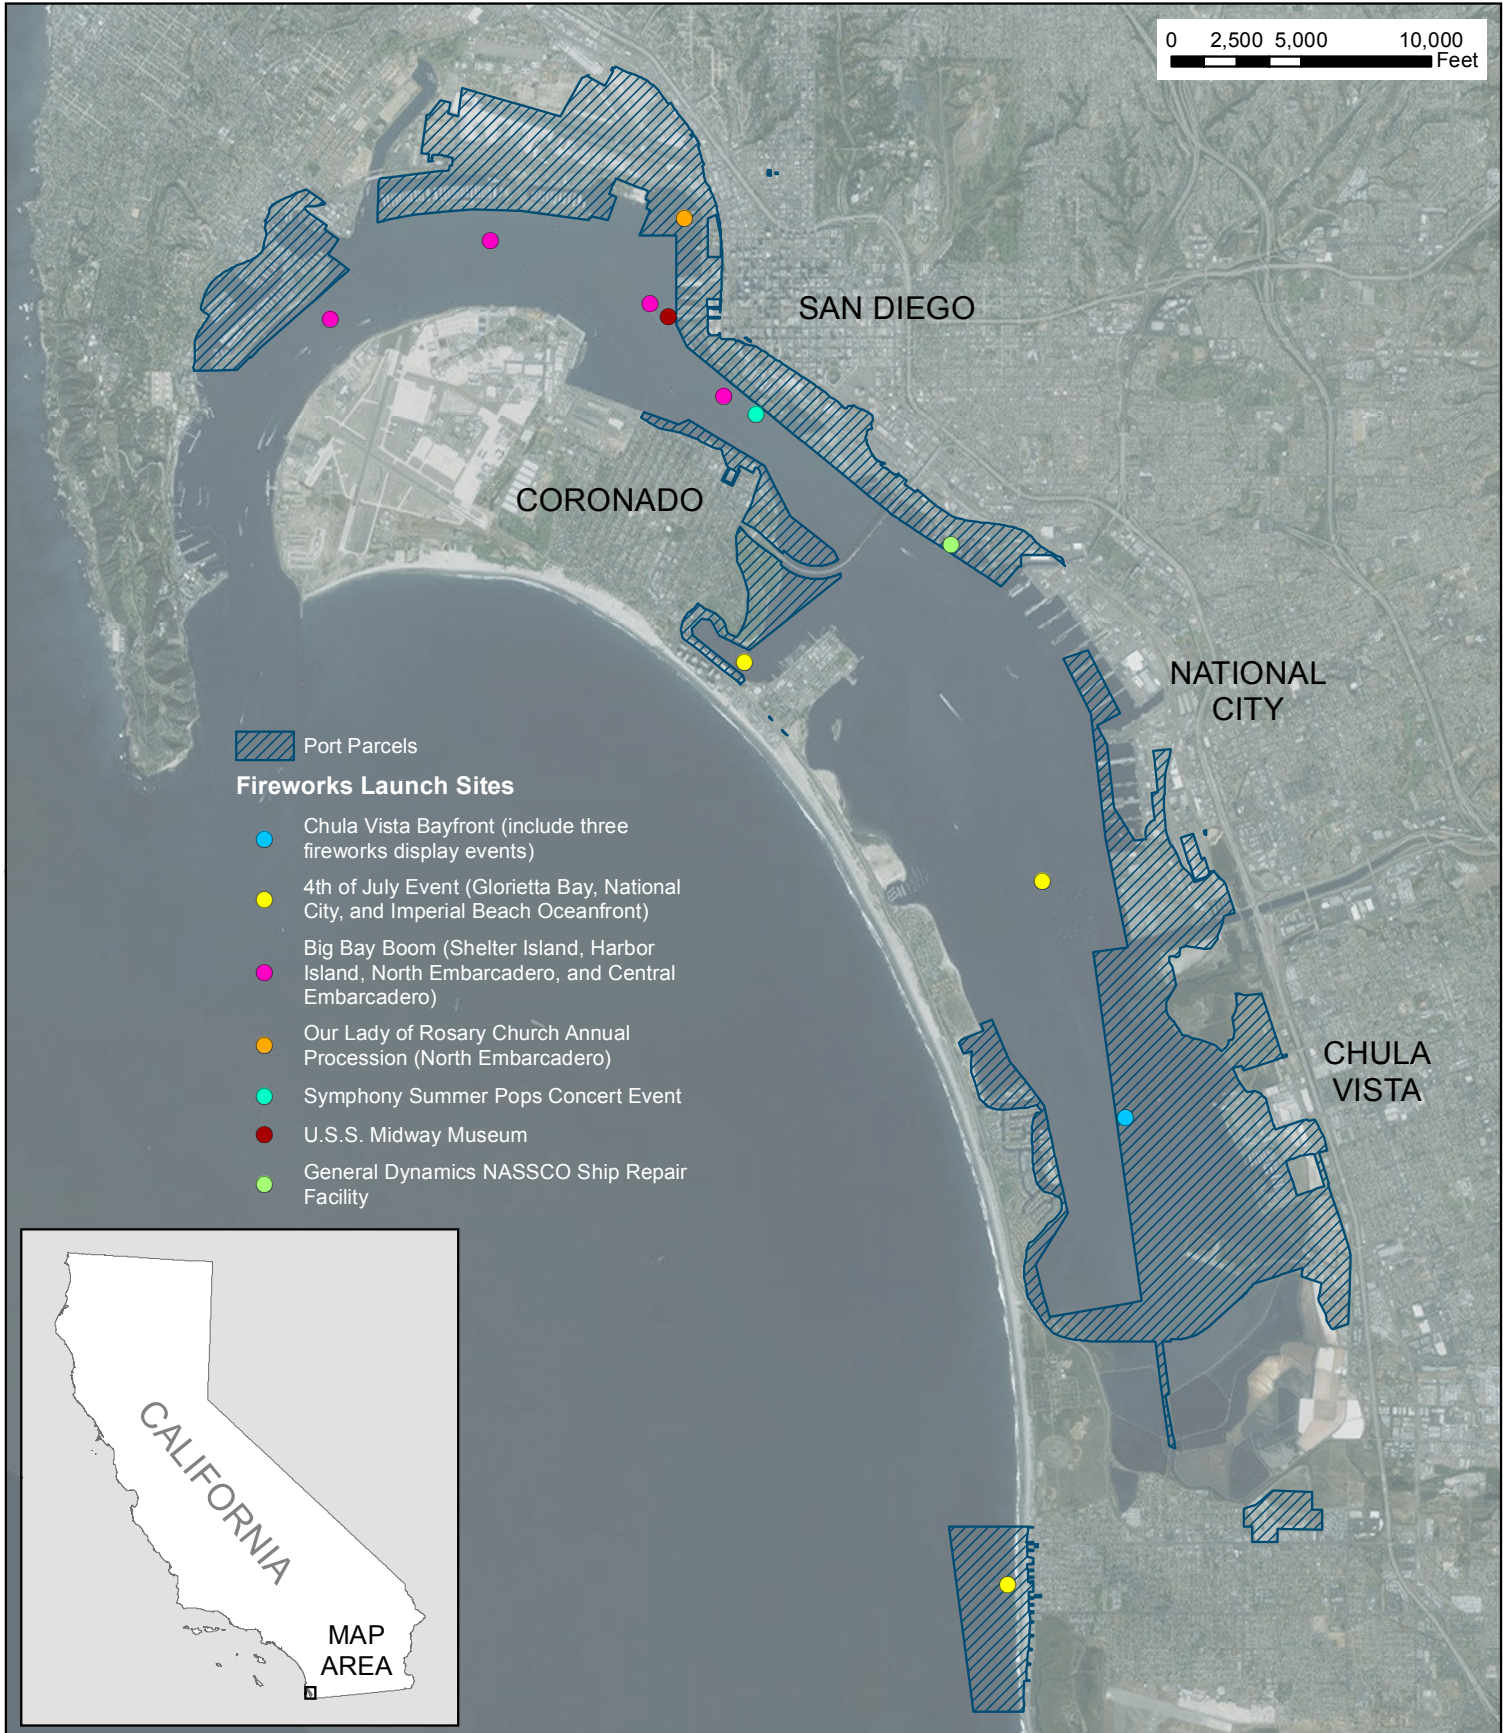

(c) Cost Recovery. ~~Pursuant to Article 2, Cost Recovery, of the District Code, the~~ The Applicant shall pay a fee to the District for the cost of services and administrative acts of the District incurred in processing a permit application pursuant to the article.

Section __.9 - ENFORCEMENT

Any person who violates this article or who fails to comply with the terms and conditions of a permit issued pursuant to this article shall be subject to punishment in accordance with District Code section 0.11, General Penalty, and section 0.13, Permit Violations.

3.2.9 Changes to Appendix F, *Biological Technical Report*

The figures on the following pages have been added to or revised in Appendix F, *Biological Technical Report*.

 Port Parcels

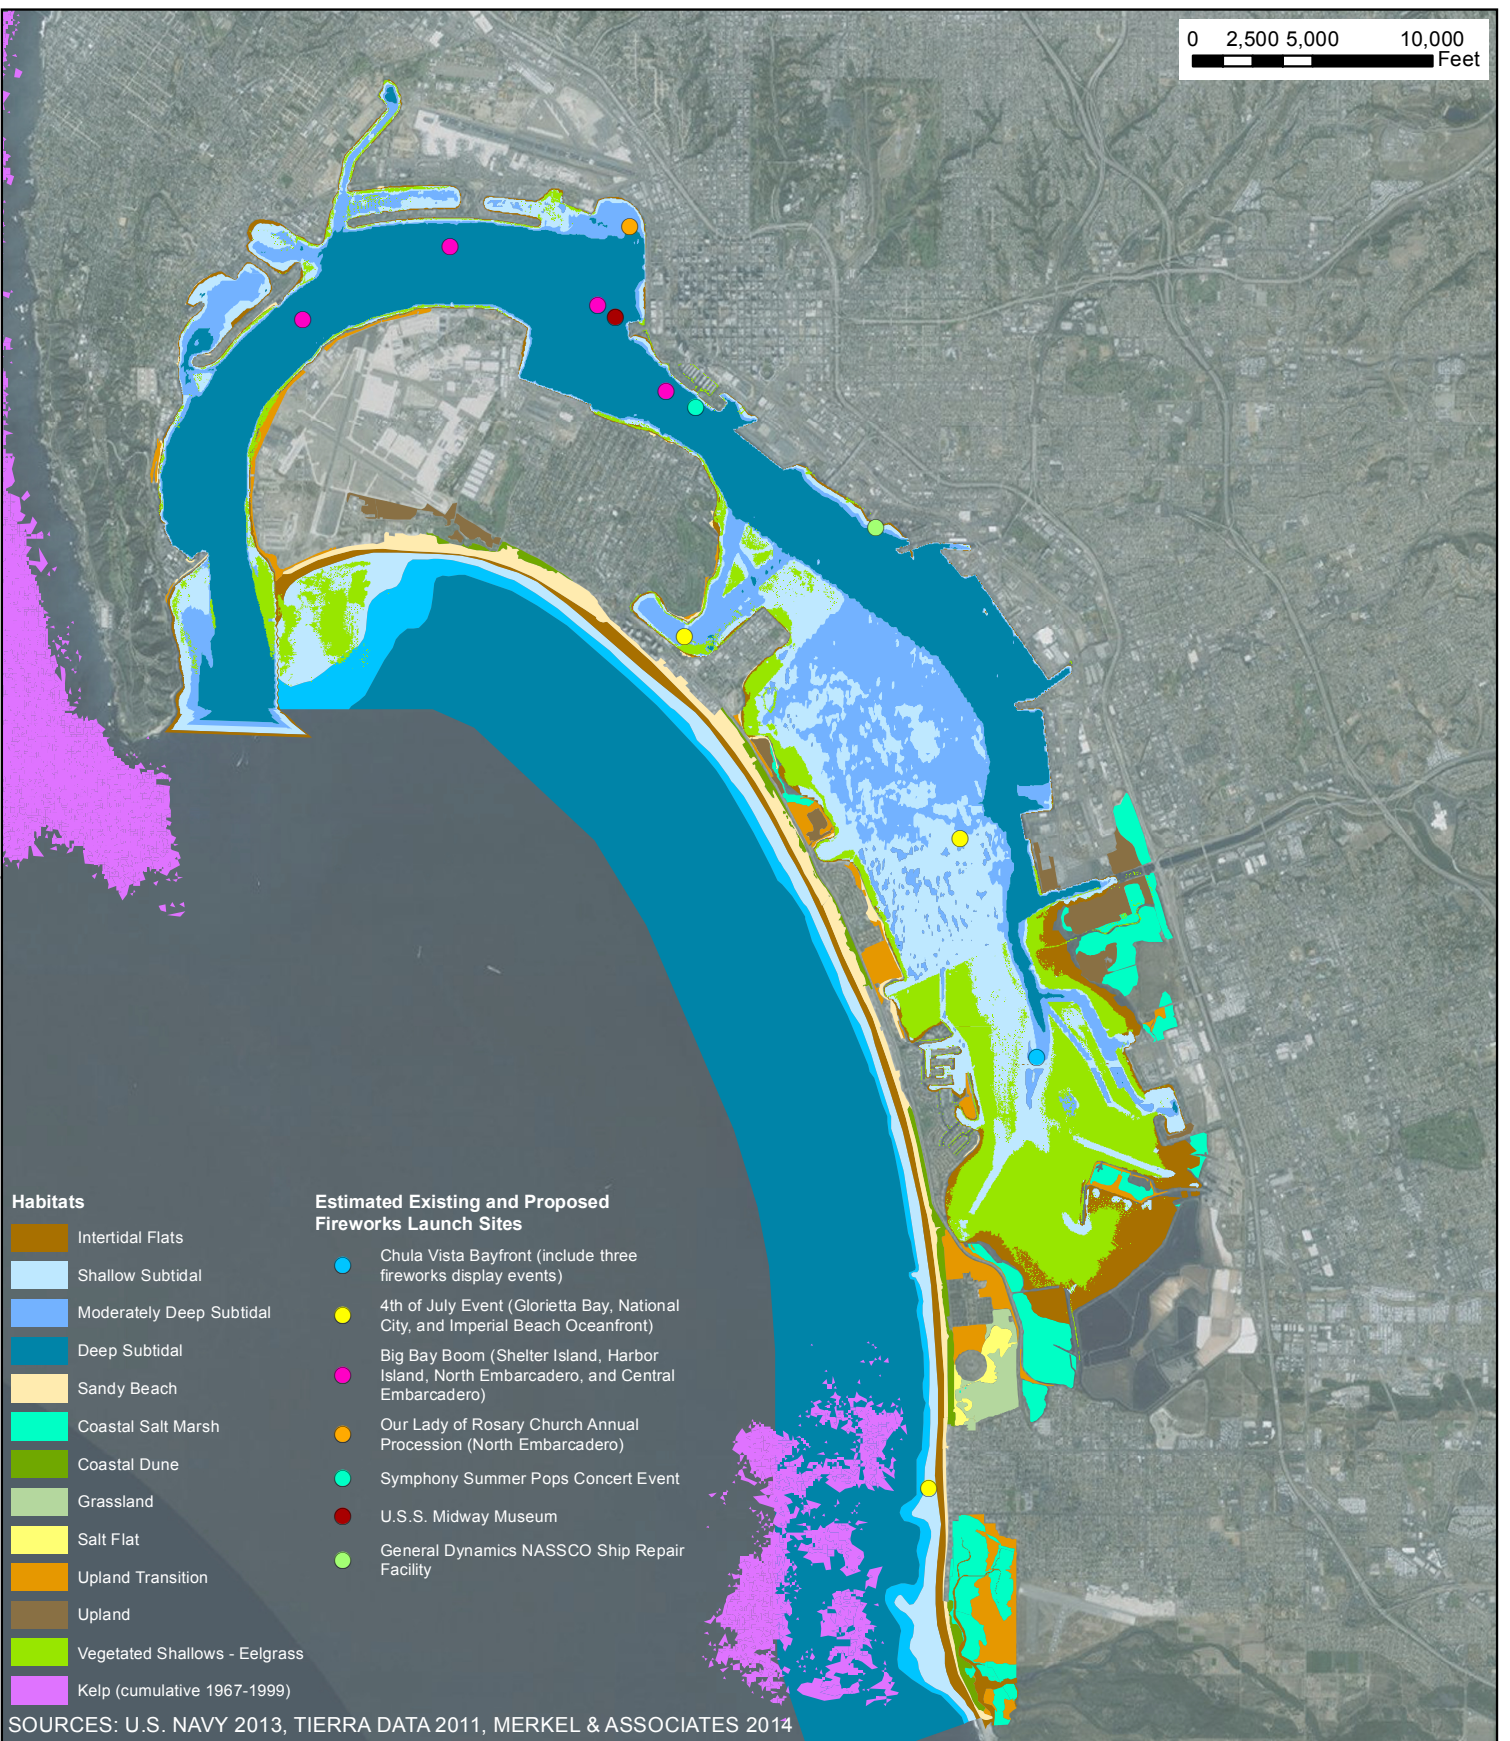

Fireworks Launch Sites

-  Chula Vista Bayfront (include three fireworks display events)
-  4th of July Event (Glorietta Bay, National City, and Imperial Beach Oceanfront)
-  Big Bay Boom (Shelter Island, Harbor Island, North Embarcadero, and Central Embarcadero)
-  Our Lady of Rosary Church Annual Procession (North Embarcadero)
-  Symphony Summer Pops Concert Event
-  U.S.S. Midway Museum
-  General Dynamics NASSCO Ship Repair Facility

Chapter 4

Comments Received and District Responses

4.1 Introduction

The Draft Environmental Impact Report (EIR) was available for public review for 45 days beginning on March 17, 2017 and ending on May 2, 2017. The District posted an electronic version on the District website, hard copies were sent to the City of San Diego Central Library, City of National City Public Library, City of Chula Vista Public Library, City of Imperial Beach Branch Library, and City of Coronado Public Library, and a copy was available for review at the District's Administration Building at 3165 Pacific Hwy, San Diego, CA 92101. A Notice of Availability was posted with the County Clerk on March 17, 2017. All requisite documents, including the Notice of Completion form, were sent to the State Clearinghouse on March 17, 2017. Below is a listing of those agencies and organizations that received a copy of the Draft EIR or a postcard noticing the availability of the Draft EIR.

4.2 Public Draft EIR Distribution List

4.2.1 Federal Agencies

Federal Aviation Administration: Air Traffic Airspace Branch; San Diego Flight Standards District Office; Southwest Region; Western-Pacific Region

Federal Emergency Management Agency: Floodplain Management and Insurance Branch

U.S. Army Corps of Engineers: Los Angeles District; San Diego Field Office; Regulatory Division

U.S. Coast Guard: San Diego Marine Safety Office; Department of Homeland Security

U.S. Department of Commerce, National Oceanic and Atmospheric Administration, National Marine Fisheries Service: West Coast Regional Office

U.S. Department of the Navy, Southwest Division: Naval Facilities Engineering Command Southwest Office, Public Affairs Department, Naval Air Station North Island, Naval Base Coronado, Naval Base San Diego, Community Planning Liaison Officer

U.S. Environmental Protection Agency: Pacific Southwest, Region 9

U.S. Fish & Wildlife Service: Carlsbad Office

U.S. Department of Homeland Security: U.S. Customs & Border Protection

4.2.2 State Agencies

California Air Resources Board

California Air Resources Board: Freight Transport Branch

California Coastal Commission: San Diego Coast District Office

California Department of Boating and Waterways

California Department of Fish and Wildlife, South Coast Region

California Department of Parks and Recreation
 California Department of Public Health
 California Department of Toxic Substances Control
 California Department of Transportation, District 11, San Diego
 California Department of Transportation: Division of Aeronautics; District 11 Office
 California Environmental Protection Agency
 California Highway Patrol
 California Integrated Waste Management Board
 California Native American Heritage Commission
 California Office of Planning and Research (State Clearinghouse)
 California Public Utilities Commission
 California Regional Water Quality Control Board: Region 9, San Diego
 California Resources Agency
 California State Lands Commission
 California State Water Resources Control Board

4.2.3 Regional and Local Agencies

City of Chula Vista: Planning Department; Chula Vista Public Library, Civic Center Branch
 City of Coronado: Community Development Department; Coronado Public Library
 City of Imperial Beach: Community Development Department; Fire Department; Imperial Beach Branch Library
 City of National City: Community Development Department; National City Public Library
 City of San Diego: Central Library; Districts 1 through 10; Development Services; Planning Department; Transportation Division; City Clerk; Mayor's Office; City Council; Water Department; Stormwater Pollution Prevention District; Wastewater Department
 County of San Diego: County Clerk; Board of Supervisors; Planning and Land Use Department; Department of Environmental Health; Air Pollution Control District; Land Use and Environmental Group
 San Diego Association of Governments
 San Diego Chamber of Commerce
 San Diego County Regional Airport Authority
 San Diego County Water Authority
 San Diego Gas & Electric
 San Diego Metropolitan Transit System

Other interested individuals, organizations, and groups also received a postcard noticing the availability of the Draft EIR.

4.3 Comments Received on the Draft EIR

The District received 10 comment letters on the Draft EIR during the public review period. Topics included air quality, biological resources, greenhouse gas (GHG) emissions, hydrology and water quality, noise, and transportation and traffic. Table 4-1 lists the agencies and interested parties that provided comment letters.

Table 4-1. Agencies and Organizations that Submitted Comment Letters on the Draft EIR

Letter	Agency/Organization	Dated	Received	Page
Federal Agencies				
A	Federal Emergency Management Agency	3/23/17	4/25/17	4-4
B	United States Fish and Wildlife Service	5/2/17	5/2/17	4-6
State Agencies				
C	Governor's Office of Planning and Research, State Clearinghouse and Planning Unit	5/3/17	5/8/17	4-24
D	California Coastal Commission	5/1/17	5/1/17	4-26
E	California Department of Fish and Wildlife	5/2/17	5/2/17	4-33

Wileen Manaos,
Real Estate Development Department
San Diego Unified Port District
3165 Pacific Highway
San Diego, California 92101-1128

Dear Ms. Manaos:

A-1 | This is in response to your request for comments regarding the Notice of Availability of a Draft Environmental Impact Report for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project.

Please review the current effective countywide Flood Insurance Rate Maps (FIRMs) for the County of San Diego (Community Number 060284) and City of San Diego (Community Number 060295), Maps revised April 5, 2016. Please note that the City of San Diego, San Diego County, California is a participant in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.

A summary of these NFIP floodplain management building requirements are as follows:

- A-2 |
- All buildings constructed within a riverine floodplain, (i.e., Flood Zones A, AO, AH, AE, and A1 through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective Flood Insurance Rate Map.
 - If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any **development** must not increase base flood elevation levels. **The term development means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials.** A hydrologic and hydraulic analysis must be performed *prior* to the start of development, and must demonstrate that the development would not cause any rise in base flood levels. No rise is permitted within regulatory floodways.

A-2
cont

- All buildings constructed within a coastal high hazard area, (any of the “V” Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.
- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical data for a flood map revision. To obtain copies of FEMA’s Flood Map Revision Application Packages, please refer to the FEMA website at <http://www.fema.gov/business/nfip/forms.shtm>.

Please Note:

A-3

Many NFIP participating communities have adopted floodplain management building requirements which are more restrictive than the minimum federal standards described in 44 CFR. Please contact the local community’s floodplain manager for more information on local floodplain management building requirements. The San Diego floodplain manager can be reached by calling Jamal Batta, CFM, P.E., Floodplain Manager, at (619) 553-7482. The San Diego County floodplain manager can be reached by calling Sara Agahi, Flood Control District Manager, at (858) 694-2665.

If you have any questions or concerns, please do not hesitate to call Mark Delorey of the Mitigation staff at (510) 627-7057.

Sincerely,

Gregor Blackburn, CFM, Branch Chief
Floodplain Management and Insurance Branch

Wileen Manaois, Real Estate Development

Response to Comment A-1

This comment is an introductory statement indicating that the Federal Emergency Management Agency (FEMA) is providing comments on the Draft EIR for the proposed project.

The District appreciates FEMA's interest in the proposed project. This comment does not raise any environmental issues requiring a response pursuant to the California Environmental Quality Act (CEQA). The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment A-2

This comment is requesting that the District review the current effective countywide Flood Insurance Rate Maps for the County of San Diego and City of San Diego, and identifies the City and County of San Diego as participants in the National Flood Insurance Program (NFIP). The comment also identifies the basic NFIP floodplain management building requirements as described in Volume 44 of the Code of Federal Regulations (CFR), Sections 59 through 65.

The District acknowledges the City and County of San Diego as participants in the NFIP. The proposed project involves the adoption of an ordinance to govern existing and proposed new fireworks display events in San Diego Bay and the Imperial Beach Oceanfront, as well as four proposed new fireworks display events in San Diego Bay adjacent to the National City and Chula Vista Bayfronts. During preparation of the Draft EIR, the District reviewed the Flood Insurance Rate Maps within the vicinity of the proposed project. However, the project does not propose the construction of any buildings or other structures; therefore, the NFIP floodplain management building requirements are not applicable to the proposed project. No changes to the Final EIR are required.

Response to Comment A-3

The comment letter concludes by noting that many communities that participate in the NFIP have adopted floodplain management building requirements that are more stringent than the federal standards described in Volume 44 of the CFR, and provides the contact information for the City and County of San Diego floodplain managers. The commenter provides the FEMA contact name and information. As previously stated in the response to comment A-2, the NFIP floodplain management building requirements are not applicable to the proposed project.

The District appreciates FEMA's interest in the proposed project. This comment does not raise any environmental issues requiring a response pursuant to CEQA, as the floodplain management building requirements do not apply to the proposed project. No changes to the Final EIR are required.

Subject: Comments on the San Diego Unified Port District's Draft Environmental Impact Report for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (UPD #EIR-2015-115)

Dear Ms. Manaois:

The U.S. Fish and Wildlife Service (Service) has reviewed the above-referenced Draft Environmental Impact Report (DEIR) for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (Project), in San Diego County, California. The enclosed comments are based on information provided in the DEIR and the Service's knowledge of sensitive and declining species and their habitats.

B-1 The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Federal Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*). The Service also owns and operates National Wildlife Refuges (NWR).

For the proposed project, the San Diego Unified Port District (Port) will (1) develop an ordinance establishing a District Code section to govern existing and proposed new fireworks display events within San Diego Bay and the Imperial Beach oceanfront, and (2) support four new fireworks display events in south San Diego Bay adjacent to the National City and Chula Vista Bayfront.

B-2 We have previously provided the Port comments on the notice of preparation of the DEIR in letter dated October 6, 2015, as well as recommendations regarding fireworks displays in San Diego Bay in letters dated May 9, 2016, and January 11, 2007, which are attached and incorporated

B-2 cont. | herein by reference. While the DEIR addresses some of our past comments, many are not adequately addressed.

B-3 | We have worked with fireworks sponsors, organizers, and operators to develop minimization measures for the federally listed threatened western snowy plover (Pacific Coast population DPS) [*Charadrius nivosus nivosus* (*C. alexandrinus* n.); plover], as well as the endangered California least tern [*Sterna antillarum browni* (*Sterna a. b.*); least tern] and light-footed Ridgway’s (=clapper) rail [*Rallus obsoletus* (=longirostris) *levipes*; rail]. In our May 9, 2017, letter, we specifically recommended that fireworks shows be excluded from South San Diego Bay during the nesting season.

B-4 | However, we continue to have concerns that fireworks conducted in south San Diego Bay will also result in impacts to nesting, roosting, rafting, and foraging seabirds, shorebirds, and waterfowl. Our concerns stem from the proximity of proposed fireworks launch sites in south San Diego Bay to the San Diego Bay NWR (Refuge) which supports thousands of nesting and wintering birds and is subject to low levels of disturbance under baseline conditions. As discussed in the Biological Technical Study (EIR, Appendix F), there is potential for avian behavioral responses to the bright lights, noise, and vibration associated with fireworks. In addition, fireworks events in south San Diego Bay may result in significant spectator presence on and near the Refuge. Due to our concerns regarding the potential direct and indirect effects of a fireworks show, we continue to recommend that fireworks shows do not occur in the vicinity of the Chula Vista Bayfront. We also recommend that the Port consider an alternative that will not introduce night time fireworks disturbance to the vicinity of the Refuge.

Specific Comments:

Chapter 2 – Environmental Setting

1) Fireworks Launch Site for the Proposed National City Fireworks Display

B-5 | The description of the location for the temporary barge that “would take place within view of Pepper Park,” as described on 2-12 of the draft EIR, appears to be inconsistent with Figure 2-1. The text states the “fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the vicinity of Pepper Park.” This text implies that the barge would be located within the Sweetwater River flood control channel; however, Figure 2-1 indicates that the site would be well to the north of Pepper Park, where there appears to be little or no public access to the waterfront. The location of potential barge sites should be clarified in the document, as the proposed location could have significant, adverse effects on least terns that nest on the D Street Fill. The understanding of the exact locations in which the fireworks displays can occur is further complicated by language provided on page 4.3-5, which states: “The sites for the proposed new fireworks display events are within and/or adjacent to the District’s jurisdiction within San Diego Bay along

B-5 cont. | the National City and Chula Vista Bayfronts. These proposed new displays are anticipated to occur on barges and/or piers within these locations” (emphasis added). Chapter 2 does not address the potential for the new sites to include pier areas. If the use of piers in addition to barges is being considered for the new sites, the draft EIR should be redistributed to public comment after it has been revised to identify potential pier sites and to address the potential impacts of using those pier sites for fireworks displays.

2) Fireworks Launch Site for the Proposed Chula Vista Bayfront Fireworks Display

B-6 | Page 2-13 states “A total of three fireworks display events (including one on the Fourth of July) along the Chula Vista Bayfront area ... are anticipated to involve the placement of a single, temporary barge in the Bay in the vicinity of the two parks.” Based on the information provided in Figure 2-1, it appears that the proposed location of this barge occurs within the boundaries of the Refuge. If the barge is to be located within the boundaries of the Refuge, the draft EIR should be revised to acknowledge that the proposal would require a Special Use Permit from the Refuge, as well as compliance with National Environmental Policy Act (NEPA). Additional discussion of this issue is provided below.

Chapter 4, Section 4.3 – Biological Resources

B-7 | 1) The habitat information provided in Figure 4.3-1 is incomplete and should be updated to show salt marsh in the western salt ponds, which were restored in 2011. In addition, the D Street Fill and South Bay Salt Works levees should be shown as supporting seabird and shorebird nesting habitat, including least terns and snowy plovers.

B-8 | 2) The habitat information provided in Figure 4.3-2 is incomplete and should be updated to include snowy plover habitat at Silver Strand State Beach and the Navy’s proposed alternate least tern nesting site at Naval Air Station, North Island. The polygon(s) depicted in the legend as “Sensitive Nesting Areas 1 mile” will need to be adjusted once the missing nesting habitat is added to the figure.

B-9 | 3) The discussion of the San Diego Bay’s subtidal vegetated habitat on page 4.3-7 should also address the importance of this habitat to the bay’s population of eastern Pacific green sea turtles.

B-10 | 4) The discussion under *Upland Transition and Upland Areas* on page 4.3-9 should be expanded to acknowledge the significant seabird nesting areas that occur in proximity to the proposed fireworks launch sites. These include the D Street Fill, located immediately south of Pepper Park, which is a mitigation site set aside as nesting habitat for the least tern and snowy plover, and the levees of the South Bay Salt Works that support tens of thousands of nesting waterbirds between the months of March and September. The significance of these nesting areas is highlighted by the fact that in 2016, the San Diego

B-10 cont. | Bay Refgure is estimated to have supported over 60,000 waterbird nests representing 16 species. The effects of impacts to this number of nesting birds should be evaluated in the effects section.

B-11 | 5) On page 4.3-10, note that the South Bay Salt Ponds are part of the Refuge, and not a separate area.

B-12 | 6) On page 4.3-11, note that the South Bay Salt Works levees and Pond 11 are managed by the Service, not the District.

B-13 | 7) Table 4.3-2 inaccurately states that eastern Pacific green sea turtle have a low potential to occur in San Diego Bay. Researchers continue to tag and monitor green sea turtles in San Diego Bay (Madrak *et al.* 2016), particularly in the south end of the Bay. In addition, norther harriers are routinely observed at Sweetwater Marsh and in the south bay, therefore, they have a high potential to occur in the affected area.

B-14 | 8) As addressed previously, the location proposed as a fireworks launch site for the Chula Vista Bayfront appears to be located within the boundaries of the Refuge; therefore, the discussion of applicable laws and regulations related to the Refuge on Page 4.3-19 should be expanded to address Federal regulations related to uses on a NWR. Uses on a NWR require compliance with the National Wildlife Refuge System (NWRS) Administration Act of 1966 as amended by the NWRS Improvement Act of 1997, 16 U.S.C. 668dd-668ee (Improvement Act) and the National Environmental Policy Act (NEPA).

B-15 | The Improvement Act provides clear standards for management, use, planning, and growth of the NWRS. The Improvement Act requires that each refuge be managed to fulfill the “wildlife first” mission of the NWRS, as well as the specific purposes for which a refuge was established. The Refuge was established to protect, manage, and restore habitats for federally listed endangered and threatened species and migratory birds, as described in the Act, and maintain and enhance the biological diversity of native plants and animals, as described in the Fish and Wildlife Act of 1956, as amended.

In accordance with the Improvement Act, uses permitted on a NWR must be determined to be compatible with the mission of the NWRS and Refuge purposes. The Service’s Appropriate Use Policy (*Service Manual, Part 603 FW 1*) provides a national framework for determining appropriate refuge uses and outlines the procedures refuge managers must follow when deciding if a new or existing use is an appropriate use on the refuge. The proposed use must contribute to the public’s understanding and appreciation of the refuge’s natural or cultural resources, or must be beneficial to the refuge’s natural or cultural resources. If this is not the case, such a use would generally be considered not appropriate.

- B-15 cont.

If a use is determined to be appropriate, it must then be evaluated for compatibility. The Service’s Compatibility Policy (*Service Manual, Part 603 FW 2*) includes guidelines for determining if a use proposed is compatible with Refuge purposes. A compatible use is defined in the policy as a proposed or existing use of a NWR that, based on sound professional judgment, will not materially interfere with or detract from the fulfillment of the NWRS mission or the purposes for which the Refuge was established.

Another significant directive of the Improvement Act is to ensure that we maintain the ecological integrity of the NWRS for present and future generations of Americans. Uses that we reasonably may anticipate to conflict with pursuing this directive are contrary to fulfilling the NWRS mission and are therefore not compatible. Under the authorities of the Improvement Act, fireworks displays conducted on a NWR would not represent an appropriate or compatible use of Refuge lands. As such, a Refuge Special Use Permit to allow such events could not be issued.
- B-16

9) If there is the potential for a barge to be sited within Sweetwater River flood control channel in the vicinity of Pepper Park or for the fireworks launch site for the National City and/or Chula Vista Bayfront to be located somewhere other than the location shown in Figure 2-1, the discussion of impacts to birds and listed species should be expanded. This is particularly important because of the potential for significant adverse effects to sensitive salt marsh habitat, nesting least terns, and resident rails as a result of siting the fireworks barge in the Sweetwater River channel or in proximity to the outer levees of the salt works.
- B-17

10) The proposed mitigation measures, particularly those intended to minimize indirect impacts related to human disturbance of nesting areas, are inadequate as they only address public viewing areas. The areas that would be affected include open water areas, and areas that are not open to the public, but would be subject to unauthorized access as a result of the proposed action.
- B-18

11) There is no monitoring proposed to determine if the measures included in the DEIR for mitigating both direct and indirect impacts are being implemented and/or are effective in avoiding and minimizing impact to nesting least terns, snowy plovers and rails. The DEIR should include requirements for monitoring to assess the initial response and overall effects to nesting success on these species.
- B-19

12) The DEIR should characterize the difference in ambient night time disturbance levels at nest sites in north San Diego Bay and the nest sites at the Refuge. The DEIR should distinguish between the baseline conditions at these sites.
- B-20

13) Appendix F of the DEIR discusses previous fireworks monitoring efforts at (1) a north San Diego Bay least tern colony (San Diego International Airport; Airport), (2) at Naval Base Coronado, (3) at Gualala Point, and (4) in the Netherlands. Although the

B-20
cont.

results from these studies demonstrate that individual birds are likely to display a direct physiological stress response, Appendix F (re-iterated in section 4.3) concludes that “it does not appear that the level of disturbance stress generated from the fireworks translate to a level achieving harassment or harm for avian species”. This conclusion is not consistent with the result of the Gualala Point study, which concluded that nests had been abandoned as a result of the fireworks display. Nest abandonment and likely chick mortality was also documented subsequent to the Big Bay Boom in 2012, when a malfunction resulted in the detonation of all of the fireworks in a short period (Patton 2012, pers. comm.). Based on the nesting chronology of the least tern, western snowy plover, and rail, it is likely that there will be active nests and adults brooding dependent chicks during the proposed 4th of July event. Although we agree that it is difficult to quantify the number or extent of impacts, we remain concerned that individual nests or chicks may be abandoned due to the night time disturbance, or chicks may flee into harm’s way, particularly since the Refuge sites are not subject to night time disturbances under baseline conditions. For example, least tern habitat at the Refuge is subject to less night time disturbance than least tern habitat at the Airport. The monitoring reports from the Airport nest site state “colonies elsewhere with less habituation to noises would be expected to react more than those at the airport, and the observed flushing of adults, fledglings, and running of chicks in response to the fireworks confirm fears of possible threat of fledglings relocating to roost in active roadways, taxiways or runway following dispersal due to fireworks.” Therefore, we anticipate that the response of avian species at the Refuge will be greater than that observed at the Airport and Naval Base Coronado.

B-21

14) The DEIR should include conservation measures to avoid and minimize the potential impacts of the Project on sensitive wildlife. The Carlsbad Fish and Wildlife Office (CFWO) has previously recommended conservation measures be included to existing and ongoing fireworks displays specifically to avoid and/or minimize potential impacts to nesting least terns and snowy plovers, including: (1) Location of discharge sites for fireworks as far away as possible (minimum of 1 mile) from the nearest least tern or snowy plover nesting site; (2) Delineation and law enforcement patrol of shoreline around least tern and snowy plover nesting areas to prevent spectators from coming ashore or anchoring in eelgrass beds; (3) Reduction in shell size to reduce the percussive vibrations associated with fireworks detonations; (4) Development and implementation of a least tern, snowy plover and rail monitoring approach approved by the CFWO; and (5) Development of a plan to mitigate any negative impacts (to least terns, snowy plovers and rails) observed by the monitoring biologist.

B-22

The DEIR should discuss the occurrence and location of rafting bird species during the non-breeding season, the anticipated footprint of increased boat traffic, and the likely impacts of increased boat traffic on rafting birds in south San Diego Bay. In addition, the DEIR should specify minimization measures to reduce the impacts of increased boat traffic on rafting birds.

B-23

Thank you for the opportunity to comment on the DEIR. We request a meeting with the Port to go over our comments and concerns regarding the Project.

If you have any questions regarding this letter, please contact Sandy Vissman of the Carlsbad Fish and Wildlife Office at (760) 431-9440 or Brian Collins of the San Diego National Wildlife Refuge at (619) 575-2704.

San Diego, California 92101

Subject: San Diego Bay and Imperial Beach Fireworks Shows on July 4, 2016

Dear Ms. Maher:

B-24

This letter responds to your request for guidance from the U.S. Fish and Wildlife Service (Service) to reduce potential impacts to sensitive wildlife from the San Diego Bay (Big Bay Boom) and Imperial Beach (IB) fireworks shows on July 4, 2016, funded by the Port of San Diego (Port). We appreciate your efforts to incorporate measures that address wildlife concerns into the 2016 fireworks shows, as the primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States, and is also responsible for administering the Federal Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*). We previously provided comments on the Port's Notice of Preparation of a Draft Environmental Impact Report for San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (UPD #EIR-2015-115)(DEIR)(Port 2015) in our letter dated October 6, 2015 (FWS-SDG-15B0320-15CPA0334)(Service 2015).

B-25

We are pleased that, consistent with recommendations in our October 6, 2015, letter, no fireworks shows are proposed at the Chula Vista Bayfront or Loew's Coronado Resort. Due to their close proximity to sensitive wildlife, including the federally listed threatened western snowy plover (*Charadrius nivosus nivosus*; snowy plover), as well as the endangered California least tern [*Sterna antillarum browni* (*Sterna a. b.*); least tern] and light-footed Ridgway's (=clapper) rail [*Rallus obsoletus* (=longirostris) *levipes*; rail] nesting sites, we recommend that the Chula Vista Bayfront and Loew's Coronado Resort be excluded from future fireworks shows during the nesting season.

B-26

The Big Bay Boom and IB fireworks shows will occur in north San Diego Bay (Bay) and IB in the same locations as previous shows. Both shows will last 18 minutes, and be launched from four barges in the north Bay and from the IB Pier. Shells launched within the Bay would be a

B-26 cont. maximum of 10-inch shells, and those launched from the IB Pier would be a maximum of 8-inch shells.

B-27 As outlined in our October 6, 2015, letter, our primary concern with fireworks shows is the potential impact to wildlife from the fireworks, spectators, and introduction of harmful chemicals and debris into the water. Numerous birds species, including the snowy plover, least tern and Ridgway's rail, use wetlands, shoreline habitats, and/or open water of the Bay and Pacific Ocean in the vicinity of the proposed fireworks shows.

B-28 Birds in areas close to fireworks shows are likely to be exposed to the explosive noises, vibrations, and bright flashes of light which may disrupt normal breeding and roosting behavior. Potential avian responses to fireworks include flushing from nests and nest abandonment (Stephensen *et al.* 2012; Weigand and McChesney 2008; Patton 2012, 2013, 2015), although these responses are not always observed (Heinz 2013; Elliott 2014). Reduced avian parental attendance from flushing exposes eggs and/or chicks to night time air temperatures and predators, and may result in changes in hatchability/survivorship depending upon variables such as the length of parental absence, temperature, and predator presence. Illumination and disturbance from fireworks may result in increased visibility of birds, eggs or chicks to predators, particularly in exposed habitat. In addition, spectators of the fireworks shows may disturb or harm breeding or roosting birds, eggs, or chicks (Caffree 1993). Spectator boats traveling within the Bay at night may disturb or collide with rafting birds. Spectators may also leave trash and food waste, which can attract potential predators to sensitive areas. Fireworks launched over water deposit debris and chemical constituents of expended shells into the water, which could indirectly affect birds.

B-29 The least tern nests at the San Diego International Airport (SDIA) and Naval Air Station, North Island (NASNI) about 1 mile from Bay launch site. The least tern also nests at the mouth of the Tijuana River in the Tijuana Slough National Wildlife Refuge (Refuge) about 1.5 miles south of the IB Pier launch site. The snowy plover nests on the beaches to the north and south of the IB Pier. Nest distribution shifts from year to year, and in 2014, two snowy plover nests were initiated less than 1 mile north and south of the IB Pier launch site (Navy 2015; Patton 2015, pers. comm.). The rail occupies the Oneonta Slough, within the Refuge, about 0.5 mile south of the IB Pier launch site. Recent monitoring estimated 127 rail pairs in the slough in 2016 (Collins 2016, pers. comm.).

B-30 Our October 6, 2015, letter recommended several conservation measures for fireworks shows to avoid and/or minimize potential impacts to least terns and snowy plovers. Consistent with our recommendations, the Port proposes to implement the following measures: 1) locating launch sites greater than 1 mile from least tern nesting sites; 2) installing signs to prevent trespass into the Refuge; 3) limiting maximum shell size to 10 inches in the Bay, and 8 inches at IB Pier; 4) limiting show length at 18 minutes; 5) picking up floating and shoreline debris after the event; 6) monitoring least tern nesting at the SDIA; and 7) monitoring water quality after the event in compliance with the Regional Water Quality Control Board fireworks permit. We appreciate the

B-30 [Port’s proposed minimization measures and offer the following comments and suggestions to
cont.] further reduce the potential for impacts to snowy plovers, least terns, and rails.

B-31 [Active least tern nests, chicks and adults will likely be present at the SDIA, NASNI and Refuge
nesting sites during the fireworks shows. Based on the baseline level of disturbance at these sites
and the results of previous monitoring, we anticipate that the Big Bay Boom fireworks show will
temporarily disrupt least tern nesting and roosting at SDIA and NASNI (Patton 2013), and will
temporarily separate parents from flightless chicks. Spectators that view the Big Bay Boom from
the parking lot adjacent to SDIA Oval O-3S could also disrupt or harm nesting or roosting terns.
The least tern nesting site at the Refuge was not monitored during past fireworks shows and we
do not have information regarding the response of this colony to fireworks. However, due to the
greater distance from the launch site (i.e., 1.5 miles) and smaller shell size (i.e., 8-inch) we
expect the fireworks show at IB to disrupt least tern nesting to a lesser degree than at SDIA.
However, spectators that view the IB show from the beach south of Sea Coast Drive could
disrupt or harm nesting or roosting terns at the mouth of the Tijuana River.

B-32 [While the current proposed launch locations are consistent with our recommendation that launch
sites be at least 1 mile from nest sites, we note that least terns nesting at SDIA (about 1 mile from
the Bay launch site) were observed to flush from nests during past Big Bay Boom fireworks
shows (Patton 2012, 2013, 2015). A firework study conducted in San Francisco Bay detected no
least tern flushing from nests when fireworks were launched about 2 miles from the colony (Elliott
2014). Therefore, we recommend that the Port increase the distance between the least tern
colonies and the Big Bay Boom launch sites as much as possible to reduce the disturbance to a
level that does not result in least tern flushing. To reduce the potential for spectator disturbance
at the SDIA nesting site, we recommend that the Port close the parking lot that lies adjacent to
nesting oval O3-S on July 4. To reduce the potential for spectator disturbance at the Refuge
nesting site, we recommend that the Port coordinate with the City of IB and the Refuge staff to
assure that, in addition to signage, adequate enforcement personnel are present south of IB Pier
to prevent spectators from entering into the nesting site. Specifically, we recommend that a
uniformed enforcement agent be stationed at the south end of Sea Coast Drive on the evening of
July 4.

B-33 [Active snowy plover nests, chicks and adults will likely be present on the beaches to the north
and south of the IB Pier during the IB fireworks show. We recommend that the Port coordinate
with the City of IB and Refuge to assure that signage and enforcement presence is in place to the
north of the IB Pier, as well as to the south (recommended above to protect least terns), to reduce
spectator foot traffic in snowy plover nesting habitat. Specifically, we recommend that a uniformed
enforcement agent be stationed at the Navy’s “Camp Surf” on the evening of July 4.

B-34 [It is likely that Oneonta Slough will support active rail nests, chicks, and adults during the IB
fireworks show. We anticipate disturbance to rails, given the close proximity of the IB Pier
launch site, and encourage the Port to offset disturbance by contributing to the efforts to improve
rail habitat, maintain water quality, reduce human and pet disturbance, and open the mouth of the
Tijuana Estuary consistent with the Light-footed Clapper Rail Recovery Plan (Service 1985).

B-35 [The Port proposes to deploy “No Trespass” signs to reduce the potential for unintended spectator impacts to rail nesting. We also recommend that the Port coordinate with the City of IB and the Refuge staff to assure that adequate enforcement is present to prevent spectators from entering into the Tijuana Slough nesting site. Specifically, we recommend that a uniformed enforcement agent be stationed at the south end of Sea Coast Drive on the evening of July 4 (as recommended above in reference to least tern and snowy plover protection). In addition, we recommend that the Port clean up any trash or food waste left by spectators near least tern, snowy plover and rail nesting sites.

B-36 [Biological monitoring during anthropogenic activities such as fireworks shows can provide valuable information that increases our understanding of wildlife response to potential disturbance. Information obtained during monitoring may assist in assessment of effects of future activities, and can also help us to refine minimization measures. Biological monitoring during night time activities, such as fireworks shows, presents unique challenges since observations are compromised by lack of light and nocturnal disturbance from the monitoring itself may impact birds. Monitoring nest sites before and after disturbance events can also aid in assessment of impacts, particularly in situations where night time monitoring is problematic. We recommend monitoring of least terns and snowy plovers, as described below, however we do not recommend monitoring of rails at this time due to the potential for disturbance associated with monitoring (Zembal 2016, pers. comm.).

B-37 [The Port proposes to monitor the least tern colony at SDIA, and we recommend that, similar to previous years, monitoring occur on the following dates and times: July 3 and July 4, 1 hour before, during, and 1 hour after the time of the fireworks show; and July 5, early in the morning. Monitoring should include assessment of nest attendance (or abandonment), and estimates of adult, chick, and fledgling numbers and behavior, including any observed responses to fireworks shells. We recommend that the Port also coordinate with the Navy regarding comparable least tern monitoring at NASNI. We also recommend that the noise and vibration be monitored at SDIA and NASNI. Reporting should include the noise and vibration levels before and during the fireworks show; the location of the night roosts (if possible); observations of spectator disturbance; observations of least tern response to fireworks and spectators; estimated number of adult least terns, active nests, and chicks onsite before and after the fireworks show; and any evidence of harm to least terns.

B-38 [We recommend that the least tern nesting colony at the Refuge be monitored on July 4 prior to the event, and in the morning on July 5 to assess colony attendance and estimate the number of active nests and chicks present onsite. Reporting should include the location of roosting/nesting area(s) and the estimated number of adult least terns, active nests, fledglings, and chicks onsite, and any observations of nest disturbance or harm to least terns.

B-39 [No snowy plover monitoring has been proposed by the Port, however we recommend that the Port coordinate with the Refuge and Navy to determine if active snowy plover nests or broods lie within 1.5 miles of the IB Pier launch site on July 3. If active nests or broods occur within this area, we recommend monitoring on July 4 and 5 to assess nest activity and brood presence

B-39
cont. [before and after the fireworks display. Reporting should include the location of nests and broods, the number of active nests, chicks and adults onsite, and any observations of nest disturbance or harm to snowy plovers.

B-40 [We appreciate the opportunity to provide recommendations to reduce potential impacts to sensitive wildlife from the Big Bay Boom and IB fireworks shows. Results from our recommended monitoring should aid the preparation of the DEIR for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project. We request that the Port provide a response to our recommendations and a draft monitoring plan for our review by June 1, 2016, and a monitoring report by September 15, 2016. Should you have any questions regarding this letter or need further assistance, please contact Sandy Vissman at (760) 431-9440, extension 274.

Sincerely,

Karen A. Goebel
Assistant Field Supervisor

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (UPD #EIR-2015-115), in San Diego County, California

Dear Mr. Giffen:

The U.S. Fish and Wildlife Service (Service) has reviewed the Notice of Preparation of a Draft Environmental Impact Report (EIR) for San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (NOP). The NOP describes the proposed project and was distributed to the Service to request guidance regarding the scope and content of the environmental information to be included in the EIR. The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Federal Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*).

B-41 The proposed Project involves continued permitting of ongoing and proposed fireworks display events in and around San Diego Bay and the Imperial Beach Oceanfront in San Diego County, California. Current fireworks display events include the "Big Bay Boom" and other smaller events operated by the San Diego Unified Port District's (District's) tenants. Proposed fireworks displays include fireworks on the Chula Vista Bayfront. Fireworks are detonated from flight decks, barges, and/or piers located adjacent to, or in the waters of San Diego Bay or the Imperial Beach Oceanfront. The District estimates that at this time approximately 50 fireworks displays are permitted per year, and anticipates that firework displays within the Project Area are likely to increase at a rate of 2 percent per year. Fireworks displays currently occur year-round, with a duration ranging from 5-20 minutes. Existing events occur at South Embarcadero, North Embarcadero, near Shelter Island, near Harbor Island, Glorietta Bay, and Imperial Beach Oceanfront.

B-41
cont.

We appreciate the efforts of the District to address the cumulative impacts of multiple fireworks displays in the proposed DEIR, and offer the following comments and recommendations to assist the District in identifying, avoiding, minimizing, and adequately mitigating direct and indirect project-related impacts to fish and wildlife resources, including Endangered and Threatened species:

B-42

1. San Diego Bay and the Imperial Beach Oceanfront, including the vicinity of some launch and viewing sites, support resident and migratory sea birds, shore birds, passerines, endangered bird species, sea turtles, fish, and marine mammals. Significant populations of birds use portions of San Diego Bay year round: during the summer months thousands of birds nest, breed, and raise young, particularly in south San Diego Bay; and during the winter months, thousands of migrating or wintering waterfowl take refuge in the Bay. Fireworks displays include significant levels of light, noise, and vibration known in some instances to result in temporary disturbance to wildlife (Patton 2013; Sandoval 2005). Fireworks may also disrupt roosting and exacerbate predation pressure (Caffree 1994). If launched over or near the water, displays may deposit residual debris and chemical constituents into the water and thereby affect water quality (San Diego Regional Water Quality Control Board 2011). Please include in the DEIR a thorough review of the available literature pertaining to the potential or documented impacts of fireworks displays or similar punctuated disturbances on wildlife.

B-43

2. To facilitate assessment of the environmental effects of the proposed action, we recommend that the DEIR include: 1) a figure that depicts the precise location of existing and future proposed launch sites; 2) a figure depicting the location of sensitive resource use areas within the vicinity of proposed launch sites (including, but not limited to, Sweetwater National Wildlife Refuge, Chula Vista Wildlife Reserve, South San Diego Bay Unit of San Diego National Wildlife Refuge, San Diego International Airport Least Tern Nesting Area, Naval Base Coronado Delta Beaches, Naval Base Coronado “heron park”, Tijuana National Wildlife Refuge, marine mammal haul out areas); 3) a figure that depicts the location and abundance of rare, endangered, and other sensitive species that occur in the vicinity of proposed launch sites (including, but not limited to, federally threatened Western snowy plover (*Charadrius nivosus nivosus*, snowy plover), federally endangered California least tern (*Sternula antillarum browni*, least tern), federally endangered Light-footed clapper rail, recently reclassified as “Ridgeway’s rail” (*Rallus longirostris levipes*, clapper rail), Belding’s Savannah sparrow (*Passerculus sandwichensis beldingi*, Savannah sparrow), American Peregrine falcon (*Falco peregrinus anatum*, peregrine falcon), gull-billed tern (*Gelochelidon nilotica*)); 4) information regarding the abundance and distribution of water birds use San Diego Bay, Tijuana Estuary, and Imperial Beach (for example, information available from San Diego Bay bird surveys supported by the U.S. Navy and the District, annual San Diego Shorebird Survey, and San Diego National Wildlife Refuge bird surveys).

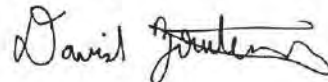

- B-44 | 3. Please include in the DEIR detailed information regarding the number, location, and duration of baseline events that have occurred in recent years, and the number, location, and duration of additional proposed events (i.e. events that have been permitted by the District, but have not yet occurred).
- B-45 | 4. The DEIR should include an analysis of the intensity and extent of light, sound, vibration, and debris/fallout anticipated as a result of the fireworks displays, based on the size and number of fireworks shells that will be used. The analysis of the effects of the proposed action should include an assessment of the areas where light, sound, vibration, and debris are expected to have a direct impact on wildlife.
- B-46 | 5. The DEIR should include an analysis of the potential indirect effects of the fireworks displays on wildlife resources in the Project Area. Potential indirect effects of fireworks displays include, but are not limited to: disturbance or impacts to resources from spectators, changes in water quality associated with debris or fallout from fireworks.
- B-47 | 6. The Carlsbad Fish and Wildlife Office has previously recommended, and continues to recommend that the no fireworks displays occur within the Chula Vista Bayfront during the avian breeding season (generally January-September) due to the close proximity to the abundance of sensitive wildlife resources that occur within and around the Sweetwater National Wildlife Refuge, the South San Diego Bay National Wildlife Refuge (Wildlife Refuges), and the Chula Vista Wildlife Reserve. Similarly, we have recommended and continue to recommend that fireworks displays be minimized at the Loew's Coronado Resort during the avian breeding season due to the proximity of this hotel to protected least tern and snowy plover habitat at Silver Strand State Beach and Naval Base Coronado.
- B-48 | 7. The DEIR should include conservation measures to avoid and minimize the potential impacts of the Project on sensitive wildlife. The Carlsbad Fish and Wildlife Office has previously recommended conservation measures be included to existing and ongoing fireworks displays specifically to avoid and/or minimize potential impacts to nesting least terns and snowy plovers, including: 1) Location of discharge sites for fireworks as far away as possible (minimum of 1 mile) from the nearest least tern or snowy plover nesting site; 2) Delineation and law enforcement patrol of shoreline around least tern and snowy plover nesting areas to prevent spectators from coming ashore or anchoring in eelgrass beds; 3) Reduction in shell size to reduce the percussive vibrations associated with fireworks detonations; 4) Development and implementation of a least tern and snowy plover monitoring approach approved by the CFWO; 5) Development of a plan to mitigate any negative impacts (to least terns and snowy plovers) observed by the monitoring biologist.

B-49

8. The District estimates that fireworks displays may increase approximately 2 percent per year. The DEIR should analyze the need for an increased number of fireworks displays. We recommend that the District consider limiting the number of fireworks displays that may occur throughout the year at approved launch sites.

We appreciate the opportunity to provide comments on this NOP. Should you have any questions regarding this letter, please contact Sandy Vissman of my staff at (760) 431-9440.

Sincerely,

for: Karen A. Goebel
Assistant Field Supervisor

Subject: Comments on the Draft Environmental Impact Report for the Chula Vista Bayfront Master Plan and Port Master Plan Amendment, City of Chula Vista, California (SCH #2005081077)

Dear Mr. Hicks,

The U.S. Fish and Wildlife Service (Service) and California Department of Fish and Game (Department) (collectively referred to as 'Wildlife Agencies') have reviewed the above-referenced draft Environmental Impact Report (DEIR) and supporting documentation for the Chula Vista Bayfront Master Plan and Port Master Plan Amendment (Proposed Project), dated September 29, 2006. The public review period for the DEIR ends January 11, 2007. The comments provided in this letter represent our concerns about the Proposed Project's potential impacts on sensitive biological resources.

The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Endangered Species Act (16 U.S.C. 1531 *et seq.*). The Department is a Trustee Agency and a Responsible Agency pursuant to the California Environmental Quality Act (CEQA) Guidelines, Sections 15386 and 15381, respectively. The Department is responsible for the conservation, protection, and management of the state's biological resources, including rare, threatened, and endangered plant and animal species, pursuant to the California Endangered Species Act and other sections of the Fish and Game Code, and administers the Natural Community Conservation Planning (NCCP) program.

The 562-acre Chula Vista Bayfront (Bayfront) is located on the southeastern edge of San Diego Bay in the City of Chula Vista. The subject planning area shares a common border with the Sweetwater Marsh Unit of the San Diego Bay NWR at its northern boundary and the South San Diego Bay Unit of the San Diego Bay NWR at its southern boundary. In 2002, the San Diego Unified Port District (Port) and the City of Chula Vista (City) joined together to prepare a master

plan for the Bayfront, which includes approximately 500 acres of land area and 62 acres of water area. Proposed uses include hotel, retail, entertainment, conference center, office, residential, civic/cultural, marina and ferry terminal, recreation, parkland, environmental buffers, a public pier, and associated public facilities such as streets, bikeways, pedestrian paths, and parking structures. Key components of the Proposed Project described in the DEIR include:

- A resort conference center and other hotels with a maximum height limit of 300 feet (25 stories);
- Up to 2,000 residential units with a maximum height limit that ranges from 300 feet in the Harbor District to 200 feet in the Otay District;
- Mixed use office and commercial recreation uses with maximum allowable heights ranging from 85 to 200 feet in the Harbor District and 40 to 100 feet in the Sweetwater District;
- Waterfront retail uses and public gathering spaces around the harbor;
- A new commercial harbor, ferry terminal, and realigned navigation channel;
- A 21-acre public park and other open space areas;
- A public promenade and bike trail through the entire Bayfront;
- A new traffic circulation system, storm water system, and the installation of various other public services and facilities to serve the proposed uses; and
- The relocation of the existing power plant to the southern end of the planning area.

The master planning area has been divided into three districts: the northern 129-acre Sweetwater District; the central 280-acre Harbor District; and the southern 153-acre Otay District. Development within the planning area would occur in three phases over an approximately 25-year period. Construction of Phase I is proposed to begin upon project approval and conclude approximately six years later. Phase I components would be concentrated in the Harbor and Sweetwater Districts. Phase II construction would be completed approximately five years after the completion of Phase I and Phase III is expected to be completed approximately 13 years after the completion of Phase II.

As the master plan represents a joint planning effort covering a large area of land and water, a number of jurisdictional issues must be addressed and resolved. The Port currently has jurisdiction over much of the land and water areas, while the City currently exercises jurisdiction over some of the inland portions of the planning area. The Proposed Project includes a land exchange between the Port and a private developer. This land exchange would include the transfer of up to 97 acres of land in the Sweetwater District from a private developer to the Port, in exchange for up to 57 acres of land in the Harbor and Otay Districts from the Port to the private developer. In association with this exchange, lands currently designated for residential use in the Sweetwater District would be redesignated for uses permitted on State tidelands and areas in the Harbor and Otay District would be redesignated to allow for residential development.

The DEIR also addresses the following Project-related actions: an amendment to the Port Master Plan; a coastal development permit for those portions of the project that would occur within the Port's jurisdiction; an amendment to the City's Bayfront Area Plan of the General Plan; amendments to the City's Local Coastal Program, Bayfront Specific Plan, and Bayfront/Town Centre 1 Redevelopment Plan; approval of a dredging permit from the State Lands Commission

in order to realign the existing navigation channel in San Diego Bay; and issuance of permits from the U.S. Army Corps of Engineers, the Department, and the Regional Water Quality Control Board.

The Department and the Service previously commented on the Notice of Preparation (NOP, SCH# 2002081116) for the Bayfront Village Project that was restricted to the 128-acre area currently included in the Sweetwater District. The Department commented in a letter dated September 24, 2002, and the Service provided a similar letter, dated September 19, 2002. The Wildlife Agencies also commented on the NOP for the Proposed Project in a letter dated September 12, 2005. The Service also provided a letter to the Port and City, dated April 22, 2004, that emphasized the importance of the habitats in the south end of San Diego Bay and the need for the Proposed Project to adequately protect the south bay's locally, regionally, and globally important natural resources. We appreciate that, relative to the project previously proposed in 2002, it appears that the currently Proposed Project would result in considerably adverse biological impacts within the Sweetwater District. However, considering the overall intensity of the larger project proposal, we retain many of the concerns that we raised in our previous letters. All of our comments in past letters also apply to the Proposed Project, as described in the DEIR dated September 2006.

A summary of the Wildlife Agencies' primary comments and concerns about the DEIR follows. We are disappointed that the DEIR provides no or inadequate analysis of, and mitigation for, many of the biological impacts about which we previously provided (in letters and electronic mail to, and meetings with, the Port) substantive comments and recommendations, and requested the DEIR thoroughly address. We request a meeting with the Port, the City, and stakeholders to further discuss the Proposed Project and our comments, after we have had an opportunity to review the responses to our comments, and prior to the Port's decision as to whether to revise and recirculate the DEIR (comment 2 below), or well in advance of the Board of Port Commissioners' consideration of the DEIR for certification.

1. The Wildlife Agencies do not concur with the DEIR that significant impacts to biological resources and wetlands have been minimized to a level less than significant (Section 4.8.7). The DEIR does not adequately evaluate all project impacts to biological resources, even at a programmatic level, and the full range of mitigation measures needed to reduce potential impacts to a level less than significant are either not addressed or, in some instances where measures are addressed, future implementation of the measures cannot be assured. We strongly urge the Port to (a) revise the DEIR to adequately identify and analyze the Proposed Project's biological impacts addressed in this comment letter, and to provide appropriate mitigation for the impacts, and (b) to recirculate the revised DEIR for public review and comment.
2. The Wildlife Agencies support a land exchange that eliminates or minimizes the possibility of residential development and its associated direct and indirect impacts to on-site and adjacent sensitive biological resources. We therefore recommend that the Proposed Project be modified to incorporate certain components of both the Modified Land Exchange and the Harbor Park Alternative, as specified in our detailed comments in the Enclosure. We do not support the inclusion of a 2,000 to 5,000 seat amphitheater on

parcel HP-1, which is proposed as part of the Harbor Park alternative, because it would increase disturbance to wildlife that roost and nest within and/or in the vicinity of the project site.

3. Based on information available regarding the Proposed Project, we are especially concerned about its potential direct and indirect impacts to: (a) intertidal wetlands (*e.g.*, Sweetwater Marsh, F&G Street Marsh, J Street Marsh, and the mudflats located north of the Harbor District) and their associated federally and state-listed plant and wildlife species, including the light-footed clapper rail (*Rallus longirostris levipes*) and Belding's savannah sparrow (*Passerculus sandwichensis beldingi*); (b) subtidal bay habitats and their associated fisheries resources, eelgrass beds, and migratory bird foraging and rafting areas; (c) migratory birds, including those birds identified by the Service as Birds of Conservation Concern, that rely on the south San Diego Bay for foraging and resting areas during migration along the Pacific Flyway; (d) colonial nesting seabirds such as the federally and state-listed California least tern (*Sterna antillarum browni*) and federally listed western snowy plover (*Charadrius alexandrinus nivosus*), shorebirds, and waterfowl that nest in proximity to the project site; and (e) species covered by the City's Multiple Species Conservation Program (MSCP) Subarea Plan.
4. The level of detail provided in the DEIR for specific project design, potential project impacts, and appropriate mitigation measures for the Phase I projects is not sufficient to allow adequate project-specific review under CEQA. Therefore, the analyses provided throughout the DEIR should be considered programmatic.
5. Portions of the Proposed Project and lands adjacent thereto are subject to the standards laid out in the City MSCP Subarea Plan. Since the Port does not have a habitat conservation plan/NCCP to guide its development projects, the entire project should meet or exceed the mitigation ratios, guidelines, and standards required by the City's MSCP Subarea Plan to maintain consistency with its application to the on-site and adjacent areas within Plan.
6. The DEIR does not identify the Proposed Project's many indirect impacts to adjacent sensitive habitats and sensitive species located therein, nor does it propose adequate measures to mitigate such impacts. Such indirect impacts, otherwise known as "edge effects," include increased predation, increased disturbances to wildlife, bird strikes and disorientation, shading of adjacent habitat, human encroachment, increased noise, increased illumination, and detrimental changes to hydrology and water quality. A fenced minimum 100-foot wide "no-touch" habitat buffer should be provided around all sensitive habitats, including mitigation habitats, to minimize indirect impacts. Degradation of habitats due to unavoidable indirect impacts should be mitigated, in part, through creation or restoration of similar habitats.

The Wildlife Agencies offer the preceding general comments, and our general and specific recommendations and comments on the adequacy of DEIR in the accompanying Enclosure, to assist the Port and project applicant(s) in ensuring that the Proposed Project's biological impacts are avoided and/or minimized to below a level of significant.

We appreciate the opportunity to comment on the DEIR. For questions regarding this letter, contact: Carolyn Lieberman or Amber Himes at (760) 431-9440 of the Service; and Libby Lucas at (858) 467-4230 or Marilyn Fluharty at (858) 467-4231 of the Department.

Sincerely,

**WILDLIFE AGENCIES' COMMENTS ON THE DRAFT EIR FOR
THE CHULA VISTA BAYFRONT MASTER PLAN AND
PORT MASTER PLAN AMENDMENT**

The Wildlife Agencies offer the following general and specific recommendations and comments on the adequacy of Draft Environmental Impact Report (DEIR) to assist the San Diego Unified Port District (Port) and project applicant(s) in ensuring project impacts to biological resources are avoided and/or minimized to below a level of significant. Our specific comments are based on the preferred alternative. If the alternative approved for implementation deviates from the preferred alternative presented in the DEIR, we may have additional comments. We request a meeting with the Port, the City, and stakeholders to further discuss the Proposed Project and our comments, after we have had an opportunity to review the responses to our comments, and prior to the Port's decision as to whether to revise and recirculate the DEIR (comment 2 below), or well in advance of the Board of Port Commissioners' and consideration of the DEIR for certification.

The Proposed Land Exchange

1. The Wildlife Agencies support a land exchange that eliminates or minimizes the possibility of includes removal of residential development and its associated direct and indirect impacts to on-site and adjacent sensitive biological resources. We therefore recommend that the Proposed Project implement an alternative that incorporates the following components of both the Modified Land Exchange and the Harbor Park Alternative:
 - a. the components of the Modified Land Exchange that avoid placing residential development and its associated impacts adjacent to the J Street Marsh and the Sweetwater Marsh and South San Diego Bay Units of the San Diego NWR;
 - b. the components of the Harbor Park Alternative that relocate (i) the Signature Park from the Sweetwater District (S-2) to the Harbor District (H-3), and (ii) a conference hotel from the Harbor District to the Sweetwater District (S-2), to minimize uncontrolled human and animal encroachment into the Sweetwater Marsh Unit and adjacent mudflats;
 - c. move the Resort Conference Center (RCC) farther away from San Diego Bay (from H-3 to H-23) to avoid impacts to the F&G Street Marsh and the Bay due to shading, to minimize its potential for losses of listed species from avian predators perching on tall structures, and to reduce the potential for bird strikes; and,
 - d. reduce the building heights in the areas of the Sweetwater District (S-1) that are adjacent to the Sweetwater Marsh Unit to avoid impacts related to shading and predator perching.

We do not however support the inclusion of a 2,000 to 5,000 seat amphitheater on parcel HP-1, which is proposed as part of the Harbor Park alternative, because it would increase disturbance to wildlife that roost and nest within and/or in the vicinity of the project site.

Adequacy of Environmental Review under CEQA

2. Throughout the DEIR, there are multiple instances of inadequate identification and analysis (even at a programmatic level) of biological impacts, and inadequate, or inappropriate deferral of, mitigation. Subsequently, the impact analyses and proposed mitigation is insufficiently detailed to assess the biological implications of the Proposed Project. CEQA requires that all anticipated impacts and proposed mitigation be clearly identified in a DEIR and not deferred for future study. This is supported by *Sundstrom v. County of Mendocino*, 202 Cal.App3d 296, which states “the requirement that the applicant adopt mitigation measures recommended in a future study is in direct conflict with the guidelines implementing CEQA....By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process.”

The lack of inadequate analysis and mitigation in the DEIR undermines the basic purposes of CEQA. These purposes include, but are not limited to the following: (a) informing governmental decision-makers and the public about the potential, significant environmental effects of proposed activities; (b) identifying the ways that environmental damage can be avoided or significantly reduced; and (c) preventing significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible [CEQA Guidelines, section 15002(a)].

Based on the foregoing and ensuing comments and recommendations, we strongly urge the Port to (a) revise the DEIR to adequately identify and analyze the Proposed Project’s biological impacts addressed in this comment letter, and to provide appropriate mitigation for the impacts, and (b) pursuant to Section 15088.5 of the CEQA Guidelines, recirculate the revised DEIR for public review prior to its consideration for certification.

This would be particularly appropriate if, for example, there is one or more feasible project alternative(s), or there are mitigation measures, considerably different from those previously analyzed that would clearly lessen the environmental impacts of the Proposed Project, but the Port declines to adopt them [CEQA Guidelines, Section 15088.5(a)(3)]. Our recommendation derives from the lack of basic impact analyses in the DEIR, analyses needed to conform to CEQA. The revisions to the DEIR to be recirculated should be fully responsive to our comments by providing full disclosure of the potential project-related biological impacts, and additional measures necessary to mitigate the impacts to a level less than significant.

3. The DEIR states, “Additional environmental review ...required for Phases II and III projects will be determined pursuant to State CEQA Guidelines Section 15168.” However, the project description, impact analysis, and proposed mitigation measures in the DEIR for Phase I projects provide insufficient information to constitute a project-level review under CEQA. Again, the DEIR does not satisfy the basic purposes of CEQA because it lacks the level of detail (particularly with respect to project descriptions, impact analysis, and proposed mitigation) needed for thorough evaluation and review of potential Project-related impacts. For these reasons, as discussed further in subsequent comments herein, the entire DEIR should be considered a programmatic DEIR, and all project components, including those in Phase I, should be subject to subsequent public review and comment.
4. The existing conditions discussion of Land/Water Use Compatibility (Section 4.1 of the DEIR) is generally limited to land uses within the Proposed Project footprint, though the discussion should also address the Proposed Project’s compatibility with adjacent uses. The document should describe the land uses and planning policies established for the San Diego Bay National Wildlife Refuge (NWR), which abut the Proposed Project site to the north, south, and west. For this purpose, Section 4.1.1.1 of the recirculated/final EIR should include a discussion of the recently approved Comprehensive Conservation Plan for the NWR. In addition, the recirculated/final EIR should accurately analyze the potentially significant land use compatibility impacts to the NWR that could result from the implementation of various components of the Proposed Project.

Specific Comments

The following comments address specific sections in the DEIR where project information is insufficient for the level of review necessary under CEQA. The recirculated/final EIR should provide a level of detail necessary for adequate analysis and disclosure of biological impacts and determination of appropriate mitigation.

5. Section 4.1.1.1 should be revised to address the NWR, and Figure 4.1-5 should be revised to include not only the current boundary of the Sweetwater Marsh Unit of the NWR, but also the current boundary of the South San Diego Bay Unit of the NWR to the south and west. Suggested language for Section 4.1.1.1 (San Diego Bay NWR Comprehensive Conservation Plan) is provided below.

g. San Diego Bay NWR Comprehensive Conservation Plan

The U.S. Fish and Wildlife Service recently completed a Comprehensive Conservation Plan (CCP) for the San Diego Bay NWR (USFWS 2006). The CCP, which provides a 15-year strategy for achieving refuge purposes and contributing towards the mission of the National Wildlife Refuge System, describes why this Refuge was established and outlines the Refuge purposes, vision, goals, and objectives.

The San Diego Bay NWR includes the 316-acre Sweetwater Marsh Unit to the north of the Proposed Project, and the South San Diego Bay Unit, which includes 2,300 acres of land and water to the south and west of the Proposed Project. The Refuge was established to protect, manage, and restore habitats for federally listed species and migratory birds, and to maintain and enhance the biological diversity of native plants and animals on the Refuge. The Refuge includes most of what remains of San Diego Bay's historic coastal salt marsh and intertidal mudflat habitat. Refuge goals include: protecting, managing, enhancing, and restoring the coastal wetland and upland habitats on the Refuge to benefit native fish, wildlife, and plant species; protecting state and federally listed species and migratory birds supported on the Refuge; protecting foraging and nesting habitat for colonial nesting seabirds in the South San Diego Bay Unit; and providing opportunities for public uses that are compatible with Refuge purposes.

6. The project description in the recirculated/final EIR should provide more than only limited acknowledgement that the southern end of the Proposed Project footprint abuts a segment of the South San Diego Bay Unit NWR. A portion of parcel OP-2A directly borders 3000 feet of the NWR. The label "South San Diego Bay Unit of the San Diego Bay National Wildlife Refuge" should be used to identify the NWR on Figures 3-2, 3-3, 3-4, 3-5, 3-7, and 4.8-1. In addition, Section 3.1 and associated graphics should be revised to distinguish between the Sweetwater Marsh Unit and the South San Diego Bay Unit of the NWR. The last sentence in the second paragraph of Section 3.1 should read: "Palomar Street and the South San Diego Bay Unit of the San Diego Bay NWR, which includes the existing salt evaporation ponds, at the southern end of San Diego Bay border the planning area to the south and west."
7. The analysis of compatibility of the Proposed Project with the NWR on page 4.1-77 of the DEIR is inadequate. The significant impacts identified on page 4.1-68 of the DEIR related to public access, lighting, and noise (which should also address fireworks, outdoor concerts, and in-water uses) should also be clearly presented under Criterion 3 in Section 4.1.3 and should be expanded to address both the Sweetwater Marsh and South San Diego Bay Units of the NWR. Factors that should be considered in determining the Proposed Project's compatibility with the NWR include impacts to NWR habitats and wildlife from shading, storm water discharge, changes in topography that could affect current hydrological conditions on the NWR, increased noise levels and increased night lighting and sky glow, increases in predation, unauthorized access onto sensitive habitats, and other factors addressed throughout this comment letter. Corresponding enforceable mitigation measures that would reduce impacts to a level less than significant should also be added to Section 4.1.4. Finally, the Wildlife Agencies do not concur with the conclusion of the DEIR that "strategic" fencing would reduce compatibility impacts to a level less than significant, in part because no amount of fencing will minimize most the negative effects of most of the factors mentioned above. Nevertheless, the entire boundary of the Proposed

Project should have fencing or other suitable barriers that would prevent unauthorized access by humans and pets into sensitive coastal habitats.

8. The Wildlife Agencies consider the DEIR misleading in its classification of wetland resources under different regulatory jurisdictions. For example, the DEIR indicates that seasonal ponds in the Otay District and mulefat scrub in the Sweetwater District are exempt from the U.S. Army Corps of Engineers' (Corps) jurisdiction due to isolation. And, Figure 4.8-6, *Overview of USACE Jurisdictional Resources*, labels these wetlands as "exempt from jurisdiction." However, the Corps has not made this conclusion. Until the Corps designates which areas within the Project footprint are subject to or exempt from their regulation, the EIR should refrain from making such designations. The Wildlife Agencies believe that these seasonal ponds may be subject to the Corps jurisdiction based on information provided in the DEIR. Specifically, the DEIR indicates that the Soil Survey for San Diego County maps tidal flat soils along the eastern edge of the Otay District. Furthermore, the historic footprint (*i.e.*, 1859) of San Diego Bay also occurred within the Otay District (Map 3-1 in San Diego Bay Integrated Natural Resource Management Plan, Navy and Port 2000). We recommend that the recirculated/final EIR reflect wetland delineations that have been verified by the appropriate agencies so that the public can review all impacts to wetlands and waters, and their associated mitigation.
9. Based on the description of the uses to be permitted within the eastern 200 feet of the proposed 400-foot wide "ecological buffer," the Wildlife Agencies request that the nomenclature used for the buffer be changed to avoid any misunderstanding on the part of the public or the decision makers. As described in the DEIR, the 400-foot-wide area does not meet the intent of an "ecological buffer." Specifically, the human activities to be allowed within the eastern 200 feet are not compatible with the purposes of an ecological buffer. A true ecological buffer represents an area where no human activity is allowed except for conservation and restoration purposes. In the case of the Proposed Project, the only ecological buffer is within the 200-foot no touch/mitigation area, with the exception of the proposed trail outlooks. The 100-foot limited use buffer and 100-foot transitional use zone should not be considered ecological buffers because they allow uses that are not compatible with conservation. Therefore, the recirculated/final EIR should rename this 200-foot area to more accurately describe the types of low intensity park uses that are proposed within it. Note that we are not requesting a wider true ecological buffer; we are simply a requesting clarification of the intent and uses that would occur within the 400-foot-wide area that abuts the Sweetwater Marsh Unit.
10. The DEIR does not identify the numbers, heights, or locations of the buildings proposed on each parcel. This lacking information is particularly important for parcels S-1, S-4, H-3, H-13, H-14, and O-1A and O-1B, which are adjacent to preserved wetlands within the NWR or other wetland areas (*e.g.*, Sweetwater Marsh, F&G Street Marsh, and J Street Marsh). Depending on their design and location, the buildings on these parcels could provide raptorial perches that overlook wildlife habitat supporting several sensitive avian species

that are prey for raptors, result in bird strikes, and shade adjacent wildlife habitats. Yet, the DEIR does not include adequate mitigation measures to avoid and minimize biological impacts associated with the buildings.

11. The DEIR does not provide adequate information to enable the reviewer to understand how the existing elevations within the Proposed Project site would be changed or how existing drainage patterns would be altered to accommodate future development. The full project-level impact analysis of Phase I in the recirculated/final EIR should include a detailed grading plan for each of the Phase I development areas. Without this information, it is infeasible to properly assess the Phase I potential effects to adjacent coastal resources.
12. The overall design of the Proposed Project should minimize biological impacts in all three project Phases. Project components of Phase I should not foreclose the potential to avoid or minimize the biological impacts from Phases II and III. For example, to a considerable degree, the design (e.g., height) and location of the buildings (i.e., aspects of the buildings that affect biological resources such as the Pacific Flyway) in Phase I will dictate the same for buildings in Phases II and III. Trade-offs among the three Phases in the design and location of buildings warrant considering the entire project as a whole to avoid or minimize its biological impacts.
13. The project description for Parcel S-2 Signature Park (Phase I) lacks the detail necessary for a full analysis of its impacts. The recirculated/final EIR should include: an as-built 11"x17" rendering of the of the Proposed Project design; a full description, with all permitted uses, anticipated activities, hours of operation, structures, lighting fixtures, and other accessory features fully described; and, a detailed analysis of the impacts associated with each of these proposed elements.
14. The project description for Parcel S-2A Open Space (Phase I) describes the parcel as an existing street and as a project mitigation site. The DEIR provides no description of the condition of the vegetation on site, nor details regarding the possible use of the site for mitigation. If this parcel is to be included in Phase I, then the proposed use of the parcel should be fully described. Decisions regarding use of the site for mitigation and whether or not the existing street segment would be demolished are necessary in order to complete adequate project specific CEQA review. The EIR should address the following: whether the site, if used for mitigation, would become part of the F & G Street Marsh; how might the restored habitat be affected by implementation of the Proposed Project; and what would be the value of the site in terms of conservation.
15. The project description in the recirculated/final EIR should acknowledge that the southern end of the Proposed Project is located in the vicinity of the City of San Diego's MSCP preserve, the Multiple Habitat Planning Area (MHPA). Figure 4.8-1 should be revised to include the boundaries of the MHPA.

16. Figure 4.8-1 should be revised to identify the mudflats located west of the Sweetwater Marsh and north of the Harbor District. The recirculated/final EIR should discuss the importance of this mudflat as a biological resource that provides essential foraging and resting areas for birds migrating along the Pacific Flyway.
17. The recirculated/final EIR should provide the details and purpose of the habitat buffer (*e.g.*, buffer width, vegetative cover, permitted and prohibited uses within) between the J Street Channel and development in the Harbor District or around the F&G Street Marsh.
18. The description of the design of the new F&G Street Marsh Bridge is not of sufficient detail to allow for adequate project-level analysis of potential impacts to wetlands and biological resources in the adjacent NWR. The description lacks important details such as the overall design (*e.g.*, length of the bridge), the type of crossing (*e.g.*, box culvert, open span), and duration of its construction.
19. If the recirculated/final EIR retains (we recommend that it not – comment 31b) the proposed pedestrian bridge at Lagoon Drive between the seasonal wetland (SP-2) and F&G Street Marsh, it should provide an evaluation of how the bridge could affect the restoration potential of these two marshes (*e.g.*, any restoration limitations due to the length and height of the bridge).
20. The recirculated/final EIR should provide the design specifications (*e.g.*, box culvert or open expanse, length, height) of the bridge for the new E Street as it crosses the primary tidal channel connecting the F&G Street Marsh to San Diego Bay (see comment 31d).
21. The design of the Resort Conference Center (RCC; Parcel H-3) is not described sufficiently to fully analyze potential impacts. Important design features that need to be discussed in the project description include the proposed building layout on the site with all building heights indicated, the building surface design (*e.g.*, amount and height of glass), building and landscape lighting proposals, and the major components of the landscape design (*e.g.*, tree placement and potential species mix).
22. The project description for parcel HP-23A states, “Because no specific use is proposed, uses that would generate traffic would be subject to separate environmental review pursuant to CEQA Guidelines 15168.” This is a misleading statement in that, regardless of the amount of traffic they would generate, all of the programmatic level components (*i.e.*, all project components of Phase II or III, not just parcel HP-23A) of the Proposed Project would likely be subject to subsequent environmental project-level analysis pursuant to CEQA in order to fully evaluate all of their potential environmental effects. This project-level analysis should occur only after site plans and design for Phases II and III are prepared.

Mitigation for Direct Losses of Habitat and Species

23. Throughout the project description, there is mention of small areas that would be designated as “Wetlands and Mitigation Bank.” However, there is no description of what this designation means. It is unclear whether these areas are intended solely for project-related mitigation obligations, or to provide the latter plus mitigation “credits” using excess (*i.e.*, beyond the project-related mitigation obligations) mitigation for other projects. If the intent is the former, the term “Mitigation Bank” should not be used. If the intent is the latter, the project applicant needs to go through the appropriate channels to obtain authorization to sell mitigation credits. In this case, the project applicant should discuss this with the Wildlife Agencies as soon as possible, though it may be that the Wildlife Agencies will accept these mitigation areas as mitigation only for the indirect impacts of the Proposed Project.
24. The DEIR identifies the mitigation for the entire Proposed Project. While this addresses the cumulative impacts of the Proposed Project, recirculated/final EIR should also provide the impacts and associated mitigation broken down per parcel. Assuming that the owners of each individual parcel would be responsible for mitigating the impacts to that parcel, it will be necessary to have a table and/or text description of who would be responsible for what impacts and mitigation per.
25. The recirculated/final EIR should clarify why Table 4.8-5 distinguishes between total acreage and total credits, and which number is intended to account for the mitigation obligations of the Proposed Project
26. Since the clapper rail is not only a federal and state endangered species, but also a State Fully Protected Species, only the Service can authorize its take.¹ Therefore, Mitigation Measure 4.8-4, which addresses direct impacts to light-footed clapper rail (*Rallus longirostris levipes*, clapper rail), should be modified to assure that impacts to clapper rail are avoided year-round because this species is a year-round resident. As the species is secretive and reacts to disturbances by hiding in the vegetation, it is susceptible to being crushed by heavy equipment. Therefore, any work occurring within potential clapper rail habitat may affect this listed species and requires consultation with the Service pursuant to the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.). The DEIR should acknowledge that any take must be authorized by the Service and should be expanded to indicate how implementation of the proposed biological monitoring will be assured. Mitigation measure 4.8-7 should be revised to provide assurance that there will be no take of clapper rail.

¹ Pursuant to Section 3511 of the California Fish and Game Code, the light-footed clapper rail is also designated as a State Fully Protected species. This designation prohibits take or possession of this species at any time (*i.e.*, no take authorizations from the State are available). This also applies to the bird’s eggs.

27. The statement on page 4.8-37 indicating that gnatcatcher have not been reported in the project vicinity is incorrect. The statement should be revised to state that gnatcatcher have been observed in upland habitat on the Sweetwater Marsh NWR. The impact and mitigation section should also be revised to recognize the project's effect on gnatcatchers. Any potential take, either direct or indirect, of gnatcatchers requires consultation with the Service pursuant to the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).
28. Mitigation Measure 4.8-9 B and Mitigation Measure 4.8-10 B should be revised to require that all updated assessments of potential impacts from the Proposed Project and proposed mitigation be submitted to the Wildlife Agencies for review and approval, in addition to being submitted to the Port and/or City.
29. Inappropriately, the DEIR does not require mitigation for losses of raptor foraging habitat (e.g., non-native grassland). Mitigation for project-related losses of raptor foraging habitat should occur at a ratio of 1:1 away from the project site (e.g., east of Interstate 5 or south of the South San Diego Bay Unit) since concentrating raptor habitat, and thus raptors, into the remaining habitat within and adjacent to the project site could compromise the survivorship of sensitive ground nesting birds raptors prey upon.
30. Except for mitigation for impacts to raptor foraging habitat, the Wildlife Agencies recommend that all mitigation for project-related direct and indirect impacts to sensitive habitats occur within or adjacent to the project area.
31. The following comments are specific to the *Mitigation Opportunities for the Chula Vista Bayfront Project in the City of Chula Vista, California (Recon 2006, Mitigation Plan, and Appendix AA)*.
 - a. To offset loss of wetlands and uplands, the DEIR proposes mitigation within the approximate 200-foot "no-touch" habitat buffer along the western boundaries of the Sweetwater (Parcel SP-1) and Otay (Parcel OP-2A) Districts. The Mitigation Plan (Appendix AA) states, "A carefully designed buffer zone...will lessen the impacts associated with development and create an interface that gradually transitions from undeveloped native landscape to developed areas." The Wildlife Agencies consider the restored habitat within the no-touch buffer zone as mitigation only for indirect impacts to the adjacent sensitive biological resources (e.g., Sweetwater Marsh and associated mudflats and J Street Marsh), not for direct impacts (i.e., habitat losses). Created or restored habitat that is intended as mitigation for loss of sensitive habitat should have a minimum 100-foot no-touch habitat buffer between it and adjacent development to minimize indirect impacts from development to the mitigation site. Therefore, the recirculated/final EIR should identify locations other than the no-touch buffer zone to create or restore habitat as mitigation for habitat losses. The Wildlife Agencies do, however,

concur that the habitat restoration within the buffer should be subject to a monitoring and maintenance program.

- b. Rather than replace Lagoon Drive [between the seasonal wetland (SP-2) and F&G Street Marsh] with a pedestrian bridge, the Wildlife Agencies recommend that Lagoon Drive be permanently removed to maximize restoration opportunities within and adjacent to the F&G Street Marsh and the seasonal wetland (SP-2). This would partially meet mitigation obligations for loss of habitat, and would minimize human disturbances to the wildlife that may reside within them.
- c. Consistent with our July 20, 2006, letter to the City of Chula Vista concerning the Mapping Conflict within the F&G Street Marsh area of the Chula Vista MSCP Subarea Plan, (FWS-SDG-882.7) we request that Marina Parkway proposed to also be demolished and restored as part of the buffer between the project and F&G Street Marsh, and that the restored area be remapped to again be within the City's MSCP Preserve. This would partially meet mitigation obligations for loss of habitat, and would minimize human disturbances to the wildlife that may reside within F&G Street Marsh.
- d. The Wildlife Agencies recommend an open expanse for the bridge of the proposed E Street crossing the primary tidal channel between the F&G Street Marsh and San Diego Bay. In addition, the length and height of the bridge should be maximized. This would ensure that the restoration potential within F&G Street Marsh is not limited by insufficient tidal exchange and that adequate high-tide refugia are provided to accommodate wildlife moving between the Bay and the marsh.
- e. Any habitat mitigation proposed within the F&G Street Marsh must be coordinated with, and approved by, the Refuge Manager in accordance with the existing Memorandum of Understanding for the Mitigation Leasehold Overlays on the Sweetwater Marsh Unit. Habitat mitigation and/or changes to the existing tidal channel that connects the F&G Street Marsh to San Diego Bay should also be coordinated with the Refuge Manager to ensure that no adverse effects to NWR resources could result from such actions.

Indirect Impacts and Habitat Degradation

32. The DEIR should acknowledge that indirect impacts associated with development adjacent to sensitive habitats would result in a degradation of habitat. The Proposed Project would introduce new and exacerbate existing anthropogenic negative indirect effects to adjacent biological resources; these effects include increased predation on wildlife, increased disturbances to wildlife, bird strikes and disorientation, shading of adjacent habitat, human encroachment, increased noise, increased illumination, and

detrimental changes to hydrology and water quality. Many of these indirect impacts, also referred to as “edge effects,” result in a degradation of habitat. In addition, the DEIR should analyze the adverse effects of human activity within 100 feet of the adjacent Sweetwater Marsh Unit, and does it identify potential impacts related to unencumbered access from the Signature Park into the adjacent wetlands (*i.e.*, a continuous fence to protect coastal resources from human and domestic animal intrusion).

A report published by the Department in 1973 on the natural resources of San Diego Bay states, “direct and indirect impacts upon the Sweetwater marsh complex by any further development will seriously threaten the capacity of the area to support resident and migrant wildlife populations” (Department 1973; page 87). It is primarily the potential indirect impacts associated with development that are of such concern. In 1979, the Department wrote a memo to the San Diego Coast Regional Commission on the Chula Vista Land Use Plan. The memo favors the maintenance of the agricultural operation that existed at that time adjacent to the coastal salt marsh, stating, “It would seem to be more compatible with the marsh than the proposed residential and visitor serving development. The agricultural operation provides an effective buffer between the marsh habitat and urban (or industrial) encroachment” (Department 1979).

The Wildlife Agencies recognize the efforts made to reduce the intensity of the development proposed adjacent to the Sweetwater Marsh. However, despite these efforts, we concur with the sentiments reflected in the preceding paragraph because the overall intensity of development within the Proposed Project area could still result in significant direct and indirect impacts to sensitive habitats and the species they support. The wildlife habitats that occur within or in close proximity to the Proposed Project area (*e.g.*, Sweetwater Marsh and South San Diego Bay Units of the NWR, the F&G Street Marsh, the J Street Marsh, the shoreline and mudflats of San Diego Bay, and the Chula Vista Nature Reserve) are important to the survival of numerous resident and migratory species. As such, future development must retain the biological functions and values of these sensitive habitats. The recirculated/final EIR should reflect project modifications and require habitat restoration and management elements that would mitigate for the direct, indirect, and cumulative impacts from the project. We provide below a more detailed discussion of specific indirect impacts and possible mitigation measures to reduce impacts that should be identified and addressed in the recirculated/final EIR.

Mitigation Measures for All Indirect Impacts

33. Mitigation for indirect impacts that result in permanent degradation of sensitive habitats within or adjacent to the project site should include enhancement or restoration of directly and indirectly avoided in-kind habitat elsewhere within the Proposed Project area at a minimum of a 1:1 ratio. For example, the project description indicates that Parcel HP-5, consisting of wetlands within an existing narrow “L” shaped drainage channel, would remain, and would contain a 50-foot-wide setback on either side to protect against

encroachment into the wetlands. The Wildlife Agencies generally recommend that a minimum of a 100-foot wide buffer be provided between wetlands and development. Although the wetland on Parcel HP-5 is considered open space and un-impacted in the DEIR, this wetland would experience a number of indirect impacts (*e.g.*, shading, night lighting, urban runoff). The recirculated/final EIR should fully address all such impacts to wetlands and other sensitive habitats and should provide appropriate mitigation to reduce the impacts to a level less than significant. Similarly, mitigation for degradation of the wetlands located in the Sweetwater District (SP-2 and SP-1) and the F&G Street Marsh and its tidal tributary should include enhancement of those wetlands and the restoration of similar habitats at a minimum of a 1:1 ratio.

Buffers to Sensitive Habitat and Wildlife

34. In our September 12, 2005, letter, we requested that adequate habitat buffers (*e.g.*, no touch buffers) surround all sensitive biological areas to minimize indirect impacts from adjacent development. These buffers should prohibit human and domestic animal access, consist of only appropriate locally native species, and be free of all project infrastructure (*e.g.*, erosion control devices, fences, brush management, trails, and picnic tables). To prevent human and mammalian access into buffer areas, fencing or other suitable barrier systems should be installed at the outside edge of the habitat buffer prior to the initiation of project construction. Additionally, screening or berms should be incorporated around or within the habitat buffers to protect wetland birds from lighting and noise related-disturbances from beyond the buffer. In concert with the habitat buffer, land uses adjacent to the buffer should include low intensity public use (*e.g.*, walking, biking, and passive recreation) to minimize indirect impacts (*e.g.*, lighting, shading, and noise) associated with high intensity development. We recommend that landscaping adjacent to buffers utilize only native species to conserve water and avoid or minimize pollutant (*e.g.*, fertilizers, pesticides) discharge into wetlands.

Specific Comments

35. In addition to the habitat buffers proposed in the DEIR, a no-touch minimum 100-foot wide habitat buffer should be designed around any wetland in or adjacent to the project site. For instance, buffers should surround the wetlands in SP-1, SP-2, HP-5 (L Marsh), F&G Street Marsh and its associated tidal inlet, J Street Marsh, Telegraph Creek (OP-2A), and the South San Diego Bay Unit of the NWR. These buffers should be incorporated into Parcels SP-1, S-2, HP-11, S-2A, H-13, H-14, HP-6, HP-7, OP-2A, and O-1A. A 100-foot buffer should also be placed along the entire shoreline to prevent human and domestic animal access to the mudflats and salt marsh. As the project is proposed, only parcel H-1A is designed to have a 100-foot buffer along its shoreline.
36. The DEIR inappropriately identifies the 400-foot-wide buffer (Parcel SP-1) between development (S-1, SP-3, and S-2) and Sweetwater Marsh Unit as an "ecological buffer."

Comment 9 explains why this term inaccurately describes the proposed buffer. As discussed in our September 12, 2005, letter, the 200-foot no-touch buffer zone within the Sweetwater District (Parcel SP-1) should include no human activities and should be protected with a permanent fence. As shown in Figure 4.8-24, there is an outlook, fence, and berm proposed within this no-touch buffer. The outlook, fence, and berm all need to be relocated to the 100-foot limited use zone. A permanent fence should be placed along the northern and westerly edge of the entire length of the 200-foot buffer to prevent human and animal encroachment into the habitat buffer and adjacent sensitive habitats. As recommended in our September 12, 2005, letter and discussed at several meetings with Port and City representatives, mitigation for significant direct and indirect impacts to sensitive wetland areas as a result of increased human and domestic animal activity in and around Sweetwater Marsh and adjacent intertidal areas should be provided through installation of appropriate fencing. We continue to recommend a minimum six-foot-high black vinyl chain link fence along the development side of the habitat buffer boundary. Any fencing between development and the NWR should be coordinated with the Refuge Manager. Native cacti, as proposed on page 3-28 of the DEIR, would not adequately mitigate potential impacts related to unauthorized access into sensitive areas from the adjacent park site.

The Mitigation Plan (Appendix AA) indicates that the Transitional Use Zone in SP-1 may incorporate a more landscaped theme. The Wildlife Agencies recommend that landscaping use only native species to conserve water and avoid and minimize pollutant (*e.g.*, fertilizers, pesticides) discharge into wetlands. Landscaping should not include trees that may provide nesting for pest species (*e.g.*, rats) or predator perches with a line-of-sight into the NWR or adjacent mudflats.

The Wildlife Agencies recommend that impacts to the woolly sea-blite population located within SP-1, which is considered a buffer, be avoided.

37. A buffer of at least 200 feet should be provided between wetland resources within the Sweetwater Marsh Unit and the edge of Parcel S.
38. A no-touch habitat buffer should be included between the office buildings proposed on Parcel S-4 and the wetlands to the north, which are located on the NWR.
39. The mudflat shoreline extending north of the Harbor District is used by migratory birds for foraging and resting. Human and animal encroachment into the mudflats would disturb the birds, causing them to move and expend energy otherwise necessary for completion of their migration. The DEIR proposes a buffer and signage along the entire shoreline of the project in the Sweetwater District to help protect the mudflats from human impacts. We recommend that suitable physical barriers (*i.e.*, chain link fence) be provided along the buffer edge farthest from the mudflat shoreline to minimize encroachment from humans and domestic animals into the mudflats.

40. The Wildlife Agencies recommend that the buffer and shoreline north of the J Street Channel (HP-6 and HP-7) be naturalized. For instance, the rip rap could be removed to provide a more natural shoreline, with native upland plants installed between the channel and the proposed promenade. As already indicated, the habitat buffer north of the J Street Channel should be at least 100 feet wide. To maximize the width of the habitat buffer, we recommend that the width of the promenade be reduced from 12 feet to 8 feet.
41. Although parcel OP-2A is designated as an ecological buffer, the project description refers to a pedestrian pathway and a public boardwalk/observation area that could encroach into the buffer. The recirculated/final EIR should identify where encroachment occurs and fully analyze all associated impacts to the ecological buffer within parcel OP-2A, as well as to the adjacent segment of the Refuge, J Street Marsh, and the wildlife these areas support.
42. The DEIR provides no discussion in the project description about parcel O-4 or the buffer area shown immediately to the west of this parcel on Figure 1-1. The recirculated/final EIR should indicate what, if any, uses are proposed between the relocated power plant and the South San Diego Bay Unit of the NWR. The Wildlife Agencies recommend that a 100-foot-wide ecological buffer be provided to minimize or avoid impacts to the adjacent wetland area.

Increased predation on wildlife

43. The DEIR does not adequately address the inevitable project-related increase in levels of predation on sensitive species located on the NWR and other sensitive habitats. The recirculated/final EIR should include an adequate analysis of the impacts related to increased predation as a result of: (1) increases in nocturnal lighting; (2) displacement of foraging raptors and mammalian predators from the project site to adjacent wildlife habitats; (3) increases in the numbers of generalist predators (*e.g.*, rats, ravens, crows, gulls) attracted to the area due to increases in trash; and (4) the introduction of additional cats and dogs as a result of new residential development. The recirculated/final EIR should also propose adequate measures to mitigate these impacts to a level less than significant.
44. The Wildlife Agencies are concerned about the inclusion of the proposed Signature Park on S-2 because it would likely attract generalist predators to the adjacent NWR and mudflats. The Signature Park includes amenities such as lighting, picnic areas, and vending of food and beverages, which could attract generalist predators due to an increase in trash. Though trash containers would be provided, some windblown trash from park users would end up in the adjacent wildlife habitats (Significant Impact 4.5-1), thus attracting predators that also prey on ground nesting birds.

45. The recirculated/final EIR should identify the potential for indirect impacts to wildlife from increased predator perching due to the building heights and designs and types of landscaping proposed on the following parcels (adjacent habitat affected shown in parenthesis): S-1 (Sweetwater Marsh), S-4 (Sweetwater Marsh), H-3 (F&G Street Marsh), H-13 (J Street Marsh), H-14 (J Street Marsh), and O-1A and O-1B (J Street Marsh).

Mitigation Measures

46. We recommend that all relatively tall structures and all landscaping within the project site be situated away from sensitive habitats to reduce predator perches with a line-of-sight into adjacent sensitive habitats, as well as to reduce shading effects on sensitive habitats, and bird strikes (*i.e.*, collisions with reflective glass). For example, development on S-1 and S-4 should be re-oriented so that the buildings (*e.g.*, 125-foot tall buildings proposed on Parcel S-4) and any tall landscaping is located at the southern portion of the parcels while the parking is located at the north end of the parcels. This would minimize the introduction of predator perching with a line-of-sight into the adjacent marshes north and west of the parcels. Figure 3-9 of the DEIR shows that the buildings are proposed to be located at the northern end of the parcels in close proximity to the adjacent sensitive habitats. Similarly, the tallest buildings associated with the RCC should be located on the southeast portion of Parcel H-3. This would also reduce the RCC's shading impacts to the F&G Street Marsh and minimize the potential for bird strikes.
47. While the DEIR acknowledges that increased predation could result from an increase in predator perches with a line-of-site into habitats, no mitigation measures are proposed to avoid and minimize such impacts. The recirculated/final EIR should require that all buildings, signs, lighting fixtures, and tall landscaping with a line-of-site into sensitive habitats be designed and/or placed in such a manner to avoid the introduction of predator perches and thereby reduce the potential for take of sensitive wildlife.
48. To at least partially mitigate for the project-related increase of predation take of federally and/or state listed ground nesting birds (*i.e.*, least tern, western snowy plover, clapper rail, and Belding's savannah sparrow), the recirculated/final EIR should require (a) that the applicant establish a non-wasting endowment that would accrue sufficient interest annually to underwrite the costs of the services of predator control specialists, such as U.S. Department of Agriculture, Wildlife Services, and (b) the in-perpetuity implementation of a predator control on the adjacent NWR (Sweetwater Marsh and South San Diego Bay Units) and other sensitive habitat areas (mudflats west of Sweetwater District, J Street Marsh). The Port should coordinate with the Refuge Manager to determine the appropriate size of the endowment commensurate with the project-related impacts.
49. The Proposed Project would result in a significant impact to San Diego Bay and adjacent wetlands due to wind-blown litter (Significant Impact 4.5-1). To mitigate such impacts,

the project includes trash control measures (*e.g.*, trash containers with attached lids, trash control enclosures). However, this may not be adequate. Chain link fencing should be provided along the entire interface of development and sensitive habitats to capture trash and reduce attraction of predators and pest species into sensitive areas.

Disturbances to Wildlife

50. Disturbances to wildlife associated with the implementation and long-term operation of the Proposed Project should be addressed. For instance, outdoor activities, such as fireworks, concerts, and other light and noise generating activities that could be associated with the resort/conference center, Signature Park, other parkland, harbor, ferry terminal, and various retail/commercial recreation areas, and their impacts to wildlife are need to be described, and their impacts analyzed. Similarly, impacts to migratory, resident, and breeding birds that could result from the increased on-water recreation from redevelopment of the South Bay Boatyard (HW-6) and the Commercial Harbor (HW-3) within the Chula Vista Marina should also be described.

The new commercial harbor is intended to enhance public access to the water, and enhance boating activity on the water. Envisioned for this commercial harbor are water taxis, dinner boats, harbor cruises, visiting historic vessels, and boat rentals, a ferry terminal, and restaurant. Increased boating activity could negatively affect foraging and loafing activities of shorebirds and waterfowl. Increased disturbances to foraging habitat could negatively affect the stability of the adjacent nesting bird colonies (*i.e.*, South San Diego Bay and Sweetwater Marsh Refuge) because disturbance-free foraging areas to obtain food for chicks are important (Rodgers and Smith 1997). Increased boating could also displace water fowl access to feeding areas and result in a subsequent loss of production of young (Drent and Guiguet 1961, Conservation Committee Report 1978, Huffman 1999, Manning 2002). Although the birds can fly to other areas to avoid highly disturbed foraging habitat, such behavioral adaptations can increase the numbers of flights and flight times between foraging and loafing, resulting in energy deficiencies that could translate to reduced productivity and fitness (Manning 2002).

51. Though impacts to wildlife from construction noise are addressed, the DEIR does not adequately address impacts to wildlife from operational noise. The Biology sections of the recirculated/final EIR should include a discussion of operational noise impacts to wildlife. Currently, operational noise is addressed only in Section 4.7 *Noise*. Based on figure 4.7-3, it appears that noise levels that may affect several sensitive avian species could occur within all habitats within the project site [*e.g.*, L Street Marsh (HP-5), Telegraph Creek (OP-2A), ephemeral wetland (S-2A)] and habitats adjacent to the project site (J Street Channel and Marsh, and F&G Street Marsh and its tidal tributary). However, impacts to other habitats adjacent to the project site (*e.g.*, Sweetwater Marsh and South San Diego Bay Units of the NWR, Chula Vista Nature Reserve) cannot be evaluated because the noise contours provided in Figure 4.7-3 do not extend sufficiently

beyond the project boundary. As such, Figure 4.7-3 should be revised to include noise contour that extend 200 feet beyond the project boundary.

Mitigation Measures

52. Fireworks and outdoor concerts that generate noise beyond the development boundary should be restricted to outside the avian breeding season (*i.e.*, January through September, depending on the species) to minimize impacts to nesting and fledging birds.
53. To partially mitigate the Proposed Project's indirect impacts, the recirculated/final EIR should: (a) prohibit boating in the open waters east of the proposed realigned navigation channel and north of the South Bay boat yard to avoid or minimize disturbance to migratory birds feeding along the mudflats and resting in San Diego Bay; (b) require the installation of regulatory signage on buoys and boat markers along the boat channel; and, (c) require increased enforcement by the Harbor Patrol to deter watercraft from going ashore onto sensitive habitat areas (*e.g.*, Chula Vista Wildlife Reserve, northern levees of the Salt Ponds, mudflats along Sweetwater Marsh, J Street Marsh) and adversely affecting the birds and habitat that nest, forage, and rest there, and are subject to indirect project-related impacts.
54. Depending on an analysis of the noise contours in Figure 4.7-3 requested above, it may be necessary to mitigate for traffic related noise. For example, sound walls along the roads adjacent to sensitive habitats may be warranted. Potential mitigation should be addressed in the recirculated/final EIR.

Human Encroachment

55. The Wildlife Agencies are concerned that the Signature Park on Parcel S-2 would invite uncontrolled human and domestic animal encroachment onto the Refuge and the adjacent mudflats, thus disrupting wildlife. The recirculated/final EIR should require that the Proposed Project provide full-time personnel at the Signature Park to enforce restrictions on human and domestic animal access to the NWR and mudflats.
56. Shoreline promenades (HP-3, HP-6, and HP-7) occur immediately north of the J Street Channel and J Street Marsh. A four-foot-high railing is proposed to minimize encroachment into the J Street Channel and Marsh. The Wildlife Agencies recommend that the recirculated/final EIR require that the design of the railing include multiple horizontal railings and/or mesh fencing to ensure that domestic animals do not move under the railing into the marsh.
57. The following comments pertain to the Draft Port Master Plan Amendment (Appendix B to the DEIR; Draft Amendment).

- a. Page 33 of the proposed Draft Amendment describes land use designations utilized for Port-owned lands. The Port proposes to modify the “wetland” designation to “wetland and mitigation bank area.” Specifically, the Draft Amendment includes language to allow areas within the wetlands on site identified for potential enhancement, restoration, and/or creation opportunities to be utilized as mitigation for future development projects. As indicated in Comment 23, this language may be inappropriate, and should be considered for elimination from the Draft Amendment.
- b. The Draft Amendment proposes language (Page 33) that allows passive uses, such as overlooks, picnic areas, and/or spur-trails, within the wetland buffers with the proposed designation of “wetland and mitigation bank area.” These proposed modifications are inappropriate. Any wetland area, or their associated biological buffers, should be devoid of all development, including the passive uses proposed to be allowed. If such uses are to be allowed within wetland areas or their associated buffers, the recirculated/final EIR should provide an adequate analysis of the potential impacts to wetlands from these uses and discuss appropriate mitigation. Otherwise, the Port should remove from the Draft Amendment the proposed language allowing such uses.
- c. The Draft Amendment also includes language (Page 33) allowing interpretive and educational opportunities within the wetland buffers while, including coastal access. While the proposed language requires that such uses occur in a manner that will ensure the protection and preservation of these sensitive habitat areas. We recommend that all outlooks and interpretive tools occur outside of the 100-foot wetland buffer.

Bird Strikes and Disorientation

58. Despite our recommendations in our September 2005, letter, and in electronic mail to and meetings with the Port, on how the Proposed Project could avoid or minimize bird strikes and/or disorientation from collisions with buildings, the DEIR does not adequately address these impacts to migrating or resident birds. South San Diego Bay has been identified as a significant wintering ground and migratory stopover point along the Pacific Flyway because of its proximity to high-quality coastal salt marsh and San Diego Bay. Much of what remains of San Diego Bay’s historical shallow subtidal, intertidal mudflat, and salt marsh habitats within the south bay provides essential foraging and resting areas for ten of thousands of birds migrating along the Pacific Flyway. In recognition of the importance of these remaining habitats, the south bay has been designated a Western Hemisphere Shorebird Reserve Network Site and the Units within the Refuge have each been recognized as Globally Important Bird Areas by the American Bird Conservancy. The recirculated/final EIR should address these important biological resources that occur immediately adjacent to the project boundaries. Additionally, the recirculated/final EIR

should include a map showing potential migration corridors through and/or adjacent to the subject property and how the migration corridor would be affected by the project.

Mitigation measures

59. There is a high potential for impacts to migrating and resident birds colliding with the buildings located on the following parcels: S-1 (Sweetwater Marsh), S-4 (Sweetwater Marsh), H-3 (F&G Street Marsh), H-13 (J Street Marsh), H-14 (J Street Marsh), and O-1A and O-1B (J Street Marsh). The DEIR includes mitigation measures to address these impacts only from buildings greater than 100 feet in height (Mitigation Measure 4.8-24). However, as stated in the DEIR, “both tall buildings and low buildings can be dangerous to birds” (Page 4.8-89). Therefore, such measures should be applied to all buildings that have an unobstructed line of sight to nearby open water or large areas of open space regardless of height. To determine if these measures are adequate, we again recommend that monitoring for bird strikes be implemented during Phase I of project implementation. The recirculated/final EIR should also require that, if there is evidence that bird strikes are occurring, the applicant contact the Wildlife Agencies as soon as possible to discuss potential measures for implementation to reduce these impacts.
60. Buildings should be oriented so the tallest buildings are as far away as possible from San Diego Bay or adjacent habitats.
61. The height limits on Parcel H-3 should be reduced to a maximum of three stories (or 50 feet) to avoid shading impacts to adjacent habitat areas and to minimize the potential for bird strikes.

Shading of Adjacent Habitat

62. Despite our recommendations in our September 12, 2005, letter, and in electronic mail to and meetings with the Port, the DEIR fails to address the biological impacts associated with shading of habitat by buildings and structures. Reductions in available light levels from shading can disrupt photosynthetic processes and impair growth of plants, algae, and phytoplankton in wetlands or waters, and thus modify existing habitats, which in turn can impair their suitability for avian species and other wildlife. We recommended that for each development option, the recirculated/final EIR provide three-dimensional images of any structures that could cast shadows on adjacent freshwater, intertidal, and tidal wetland areas. These images should reflect the maximum allowable floor area ratio, the maximum allowable height, and the minimum contemplated setbacks (*i.e.*, buffers). The acreages of the shaded areas should be quantified by habitat type and described. Based on our review of the DEIR, we anticipate the following project components would impact habitats from shading.

- a. Development adjacent to the L-Marsh (HP-5) would consist of 300-foot tall buildings set only 50 feet back from the wetland. These buildings would shade and negatively affect the L Marsh and could potentially affect the J Street Channel and J Street Marsh. Based on an analysis of the potential shading effects of each building on sensitive habitat, the recirculated/final EIR should (a) describe modifications to building designs and/or locations (*i.e.*, reduced building heights or increased width of setbacks), and (b) if shading impacts still occur, require appropriate mitigation consistent with Comment 33.
- b. Parcel H-3 has a maximum building height of 300 feet. Depending upon the placement of the buildings on this site, future development could negatively affect the F&G Street Marsh (which would represent a direct impact to resources located on federal owned land) and its tidal inlet. To avoid shading impacts, the maximum height limit on this parcel should be reduced to three stories (or 50 feet). The recirculated/final EIR should (a) describe such modifications to the building designs, and (b) if shading impacts still occur, require appropriate mitigation consistent with Comment 33.

Increased Illumination

63. Despite our recommendations in our September 12, 2005, letter, and in electronic mail to and meetings with the Port, the DEIR does not fully address impacts associated with artificial night lighting (ANL), including direct and indirect (*i.e.*, sky glow, light pollution) ANL. ANL generally threatens wildlife by disrupting biological rhythms and otherwise interfering with the behavior of nocturnal animals (see contributions from Artificial Night Lighting Conference 2002). Nocturnal and migrating birds, migrating bats, insects, fish, and sea turtles are particularly impacted by ANL (Evans Ogden 1996 and citations therein). Migrating birds use the stars and moon for navigation during migrations. These birds can become disoriented when flying through a brightly lit area; this disorientation can lead to injury and/or death. Artificial night lighting also disrupts the behavior of fish and amphibians, and billions of moths and other insects are killed from the lights each year. ANL can also affect aquatic invertebrates that are prey for other animals. Some zooplankton migrate vertically in response to lighting. In the evening, they rise in the water column to feed on drifting microscopic plants (phytoplankton). When daylight approaches they migrate down to avoid predators. However, ANL may keep them from rising and feeding (Moore et al. 2000). Reduced predation on the phytoplankton can result in phytoplankton blooms which deplete the dissolved oxygen in the water and shade aquatic vegetation (Harder 2004). Reduced oxygen levels can then negatively affect fish or other organisms depending on dissolved oxygen in the water column.

Mitigation measures

64. The recirculated/final EIR should provide a delineation of areas with sensitive habitats that are expected to be directly or indirectly exposed to light levels of higher intensity (including increased sky glow) than existing ambient levels. The delineation should be on a large scale aerial photograph (a scaled figure). The recirculated/final EIR should evaluate the direct, indirect, and cumulative biological impacts resulting from the project-related ANL, based on the delineation, and should propose specific measures whose implementation would prevent an increase in existing ambient light levels in sensitive habitats.
65. To minimize the biological impacts from outdoor ANL, we recommend that design standards for all phases of development ensure that outdoor lighting throughout the project study area is minimized and that no project-related lighting falls outside the project boundaries, upon any habitat buffers, habitats, or open water. All lights, including street lights, pedestrian and bicycle path lighting, and any recreational lighting should be directed away from and fully shielded so as to not illuminate adjacent habitats. In addition, no external lighting of buildings (*e.g.*, cosmetic lighting) or other structures should be permitted, no lighted building signs should be permitted beyond the first floor, and all commercial signage should be provided on monument signs rather than pole signs or on the sides of buildings.
66. Lighting proposed for the Signature Park (S-2) and the Shoreline Promenade (HP-3, HP-6, and HP-7) should be placed only where needed for human safety. Lights should be on low-standing (*e.g.*, 2-foot tall) bollards, shielded, and flat-bottomed so illumination is directed downward onto the walkway and does not scatter. Low-pressure sodium bulbs that emit only a narrow range of yellow light should be utilized because monochromatic yellow light, which is not perceived as “natural” light by wildlife, minimizes ecological disruptions.

Increased Freshwater Input, Degraded Water Quality, and/or Erosional Surface Flows

67. The DEIR does not adequately describe or analyze the potential degradation of existing wetlands within and adjacent to the project site due to project-related changes in surface storm water flows, nor does it provide measures to prevent, or mitigation to offset, such degradation. The project-related storm water (freshwater) flows would be discharged into the seasonal wetland in the Sweetwater District (S-2), the F&G Street Marsh and its tidal tributary, the J Street Channel, Telegraph Creek, and the J Street Marsh. Grading in SP-1 and S-1 would increase water flows into Parcel SP-2 (season wetlands) and F&G Street Marsh, and there would be more storm drains draining into the J Street Channel and Telegraph Creek. Increases in storm water flows into relatively rare salt-water wetlands can result in a type-conversion to more common freshwater wetlands. In addition, depending on the velocity of the storm water discharges, the flows could disrupt the

morphology of the receiving waters/habitats by ongoing erosion. Over time, the discharges can seriously damage sensitive habitats. Increases in flows from impervious surfaces associated with urbanization can result in: a) stream bed scouring and habitat degradation; b) shoreline erosion and stream bank widening; c) loss of aquatic species; and d) decreased baseflow (USEPA 1999). Furthermore, the project-related increases in traffic will result in higher concentrations of vehicle-related contaminants (*e.g.*, copper, asbestos, hydrocarbons, and antifreeze) in the storm water flows.

We are particularly concerned about deleterious changes to the salt balance, morphology, hydrology, and water quality of the F&G Street Marsh and its tidal tributary because such changes can negatively affect future restoration of the F&G Street Marsh, and because the light-footed clapper rail has been known to reside there. Conversely, current storm water flows into the L-Marsh (HP-5) would be redirected to the street, potentially reducing water flows to the wetland and thereby also reducing the wetland habitat. While the DEIR acknowledges the expected changes in storm water flows, it does not quantify the changes in flow, nor does it identify the design and location of the best management practices (BMPs) for Phase I to avoid impacts associated with the post-construction surface flows. The recirculated/final EIR should include a thorough discussion of project-related changes in surface flows and how these changes would affect the existing wetlands within and adjacent to the project site.

Mitigation Measures

68. All storm water flows should be treated and filtered prior to entering existing wetlands and San Diego Bay to avoid the introduction of pollutants (*e.g.*, hydrocarbons, sediments, fertilizers, pesticides, and trash).
69. The site designs for the Proposed Project should minimize the project-related increase in dry and wet-weather surface flows, and integrate on-site BMPs that would attenuate the flows (prior to their discharge) to reduce their impacts on the morphology of sensitive habitats to which they ultimately discharge. Examples of BMPs to consider include appropriately sized grass swales and vegetated detention basins. Because these BMPs occupy space, their timely consideration of the requirements that apply to the project site pursuant to the numeric sizing criteria in the Municipal Storm Water Permit is necessary. All BMPs should be within the development footprint, outside of the buffers. The recirculated/final EIR should provide the location(s) and descriptions of the proposed construction and post-construction BMPs, and should discuss the long-term maintenance of the latter.

Marine Biological Resources and In-water Construction

70. To adequately evaluate marine biological resources and potential impacts to these resources, the recirculated/final EIR should:

- a. provide a figure indicating the different marine habitat classifications (*i.e.*, intertidal, shallow subtidal, moderate subtidal, deep subtidal, salt marsh, and eelgrass) within and adjacent to the project area;
 - b. provide a table that identifies the range of depth of different marine habitat classifications, including: (1) intertidal (+7.8 feet to -2.2 feet MLLW (mean lower low water)); (2) shallow subtidal (-2.2 MLLW to -12 feet MLLW); (3) medium subtidal (-12 feet MLLW to -20 feet MLLW), and deep subtidal (deeper than -20 feet MLLW) habitats; and
 - c. indicate the areas of intertidal habitat and shallow subtidal habitat that are/would be natural (*e.g.*, soft-bottom) vs. artificial (*e.g.*, rip rap, concrete) before and after project development. Soft bottom intertidal habitat provides foraging habitat for wading birds and shorebirds, including the federally listed endangered western snowy plover (*Charadrius alexandrinus nivosus*). Shallow subtidal habitat consisting of either unvegetated soft bottom areas or areas vegetated with eelgrass (*Zostera marina*) are considered significant habitats for birds (including the least tern and brown pelican), fish, benthic invertebrates, and other organisms (including the Pacific green sea turtle).
71. Section 4.9, *Marine Biology*, in the recirculated/final EIR should include a discussion of permanent and temporary losses of foraging habitat for birds that visually search for their fish prey and plunge-dive into the water to capture their fish. Foraging habitat is defined as open water containing suitable fish prey that is available for foraging by plunge-diving birds (*e.g.*, least terns and brown pelicans) by not being obstructed and/or covered by structures (*e.g.*, piers, docks, or boats). This is particularly significant resource at the project site due to its close proximity to the Sweetwater Marsh and South San Diego Bay Units of the Refuge and the Chula Vista Wildlife Reserve (*i.e.*, approximately 1 mile or less), where plunge-diving birds both nest and/or roost during their migration. Additionally, covering open water habitats with structures would reduce light availability in the water column and introduce hard substrate which would likely support a different species composition and biological community than the extant composition. In essence, there could be an ecological type conversion where structures are introduced. We recognize that there is a discussion of the permanent impacts to surface water foraging habitat in the Section 4.8, *Terrestrial Biology*, but the impacts to this resource resulting from in-water construction make it appropriate to include a discussion of these impacts in Section 4.9.

Mitigation measures

72. The Wildlife Agencies concur that increases in structures (*e.g.*, docks, wharfs, piers) covering the San Diego Bay should be offset (Mitigation Measures 4.8-7 and 4.8-8 in the

Section 4.8, *Terrestrial Biology*). Temporary and/or permanent reductions in foraging habitat for sight-foraging birds that feed on fish (*e.g.*, least tern, brown pelican) should be avoided and minimized. We also recommend that a mitigation measure be added that requires that temporary reductions in foraging habitat due to in-water construction activities that result in increased turbidity (*e.g.*, dredging, pile pulling, jetting, and driving) be conducted outside the breeding season of the least tern (April 1 to September 15) to avoid impacts to this listed species.

73. The Wildlife Agencies recommend that losses of intertidal habitat (*i.e.*, 0.03 acre anticipated from redevelopment of HW-3) be mitigated with creation of in-kind habitat and at a minimum 1:1 ratio. Impacts to pickleweed habitat (*i.e.*, salt marsh habitat) should be mitigated at a 4:1 ratio to be consistent with City's MSCP Subarea Plan. As such, Mitigation Measure 4.9-5A should be revised to include mitigation of 0.004 acre of pickleweed.
74. The Wildlife Agencies recommend that dredging activities be surrounded by silt curtains to minimize sedimentation and smothering of adjacent eelgrass.
75. The DEIR indicates that losses in the existing benthic community from dredging activities would be less than significant due to the rapid recolonization of the benthic community in the new area. The Wildlife Agencies request that the recirculated/final EIR provide documentation to support this conclusion. Absent such documentation, we recommend that the dredging activities be coupled with a benthic study to characterize (*e.g.*, rate and community composition) recolonization of the benthic community.

Hazards and hazardous materials/public safety (*i.e.*, contaminants)

76. The DEIR highlights areas where property owners are potentially liable for impacts of contamination. The DEIR notes that known contaminated sites must be remediated to the satisfaction of the Regional Water Quality Control Board, County of San Diego Department of Environmental Health, State Department of Toxic Substances and Disease Control (DTSC) and perhaps others. We would like to work with the above regulatory agencies to ensure that remedial actions at identified sites would be protective of ecological receptors. Such actions include consideration of ecological risk based cleanup goals for contaminated media, and ensuring that contaminated media that are on site do not migrate off site into ecologically sensitive areas such as San Diego Bay and neighboring marsh habitats, especially those in the NWR. In that regard, the recirculated/final EIR should address the following specific comments.
 - a. Mitigation for hazards posed by clean-up and construction operations should include the preparation and implementation of plans to prevent migration of contaminated material into environmentally sensitive areas. Migration paths of concern for ecological receptors include groundwater that may surface in marshes,

streams or San Diego Bay (especially at the sediment-water interface), and soil that may migrate off site via erosion and surface runoff. Contaminant levels that pose insignificant risk to human health, especially under the commercial/industrial use scenario, may still pose significant risk to ecological receptors, both in terrestrial and aquatic settings. Consequently, contaminant levels deemed to be safe for humans are not necessarily safe for ecological receptors, and measures to prevent off-site migration of hazardous contaminants should be planned and implemented even though risks to humans may not be significant.

- b. Actions being taken to address ecological hazards should be noted. For example, clean-up of Parcel HP-5 (*i.e.*, L Marsh) and any potentially contaminated areas should ensure that concentrations of contaminants in materials left on site and/or leaving the site(s) should not meet or exceed concentrations of risk to ecological receptors (*e.g.*, invertebrates, birds).
- c. Mitigation Measures 4.12-1, Item B, should mention ecological risks for areas that are to remain open and are being remediated to ecological risk-based goals (*e.g.*, the L Marsh or Unit HP-5). In Item B, replace “(*i.e.*, commercial, residential)” with “(*i.e.*, commercial, residential, ecological).”
- d. Contaminant levels suitable for ocean disposal may not be suitable for re-suspension in San Diego Bay. Accordingly, Mitigation Measures 4.5-4 and 4.9-6 should be revised by deleting the following text from part B: “If the sediment would be suitable for ocean disposal, no silt curtain shall be required.”

Consistency with the City of Chula Vista’s MSCP Subarea Plan

77. The proposed land exchange would bring lands into the City’s jurisdiction that were not considered in the development and approval of the City’s MSCP Subarea Plan. As such, take of listed species and impacts to covered species on those lands are not authorized by the MSCP. In order to bring those lands into the MSCP, development within the area to be annexed must be consistent with the MSCP and the City’s Subarea Plan. An amendment to the Subarea Plan and incidental take permit will be required (Section 5.3.1.2 of the City’s Subarea Plan). The recirculated/final EIR should incorporate this requirement and the applicant should begin working with the City and the Wildlife Agencies as soon as possible to start the amendment process.
78. Portions of Proposed Project lie within the boundaries of the City’s MSCP Subarea Plan and portions of the proposed land transfer that are currently within the Port’s jurisdiction would come under the jurisdiction of the City. Furthermore, the Proposed Project borders portions of the City’s MSCP Preserve and is surrounded by adjacent lands that lie within the boundaries of the City’s MSCP Subarea Plan. Some portions of Proposed Project site currently lie within the City and some portions of the Proposed Project site that are

currently under the Port's jurisdiction would come under the jurisdiction of the City with the proposed land exchange. Furthermore, the lands within the City are/would be within the boundaries of the City's MSCP Subarea Plan, and portions of the Proposed Project site are adjacent to the City's MSCP Preserve. As an important component of regional conservation planning efforts, the City's MSCP Subarea Plan provides a strong framework for how and where development and habitat conservation occurs within the City. Mitigation ratios established through the negotiations for habitat conservation plans (HCP)/NCCPs are generally lower than those in areas not subject to an HCP/NCCP because the planning assures that mitigation is conducted in a manner and at pre-determined locations agreed to by all parties to create a habitat preserve. The Port is not party to the MSCP or any other HCP/NCCP. We typically expect that the mitigation for project-related habitat losses within a jurisdiction with no HCP/NCCP would be provided at higher ratios than required by an HCP/NCCP to account for the lack of coordination provided by an HCP/NCCP. In this instance, we recommend that the habitat losses throughout the project site, regardless of jurisdiction, meet or exceed the mitigation ratios, guidelines, and standards required by the City's MSCP Subarea Plan to maintain consistency with its application to the on-site and adjacent areas within Plan.

79. The Wildlife Agencies recommend that vegetation classifications provided in Table 4.8-1 *Existing Vegetation Communities and Land Cover Types (acres)* and Figure 4.8-3 *Vegetation Communities and Land Cover Types* be consistent with the vegetation classification for the City's MSCP. The DEIR utilizes alternative vegetation classifications for some habitat types. For instance, coastal brackish marsh in the DEIR is classified as southern coastal salt marsh by the MSCP, seasonal pond in the DEIR is classified as disturbed wetland by the MSCP, and disturbed riparian in the DEIR is classified as disturbed southern coastal salt marsh by the MSCP.

Mitigation Measures

To assure consistency with the MSCP throughout the project site, we provide the following specific comments on the proposed mitigation measures.

80. In order to limit construction disturbance to raptors, we recommend that Mitigation Measure 4.8-1 be modified, as follows.

To ensure that no direct or indirect impacts to nesting raptors occur during construction (including clearing and grubbing), construction activities within the area of potential effect for nesting habitat should occur outside of the raptor breeding season (January 15 to July 31), or sooner if a qualified biologist demonstrates to the satisfaction of the Wildlife Agencies that all nesting activities are complete. If construction (other than vegetation clearing and grubbing) must occur during the breeding season, prior to initiating any construction-related activities,

pre-construction surveys must be performed by a City- or Port-approved (depending on the jurisdiction) biologist to determine the presence or absence of nesting raptors within 500-feet of the construction area. The pre-construction survey must be conducted within 10 calendar days prior to the start of construction, and its results submitted to the City or Port (depending on the jurisdiction) for review and approval prior to initiating any construction activities. If nesting raptors are detected, a mitigation plan shall be prepared by a City- or Port-approved biologist and submitted to both the City and Port for review and approval. The applicant shall implement the mitigation plan to the satisfaction of the City and Port to ensure that disturbance of breeding activities is reduced to a level less than significant. A bio-monitor must be on site during construction until all young have fledged to minimize construction impacts and ensure that no nests are removed or disturbed and no nesting activities are disrupted.

81. In order to limit construction disturbance to burrowing owls, we recommend that Mitigation Measure 4.8-2 be modified, as follows:

To ensure that no direct or indirect impacts to nesting burrowing owls occur during construction (including clearing and grubbing), construction activities within the area of potential effect for nesting habitat should occur outside of the burrowing owl's breeding season (April 15 to July 31), or sooner if a qualified biologist demonstrates to the satisfaction of the Wildlife Agencies that all nesting is complete. If construction (other than vegetation clearing and grubbing) must occur during the breeding season, prior to initiating any construction-related activities, pre-construction surveys must be performed by a City- or Port-approved (depending on the jurisdiction) biologist to determine the presence or absence of active burrows within all suitable habitat. The pre-construction survey must be conducted within 10 calendar days prior to the start of construction, and its results submitted to the City or Port (depending on the jurisdiction) for review and approval prior to initiating any construction activities. If an active burrow is detected during the breeding season, a mitigation plan shall be prepared by a City- or Port-approved biologist and submitted to both the City and Port for review and approval. The applicant shall implement the mitigation plan to the satisfaction of the City and Port to ensure that disturbance of breeding activities is reduced to a level less than significant. Construction setbacks of 300 feet from occupied burrows shall be implemented until the young are completely independent of the nest. A bio-monitor must be on site during construction until all young have fledged to minimize construction impacts and ensure that no nests are removed or disturbed

and no nesting activities are disrupted. If an active burrow is found outside of the breeding season, or after an active nest is determined to no longer be active by a qualified biologist, the burrowing owl would be relocated in coordination with the Wildlife Agencies.

82. In order to limit construction disturbance to migratory birds, we recommend that Mitigation Measure 4.8-3 be modified, as follows:

To ensure that no direct or indirect impacts to nesting migratory birds occur during construction (including clearing and grubbing), construction activities within the area of potential effect for nesting habitat should occur outside of the general avian breeding season (January 15 to August 31), or sooner if a qualified biologist demonstrates to the satisfaction of the Wildlife Agencies that all nesting is complete. If construction (other than vegetation clearing and grubbing) must occur during the breeding season, prior to initiating any construction-related activities, pre-construction surveys must be performed by a City- or Port-approved (depending on the jurisdiction) approved biologist to determine the presence or absence of nesting birds within 300 feet of the construction area. The pre-construction survey must be conducted within 10 calendar days prior to the start of construction, and its results submitted to the City or Port (depending on the jurisdiction) for review and approval prior to initiating any construction activities. If nesting birds are detected, a mitigation plan shall be prepared by a City- or Port-approved biologist and submitted to both the City and Port for review and approval. The applicant shall implement the mitigation plan to the satisfaction of the City and Port to ensure that disturbance of breeding activities is reduced to a level less than significant. A bio-monitor should be on site during construction until all young have fledged to minimize construction impacts and ensure that no nest is removed or disturbed and no nesting activities are disrupted.

83. As indicated on page 3-17 of the DEIR, “The project site is situated entirely within the Chula Vista Coastal Zone.” To be consistent with the City’s MSCP Subarea Plan, recirculated/final EIR should require that all impacts to riparian scrub be mitigated at a 3:1 ratio, not 2:1 as indicated in Mitigation Measures 4.8-9 and 4.8-10.
84. The following comments relate to the Proposed Project’s consistency with the City’s MSCP Preserve adjacency guidelines. The recirculated/final EIR should reflect that application of these guidelines to all parcels adjacent to City’s MSCP Preserve (*i.e.*, Parcels SP-1, S-4, SP-2, S-2A, HP-11, HP-6, and HP-7), as well any parcels adjacent to sensitive habitats [Sweetwater Marsh and South San Diego Bay Units of the Refuge, San

Diego Bay, the mudflats west of the Sweetwater District, F&G Street Marsh and its associated tidal inlet, L Marsh (HP-5), J Street Marsh, Telegraph Creek, and Chula Vista Wildlife Reserve]. For purposes of this letter, all of the sensitive habitats listed in the brackets above are considered Preserve.

- a. In parcels adjacent to Preserve areas, permanent fencing (*i.e.*, a minimum six-foot tall black vinyl chain link fence) should be placed along the boundary between the ecological buffer and the Proposed Project use area. Stands of native cacti, for example as proposed on page 4.8-71 of the DEIR, cannot effectively keep humans and domestic animals out of the Preserve areas.
- b. Mitigation Measure 4.8-6 A. should be modified to read as follows.

Construction related noise shall be limited adjacent to the Sweetwater Marsh and South San Diego Bay Units of the Refuge, F&G Street Marsh, the mudflats west of the Sweetwater District, and J Street Marsh during the general avian breeding season of January 15 to August 31. During the avian breeding season, noise levels from construction activities must not exceed 60 dB(A) L_{eq} , or ambient noise levels if higher than 60dB(A). Before any construction begins, a qualified acoustician shall prepare and submit to the Port and City for review and approval an acoustical analysis to determine the ambient noise level, anticipated noise level of construction, and whether noise attenuation measures will need to be implemented to reduce the expected noise level to below 60dB(A). If noise attenuation measures or modifications to construction activities are unable to reduce the noise level below 60dB(A), either the applicant must immediately consult with the Wildlife Agencies to develop a noise attenuation plan or construction in the affected areas must cease until the end of the breeding season.

- c. The first sentence of Mitigation Measure 4.8-6 B should read as follows.

To reduce the potential for raptors to perch within the landscaping and hunt sensitive bird species from those perches, the following design criteria will be identified in the CVBMP master landscape plan and incorporated into all building and landscape plans with a line-of-sight to the City's MSCP Preserve, buffer zones, and on-site open space.

- d. Mitigation Measure 4.8-6 F indicates that all landscaping plans must ensure that no plants listed in Appendix N of the City's MSCP Subarea Plan are planted in

the project area. However, when referring to landscaping, the City's MSCP Subarea Plan makes reference instead to the "Wildland/Urban Interface: Fuel Modification Standards," or Appendix L, of the Subarea Plan. In addition, it specifies that no invasive non-native plant species should be introduced into areas immediately adjacent to Preserve areas. All project-related landscaping plans should include, to the maximum extent practicable, native plants that are compatible with native vegetation located in the ecological buffers and/or MSCP Preserve.

- e. Mitigation Measure 4.8-6 G should provide more specific language as to how the Proposed Project would minimize the release of toxins, chemicals, petroleum products, exotic plant materials, and other pollutants that might degrade or harm the natural environment or ecosystem processes within the Preserve. As discussed above (and as mentioned in Comment 67), it is unclear what BMPs would be used to prevent the release of such pollutants and how the project would meet NPDES (National Pollution Discharge Elimination System) standards and the requirements of the City's Standard Urban Storm Mitigation Plan.
- f. Mitigation Measure 4.8-6 J should specify that all trash cans installed on the project site would be animal- (non-human) proof. The proposal to provide trash cans with lids is not enough of a deterrent to scavenging animals.
- g. Table 4.8-6 *Mitigation Required for Significant Impacts to Vegetation Communities and Land Cover Types – Port Lands (acres)* should include the following revisions.
 - i. The mitigation ratio for disturbed seasonal pond (*e.g.*, classified as disturbed wetland per the City's MSCP) should be increased from 1:1 to 2:1 to be consistent with the City's MSCP Subarea Plan.
 - ii. Impacts and mitigation for losses to non-native grassland and other raptor foraging habitat (*i.e.*, habitat in the Sweetwater District) should be included in the table consistent with the City's MSCP. The mitigation ration for losses to non-native grassland and other raptor foraging habitat is 0.5:1 if mitigated inside Preserve-designated land and 1:1 if mitigated outside preserve-designated land. As explained in Comment 29, mitigation for project-related losses of raptor foraging habitat should occur at a ratio of 1:1 away from the project site.
 - iii. The acreage of permanent impacts to southern coastal salt marsh during Phase II should be increased from 0.04 to 0.10 to be consistent with the text on page 4.8–75 of the DEIR. The acreage of mitigation provided for

this impact should be appropriately revised to 0.4 acre, as written under Mitigation Measure 4.8-9.

- h. Mitigation Measure 4.8-9 should be revised to include mitigation for loss of non-native grassland, disturbed habitat that is raptor foraging habitat (*i.e.*, Sweetwater District), and coastal sage scrub in Phase III.
 - i. Mitigation Measure 4.8-11 and Table 4.8-9 should be revised to indicate that impacts to Corps jurisdictional waters should be mitigated at a 2:1 ratio to be consistent with the City's MSCP.
85. The DEIR identifies temporary impacts that the project would have on sensitive habitats within the project footprint and indicates that all temporary impacts would be mitigated at 1:1. This is inconsistent with the guidelines established by the City's MSCP Subarea Plan, which requires the same mitigation for temporary and permanent impacts. Therefore, the recirculated/final EIR should account for appropriate temporary impact mitigation according to the mitigation ratios listed in Tables 5-3 and 5-6 of the MSCP Subarea Plan.
86. The recirculated/final EIR should include a map that clearly depicts: a) the jurisdictional boundaries before and after the land exchange; b) vegetation communities within both areas; and c) sensitive species points that are present in both the Port and City's jurisdictions after the land exchange. This will allow a determination of the Proposed Project's effects on habitats and species within each jurisdiction. This information will also be necessary to process the required amendment to the City's MSCP Subarea Plan and incidental take permit.

Growth Inducement

84. The Growth Inducement discussion in the DEIR focuses on the economic effects of the Proposed Project, but ignores the significant effects to the environment that could result from growth in the surrounding area, that is, growth that is related to redevelopment of the subject property. The recirculated/final EIR should expand this section to address the significant effects on the environment, both individually and cumulatively, from growth stimulated by the subject project (*i.e.*, growth that would likely not occur but for the approval and implementation of the Chula Vista Bayfront Master Plan). An evaluation of the effects on air and water quality as a result of this new growth should be provided, as well as a discussion of the potential for even greater impacts (*e.g.*, night lighting, human and pet intrusion, increased noise levels) than the Proposed Project alone would cause to nearby sensitive biological resources.

Mitigation Measure

85. Impacts associated with the growth-inducing effects of project implementation could be reduced if the appropriate planning documents that regulate development in the areas immediately surrounding the project are amended to include specific development and design criteria for new development. Such criteria would include: restrictions on lighted signage; requirements for fully shielded street and other outdoor lights; restrictions on uses that could generate excessive noise impacts, particularly at night; building design standards that address height, lighting, and window design; and requirements for adequately sized open space and public recreation areas to accommodate new residents and their pets.

Unavoidable and Irreversible Significant Environmental Effects

86. The Wildlife Agencies do not agree that implementation of the mitigation measures identified in the DEIR would reduce the impacts to biological resources to a level less than significant. Therefore, this section in the recirculated/final EIR should discuss the unavoidable and irreversible effects that implementation of the Proposed Project would have on the sensitive coastal resources that occur within and adjacent to the project boundaries.

Response to Comment B-1

This comment is an introductory comment indicating that the U.S. Fish and Wildlife Service (USFWS) is providing comments on the Draft EIR for the proposed project. Additionally, the comment also states USFWS's legal responsibility and that it owns and operates the National Wildlife Refuge (NWR). The comment also summarizes the proposed project.

The District appreciates USFWS's interest in the proposed project. This comment does not raise any issues requiring a response pursuant to CEQA. The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment B-2

This comment identifies the previous comments provided to the District by USFWS, which includes comments on the Notice of Preparation (NOP) for the Draft EIR, as well as recommendations for fireworks display events in San Diego Bay. The comment also states that the Draft EIR addresses some past comments, but indicates that many are not adequately addressed.

The specific responses to these letters are provided in responses to comments B-24 through B-49 below. No specific environmental issues are raised in this comment, so no further response is warranted.

Response to Comment B-3

This comment states that USFWS has been involved in past fireworks display events to develop minimization measures for federally listed species. The comment also indicates that USFWS suggested in a letter dated May 9, 2016 that fireworks display events be excluded in south San Diego Bay during the nesting season.

The specific responses to this letter are provided in responses to comments B-24 through B-40 below. No specific environmental issues are raised in this comment, so no further response is needed.

Response to Comment B-4

The comment states USFWS's concerns that fireworks display events in south San Diego Bay will result in impacts on nesting, roosting, rafting, and foraging seabirds, shorebirds, and waterfowl. The comment specifically identifies that fireworks noise, light, and vibration, as well as a significant increase in spectators, may result in direct and indirect effects on avian species present in south San Diego Bay and the San Diego Bay NWR. The comment recommends that fireworks display events do not occur in the vicinity of the Chula Vista Bayfront, and that the District consider an alternative that would not introduce nighttime lighting near the NWR.

The environmental impacts of the proposed project are fully disclosed in the Draft EIR. The Draft EIR considered the potential direct and indirect effects of the proposed new fireworks display events on biological resources, including sensitive species, habitat, and native wildlife nursery sites, which included impacts associated with fireworks noise, light, and vibration, as well as trash and debris from the fireworks themselves. The potential indirect effects analyzed included human-generated trash and debris, human trespass within or adjacent to sensitive areas and wetlands, and increased boat traffic. As discussed in Section 4.3, *Biological Resources*, of the Draft EIR, all

potentially significant impacts would be reduced to a less than significant level with the implementation of mitigation measures.

Regarding the commenter's recommendation to consider an alternative that will not introduce nighttime fireworks in the vicinity of the NWR, the No Project Alternative (as described in Chapter 7, *Alternatives to the Proposed Project*), would meet this recommendation. The No Project Alternative was one of three alternatives considered and selected for detailed analysis in the Draft EIR. Under the No Project Alternative, the proposed new fireworks display events along the National City and Chula Vista Bayfronts would not occur. As a result, no nighttime fireworks would be introduced in the vicinity of the NWR or any other sensitive habitat or species within south San Diego Bay. No changes to the Final EIR are required.

Response to Comment B-5

This comment states that the description of the proposed barge location for the National City Bayfront fireworks display event is inconsistent with Figure 2-1. The comment states that the text of the Draft EIR implies that the barge for this display would be located in the Sweetwater River channel.

The commenter is correct in stating that the proposed barge location for the National City Bayfront fireworks display event would be well north of Pepper Park, where there would be little to no public access to the waterfront. Pepper Park is the closest publicly accessible space that could potentially have a partial view of this fireworks display event. As depicted on Figure 2-1, the proposed barge is located in the middle of the Bay and not within the Sweetwater River channel. Chapter 2, *Environmental Setting*, has been revised to further clarify the location of the proposed barge for the National City Bayfront fireworks display event. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

The comment identifies concerns with potential impacts on least terns from fireworks launch sites. The potential impacts on the California least tern are detailed within Section 4.3, *Biological Resources*, of the Draft EIR.

Additionally, the commenter is correct that Chapter 2 does not address the potential for the new sites to include pier areas. As indicated in Chapter 3, *Project Description*, of the Draft EIR, the proposed new fireworks display events are anticipated to be launched from barges within San Diego Bay. Section 4.3, *Biological Resources*, of the Draft EIR has been revised to clarify that the proposed new fireworks display event is anticipated to occur on barges only. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR. As pier areas are not being used (as clarified in the Errata), the Draft EIR does not require recirculation.

Response to Comment B-6

The comment indicates that the proposed barge location for the Chula Vista Bayfront fireworks display events appears to be located within the NWR based on Figure 2-1. The comment states that any fireworks display event within the NWR would require a Special Use Permit from USFWS and compliance with NEPA. The comment indicates that additional discussion regarding this issue is to follow.

In response to USFWS's concerns regarding the barge for the proposed Chula Vista Bayfront fireworks display events being located within the NWR, the barge for these fireworks display events

has been relocated outside of the NWR. Specifically, the relocated barge has been positioned outside of the eastern boundary of the Refuge, in the middle of the Bay. Accordingly, the revised location for the Chula Vista Bayfront fireworks display events has been updated in Figure 2-1. The relocated barge site for the proposed Chula Vista Bayfront fireworks display event would still maintain a minimum 1-mile distance from least tern and snowy plover nesting colonies, and therefore would not result in any changes to the impact analysis. In addition, because the relocated barge site would be positioned in deeper open water, the potential for eelgrass impacts is reduced from what was originally proposed. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-7

The comment suggests that the habitat information provided in Figure 4.3-1 is incomplete and should be updated to show additional salt marsh, as well as the D Street Fill and South Bay Salt Works levees, which should be shown as supporting seabird and shorebird nesting habitat.

Figure 4.3-1 has been updated as suggested to include additional habitat. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-8

The comment suggests that the habitat information provided in Figure 4.3-2 is incomplete and should be updated to include snowy plover habitat at Silver Strand State Beach and the Navy's proposed alternate least tern nesting site at Naval Air Station North Island. The comment also states that the "Sensitive Nesting Area 1 Mile" will need to be adjusted to reflect this new habitat.

Figure 4.3-2 has been updated as suggested to include snowy plover habitat at Silver Strand State Beach and the 1-mile buffer has been revised accordingly. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-9

The comment states that the discussion of San Diego Bay's subtidal vegetated habitat should also address the importance of this habitat to the Bay's population of eastern Pacific green sea turtles.

Section 4.3, *Biological Resources*, of the Draft EIR has been updated to identify that eelgrass beds are considered an important foraging resource for the resident population of eastern Pacific green sea turtles, a threatened species under the Endangered Species Act. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-10

This comment suggests that the discussion of upland transition and upland areas be expanded to recognize seabird nesting areas in proximity to the proposed new fireworks displays, including the D Street Fill and levees of the South Bay Salt Works. The comment states that the effects on nesting birds within these areas should be evaluated.

The effects on nesting birds within these areas is evaluated in Section 4.3, *Biological Resources*, of the Draft EIR. Section 4.3 has been updated to recognize seabird nesting areas within the South Bay Salt Works, on the D Street Fill, and on portions of the Chula Vista Wildlife Reserve Island. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-11

The comment states that the South Bay Salt Ponds are part of the NWR and not a separate area.

Section 4.3, *Biological Resources*, of the Draft EIR has been updated as suggested to clarify that the South Bay Salt Ponds are part of the NWR. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-12

The comment states that the South Bay Salt Works levees and Pond 11 are managed by USFWS, not the District.

Section 4.3, *Biological Resources*, of the Draft EIR has been updated as suggested to clarify that the South Bay Salt Works levees and Pond 11 are managed by USFWS, rather than the District. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-13

The comment states that Table 4.3-2 inaccurately states that eastern Pacific green sea turtles have a low potential to occur in San Diego Bay. In addition, the comment states that northern harriers have a high potential to occur south San Diego Bay.

Table 4.3-2 has been updated as suggested to indicate that eastern Pacific green sea turtles and northern harrier have a high potential to occur. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-14

The comment indicates that the barge location for the proposed Chula Vista Bayfront fireworks display events appears to be located within the boundaries of the NWR, and suggests that the discussion of applicable laws and regulations in the Draft EIR be expanded to address Federal regulations related to uses on a NWR.

Please see response to comment B-6. The barge for the proposed Chula Vista Bayfront fireworks display events has been relocated outside of the NWR. Moreover, Section 4.3, *Biological Resources*, of the Draft EIR has been updated to include a discussion of the applicable Federal regulations related to uses on a NWR, including National Wildlife Refuge System Administration Act of 1966 as amended by the National Wildlife Refuge System Improvements Act of 1997, as well as the National Environmental Policy Act. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-15

The comment summarizes the requirements of the National Wildlife Refuge System Improvements Act and USFWS's Appropriate Use Policy. The comment further states that, under the authority of the National Wildlife Refuge System Improvements Act, fireworks displays conducted on a NWR would not represent an appropriate or compatible use of NWR lands. The commenter further indicates that a Refuge Special Use Permit to allow such events could not be issued.

Please see response to comment B-6. The barge for the proposed Chula Vista Bayfront fireworks display events has been relocated outside of the NWR based on guidance from USFWS. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-16

The comment states that the discussion of impacts on birds and listed species should be expanded if there is a potential for a barge to be sited within the Sweetwater River channel near Pepper Park or if the proposed new fireworks display events would be located anywhere other than where they are currently identified on Figure 2-1.

Please see responses to comments B-5 and B-6. No barges are proposed to be sited anywhere within the Sweetwater River channel. Therefore, an expanded discussion of impacts on birds and other listed species is not required. As indicated in earlier responses, the barge for the proposed Chula Vista Bayfront fireworks display events has been relocated outside of the NWR based on guidance from USFWS. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment B-17

The comment states that the proposed mitigation measures to minimize indirect impacts related to human disturbance on nesting areas is inadequate because they only address public viewing areas. Areas that may be impacted by unauthorized access are the open water areas and other areas not open to the public. The comment also states the USFWS opinion that the proposed mitigation to minimize human impacts on nesting areas is inadequate specifically regarding unauthorized access.

In response to this comment the District has revised the mitigation measure MM-BIO-2 and the proposed ordinance to include requirements for events in the South Bay to hire private security to patrol the water area and enforce the existing restrictions on access to unauthorized areas as follows:

- (e) Protection of Species and Habitat. The following conditions shall apply to fireworks display events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:
 - 3. Security. For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays.

In addition, the fireworks organizer shall provide security patrols of the water area to enforce the existing restrictions on access to unauthorized areas during such fireworks display events in the South Bay.

Response to Comment B-18

The comment indicates that no monitoring is currently proposed to determine if the measures included in the Draft EIR are being implemented and or are effective in avoiding and minimizing impacts on nesting least terns, snowy plovers, and rails. The comment suggests that monitoring

should be included to assess the initial response and overall effects on nesting success on these species. The comment states that additional assurance is needed to ensure that avoidance and minimization are effectively implemented as described in the Draft EIR.

Section 4.3, *Biological Resources*, of the Draft EIR has been updated to include a clarifying mitigation measure (MM-BIO-4) that would require biological monitoring and reporting for the proposed new fireworks display events in south San Diego Bay. It should be noted that all potentially significant impacts on biological resources were determined in the Draft EIR to be less than significant with the implementation of mitigation measures. The addition of the biological monitoring mitigation measure as suggested by USFWS and CDFW would not result in any changes to the determinations made in the Draft EIR. Changes to mitigation are included in Chapter 3, *Errata and Revisions*, of the Final EIR and are reflected in the project's Mitigation Monitoring and Reporting Program (MMRP).

In addition, Section 7 (o) has been added to the proposed ordinance as follows and shown in Chapter 3, *Errata and Revisions*, of the Final EIR:

- (o) Mitigation Measures: All permit applications shall be reviewed by the District for consistency with the Mitigation Monitoring and Reporting Program (MMRP) from the Final Environmental Impact Report for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project, as certified by the Board of Port Commissioners, and all applicable mitigation measures from the MMRP shall be identified as required conditions of the approved permit issued by the District.

Response to Comment B-19

The comment suggests that the Draft EIR should distinguish between the ambient nighttime disturbance levels at nesting sites in north San Diego Bay and the Refuge under baseline conditions.

Section 4.3, *Biological Resources*, of the Draft EIR has been updated as suggested to distinguish between the existing ambient nighttime disturbance levels at nesting sites in north San Diego Bay and the Refuge. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR. The revisions to Section 4.3 do not result in changes to the conclusions of impacts and mitigation measures as identified in the EIR.

Response to Comment B-20

The comment identifies the previous fireworks monitoring efforts that were discussed in Appendix F, Biological Technical Report, of the Draft EIR. The comment repeats the conclusion in Appendix F that the level of stress generated from the fireworks translate to a level achieving harassment or harm for avian species. The comment states that this conclusion is not consistent with the results of the Gualala Point study, and cites the malfunction that occurred during the 2012 Big Bay Boom. The comment acknowledges that it is difficult to quantify the number and extent of impacts, but states that USFWS remains concerned about potential effects. The comment states the difference in ambient nighttime disturbances between the Refuge and San Diego International Airport and Naval Base Coronado. The comment further states that USFWS anticipates avian response to be greater at the Refuge because of these differences.

The discussion of fireworks disturbance to nesting birds has included a broad survey of available information with a range of avian response to fireworks shows that range from nest abandonment to temporary disturbance without lasting effects. This summary of available case studies was

provided and utilized in Appendix F, Biological Technical Report (BTR) of the Draft EIR in order to frame the discussion on impact scale anticipated within San Diego Bay and make a determination as to the anticipated nature and degree of effect the San Diego Bay fireworks shows would have on sensitive nesting species. The commenter notes that Appendix F identified differing degrees of avian response from differing fireworks events and that its conclusions appear to be inconsistent with the study at Gualala Point, as well as observations reported by Robert Patton at the San Diego Airport colony during the malfunction detonation of all fireworks simultaneously during 2012. However, in these instances, the circumstances differed substantively from the proposed fireworks activities. In the first, as reported in the BTR, both the circumstances of the colony site and the bird species involved were substantively different from the activities proposed for San Diego Bay. In the second instance, the fireworks disturbance was the result of an anomalous malfunction resulting in a 30-second continuous detonation rather than an extended fireworks show with lower illumination and noise levels over a more prolonged period. For these reasons, it is believed that the best indication of avian response to the fireworks shows in San Diego Bay are derived from the results from monitoring during prior events within the Bay with normal detonation sequencing and frequencies. We concur with the commenter's note that the ambient conditions at the nest sites vary through the Bay with the Refuge and other South Bay colonies having lower overall disturbance levels and thus it would be expected that birds on these nest sites would be less habituated to disturbance (see response to B-19). This was noted in the BTR. The proposed ordinance integrates conditions requiring that launch sites be located at least 1 mile from nest colony sites or that shells be reduced to no more than 8-inch diameter in order to control the experienced scale of the show at sensitive species nest sites. In addition, as previously stated, measures have been integrated into the proposed ordinance to control secondary disturbance of public access on sensitive nest areas. With these measures, it is anticipated that the distance from nest sites of plovers and terns and the scale of the new fireworks display event would be adequately controlled to remain similar in effect to those that have been occurring in the north Bay.

Response to Comment B-21

The comment suggests that the Draft EIR should include conservation measures similar to those previously provided by the USFWS's Carlsbad Office to avoid and minimize impacts on sensitive wildlife, such as nesting least terns and snowy plovers. The comment also lists the specific conservation measures that were previously provided by USFWS.

The recommended conservation measures were previously provided by USFWS in a comment letter on the NOP for the proposed project on October 6, 2015. The District considered USFWS's previously recommended conservation measures when preparing the Draft EIR. As detailed in Section 4.3, *Biological Resources*, of the Draft EIR, all potentially significant biological resources impacts would be less than significant with the implementation of mitigation. As originally proposed in Chapter 3, *Project Description*, of the Draft EIR, the proposed barge locations for both the National City and Chula Vista Bayfront fireworks display events were located a minimum of 1 mile from sensitive nesting colonies. The barge for the proposed Chula Vista Bayfront fireworks display events has been relocated outside of the NWR as suggested by USFWS. As shown on Figure 4.3-1, which has been revised to reflect the relocated barge for the Chula Vista Bayfront fireworks display events, both launch sites for the proposed new fireworks display events are located a minimum of 1 mile from the closest sensitive nesting colonies.

Regarding recommended conservation measure (2), mitigation measure MM-BIO-2 requires the provision of security guards to direct persons away from and to discourage trespass into sensitive

nesting areas or habitat during the proposed new fireworks display events. As discussed in Section 4.3, the Harbor Police Department (HPD) currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units during existing fireworks display events (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, HPD would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. The District staff will continue to coordinate with HPD and U.S. Coast Guard, who are responsible for lawful boating practices in the Bay. In addition, MM-BIO-2 in Section 4.3 of the Draft EIR has been updated to include clarifying language to augment landside security patrols with in-water security patrols. This clarifying language is consistent with the analysis provided in the Draft EIR and current best practices. This clarifying language is included in Chapter 3, *Errata and Revisions*, of the Final EIR and is reflected in the project's MMRP.

Regarding recommended conservation measure (3), the maximum shell size allowed for the proposed new displays would be limited to 8 inches, as detailed in Chapter 3, *Project Description*, of the Draft EIR. This represents a reduction of 2 inches from other Fourth of July fireworks display events such as the Big Bay Boom. The 8-inch maximum shell size is consistent with the Fourth of July Imperial Beach Fireworks Show, as discussed in USFWS's letter dated May 6, 2016. In addition, mitigation measure MM-NOI-1 as described in Section 4.8, *Noise and Vibration*, requires that the maximum shell size is limited to 8 inches for any fireworks display event located within 1 mile of sensitive nesting colonies. This would further ensure that noise levels are reduced around sensitive nesting colonies.

Regarding recommended conservation measures (4) and (5), Section 4.3, *Biological Resources*, of the Draft EIR has been updated to include a clarifying mitigation measure (MM-BIO-4) that provides additional assurance that biological impacts would remain less than significant by requiring biological monitoring and reporting specific to the proposed new fireworks display events along the National City and Chula Vista Bayfronts. This measure is provided to ensure the fireworks are carried out as described in Chapter 3, *Project Description*, of the Draft EIR, and to account for any needed adjustments to continue to avoid and minimize impacts on biological resources. This clarifying mitigation measure is included in Chapter 3, *Errata and Revisions*, of the Final EIR and is reflected in the project's MMRP.

Response to Comment B-22

The comment states that the Draft EIR should discuss the occurrence and location of rafting bird species during the non-breeding season, footprint of increased boat traffic, and the potential impacts of increased boat traffic on rafting birds in south San Diego Bay. The comment also states that minimization measures should be identified to reduce the impacts of increased boat traffic on rafting birds.

Section 4.3, *Biological Resources*, of the Draft EIR has been updated to describe the rafting bird use of the Bay and to analyze project effects on this resource in more detail. The concerns over increased boat traffic impacts on nesting and roosting birds was discussed in the BTR and Draft EIR, however there was not a focus on loafing and rafting birds. The effects of increased boat traffic and fireworks displays on rafting birds are considered to be less than significant, causing temporary displacement over short periods of time within areas that are centered around launch barges. This effect is

substantially curtailed outside of the winter migratory period due to an overall reduction in the number of birds rafting on the waters. Additionally, south San Diego Bay has a posted 5 miles per hour speed limit. Further, because rafting tends to be highest in waters of protected leeward environments or extreme shallows, and vessel traffic and activities would be expected to be aggregated around launch barges that are proposed to be located further from shore or in areas of existing high traffic as a result of nesting colony buffering distances and established show locations, the highest density loafing areas would likely see little increase in vessel traffic disturbance.

Response to Comment B-23

This comment concludes the comment letter and provides a contact name and information.

The District appreciates USFWS's interest in the proposed project. This comment does not raise any issues needing a response pursuant to CEQA.

Response to Comment B-24

This comment is an introductory comment stating that the comment letter is being provided in response to the District's request for guidance from USFWS to reduce the potential effects on biological resources from the Big Bay Boom and Fourth of July Imperial Beach Fireworks Show on July 4, 2016. The comment also notes that USFWS previously provided comments on the NOP for the proposed project in a letter dated October 6, 2015.

Please refer to responses B-41 through B-49 regarding comments on the NOP on the Draft Environmental Impact Report in the letter dated October 6, 2015.

Response to Comment B-25

The comment states that USFWS is pleased that no fireworks display events are proposed at the Chula Vista Bayfront or Loews Coronado Resort for 2016 due to their proximity to sensitive wildlife. The comment also recommends that no future fireworks displays occur in these areas in the future during the nesting season.

This comment was based on anticipated Fourth of July fireworks display events for 2016. As discussed in Chapter 3, *Project Description*, of the Draft EIR, the proposed project includes three proposed new fireworks display events in San Diego Bay adjacent to the Chula Vista Bayfront, including one display on the Fourth of July. As identified in Section 4.3, *Biological Resources*, of the Draft EIR, the Draft EIR and the proposed ordinance include measures to reduce impacts on avian species during the nesting season to less than significant. The recommendation to exclude future fireworks display events in the nesting season adjacent to the Chula Vista Bayfront or Loews Coronado Resort would be considered by the Board of Port Commissioners when it makes its decision on whether or not to certify the Draft EIR.

Response to Comment B-26

The comment states the 2016 Big Bay Boom and Imperial Beach fireworks shows will occur in the same locations as previous shows. The comment states that the shells launched from the barges will be a maximum of 10-inches, and the shells launched from the Imperial Beach Pier will be a maximum of 8 inches.

This comment repeats the characteristics of the 2016 Big Bay Boom and Fourth of July Imperial Beach Fireworks Show. The comment does not raise specific issues related to the adequacy of the environmental analysis in the EIR; therefore, no additional response is required.

Response to Comment B-27

The comment states that USFWS's primary concern with fireworks shows is the potential impact on wildlife from fireworks, spectators, and introduction of chemicals and debris into the water. Numerous bird species are located in the vicinity of the fireworks show.

The potential impacts on wildlife associated with fireworks display events are discussed in Section 4.3, *Biological Resources*, of the Draft EIR, including potential impacts on the bird species referred to in the comment.

Response to Comment B-28

The comment states USFWS's concerns that birds in areas close to fireworks shows are likely exposed to noises, vibrations, and light that may disrupt normal breeding and roosting behavior. Several impacts on avian species were discussed including flushing from nests, abandonment, parental attendance, illumination and disturbance may expose habitat. Impacts from spectators of shows was also discussed.

The comment expresses specific concerns that were raised in USFWS's October 6, 2015 letter, which was submitted before preparation of the Draft EIR. These concerns were addressed in Section 4.3, *Biological Resources*, of the Draft EIR.

Response to Comment B-29

The comment states that least tern nests at the San Diego International Airport and Naval Air Station, North Island are located about 1 mile from the Bay launch site. The least tern also nests at the mouth of the Tijuana River about 1.5 south of the Imperial Beach Pier launch site. The snowy plover nests on the beaches to the north and south of the Imperial Beach Pier. The rail occupies the Oneonta Slough, which is about 0.5 mile south of the Imperial Beach Pier launch site.

The comment expresses specific concerns that were raised in USFWS's October 6, 2015 letter, which was submitted before preparation of the Draft EIR. These concerns were addressed in Section 4.3, *Biological Resources*, of the Draft EIR.

Response to Comment B-30

This comment refers to USFWS's October 6, 2015 letter, which recommended several conservation measures for fireworks shows to avoid or minimize impacts on least terns and snowy plovers. The comments states that USFWS appreciates the District's minimization measures and offered comments and suggestions to further reduce potential impacts on the snowy plovers, least terns, and rails.

The comment refers to measures that the District implemented for the 2016 Big Bay Boom Fireworks Display Event. The mitigation measures for the proposed new fireworks display events are identified in Section 4.3, *Biological Resources*, of the Draft EIR.

Response to Comment B-31

The comment refers to measures that the District implemented for the 2016 Big Bay Boom Fireworks Display Event. The mitigation measures for the proposed new fireworks display events are identified in Section 4.3, *Biological Resources*, of the Draft EIR. This comment expresses concern regarding the potential impacts of the Big Bay Boom and Imperial Beach fireworks displays on active least tern nesting sites.

The Big Bay Boom and Imperial Beach fireworks displays are existing events that have occurred annual for many years. As such, they are part of the physical conditions that existed at the time the District commenced preparation of the Draft EIR and are identified in the Draft EIR as part of the environmental setting for the proposed project, not part of the proposed project itself (Draft EIR, Ch. 2, Environmental Setting, pp. 2-5-2-8). CEQA does not require a lead agency to evaluate the potential impacts of existing conditions or to provide mitigation measures for existing environmental conditions. Although not subject to CEQA review, existing fireworks display events like the Big Bay Boom and the Imperial Beach events will be subject to the terms and conditions of the proposed ordinance. Accordingly, no further response is warranted.

Response to Comment B-32

This comment recommends measures to reduce potential impacts on biological resources that may result from the Big Bay Boom and the Imperial Beach fireworks display events. Please see response to comment B-31 above. Although not required by CEQA, the proposed ordinance includes conditions of approval concerning distance of launch sites from sensitive avian species, as well as security and educational measures to minimize trespass into sensitive habitat and disturbance of nesting colonies. The proposed ordinance does not include a condition requiring closure of parking lots because it would conflict with the public access requirements of the California Coastal Act and may inadvertently result in increased trespass related impacts.

Response to Comment B-33

This comment recommends measures to reduce impacts from spectator foot traffic on snowy plover nests on beaches near the Imperial Beach Pier. Please see responses to comments B-31 and B-32 above.

Response to Comment B-34

This comment expresses concern regarding potential impacts of the Imperial Beach fireworks display event on active rail nests in the Oneonta Slough. Please see responses to comments B-31 and B-32 above.

Response to Comment B-35

This comment recommends the District implement security and trash management measures to reduce potential impacts of the Imperial Beach fireworks display event on active rail nests in the Tijuana Slough and at the south end of Sea Coast Drive. Please see responses to comments B-31 and B-32 above.

Response to Comment B-36

This comment describes the benefits of biological monitoring and recommends monitoring least terns and snowy plovers, but does not recommend monitoring of rails due to the potential for disturbance associated with monitoring. The Draft EIR will be revised to include a mitigation measure requiring monitoring with respect to the proposed new fireworks display events (MM-BIO-4). With respect to monitoring of existing fireworks display events, please see responses to comments B-31 and B-32 above.

Response to Comment B-37

This comment recommends a monitoring program for the potential impacts of the Big Bay Boom fireworks display event on the least tern colony at San Diego International Airport. Please see responses to comments B-31 and B-32 above.

Response to Comment B-38

This comment recommends monitoring the least tern colony at the NWR for potential impacts resulting from the Imperial Beach fireworks display event. Please see responses to comments B-31 and B-32 above.

Response to Comment B-39

This comment recommends monitoring of snowy plover nests or broods within 1.5 miles of the launch site for potential impacts resulting from the Imperial Beach fireworks display event. Please see responses to comments B-31 and B-32 above.

Response to Comment B-40

This comment states the author's appreciation for the opportunity to provide recommendations to reduce potential impacts on sensitive wildlife from the Big Bay Boom and Imperial Beach fireworks display events, and requests the District provide a response to the recommendations and a draft monitoring plan by a specified date. Please see responses to comments B-31 and B-32 above.

Response to Comment B-41

This comment indicates that USFWS has reviewed the NOP and Draft EIR for the proposed project. The primary concern and mandate of USFWS is the protection of public fish and wildlife resources and their habitats. This comment states that USFWS appreciates the Districts' efforts to address the cumulative impacts of multiple fireworks displays in the proposed Draft EIR and offers comments and recommendations to assist the District in identifying, avoiding, minimizing, and mitigating direct and indirect project related impacts.

The District appreciates USFWS's interest in the proposed project. This comment does not raise any specific issues requiring a response pursuant to CEQA. The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment B-42

This comment indicates that the San Diego Bay and Imperial Beach Oceanfront support resident and migratory sea birds, shore birds, passerines, endangered bird species, sea turtles, fish and marine mammals. This comment states that USFWS requests that the Draft EIR include a thorough review of the available literature pertaining to the potential or documented impacts of fireworks displays or similar punctuated disturbances on wildlife.

The Draft EIR includes an in-depth discussion of numerous existing studies that analyzed the effects of fireworks on wildlife, such as migratory sea birds, shore birds, passerines, endangered bird species, sea turtles, fish and marine mammals. As discussed in Section 4.3, *Biological Resources*, of the Draft EIR, an extensive literature review was completed with a focus on effects of fireworks in coastal areas outside of the San Diego region, and the effects of pyrotechnics and loud sounds, in general, on marine resources. The environmental impacts of the project are fully disclosed and any significant adverse impacts on biological resources would be mitigated to less than significant in the Draft EIR. No changes to the Final EIR are required.

Response to Comment B-43

This comment states that USFWS requests that the Draft EIR include the following:

- Figure that depicts the precise location of existing and future proposed launch sites.
- Figure depicting the located of sensitive resource use areas within the vicinity of proposed launch sites
- Figure that depicts the location and abundance of rare, endangered, and other sensitive species that occur in the vicinity of proposed launch sites
- Information regarding the abundance and distribution of water birds that use San Diego Bay, Tijuana Estuary, and Imperial Beach

The proposed launch sites for the fireworks display events are provided on Figure 3-1 in Chapter 3, *Project Description*, of the Draft EIR. The general biological habitats, sensitive habitats, wetlands, and locations of sensitive species of the Bay and Imperial Beach Oceanfront are mapped on Figures 4.3-1 and 4.3-2 of Section 4.3, *Biological Resources*, of the Draft EIR. Figure 4.3-2 specifically depicts the locations of habitat protection areas, marine mammal haul-out areas, sensitive habitats such as eelgrass and coastal salt marsh, and sensitive nesting areas for light-footed Ridgway's rail, Belding's Savannah sparrow, Western snowy plover, and California least tern, as well as a 1-mile buffer around these sensitive nesting areas. The locations of each of these sensitive habitats, wetlands, and sensitive species are mapped in relation to the barge locations for both existing and proposed new fireworks display events. Information regarding the abundance and distribution of water birds within the San Diego Bay is provided on Figure 4.3-2 and discussed in Section 4.3 of the Draft EIR.

Response to Comment B-44

This comment requests that the EIR include detailed information regarding the number, location and duration of baseline events that have occurred in recent years, and the number, location and duration of additional proposed events (events permitted by the District, but have not yet occurred).

As discussed in Chapter 2, *Environmental Setting*, of the Draft EIR, a number of existing fireworks display events occur year-round in and around San Diego Bay and the Pacific Ocean near Imperial

Beach. A list of these fireworks display events, and a description of their operational characteristics, is provided in Tables 2-1 and 2-2 respectively. Chapter 3, *Project Description*, of the Draft EIR provides a detailed project description of the four proposed new fireworks display events would be located adjacent to the National City and Chula Vista Bayfronts.

Response to Comment B-45

This comment requests an analysis of the intensity and extent of light, sound, vibration, and debris/fallout anticipated as a result of the fireworks displays, based on the size and number of fireworks shells that will be used. The analysis of the effects should include an assessment of the areas where light, sound, vibration, and debris are expected to have a direct impact on wildlife.

The Draft EIR included an in-depth discussion of numerous existing studies that analyzed the effects of fireworks on wildlife, including birds and marine mammals. As discussed in Section 4.3, *Biological Resources*, of the Draft EIR, an extensive literature review was completed with a focus on effects of fireworks in coastal areas outside of the San Diego region, and the effects of pyrotechnics and loud sounds, in general, on marine resources. In addition, the impact analysis made use of existing biological information for San Diego Bay, including the San Diego Bay Integrated Natural Resources Management Plan prepared by the U.S. Navy in conjunction with the District. Furthermore, general information was drawn from surveys of the nearshore environment near Imperial Beach Pier, particularly from the 2011–2012 benthic habitat mapping for the U.S. Navy’s Silver Strand Training Complex Boat Lanes (Merkel & Associates, Inc. 2011a, 2012), surveys performed offshore of the Imperial Beach Pier for nearshore beach nourishment (Merkel & Associates, Inc. 2011b), nearshore habitat mapping performed by San Diego Association of Governments (SANDAG 2002; Merkel & Associates, Inc. et al. 2004), studies completed for the Naval Base Coronado Naval Outlying Field in Imperial Beach (Tierra Data 2011; Merkel & Associates, Inc. 2014a), and beach monitoring performed in association with the regional beach nourishment program (Merkel & Associates, Inc. 2014b). The results of these studies and surveys were incorporated into the impact analysis and were used to determine potential impacts related to the proposed project. The environmental impacts of the project are fully disclosed and any significant adverse impacts on biological resources would be mitigated to less than significant in the Draft EIR. No changes to the Final EIR are required.

Response to Comment B-46

This comment requests that the Draft EIR include an analysis of the potential indirect effects of the fireworks displays on wildlife resources including impacts from spectators, changes in water quality associated with debris or fallout from fireworks.

Section 4.3, *Biological Resources*, and Section 4.6, *Hydrology and Water Quality*, of the Draft EIR included an in-depth discussion of indirect effects of the fireworks displays on wildlife resources including impacts from spectators as well as changes in water quality associated with debris or fallout from fireworks. No changes to the Final EIR are required.

Response to Comment B-47

This comment indicates that the Fish and Wildlife Office has previously recommended that no fireworks displays occur within the Chula Vista Bayfront during the avian breeding season due to the close proximity of sensitive wildlife resources. USFWS has recommended that fireworks displays

be minimized at Loews Coronado Resort during avian breeding season due to sensitive habitat at Silver Strand Beach and Naval Base Coronado.

The proposed project includes four new fireworks display events in San Diego Bay adjacent to the National City and Chula Vista Bayfronts. Section 4.3, *Biological Resources*, of the Draft EIR provides an in depth discussion of the existing habitats and wildlife of the Bay and identifies the specific sensitive habitats and species in the vicinity of the proposed locations for the new fireworks display events. The Draft EIR determined that any potential impacts on wildlife resources would be reduced below significance with the implementation of the proposed mitigation measure identified in Section 4.3 of the Draft EIR. All firework display events that will occur along the Chula Vista Bayfront would be required to comply with the Chula Vista Bayfront Master Plan Settlement Agreement dated May 20, 2010.

For that reason the proposed project recommends allowing fireworks display events along the Chula Vista Bayfront within the avian breeding season. The District believes that the mitigation measures identified in Section 4.3 of the Draft EIR, and the conditions of approval of the proposed ordinance would adequately protect sensitive species during the nesting season.

With regard to Loews Coronado, the District agrees with the comments recommendation to minimize fireworks displays at Loew's Coronado resort during the avian breeding season. Fireworks display events at Loews Coronado are not included in the EIR or the proposed ordinance as an existing show that requires a discretionary action or is anticipated to require a discretionary action by the District.

Response to Comment B-48

This comment indicates that the Draft EIR include conservation measures to avoid and minimize the potential impacts on sensitive wildlife. The Carlsbad Fish and Wildlife Office has previously recommended conservation measures be included to existing and ongoing fireworks displays to avoid or minimize potential impacts on nesting least terns and snowy plovers, including:

- Location of discharge site a minimum of 1 mile from nearest least tern or snowy plover nesting site;
- Delineation and law enforcement patrol of shoreline around least tern and snowy plover nesting area to prevent spectators from coming ashore or anchoring in eelgrass;
- Reduction in shell size to reduce the percussive vibrations associated with fireworks detonations;
- Development and implementation of a least tern and snowy plover monitoring approach approved by the Carlsbad Fish and Wildlife Office; and
- Development of a plan to mitigate negative impacts observed by the biologist.

These recommendations are addressed in response to comment B-21.

The recommended conservation measures were previously provided by USFWS in comment letter on the NOP for the proposed project on October 6, 2015. The District considered USFWS's previously recommended conservation measures when preparing the Draft EIR. As detailed in Section 4.3, *Biological Resources*, of the Draft EIR, all potentially significant biological resources impacts would be less than significant with the implementation of mitigation. As originally proposed in Chapter 3, *Project Description*, of the Draft EIR, the proposed barge locations for both the National

City and Chula Vista Bayfront fireworks display events were located a minimum of 1 mile from sensitive nesting colonies. The barge for the proposed Chula Vista Bayfront fireworks display events has been relocated outside of the NWR as suggested by USFWS. As shown on Figure 4.3-1, which has been revised to reflect the relocated barge for the Chula Vista Bayfront fireworks display events, both launch sites for the proposed new fireworks display events are located a minimum of 1 mile from the closest sensitive nesting colonies.

Regarding recommended conservation measure (2), mitigation measure MM-BIO-2 requires the provision of security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during the proposed new fireworks display events. As discussed in Section 4.3 of the Draft EIR, HPD currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units during existing fireworks display events (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, HPD would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. The District staff will continue to coordinate with HPD and U.S. Coast Guard, who are responsible for lawful boating practices in the Bay. In addition, MM-BIO-2 in Section 4.3 of the Draft EIR has been updated to include clarifying language to augment landside security patrols with in-water security patrols. This clarifying language is consistent with the analysis provided in the Draft EIR and current best practices. This clarifying language is included in Chapter 3, *Errata and Revisions*, of the Final EIR and is reflected in the project's MMRP.

Regarding recommended conservation measure (3), the maximum shell size allowed for the proposed new displays would be limited to 8 inches, as detailed in Chapter 3, *Project Description*, of the Draft EIR. This represents a reduction of 2 inches from other Fourth of July fireworks display events such as the Big Bay Boom. The 8-inch maximum shell size is consistent with the Fourth of July Imperial Beach Fireworks Show, as discussed in USFWS's letter dated May 6, 2016. In addition, mitigation measure MM-NOI-1 as described in Section 4.8, *Noise and Vibration*, requires that the maximum shell size is limited to 8 inches for any fireworks display event located within 1 mile of sensitive nesting colonies. This would further ensure that noise levels are reduced around sensitive nesting colonies.

Regarding recommended conservation measures (4) and (5), Section 4.3 of the Draft EIR has been updated to include a clarifying mitigation measure (MM-BIO-4) that provides additional assurance that biological impacts would remain less than significant by requiring biological monitoring and reporting specific to the proposed new fireworks display events along the National City and Chula Vista Bayfronts. This measure is provided to ensure the fireworks are carried out as described in Chapter 3, *Project Description*, of the Draft EIR, and to account for any needed adjustments to continue to avoid and minimize impacts on biological resources. This clarifying mitigation measure is included in Chapter 3, *Errata and Revisions*, of the Final EIR and is reflected in the project's MMRP.

Response to Comment B-49

This comment noted that USFWS has requested that the Draft EIR analyze the need for an increased number of fireworks displays. USFWS recommends that the District consider limiting the number of fireworks displays that may occur throughout the year at approved launch sites.

As described in Chapter 3, *Project Description*, of the Draft EIR, the proposed would allow four new fireworks display events would be limited to four times per year, with two displays occurring on the Fourth of July, at the Chula Vista and National City Bayfronts. The proposed project would not increase the number of firework display events beyond these four proposed new events.

Response to Comment B-50

This letter is a comment letter that USFWS submitted to the District on the Draft EIR for the Chula Vista Bayfront Master Plan and Port Master Plan Amendment. The comment letter identifies three references to fireworks and request that impacts related to public access, lighting, noise, and wildlife disturbances, associated with such events should be evaluated in the EIR.

The Final EIR for the Chula Vista Bayfront Master Plan and Port Master Plan Amendment responded to all of the comments raised in this letter (District 2010). All of the issues raised in this comment letter related to fireworks have been addressed in Section 4.3, *Biological Resources*, of the Draft EIR. Consistent with the Chula Vista Bayfront Master Plan EIR, a maximum of three shows are proposed within the Chula Vista Bayfront, which all will occur outside of the least tern nesting season, except the Fourth of July. As identified on page 4.3-45, in accordance with the Chula Vista Bayfront Settlement Agreement and Natural Resources Management Plan (May 2016), proposed new fireworks display events that would occur within the Chula Vista Bayfront area during the least tern nesting season, which would include a Fourth of July event, are required to monitor the nesting colonies and be in full regulatory compliance with all applicable water quality and species protection regulations. All other comments are related to the Chula Vista Bayfront Master Plan and are not applicable to the proposed project. Therefore, no further response to this letter is required.

4.4.3 Comment Letter C: Governor’s Office of Planning and Research, State Clearinghouse and Planning Unit

EDMUND G. BROWN JR.
GOVERNOR May 3, 2017

STATE OF CALIFORNIA
GOVERNOR'S OFFICE of PLANNING AND RESEARCH
STATE CLEARINGHOUSE AND PLANNING UNIT

KEN ALEX
DIRECTOR

San Diego, CA 92101

Subject: San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project
SCH#: 2015081013

Dear Wileen Manaois:

The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on May 1, 2017. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

C-1

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2015081013) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

STATE CLEARINGHOUSE

Subject: Comments on the San Diego Unified Port District's Draft Environmental Impact Report for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (UPD #EIR-2015-115)

Dear Ms. Manaois:

The U.S. Fish and Wildlife Service (Service) has reviewed the above-referenced Draft Environmental Impact Report (DEIR) for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (Project), in San Diego County, California. The enclosed comments are based on information provided in the DEIR and the Service's knowledge of sensitive and declining species and their habitats.

The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Federal Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*). The Service also owns and operates National Wildlife Refuges (NWR).

For the proposed project, the San Diego Unified Port District (Port) will (1) develop an ordinance establishing a District Code section to govern existing and proposed new fireworks display events within San Diego Bay and the Imperial Beach oceanfront, and (2) support four new fireworks display events in south San Diego Bay adjacent to the National City and Chula Vista Bayfront.

We have previously provided the Port comments on the notice of preparation of the DEIR in letter dated October 6, 2015, as well as recommendations regarding fireworks displays in San Diego Bay in letters dated May 9, 2016, and January 11, 2007, which are attached and incorporated

herein by reference. While the DEIR addresses some of our past comments, many are not adequately addressed.

We have worked with fireworks sponsors, organizers, and operators to develop minimization measures for the federally listed threatened western snowy plover (Pacific Coast population DPS) [*Charadrius nivosus nivosus* (*C. alexandrinus* n.); plover], as well as the endangered California least tern [*Sterna antillarum browni* (*Sterna a. b.*); least tern] and light-footed Ridgway's (=clapper) rail [*Rallus obsoletus* (=longirostris) *levipes*; rail]. In our May 9, 2017, letter, we specifically recommended that fireworks shows be excluded from South San Diego Bay during the nesting season.

However, we continue to have concerns that fireworks conducted in south San Diego Bay will also result in impacts to nesting, roosting, rafting, and foraging seabirds, shorebirds, and waterfowl. Our concerns stem from the proximity of proposed fireworks launch sites in south San Diego Bay to the San Diego Bay NWR (Refuge) which supports thousands of nesting and wintering birds and is subject to low levels of disturbance under baseline conditions. As discussed in the Biological Technical Study (EIR, Appendix F), there is potential for avian behavioral responses to the bright lights, noise, and vibration associated with fireworks. In addition, fireworks events in south San Diego Bay may result in significant spectator presence on and near the Refuge. Due to our concerns regarding the potential direct and indirect effects of a fireworks show, we continue to recommend that fireworks shows do not occur in the vicinity of the Chula Vista Bayfront. We also recommend that the Port consider an alternative that will not introduce night time fireworks disturbance to the vicinity of the Refuge.

Specific Comments:

Chapter 2 – Environmental Setting

1) Fireworks Launch Site for the Proposed National City Fireworks Display

The description of the location for the temporary barge that “would take place within view of Pepper Park,” as described on 2-12 of the draft EIR, appears to be inconsistent with Figure 2-1. The text states the “fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the vicinity of Pepper Park.” This text implies that the barge would be located within the Sweetwater River flood control channel; however, Figure 2-1 indicates that the site would be well to the north of Pepper Park, where there appears to be little or no public access to the waterfront. The location of potential barge sites should be clarified in the document, as the proposed location could have significant, adverse effects on least terns that nest on the D Street Fill. The understanding of the exact locations in which the fireworks displays can occur is further complicated by language provided on page 4.3-5, which states: “The sites for the proposed new fireworks display events are within and/or adjacent to the District’s jurisdiction within San Diego Bay along

the National City and Chula Vista Bayfronts. These proposed new displays are anticipated to occur on barges and/or piers within these locations” (emphasis added). Chapter 2 does not address the potential for the new sites to include pier areas. If the use of piers in addition to barges is being considered for the new sites, the draft EIR should be redistributed to public comment after it has been revised to identify potential pier sites and to address the potential impacts of using those pier sites for fireworks displays.

2) Fireworks Launch Site for the Proposed Chula Vista Bayfront Fireworks Display

Page 2-13 states “A total of three fireworks display events (including one on the Fourth of July) along the Chula Vista Bayfront area ... are anticipated to involve the placement of a single, temporary barge in the Bay in the vicinity of the two parks.” Based on the information provided in Figure 2-1, it appears that the proposed location of this barge occurs within the boundaries of the Refuge. If the barge is to be located within the boundaries of the Refuge, the draft EIR should be revised to acknowledge that the proposal would require a Special Use Permit from the Refuge, as well as compliance with National Environmental Policy Act (NEPA). Additional discussion of this issue is provided below.

Chapter 4, Section 4.3 – Biological Resources

- 1) The habitat information provided in Figure 4.3-1 is incomplete and should be updated to show salt marsh in the western salt ponds, which were restored in 2011. In addition, the D Street Fill and South Bay Salt Works levees should be shown as supporting seabird and shorebird nesting habitat, including least terns and snowy plovers.
- 2) The habitat information provided in Figure 4.3-2 is incomplete and should be updated to include snowy plover habitat at Silver Strand State Beach and the Navy’s proposed alternate least tern nesting site at Naval Air Station, North Island. The polygon(s) depicted in the legend as “Sensitive Nesting Areas 1 mile” will need to be adjusted once the missing nesting habitat is added to the figure.
- 3) The discussion of the San Diego Bay’s subtidal vegetated habitat on page 4.3-7 should also address the importance of this habitat to the bay’s population of eastern Pacific green sea turtles.
- 4) The discussion under *Upland Transition and Upland Areas* on page 4.3-9 should be expanded to acknowledge the significant seabird nesting areas that occur in proximity to the proposed fireworks launch sites. These include the D Street Fill, located immediately south of Pepper Park, which is a mitigation site set aside as nesting habitat for the least tern and snowy plover, and the levees of the South Bay Salt Works that support tens of thousands of nesting waterbirds between the months of March and September. The significance of these nesting areas is highlighted by the fact that in 2016, the San Diego

Bay Refugure is estimated to have supported over 60,000 waterbird nests representing 16 species. The effects of impacts to this number of nesting birds should be evaluated in the effects section.

5) On page 4.3-10, note that the South Bay Salt Ponds are part of the Refuge, and not a separate area.

6) On page 4.3-11, note that the South Bay Salt Works levees and Pond 11 are managed by the Service, not the District.

7) Table 4.3-2 inaccurately states that eastern Pacific green sea turtle have a low potential to occur in San Diego Bay. Researchers continue to tag and monitor green sea turtles in San Diego Bay (Madrak *et al.* 2016), particularly in the south end of the Bay. In addition, norther harriers are routinely observed at Sweetwater Marsh and in the south bay, therefore, they have a high potential to occur in the affected area.

8) As addressed previously, the location proposed as a fireworks launch site for the Chula Vista Bayfront appears to be located within the boundaries of the Refuge; therefore, the discussion of applicable laws and regulations related to the Refuge on Page 4.3-19 should be expanded to address Federal regulations related to uses on a NWR. Uses on a NWR require compliance with the National Wildlife Refuge System (NWRS) Administration Act of 1966 as amended by the NWRS Improvement Act of 1997, 16 U.S.C. 668dd-668ee (Improvement Act) and the National Environmental Policy Act (NEPA).

The Improvement Act provides clear standards for management, use, planning, and growth of the NWRS. The Improvement Act requires that each refuge be managed to fulfill the “wildlife first” mission of the NWRS, as well as the specific purposes for which a refuge was established. The Refuge was established to protect, manage, and restore habitats for federally listed endangered and threatened species and migratory birds, as described in the Act, and maintain and enhance the biological diversity of native plants and animals, as described in the Fish and Wildlife Act of 1956, as amended.

In accordance with the Improvement Act, uses permitted on a NWR must be determined to be compatible with the mission of the NWRS and Refuge purposes. The Service’s Appropriate Use Policy (*Service Manual, Part 603 FW 1*) provides a national framework for determining appropriate refuge uses and outlines the procedures refuge managers must follow when deciding if a new or existing use is an appropriate use on the refuge. The proposed use must contribute to the public’s understanding and appreciation of the refuge’s natural or cultural resources, or must be beneficial to the refuge’s natural or cultural resources. If this is not the case, such a use would generally be considered not appropriate.

If a use is determined to be appropriate, it must then be evaluated for compatibility. The Service's Compatibility Policy (*Service Manual, Part 603 FW 2*) includes guidelines for determining if a use proposed is compatible with Refuge purposes. A compatible use is defined in the policy as a proposed or existing use of a NWR that, based on sound professional judgment, will not materially interfere with or detract from the fulfillment of the NWRS mission or the purposes for which the Refuge was established.

Another significant directive of the Improvement Act is to ensure that we maintain the ecological integrity of the NWRS for present and future generations of Americans. Uses that we reasonably may anticipate to conflict with pursuing this directive are contrary to fulfilling the NWRS mission and are therefore not compatible. Under the authorities of the Improvement Act, fireworks displays conducted on a NWR would not represent an appropriate or compatible use of Refuge lands. As such, a Refuge Special Use Permit to allow such events could not be issued.

9) If there is the potential for a barge to be sited within Sweetwater River flood control channel in the vicinity of Pepper Park or for the fireworks launch site for the National City and/or Chula Vista Bayfront to be located somewhere other than the location shown in Figure 2-1, the discussion of impacts to birds and listed species should be expanded. This is particularly important because of the potential for significant adverse effects to sensitive salt marsh habitat, nesting least terns, and resident rails as a result of siting the fireworks barge in the Sweetwater River channel or in proximity to the outer levees of the salt works.

10) The proposed mitigation measures, particularly those intended to minimize indirect impacts related to human disturbance of nesting areas, are inadequate as they only address public viewing areas. The areas that would be affected include open water areas, and areas that are not open to the public, but would be subject to unauthorized access as a result of the proposed action.

11) There is no monitoring proposed to determine if the measures included in the DEIR for mitigating both direct and indirect impacts are being implemented and/or are effective in avoiding and minimizing impact to nesting least terns, snowy plovers and rails. The DEIR should include requirements for monitoring to assess the initial response and overall effects to nesting success on these species.

12) The DEIR should characterize the difference in ambient night time disturbance levels at nest sites in north San Diego Bay and the nest sites at the Refuge. The DEIR should distinguish between the baseline conditions at these sites.

13) Appendix F of the DEIR discusses previous fireworks monitoring efforts at (1) a north San Diego Bay least tern colony (San Diego International Airport; Airport), (2) at Naval Base Coronado, (3) at Gualala Point, and (4) in the Netherlands. Although the

results from these studies demonstrate that individual birds are likely to display a direct physiological stress response, Appendix F (re-iterated in section 4.3) concludes that “it does not appear that the level of disturbance stress generated from the fireworks translate to a level achieving harassment or harm for avian species”. This conclusion is not consistent with the result of the Gualala Point study, which concluded that nests had been abandoned as a result of the fireworks display. Nest abandonment and likely chick mortality was also documented subsequent to the Big Bay Boom in 2012, when a malfunction resulted in the detonation of all of the fireworks in a short period (Patton 2012, pers. comm.). Based on the nesting chronology of the least tern, western snowy plover, and rail, it is likely that there will be active nests and adults brooding dependent chicks during the proposed 4th of July event. Although we agree that it is difficult to quantify the number or extent of impacts, we remain concerned that individual nests or chicks may be abandoned due to the night time disturbance, or chicks may flee into harm’s way, particularly since the Refuge sites are not subject to night time disturbances under baseline conditions. For example, least tern habitat at the Refuge is subject to less night time disturbance than least tern habitat at the Airport. The monitoring reports from the Airport nest site state “colonies elsewhere with less habituation to noises would be expected to react more than those at the airport, and the observed flushing of adults, fledglings, and running of chicks in response to the fireworks confirm fears of possible threat of fledglings relocating to roost in active roadways, taxiways or runway following dispersal due to fireworks.” Therefore, we anticipate that the response of avian species at the Refuge will be greater than that observed at the Airport and Naval Base Coronado.

14) The DEIR should include conservation measures to avoid and minimize the potential impacts of the Project on sensitive wildlife. The Carlsbad Fish and Wildlife Office (CFWO) has previously recommended conservation measures be included to existing and ongoing fireworks displays specifically to avoid and/or minimize potential impacts to nesting least terns and snowy plovers, including: (1) Location of discharge sites for fireworks as far away as possible (minimum of 1 mile) from the nearest least tern or snowy plover nesting site; (2) Delineation and law enforcement patrol of shoreline around least tern and snowy plover nesting areas to prevent spectators from coming ashore or anchoring in eelgrass beds; (3) Reduction in shell size to reduce the percussive vibrations associated with fireworks detonations; (4) Development and implementation of a least tern, snowy plover and rail monitoring approach approved by the CFWO; and (5) Development of a plan to mitigate any negative impacts (to least terns, snowy plovers and rails) observed by the monitoring biologist.

The DEIR should discuss the occurrence and location of rafting bird species during the non-breeding season, the anticipated footprint of increased boat traffic, and the likely impacts of increased boat traffic on rafting birds in south San Diego Bay. In addition, the DEIR should specify minimization measures to reduce the impacts of increased boat traffic on rafting birds.

Ms. Wileen Manaos (FWS-SDG-15B0320-17CPA0125)

7

Thank you for the opportunity to comment on the DEIR. We request a meeting with the Port to go over our comments and concerns regarding the Project.

If you have any questions regarding this letter, please contact Sandy Vissman of the Carlsbad Fish and Wildlife Office at (760) 431-9440 or Brian Collins of the San Diego National Wildlife Refuge at (619) 575-2704.

Sincerely,

Subject: San Diego Bay and Imperial Beach Fireworks Shows on July 4, 2016

Dear Ms. Maher:

This letter responds to your request for guidance from the U.S. Fish and Wildlife Service (Service) to reduce potential impacts to sensitive wildlife from the San Diego Bay (Big Bay Boom) and Imperial Beach (IB) fireworks shows on July 4, 2016, funded by the Port of San Diego (Port). We appreciate your efforts to incorporate measures that address wildlife concerns into the 2016 fireworks shows, as the primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States, and is also responsible for administering the Federal Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*). We previously provided comments on the Port's Notice of Preparation of a Draft Environmental Impact Report for San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (UPD #EIR-2015-115)(DEIR)(Port 2015) in our letter dated October 6, 2015 (FWS-SDG-15B0320-15CPA0334)(Service 2015).

We are pleased that, consistent with recommendations in our October 6, 2015, letter, no fireworks shows are proposed at the Chula Vista Bayfront or Loew's Coronado Resort. Due to their close proximity to sensitive wildlife, including the federally listed threatened western snowy plover (*Charadrius nivosus nivosus*; snowy plover), as well as the endangered California least tern [*Sterna antillarum brownii* (*Sterna a. b.*); least tern] and light-footed Ridgway's (=clapper) rail [*Rallus obsoletus* (=longirostris) *levipes*; rail] nesting sites, we recommend that the Chula Vista Bayfront and Loew's Coronado Resort be excluded from future fireworks shows during the nesting season.

The Big Bay Boom and IB fireworks shows will occur in north San Diego Bay (Bay) and IB in the same locations as previous shows. Both shows will last 18 minutes, and be launched from four barges in the north Bay and from the IB Pier. Shells launched within the Bay would be a

maximum of 10-inch shells, and those launched from the IB Pier would be a maximum of 8-inch shells.

As outlined in our October 6, 2015, letter, our primary concern with fireworks shows is the potential impact to wildlife from the fireworks, spectators, and introduction of harmful chemicals and debris into the water. Numerous birds species, including the snowy plover, least tern and Ridgway's rail, use wetlands, shoreline habitats, and/or open water of the Bay and Pacific Ocean in the vicinity of the proposed fireworks shows.

Birds in areas close to fireworks shows are likely to be exposed to the explosive noises, vibrations, and bright flashes of light which may disrupt normal breeding and roosting behavior. Potential avian responses to fireworks include flushing from nests and nest abandonment (Stephensen *et al.* 2012; Weigand and McChesney 2008; Patton 2012, 2013, 2015), although these responses are not always observed (Heinz 2013; Elliott 2014). Reduced avian parental attendance from flushing exposes eggs and/or chicks to night time air temperatures and predators, and may result in changes in hatchability/survivorship depending upon variables such as the length of parental absence, temperature, and predator presence. Illumination and disturbance from fireworks may result in increased visibility of birds, eggs or chicks to predators, particularly in exposed habitat. In addition, spectators of the fireworks shows may disturb or harm breeding or roosting birds, eggs, or chicks (Caffree 1993). Spectator boats traveling within the Bay at night may disturb or collide with rafting birds. Spectators may also leave trash and food waste, which can attract potential predators to sensitive areas. Fireworks launched over water deposit debris and chemical constituents of expended shells into the water, which could indirectly affect birds.

The least tern nests at the San Diego International Airport (SDIA) and Naval Air Station, North Island (NASNI) about 1 mile from Bay launch site. The least tern also nests at the mouth of the Tijuana River in the Tijuana Slough National Wildlife Refuge (Refuge) about 1.5 miles south of the IB Pier launch site. The snowy plover nests on the beaches to the north and south of the IB Pier. Nest distribution shifts from year to year, and in 2014, two snowy plover nests were initiated less than 1 mile north and south of the IB Pier launch site (Navy 2015; Patton 2015, pers. comm.). The rail occupies the Oneonta Slough, within the Refuge, about 0.5 mile south of the IB Pier launch site. Recent monitoring estimated 127 rail pairs in the slough in 2016 (Collins 2016, pers. comm.).

Our October 6, 2015, letter recommended several conservation measures for fireworks shows to avoid and/or minimize potential impacts to least terns and snowy plovers. Consistent with our recommendations, the Port proposes to implement the following measures: 1) locating launch sites greater than 1 mile from least tern nesting sites; 2) installing signs to prevent trespass into the Refuge; 3) limiting maximum shell size to 10 inches in the Bay, and 8 inches at IB Pier; 4) limiting show length at 18 minutes; 5) picking up floating and shoreline debris after the event; 6) monitoring least tern nesting at the SDIA; and 7) monitoring water quality after the event in compliance with the Regional Water Quality Control Board fireworks permit. We appreciate the

Port's proposed minimization measures and offer the following comments and suggestions to further reduce the potential for impacts to snowy plovers, least terns, and rails.

Active least tern nests, chicks and adults will likely be present at the SDIA, NASNI and Refuge nesting sites during the fireworks shows. Based on the baseline level of disturbance at these sites and the results of previous monitoring, we anticipate that the Big Bay Boom fireworks show will temporarily disrupt least tern nesting and roosting at SDIA and NASNI (Patton 2013), and will temporarily separate parents from flightless chicks. Spectators that view the Big Bay Boom from the parking lot adjacent to SDIA Oval O-3S could also disrupt or harm nesting or roosting terns. The least tern nesting site at the Refuge was not monitored during past fireworks shows and we do not have information regarding the response of this colony to fireworks. However, due to the greater distance from the launch site (i.e., 1.5 miles) and smaller shell size (i.e., 8-inch) we expect the fireworks show at IB to disrupt least tern nesting to a lesser degree than at SDIA. However, spectators that view the IB show from the beach south of Sea Coast Drive could disrupt or harm nesting or roosting terns at the mouth of the Tijuana River.

While the current proposed launch locations are consistent with our recommendation that launch sites be at least 1 mile from nest sites, we note that least terns nesting at SDIA (about 1 mile from the Bay launch site) were observed to flush from nests during past Big Bay Boom fireworks shows (Patton 2012, 2013, 2015). A firework study conducted in San Francisco Bay detected no least tern flushing from nests when fireworks were launched about 2 miles from the colony (Elliott 2014). Therefore, we recommend that the Port increase the distance between the least tern colonies and the Big Bay Boom launch sites as much as possible to reduce the disturbance to a level that does not result in least tern flushing. To reduce the potential for spectator disturbance at the SDIA nesting site, we recommend that the Port close the parking lot that lies adjacent to nesting oval O3-S on July 4. To reduce the potential for spectator disturbance at the Refuge nesting site, we recommend that the Port coordinate with the City of IB and the Refuge staff to assure that, in addition to signage, adequate enforcement personnel are present south of IB Pier to prevent spectators from entering into the nesting site. Specifically, we recommend that a uniformed enforcement agent be stationed at the south end of Sea Coast Drive on the evening of July 4.

Active snowy plover nests, chicks and adults will likely be present on the beaches to the north and south of the IB Pier during the IB fireworks show. We recommend that the Port coordinate with the City of IB and Refuge to assure that signage and enforcement presence is in place to the north of the IB Pier, as well as to the south (recommended above to protect least terns), to reduce spectator foot traffic in snowy plover nesting habitat. Specifically, we recommend that a uniformed enforcement agent be stationed at the Navy's "Camp Surf" on the evening of July 4.

It is likely that Oneonta Slough will support active rail nests, chicks, and adults during the IB fireworks show. We anticipate disturbance to rails, given the close proximity of the IB Pier launch site, and encourage the Port to offset disturbance by contributing to the efforts to improve rail habitat, maintain water quality, reduce human and pet disturbance, and open the mouth of the Tijuana Estuary consistent with the Light-footed Clapper Rail Recovery Plan (Service 1985).

The Port proposes to deploy “No Trespass” signs to reduce the potential for unintended spectator impacts to rail nesting. We also recommend that the Port coordinate with the City of IB and the Refuge staff to assure that adequate enforcement is present to prevent spectators from entering into the Tijuana Slough nesting site. Specifically, we recommend that a uniformed enforcement agent be stationed at the south end of Sea Coast Drive on the evening of July 4 (as recommended above in reference to least tern and snowy plover protection). In addition, we recommend that the Port clean up any trash or food waste left by spectators near least tern, snowy plover and rail nesting sites.

Biological monitoring during anthropogenic activities such as fireworks shows can provide valuable information that increases our understanding of wildlife response to potential disturbance. Information obtained during monitoring may assist in assessment of effects of future activities, and can also help us to refine minimization measures. Biological monitoring during night time activities, such as fireworks shows, presents unique challenges since observations are compromised by lack of light and nocturnal disturbance from the monitoring itself may impact birds. Monitoring nest sites before and after disturbance events can also aid in assessment of impacts, particularly in situations where night time monitoring is problematic. We recommend monitoring of least terns and snowy plovers, as described below, however we do not recommend monitoring of rails at this time due to the potential for disturbance associated with monitoring (Zemba 2016, pers. comm.).

The Port proposes to monitor the least tern colony at SDIA, and we recommend that, similar to previous years, monitoring occur on the following dates and times: July 3 and July 4, 1 hour before, during, and 1 hour after the time of the fireworks show; and July 5, early in the morning. Monitoring should include assessment of nest attendance (or abandonment), and estimates of adult, chick, and fledgling numbers and behavior, including any observed responses to fireworks shells. We recommend that the Port also coordinate with the Navy regarding comparable least tern monitoring at NASNI. We also recommend that the noise and vibration be monitored at SDIA and NASNI. Reporting should include the noise and vibration levels before and during the fireworks show; the location of the night roosts (if possible); observations of spectator disturbance; observations of least tern response to fireworks and spectators; estimated number of adult least terns, active nests, and chicks onsite before and after the fireworks show; and any evidence of harm to least terns.

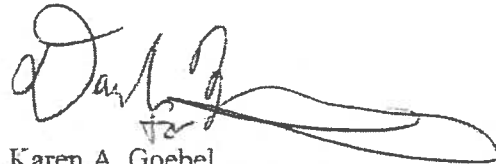

We recommend that the least tern nesting colony at the Refuge be monitored on July 4 prior to the event, and in the morning on July 5 to assess colony attendance and estimate the number of active nests and chicks present onsite. Reporting should include the location of roosting/nesting area(s) and the estimated number of adult least terns, active nests, fledglings, and chicks onsite, and any observations of nest disturbance or harm to least terns.

No snowy plover monitoring has been proposed by the Port, however we recommend that the Port coordinate with the Refuge and Navy to determine if active snowy plover nests or broods lie within 1.5 miles of the IB Pier launch site on July 3. If active nests or broods occur within this area, we recommend monitoring on July 4 and 5 to assess nest activity and brood presence

before and after the fireworks display. Reporting should include the location of nests and broods, the number of active nests, chicks and adults onsite, and any observations of nest disturbance or harm to snowy plovers.

We appreciate the opportunity to provide recommendations to reduce potential impacts to sensitive wildlife from the Big Bay Boom and IB fireworks shows. Results from our recommended monitoring should aid the preparation of the DEIR for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project. We request that the Port provide a response to our recommendations and a draft monitoring plan for our review by June 1, 2016, and a monitoring report by September 15, 2016. Should you have any questions regarding this letter or need further assistance, please contact Sandy Vissman at (760) 431-9440, extension 274.

Sincerely,

A handwritten signature in black ink, appearing to read 'Karen A. Goebel', with a long, sweeping horizontal flourish extending to the right.

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (UPD #EIR-2015-115), in San Diego County, California

Dear Mr. Giffen:

The U.S. Fish and Wildlife Service (Service) has reviewed the Notice of Preparation of a Draft Environmental Impact Report (EIR) for San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (NOP). The NOP describes the proposed project and was distributed to the Service to request guidance regarding the scope and content of the environmental information to be included in the EIR. The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Federal Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*).

The proposed Project involves continued permitting of ongoing and proposed fireworks display events in and around San Diego Bay and the Imperial Beach Oceanfront in San Diego County, California. Current fireworks display events include the "Big Bay Boom" and other smaller events operated by the San Diego Unified Port District's (District's) tenants. Proposed fireworks displays include fireworks on the Chula Vista Bayfront. Fireworks are detonated from flight decks, barges, and/or piers located adjacent to, or in the waters of San Diego Bay or the Imperial Beach Oceanfront. The District estimates that at this time approximately 50 fireworks displays are permitted per year, and anticipates that firework displays within the Project Area are likely to increase at a rate of 2 percent per year. Fireworks displays currently occur year-round, with a duration ranging from 5-20 minutes. Existing events occur at South Embarcadero, North Embarcadero, near Shelter Island, near Harbor Island, Glorietta Bay, and Imperial Beach Oceanfront.

We appreciate the efforts of the District to address the cumulative impacts of multiple fireworks displays in the proposed DEIR, and offer the following comments and recommendations to assist the District in identifying, avoiding, minimizing, and adequately mitigating direct and indirect project-related impacts to fish and wildlife resources, including Endangered and Threatened species:

1. San Diego Bay and the Imperial Beach Oceanfront, including the vicinity of some launch and viewing sites, support resident and migratory sea birds, shore birds, passerines, endangered bird species, sea turtles, fish, and marine mammals. Significant populations of birds use portions of San Diego Bay year round: during the summer months thousands of birds nest, breed, and raise young, particularly in south San Diego Bay; and during the winter months, thousands of migrating or wintering waterfowl take refuge in the Bay. Fireworks displays include significant levels of light, noise, and vibration known in some instances to result in temporary disturbance to wildlife (Patton 2013; Sandoval 2005). Fireworks may also disrupt roosting and exacerbate predation pressure (Caffree 1994). If launched over or near the water, displays may deposit residual debris and chemical constituents into the water and thereby affect water quality (San Diego Regional Water Quality Control Board 2011). Please include in the DEIR a thorough review of the available literature pertaining to the potential or documented impacts of fireworks displays or similar punctuated disturbances on wildlife.
2. To facilitate assessment of the environmental effects of the proposed action, we recommend that the DEIR include: 1) a figure that depicts the precise location of existing and future proposed launch sites; 2) a figure depicting the location of sensitive resource use areas within the vicinity of proposed launch sites (including, but not limited to, Sweetwater National Wildlife Refuge, Chula Vista Wildlife Reserve, South San Diego Bay Unit of San Diego National Wildlife Refuge, San Diego International Airport Least Tern Nesting Area, Naval Base Coronado Delta Beaches, Naval Base Coronado “heron park”, Tijuana National Wildlife Refuge, marine mammal haul out areas); 3) a figure that depicts the location and abundance of rare, endangered, and other sensitive species that occur in the vicinity of proposed launch sites (including, but not limited to, federally threatened Western snowy plover (*Charadrius nivosus nivosus*, snowy plover), federally endangered California least tern (*Sternula antillarum browni*, least tern), federally endangered Light-footed clapper rail, recently reclassified as “Ridgeway’s rail” (*Rallus longirostris levipes*, clapper rail), Belding’s Savannah sparrow (*Passerculus sandwichensis beldingi*, Savannah sparrow), American Peregrine falcon (*Falco peregrinus anatum*, peregrine falcon), gull-billed tern (*Gelochelidon nilotica*)); 4) information regarding the abundance and distribution of water birds use San Diego Bay, Tijuana Estuary, and Imperial Beach (for example, information available from San Diego Bay bird surveys supported by the U.S. Navy and the District, annual San Diego Shorebird Survey, and San Diego National Wildlife Refuge bird surveys).

3. Please include in the DEIR detailed information regarding the number, location, and duration of baseline events that have occurred in recent years, and the number, location, and duration of additional proposed events (i.e. events that have been permitted by the District, but have not yet occurred).
4. The DEIR should include an analysis of the intensity and extent of light, sound, vibration, and debris/fallout anticipated as a result of the fireworks displays, based on the size and number of fireworks shells that will be used. The analysis of the effects of the proposed action should include an assessment of the areas where light, sound, vibration, and debris are expected to have a direct impact on wildlife.
5. The DEIR should include an analysis of the potential indirect effects of the fireworks displays on wildlife resources in the Project Area. Potential indirect effects of fireworks displays include, but are not limited to: disturbance or impacts to resources from spectators, changes in water quality associated with debris or fallout from fireworks.
6. The Carlsbad Fish and Wildlife Office has previously recommended, and continues to recommend that the no fireworks displays occur within the Chula Vista Bayfront during the avian breeding season (generally January-September) due to the close proximity to the abundance of sensitive wildlife resources that occur within and around the Sweetwater National Wildlife Refuge, the South San Diego Bay National Wildlife Refuge (Wildlife Refuges), and the Chula Vista Wildlife Reserve. Similarly, we have recommended and continue to recommend that fireworks displays be minimized at the Loew's Coronado Resort during the avian breeding season due to the proximity of this hotel to protected least tern and snowy plover habitat at Silver Strand State Beach and Naval Base Coronado.
7. The DEIR should include conservation measures to avoid and minimize the potential impacts of the Project on sensitive wildlife. The Carlsbad Fish and Wildlife Office has previously recommended conservation measures be included to existing and ongoing fireworks displays specifically to avoid and/or minimize potential impacts to nesting least terns and snowy plovers, including: 1) Location of discharge sites for fireworks as far away as possible (minimum of 1 mile) from the nearest least tern or snowy plover nesting site; 2) Delineation and law enforcement patrol of shoreline around least tern and snowy plover nesting areas to prevent spectators from coming ashore or anchoring in eelgrass beds; 3) Reduction in shell size to reduce the percussive vibrations associated with fireworks detonations; 4) Development and implementation of a least tern and snowy plover monitoring approach approved by the CFWO; 5) Development of a plan to mitigate any negative impacts (to least terns and snowy plovers) observed by the monitoring biologist.

8. The District estimates that fireworks displays may increase approximately 2 percent per year. The DEIR should analyze the need for an increased number of fireworks displays. We recommend that the District consider limiting the number of fireworks displays that may occur throughout the year at approved launch sites.

We appreciate the opportunity to provide comments on this NOP. Should you have any questions regarding this letter, please contact Sandy Vissman of my staff at (760) 431-9440.

Sincerely,

for: Karen A. Goebel
Assistant Field Supervisor

Subject: Comments on the Draft Environmental Impact Report for the Chula Vista Bayfront Master Plan and Port Master Plan Amendment, City of Chula Vista, California (SCH #2005081077)

Dear Mr. Hicks,

The U.S. Fish and Wildlife Service (Service) and California Department of Fish and Game (Department) (collectively referred to as 'Wildlife Agencies') have reviewed the above-referenced draft Environmental Impact Report (DEIR) and supporting documentation for the Chula Vista Bayfront Master Plan and Port Master Plan Amendment (Proposed Project), dated September 29, 2006. The public review period for the DEIR ends January 11, 2007. The comments provided in this letter represent our concerns about the Proposed Project's potential impacts on sensitive biological resources.

The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Endangered Species Act (16 U.S.C. 1531 *et seq.*). The Department is a Trustee Agency and a Responsible Agency pursuant to the California Environmental Quality Act (CEQA) Guidelines, Sections 15386 and 15381, respectively. The Department is responsible for the conservation, protection, and management of the state's biological resources, including rare, threatened, and endangered plant and animal species, pursuant to the California Endangered Species Act and other sections of the Fish and Game Code, and administers the Natural Community Conservation Planning (NCCP) program.

The 562-acre Chula Vista Bayfront (Bayfront) is located on the southeastern edge of San Diego Bay in the City of Chula Vista. The subject planning area shares a common border with the Sweetwater Marsh Unit of the San Diego Bay NWR at its northern boundary and the South San Diego Bay Unit of the San Diego Bay NWR at its southern boundary. In 2002, the San Diego Unified Port District (Port) and the City of Chula Vista (City) joined together to prepare a master

plan for the Bayfront, which includes approximately 500 acres of land area and 62 acres of water area. Proposed uses include hotel, retail, entertainment, conference center, office, residential, civic/cultural, marina and ferry terminal, recreation, parkland, environmental buffers, a public pier, and associated public facilities such as streets, bikeways, pedestrian paths, and parking structures. Key components of the Proposed Project described in the DEIR include:

- A resort conference center and other hotels with a maximum height limit of 300 feet (25 stories);
- Up to 2,000 residential units with a maximum height limit that ranges from 300 feet in the Harbor District to 200 feet in the Otay District;
- Mixed use office and commercial recreation uses with maximum allowable heights ranging from 85 to 200 feet in the Harbor District and 40 to 100 feet in the Sweetwater District;
- Waterfront retail uses and public gathering spaces around the harbor;
- A new commercial harbor, ferry terminal, and realigned navigation channel;
- A 21-acre public park and other open space areas;
- A public promenade and bike trail through the entire Bayfront;
- A new traffic circulation system, storm water system, and the installation of various other public services and facilities to serve the proposed uses; and
- The relocation of the existing power plant to the southern end of the planning area.

The master planning area has been divided into three districts: the northern 129-acre Sweetwater District; the central 280-acre Harbor District; and the southern 153-acre Otay District. Development within the planning area would occur in three phases over an approximately 25-year period. Construction of Phase I is proposed to begin upon project approval and conclude approximately six years later. Phase I components would be concentrated in the Harbor and Sweetwater Districts. Phase II construction would be completed approximately five years after the completion of Phase I and Phase III is expected to be completed approximately 13 years after the completion of Phase II.

As the master plan represents a joint planning effort covering a large area of land and water, a number of jurisdictional issues must be addressed and resolved. The Port currently has jurisdiction over much of the land and water areas, while the City currently exercises jurisdiction over some of the inland portions of the planning area. The Proposed Project includes a land exchange between the Port and a private developer. This land exchange would include the transfer of up to 97 acres of land in the Sweetwater District from a private developer to the Port, in exchange for up to 57 acres of land in the Harbor and Otay Districts from the Port to the private developer. In association with this exchange, lands currently designated for residential use in the Sweetwater District would be redesignated for uses permitted on State tidelands and areas in the Harbor and Otay District would be redesignated to allow for residential development.

The DEIR also addresses the following Project-related actions: an amendment to the Port Master Plan; a coastal development permit for those portions of the project that would occur within the Port's jurisdiction; an amendment to the City's Bayfront Area Plan of the General Plan; amendments to the City's Local Coastal Program, Bayfront Specific Plan, and Bayfront/Town Centre 1 Redevelopment Plan; approval of a dredging permit from the State Lands Commission

in order to realign the existing navigation channel in San Diego Bay; and issuance of permits from the U.S. Army Corps of Engineers, the Department, and the Regional Water Quality Control Board.

The Department and the Service previously commented on the Notice of Preparation (NOP, SCH# 2002081116) for the Bayfront Village Project that was restricted to the 128-acre area currently included in the Sweetwater District. The Department commented in a letter dated September 24, 2002, and the Service provided a similar letter, dated September 19, 2002. The Wildlife Agencies also commented on the NOP for the Proposed Project in a letter dated September 12, 2005. The Service also provided a letter to the Port and City, dated April 22, 2004, that emphasized the importance of the habitats in the south end of San Diego Bay and the need for the Proposed Project to adequately protect the south bay's locally, regionally, and globally important natural resources. We appreciate that, relative to the project previously proposed in 2002, it appears that the currently Proposed Project would result in considerably adverse biological impacts within the Sweetwater District. However, considering the overall intensity of the larger project proposal, we retain many of the concerns that we raised in our previous letters. All of our comments in past letters also apply to the Proposed Project, as described in the DEIR dated September 2006.

A summary of the Wildlife Agencies' primary comments and concerns about the DEIR follows. We are disappointed that the DEIR provides no or inadequate analysis of, and mitigation for, many of the biological impacts about which we previously provided (in letters and electronic mail to, and meetings with, the Port) substantive comments and recommendations, and requested the DEIR thoroughly address. We request a meeting with the Port, the City, and stakeholders to further discuss the Proposed Project and our comments, after we have had an opportunity to review the responses to our comments, and prior to the Port's decision as to whether to revise and recirculate the DEIR (comment 2 below), or well in advance of the Board of Port Commissioners' consideration of the DEIR for certification.

1. The Wildlife Agencies do not concur with the DEIR that significant impacts to biological resources and wetlands have been minimized to a level less than significant (Section 4.8.7). The DEIR does not adequately evaluate all project impacts to biological resources, even at a programmatic level, and the full range of mitigation measures needed to reduce potential impacts to a level less than significant are either not addressed or, in some instances where measures are addressed, future implementation of the measures cannot be assured. We strongly urge the Port to (a) revise the DEIR to adequately identify and analyze the Proposed Project's biological impacts addressed in this comment letter, and to provide appropriate mitigation for the impacts, and (b) to recirculate the revised DEIR for public review and comment.
2. The Wildlife Agencies support a land exchange that eliminates or minimizes the possibility of residential development and its associated direct and indirect impacts to on-site and adjacent sensitive biological resources. We therefore recommend that the Proposed Project be modified to incorporate certain components of both the Modified Land Exchange and the Harbor Park Alternative, as specified in our detailed comments in the Enclosure. We do not support the inclusion of a 2,000 to 5,000 seat amphitheater on

parcel HP-1, which is proposed as part of the Harbor Park alternative, because it would increase disturbance to wildlife that roost and nest within and/or in the vicinity of the project site.

3. Based on information available regarding the Proposed Project, we are especially concerned about its potential direct and indirect impacts to: (a) intertidal wetlands (*e.g.*, Sweetwater Marsh, F&G Street Marsh, J Street Marsh, and the mudflats located north of the Harbor District) and their associated federally and state-listed plant and wildlife species, including the light-footed clapper rail (*Rallus longirostris levipes*) and Belding's savannah sparrow (*Passerculus sandwichensis beldingi*); (b) subtidal bay habitats and their associated fisheries resources, eelgrass beds, and migratory bird foraging and rafting areas; (c) migratory birds, including those birds identified by the Service as Birds of Conservation Concern, that rely on the south San Diego Bay for foraging and resting areas during migration along the Pacific Flyway; (d) colonial nesting seabirds such as the federally and state-listed California least tern (*Sterna antillarum browni*) and federally listed western snowy plover (*Charadrius alexandrinus nivosus*), shorebirds, and waterfowl that nest in proximity to the project site; and (e) species covered by the City's Multiple Species Conservation Program (MSCP) Subarea Plan.
4. The level of detail provided in the DEIR for specific project design, potential project impacts, and appropriate mitigation measures for the Phase I projects is not sufficient to allow adequate project-specific review under CEQA. Therefore, the analyses provided throughout the DEIR should be considered programmatic.
5. Portions of the Proposed Project and lands adjacent thereto are subject to the standards laid out in the City MSCP Subarea Plan. Since the Port does not have a habitat conservation plan/NCCP to guide its development projects, the entire project should meet or exceed the mitigation ratios, guidelines, and standards required by the City's MSCP Subarea Plan to maintain consistency with its application to the on-site and adjacent areas within Plan.
6. The DEIR does not identify the Proposed Project's many indirect impacts to adjacent sensitive habitats and sensitive species located therein, nor does it propose adequate measures to mitigate such impacts. Such indirect impacts, otherwise known as "edge effects," include increased predation, increased disturbances to wildlife, bird strikes and disorientation, shading of adjacent habitat, human encroachment, increased noise, increased illumination, and detrimental changes to hydrology and water quality. A fenced minimum 100-foot wide "no-touch" habitat buffer should be provided around all sensitive habitats, including mitigation habitats, to minimize indirect impacts. Degradation of habitats due to unavoidable indirect impacts should be mitigated, in part, through creation or restoration of similar habitats.

The Wildlife Agencies offer the preceding general comments, and our general and specific recommendations and comments on the adequacy of DEIR in the accompanying Enclosure, to assist the Port and project applicant(s) in ensuring that the Proposed Project's biological impacts are avoided and/or minimized to below a level of significant.

We appreciate the opportunity to comment on the DEIR. For questions regarding this letter, contact: Carolyn Lieberman or Amber Himes at (760) 431-9440 of the Service; and Libby Lucas at (858) 467-4230 or Marilyn Fluharty at (858) 467-4231 of the Department.

Sincerely,

//s//Kathleen Brubaker, for

**WILDLIFE AGENCIES' COMMENTS ON THE DRAFT EIR FOR
THE CHULA VISTA BAYFRONT MASTER PLAN AND
PORT MASTER PLAN AMENDMENT**

The Wildlife Agencies offer the following general and specific recommendations and comments on the adequacy of Draft Environmental Impact Report (DEIR) to assist the San Diego Unified Port District (Port) and project applicant(s) in ensuring project impacts to biological resources are avoided and/or minimized to below a level of significant. Our specific comments are based on the preferred alternative. If the alternative approved for implementation deviates from the preferred alternative presented in the DEIR, we may have additional comments. We request a meeting with the Port, the City, and stakeholders to further discuss the Proposed Project and our comments, after we have had an opportunity to review the responses to our comments, and prior to the Port's decision as to whether to revise and recirculate the DEIR (comment 2 below), or well in advance of the Board of Port Commissioners' and consideration of the DEIR for certification.

The Proposed Land Exchange

1. The Wildlife Agencies support a land exchange that eliminates or minimizes the possibility of includes removal of residential development and its associated direct and indirect impacts to on-site and adjacent sensitive biological resources. We therefore recommend that the Proposed Project implement an alternative that incorporates the following components of both the Modified Land Exchange and the Harbor Park Alternative:
 - a. the components of the Modified Land Exchange that avoid placing residential development and its associated impacts adjacent to the J Street Marsh and the Sweetwater Marsh and South San Diego Bay Units of the San Diego NWR;
 - b. the components of the Harbor Park Alternative that relocate (i) the Signature Park from the Sweetwater District (S-2) to the Harbor District (H-3), and (ii) a conference hotel from the Harbor District to the Sweetwater District (S-2), to minimize uncontrolled human and animal encroachment into the Sweetwater Marsh Unit and adjacent mudflats;
 - c. move the Resort Conference Center (RCC) farther away from San Diego Bay (from H-3 to H-23) to avoid impacts to the F&G Street Marsh and the Bay due to shading, to minimize its potential for losses of listed species from avian predators perching on tall structures, and to reduce the potential for bird strikes; and,
 - d. reduce the building heights in the areas of the Sweetwater District (S-1) that are adjacent to the Sweetwater Marsh Unit to avoid impacts related to shading and predator perching.

We do not however support the inclusion of a 2,000 to 5,000 seat amphitheater on parcel HP-1, which is proposed as part of the Harbor Park alternative, because it would increase disturbance to wildlife that roost and nest within and/or in the vicinity of the project site.

Adequacy of Environmental Review under CEQA

2. Throughout the DEIR, there are multiple instances of inadequate identification and analysis (even at a programmatic level) of biological impacts, and inadequate, or inappropriate deferral of, mitigation. Subsequently, the impact analyses and proposed mitigation is insufficiently detailed to assess the biological implications of the Proposed Project. CEQA requires that all anticipated impacts and proposed mitigation be clearly identified in a DEIR and not deferred for future study. This is supported by *Sundstrom v. County of Mendocino*, 202 Cal.App3d 296, which states “the requirement that the applicant adopt mitigation measures recommended in a future study is in direct conflict with the guidelines implementing CEQA....By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process.”

The lack of inadequate analysis and mitigation in the DEIR undermines the basic purposes of CEQA. These purposes include, but are not limited to the following: (a) informing governmental decision-makers and the public about the potential, significant environmental effects of proposed activities; (b) identifying the ways that environmental damage can be avoided or significantly reduced; and (c) preventing significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible [CEQA Guidelines, section 15002(a)].

Based on the foregoing and ensuing comments and recommendations, we strongly urge the Port to (a) revise the DEIR to adequately identify and analyze the Proposed Project's biological impacts addressed in this comment letter, and to provide appropriate mitigation for the impacts, and (b) pursuant to Section 15088.5 of the CEQA Guidelines, recirculate the revised DEIR for public review prior to its consideration for certification.

This would be particularly appropriate if, for example, there is one or more feasible project alternative(s), or there are mitigation measures, considerably different from those previously analyzed that would clearly lessen the environmental impacts of the Proposed Project, but the Port declines to adopt them [CEQA Guidelines, Section 15088.5(a)(3)]. Our recommendation derives from the lack of basic impact analyses in the DEIR, analyses needed to conform to CEQA. The revisions to the DEIR to be recirculated should be fully responsive to our comments by providing full disclosure of the potential project-related biological impacts, and additional measures necessary to mitigate the impacts to a level less than significant.

3. The DEIR states, "Additional environmental review ...required for Phases II and III projects will be determined pursuant to State CEQA Guidelines Section 15168." However, the project description, impact analysis, and proposed mitigation measures in the DEIR for Phase I projects provide insufficient information to constitute a project-level review under CEQA. Again, the DEIR does not satisfy the basic purposes of CEQA because it lacks the level of detail (particularly with respect to project descriptions, impact analysis, and proposed mitigation) needed for thorough evaluation and review of potential Project-related impacts. For these reasons, as discussed further in subsequent comments herein, the entire DEIR should be considered a programmatic DEIR, and all project components, including those in Phase I, should be subject to subsequent public review and comment.
4. The existing conditions discussion of Land/Water Use Compatibility (Section 4.1 of the DEIR) is generally limited to land uses within the Proposed Project footprint, though the discussion should also address the Proposed Project's compatibility with adjacent uses. The document should describe the land uses and planning policies established for the San Diego Bay National Wildlife Refuge (NWR), which abut the Proposed Project site to the north, south, and west. For this purpose, Section 4.1.1.1 of the recirculated/final EIR should include a discussion of the recently approved Comprehensive Conservation Plan for the NWR. In addition, the recirculated/final EIR should accurately analyze the potentially significant land use compatibility impacts to the NWR that could result from the implementation of various components of the Proposed Project.

Specific Comments

The following comments address specific sections in the DEIR where project information is insufficient for the level of review necessary under CEQA. The recirculated/final EIR should provide a level of detail necessary for adequate analysis and disclosure of biological impacts and determination of appropriate mitigation.

5. Section 4.1.1.1 should be revised to address the NWR, and Figure 4.1-5 should be revised to include not only the current boundary of the Sweetwater Marsh Unit of the NWR, but also the current boundary of the South San Diego Bay Unit of the NWR to the south and west. Suggested language for Section 4.1.1.1 (San Diego Bay NWR Comprehensive Conservation Plan) is provided below.

g. San Diego Bay NWR Comprehensive Conservation Plan

The U.S. Fish and Wildlife Service recently completed a Comprehensive Conservation Plan (CCP) for the San Diego Bay NWR (USFWS 2006). The CCP, which provides a 15-year strategy for achieving refuge purposes and contributing towards the mission of the National Wildlife Refuge System, describes why this Refuge was established and outlines the Refuge purposes, vision, goals, and objectives.

The San Diego Bay NWR includes the 316-acre Sweetwater Marsh Unit to the north of the Proposed Project, and the South San Diego Bay Unit, which includes 2,300 acres of land and water to the south and west of the Proposed Project. The Refuge was established to protect, manage, and restore habitats for federally listed species and migratory birds, and to maintain and enhance the biological diversity of native plants and animals on the Refuge. The Refuge includes most of what remains of San Diego Bay's historic coastal salt marsh and intertidal mudflat habitat. Refuge goals include: protecting, managing, enhancing, and restoring the coastal wetland and upland habitats on the Refuge to benefit native fish, wildlife, and plant species; protecting state and federally listed species and migratory birds supported on the Refuge; protecting foraging and nesting habitat for colonial nesting seabirds in the South San Diego Bay Unit; and providing opportunities for public uses that are compatible with Refuge purposes.

6. The project description in the recirculated/final EIR should provide more than only limited acknowledgement that the southern end of the Proposed Project footprint abuts a segment of the South San Diego Bay Unit NWR. A portion of parcel OP-2A directly borders 3000 feet of the NWR. The label "South San Diego Bay Unit of the San Diego Bay National Wildlife Refuge" should be used to identify the NWR on Figures 3-2, 3-3, 3-4, 3-5, 3-7, and 4.8-1. In addition, Section 3.1 and associated graphics should be revised to distinguish between the Sweetwater Marsh Unit and the South San Diego Bay Unit of the NWR. The last sentence in the second paragraph of Section 3.1 should read: "Palomar Street and the South San Diego Bay Unit of the San Diego Bay NWR, which includes the existing salt evaporation ponds, at the southern end of San Diego Bay border the planning area to the south and west."
7. The analysis of compatibility of the Proposed Project with the NWR on page 4.1-77 of the DEIR is inadequate. The significant impacts identified on page 4.1-68 of the DEIR related to public access, lighting, and noise (which should also address fireworks, outdoor concerts, and in-water uses) should also be clearly presented under Criterion 3 in Section 4.1.3 and should be expanded to address both the Sweetwater Marsh and South San Diego Bay Units of the NWR. Factors that should be considered in determining the Proposed Project's compatibility with the NWR include impacts to NWR habitats and wildlife from shading, storm water discharge, changes in topography that could affect current hydrological conditions on the NWR, increased noise levels and increased night lighting and sky glow, increases in predation, unauthorized access onto sensitive habitats, and other factors addressed throughout this comment letter. Corresponding enforceable mitigation measures that would reduce impacts to a level less than significant should also be added to Section 4.1.4. Finally, the Wildlife Agencies do not concur with the conclusion of the DEIR that "strategic" fencing would reduce compatibility impacts to a level less than significant, in part because no amount of fencing will minimize most the negative effects of most of the factors mentioned above. Nevertheless, the entire boundary of the Proposed

Project should have fencing or other suitable barriers that would prevent unauthorized access by humans and pets into sensitive coastal habitats.

8. The Wildlife Agencies consider the DEIR misleading in its classification of wetland resources under different regulatory jurisdictions. For example, the DEIR indicates that seasonal ponds in the Otay District and mulefat scrub in the Sweetwater District are exempt from the U.S. Army Corps of Engineers' (Corps) jurisdiction due to isolation. And, Figure 4.8-6, *Overview of USACE Jurisdictional Resources*, labels these wetlands as "exempt from jurisdiction." However, the Corps has not made this conclusion. Until the Corps designates which areas within the Project footprint are subject to or exempt from their regulation, the EIR should refrain from making such designations. The Wildlife Agencies believe that these seasonal ponds may be subject to the Corps jurisdiction based on information provided in the DEIR. Specifically, the DEIR indicates that the Soil Survey for San Diego County maps tidal flat soils along the eastern edge of the Otay District. Furthermore, the historic footprint (*i.e.*, 1859) of San Diego Bay also occurred within the Otay District (Map 3-1 in San Diego Bay Integrated Natural Resource Management Plan, Navy and Port 2000). We recommend that the recirculated/final EIR reflect wetland delineations that have been verified by the appropriate agencies so that the public can review all impacts to wetlands and waters, and their associated mitigation.
9. Based on the description of the uses to be permitted within the eastern 200 feet of the proposed 400-foot wide "ecological buffer," the Wildlife Agencies request that the nomenclature used for the buffer be changed to avoid any misunderstanding on the part of the public or the decision makers. As described in the DEIR, the 400-foot-wide area does not meet the intent of an "ecological buffer." Specifically, the human activities to be allowed within the eastern 200 feet are not compatible with the purposes of an ecological buffer. A true ecological buffer represents an area where no human activity is allowed except for conservation and restoration purposes. In the case of the Proposed Project, the only ecological buffer is within the 200-foot no touch/mitigation area, with the exception of the proposed trail outlooks. The 100-foot limited use buffer and 100-foot transitional use zone should not be considered ecological buffers because they allow uses that are not compatible with conservation. Therefore, the recirculated/final EIR should rename this 200-foot area to more accurately describe the types of low intensity park uses that are proposed within it. Note that we are not requesting a wider true ecological buffer; we are simply a requesting clarification of the intent and uses that would occur within the 400-foot-wide area that abuts the Sweetwater Marsh Unit.
10. The DEIR does not identify the numbers, heights, or locations of the buildings proposed on each parcel. This lacking information is particularly important for parcels S-1, S-4, H-3, H-13, H-14, and O-1A and O-1B, which are adjacent to preserved wetlands within the NWR or other wetland areas (*e.g.*, Sweetwater Marsh, F&G Street Marsh, and J Street Marsh). Depending on their design and location, the buildings on these parcels could provide raptorial perches that overlook wildlife habitat supporting several sensitive avian species

that are prey for raptors, result in bird strikes, and shade adjacent wildlife habitats. Yet, the DEIR does not include adequate mitigation measures to avoid and minimize biological impacts associated with the buildings.

11. The DEIR does not provide adequate information to enable the reviewer to understand how the existing elevations within the Proposed Project site would be changed or how existing drainage patterns would be altered to accommodate future development. The full project-level impact analysis of Phase I in the recirculated/final EIR should include a detailed grading plan for each of the Phase I development areas. Without this information, it is infeasible to properly assess the Phase I potential effects to adjacent coastal resources.
12. The overall design of the Proposed Project should minimize biological impacts in all three project Phases. Project components of Phase I should not foreclose the potential to avoid or minimize the biological impacts from Phases II and III. For example, to a considerable degree, the design (e.g., height) and location of the buildings (i.e., aspects of the buildings that affect biological resources such as the Pacific Flyway) in Phase I will dictate the same for buildings in Phases II and III. Trade-offs among the three Phases in the design and location of buildings warrant considering the entire project as a whole to avoid or minimize its biological impacts.
13. The project description for Parcel S-2 Signature Park (Phase I) lacks the detail necessary for a full analysis of its impacts. The recirculated/final EIR should include: an as-built 11"x17" rendering of the of the Proposed Project design; a full description, with all permitted uses, anticipated activities, hours of operation, structures, lighting fixtures, and other accessory features fully described; and, a detailed analysis of the impacts associated with each of these proposed elements.
14. The project description for Parcel S-2A Open Space (Phase I) describes the parcel as an existing street and as a project mitigation site. The DEIR provides no description of the condition of the vegetation on site, nor details regarding the possible use of the site for mitigation. If this parcel is to be included in Phase I, then the proposed use of the parcel should be fully described. Decisions regarding use of the site for mitigation and whether or not the existing street segment would be demolished are necessary in order to complete adequate project specific CEQA review. The EIR should address the following: whether the site, if used for mitigation, would become part of the F & G Street Marsh; how might the restored habitat be affected by implementation of the Proposed Project; and what would be the value of the site in terms of conservation.
15. The project description in the recirculated/final EIR should acknowledge that the southern end of the Proposed Project is located in the vicinity of the City of San Diego's MSCP preserve, the Multiple Habitat Planning Area (MHPA). Figure 4.8-1 should be revised to include the boundaries of the MHPA.

16. Figure 4.8-1 should be revised to identify the mudflats located west of the Sweetwater Marsh and north of the Harbor District. The recirculated/final EIR should discuss the importance of this mudflat as a biological resource that provides essential foraging and resting areas for birds migrating along the Pacific Flyway.
17. The recirculated/final EIR should provide the details and purpose of the habitat buffer (*e.g.*, buffer width, vegetative cover, permitted and prohibited uses within) between the J Street Channel and development in the Harbor District or around the F&G Street Marsh.
18. The description of the design of the new F&G Street Marsh Bridge is not of sufficient detail to allow for adequate project-level analysis of potential impacts to wetlands and biological resources in the adjacent NWR. The description lacks important details such as the overall design (*e.g.*, length of the bridge), the type of crossing (*e.g.*, box culvert, open span), and duration of its construction.
19. If the recirculated/final EIR retains (we recommend that it not – comment 31b) the proposed pedestrian bridge at Lagoon Drive between the seasonal wetland (SP-2) and F&G Street Marsh, it should provide an evaluation of how the bridge could affect the restoration potential of these two marshes (*e.g.*, any restoration limitations due to the length and height of the bridge).
20. The recirculated/final EIR should provide the design specifications (*e.g.*, box culvert or open expanse, length, height) of the bridge for the new E Street as it crosses the primary tidal channel connecting the F&G Street Marsh to San Diego Bay (see comment 31d).
21. The design of the Resort Conference Center (RCC; Parcel H-3) is not described sufficiently to fully analyze potential impacts. Important design features that need to be discussed in the project description include the proposed building layout on the site with all building heights indicated, the building surface design (*e.g.*, amount and height of glass), building and landscape lighting proposals, and the major components of the landscape design (*e.g.*, tree placement and potential species mix).
22. The project description for parcel HP-23A states, “Because no specific use is proposed, uses that would generate traffic would be subject to separate environmental review pursuant to CEQA Guidelines 15168.” This is a misleading statement in that, regardless of the amount of traffic they would generate, all of the programmatic level components (*i.e.*, all project components of Phase II or III, not just parcel HP-23A) of the Proposed Project would likely be subject to subsequent environmental project-level analysis pursuant to CEQA in order to fully evaluate all of their potential environmental effects. This project-level analysis should occur only after site plans and design for Phases II and III are prepared.

Mitigation for Direct Losses of Habitat and Species

23. Throughout the project description, there is mention of small areas that would be designated as "Wetlands and Mitigation Bank." However, there is no description of what this designation means. It is unclear whether these areas are intended solely for project-related mitigation obligations, or to provide the latter plus mitigation "credits" using excess (*i.e.*, beyond the project-related mitigation obligations) mitigation for other projects. If the intent is the former, the term "Mitigation Bank" should not be used. If the intent is the latter, the project applicant needs to go through the appropriate channels to obtain authorization to sell mitigation credits. In this case, the project applicant should discuss this with the Wildlife Agencies as soon as possible, though it may be that the Wildlife Agencies will accept these mitigation areas as mitigation only for the indirect impacts of the Proposed Project.
24. The DEIR identifies the mitigation for the entire Proposed Project. While this addresses the cumulative impacts of the Proposed Project, recirculated/final EIR should also provide the impacts and associated mitigation broken down per parcel. Assuming that the owners of each individual parcel would be responsible for mitigating the impacts to that parcel, it will be necessary to have a table and/or text description of who would be responsible for what impacts and mitigation per.
25. The recirculated/final EIR should clarify why Table 4.8-5 distinguishes between total acreage and total credits, and which number is intended to account for the mitigation obligations of the Proposed Project
26. Since the clapper rail is not only a federal and state endangered species, but also a State Fully Protected Species, only the Service can authorize its take.¹ Therefore, Mitigation Measure 4.8-4, which addresses direct impacts to light-footed clapper rail (*Rallus longirostris levipes*, clapper rail), should be modified to assure that impacts to clapper rail are avoided year-round because this species is a year-round resident. As the species is secretive and reacts to disturbances by hiding in the vegetation, it is susceptible to being crushed by heavy equipment. Therefore, any work occurring within potential clapper rail habitat may affect this listed species and requires consultation with the Service pursuant to the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.). The DEIR should acknowledge that any take must be authorized by the Service and should be expanded to indicate how implementation of the proposed biological monitoring will be assured. Mitigation measure 4.8-7 should be revised to provide assurance that there will be no take of clapper rail.

¹ Pursuant to Section 3511 of the California Fish and Game Code, the light-footed clapper rail is also designated as a State Fully Protected species. This designation prohibits take or possession of this species at any time (*i.e.*, no take authorizations from the State are available). This also applies to the bird's eggs.

27. The statement on page 4.8-37 indicating that gnatcatcher have not been reported in the project vicinity is incorrect. The statement should be revised to state that gnatcatcher have been observed in upland habitat on the Sweetwater Marsh NWR. The impact and mitigation section should also be revised to recognize the project's effect on gnatcatchers. Any potential take, either direct or indirect, of gnatcatchers requires consultation with the Service pursuant to the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).
28. Mitigation Measure 4.8-9 B and Mitigation Measure 4.8-10 B should be revised to require that all updated assessments of potential impacts from the Proposed Project and proposed mitigation be submitted to the Wildlife Agencies for review and approval, in addition to being submitted to the Port and/or City.
29. Inappropriately, the DEIR does not require mitigation for losses of raptor foraging habitat (e.g., non-native grassland). Mitigation for project-related losses of raptor foraging habitat should occur at a ratio of 1:1 away from the project site (e.g., east of Interstate 5 or south of the South San Diego Bay Unit) since concentrating raptor habitat, and thus raptors, into the remaining habitat within and adjacent to the project site could compromise the survivorship of sensitive ground nesting birds raptors prey upon.
30. Except for mitigation for impacts to raptor foraging habitat, the Wildlife Agencies recommend that all mitigation for project-related direct and indirect impacts to sensitive habitats occur within or adjacent to the project area.
31. The following comments are specific to the *Mitigation Opportunities for the Chula Vista Bayfront Project in the City of Chula Vista, California (Recon 2006, Mitigation Plan, and Appendix AA)*.
 - a. To offset loss of wetlands and uplands, the DEIR proposes mitigation within the approximate 200-foot "no-touch" habitat buffer along the western boundaries of the Sweetwater (Parcel SP-1) and Otay (Parcel OP-2A) Districts. The Mitigation Plan (Appendix AA) states, "A carefully designed buffer zone...will lessen the impacts associated with development and create an interface that gradually transitions from undeveloped native landscape to developed areas." The Wildlife Agencies consider the restored habitat within the no-touch buffer zone as mitigation only for indirect impacts to the adjacent sensitive biological resources (e.g., Sweetwater Marsh and associated mudflats and J Street Marsh), not for direct impacts (i.e., habitat losses). Created or restored habitat that is intended as mitigation for loss of sensitive habitat should have a minimum 100-foot no-touch habitat buffer between it and adjacent development to minimize indirect impacts from development to the mitigation site. Therefore, the recirculated/final EIR should identify locations other than the no-touch buffer zone to create or restore habitat as mitigation for habitat losses. The Wildlife Agencies do, however,

concur that the habitat restoration within the buffer should be subject to a monitoring and maintenance program.

- b. Rather than replace Lagoon Drive [between the seasonal wetland (SP-2) and F&G Street Marsh] with a pedestrian bridge, the Wildlife Agencies recommend that Lagoon Drive be permanently removed to maximize restoration opportunities within and adjacent to the F&G Street Marsh and the seasonal wetland (SP-2). This would partially meet mitigation obligations for loss of habitat, and would minimize human disturbances to the wildlife that may reside within them.
- c. Consistent with our July 20, 2006, letter to the City of Chula Vista concerning the Mapping Conflict within the F&G Street Marsh area of the Chula Vista MSCP Subarea Plan, (FWS-SDG-882.7) we request that Marina Parkway proposed to also be demolished and restored as part of the buffer between the project and F&G Street Marsh, and that the restored area be remapped to again be within the City's MSCP Preserve. This would partially meet mitigation obligations for loss of habitat, and would minimize human disturbances to the wildlife that may reside within F&G Street Marsh.
- d. The Wildlife Agencies recommend an open expanse for the bridge of the proposed E Street crossing the primary tidal channel between the F&G Street Marsh and San Diego Bay. In addition, the length and height of the bridge should be maximized. This would ensure that the restoration potential within F&G Street Marsh is not limited by insufficient tidal exchange and that adequate high-tide refugia are provided to accommodate wildlife moving between the Bay and the marsh.
- e. Any habitat mitigation proposed within the F&G Street Marsh must be coordinated with, and approved by, the Refuge Manager in accordance with the existing Memorandum of Understanding for the Mitigation Leasehold Overlays on the Sweetwater Marsh Unit. Habitat mitigation and/or changes to the existing tidal channel that connects the F&G Street Marsh to San Diego Bay should also be coordinated with the Refuge Manager to ensure that no adverse effects to NWR resources could result from such actions.

Indirect Impacts and Habitat Degradation

32. The DEIR should acknowledge that indirect impacts associated with development adjacent to sensitive habitats would result in a degradation of habitat. The Proposed Project would introduce new and exacerbate existing anthropogenic negative indirect effects to adjacent biological resources; these effects include increased predation on wildlife, increased disturbances to wildlife, bird strikes and disorientation, shading of adjacent habitat, human encroachment, increased noise, increased illumination, and

detrimental changes to hydrology and water quality. Many of these indirect impacts, also referred to as “edge effects,” result in a degradation of habitat. In addition, the DEIR should analyze the adverse effects of human activity within 100 feet of the adjacent Sweetwater Marsh Unit, and does it identify potential impacts related to unencumbered access from the Signature Park into the adjacent wetlands (*i.e.*, a continuous fence to protect coastal resources from human and domestic animal intrusion).

A report published by the Department in 1973 on the natural resources of San Diego Bay states, “direct and indirect impacts upon the Sweetwater marsh complex by any further development will seriously threaten the capacity of the area to support resident and migrant wildlife populations” (Department 1973; page 87). It is primarily the potential indirect impacts associated with development that are of such concern. In 1979, the Department wrote a memo to the San Diego Coast Regional Commission on the Chula Vista Land Use Plan. The memo favors the maintenance of the agricultural operation that existed at that time adjacent to the coastal salt marsh, stating, “It would seem to be more compatible with the marsh than the proposed residential and visitor serving development. The agricultural operation provides an effective buffer between the marsh habitat and urban (or industrial) encroachment” (Department 1979).

The Wildlife Agencies recognize the efforts made to reduce the intensity of the development proposed adjacent to the Sweetwater Marsh. However, despite these efforts, we concur with the sentiments reflected in the preceding paragraph because the overall intensity of development within the Proposed Project area could still result in significant direct and indirect impacts to sensitive habitats and the species they support. The wildlife habitats that occur within or in close proximity to the Proposed Project area (*e.g.*, Sweetwater Marsh and South San Diego Bay Units of the NWR, the F&G Street Marsh, the J Street Marsh, the shoreline and mudflats of San Diego Bay, and the Chula Vista Nature Reserve) are important to the survival of numerous resident and migratory species. As such, future development must retain the biological functions and values of these sensitive habitats. The recirculated/final EIR should reflect project modifications and require habitat restoration and management elements that would mitigate for the direct, indirect, and cumulative impacts from the project. We provide below a more detailed discussion of specific indirect impacts and possible mitigation measures to reduce impacts that should be identified and addressed in the recirculated/final EIR.

Mitigation Measures for All Indirect Impacts

33. Mitigation for indirect impacts that result in permanent degradation of sensitive habitats within or adjacent to the project site should include enhancement or restoration of directly and indirectly avoided in-kind habitat elsewhere within the Proposed Project area at a minimum of a 1:1 ratio. For example, the project description indicates that Parcel HP-5, consisting of wetlands within an existing narrow “L” shaped drainage channel, would remain, and would contain a 50-foot-wide setback on either side to protect against

encroachment into the wetlands. The Wildlife Agencies generally recommend that a minimum of a 100-foot wide buffer be provided between wetlands and development. Although the wetland on Parcel HP-5 is considered open space and un-impacted in the DEIR, this wetland would experience a number of indirect impacts (*e.g.*, shading, night lighting, urban runoff). The recirculated/final EIR should fully address all such impacts to wetlands and other sensitive habitats and should provide appropriate mitigation to reduce the impacts to a level less than significant. Similarly, mitigation for degradation of the wetlands located in the Sweetwater District (SP-2 and SP-1) and the F&G Street Marsh and its tidal tributary should include enhancement of those wetlands and the restoration of similar habitats at a minimum of a 1:1 ratio.

Buffers to Sensitive Habitat and Wildlife

34. In our September 12, 2005, letter, we requested that adequate habitat buffers (*e.g.*, no touch buffers) surround all sensitive biological areas to minimize indirect impacts from adjacent development. These buffers should prohibit human and domestic animal access, consist of only appropriate locally native species, and be free of all project infrastructure (*e.g.*, erosion control devices, fences, brush management, trails, and picnic tables). To prevent human and mammalian access into buffer areas, fencing or other suitable barrier systems should be installed at the outside edge of the habitat buffer prior to the initiation of project construction. Additionally, screening or berms should be incorporated around or within the habitat buffers to protect wetland birds from lighting and noise related-disturbances from beyond the buffer. In concert with the habitat buffer, land uses adjacent to the buffer should include low intensity public use (*e.g.*, walking, biking, and passive recreation) to minimize indirect impacts (*e.g.*, lighting, shading, and noise) associated with high intensity development. We recommend that landscaping adjacent to buffers utilize only native species to conserve water and avoid or minimize pollutant (*e.g.*, fertilizers, pesticides) discharge into wetlands.

Specific Comments

35. In addition to the habitat buffers proposed in the DEIR, a no-touch minimum 100-foot wide habitat buffer should be designed around any wetland in or adjacent to the project site. For instance, buffers should surround the wetlands in SP-1, SP-2, HP-5 (L Marsh), F&G Street Marsh and its associated tidal inlet, J Street Marsh, Telegraph Creek (OP-2A), and the South San Diego Bay Unit of the NWR. These buffers should be incorporated into Parcels SP-1, S-2, HP-11, S-2A, H-13, H-14, HP-6, HP-7, OP-2A, and O-1A. A 100-foot buffer should also be placed along the entire shoreline to prevent human and domestic animal access to the mudflats and salt marsh. As the project is proposed, only parcel H-1A is designed to have a 100-foot buffer along its shoreline.
36. The DEIR inappropriately identifies the 400-foot-wide buffer (Parcel SP-1) between development (S-1, SP-3, and S-2) and Sweetwater Marsh Unit as an "ecological buffer."

Comment 9 explains why this term inaccurately describes the proposed buffer. As discussed in our September 12, 2005, letter, the 200-foot no-touch buffer zone within the Sweetwater District (Parcel SP-1) should include no human activities and should be protected with a permanent fence. As shown in Figure 4.8-24, there is an outlook, fence, and berm proposed within this no-touch buffer. The outlook, fence, and berm all need to be relocated to the 100-foot limited use zone. A permanent fence should be placed along the northern and westerly edge of the entire length of the 200-foot buffer to prevent human and animal encroachment into the habitat buffer and adjacent sensitive habitats. As recommended in our September 12, 2005, letter and discussed at several meetings with Port and City representatives, mitigation for significant direct and indirect impacts to sensitive wetland areas as a result of increased human and domestic animal activity in and around Sweetwater Marsh and adjacent intertidal areas should be provided through installation of appropriate fencing. We continue to recommend a minimum six-foot-high black vinyl chain link fence along the development side of the habitat buffer boundary. Any fencing between development and the NWR should be coordinated with the Refuge Manager. Native cacti, as proposed on page 3-28 of the DEIR, would not adequately mitigate potential impacts related to unauthorized access into sensitive areas from the adjacent park site.

The Mitigation Plan (Appendix AA) indicates that the Transitional Use Zone in SP-1 may incorporate a more landscaped theme. The Wildlife Agencies recommend that landscaping use only native species to conserve water and avoid and minimize pollutant (*e.g.*, fertilizers, pesticides) discharge into wetlands. Landscaping should not include trees that may provide nesting for pest species (*e.g.*, rats) or predator perches with a line-of-sight into the NWR or adjacent mudflats.

The Wildlife Agencies recommend that impacts to the woolly sea-blite population located within SP-1, which is considered a buffer, be avoided.

37. A buffer of at least 200 feet should be provided between wetland resources within the Sweetwater Marsh Unit and the edge of Parcel S.
38. A no-touch habitat buffer should be included between the office buildings proposed on Parcel S-4 and the wetlands to the north, which are located on the NWR.
39. The mudflat shoreline extending north of the Harbor District is used by migratory birds for foraging and resting. Human and animal encroachment into the mudflats would disturb the birds, causing them to move and expend energy otherwise necessary for completion of their migration. The DEIR proposes a buffer and signage along the entire shoreline of the project in the Sweetwater District to help protect the mudflats from human impacts. We recommend that suitable physical barriers (*i.e.*, chain link fence) be provided along the buffer edge farthest from the mudflat shoreline to minimize encroachment from humans and domestic animals into the mudflats.

40. The Wildlife Agencies recommend that the buffer and shoreline north of the J Street Channel (HP-6 and HP-7) be naturalized. For instance, the rip rap could be removed to provide a more natural shoreline, with native upland plants installed between the channel and the proposed promenade. As already indicated, the habitat buffer north of the J Street Channel should be at least 100 feet wide. To maximize the width of the habitat buffer, we recommend that the width of the promenade be reduced from 12 feet to 8 feet.
41. Although parcel OP-2A is designated as an ecological buffer, the project description refers to a pedestrian pathway and a public boardwalk/observation area that could encroach into the buffer. The recirculated/final EIR should identify where encroachment occurs and fully analyze all associated impacts to the ecological buffer within parcel OP-2A, as well as to the adjacent segment of the Refuge, J Street Marsh, and the wildlife these areas support.
42. The DEIR provides no discussion in the project description about parcel O-4 or the buffer area shown immediately to the west of this parcel on Figure 1-1. The recirculated/final EIR should indicate what, if any, uses are proposed between the relocated power plant and the South San Diego Bay Unit of the NWR. The Wildlife Agencies recommend that a 100-foot-wide ecological buffer be provided to minimize or avoid impacts to the adjacent wetland area.

Increased predation on wildlife

43. The DEIR does not adequately address the inevitable project-related increase in levels of predation on sensitive species located on the NWR and other sensitive habitats. The recirculated/final EIR should include an adequate analysis of the impacts related to increased predation as a result of: (1) increases in nocturnal lighting; (2) displacement of foraging raptors and mammalian predators from the project site to adjacent wildlife habitats; (3) increases in the numbers of generalist predators (*e.g.*, rats, ravens, crows, gulls) attracted to the area due to increases in trash; and (4) the introduction of additional cats and dogs as a result of new residential development. The recirculated/final EIR should also propose adequate measures to mitigate these impacts to a level less than significant.
44. The Wildlife Agencies are concerned about the inclusion of the proposed Signature Park on S-2 because it would likely attract generalist predators to the adjacent NWR and mudflats. The Signature Park includes amenities such as lighting, picnic areas, and vending of food and beverages, which could attract generalist predators due to an increase in trash. Though trash containers would be provided, some windblown trash from park users would end up in the adjacent wildlife habitats (Significant Impact 4.5-1), thus attracting predators that also prey on ground nesting birds.

45. The recirculated/final EIR should identify the potential for indirect impacts to wildlife from increased predator perching due to the building heights and designs and types of landscaping proposed on the following parcels (adjacent habitat affected shown in parenthesis): S-1 (Sweetwater Marsh), S-4 (Sweetwater Marsh), H-3 (F&G Street Marsh), H-13 (J Street Marsh), H-14 (J Street Marsh), and O-1A and O-1B (J Street Marsh).

Mitigation Measures

46. We recommend that all relatively tall structures and all landscaping within the project site be situated away from sensitive habitats to reduce predator perches with a line-of-sight into adjacent sensitive habitats, as well as to reduce shading effects on sensitive habitats, and bird strikes (*i.e.*, collisions with reflective glass). For example, development on S-1 and S-4 should be re-oriented so that the buildings (*e.g.*, 125-foot tall buildings proposed on Parcel S-4) and any tall landscaping is located at the southern portion of the parcels while the parking is located at the north end of the parcels. This would minimize the introduction of predator perching with a line-of-sight into the adjacent marshes north and west of the parcels. Figure 3-9 of the DEIR shows that the buildings are proposed to be located at the northern end of the parcels in close proximity to the adjacent sensitive habitats. Similarly, the tallest buildings associated with the RCC should be located on the southeast portion of Parcel H-3. This would also reduce the RCC's shading impacts to the F&G Street Marsh and minimize the potential for bird strikes.
47. While the DEIR acknowledges that increased predation could result from an increase in predator perches with a line-of-sight into habitats, no mitigation measures are proposed to avoid and minimize such impacts. The recirculated/final EIR should require that all buildings, signs, lighting fixtures, and tall landscaping with a line-of-sight into sensitive habitats be designed and/or placed in such a manner to avoid the introduction of predator perches and thereby reduce the potential for take of sensitive wildlife.
48. To at least partially mitigate for the project-related increase of predation take of federally and/or state listed ground nesting birds (*i.e.*, least tern, western snowy plover, clapper rail, and Belding's savannah sparrow), the recirculated/final EIR should require (a) that the applicant establish a non-wasting endowment that would accrue sufficient interest annually to underwrite the costs of the services of predator control specialists, such as U.S. Department of Agriculture, Wildlife Services, and (b) the in-perpetuity implementation of a predator control on the adjacent NWR (Sweetwater Marsh and South San Diego Bay Units) and other sensitive habitat areas (mudflats west of Sweetwater District, J Street Marsh). The Port should coordinate with the Refuge Manager to determine the appropriate size of the endowment commensurate with the project-related impacts.
49. The Proposed Project would result in a significant impact to San Diego Bay and adjacent wetlands due to wind-blown litter (Significant Impact 4.5-1). To mitigate such impacts,

the project includes trash control measures (*e.g.*, trash containers with attached lids, trash control enclosures). However, this may not be adequate. Chain link fencing should be provided along the entire interface of development and sensitive habitats to capture trash and reduce attraction of predators and pest species into sensitive areas.

Disturbances to Wildlife

50. Disturbances to wildlife associated with the implementation and long-term operation of the Proposed Project should be addressed. For instance, outdoor activities, such as fireworks, concerts, and other light and noise generating activities that could be associated with the resort/conference center, Signature Park, other parkland, harbor, ferry terminal, and various retail/commercial recreation areas, and their impacts to wildlife are need to be described, and their impacts analyzed. Similarly, impacts to migratory, resident, and breeding birds that could result from the increased on-water recreation from redevelopment of the South Bay Boatyard (HW-6) and the Commercial Harbor (HW-3) within the Chula Vista Marina should also be described.

The new commercial harbor is intended to enhance public access to the water, and enhance boating activity on the water. Envisioned for this commercial harbor are water taxis, dinner boats, harbor cruises, visiting historic vessels, and boat rentals, a ferry terminal, and restaurant. Increased boating activity could negatively affect foraging and loafing activities of shorebirds and waterfowl. Increased disturbances to foraging habitat could negatively affect the stability of the adjacent nesting bird colonies (*i.e.*, South San Diego Bay and Sweetwater Marsh Refuge) because disturbance-free foraging areas to obtain food for chicks are important (Rodgers and Smith 1997). Increased boating could also displace water fowl access to feeding areas and result in a subsequent loss of production of young (Drent and Guiguet 1961, Conservation Committee Report 1978, Huffman 1999, Manning 2002). Although the birds can fly to other areas to avoid highly disturbed foraging habitat, such behavioral adaptations can increase the numbers of flights and flight times between foraging and loafing, resulting in energy deficiencies that could translate to reduced productivity and fitness (Manning 2002).

51. Though impacts to wildlife from construction noise are addressed, the DEIR does not adequately address impacts to wildlife from operational noise. The Biology sections of the recirculated/final EIR should include a discussion of operational noise impacts to wildlife. Currently, operational noise is addressed only in Section 4.7 *Noise*. Based on figure 4.7-3, it appears that noise levels that may affect several sensitive avian species could occur within all habitats within the project site [*e.g.*, L Street Marsh (HP-5), Telegraph Creek (OP-2A), ephemeral wetland (S-2A)] and habitats adjacent to the project site (J Street Channel and Marsh, and F&G Street Marsh and its tidal tributary). However, impacts to other habitats adjacent to the project site (*e.g.*, Sweetwater Marsh and South San Diego Bay Units of the NWR, Chula Vista Nature Reserve) cannot be evaluated because the noise contours provided in Figure 4.7-3 do not extend sufficiently

beyond the project boundary. As such, Figure 4.7-3 should be revised to include noise contour that extend 200 feet beyond the project boundary.

Mitigation Measures

52. Fireworks and outdoor concerts that generate noise beyond the development boundary should be restricted to outside the avian breeding season (*i.e.*, January through September, depending on the species) to minimize impacts to nesting and fledging birds.
53. To partially mitigate the Proposed Project's indirect impacts, the recirculated/final EIR should: (a) prohibit boating in the open waters east of the proposed realigned navigation channel and north of the South Bay boat yard to avoid or minimize disturbance to migratory birds feeding along the mudflats and resting in San Diego Bay; (b) require the installation of regulatory signage on buoys and boat markers along the boat channel; and, (c) require increased enforcement by the Harbor Patrol to deter watercraft from going ashore onto sensitive habitat areas (*e.g.*, Chula Vista Wildlife Reserve, northern levees of the Salt Ponds, mudflats along Sweetwater Marsh, J Street Marsh) and adversely affecting the birds and habitat that nest, forage, and rest there, and are subject to indirect project-related impacts.
54. Depending on an analysis of the noise contours in Figure 4.7-3 requested above, it may be necessary to mitigate for traffic related noise. For example, sound walls along the roads adjacent to sensitive habitats may be warranted. Potential mitigation should be addressed in the recirculated/final EIR.

Human Encroachment

55. The Wildlife Agencies are concerned that the Signature Park on Parcel S-2 would invite uncontrolled human and domestic animal encroachment onto the Refuge and the adjacent mudflats, thus disrupting wildlife. The recirculated/final EIR should require that the Proposed Project provide full-time personnel at the Signature Park to enforce restrictions on human and domestic animal access to the NWR and mudflats.
56. Shoreline promenades (HP-3, HP-6, and HP-7) occur immediately north of the J Street Channel and J Street Marsh. A four-foot-high railing is proposed to minimize encroachment into the J Street Channel and Marsh. The Wildlife Agencies recommend that the recirculated/final EIR require that the design of the railing include multiple horizontal railings and/or mesh fencing to ensure that domestic animals do not move under the railing into the marsh.
57. The following comments pertain to the Draft Port Master Plan Amendment (Appendix B to the DEIR; Draft Amendment).

- a. Page 33 of the proposed Draft Amendment describes land use designations utilized for Port-owned lands. The Port proposes to modify the "wetland" designation to "wetland and mitigation bank area." Specifically, the Draft Amendment includes language to allow areas within the wetlands on site identified for potential enhancement, restoration, and/or creation opportunities to be utilized as mitigation for future development projects. As indicated in Comment 23, this language may be inappropriate, and should be considered for elimination from the Draft Amendment.
- b. The Draft Amendment proposes language (Page 33) that allows passive uses, such as overlooks, picnic areas, and/or spur-trails, within the wetland buffers with the proposed designation of "wetland and mitigation bank area." These proposed modifications are inappropriate. Any wetland area, or their associated biological buffers, should be devoid of all development, including the passive uses proposed to be allowed. If such uses are to be allowed within wetland areas or their associated buffers, the recirculated/final EIR should provide an adequate analysis of the potential impacts to wetlands from these uses and discuss appropriate mitigation. Otherwise, the Port should remove from the Draft Amendment the proposed language allowing such uses.
- c. The Draft Amendment also includes language (Page 33) allowing interpretive and educational opportunities within the wetland buffers while, including coastal access. While the proposed language requires that such uses occur in a manner that will ensure the protection and preservation of these sensitive habitat areas. We recommend that all outlooks and interpretive tools occur outside of the 100-foot wetland buffer.

Bird Strikes and Disorientation

58. Despite our recommendations in our September 2005, letter, and in electronic mail to and meetings with the Port, on how the Proposed Project could avoid or minimize bird strikes and/or disorientation from collisions with buildings, the DEIR does not adequately address these impacts to migrating or resident birds. South San Diego Bay has been identified as a significant wintering ground and migratory stopover point along the Pacific Flyway because of its proximity to high-quality coastal salt marsh and San Diego Bay. Much of what remains of San Diego Bay's historical shallow subtidal, intertidal mudflat, and salt marsh habitats within the south bay provides essential foraging and resting areas for ten of thousands of birds migrating along the Pacific Flyway. In recognition of the importance of these remaining habitats, the south bay has been designated a Western Hemisphere Shorebird Reserve Network Site and the Units within the Refuge have each been recognized as Globally Important Bird Areas by the American Bird Conservancy. The recirculated/final EIR should address these important biological resources that occur immediately adjacent to the project boundaries. Additionally, the recirculated/final EIR

should include a map showing potential migration corridors through and/or adjacent to the subject property and how the migration corridor would be affected by the project.

Mitigation measures

59. There is a high potential for impacts to migrating and resident birds colliding with the buildings located on the following parcels: S-1 (Sweetwater Marsh), S-4 (Sweetwater Marsh), H-3 (F&G Street Marsh), H-13 (J Street Marsh), H-14 (J Street Marsh), and O-1A and O-1B (J Street Marsh). The DEIR includes mitigation measures to address these impacts only from buildings greater than 100 feet in height (Mitigation Measure 4.8-24). However, as stated in the DEIR, "both tall buildings and low buildings can be dangerous to birds" (Page 4.8-89). Therefore, such measures should be applied to all buildings that have an unobstructed line of sight to nearby open water or large areas of open space regardless of height. To determine if these measures are adequate, we again recommend that monitoring for bird strikes be implemented during Phase I of project implementation. The recirculated/final EIR should also require that, if there is evidence that bird strikes are occurring, the applicant contact the Wildlife Agencies as soon as possible to discuss potential measures for implementation to reduce these impacts.
60. Buildings should be oriented so the tallest buildings are as far away as possible from San Diego Bay or adjacent habitats.
61. The height limits on Parcel H-3 should be reduced to a maximum of three stories (or 50 feet) to avoid shading impacts to adjacent habitat areas and to minimize the potential for bird strikes.

Shading of Adjacent Habitat

62. Despite our recommendations in our September 12, 2005, letter, and in electronic mail to and meetings with the Port, the DEIR fails to address the biological impacts associated with shading of habitat by buildings and structures. Reductions in available light levels from shading can disrupt photosynthetic processes and impair growth of plants, algae, and phytoplankton in wetlands or waters, and thus modify existing habitats, which in turn can impair their suitability for avian species and other wildlife. We recommended that for each development option, the recirculated/final EIR provide three-dimensional images of any structures that could cast shadows on adjacent freshwater, intertidal, and tidal wetland areas. These images should reflect the maximum allowable floor area ratio, the maximum allowable height, and the minimum contemplated setbacks (*i.e.*, buffers). The acreages of the shaded areas should be quantified by habitat type and described. Based on our review of the DEIR, we anticipate the following project components would impact habitats from shading.

- a. Development adjacent to the L-Marsh (HP-5) would consist of 300-foot tall buildings set only 50 feet back from the wetland. These buildings would shade and negatively affect the L Marsh and could potentially affect the J Street Channel and J Street Marsh. Based on an analysis of the potential shading effects of each building on sensitive habitat, the recirculated/final EIR should (a) describe modifications to building designs and/or locations (*i.e.*, reduced building heights or increased width of setbacks), and (b) if shading impacts still occur, require appropriate mitigation consistent with Comment 33.
- b. Parcel H-3 has a maximum building height of 300 feet. Depending upon the placement of the buildings on this site, future development could negatively affect the F&G Street Marsh (which would represent a direct impact to resources located on federal owned land) and its tidal inlet. To avoid shading impacts, the maximum height limit on this parcel should be reduced to three stories (or 50 feet). The recirculated/final EIR should (a) describe such modifications to the building designs, and (b) if shading impacts still occur, require appropriate mitigation consistent with Comment 33.

Increased Illumination

63. Despite our recommendations in our September 12, 2005, letter, and in electronic mail to and meetings with the Port, the DEIR does not fully address impacts associated with artificial night lighting (ANL), including direct and indirect (*i.e.*, sky glow, light pollution) ANL. ANL generally threatens wildlife by disrupting biological rhythms and otherwise interfering with the behavior of nocturnal animals (see contributions from Artificial Night Lighting Conference 2002). Nocturnal and migrating birds, migrating bats, insects, fish, and sea turtles are particularly impacted by ANL (Evans Ogden 1996 and citations therein). Migrating birds use the stars and moon for navigation during migrations. These birds can become disoriented when flying through a brightly lit area; this disorientation can lead to injury and/or death. Artificial night lighting also disrupts the behavior of fish and amphibians, and billions of moths and other insects are killed from the lights each year. ANL can also affect aquatic invertebrates that are prey for other animals. Some zooplankton migrate vertically in response to lighting. In the evening, they rise in the water column to feed on drifting microscopic plants (phytoplankton). When daylight approaches they migrate down to avoid predators. However, ANL may keep them from rising and feeding (Moore et al. 2000). Reduced predation on the phytoplankton can result in phytoplankton blooms which deplete the dissolved oxygen in the water and shade aquatic vegetation (Harder 2004). Reduced oxygen levels can then negatively affect fish or other organisms depending on dissolved oxygen in the water column.

Mitigation measures

64. The recirculated/final EIR should provide a delineation of areas with sensitive habitats that are expected to be directly or indirectly exposed to light levels of higher intensity (including increased sky glow) than existing ambient levels. The delineation should be on a large scale aerial photograph (a scaled figure). The recirculated/final EIR should evaluate the direct, indirect, and cumulative biological impacts resulting from the project-related ANL, based on the delineation, and should propose specific measures whose implementation would prevent an increase in existing ambient light levels in sensitive habitats.
65. To minimize the biological impacts from outdoor ANL, we recommend that design standards for all phases of development ensure that outdoor lighting throughout the project study area is minimized and that no project-related lighting falls outside the project boundaries, upon any habitat buffers, habitats, or open water. All lights, including street lights, pedestrian and bicycle path lighting, and any recreational lighting should be directed away from and fully shielded so as to not illuminate adjacent habitats. In addition, no external lighting of buildings (e.g., cosmetic lighting) or other structures should be permitted, no lighted building signs should be permitted beyond the first floor, and all commercial signage should be provided on monument signs rather than pole signs or on the sides of buildings.
66. Lighting proposed for the Signature Park (S-2) and the Shoreline Promenade (HP-3, HP-6, and HP-7) should be placed only where needed for human safety. Lights should be on low-standing (e.g., 2-foot tall) bollards, shielded, and flat-bottomed so illumination is directed downward onto the walkway and does not scatter. Low-pressure sodium bulbs that emit only a narrow range of yellow light should be utilized because monochromatic yellow light, which is not perceived as "natural" light by wildlife, minimizes ecological disruptions.

Increased Freshwater Input, Degraded Water Quality, and/or Erosional Surface Flows

67. The DEIR does not adequately describe or analyze the potential degradation of existing wetlands within and adjacent to the project site due to project-related changes in surface storm water flows, nor does it provide measures to prevent, or mitigation to offset, such degradation. The project-related storm water (freshwater) flows would be discharged into the seasonal wetland in the Sweetwater District (S-2), the F&G Street Marsh and its tidal tributary, the J Street Channel, Telegraph Creek, and the J Street Marsh. Grading in SP-1 and S-1 would increase water flows into Parcel SP-2 (season wetlands) and F&G Street Marsh, and there would be more storm drains draining into the J Street Channel and Telegraph Creek. Increases in storm water flows into relatively rare salt-water wetlands can result in a type-conversion to more common freshwater wetlands. In addition, depending on the velocity of the storm water discharges, the flows could disrupt the

morphology of the receiving waters/habitats by ongoing erosion. Over time, the discharges can seriously damage sensitive habitats. Increases in flows from impervious surfaces associated with urbanization can result in: a) stream bed scouring and habitat degradation; b) shoreline erosion and stream bank widening; c) loss of aquatic species; and d) decreased baseflow (USEPA 1999). Furthermore, the project-related increases in traffic will result in higher concentrations of vehicle-related contaminants (*e.g.*, copper, asbestos, hydrocarbons, and antifreeze) in the storm water flows.

We are particularly concerned about deleterious changes to the salt balance, morphology, hydrology, and water quality of the F&G Street Marsh and its tidal tributary because such changes can negatively affect future restoration of the F&G Street Marsh, and because the light-footed clapper rail has been known to reside there. Conversely, current storm water flows into the L-Marsh (HP-5) would be redirected to the street, potentially reducing water flows to the wetland and thereby also reducing the wetland habitat. While the DEIR acknowledges the expected changes in storm water flows, it does not quantify the changes in flow, nor does it identify the design and location of the best management practices (BMPs) for Phase I to avoid impacts associated with the post-construction surface flows. The recirculated/final EIR should include a thorough discussion of project-related changes in surface flows and how these changes would affect the existing wetlands within and adjacent to the project site.

Mitigation Measures

68. All storm water flows should be treated and filtered prior to entering existing wetlands and San Diego Bay to avoid the introduction of pollutants (*e.g.*, hydrocarbons, sediments, fertilizers, pesticides, and trash).
69. The site designs for the Proposed Project should minimize the project-related increase in dry and wet-weather surface flows, and integrate on-site BMPs that would attenuate the flows (prior to their discharge) to reduce their impacts on the morphology of sensitive habitats to which they ultimately discharge. Examples of BMPs to consider include appropriately sized grass swales and vegetated detention basins. Because these BMPs occupy space, their timely consideration of the requirements that apply to the project site pursuant to the numeric sizing criteria in the Municipal Storm Water Permit is necessary. All BMPs should be within the development footprint, outside of the buffers. The recirculated/final EIR should provide the location(s) and descriptions of the proposed construction and post-construction BMPs, and should discuss the long-term maintenance of the latter.

Marine Biological Resources and In-water Construction

70. To adequately evaluate marine biological resources and potential impacts to these resources, the recirculated/final EIR should:

- a. provide a figure indicating the different marine habitat classifications (*i.e.*, intertidal, shallow subtidal, moderate subtidal, deep subtidal, salt marsh, and eelgrass) within and adjacent to the project area;
 - b. provide a table that identifies the range of depth of different marine habitat classifications, including: (1) intertidal (+7.8 feet to -2.2 feet MLLW (mean lower low water)); (2) shallow subtidal (-2.2 MLLW to -12 feet MLLW); (3) medium subtidal (-12 feet MLLW to -20 feet MLLW), and deep subtidal (deeper than -20 feet MLLW) habitats; and
 - c. indicate the areas of intertidal habitat and shallow subtidal habitat that are/would be natural (*e.g.*, soft-bottom) vs. artificial (*e.g.*, rip rap, concrete) before and after project development. Soft bottom intertidal habitat provides foraging habitat for wading birds and shorebirds, including the federally listed endangered western snowy plover (*Charadrius alexandrinus nivosus*). Shallow subtidal habitat consisting of either unvegetated soft bottom areas or areas vegetated with eelgrass (*Zostera marina*) are considered significant habitats for birds (including the least tern and brown pelican), fish, benthic invertebrates, and other organisms (including the Pacific green sea turtle).
71. Section 4.9, *Marine Biology*, in the recirculated/final EIR should include a discussion of permanent and temporary losses of foraging habitat for birds that visually search for their fish prey and plunge-dive into the water to capture their fish. Foraging habitat is defined as open water containing suitable fish prey that is available for foraging by plunge-diving birds (*e.g.*, least terns and brown pelicans) by not being obstructed and/or covered by structures (*e.g.*, piers, docks, or boats). This is particularly significant resource at the project site due to its close proximity to the Sweetwater Marsh and South San Diego Bay Units of the Refuge and the Chula Vista Wildlife Reserve (*i.e.*, approximately 1 mile or less), where plunge-diving birds both nest and/or roost during their migration. Additionally, covering open water habitats with structures would reduce light availability in the water column and introduce hard substrate which would likely support a different species composition and biological community than the extant composition. In essence, there could be an ecological type conversion where structures are introduced. We recognize that there is a discussion of the permanent impacts to surface water foraging habitat in the Section 4.8, *Terrestrial Biology*, but the impacts to this resource resulting from in-water construction make it appropriate to include a discussion of these impacts in Section 4.9.

Mitigation measures

72. The Wildlife Agencies concur that increases in structures (*e.g.*, docks, wharfs, piers) covering the San Diego Bay should be offset (Mitigation Measures 4.8-7 and 4.8-8 in the

Section 4.8, *Terrestrial Biology*). Temporary and/or permanent reductions in foraging habitat for sight-foraging birds that feed on fish (e.g., least tern, brown pelican) should be avoided and minimized. We also recommend that a mitigation measure be added that requires that temporary reductions in foraging habitat due to in-water construction activities that result in increased turbidity (e.g., dredging, pile pulling, jetting, and driving) be conducted outside the breeding season of the least tern (April 1 to September 15) to avoid impacts to this listed species.

73. The Wildlife Agencies recommend that losses of intertidal habitat (*i.e.*, 0.03 acre anticipated from redevelopment of HW-3) be mitigated with creation of in-kind habitat and at a minimum 1:1 ratio. Impacts to pickleweed habitat (*i.e.*, salt marsh habitat) should be mitigated at a 4:1 ratio to be consistent with City's MSCP Subarea Plan. As such, Mitigation Measure 4.9-5A should be revised to include mitigation of 0.004 acre of pickleweed.
74. The Wildlife Agencies recommend that dredging activities be surrounded by silt curtains to minimize sedimentation and smothering of adjacent eelgrass.
75. The DEIR indicates that losses in the existing benthic community from dredging activities would be less than significant due to the rapid recolonization of the benthic community in the new area. The Wildlife Agencies request that the recirculated/final EIR provide documentation to support this conclusion. Absent such documentation, we recommend that the dredging activities be coupled with a benthic study to characterize (*e.g.*, rate and community composition) recolonization of the benthic community.

Hazards and hazardous materials/public safety (*i.e.*, contaminants)

76. The DEIR highlights areas where property owners are potentially liable for impacts of contamination. The DEIR notes that known contaminated sites must be remediated to the satisfaction of the Regional Water Quality Control Board, County of San Diego Department of Environmental Health, State Department of Toxic Substances and Disease Control (DTSC) and perhaps others. We would like to work with the above regulatory agencies to ensure that remedial actions at identified sites would be protective of ecological receptors. Such actions include consideration of ecological risk based cleanup goals for contaminated media, and ensuring that contaminated media that are on site do not migrate off site into ecologically sensitive areas such as San Diego Bay and neighboring marsh habitats, especially those in the NWR. In that regard, the recirculated/final EIR should address the following specific comments.
 - a. Mitigation for hazards posed by clean-up and construction operations should include the preparation and implementation of plans to prevent migration of contaminated material into environmentally sensitive areas. Migration paths of concern for ecological receptors include groundwater that may surface in marshes,

streams or San Diego Bay (especially at the sediment-water interface), and soil that may migrate off site via erosion and surface runoff. Contaminant levels that pose insignificant risk to human health, especially under the commercial/industrial use scenario, may still pose significant risk to ecological receptors, both in terrestrial and aquatic settings. Consequently, contaminant levels deemed to be safe for humans are not necessarily safe for ecological receptors, and measures to prevent off-site migration of hazardous contaminants should be planned and implemented even though risks to humans may not be significant.

- b. Actions being taken to address ecological hazards should be noted. For example, clean-up of Parcel HP-5 (*i.e.*, L Marsh) and any potentially contaminated areas should ensure that concentrations of contaminants in materials left on site and/or leaving the site(s) should not meet or exceed concentrations of risk to ecological receptors (*e.g.*, invertebrates, birds).
- c. Mitigation Measures 4.12-1, Item B, should mention ecological risks for areas that are to remain open and are being remediated to ecological risk-based goals (*e.g.*, the L Marsh or Unit HP-5). In Item B, replace “(*i.e.*, commercial, residential)” with “(*i.e.*, commercial, residential, ecological).”
- d. Contaminant levels suitable for ocean disposal may not be suitable for re-suspension in San Diego Bay. Accordingly, Mitigation Measures 4.5-4 and 4.9-6 should be revised by deleting the following text from part B: “If the sediment would be suitable for ocean disposal, no silt curtain shall be required.”

Consistency with the City of Chula Vista’s MSCP Subarea Plan

77. The proposed land exchange would bring lands into the City’s jurisdiction that were not considered in the development and approval of the City’s MSCP Subarea Plan. As such, take of listed species and impacts to covered species on those lands are not authorized by the MSCP. In order to bring those lands into the MSCP, development within the area to be annexed must be consistent with the MSCP and the City’s Subarea Plan. An amendment to the Subarea Plan and incidental take permit will be required (Section 5.3.1.2 of the City’s Subarea Plan). The recirculated/final EIR should incorporate this requirement and the applicant should begin working with the City and the Wildlife Agencies as soon as possible to start the amendment process.
78. Portions of Proposed Project lie within the boundaries of the City’s MSCP Subarea Plan and portions of the proposed land transfer that are currently within the Port’s jurisdiction would come under the jurisdiction of the City. Furthermore, the Proposed Project borders portions of the City’s MSCP Preserve and is surrounded by adjacent lands that lie within the boundaries of the City’s MSCP Subarea Plan. Some portions of Proposed Project site currently lie within the City and some portions of the Proposed Project site that are

currently under the Port's jurisdiction would come under the jurisdiction of the City with the proposed land exchange. Furthermore, the lands within the City are/would be within the boundaries of the City's MSCP Subarea Plan, and portions of the Proposed Project site are adjacent to the City's MSCP Preserve. As an important component of regional conservation planning efforts, the City's MSCP Subarea Plan provides a strong framework for how and where development and habitat conservation occurs within the City. Mitigation ratios established through the negotiations for habitat conservation plans (HCP)/NCCPs are generally lower than those in areas not subject to an HCP/NCCP because the planning assures that mitigation is conducted in a manner and at pre-determined locations agreed to by all parties to create a habitat preserve. The Port is not party to the MSCP or any other HCP/NCCP. We typically expect that the mitigation for project-related habitat losses within a jurisdiction with no HCP/NCCP would be provided at higher ratios than required by an HCP/NCCP to account for the lack of coordination provided by an HCP/NCCP. In this instance, we recommend that the habitat losses throughout the project site, regardless of jurisdiction, meet or exceed the mitigation ratios, guidelines, and standards required by the City's MSCP Subarea Plan to maintain consistency with its application to the on-site and adjacent areas within Plan.

79. The Wildlife Agencies recommend that vegetation classifications provided in Table 4.8-1 *Existing Vegetation Communities and Land Cover Types (acres)* and Figure 4.8-3 *Vegetation Communities and Land Cover Types* be consistent with the vegetation classification for the City's MSCP. The DEIR utilizes alternative vegetation classifications for some habitat types. For instance, coastal brackish marsh in the DEIR is classified as southern coastal salt marsh by the MSCP, seasonal pond in the DEIR is classified as disturbed wetland by the MSCP, and disturbed riparian in the DEIR is classified as disturbed southern coastal salt marsh by the MSCP.

Mitigation Measures

To assure consistency with the MSCP throughout the project site, we provide the following specific comments on the proposed mitigation measures.

80. In order to limit construction disturbance to raptors, we recommend that Mitigation Measure 4.8-1 be modified, as follows.

To ensure that no direct or indirect impacts to nesting raptors occur during construction (including clearing and grubbing), construction activities within the area of potential effect for nesting habitat should occur outside of the raptor breeding season (January 15 to July 31), or sooner if a qualified biologist demonstrates to the satisfaction of the Wildlife Agencies that all nesting activities are complete. If construction (other than vegetation clearing and grubbing) must occur during the breeding season, prior to initiating any construction-related activities,

pre-construction surveys must be performed by a City- or Port-approved (depending on the jurisdiction) biologist to determine the presence or absence of nesting raptors within 500-feet of the construction area. The pre-construction survey must be conducted within 10 calendar days prior to the start of construction, and its results submitted to the City or Port (depending on the jurisdiction) for review and approval prior to initiating any construction activities. If nesting raptors are detected, a mitigation plan shall be prepared by a City- or Port-approved biologist and submitted to both the City and Port for review and approval. The applicant shall implement the mitigation plan to the satisfaction of the City and Port to ensure that disturbance of breeding activities is reduced to a level less than significant. A bio-monitor must be on site during construction until all young have fledged to minimize construction impacts and ensure that no nests are removed or disturbed and no nesting activities are disrupted.

81. In order to limit construction disturbance to burrowing owls, we recommend that Mitigation Measure 4.8-2 be modified, as follows:

To ensure that no direct or indirect impacts to nesting burrowing owls occur during construction (including clearing and grubbing), construction activities within the area of potential effect for nesting habitat should occur outside of the burrowing owl's breeding season (April 15 to July 31), or sooner if a qualified biologist demonstrates to the satisfaction of the Wildlife Agencies that all nesting is complete. If construction (other than vegetation clearing and grubbing) must occur during the breeding season, prior to initiating any construction-related activities, pre-construction surveys must be performed by a City- or Port-approved (depending on the jurisdiction) biologist to determine the presence or absence of active burrows within all suitable habitat. The pre-construction survey must be conducted within 10 calendar days prior to the start of construction, and its results submitted to the City or Port (depending on the jurisdiction) for review and approval prior to initiating any construction activities. If an active burrow is detected during the breeding season, a mitigation plan shall be prepared by a City- or Port-approved biologist and submitted to both the City and Port for review and approval. The applicant shall implement the mitigation plan to the satisfaction of the City and Port to ensure that disturbance of breeding activities is reduced to a level less than significant. Construction setbacks of 300 feet from occupied burrows shall be implemented until the young are completely independent of the nest. A bio-monitor must be on site during construction until all young have fledged to minimize construction impacts and ensure that no nests are removed or disturbed

and no nesting activities are disrupted. If an active burrow is found outside of the breeding season, or after an active nest is determined to no longer be active by a qualified biologist, the burrowing owl would be relocated in coordination with the Wildlife Agencies.

82. In order to limit construction disturbance to migratory birds, we recommend that Mitigation Measure 4.8-3 be modified, as follows:

To ensure that no direct or indirect impacts to nesting migratory birds occur during construction (including clearing and grubbing), construction activities within the area of potential effect for nesting habitat should occur outside of the general avian breeding season (January 15 to August 31), or sooner if a qualified biologist demonstrates to the satisfaction of the Wildlife Agencies that all nesting is complete. If construction (other than vegetation clearing and grubbing) must occur during the breeding season, prior to initiating any construction-related activities, pre-construction surveys must be performed by a City- or Port-approved (depending on the jurisdiction) approved biologist to determine the presence or absence of nesting birds within 300 feet of the construction area. The pre-construction survey must be conducted within 10 calendar days prior to the start of construction, and its results submitted to the City or Port (depending on the jurisdiction) for review and approval prior to initiating any construction activities. If nesting birds are detected, a mitigation plan shall be prepared by a City- or Port-approved biologist and submitted to both the City and Port for review and approval. The applicant shall implement the mitigation plan to the satisfaction of the City and Port to ensure that disturbance of breeding activities is reduced to a level less than significant. A bio-monitor should be on site during construction until all young have fledged to minimize construction impacts and ensure that no nest is removed or disturbed and no nesting activities are disrupted.

83. As indicated on page 3-17 of the DEIR, "The project site is situated entirely within the Chula Vista Coastal Zone." To be consistent with the City's MSCP Subarea Plan, recirculated/final EIR should require that all impacts to riparian scrub be mitigated at a 3:1 ratio, not 2:1 as indicated in Mitigation Measures 4.8-9 and 4.8-10.
84. The following comments relate to the Proposed Project's consistency with the City's MSCP Preserve adjacency guidelines. The recirculated/final EIR should reflect that application of these guidelines to all parcels adjacent to City's MSCP Preserve (*i.e.*, Parcels SP-1, S-4, SP-2, S-2A, HP-11, HP-6, and HP-7), as well any parcels adjacent to sensitive habitats [Sweetwater Marsh and South San Diego Bay Units of the Refuge, San

Diego Bay, the mudflats west of the Sweetwater District, F&G Street Marsh and its associated tidal inlet, L Marsh (HP-5), J Street Marsh, Telegraph Creek, and Chula Vista Wildlife Reserve]. For purposes of this letter, all of the sensitive habitats listed in the brackets above are considered Preserve.

- a. In parcels adjacent to Preserve areas, permanent fencing (*i.e.*, a minimum six-foot tall black vinyl chain link fence) should be placed along the boundary between the ecological buffer and the Proposed Project use area. Stands of native cacti, for example as proposed on page 4.8-71 of the DEIR, cannot effectively keep humans and domestic animals out of the Preserve areas.
- b. Mitigation Measure 4.8-6 A. should be modified to read as follows.

Construction related noise shall be limited adjacent to the Sweetwater Marsh and South San Diego Bay Units of the Refuge, F&G Street Marsh, the mudflats west of the Sweetwater District, and J Street Marsh during the general avian breeding season of January 15 to August 31. During the avian breeding season, noise levels from construction activities must not exceed 60 dB(A) L_{eq} , or ambient noise levels if higher than 60dB(A). Before any construction begins, a qualified acoustician shall prepare and submit to the Port and City for review and approval an acoustical analysis to determine the ambient noise level, anticipated noise level of construction, and whether noise attenuation measures will need to be implemented to reduce the expected noise level to below 60dB(A). If noise attenuation measures or modifications to construction activities are unable to reduce the noise level below 60dB(A), either the applicant must immediately consult with the Wildlife Agencies to develop a noise attenuation plan or construction in the affected areas must cease until the end of the breeding season.

- c. The first sentence of Mitigation Measure 4.8-6 B should read as follows.

To reduce the potential for raptors to perch within the landscaping and hunt sensitive bird species from those perches, the following design criteria will be identified in the CVBMP master landscape plan and incorporated into all building and landscape plans with a line-of-sight to the City's MSCP Preserve, buffer zones, and on-site open space.

- d. Mitigation Measure 4.8-6 F indicates that all landscaping plans must ensure that no plants listed in Appendix N of the City's MSCP Subarea Plan are planted in

the project area. However, when referring to landscaping, the City's MSCP Subarea Plan makes reference instead to the "Wildland/Urban Interface: Fuel Modification Standards," or Appendix L. of the Subarea Plan. In addition, it specifies that no invasive non-native plant species should be introduced into areas immediately adjacent to Preserve areas. All project-related landscaping plans should include, to the maximum extent practicable, native plants that are compatible with native vegetation located in the ecological buffers and/or MSCP Preserve.

- e. Mitigation Measure 4.8-6 G should provide more specific language as to how the Proposed Project would minimize the release of toxins, chemicals, petroleum products, exotic plant materials, and other pollutants that might degrade or harm the natural environment or ecosystem processes within the Preserve. As discussed above (and as mentioned in Comment 67), it is unclear what BMPs would be used to prevent the release of such pollutants and how the project would meet NPDES (National Pollution Discharge Elimination System) standards and the requirements of the City's Standard Urban Storm Mitigation Plan.
- f. Mitigation Measure 4.8-6 J should specify that all trash cans installed on the project site would be animal- (non-human) proof. The proposal to provide trash cans with lids is not enough of a deterrent to scavenging animals.
- g. Table 4.8-6 *Mitigation Required for Significant Impacts to Vegetation Communities and Land Cover Types – Port Lands (acres)* should include the following revisions.
 - i. The mitigation ratio for disturbed seasonal pond (*e.g.*, classified as disturbed wetland per the City's MSCP) should be increased from 1:1 to 2:1 to be consistent with the City's MSCP Subarea Plan.
 - ii. Impacts and mitigation for losses to non-native grassland and other raptor foraging habitat (*i.e.*, habitat in the Sweetwater District) should be included in the table consistent with the City's MSCP. The mitigation ratio for losses to non-native grassland and other raptor foraging habitat is 0.5:1 if mitigated inside Preserve-designated land and 1:1 if mitigated outside preserve-designated land. As explained in Comment 29, mitigation for project-related losses of raptor foraging habitat should occur at a ratio of 1:1 away from the project site.
 - iii. The acreage of permanent impacts to southern coastal salt marsh during Phase II should be increased from 0.04 to 0.10 to be consistent with the text on page 4.8-75 of the DEIR. The acreage of mitigation provided for

this impact should be appropriately revised to 0.4 acre, as written under Mitigation Measure 4.8-9.

- h. Mitigation Measure 4.8-9 should be revised to include mitigation for loss of non-native grassland, disturbed habitat that is raptor foraging habitat (*i.e.*, Sweetwater District), and coastal sage scrub in Phase III.
 - i. Mitigation Measure 4.8-11 and Table 4.8-9 should be revised to indicate that impacts to Corps jurisdictional waters should be mitigated at a 2:1 ratio to be consistent with the City's MSCP.
85. The DEIR identifies temporary impacts that the project would have on sensitive habitats within the project footprint and indicates that all temporary impacts would be mitigated at 1:1. This is inconsistent with the guidelines established by the City's MSCP Subarea Plan, which requires the same mitigation for temporary and permanent impacts. Therefore, the recirculated/final EIR should account for appropriate temporary impact mitigation according to the mitigation ratios listed in Tables 5-3 and 5-6 of the MSCP Subarea Plan.
86. The recirculated/final EIR should include a map that clearly depicts: a) the jurisdictional boundaries before and after the land exchange; b) vegetation communities within both areas; and c) sensitive species points that are present in both the Port and City's jurisdictions after the land exchange. This will allow a determination of the Proposed Project's effects on habitats and species within each jurisdiction. This information will also be necessary to process the required amendment to the City's MSCP Subarea Plan and incidental take permit.

Growth Inducement

84. The Growth Inducement discussion in the DEIR focuses on the economic effects of the Proposed Project, but ignores the significant effects to the environment that could result from growth in the surrounding area, that is, growth that is related to redevelopment of the subject property. The recirculated/final EIR should expand this section to address the significant effects on the environment, both individually and cumulatively, from growth stimulated by the subject project (*i.e.*, growth that would likely not occur but for the approval and implementation of the Chula Vista Bayfront Master Plan). An evaluation of the effects on air and water quality as a result of this new growth should be provided, as well as a discussion of the potential for even greater impacts (*e.g.*, night lighting, human and pet intrusion, increased noise levels) than the Proposed Project alone would cause to nearby sensitive biological resources.

Mitigation Measure

85. Impacts associated with the growth-inducing effects of project implementation could be reduced if the appropriate planning documents that regulate development in the areas immediately surrounding the project are amended to include specific development and design criteria for new development. Such criteria would include: restrictions on lighted signage; requirements for fully shielded street and other outdoor lights; restrictions on uses that could generate excessive noise impacts, particularly at night; building design standards that address height, lighting, and window design; and requirements for adequately sized open space and public recreation areas to accommodate new residents and their pets.

Unavoidable and Irreversible Significant Environmental Effects

86. The Wildlife Agencies do not agree that implementation of the mitigation measures identified in the DEIR would reduce the impacts to biological resources to a level less than significant. Therefore, this section in the recirculated/final EIR should discuss the unavoidable and irreversible effects that implementation of the Proposed Project would have on the sensitive coastal resources that occur within and adjacent to the project boundaries.

STATE CLEARINGHOUSE

Subject: Comments on the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project, City of San Diego, San Diego County, California (UPD No. EIR-2015-115; SCH No. 2015081013)

Dear Ms. Manaois:

The Department of Fish and Wildlife (Department) has reviewed the San Diego Unified Port District's (Port District's) San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (proposed project) Draft Environmental Impact Report (DEIR). The following statements and comments have been prepared pursuant to the Department's authority as Trustee Agency with jurisdiction over natural resources affected by the proposed project (California Environmental Quality Act, [CEQA] Guidelines § 15386) and pursuant to our authority as a Responsible Agency under CEQA Guidelines section 15381 over those aspects of the proposed project that come under the purview of the California Endangered Species Act (CESA; Fish and Game Code § 2050 *et seq.*) and Fish and Game Code section 1600 *et seq.*

The proposed project consists of (1) an ordinance establishing a Port District Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the Port District or that are operated by the Port District's tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the Port District. Existing fireworks display events are launched from barges, piers, and/or flight decks. The proposed new fireworks displays would occur year round and are anticipated to last between 3 to 10 minutes in duration for non-Fourth of July displays and 15 to 20 minutes for Fourth of July displays. The new fireworks displays are proposed to be launched from barges within the San Diego Bay, and would be governed by the proposed ordinance. All existing and proposed new fireworks display events that either require a discretionary action by the District or those operated by the District's tenants would be subject to all applicable federal, state, and local laws and regulations governing fireworks as well as any additional requirements set forth in the proposed ordinance.

The Department offers the following comments and recommendations to assist the Port District in avoiding, minimizing, and adequately mitigating project-related impacts to biological resources.

General Compatibility

Given the concentration of biological resources within the project area, the San Diego Bay National Wildlife Refuge, the Sweetwater Marsh Refuge Unit, the South San Diego Bay Refuge Unit, and other conservation efforts including federal funding associated with National City and the south bay, the Department is concerned with the compatibility and appropriateness of adding fireworks displays to the south bay that have the potential to adversely impact the region's rich natural resources. The DEIR's analysis should carefully examine the need of the proposed expansion, and consider the mitigation and monitoring requirements necessary to protect south bay habitats and their residents.

San Diego Fireworks Display EIR Notes

The DEIR should include an analysis of direct and indirect impacts to all avifauna nesting within National City and the south bay, including D-Street Fill, Sweetwater Marsh, F and G Street Marshes, J Street Marsh, Paradise Marsh, Chula Vista Wildlife Reserve, and Silver Strand State Beach. The analysis should focus on the area's importance as a regional and international site utilized for nesting, roosting, foraging, and as a migratory stopover within the Pacific Flyway for common and designated sensitive species. The proposed project areas, particularly those proposed within the vicinity of Ecological Refuges and other open spaces within the south bay, host thousands of resident and migratory birds that could be adversely impacted by the proposed project.

The Department believes that based on the available literature including unpublished reports, and other limited publications, common and sensitive species including, but not limited to light-footed Ridgway's rail (*Rallus longirostris levipes*; a CESA and Endangered Species Act [ESA] endangered species, and a State Fully Protected Species [FPS] under Fish and Game Code § 3511); California least tern (*Sternula antillarum browni*; a CESA and ESA endangered species and FPS); Belding's savannah sparrow (*Passerculus sandwichensis beldingi*; a CESA endangered species); western snowy plover (*Charadrius alexandrinus nivosus*; ESA threatened species and a State Species of Special Concern [SSC]); black skimmer (*Rynchops niger*; a SSC); elegant tern (*Thalasseus elegans*); Caspian tern (*Hydroprogne caspia*); double-crested cormorant (*Phalacrocorax auritus*); northern harrier (*Circus cyaneus*; a SSC); and osprey (*Pandion haliaetus*) are likely to exhibit a physiologic response to fireworks-generated flash and noise. Page 4.3-28 of the DEIR identifies that "[t]he flash and noise from the proposed new fireworks display events are [emphasis added] expected to generate physiologic response of stress within birds." However, later in the DEIR it is concluded that "the proposed new fireworks display events are not anticipated to result in any long-term or permanent substantial adverse effects on avian species because temporary disturbance from noise and light would be short term and infrequent and would not result in direct mortality of birds, a decrease in productivity, or long-term changes in behavior (e.g., colony abandonment)" (Port District, 2017; p. 4.3-31), concluding that no significant impact would occur. The Department does not believe that the analysis provided in the DEIR adequately supports the conclusion that fireworks displays would not directly impact sensitive avian species throughout San Diego Bay and Imperial Beach. For example, while certain colonies (that are routinely exposed to loud noise) may not be abandoning nests or chicks, vocalizations, flushing behaviors, and other movements indicated that these birds were stressed by the fireworks displays and loud noises they produce (Port

District, 2017). It is unknown how the stress responses elicited from cumulative fireworks displays affect species' energy expenditure, their underlying health, or if the stress affects subsequent nesting attempts. The DEIR suggests that because they have not historically been exposed to continuous loud noise, south bay avian colonies could be comparatively more sensitive to fireworks displays. Additionally, while behavioral observations of California least terns and western snowy plovers in response to fireworks displays are scant, studies for light-footed Ridgway's rail and Belding's savannah sparrow do not exist. For these reasons, the Department continues to stress the importance that the project include a comprehensive mitigation strategy, including a robust monitoring protocol, that minimizes sensitive species' exposure by maximizing spatial buffers from the fireworks display source (e.g., barge, pier, etc.) and sensitive receptors (i.e., nesting and critical roosting and foraging grounds for avian species).

Monitoring

In our comments on the Notice of Preparation for the proposed project (September 8, 2015) we recommended that for sites likely affected by fireworks displays, a monitoring protocol be developed as part of a comprehensive mitigation strategy. The DEIR does not include a monitoring protocol as recommended. Given the data gaps regarding the effects of fireworks displays on sensitive avian species, the DEIR should include an adaptive management plan requiring ongoing monitoring of sensitive receptor sites for individual fireworks displays (e.g., known sensitive species nesting and/or roosting sites). The adaptive management plan should include specific mitigation strategies to further minimize impacts to sensitive receptors (e.g., increase buffer size, temporal restrictions, etc.) and measures to gradually reduce the ongoing monitoring (as a component of the adaptive management plan) should the monitoring demonstrate that the mitigation measures are successful. The Port District should confer with the Department to reduce the interval or intensity of ongoing monitoring requirements. The Department offers the monitoring recommendations below (adapted from U.S. Fish and Wildlife Service [Service] recommendations):

1. Sensitive habitats (e.g., nesting and roosting sites within 1.2 mile of the fireworks) including areas within the vicinity of where spectators may congregate should be surveyed by a qualified biologist prior to, during, and following the fireworks display. Where appropriate, and when less intrusive than direct observation, nest cameras may be used to monitor sites that have no terrestrial or aquatic access. Monitoring activities themselves should not result in undue harassment. At a minimum, monitors should record and/or perform the following:
 - a. site location, name of monitor, date and time of observations;
 - b. number of adults, nests, and chicks observed within ½ mile of spectator viewing areas;
 - c. species behavior prior to, during, and post fireworks displays;
 - d. sources of stressors (e.g., light, noise, trespass, debris);
 - e. foraging behavior no sooner than 48 hours prior to and no later than 24 hours following fireworks displays;
 - f. counts of human and dog tracks intersecting with symbolically fenced areas before and after the fireworks event;
 - g. counts of persons within access-controlled areas;
 - h. counts of litter items within symbolically fenced areas before and after the fireworks event;

- i. counts of illegal pyrotechnics;
- j. recommendations, as applicable, to further minimize physiologic response to fireworks displays (e.g., identify known, new, or persisting management needs). Monitoring observations should be evaluated by the Port District to increase buffer distances, further limit noise levels or other actions as appropriate.

The Port District should:

2. Provide monitoring data directly to the Department.
3. Ensure sensitive habitats are symbolically fenced and posted off-limits during events. Conduct repairs to symbolic fencing of any damaged or missing sections of fencing prior to fireworks display permit issuance.
4. Close parking lots and beach access points in the vicinity of sensitive resources, as appropriate.
5. Provide adequate numbers of monitors and patrols (commensurate with anticipated number or spectators, and exposure/accessibility of sensitive resources) prior to spectators congregating and continuing until spectators disperse.
6. Monitor noise at sensitive receptor sites.
7. Ensure monitors and other enforcement personnel receive accurate information regarding the location of sensitive resources.
8. Prohibit pets on beaches and within sensitive resource areas.

Compliance

Monitors should have direct communication with patrols (e.g., San Diego Harbor Police, law enforcement, and private security) to effectively prevent inadvertent and unauthorized impacts to sensitive biological receptors. The DEIR identifies that fireworks displays not only elicit a physiological reaction from sensitive avian species, but that there are additional indirect effects associated with trespass from spectators accessing beach and dune areas closed for breeding and roosting. The Department commends the Port District for increasing the Harbor Police Department presence during fireworks displays, and the DEIR should memorialize the following DEIR language as a mitigation measure of future fireworks display permits. "*Consistent with its current operational practices, the Harbor Police Department would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events*" (Port District, 2017; p. 4.3-33). Additionally, the Port District should coordinate with staff from the Harbor Police Department to determine the number of patrols necessary to protect biological resources and to identify specific/targeted enforcement areas of sensitive resources where unauthorized spectating (e.g., beach access or beaching/mooring) is prohibited.

Environmentally Superior Alternative

The DEIR is not clear how the Quiet Fireworks Display Alternative (e.g., Environmentally Superior Alternative) fails to meet the project objectives. Per the DEIR, "... the Quiet Fireworks Display Events Alternative would not meet the fundamental project objectives" (Port District, 2017; p. ES-10). Of the alternatives analyzed by the DEIR, the Quiet Fireworks Display Alternative best aligns with protecting sensitive natural resources within the immediate proximity of firework displays (e.g., known nesting sites for California least tern, light-footed Ridgway's rail, Belding's savannah sparrow, western snowy plovers, etc.). The DEIR describes four (4) project objectives.

Objective one. Objective one is to develop a Port District ordinance that establishes a Port District Code section with policies and performance standards, for fireworks display events that require a discretionary action by the Port District or those firework display events operated by the Port District's tenants. The Quiet Fireworks Display Alternative would not impede the District's ability to establish policies; conversely, it would assist the Port District by providing specific performance standards that are both measurable and enforceable.

Objective two. The Quiet Fireworks Alternative fulfills project objective two by allowing "...for the continued occurrence of traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach..." (Port District, 2017; p. 3-2). Furthermore, the Port District is presented with an opportunity to educate local communities regarding San Diego's unique biological resources and recognize the protective measures that the District and the community collectively take. Communal resources can foster a sense of hometown appreciation—achieving objective two by "...providing a popular and region-wide way to celebrate and express civic pride..." while also facilitating fireworks displays.

Objective three. Project objective three seeks to allow "...the continued occurrence of existing and future occurrence of proposed new traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach...." (Port District, 2017; p. 3-2). The Quiet Fireworks Alternative would not impede the occurrence of current or future fireworks displays and unequivocally "...considers the health, safety, and welfare of people, property, and the environment..." (Port District, 2017; p. 3-2).

Objective four. Finally, there is no evidence that the Quiet Fireworks Alternative fails to achieve project objective four, which aims "[t]o continue to enhance the visitor-serving experience of viewing fireworks display events from various vantage points around District tidelands by providing safe, high-quality fireworks display events using existing and new fireworks technologies as they become available" (Port District, 2017; p. 3-2). Nothing within the Quiet Fireworks Alternative suggests that access to fireworks displays would be limited beyond existing public safety, right of access, or other applicable restrictions.

Regardless of the selected project alternative, acousticians should be utilized to monitor the actual sound levels generated during these events in relationship to sensitive biological receptor sites. Point monitoring of sensitive biological receptors should be made a requirement for each firework display permit until it can be demonstrated that the existing or additional events do not adversely impact these receptor sites.

Alternative 3 – No Salute Fireworks Alternative

The Department appreciates the consideration of project alternatives intended to reduce the noise and light impacts to sensitive receptors, however, Alternative 3 allows fireworks that are equally loud as a typical 3-inch "salute". "The No Salute Fireworks Alternative would have the same characteristics as all of the fireworks display events that compose the proposed project, including the same total pounds of fireworks per event (as outlined in Table 3-2 in Chapter 3, *Project Description*), but would prohibit the use of salute fireworks and limit the noise produced by all fireworks during fireworks display events to a maximum of 140 dB" (Port District, 2017; p. ES-9). Under Alternative 3, fireworks noise would not be minimized below the typical salute fireworks the DEIR describes as being prohibited. As stated in the DEIR, salute fireworks are specifically designed to be loud and bright and "[w]hile the noise level of these fireworks varies by type, a typical linear (unweighted) peak noise level directly below a 3-inch salute exploding at

its normal altitude is 140 decibels (dB) (Journal of Pyrotechnics, Inc. 2012)." Therefore the effect of Alternative 3 only limits fireworks that exceed the typical noise generated by current fireworks and/or fireworks specifically labeled as salute fireworks.

Impacts to Nursery Sites

The proposed project has the potential to impact various nursery sites (i.e., avian nesting sites). Based on a literature review of relevant information, the U.S. Fish and Wildlife Service's *Guidelines for Managing Fireworks in the Vicinity of Piping Plovers and Seabeach Amaranth on the U.S. Atlantic Coast* (USFWS, 1997) is a guidance document that evaluates impacts on tern species. Absent updated and site-specific information, the Service's guidelines serve as the best available science for minimizing impacts to terns and plovers. With regard to selecting firework shell size, the Department's literature review suggests a firework display's impacts on avian species is associated the noise and light and not necessarily associated with the shell size of a given firework. Edits below suggest uncoupling firework shell size from the recommended avian buffer. To partially mitigate noise impacts to avian nesting and/or roosting sites the text of MM-NOI-1: *Implementation of Noise-related Conditions of the Proposed Ordinance* (p. ES-41) should be modified accordingly (deletions in ~~strikeout~~ and additions in ***bold italics***):

MM-NOI-1: Implementation of Noise-Related Conditions of the Proposed Ordinance.

The fireworks organizer and operator are required to comply with the following noise related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(e) Protection of Sensitive Species and Habitat. The following conditions shall apply to Fireworks Display Events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1.2) mile from any federally or state-listed avian species nesting ***sites***:

1. Location. Fireworks display events shall be located not less than one ***and two-tenths*** (1.2) mile from any federally, or state-listed ***or other sensitive*** avian species nesting colony.
2. Salutes. Fireworks display events shall not use concussion type, non-color shells such as "salutes" or "reports" during the initial twenty-five percent (25 percent) of the duration of any display (e.g., within the first 5 minutes of a 20-minute display). ***Concussion fireworks (e.g., Salutes or Reports) shall not exceed 120 linear (unweighted) peak sound pressure level as measured directly under the shell burst occurring at its normal altitude, using a Type 1 sound measuring device with a free-field microphone at a height of 1 meter above the ground.***

Debris

Despite Mitigation Measure MM-BIO-1, the proposed project could cause a considerable amount of plastic and other non-biodegradable materials to fall within San Diego Bay. Mitigation Measure MM-BIO-1 does not fully mitigate the potential for ingestion of firework byproducts that could harm green sea turtles, marine mammals, and/or avian species. Specifically, MM-BIO-1 (d)(2)(B) only prohibits fireworks with plastic casings or non-biodegradable inner components

exceeding five percent of the firework's mass (Port District, 2017; p. ES-16). The proposed addition of Chula Vista Bayfront firework displays alone could cause an additional 34.2 pounds of plastic and other non-biodegradable byproducts to fall directly within San Diego Bay¹. The DEIR should present the total amount of debris deposited within San Diego Bay that could be caused from existing fireworks shows, and newly proposed additions (e.g., National City and Chula Vista shows) within the DEIR. To the extent feasible, MM-BIO-1 should be revised to prohibit the use of non-biodegradable materials.

Mitigation Measure MM-BIO-1(8), (9), and (10), and MM-WQ-1 should specify that collected firework-generated trash and debris should be weighed dry, not wet, to better achieve a proportional collection weight commensurate with the weight of introduced debris. Mitigation Measure MM-BIO-1(8), (9), and (10) should specify that weight criteria must be fulfilled using firework-generated debris only.

To mitigate impacts associated with increased debris associated with boating activities and increased foot traffic (see Impact-BIO-3, Impact-BIO-4, Impact-BIO-8, and Impact-C-BIO-1) associated with spectators, Mitigation Measure MM-BIO-1 should require the fireworks organizer to collect incidental spectator-generated trash. To accomplish this, the Department recommends the following is incorporated in the DEIR as enforceable mitigation measures for future fireworks display permits:

- A) A refundable deposit fee, based on the number of anticipated spectators (e.g., per capita) paid by the fireworks organizer. The refundable deposit fee should be an inflation-adjusted amount to fund two Port District or respective City cleanup personnel, equipment (e.g., truck, boat, nets, bags, personal protection equipment, debris disposal fees, etc.) per 500 spectators. The refundable deposit should be released or prorated based on the Port District's and hosting-city's satisfaction with firework organizer's cleanup.
- B) To defray potential costs borne by the firework organizer and/or hosting-city, firework organizer and Port District shall implement Mitigation Measure MM-BIO-2(5) to include daily announcements through digital/social media in conjunction with physical signage and/or press releases. MM-BIO-2 should be revised to require educational programs for each event designed to minimize debris, and prohibit impacts to sensitive resources (e.g., nesting or roosting sites, green turtle foraging areas, and eel grass beds).
- C) While MM-BIO-2 requires a minimum of two "...professional security guards to direct persons away from and discourage trespass..." (Port District, 2017; p. ES-22) the number of required security guards should be based on the number of spectators, potential threat to sensitive areas (e.g., fenced vs. unfenced habitats) and mode of spectator access (e.g., land vs. aquatic, or both). Two security guards are inadequate for most locations and the DEIR does not specifically require boat patrols. MM-BIO-2 should be revised to provide security requirements based on site sensitivity and include provisions to increase Harbor Police patrols funded by the firework organizer and/or cooperating local agency.

¹ Based on the DEIR's Table ES-1 *Proposed New Fireworks Display Events Requiring a Future Discretionary Action by the District.*

Dear Wileen Manaois:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. The review period closed on May 1, 2017, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Response to Comment C-1

The comment notes the State agencies that received the Draft EIR for comment and the date the comment period closed, and includes one attached letter from USFWS and one attached letter from the California Department of Fish and Wildlife (CDFW). The comment states that these comment letters were received by the State Clearinghouse after the end of the state review period, which ended on May 1, 2017. In addition, the comment notes that the project has complied with the State Clearinghouse review requirements for the Draft EIR pursuant to CEQA. A letter from the State Clearinghouse that was received on May 4, 2016 is included as an attachment to this comment letter. This comment letter was received on May 8, 2016, and therefore replaces the previous letter from State Clearinghouse.

The District appreciates the Office of Planning and Research's coordination of the Draft EIR. As indicated, two comment letters were received by the State Clearinghouse. The responses to these individual comment letters are provided under Comment Letter B (USFWS) and Comment Letter E (CDFW).

Subject: Comments on the Draft Environmental Impact Report for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project

Dear Ms. Manaois:

D-1 | Commission staff appreciates the opportunity to review and provide comment on the above-referenced environmental document which was received by our San Diego District Office on March 20, 2017. The Commission’s ecologist, Dr. Laurie Koteen, has conducted a review and offers the following comments regarding the Draft Environmental Impact Report (“DEIR”), dated March 2017, for the proposed project which consists of: (1) an ordinance establishing a District Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District’s tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the District.

D-2 | There are many potential concerns raised by the DEIR for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Event. Of primary concern to Commission staff are the biological impacts from excessive noise, light, chemical pollutants and firework debris on birds, marine mammals, fish and other wildlife.

D-3 | Overall, staff views fireworks displays as a potentially impactful activity that should be minimized to a few events a year, and very carefully located in areas likely to have the lowest impacts on birds, sensitive habitats and marine life. Fireworks should be scheduled outside of nesting periods, which generally span from February through September, with the exception of the fourth of July. In addition, we have the following comments:

D-4 | • The DEIR should contain greater analysis from the literature on studies documenting impacts of fireworks on birds and marine mammals in particular.

D-5 | • The DEIR presents a single project without an evaluation of alternatives based on location. The only alternatives evaluated are no fireworks, quiet fireworks, and no “salute” fireworks. Alternatives should also be considered that evaluate impacts of fireworks in different locations in addition to noise impacts. The

- D-5 cont. [decibel threshold of 140 dB is very high and a lower threshold should be considered as well.
- D-6 [
 - To the extent that fireworks can be made of materials with reduced toxicity and more complete combustion of each firework in the air, those avenues should be pursued.
- D-7 [
 - Each individual proposed location for firework launches must be evaluated in light of the sensitive resources and species in the immediate vicinity. An area of impact around each potential launch site should be identified based on the expected impact horizon (separately evaluated for noise, light, debris and pollutants). The sensitive species and resources around each site should be carefully mapped, and impacts evaluated in light of the specific species and habitats in each location. Those areas where sensitive species are concentrated should be avoided completely.
- D-8 [
 - Human crowd management should also be considered. Large crowds can also impact wildlife and prompt avoidance behaviors and stress. The stress of the large human presence will be felt on top of the stress of the fireworks themselves, elevating the cumulative stress to wildlife. Crowds in the boats in the water must also be considered, and may need to be limited to certain densities.
- D-9 [
 - Fireworks should not occur on consecutive nights in the same location, or if this is to occur, cumulative impacts of multiple nights must be considered.
- D-10 [
 - A thorough discussion of mitigation of unavoidable impacts is lacking and should be developed based on specific projected impacts for specific locations, species and habitats.
- D-11 [
 - Special attention must be paid to potential impacts to sensitive species including the California Least tern, the Western snowy plover, Belding's Savannah sparrow, Ridgeway's rail, and sea turtles, and any others not listed here.
- D-12 [Thank you again for the opportunity to provide review and comment on the proposed project. If you have any questions or require further clarification, please do not hesitate to contact me at the above office.

Sincerely,

Melody Lasiter
Coastal Program Analyst

Response to Comment D-1

This comment is an introductory comment that states that Coastal Commission staff received the Draft EIR at the San Diego District Office. The commenter indicates that the Commission's ecologist reviewed the Draft EIR and provided specific comments for the proposed project.

The District appreciates the Coastal Commission's interest in the proposed project. This comment does not raise any specific issues requiring a response pursuant to CEQA. The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment D-2

The comment states that the primary concern to Commission staff are potential biological resources impacts from excessive noise, light, chemical pollutants and firework debris on wildlife.

The commenter identifies general issues that are analyzed in detail throughout Section 4.3, *Biological Resources*, of the Draft EIR. As the comment does not raise a specific issue, a specific response cannot be provided. No changes to the Final EIR are required.

Response to Comment D-3

The comment indicates that Commission staff views fireworks displays as potentially impactful activities that should be minimized in occurrence, located in areas that are least impactful to wildlife and habitat, and scheduled outside of nesting periods, with the exception of the Fourth of July. In addition, the commenter notes that additional comments are to follow.

The environmental impacts of the project are fully disclosed and any significant adverse impacts on biological resources would be mitigated to less than significant in Section 4.3, *Biological Resources*, of the Draft EIR. As described in Chapter 3, *Project Description*, of the Draft EIR, the proposed new fireworks display events would be limited to four times per year, with two displays occurring on the Fourth of July. As shown in Table 3-1 of Chapter 3 of the Draft EIR, the remaining two fireworks display events would occur at different periods throughout the year, with one display occurring during the timeframe of January to March, and one display occurring during October to December. Both of these timeframes are generally outside of the avian nesting season. In addition, see response to comment B-6, which states that the proposed barge locations have been sited to minimize the effects of fireworks on biological resources to the maximum extent feasible.

Response to Comment D-4

The comment states that the Draft EIR should provide greater analysis from studies documenting impacts of fireworks on birds and marine mammals in particular. The comment does not specifically state which studies should be included within the Draft EIR.

The Draft EIR included an in-depth discussion of numerous existing studies that analyzed the effects of fireworks on wildlife, including birds and marine mammals. As discussed in Section 4.3, *Biological Resources*, of the Draft EIR, an extensive literature review was completed with a focus on effects of fireworks in coastal areas outside of the San Diego region, and the effects of pyrotechnics and loud sounds, in general, on marine resources. In addition, the impact analysis made use of existing biological information for San Diego Bay, including the San Diego Bay Integrated Natural Resources Management Plan prepared by the U.S. Navy in conjunction with the District. Furthermore, general

information was drawn from surveys of the nearshore environment near Imperial Beach Pier, particularly from the 2011–2012 benthic habitat mapping for the U.S. Navy’s Silver Strand Training Complex Boat Lanes (Merkel & Associates, Inc. 2011a, 2012), surveys performed offshore of the Imperial Beach Pier for nearshore beach nourishment (Merkel & Associates, Inc. 2011b), nearshore habitat mapping performed by San Diego Association of Governments (SANDAG 2002; Merkel & Associates, Inc. et al. 2004), studies completed for the Naval Base Coronado Naval Outlying Field in Imperial Beach (Tierra Data 2011; Merkel & Associates, Inc. 2014a), and beach monitoring performed in association with the regional beach nourishment program (Merkel & Associates, Inc. 2014b). The results of these studies and surveys were incorporated into the impact analysis and were used to determine potential impacts related to the proposed project. The environmental impacts of the project are fully disclosed and any significant adverse impacts on biological resources would be mitigated to less than significant in the Draft EIR. No changes to the Final EIR are required.

Response to Comment D-5

The comment identifies the alternatives fully analyzed in the Draft EIR and indicates that an alternative based on different locations should also be considered. The commenter also states that the 140 dB threshold is too high, and a lower threshold should be considered.

As discussed in Chapter 7, *Alternatives to the Proposed Project*, of the Draft EIR, one of the alternatives considered but rejected included a Landside Fireworks Display Events on Port Tidelands Alternative. Under this alternative, all proposed new fireworks display events would be required to be held within landside areas under the jurisdiction of the District. The locations of the proposed new fireworks display events as proposed and described in Chapter 3, *Project Description*, of the Draft EIR would be within San Diego Bay. Therefore, with the Landside Fireworks Display Events on Port Tidelands Alternative, the Draft EIR essentially considered an alternative location from what was proposed in Chapter 3. However, as discussed in Chapter 7, the Landside Fireworks Display Events on Port Tidelands Alternative was rejected for various reasons, including a potential for increased acute health risk and risk to public safety, reduced number of public viewing areas, increased potential for fire hazards, and increased traffic impacts because more intersections and roadways may need to be closed within the public safety zone.

Although this comment does not specify why the 140 dB threshold is too high or suggest a lower threshold, the District is providing the following information to address the comment. Distance from sensitive biological resource was one of the factors considered in selecting the launch locations for the proposed new fireworks display events. As discussed in response to comment B-6, the location of the proposed Chula Vista Bayfront launch barge has also been revised for the Final EIR to avoid the Refuge. The geographic location of each launch site is defined by the public viewing area(s) it is intended to serve as well minimum distances from land that are required to provide a safety buffer. As such, there is limited flexibility in where each launch site can be placed. Furthermore, because of the large noise impact distances identified the Draft EIR, it is generally not practical to move a launch site a large enough distance to substantially change the impacts. Therefore, project alternatives were selected that focused primarily on changing the characteristics of the fireworks display events themselves, rather than the launch locations for the displays. The decibel threshold of 140 dB is based on available data for salute fireworks, which are the loudest type of traditional fireworks used and are specifically designed to generate high noise levels. Because this type of firework is currently used as part of the existing traditional fireworks display events, this noise level is anticipated and not unrealistic. It should be noted that the 140 dB limit refers to linear (unweighted) peak noise levels that address very brief (instantaneous) peak noise, which is more

restrictive than typical A-weighted (i.e., dBA) maximum or average noise level limits that are typically used in assessing long-term environmental noise; the noise level limit is also specified directly under the shell burst, rather than at a more distant observation point. As requested in the comment, the Final EIR considers a decibel threshold lower than 140 dB. The noise limit under the No Salute Fireworks Alternative has been reduced in the Final EIR to “130 dB linear (unweighted) peak sound pressure level due to the firework break(s), as measured at a horizontal distance of 15 meters from the launch point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.” However, reducing the noise limit to 130 dB would not allow for any other alternate barge locations because the barges would still need to be sited a minimum of 1 mile from sensitive nesting colonies. The changes are included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment D-6

The commenter suggests that fireworks consisting of materials with reduced toxicity and more complete aerial combustion should be considered.

As part of the proposed ordinance, the District is requiring the use of alternative fireworks technologies to the extent that they are commercially available. These alternative fireworks are produced with pyrotechnic formulas that replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters.

Response to Comment D-7

The comment states that each proposed fireworks launch site location must be evaluated in relation to nearby sensitive biological resources. The comment also suggests that an area of impact be identified around each fireworks launch site for different impact topics including noise, light, debris, and pollutants. Furthermore, the comment states that sensitive biological resources present around each fireworks launch site should be mapped and impacts on those resources should be evaluated for each location. The comment states that areas where sensitive species are concentrated should be entirely avoided.

The proposed project includes four new fireworks display events in San Diego Bay adjacent to the National City and Chula Vista Bayfronts. Section 4.3, *Biological Resources*, of the Draft EIR provides an in depth discussion of the existing habitats and wildlife of the Bay and identifies the specific sensitive habitats and species in the vicinity of the proposed locations for the new fireworks display events. In addition, the general biological habitats, sensitive habitats, wetlands, and locations of sensitive species of the Bay and Imperial Beach Oceanfront are mapped on Figures 4.3-1 and 4.3-2 of Section 4.3 of the Draft EIR. Figure 4.3-2 specifically depicts the locations of habitat protection areas, marine mammal haul-out areas, sensitive habitats such as eelgrass and coastal salt marsh, and sensitive nesting areas for light-footed Ridgway’s rail, Belding’s Savannah sparrow, Western snowy plover, and California least tern, as well as a 1-mile buffer around these sensitive nesting areas. The locations of each of these sensitive habitats, wetlands, and sensitive species are mapped in relation to the barge locations for both existing and proposed new fireworks display events.

The potential effects of the four proposed new fireworks display events on these sensitive species and habitats were analyzed throughout Section 4.3 of the Draft EIR, including the potential effects associated with fireworks noise, light, debris, and pollutants. Specifically, the potential effects of fireworks noise, light, debris, and pollutants on sensitive species, including native and migratory

wildlife species, are analyzed under Thresholds 1 and 4 of Section 4.3 of the Draft EIR. Additionally, the potential effects of fireworks noise, light, debris, and pollutants on sensitive habitats, including wetlands and wildlife nursery sites, are analyzed under Thresholds 2, 3, and 4 of Section 4.3 of the Draft EIR. The proposed barge locations have been sited to minimize the effects of fireworks on sensitive species and resources. Both the proposed National City and Chula Vista barges would be located approximately 1 mile from sensitive nesting areas within and around San Diego Bay to minimize the visual and audible effects of fireworks to these areas. No changes to the Final EIR are required.

Response to Comment D-8

The comment states that crowd management should also be considered in the EIR. The comment states that large crowds can affect wildlife and result in behavioral changes and stress, which is in addition to the stress caused by fireworks themselves. The comment also states that the effects of boat crowds should be considered and that certain densities may need to be limited.

The potential significant impacts associated with human activities is evaluated in Section 4.3, *Biological Resources*, of the Draft EIR. The proposed new fireworks display events would be located within view of publicly accessible areas such as parks, promenades, publicly accessible piers, and plazas. As a result, the District cannot prohibit access to these areas. However, the proposed ordinance includes several conditions of approval intended to reduce the effects of trespass into sensitive habitat areas, including security, signage, and education measures for publicly advertised fireworks display events. The implementation of these conditions of approval are required by mitigation measure MM-BIO-2.

As discussed in Section 4.3 of the Draft EIR, HPD currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units during existing fireworks display events (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, HPD would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. The District will continue to coordinate with HPD and U.S. Coast Guard who are responsible for proper boating practices in the Bay.

In addition, please see response to comment B-21. Based on recommendations received during the public comment period, Section 4.3 of the Draft EIR has been updated to a clarifying mitigation measure (MM-BIO-4) requiring biological monitoring and reporting, and updates to MM-BIO-2 to include clarifying language to augment landside security patrols with in-water security patrols. Changes to mitigation are included in Chapter 3, *Errata and Revisions*, of the Final EIR and are reflected in the project's MMRP.

Response to Comment D-9

The comment suggests that fireworks displays should not occur on consecutive nights in the same location unless the cumulative effects of these events is considered.

The proposed project includes four proposed new fireworks display events, two of which would occur on the Fourth of July. The timing of the two proposed new non-Fourth of July displays is detailed in Table 3-1, which specifies that one display would occur from the months of January to

March, and one display would occur from October to December. Therefore, there would be no potential for the proposed new fireworks display events to occur on consecutive nights. In addition, Chapter 5, *Cumulative Impacts*, of the Draft EIR evaluated the potential impacts associated with the combined effects of the proposed new fireworks display events and the existing fireworks display events that currently occur in San Diego Bay. As discussed in Chapter 5, the implementation of MM-BIO-1 would ensure that fireworks-generated trash and debris are collected and disposed of, and MM-BIO-2 would ensure that indirect effects from increased boat traffic, trespass, and human-generated trash and debris are reduced. The implementation of these mitigation measures would reduce potential cumulative biological resources impacts to a level less than cumulatively considerable. Therefore, no changes to the Final EIR are required.

Response to Comment D-10

The comment generally states that the Draft EIR is lacking a thorough discussion of mitigation of unavoidable impacts, and suggests that mitigation be developed based on specific location, species, and habitat impacts.

As discussed in Section 4.3, *Biological Resources*, of the Draft EIR, all potentially significant impacts on biological resources would be reduced to a less than significant level with the implementation of mitigation measures. Therefore, the proposed project would not result in any significant and unavoidable impacts on biological resources. This comment does not suggest any specific location, habitat, or species and also does not identify any unavoidable impacts for which mitigation is lacking. Therefore, a specific response cannot be provided. No changes to the Final EIR are required.

Response to Comment D-11

The comment states that special attention be paid to sensitive species such as the California least tern, Western snowy plover, Belding's Savannah sparrow, Ridgeway's rail, sea turtles, and any others not previously listed.

Section 4.3, *Biological Resources*, of the Draft EIR identifies the individual protected, rare, sensitive, threatened, and endangered species as designated by USFWS, National Marine Fisheries Service, and CDFW that are expected to be present in San Diego Bay and the Imperial Beach Oceanfront. As discussed in Section 4.3 of the Draft EIR, four avian species listed by USFWS and/or CDFW as federally or state-listed as endangered or threatened have a high potential to occur within San Diego Bay and the Imperial Beach Oceanfront. These include California least tern, western snowy plover, light-footed Ridgeway's rail, and Belding's Savannah sparrow. Other sensitive avian species with a high potential to occur include California brown pelican and double-crested cormorant, as well as sensitive raptors such as osprey, northern harrier, and American peregrine falcon. In addition, Section 4.3 specifies that south San Diego Bay supports a population of eastern Pacific green sea turtles. The potential effects of the proposed project on these various species are analyzed under Thresholds 1 and 4 of Section 4.3 of the Draft EIR, which determined that all potentially significant impacts would be reduced to less than significant with the implementation of mitigation measures. No changes to the Final EIR are required.

Response to Comment D-12

This comment concludes the comment letter and provides a contact name and information.

The District appreciates the Coastal Commission's interest in the proposed project. This comment does not raise any issues requiring a response pursuant to CEQA.

Subject: Comments on the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project, City of San Diego, San Diego County, California (UPD No. EIR-2015-115; SCH No. 2015081013)

Dear Ms. Manaos:

The Department of Fish and Wildlife (Department) has reviewed the San Diego Unified Port District's (Port District's) San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (proposed project) Draft Environmental Impact Report (DEIR). The following statements and comments have been prepared pursuant to the Department's authority as Trustee Agency with jurisdiction over natural resources affected by the proposed project (California Environmental Quality Act, [CEQA] Guidelines § 15386) and pursuant to our authority as a Responsible Agency under CEQA Guidelines section 15381 over those aspects of the proposed project that come under the purview of the California Endangered Species Act (CESA; Fish and Game Code § 2050 *et seq.*) and Fish and Game Code section 1600 *et seq.*

The proposed project consists of (1) an ordinance establishing a Port District Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the Port District or that are operated by the Port District's tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the Port District. Existing fireworks display events are launched from barges, piers, and/or flight decks. The proposed new fireworks displays would occur year round and are anticipated to last between 3 to 10 minutes in duration for non-Fourth of July displays and 15 to 20 minutes for Fourth of July displays. The new fireworks displays are proposed to be launched from barges within the San Diego Bay, and would be governed by the proposed ordinance. All existing and proposed new fireworks display events that either require a discretionary action by the District or those operated by the District's tenants would be subject to all applicable federal, state, and local laws and regulations governing fireworks as well as any additional requirements set forth in the proposed ordinance.

E-1

E-1
cont. | The Department offers the following comments and recommendations to assist the Port District in avoiding, minimizing, and adequately mitigating project-related impacts to biological resources.

General Compatibility

E-2 | Given the concentration of biological resources within the project area, the San Diego Bay National Wildlife Refuge, the Sweetwater Marsh Refuge Unit, the South San Diego Bay Refuge Unit, and other conservation efforts including federal funding associated with National City and the south bay, the Department is concerned with the compatibility and appropriateness of adding fireworks displays to the south bay that have the potential to adversely impact the region's rich natural resources. The DEIR's analysis should carefully examine the need of the proposed expansion, and consider the mitigation and monitoring requirements necessary to protect south bay habitats and their residents.

San Diego Fireworks Display EIR Notes

E-3 | The DEIR should include an analysis of direct and indirect impacts to all avifauna nesting within National City and the south bay, including D-Street Fill, Sweetwater Marsh, F and G Street Marshes, J Street Marsh, Paradise Marsh, Chula Vista Wildlife Reserve, and Silver Strand State Beach. The analysis should focus on the area's importance as a regional and international site utilized for nesting, roosting, foraging, and as a migratory stopover within the Pacific Flyway for common and designated sensitive species. The proposed project areas, particularly those proposed within the vicinity of Ecological Refuges and other open spaces within the south bay, host thousands of resident and migratory birds that could be adversely impacted by the proposed project.

E-4 | The Department believes that based on the available literature including unpublished reports, and other limited publications, common and sensitive species including, but not limited to light-footed Ridgway's rail (*Rallus longirostris levipes*; a CESA and Endangered Species Act [ESA] endangered species, and a State Fully Protected Species [FPS] under Fish and Game Code § 3511); California least tern (*Sternula antillarum browni*; a CESA and ESA endangered species and FPS); Belding's savannah sparrow (*Passerculus sandwichensis beldingi*; a CESA endangered species); western snowy plover (*Charadrius alexandrinus nivosus*; ESA threatened species and a State Species of Special Concern [SSC]); black skimmer (*Rynchops niger*; a SSC); elegant tern (*Thalasseus elegans*); Caspian tern (*Hydroprogne caspia*); double-crested cormorant (*Phalacrocorax auritus*); northern harrier (*Circus cyaneus*; a SSC); and osprey (*Pandion haliaetus*) are likely to exhibit a physiologic response to fireworks-generated flash and noise. Page 4.3-28 of the DEIR identifies that "[t]he flash and noise from the proposed new fireworks display events are [emphasis added] expected to generate physiologic response of stress within birds." However, later in the DEIR it is concluded that "the proposed new fireworks display events are not anticipated to result in any long-term or permanent substantial adverse effects on avian species because temporary disturbance from noise and light would be short term and infrequent and would not result in direct mortality of birds, a decrease in productivity, or long-term changes in behavior (e.g., colony abandonment)" (Port District, 2017; p. 4.3-31), concluding that no significant impact would occur. The Department does not believe that the analysis provided in the DEIR adequately supports the conclusion that fireworks displays would not directly impact sensitive avian species throughout San Diego Bay and Imperial Beach. For example, while certain colonies (that are routinely exposed to loud noise) may not be abandoning nests or chicks, vocalizations, flushing behaviors, and other movements indicated that these birds were stressed by the fireworks displays and loud noises they produce (Port

E-4
cont.

District, 2017). It is unknown how the stress responses elicited from cumulative fireworks displays affect species' energy expenditure, their underlying health, or if the stress affects subsequent nesting attempts. The DEIR suggests that because they have not historically been exposed to continuous loud noise, south bay avian colonies could be comparatively more sensitive to fireworks displays. Additionally, while behavioral observations of California least terns and western snowy plovers in response to fireworks displays are scant, studies for light-footed Ridgway's rail and Belding's savannah sparrow do not exist. For these reasons, the Department continues to stress the importance that the project include a comprehensive mitigation strategy, including a robust monitoring protocol, that minimizes sensitive species' exposure by maximizing spatial buffers from the fireworks display source (e.g., barge, pier, etc.) and sensitive receptors (i.e., nesting and critical roosting and foraging grounds for avian species).

Monitoring

E-5

In our comments on the Notice of Preparation for the proposed project (September 8, 2015) we recommended that for sites likely affected by fireworks displays, a monitoring protocol be developed as part of a comprehensive mitigation strategy. The DEIR does not include a monitoring protocol as recommended. Given the data gaps regarding the effects of fireworks displays on sensitive avian species, the DEIR should include an adaptive management plan requiring ongoing monitoring of sensitive receptor sites for individual fireworks displays (e.g., known sensitive species nesting and/or roosting sites). The adaptive management plan should include specific mitigation strategies to further minimize impacts to sensitive receptors (e.g., increase buffer size, temporal restrictions, etc.) and measures to gradually reduce the ongoing monitoring (as a component of the adaptive management plan) should the monitoring demonstrate that the mitigation measures are successful. The Port District should confer with the Department to reduce the interval or intensity of ongoing monitoring requirements. The Department offers the monitoring recommendations below (adapted from U.S. Fish and Wildlife Service [Service] recommendations):

E-6

1. Sensitive habitats (e.g., nesting and roosting sites within 1.2 mile of the fireworks) including areas within the vicinity of where spectators may congregate should be surveyed by a qualified biologist prior to, during, and following the fireworks display. Where appropriate, and when less intrusive than direct observation, nest cameras may be used to monitor sites that have no terrestrial or aquatic access. Monitoring activities themselves should not result in undue harassment. At a minimum, monitors should record and/or perform the following:
 - a. site location, name of monitor, date and time of observations;
 - b. number of adults, nests, and chicks observed within ½ mile of spectator viewing areas;
 - c. species behavior prior to, during, and post fireworks displays;
 - d. sources of stressors (e.g., light, noise, trespass, debris);
 - e. foraging behavior no sooner than 48 hours prior to and no later than 24 hours following fireworks displays;
 - f. counts of human and dog tracks intersecting with symbolically fenced areas before and after the fireworks event;
 - g. counts of persons within access-controlled areas;
 - h. counts of litter items within symbolically fenced areas before and after the fireworks event;

- E-6 cont.
- i. counts of illegal pyrotechnics;
 - j. recommendations, as applicable, to further minimize physiologic response to fireworks displays (e.g., identify known, new, or persisting management needs). Monitoring observations should be evaluated by the Port District to increase buffer distances, further limit noise levels or other actions as appropriate.

- E-7
- The Port District should:
2. Provide monitoring data directly to the Department.
 3. Ensure sensitive habitats are symbolically fenced and posted off-limits during events. Conduct repairs to symbolic fencing of any damaged or missing sections of fencing prior to fireworks display permit issuance.
 4. Close parking lots and beach access points in the vicinity of sensitive resources, as appropriate.
 5. Provide adequate numbers of monitors and patrols (commensurate with anticipated number or spectators, and exposure/accessibility of sensitive resources) prior to spectators congregating and continuing until spectators disperse.
 6. Monitor noise at sensitive receptor sites.
 7. Ensure monitors and other enforcement personnel receive accurate information regarding the location of sensitive resources.
 8. Prohibit pets on beaches and within sensitive resource areas.

Compliance

E-8

Monitors should have direct communication with patrols (e.g., San Diego Harbor Police, law enforcement, and private security) to effectively prevent inadvertent and unauthorized impacts to sensitive biological receptors. The DEIR identifies that fireworks displays not only elicit a physiological reaction from sensitive avian species, but that there are additional indirect effects associated with trespass from spectators accessing beach and dune areas closed for breeding and roosting. The Department commends the Port District for increasing the Harbor Police Department presence during fireworks displays, and the DEIR should memorialize the following DEIR language as a mitigation measure of future fireworks display permits. "*Consistent with its current operational practices, the Harbor Police Department would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events*" (Port District, 2017; p. 4.3-33). Additionally, the Port District should coordinate with staff from the Harbor Police Department to determine the number of patrols necessary to protect biological resources and to identify specific/targeted enforcement areas of sensitive resources where unauthorized spectating (e.g., beach access or beaching/mooring) is prohibited.

Environmentally Superior Alternative

E-9

The DEIR is not clear how the Quiet Fireworks Display Alternative (e.g., Environmentally Superior Alternative) fails to meet the project objectives. Per the DEIR, "... the Quiet Fireworks Display Events Alternative would not meet the fundamental project objectives" (Port District, 2017; p. ES-10). Of the alternatives analyzed by the DEIR, the Quiet Fireworks Display Alternative best aligns with protecting sensitive natural resources within the immediate proximity of firework displays (e.g., known nesting sites for California least tern, light-footed Ridgway's rail, Belding's savannah sparrow, western snowy plovers, etc.). The DEIR describes four (4) project objectives.

E-10 **Objective one.** Objective one is to develop a Port District ordinance that establishes a Port District Code section with policies and performance standards, for fireworks display events that require a discretionary action by the Port District or those firework display events operated by the Port District's tenants. The Quiet Fireworks Display Alternative would not impede the District's ability to establish policies; conversely, it would assist the Port District by providing specific performance standards that are both measurable and enforceable.

E-11 **Objective two.** The Quiet Fireworks Alternative fulfills project objective two by allowing "...for the continued occurrence of traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach..." (Port District, 2017; p. 3-2). Furthermore, the Port District is presented with an opportunity to educate local communities regarding San Diego's unique biological resources and recognize the protective measures that the District and the community collectively take. Communal resources can foster a sense of hometown appreciation—achieving objective two by "...providing a popular and region-wide way to celebrate and express civic pride..." while also facilitating fireworks displays.

E-12 **Objective three.** Project objective three seeks to allow "...the continued occurrence of existing and future occurrence of proposed new traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach...." (Port District, 2017; p. 3-2). The Quiet Fireworks Alternative would not impede the occurrence of current or future fireworks displays and unequivocally "...considers the health, safety, and welfare of people, property, and the environment..." (Port District, 2017; p. 3-2).

E-13 **Objective four.** Finally, there is no evidence that the Quiet Fireworks Alternative fails to achieve project objective four, which aims "[t]o continue to enhance the visitor-serving experience of viewing fireworks display events from various vantage points around District tidelands by providing safe, high-quality fireworks display events using existing and new fireworks technologies as they become available" (Port District, 2017; p. 3-2). Nothing within the Quiet Fireworks Alternative suggests that access to fireworks displays would be limited beyond existing public safety, right of access, or other applicable restrictions.

E-14 Regardless of the selected project alternative, acousticians should be utilized to monitor the actual sound levels generated during these events in relationship to sensitive biological receptor sites. Point monitoring of sensitive biological receptors should be made a requirement for each firework display permit until it can be demonstrated that the existing or additional events do not adversely impact these receptor sites.

Alternative 3 – No Salute Fireworks Alternative

E-15 The Department appreciates the consideration of project alternatives intended to reduce the noise and light impacts to sensitive receptors, however, Alternative 3 allows fireworks that are equally loud as a typical 3-inch "salute". "The No Salute Fireworks Alternative would have the same characteristics as all of the fireworks display events that compose the proposed project, including the same total pounds of fireworks per event (as outlined in Table 3-2 in Chapter 3, *Project Description*), but would prohibit the use of salute fireworks and limit the noise produced by all fireworks during fireworks display events to a maximum of 140 dB" (Port District, 2017; p. ES-9). Under Alternative 3, fireworks noise would not be minimized below the typical salute fireworks the DEIR describes as being prohibited. As stated in the DEIR, salute fireworks are specifically designed to be loud and bright and "[w]hile the noise level of these fireworks varies by type, a typical linear (unweighted) peak noise level directly below a 3-inch salute exploding at

E-15
cont. | its normal altitude is 140 decibels (dB) (Journal of Pyrotechnics, Inc. 2012).” Therefore the effect of Alternative 3 only limits fireworks that exceed the typical noise generated by current fireworks and/or fireworks specifically labeled as salute fireworks.

Impacts to Nursery Sites

The proposed project has the potential to impact various nursery sites (i.e., avian nesting sites). Based on a literature review of relevant information, the U.S. Fish and Wildlife Service’s *Guidelines for Managing Fireworks in the Vicinity of Piping Plovers and Seabeach Amaranth on the U.S. Atlantic Coast* (USFWS, 1997) is a guidance document that evaluates impacts on tern species. Absent updated and site-specific information, the Service’s guidelines serve as the best available science for minimizing impacts to terns and plovers. With regard to selecting firework shell size, the Department’s literature review suggests a firework display’s impacts on avian species is associated the noise and light and not necessarily associated with the shell size of a given firework. Edits below suggest uncoupling firework shell size from the recommended avian buffer. To partially mitigate noise impacts to avian nesting and/or roosting sites the text of MM-NOI-1: *Implementation of Noise-related Conditions of the Proposed Ordinance* (p. ES-41) should be modified accordingly (deletions in ~~strikeout~~ and additions in **bold italics**):

MM-NOI-1: Implementation of Noise-Related Conditions of the Proposed Ordinance.

E-16 | The fireworks organizer and operator are required to comply with the following noise related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(e) Protection of Sensitive Species and Habitat. The following conditions shall apply to Fireworks Display Events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1.2) mile from any federally or state-listed avian species nesting **sites**:

1. Location. Fireworks display events shall be located not less than one **and two-tenths (1.2)** mile from any federally, ~~or~~ state-listed **or other sensitive** avian species nesting colony.
2. Salutes. Fireworks display events shall not use concussion type, non-color shells such as “salutes” or “reports” during the initial twenty-five percent (25 percent) of the duration of any display (e.g., within the first 5 minutes of a 20-minute display). **Concussion fireworks (e.g., Salutes or Reports) shall not to exceed 120 linear (unweighted) peak sound pressure level as measured directly under the shell burst occurring at its normal altitude, using a Type 1 sound measuring device with a free-field microphone at a height of 1 meter above the ground.**

Debris

E-17 | Despite Mitigation Measure MM-BIO-1, the proposed project could cause a considerable amount of plastic and other non-biodegradable materials to fall within San Diego Bay. Mitigation Measure MM-BIO-1 does not fully mitigate the potential for ingestion of firework byproducts that could harm green sea turtles, marine mammals, and/or avian species. Specifically, MM-BIO-1 (d)(2)(B) only prohibits fireworks with plastic casings or non-biodegradable inner components

E-17 cont. | exceeding five percent of the firework's mass (Port District, 2017; p. ES-16). The proposed addition of Chula Vista Bayfront firework displays alone could cause an additional 34.2 pounds of plastic and other non-biodegradable byproducts to fall directly within San Diego Bay¹. The DEIR should present the total amount of debris deposited within San Diego Bay that could be caused from existing fireworks shows, and newly proposed additions (e.g., National City and Chula Vista shows) within the DEIR. To the extent feasible, MM-BIO-1 should be revised to prohibit the use of non-biodegradable materials.

E-18 | Mitigation Measure MM-BIO-1(8), (9), and (10), and MM-WQ-1 should specify that collected firework-generated trash and debris should be weighed dry, not wet, to better achieve a proportional collection weight commensurate with the weight of introduced debris. Mitigation Measure MM-BIO-1(8), (9), and (10) should specify that weight criteria must be fulfilled using firework-generated debris only.

E-19 | To mitigate impacts associated with increased debris associated with boating activities and increased foot traffic (see Impact-BIO-3, Impact-BIO-4, Impact-BIO-8, and Impact-C-BIO-1) associated with spectators, Mitigation Measure MM-BIO-1 should require the fireworks organizer to collect incidental spectator-generated trash. To accomplish this, the Department recommends the following is incorporated in the DEIR as enforceable mitigation measures for future fireworks display permits:

E-20 | A) A refundable deposit fee, based on the number of anticipated spectators (e.g., per capita) paid by the fireworks organizer. The refundable deposit fee should be an inflation-adjusted amount to fund two Port District or respective City cleanup personnel, equipment (e.g., truck, boat, nets, bags, personal protection equipment, debris disposal fees, etc.) per 500 spectators. The refundable deposit should be released or prorated based on the Port District's and hosting-city's satisfaction with firework organizer's cleanup.

E-21 | B) To defray potential costs borne by the firework organizer and/or hosting-city, firework organizer and Port District shall implement Mitigation Measure MM-BIO-2(5) to include daily announcements through digital/social media in conjunction with physical signage and/or press releases. MM-BIO-2 should be revised to require educational programs for each event designed to minimize debris, and prohibit impacts to sensitive resources (e.g., nesting or roosting sites, green turtle foraging areas, and eel grass beds).

E-22 | C) While MM-BIO-2 requires a minimum of two "...professional security guards to direct persons away from and discourage trespass..." (Port District, 2017; p. ES-22) the number of required security guards should be based on the number of spectators, potential threat to sensitive areas (e.g., fenced vs. unfenced habitats) and mode of spectator access (e.g., land vs. aquatic, or both). Two security guards are inadequate for most locations and the DEIR does not specifically require boat patrols. MM-BIO-2 should be revised to provide security requirements based on site sensitivity and include provisions to increase Harbor Police patrols funded by the firework organizer and/or cooperating local agency.

¹ Based on the DEIR's Table ES-1 *Proposed New Fireworks Display Events Requiring a Future Discretionary Action by the District.*

Ms. Wileen Manaois
Real Estate Development Department, San Diego Unified Port District

Response to Comment E-1

This comment is an introductory comment that explains CDFW is providing recommendations to assist the District in avoiding, minimizing, and adequately mitigating project related impacts on biological resources. The comment states CDFW's authority as a Trustee Agency with jurisdiction over natural resources and a Responsible Agency under State CEQA Guidelines section 15381. The comment also summarizes the proposed project analyzed in the EIR.

The District appreciates CDFW's interest in the proposed project. This comment does not raise any issues needing a response pursuant to CEQA. The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment E-2

This comment notes that CDFW is concerned with the compatibility and appropriateness of adding fireworks displays to the south Bay that have the potential to affect the natural resources. The comment indicates that the Draft EIR should analyze the proposed expansion and consider mitigation requirements to protect the south Bay habitats and their residents.

The commenter has raised two points. The first is a recommendation to consider the need of the proposed expansion of fireworks shows to include new shows in the South Bay, and the second is to consider mitigation and monitoring requirements necessary to protect South Bay habitats and resident resources. It is not necessary under CEQA to evaluate the need for a proposed action, only the environmental effects of the action itself. As such, the Draft EIR does not address project need. Relative to evaluation of mitigation and monitoring necessary, the Draft EIR has reviewed the potential nature, scale, and severity of anticipated impacts associated with the considered actions, including adoption of the proposed ordinance. This is documented in Section 4.3, *Biological Resources*, of the Draft EIR. From this analysis, multiple impacts were identified that would be considered significant without mitigation. The Draft EIR goes on to identify mitigation measures suited to reducing the extent of impacts to a less-than-significant level. In addition, an MMRP is required to be implemented to monitor and report on the success of the mitigation. The MMRP is attached to the Final EIR.

Response to Comment E-3

This comment states that CDFW requests that the Draft EIR include an analysis of direct and indirect impacts on all avifauna nesting within National City and the south Bay. The comment indicates that the analysis should focus on the area's importance as a regional and international site utilized for nesting, roosting, and foraging, and as a migratory stopover within the Pacific Flyway for common and designated sensitive species.

The commenter raises concerns over the resident and migratory avian resources of the project area. This was discussed in Draft EIR and Appendix F, BTR. It was also raised in comments B-7, B-8, B-10 and B-11 by USFWS (Please refer to these responses). Marshlands, nesting areas, and other resource areas within proximity to the proposed new fireworks display events have been identified in Figure 4.3-2, as updated based on USFWS comments. These resource areas have been identified as habitat protection areas along with resource management areas such as designated and other nesting sites. Section 4.3, *Biological Resources*, of the Draft EIR evaluates impacts on these resources and the Pacific Flyway.

Response to Comment E-4

This comment states that CDFW believes that certain common and sensitive species are likely to exhibit a physiologic response to fireworks-generated flash and noise. The comment states that CDFW does not believe that the Draft EIR analysis adequately supports the conclusion that the fireworks displays would not directly impact sensitive avian species throughout San Diego Bay and Imperial Beach.

This comment states that it is unknown how the stress responses from cumulative fireworks display affect species energy expenditure, health, or if the stress affects subsequent nesting attempts. The comment notes that the Draft EIR suggests that because south Bay avian colonies have not historically been exposed to loud noise, the colonies could be comparatively more sensitive to fireworks displays. The comment states that CDFW continues to stress the importance that the project include a comprehensive mitigation strategy, including a robust monitoring protocol, that minimizes sensitive species' exposure by maximizing spatial buffers from the fireworks display source and sensitive receptors.

The Draft EIR analyzes the potential impacts related to physiological stress in birds, and indicates that the stress levels generated may be expected to vary from north to south in the Bay based on habituation to differing ambient conditions. The Draft EIR has also concluded that the extent of impact is anticipated to fall below a level of significance as defined under CEQA. The Draft EIR analyzes each of the identified impacts against thresholds of significance within Draft EIR Section 4.3.4.3. As described in Draft EIR Section 4.3.4.2, *Thresholds of Significance*, biological resources impacts would be considered significant if the proposed project would have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species, including sensitive avian species. Based on the information presented above, the proposed new fireworks display events may result in short-term and infrequent changes in behavior in sensitive avian species as a result of disturbance from fireworks. However, the proposed new fireworks display events are not anticipated to result in any long-term or permanent substantial adverse effects on avian species because temporary disturbance from noise and light would be short term and infrequent and would not result in direct mortality of birds, a decrease in productivity, or long-term changes in behavior (e.g., colony abandonment). As such, any temporary disturbance would not be considered a substantial adverse effect on a sensitive species. Therefore, as identified in Section 4.3, *Biological Resources*, of the Draft EIR, impacts would be less than significant.

The commenter raised concerns over how nesting birds may respond to cumulative fireworks displays. The biological resource expert retained by the District who assisted in preparation of the Draft EIR evaluated these concerns and determined as follows. The proposed project includes four proposed new fireworks display events, two of which would occur on the Fourth of July and the other two proposed new non-Fourth of July displays are identified as occurring between the months of January to March and between October to December. Therefore, there would not be a potential for accumulation of stress over time from repetitive shows.

The commenter further notes that while there are behavioral observations and studies for California least tern and western snowy plover with respect to response to fireworks, there are no such studies for Ridgeway's rail and Belding's savannah sparrow. This is true, but given that these species nest within vegetation screened nesting habitat and they are secretive at the nest site, they are less likely to exhibit detrimental stress responses than would be the case for birds that nest on open

ground and would thus be exposed to the full effects of light and noise associated with the fireworks events. The lack of information on secretive bird behavior is not taken as an indication of expanded concern for these species, but rather the species behavior would be expected to reduce potential concerns for detrimental effects rather than raise them.

Finally, in light of the concerns raised, CDFW recommended a comprehensive mitigation strategy that includes monitoring protocol. Section 4.3 of the Draft EIR provides a comprehensive mitigation strategy, which has been updated to include a clarifying mitigation measure requiring biological monitoring for the proposed new fireworks display events in south San Diego Bay (MM-BIO-4). It should be noted that all potentially significant impacts on biological resources were determined in the Draft EIR to be less than significant with the implementation of mitigation measures. The addition of the biological monitoring mitigation measure is suggested by USFWS and CDFW, which both have regulatory oversight of biological resources within San Diego Bay, and would not result in any changes to the determinations made in the Draft EIR. Changes to mitigation are included in Chapter 3, *Errata and Revisions*, of the Final EIR and are reflected in the project's MMRP.

Response to Comment E-5

The comment notes that CDFW recommended a monitoring protocol be developed as part of the comprehensive mitigation strategy. The comment indicates that CDFW recommends that an adaptive management plan requiring ongoing monitoring of sensitive receptor sites for individual fireworks displays that should include specific mitigation strategies to further minimize impacts on sensitive receptors and measures to gradually reduce the ongoing monitoring.

Please see response to comment E-4. Based on similar recommendations received during the public comment period, Section 4.3, *Biological Resources*, of the Draft EIR has been updated to include a clarifying mitigation measure requiring biological monitoring for the proposed new fireworks display events in south San Diego Bay (MM-BIO-4). The mitigation measures provided in the Draft EIR and the clarifying mitigation measure requiring biological monitoring provide an adaptive management plan as recommended in this comment. It should be noted that all potentially significant impacts on biological resources were determined in the Draft EIR to be less than significant with the implementation of mitigation measures. The addition of the biological monitoring mitigation measure is suggested by USFWS and CDFW, which both have regulatory oversight of biological resources within San Diego Bay, and would not result in any changes to the determinations made in the Draft EIR. Changes to mitigation are included in Chapter 3, *Errata and Revisions*, of the Final EIR and are reflected in the project's MMRP.

Response to Comment E-6

This comment indicates that sensitive habitats should be surveyed by a qualified biologist prior to, during, and following the fireworks display. Where appropriate, nest cameras may be used to monitor sites that have no terrestrial or aquatic access. CDFW provided a list of standards for the monitors.

Please see response to comment E-4, which added mitigation measure MM-BIO-4 to the EIR to address the suggested monitoring raised in this comment.

Response to Comment E-7

The comment notes that CDFW recommends that the District should (recommendation in italics and District's response follows):

2. Provide monitoring data to the CDFW

The District agrees with this recommendation and has incorporated this recommendation into Mitigation Measure MM-BIO-4. See Chapter 3, *Errata and Revisions*, of the Final EIR.

3. Ensure sensitive habitats are symbolically fenced and posted off limits during events

The comment does not define what is meant by a "symbolic fence." The District's biologist identifies that the installation of fencing would result in additional impacts on wildlife resources because it could serve as a predator perch and the installation and removal of fencing would result in increased noise and human disturbance within sensitive habitats. As identified in the EIR as part of Mitigation Measure MM-BIO-2, the fireworks organizer and operator are required to comply with the proposed ordinance, including Section X.07 Permits – Conditions of Approval, (e) Protection of Species and Habitat, which requires security, signage, and education for fireworks display events with public viewing areas within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas.

4. Close parking lots and beach access points in vicinity of sensitive resources

The closure of parking lots and beach access points within the coastal zone would result in adverse effects on public access, which is contrary to the California Coastal Act. Additionally it would result in the closure of desirable access areas for the fireworks displays event and has the potential to result in increased trespassing into existing non-accessible areas, which may result in greater impacts on sensitive habitat areas. Therefore, this recommendation has not been included in Mitigation Measure MM-BIO-4.

5. Provide adequate number of monitors and patrols

The implementation of Mitigation Measures MM-BIO-4, which includes monitoring and an adaptive management plan, will identify if additional security patrols is needed beyond the minimum of two professional security guards that are identified Mitigation Measure MM-BIO-2.

6. Monitor noise at sensitive receptor sites

The District agrees with this recommendation and has incorporated this into Mitigation Measure MM-BIO-4. See Chapter 3, *Errata and Revisions*, of the Final EIR.

7. Ensure monitors and other enforcement personnel receive accurate information regarding the location of sensitive resources

The District agrees with this recommendation and has incorporated this into Mitigation Measure MM-BIO-4. See Chapter 3, *Errata and Revisions*, of the Final EIR.

8. Prohibit pets on beaches and within sensitive resource areas

Existing laws, regulations, and applicable agreements adequately restrict unleashed pets on beaches, public parks, and sensitive habitat areas. Chula Vista Bayfront Master Plan Final EIR provides Domestic Animal Control Mitigation Measures (MM 4.8-6 and 4.8-7), which provide provisions to ensure that domestic pets within the Chula Vista Bayfront areas do not impact adjacent sensitive habitat areas. In addition Section 4.1.8 of the Chula Vista Bayfront Master Plan Settlement Agreement requires that all dogs be leashed in all areas of the proposed project at all times except in any designated and controlled off-leash areas. Furthermore, the National City Municipal Code Section 10.52.010 (d) requires owners to leash their dogs at all times within any City parks.

Response to Comment E-8

This comment indicates that monitors should have direct communication with patrols to effectively prevent inadvertent and unauthorized impacts on sensitive biological receptors. The comment states that the CDFW commends the Port District on coordinating with staff from HPD to determine the number of patrols necessary to protect biological resources and identify enforcement areas where unauthorized spectating is prohibited.

As discussed in Section 4.3, *Biological Resources*, of the Draft EIR, HPD currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units during existing fireworks display events (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, HPD would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. The District staff will continue to coordinate with HPD and U.S. Coast Guard, who are responsible for lawful boating practices in the Bay. In addition, MM-BIO-2 in Section 4.3 of the Draft EIR has been updated to include clarifying language to augment landside security patrols with in-water security patrols. This clarifying language is consistent with the analysis provided in the Draft EIR and current best practices.

In addition, implementation of Mitigation Measure MM-BIO-4, which includes avian nesting colonies monitoring, will identify if additional security patrols are needed beyond the minimum of two professional security guards that are identified Mitigation Measure MM-BIO-2. The monitors will have direct contact with HPD as needed to prevent inadvertent and unauthorized access.

This clarifying language is included in Chapter 3, *Errata and Revisions*, of the Final EIR and is reflected in the project's MMRP.

Response to Comment E-9

This comment states the author's opinion that it is unclear how the Quiet Fireworks Display Alternative fails to meet the project objectives and that it is the alternative that best aligns with protecting sensitive natural resources within the immediate proximity of fireworks displays. This comment is an introduction to the specific issues raised in comments E-12 through E-15, which are addressed in the responses to those comments below. No further response to this comment is necessary.

Response to Comment E-10

This comment summarizes Objective # 1 of the proposed project and states the Quiet Fireworks Display Alternative would not impede the achievement of this objective. The comment agrees with the conclusion reached in the Draft EIR, which states: “The Quiet Fireworks Display Alternative would meet Objectives # 1 and # 3 because it would include adoption of an ordinance that would establish policies and performance standards that would be applied to fireworks display events occurring in and around San Diego Bay and the Pacific Ocean near Imperial Beach” (Draft EIR, Section 7.5.2.12, p. 7-14). Therefore, no further response is required.

Response to Comment E-11

This comment states the Quiet Fireworks Display Alternative fulfills Objective # 2 by allowing the continued occurrence of traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach. The comment disagrees with the Draft EIR’s determination that the Quiet Fireworks Display Alternative would not meet the portion of Objective # 2 regarding the continuation of traditional fireworks displays. As discussed more fully in the Draft EIR, traditional fireworks displays are defined by the U.S. Department of Alcohol, Tobacco, Firearms and Explosives as large fireworks that are designed to produce visible or audible effects by combustion, deflagration or detonation and typically include fireworks such as salutes and aerial shells (Draft EIR, Section 3.2, p. 3-2, footnote 1). The Quiet Fireworks Display Alternative would not allow the continuance of traditional fireworks displays because the type of fireworks used in this alternative would not achieve the same heights and sounds as the fireworks used in traditional Fourth of July and other celebrations (Draft EIR, Section 7.5.2.12, p. 7-15). The Quiet Fireworks Display Events Alternative was intended to reduce the loud noises associated with traditional fireworks display events by eliminating the loud fireworks, including but not limited to salute fireworks, used in traditional fireworks displays, which are designed to provide entertainment value by making loud noises and intense flashes of light. Unlike traditional fireworks displays, the Quiet Fireworks Display Events Alternative would involve fireworks that are concentrated closer to the ground with fewer aerial shells being employed due to the loud noise that can occur during propulsion of an aerial shell (Draft EIR, Section 7.4.2.2, pp. 7-6-7-7; see also Draft EIR Section 3.3.3, pp. 3-7-3-8 [Description of Pyrotechnic Devices]). For these reasons, the Draft EIR concluded the Quiet Fireworks Display Alternative would not fulfill that portion of Objective # 2 to allow the continued occurrence of traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach.

This comment next states the District is presented with an opportunity to educate local communities regarding San Diego’s unique biological resources and recognize protective measures the District and the community can take. The District agrees with this comment. The unique biological resources in the project area are discussed in detail in Section 4.3, *Biological Resources*, of the Draft EIR, and the educational and protective measures the District, the fireworks organizers, fireworks operators and others in the community can take are set forth in the conditions of approval required by the proposed ordinance, which are specifically intended to protect biological resources in the project area (see Draft EIR, Appendix D, Proposed Fireworks Display Ordinance, Section X.07, subdivisions (a) – (k)). The conditions of approval in the proposed ordinance that address the potential impacts of the proposed new fireworks display events in National City and Chula Vista on biological resources are discussed and recommended in the Draft EIR as Mitigation Measure BIO-1, BIO-2 and BIO-3 (Draft EIR, Section 4.3, pp. 4.3-41-45, 51).

Lastly, this comment states the Quiet Fireworks Display Alternative can achieve the portion of Objective # 2, which refers to fireworks displays as “providing a popular and region-wide way to celebrate and express civic pride.” The comment agrees with the Draft EIR’s determination that the Quiet Fireworks Display Alternative would partially meet Objective # 2 because fireworks display events would provide a popular and region-wide way to celebrate and express civic pride (Draft EIR, Section 7.5.2.12, p. 7-15). Therefore, no further response is required.

Response to Comment E-12

This comment summarizes Objective # 3 of the proposed project and states the Quiet Fireworks Display Alternative would not impede the achievement of this objective. The Quiet Fireworks Display Alternative would allow the continued occurrence of fireworks display events in and around San Diego Bay and near Imperial Beach in a manner that considers the health, safety, and welfare of people, property, and the environment. However, this alternative would not allow traditional fireworks display events, which are designed to produce substantial visible or audible effects that involve loud noises and intense flashes of light (Draft EIR, Section 3.2, p. 3-2, footnote 1). The Quiet Fireworks Display Alternative would differ significantly from traditional fireworks display events because it would not achieve the same heights and sounds as the fireworks used in traditional Fourth of July and other celebrations. Unlike traditional fireworks displays, the Quiet Fireworks Display Events Alternative would involve fireworks that are concentrated closer to the ground with fewer aerial shells being employed due to the loud noise that can occur during propulsion of an aerial shell (Draft EIR, Section 7.4.2.2, pp. 7-6–7-7; see also Draft EIR, Section 3.3.3, pp. 3-7–3-8 [Description of Pyrotechnic Devices]). The Draft EIR will be revised to reflect that the Quiet Fireworks Display Alternative would partially fulfill Objective # 3 (Draft EIR, Section 7.5.2.12, pp. 7-14–7-15).

Response to Comment E-13

This comment states there is no evidence that the Quiet Fireworks Display Alternative fails to achieve Objective # 4 and that nothing within this alternative suggests that access to fireworks displays would be limited beyond existing public safety, right of access, or other applicable restrictions. Objective # 4 states the proposed project is intended “to continue and enhance the visitor-serving experience of viewing fireworks display events from various vantage points around District tidelands by providing safe, high-quality fireworks display events using existing and new fireworks technologies as they become available” (Draft EIR, Section 7.3, p. 7-2). The comment disagrees with the Draft EIR, which determined the Quiet Fireworks Display Alternative would not meet Objective # 4 because it would be concentrated lower to the ground and, as such, it would limit the vantage points from which fireworks display events would be visible and would decrease the number of spectators that would be able to view the events (Draft EIR, Section 7.5.2.12, p. 7-15). This determination was based on additional information provided in the Draft EIR, which explained that the Quiet Fireworks Display Events Alternative was intended to reduce the loud noises associated with traditional fireworks display events by eliminating the use of loud fireworks, including but not limited to salute fireworks, which are designed to make a very loud bang and an intense flash of light, and instead focus on rich color effects and tight visual choreography in order to provide similar entertainment value. The Draft EIR further explained that the fireworks used in the Quiet Fireworks Display Events Alternative would “include fountains, wheels, cakes (such as cassettes, comets, spinners or turbillions, colored stars, fish or bees, and falling leaves), Chinese lanterns, and lanceworks (United Kingdom Fireworks Review 2016).” In addition, the Quiet

Fireworks Display Events Alternative would involve fireworks that are concentrated closer to the ground with fewer aerial shells being employed due to the loud noise that can occur during propulsion of an aerial shell (Draft EIR, Section 3.3.3, p. 3-8 [Low-Level Fireworks Devices, Set Piece/Ground-Level Fireworks]). Because the Quiet Fireworks Display Events Alternative would rely on fireworks that do not achieve the same heights or the same magnitude of traditional fireworks, they would not be as visible and the viewing area would be smaller than that which exists for the proposed project (Draft EIR, Section 7.4.2.2, pp. 7-6–7-7).

The Quiet Fireworks Display Events Alternative would require the proposed new fireworks display events along the Chula Vista and National City bayfronts to be quiet fireworks display events that would not exceed a noise limit of 120 dBA.¹ For this type of fireworks display event, the pyrotechnicians design a fireworks package that relies on the quieter types of fireworks. These fireworks display events would result in less noise impacts than the proposed project.

Response to Comment E-14

This comment notes that point monitoring of sensitive biological receptors should be made a requirement for each firework display permit until it can be demonstrated that the existing or additional events do not adversely impact these receptor sites.

As identified above in response to comment E-5, the EIR has been updated to include a clarifying mitigation measure requiring biological monitoring for the proposed new fireworks display events in south San Diego Bay (MM-BIO-4). The recommendation to conduct noise monitoring during monitoring of sensitive biological receptors has been included in Mitigation Measure MM-BIO-4. See Chapter 3, *Errata and Revisions*, of the Final EIR. As part of this plan, at least one of the biological observers/monitors will be trained to operate a sound level meter and conduct point monitoring of actual sound levels at sensitive biological receptors.

Response to Comment E-15

This comment states that CDFW appreciates the consideration of project alternatives intended to reduce the noise and light impacts on sensitive receptors, however, Alternative 3 allows fireworks that are equally loud as a typical 3-inch “salute.” This alternative would have the same characteristics as all of the fireworks display events that compose the proposed project, including the same total pounds of fireworks per event, but would prohibit the use of salute fireworks and limit the noise produced by all fireworks during fireworks display events to a maximum of 140 dB. The effect of Alternative 3 only limits fireworks that exceed the typical noise generated by current fireworks and/or fireworks specifically labeled as salute fireworks.

Because “salute” (also known as “maroon”) fireworks are specifically designed to have a loud report, this type of firework is explicitly prohibited under the No Salutes Alternative, regardless of specific noise level. Fireworks that are not categorized as salutes would typically be noticeably quieter than salutes. Nonetheless, the 140 dB limit was included to avoid any unusually loud non-salute fireworks. The analysis of the No Salute Alternative concludes that “...noise impacts would be reduced under this alternative. However, it is expected that significant and unavoidable impacts related to substantial temporary or periodic increases in ambient noise levels would still occur,

¹ 120 dB maximum A-weighted impulse sound pressure level as measured at a horizontal distance of 15 meters from the testing point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.

particularly during the Fourth of July fireworks display events. Overall, this alternative would result in reduced noise impacts compared to the proposed project” (Draft EIR, Section 7.5.3.8, p. 7-17). As noted in response to comment D-5, the noise limit under the No Salute Fireworks Alternative has been reduced in the Final EIR to “130 dB linear (unweighted) peak sound pressure level due to the firework break(s), as measured at a horizontal distance of 15 meters from the launch point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.” Reducing the 140 dB limit to 130 dB could further reduce noise impacts under this alternative, however it would not reduce noise impacts to less-than-significant levels and the conclusion of the analysis for the No Salute Alternative would not change. Therefore, no changes have been made to the EIR in response to this comment.

Response to Comment E-16

This comment notes that, with regard to shell size, CDFW’s literature review suggests a firework display’s impacts on avian species is associated with noise and light and not necessarily associated with the shell size of a given firework.

The District disagrees with this comment. It is noted in Section 3.3.3, *Description of Pyrotechnic Devices*, of the Draft EIR that increased fireworks shell size does correlate to greater impacts associated with noise and light. As noted in response to comment B-31, USFWS agreed that reducing shell size also reduces impacts on sensitive species.

Additionally, this comment notes that the proposed project has the potential to affect various nursery sites (i.e., avian nesting sites). The comment recommends that MM-NOI-1 be changed in four ways:

1. Increasing the exclusion distance from between fireworks and federally or state-listed avian species nesting sites, from 1 mile to 1.2 mile.
2. Revising “nesting colonies to “nesting sites.”
3. Broadening the nesting colony definition (from “state-listed avian species” to “state-listed or other sensitive avian species”).
4. Adding the following condition to the proposed ordinance: “Concussion fireworks (e.g., Salutes or Reports) shall not to exceed 120 linear (unweighted) peak sound pressure level as measured directly under the shell burst occurring at its normal altitude, using a Type 1 sound measuring device with a free-field microphone at a height of 1 meter above the ground.”

Draft EIR Section 4.3, *Biological Resources*, and Appendix F, BTR, provide a summary of substantial evidence of potentially significant wildlife impacts from fireworks displays, and includes extracts from a number of documents, including, among others, *Guidelines for Managing Fireworks in the Vicinity of Piping Plovers at Sea Beach Amaranth on the U.S. Atlantic Coast* (USFWS 1997).

Additionally, the Draft EIR and proposed ordinance include measures to avoid direct and indirect impacts on nursery sites, and special-status avian species in particular. Fireworks organizers and operators will implement mitigation measures to attenuate noise and reduce impacts on avian nesting sites, including MM-BIO-1, MM-BIO-2, and MM-NOI-1.

The comment references USFWS’s *Guidelines for Managing Fireworks in the Vicinity of Piping Plovers and Seabeach Amaranth on the U.S. Atlantic Coast* (USFWS 1997) and states that these guidelines serve as the best available science for minimizing impacts on least terns and plovers. The biological resource expert retained by the District reviewed this document and determined that the mitigation

measures recommended in the Draft EIR will reduce significant impacts on avian species to a level below significance. These mitigation measures were developed based on comments previously received by USFWS concerning the NOP for the Draft EIR, inclusive of a minimum 1-mile buffer from the nearest least tern and snowy plover nesting site. Although the changes to MM-NOI-1 proposed in the comment may further reduce potential impacts, no additional mitigation is required under CEQA once significant impacts are reduced below a level of significance. Since the additional mitigation proposed in this comment is not needed to reduce impacts below a level of significance, no changes will be made to MM-NOI-1.

In conclusion, no revisions to the Draft EIR have been made in response to this comment. However, as identified in above in response to comment E-5, the Draft EIR has been updated to include a clarifying mitigation measure requiring biological monitoring for the proposed new fireworks display events in south San Diego Bay (MM-BIO-4). The recommendation to conduct noise monitoring during monitoring of sensitive biological receptors has been included in Mitigation Measure MM-BIO-4. See Chapter 3, *Errata and Revisions*, of the Final EIR. Therefore, with the implementation of MM-BIO-4, if it is determined that MM-NOI-1 needs to be adapted based on the result of the monitoring, the District will revise the mitigation measure and condition of the proposed ordinance for fireworks display events that would occur along the National City and Chula Vista Bayfronts.

Response to Comment E-17

This comment states that despite MM-BIO-1, the proposed project could cause a considerable amount of plastic and other non-biodegradable materials to fall within San Diego Bay. MM-BIO-1 does not fully mitigate the potential for ingestion of firework byproducts that could harm green sea turtles, marine mammals, and/or avian species. The Draft EIR should present the total amount of debris deposited within San Diego Bay that could be caused from existing fireworks shows, and newly proposed additions, and MM-BIO-1 should be revised to prohibit the use of non-biodegradable materials.

The Draft EIR analyzes the potential impact on biological resources from fireworks trash and debris and concluded that such impacts would be significant. As a result, the Draft EIR recommends MM-BIO-1 to reduce the amount of non-biodegradable fireworks trash and debris that may fall into the Bay. MM-BIO-1 requires a series of packaging limitations and best management practices designed to prevent fireworks trash and debris from entering the Bay and to clean up and remove from the Bay an amount of trash equivalent to that which could result from the proposed fireworks displays. Although the comment asserts that MM-BIO-1 does not fully mitigate the potential for ingestion of fireworks by-products by affected species, based on the BTR (Appendix F) the Draft EIR concluded that MM-BIO-1 will reduce the potential impacts to a level below significance.

Response to Comment E-18

This comment states that MM-BIO-1 and MM-WQ-1 should specify that collected firework-generated trash and debris should be weighed dry, not wet, to better achieve a proportional collection weight commensurate with the weight of introduced debris, and that MM-BIO-1 should specify that weight criteria must be fulfilled using firework-generated debris only.

In response to the comment, Mitigation Measure MM-WQ-1 has been revised as follows:

10. Within ~~five~~¹⁰ (5-10) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the dry weight of the fireworks trash and debris collected is less than fifty percent (50%) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.

Changes to mitigation are included in Chapter 3, *Errata and Revisions*, of the Final EIR and are reflected in the project's MMRP.

In response to the last sentence of the comment "Mitigation Measure MM-BIO-1(8), (9), and (10) should specify that weight criteria must be fulfilled using firework-generated debris only," to clarify, condition (8) and (9) would occur the morning after the fireworks display event and would focus on picking up fireworks trash and debris. As identified in the EIR, MM-BIO-1 and MM-WQ-1 would ensure that fireworks-generated debris is properly cleaned up and disposed of, thereby reducing the amount of unrecovered fireworks debris that could create or contribute substantial additional sources of polluted runoff and substantially degrade water quality. However, as identified in the EIR, uncontrollable factors such as weather conditions, amount of paper incinerated, sunken material, or material that is blown onto land may affect the ability to recover all post-show debris related to fireworks on surface waters (Draft EIR, Section 4.6.4.3, pp. 4.6-36). Therefore, due to these uncontrollable factors, condition (10) was included to provide an additional debris clean-up efforts in the event the fireworks organizer is unable to recover the required amount of trash and debris to meet the requirements of the condition. Condition (10) is not limited to fireworks trash and debris because "Operation Clean Sweep" occurs weeks after many of the allowed fireworks display events have occurred and CEQA specifically allows mitigation that compensates for an impact by replacing or providing a substitute approach or that rectifies an impact by restoring the affected environment. No revisions to the Final EIR or MM-BIO-1 were made in response to this comment.

Response to Comment E-19

This comment indicates that MM-BIO-1 should require the fireworks organizer to collect incidental spectator-generated trash to mitigate for Impact BIO-3, Impact BIO-4, Impact BIO-8 and Impact C-BIO-1. To accomplish this, CDFW recommends additional mitigation measures for future fireworks display permits. The Draft EIR determined that Impact BIO-3, Impact BIO-4, Impact BIO-8 and Impact C-BIO-1 would be mitigated to a level below significance by the implementation of MM-BIO-1. Once a significant impact has been mitigated to a level below significance, CEQA does not require a lead agency to adopt additional mitigation measures. Therefore, although the additional mitigation proposed in the comment is not necessary or required, a response to each suggested recommendation is provided below in responses to comments E-20 through E-22 for informational purposes.

Response to Comment E-20

This comment states that a refundable deposit fee, based on the number of spectators should be paid by the fireworks organizer. The refundable deposit fee should be an inflation-adjusted amount

to fund two Port District or respective City cleanup personnel, equipment per 500 spectators, and the refundable deposit should be released or prorated based on the Port District's and hosting city's satisfaction with firework organizer's cleanup.

As part of the District's existing special event process, the District provides additional clean-up efforts for any special events including publicly advertised firework display events such as the Fourth of July fireworks display events that utilized Port tideland parks as public viewing areas. The comment does not provide supporting evidence for the need of the refundable deposit fee in order to further reduce impacts on biological resources. Therefore, this change has not been made in the EIR.

Response to Comment E-21

This comment indicates that the District should include daily announcements through digital/social media in conjunction with physical signage and/or press releases and recommends that MM-BIO-2 should be revised to require educational programs for each event designed to minimize debris, and prohibit impacts on sensitive resources. MM-BIO-2 is revised as follows:

5. **Education.** Beginning not less than seven (7) days before fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall implement a public education program using daily announcements on social media, press releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to reminds viewers of appropriate viewing behavior in and near sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).

Changes to mitigation are included in Chapter 3, *Errata and Revisions*, of the Final EIR and are reflected in the project's MMRP.

Response to Comment E-22

This comment states that the number of security guards are inadequate for most locations and the Draft EIR does not specifically require boat patrols. CDFW recommends that MM-BIO-2 should be revised to provide security requirements based on site sensitivity and include provisions to increase HPD patrols funded by the firework organizer and/or cooperating local agency.

Please see response to comment D-7 related to CDFW's recommendation for additional patrol. The implementation of Mitigation Measures MM-BIO-4, which includes monitoring and an adaptive management plan, will identify if additional security patrols are needed beyond the minimum of two professional security guards that are required by Mitigation Measure MM-BIO-2.

Response to Comment E-23

This comments states that CDFW appreciates the opportunity to comment on the Draft EIR.

The District appreciates CDFW's interest in the proposed project. This comment does not raise any environmental issues needing a response pursuant to CEQA.

Re: **Draft Environmental Impact Report Fireworks Display Events Project**
CERF Comments Regarding Inadequacy of CEQA Review

Dear Ms. Manaois:

F-1 Please accept these comments on behalf of the Coastal Environmental Rights Foundation (CERF) in regard to the San Diego Unified Port District (“Port”) Draft Environmental Impact Report (“DEIR”) for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (“Project”). CERF is a nonprofit environmental organization founded by surfers in North San Diego County and active throughout California’s coastal communities. CERF was established to aggressively advocate, including through litigation, for the protection and enhancement of coastal natural resources and the quality of life for coastal residents.

For years, CERF has played a key role in addressing and challenging various unlawful firework events in the region. On numerous occasions CERF has notified the Port of its regulatory obligations with respect to fireworks event approvals, including CEQA review. While the Port’s commitment to conduct CEQA review now is a step in the right direction, the DEIR itself lacks the requisite analysis and mitigation measures. As detailed below, unless these issues are addressed, the DEIR will remain legally deficient.

A. The Project Will Result in Significant Water Quality Impacts

F-2 San Diego Bay is listed as impaired for numerous constituents, including many commonly associated with fireworks. The entire Bay is listed for PCBs, while segments of the Bay are listed as impaired for copper, zinc, mercury, benthic community effects, sediment toxicity, bacteria, PAHs, and chlordanes. (See DEIR, pp. 4.6-9-10). To assess the Project’s water quality impacts, including the potential to “further affect” impaired water bodies, the DEIR relies on Big Bay Boom monitoring data. The DEIR’s analysis is flawed in numerous respects.

F-3 First, the DEIR incorrectly notes for 2016, “two fireworks barges...collected samples immediately (within 1 to 2 minutes) following the end of the fireworks display event.” (DEIR, p. 4.6-22; see also, p. 4.6-23, Table 4.6-6). However, the 2016 Big Bay Boom Water Quality Monitoring Report reveals: “The 0-foot distance sample next to the barge was collected using an auto sampler tied to the side of the barge. **Sample collection at this location commenced approximately 5-minutes prior to the conclusion of the fireworks show.**” (2016 Big Bay Boom Water Quality Monitoring Report, p. 2, footnote 2, emphasis added). Because the final five minutes of the fireworks event represent the most concentrated discharge of pollutants (“the finale”) the samples taken prior to the finale do not accurately reflect water quality impacts.

F-4 Then, based on an analysis of limited SeaWorld and Big Bay Boom monitoring data, the DEIR concludes “the proposed new fireworks display events would not violate any water quality standards or waste discharge requirements, and potential impacts would be less than significant.” (DEIR, p. 4.6-29). The Big Bay Boom sampling data does not support such a conclusion. Rather, the sampling data indicates prevalent water quality exceedances for copper.

F-5 For example, in 2014, two out of three post-event total copper samples exceeded the California Toxics Rule (CTR) and were higher post-event. (2014 Big Bay Boom Water Quality Monitoring Report, Appendix A). That same year, all dissolved copper samples were higher post-event. (*Id.*). In 2015, the monitoring data revealed CTR exceedances for all pre- and post-event dissolved copper samples.¹ (2015 Big Bay Boom Post Event Report and Monitoring Data, p. A-1). Lastly, despite the fact that some of the samples were taken prior to the finale, the 2016 samples similarly showed copper exceedances. Nearly half of the 32 samples showed CTR exceedances for copper, and the Seaport Village zero foot post-event samples were nearly double those of the pre-event samples. (2016 Big Bay Boom Water Quality Monitoring Report, Appendix A). In summary, the Big Bay Boom data – though limited and imperfect – reveals fireworks do result in appreciable copper discharges to receiving waters. Because San Diego Bay is already impaired for copper, any additional amount of copper (no matter how slight) in fireworks discharge residue would contribute to an exceedance of an applicable water quality standard (i.e. the CTR). (See MS4 Permit, § II.2.a.; General Fireworks Permit, § IV.A. and B.).

F-6 In addition, the Regional Board concluded larger firework events result in levels of pollutants such as arsenic, copper, mercury, tin, zinc and phosphorous above water quality criteria and that the “discharge of pollutants associated with larger fireworks events has the reasonable potential to cause or contribute to an exceedance of the narrative sediment quality objectives stated in section VI.A.3.c of the [Final Permit].” (General Fireworks Permit, p. F-17). Larger fireworks events include Fourth of July events – not just the Big Bay Boom.

F-7 Thus, the DEIR’s conclusion that new fireworks events will not violate water quality standards or waste discharge requirements is contrary to existing evidence. Likewise, the finding that the proposed ordinance – which enables fireworks events such as the Big Bay Boom – would not result in water quality impacts is directly undermined by the aforementioned data.

F-8 The DEIR’s reliance on mitigation measure WQ-1 does not reduce such impacts to a less than significant level. (*Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1168 [finding no evidence that GHG reduction measures would function as enforceable and effective mitigation measures]; see *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1116 [“We agree with appellants that there is no substantial evidence that the mitigation measures are feasible or effective in remedying the potentially significant problem of decline in water levels of neighboring wells.”]).

F-9 Operation Clean Sweep, a once-per-year clean-up conducted in late August, neither addresses the temporal water quality impact caused by the majority of debris from year-round fireworks shows or bears any discernable relation to the type and scale of the impact caused by fireworks debris.

¹ The DEIR address only dissolved copper monitoring data. (See, DEIR, Figure 4.6-2). However, Big Bay Boom sampling included total copper as well. Applying the California Toxics Rule conversion factor for the saltwater total recoverable fraction (.83), the total/unfiltered copper data can be analyzed as well. (See 40 C.F.R. §131.38 (b)(2) notes).

F-9
cont.

Amec Foster Wheeler (2016) indicates that the weight of the debris recovered from the detonation barges combined with the dry weight of the debris collected from the surrounding waters should equal approximately one-half of the total display weight. **Therefore, if the total weight of recovered debris is less than this, it can be assumed that this unaccounted portion remains in the water and surrounding habitat.**

Based on the trash generation percentages described above, it can be assumed that approximately 228 pounds of debris would be generated by each of the proposed new Fourth of July fireworks display events and approximately 57 pounds of debris would be generated by each of the proposed new non-Fourth of July displays, some of which may remain in the water following the display and **potentially degrade sensitive habitats or wetlands within the south Bay.**

(Appendix F, pp. 29-30, emphasis added).

As reflected in the post-event monitoring reports for all major firework events under the General Fireworks Permit, no dischargers come close to retrieving 50 percent of the total weight of aerial fireworks shells and the required General Fireworks Permit BMPs are generally ineffective in mitigating impacts from fireworks debris.² (See Appendix F, Biological Technical Study p. 29; see also, Enclosure). As a result, significant amounts of debris will result in continuing impacts to water quality which have not been adequately addressed in the DEIR.

B. The Project Will Result in Significant Wildlife Impacts

F-10

As noted by the wildlife agencies, Chula Vista bayfront fireworks will likely result in significant wildlife impacts. "The Carlsbad Fish and Wildlife Office has previously recommended, and continues to recommend that the no fireworks displays occur within the Chula Vista Bayfront during the avian breeding season (generally January-September) due to the close proximity to the abundance of sensitive wildlife resources that occur within and around the Sweetwater National Wildlife Refuge, the South San Diego Bay National Wildlife Refuge (Wildlife Refuges), and the Chula Vista Wildlife Reserve." (US FWS NOP Comments, p. 3). The DEIR fails to adequately address the wildlife agency concerns, offering minimal restrictions within the proposed ordinance. Most notably, restriction of concussion salutes during the initial 25 percent of a display fails to ensure the *remainder* of the display will not result in significant impacts. (See DEIR, p. 4.8–27).

F-11

Likewise, the DEIR fails to substantiate how required eelgrass surveys and potential resultant mitigation will account for fireworks-related impacts. (Appendix D, p. 10; Appendix F, p. 31). Even direct, physical habitat destruction from tugboats and barges will not be evident through simple spatial surveys, much less impacts due to fireworks residue and debris deposition. Long-term impacts to eelgrass due to such deposition within sensitive habitat will therefore remain significant and unmitigated.

² See enclosed debris management summary. The Del Mar Fairgrounds, with a substantial portion of the fireworks deposition area over land, has historically retrieved far more debris than the Big Bay Boom. In the best year, only 35 percent of total weight was successfully retrieved.

C. The DEIR's Failure to Analyze VMT-Related Impacts Violates CEQA

F-12 | The DEIR fails to analyze both air quality impacts and greenhouse gas emissions associated with the Project's visitor traffic, ostensibly because "regional traffic patterns related to the fireworks display events cannot be accurately analyzed because of the limitations of traffic modeling and uniqueness of the events." (DEIR, pp. 4.2-24; 4.4-17-18). The is entirely improper.

F-13 | "Drafting an EIR or preparing a negative declaration necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can." (14 Cal. Code Regs. §15144). As the lead agency performing the environmental analysis, the Port sits as the trier of fact and there is "no rule of law that allows an agency to escape that responsibility simply because the factual question is difficult." (*Poet, LLC v. State Air Resources Board* (Cal. Ct. App., Apr. 10, 2017, No. F073340) 2017 WL 1325296, at *17). Though perfection in evaluation of environmental effects is not required, the Port must analyze what is "reasonably feasible" and provide "adequacy, completeness, and a good faith effort at full disclosure." (14 Cal. Code Regs. §15151).

F-14 | Appendix J, the Traffic Assessment, concludes "Since it is difficult to assess what transportation related impacts are associated with the actual fireworks display event and what impacts are associated with the Fourth of July holiday, specific travel related impacts cannot be assessed through a conventional traffic impact analysis approach, which would include intersection and roadway level of service analyses." (Appendix J, p. 6). However, Big Bay Boom proponents have consistently boasted massive attendance and Port tidelands activation as a direct result of the fireworks displays.³ Reports of Big Bay Boom traffic impacts and traffic planning are ubiquitous.⁴ Big Bay Boom sponsors themselves acknowledge traffic impacts of the event and strongly suggest spectators take public transit because of traffic impacts, although pre-purchased, reserved parking is available for the event.⁵ The Port itself offers free shuttle service for spectators until 11 PM.⁶

F-15 | The Big Bay Boom is featured as an event that "activates" Port Tidelands and is specifically meant to "bring business to the Port Tenants."⁷ Indeed, the first few criteria for evaluating Port Tidelands Activation Program grant recipients include "[t]he number of people the event will attract to the Port Tidelands" and "[t]he ability of the event to...[a]ttract diverse visitors and demographics

3

<http://www.procopio.com/articles/view/procopio-attorneys-successfully-defend-san-diego-bay-fireworks-display> ["As one of the largest pyrotechnic displays in the nation, the "Big Bay Boom" draws 750,000 people each year..."]

⁴ <http://www.nbcsandiego.com/news/local/Big-Bay-Boom-Transportation-Parking-385242631.html> ["San Diego's biggest 4th of July fireworks show, the Big Bay Boom, goes down Monday, and is expected to draw up to a half-million patriotic spectators. With that large of a crowd, organizers of the Port of San Diego's 16th annual Big Bay Boom urge visitors to use public transportation to get to the big event, including the MTS trolley and buses."]

⁵ <https://www.bigbayboom.com/locations/transportation/> and <https://www.bigbayboom.com/locations/guaranteed-san-diego-bay-parking/>

⁶ <https://www.bigbayboom.com/locations/harbor-island/>

⁷ <https://www.bigbayboom.com/donate/about-the-fireworks-show/>
["The Port of San Diego's Big Bay July 4th Fireworks Show was established in 2001 to bring business to the Port Tenants and to benefit the San Diego Armed Services YMCA's family service programs for our military families including our wounded warriors at Balboa Naval Hospital."]

F-15 cont. | to District Tidelands.”⁸ Attendance for the Tidelands Activation Program is estimated at 500,000 people and the sponsor’s application form notes “The Big Bay Boom is a fireworks show of unquestionable quality and prominence, attracting huge numbers of people to the Port tidelands on land and water.” (AS YMCA Application and Evaluation Form FY 2017-2018).

F-16 | Lastly, the Transportation Assessment itself is replete with references to spikes in traffic just prior to and just after the fireworks event. (Appendix J, p.13; p. 15 [“There was an average increase of 480% in pedestrian activity, and an average increase of 224% of cyclist activity in the hours before and after the Big Bay Boom event.”]; p. 17 [“As shown, the highest traffic volumes for the majority of the roadway segments were observed between 8:00 PM and 9:00 PM, just prior to the start of the Big Bay Boom event.”], p. 18).

F-17 | Thus, the Port’s claim that it is “difficult” to assess traffic impacts of fireworks events is specious at best. “The fact that a single methodology does not currently exist that would provide the Port with a precise, or ‘universally accepted,’ quantification...does not excuse the preparation of any health risk assessment—it requires the Port to do the necessary work to educate itself about the different methodologies that are available.” (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Com'rs* (2001) 91 Cal.App.4th 1344, 1370). Here, methodologies are available and traffic data has been collected. (See, Appendix J, pp. 11-45; p. 55 [“higher traffic volumes were typically observed before and after the sample event” and “traffic congestion was observed on the freeway facilities serving the Big Bay Boom viewing areas up to three hours after the conclusion of the event.”]). The DEIR also identifies the additional information purportedly necessary to adequately calculate VMT. This information is readily available, especially in light of the Port’s willingness to ascribe a number to the Big Bay Boom’s Tidelands’ activation, as well as the DEIR’s conclusion that a spike in traffic just before and after the Big Bay Boom fireworks event can be attributed to event spectators. The Port’s reluctance to assess GHG emissions or air quality impacts associated with spectator traffic in light of this data is a blatant violation of CEQA.

D. Conclusion

F-18 | Unless the Port updates its EIR with the aforementioned analysis and incorporates adequate mitigation measures, the DEIR will not withstand judicial scrutiny. We urge the Port to conduct the requisite analysis prior to release of the Final EIR and to include mitigation and avoidance measures which address the significant water quality impacts associated with the Project. Thank you for your consideration of these comments.

Sincerely,

COAST LAW GROUP LLP

SIGNATURE EVENT

ORGANIZATION	EVENT	DATE (S)
Armed Services YMCA of the USA - San Diego Branch	Port of San Diego Big Bay Boom July 4th Fireworks Show	7/4/2018

Event Contact: H. P. "Sandy" Purdon **Phone:** 619-822-1177

Location: North San Diego Bay with barges located off Shelter Island, Harbor Island, North Embarcadero, Seaport Village/South Embarcadero/Coronado Ferry Landing

Description: The Port of San Diego Big Bay Boom started in 2001 with two barges and now has grown to 4 barges located around North San Diego Bay. Spectators can view the show from Shelter Island, Harbor Island, North Embarcadero and the Seaport/South Embarcadero/Coronado Ferry Landing. The event consists of approximately 20 minutes of spectacular fireworks choreographed to music and simulcast on radio and television available to over 25 million people in Southern California.. There is no admission charge and viewing is also available from recreational boats and commercial charter boats on the bay.

Attendance: 500,000

Event Admission Fee: There are no admission charges.

Funding History:	Funding		Services	
FY	Requested	Granted	Requested	Granted
16-17	\$250,000	\$145,000	\$50,000	\$50,000
15-16	\$200,000	\$145,000	\$50,000	\$50,000
14-15	\$200,000	\$145,000	\$50,000	\$50,000

FY2017 / 2018 Financial Information:

Funding Requested	Fee Waivers/ Services Requested	Event/Program Budget Expenses	% of Budget Requested
\$200,000	\$140,185	\$550,000	49%

Surplus Projections

With requested sponsorship	With no sponsorship	With staff recommended sponsorship
\$0	(\$190,185)	\$95,000

Recipients of proceeds: The proceeds of the event stay with the Armed Services YMCA of the USA - San Diego Branch. They collect all the funds and pay the expenses. This amount is usually about 10% of the total gross budget.

Staff Recommendation & Comments

Funding:	\$145,000	Services:	\$140,185
-----------------	------------------	------------------	------------------

Comments: The Big Bay Boom is a fireworks show of unquestionable quality and prominence, attracting huge numbers of people to the Port tidelands on land and water. For the past three years, the Port has provided \$145,000 in funding and a full range of services at varying values. The show's producer, acting on behalf of the applicant, has indicated to Port staff that the costs of producing the show have risen substantially. These include a \$33,000 increase in barges and fireworks for 2018. It is also noted that the Port's costs for supporting the Big Bay Boom with services from the San Diego Harbor Police, General Service Department and their contractors totals \$140,185. This number does not include the Port's funding of an Environmental Impact Report (EIR) to entitle fireworks on San Diego Bay. Currently in process, the EIR is expected to cost over \$400,000. Staff recognizes the rising cost of the show; however the Port has funded the entirety of the EIR and staff therefore recommends that the Port's sponsorship funding remain stable at \$145,000 for the July 4, 2018 Big Bay Boom and that the Port provide all required Port services, at a value of \$140,185.

Big Bay Boom: Parking, Transit & Where to Watch

All of the transportation and parking info you need for this year's Big Bay Boom 4th of July fireworks celebration

By Beatriz Cabanas

More than 14,000 pounds of explosives light up the San Diego Embarcadero during the city's annual Big Bay Boom.

San Diego's biggest 4th of July fireworks show, the Big Bay Boom, goes down Monday, and is expected to draw up to a half-million patriotic spectators.

With that large of a crowd, organizers of the Port of San Diego's 16th annual Big Bay Boom urge visitors to use public transportation to get to the big event, including the MTS trolley and buses.

If you choose to drive, there will be free parking available at Qualcomm Stadium. From there, you can buy a trolley ticket and travel to several spots along downtown San Diego and the Embarcadero considered prime Big Bay Boom fireworks viewing locations.

Port of San Diego

Harbor Island

- North Embarcadero
- Seaport Village
- South Embarcadero
- Coronado Ferry Landing

Free shuttle services will be offered to spectators heading to the Shelter Island and Harbor Island viewing spots.

The Shelter Island shuttle will pick up visitors from the corner of Carleton and Rosecrans streets in Point Loma. Street parking is available around that area, though it will be limited. The last return shuttle from Shelter Island (at the Gazebo point) runs at 11 p.m.

Meanwhile, the Harbor Island shuttle service will give visitors a ride from the corner of McCain Road and N. Harbor Drive, west of Airport Terminal 2. The drop off location for Harbor Island will be the San Diego Harbor Police Headquarters, and spectators can walk to their viewing point from there. Those hopping on the Harbor Island shuttle can park at the airport parking lot on McCain Road and N. Harbor Drive, where parking is \$12, cash, per car. The final free return shuttle from Harbor Island runs at 11 p.m., too.

The North Embarcadero, Seaport Village, South Embarcadero and the Coronado Ferry Landing viewing points offer limited parking on or around the areas.

North Embarcadero parking is available from Grape Street to Broadway including the B Street Pier. There are various lots and streets from Harbor Drive to Pacific Highway as well.

For Seaport Village and South Embarcadero, parking is available in the Seaport Village and Hilton parking lots. Specifically at Seaport Village, visitors who park before 3p.m. pay \$5 for the first three hours, \$3 every 30 minutes thereafter. Validation is available with a minimum \$10 purchase. Non Validated self-parking is \$8 per hour. After 3p.m., there is a flat rate of \$25 per car.

Seaport Village also has valet parking available. Before 3p.m., the fees are \$15 up to five hours, \$30 up to 10 hours and \$40 max over 10 hours. After 3p.m., restaurant reservations can valet for \$30 and all others can valet for \$50.

Finally, parking at the Coronado Ferry Landing is available in the shopping area as well as public street parking in the general vicinity.

The Big Bay Boom starts at 9 p.m. sharp, so plan accordingly. It's sure to be a blast.

HARBOR ISLAND

Harbor Island Parking

Parking is very limited on Harbor Island and full by early afternoon. Your best bet might be to take the free shuttle bus service from the Port of San Diego. Once all parking is taken there, the Harbor Police will close it. Please be patient as the attendance will be very large. We **strongly encourage** you to use our [transportation partners](#).

Free 4th of July Special Bus Shuttle Service to Harbor Island

Goldfield Stage will provide Free shuttle service to Harbor Island. Pick up will be at the corner of McCain Road and North Harbor Drive west of Airport Terminal 2. Passengers will be dropped off and picked up after the show at the San Diego Harbor Police Headquarters. The final shuttle run will be at 11 p.m. Park at the airport parking lot off McCain Road and North Harbor Drive west of Airport Terminal 2. ***Please note that shuttle service is free, however parking at this lot will be \$12.00 (cash) per car.* [Click to download Shuttle Pickup and Drop Off locations](#) (PDF file)

New permits may be required after Super Bowl show trashed beach

By **Kimberly Veklerov** Updated 4:25 pm, Wednesday, February 10, 2016

IMAGE 3 OF 3

Volunteers picked up trash after Friday's Super Bowl fireworks show.

State officials are mulling whether to require new permits for firework companies after pyrotechnic debris washed up on parts of San Francisco's shoreline after two Super Bowl shows.

Five volunteers from Shark Stewards, a nonprofit that advocates ocean health, collected 30 pounds of trash, including more than 1,000 pieces of plastic, Saturday — a day after the second Super Bowl fireworks show off the Embarcadero, according to David McGuire, the organization's director. The haul included cardboard casings, plastic caps, and what appeared to be unspent shells.

McGuire and other environmental advocates are worried the fireworks debris they collected is only half the story.

“It’s not like we just clean up the beach and it goes away,” he said. “How many pounds of that plastic is still out there?”

Macy’s, which put on the shows, hired Pyro Spectaculars to launch the fireworks from a barge at the start and end of Super Bowl week. After the first show on Jan. 30 — which National Park Service officials said deposited in Aquatic Park enough firework junk to fill four 50-gallon trash containers — Macy’s officials said they took additional steps to minimize pollution. The fireworks company changed its materials, secured them better on the barge and collected debris after the show, said Orlando Veras, a Macy’s spokesman.

But when Shark Stewards volunteers did their regular cleanup of the shoreline the next day, which usually focuses on cigarette butts, they found another load of pyrotechnic litter — though not as large as what park officials found the week before.

“This is unacceptable when we’re doing something for our entertainment and it’s adding to this plastic load,” McGuire said, referring to the millions of tons of plastic that enter the ocean every year.

In the wake of the cleanup efforts, a watchdog group that fights ocean pollution is now urging regional water agency officials to require Clean Water Act permits for companies to launch fireworks.

“We haven’t heard of this kind of debris coming onto the shore during our 26 years watch-dogging the Bay,” said Sejal Choksi-Chugh, director of the group, San Francisco Baykeeper.

And regional water control officials are listening.

Lila Tang, a division chief of the San Francisco Bay Regional Water Quality Control Board, said agency officials are looking into the possibility of mandating Clean Water Act permits for firework shows over bodies of water, and there’s a good chance they will enact the measure. Ideally, Tang said, the requirement would be statewide rather than

region by region. The board may also investigate what happened during the Super Bowl shows and fine those responsible.

The permit action wouldn't be without precedent. The San Diego water quality office began requiring the permits in 2011, according to Ben Neill, a water resource control engineer in San Diego.

The permits require companies launching fireworks to show proof ahead of time that the pyrotechnics will not pollute the water.

“The companies need to step up and clean up their mess,” Choksi-Chugh said. “It’s pretty unacceptable that nonprofits have to step in.”

PROCOPIO ATTORNEYS SUCCESSFULLY DEFEND SAN DIEGO BAY FIREWORKS DISPLAY

San Diego, CA - The law firm of Procopio, Cory, Hargreaves & Savitch LLP successfully represented pro bono client San Diego Armed Services YMCA (“SDAS”) against threats from a local environmental group to shut down the annual San Diego Bay Independence Day Fireworks display. As one of the largest pyrotechnic displays in the nation, the “Big Bay Boom” draws 750,000 people each year and generates around \$40,000 in proceeds for the SDAS. In addition, the event provides substantial social and economic benefits to the community as a whole.

The Coastal Environmental Rights Foundation (“CERF”), has claimed that any fireworks displays over water require a permit and California Environmental Quality Act (“CEQA”) analysis. In October of last year, CERF’s legal threats led to the cancellation of a San Diego Bay fireworks display scheduled for New Years Eve. In late June, CERF filed complaints against the City of San Diego alleging that their La Jolla fireworks display would violate state environmental law. CERF threatened the same for the SDAS’ July 4th Big Bay Boom.

The Procopio team that represented SDAS included Partner **Robert G. Russell**, Senior Counsel **Walter E. Rusinek** and Associate **Kevin M. Davis** and was led by Procopio Partner **John J. Lormon**.

“John Lormon was the key person in our successful reviews by the Regional Water Quality Control Board and our “exemption” from the California Coastal Commission,” said Sandy Purdon, Executive Producer and Founder of the Big Bay Boom. “If it hadn’t been for John and Procopio, we could be facing a far different circumstance with the Big Bay Boom July 4th Fireworks Show. If I had to name a MVP for this effort to save the July 4th fireworks show for San Diego Bay it would be John Lormon.”

Even with the exemption in place, for business reasons the SDAS sought to resolve all possible legal exposures. Therefore, on June 24th, Lormon negotiated a settlement with CERF that provided the client with the certainty needed to keep in-kind volunteers in place and the show on schedule. Lormon also

obtained concurrence from the Port District that the Imperial Beach Pier portion of the show was excluded from Port coastal jurisdiction.

About Procopio, Cory, Hargreaves & Savitch LLP

With more than 110 attorneys in San Diego and Carlsbad, Procopio, Cory, Hargreaves & Savitch LLP is one of the largest full-services business law firms in Southern California. We are a local law firm with a global network that gives us the ability to serve our clients' interests throughout the world. Procopio is dedicated to understanding the businesses and industries of our clients and collaborating with them to develop tailored strategies. We advise companies at every stage in the corporate life cycle, helping them to plan, finance and operate their businesses. Since 1946, our success has been derived from our commitment to our clients and our ability to maximize the value we provide to them. Our goal is to continue building long-term relationships with our clients through a steady, team-oriented approach. For additional information, please visit www.procopio.com.

Response to Comment F-1

This comment is an introductory comment indicating that the Coastal Environmental Rights Foundation (CERF) is providing comments on the Draft EIR and believes the Draft EIR is legally deficient.

The District appreciates CERF's interest in the proposed project. This general comment does not raise any issues needing a response pursuant to CEQA. The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment F-2

This comment summarizes the list of impairments for San Diego Bay as described in the Draft EIR. The comment also restates the methodology used in the Draft EIR for determining the water quality effects of the proposed new fireworks display events. The comment further states that the Draft EIR's analysis is flawed for various reasons that follow.

The comment repeats information provided in the Draft EIR related to existing water quality conditions in the San Diego Bay and indicates that the Draft EIR relies on the Big Bay Boom water quality monitoring data. The commenter indicates that the analysis is flawed in numerous respects, which are listed in subsequent comments to which the District responds below. No further response is required.

Response to Comment F-3

The comment cites information from the Draft EIR regarding the water quality monitoring methodology for the 2016 Big Bay Boom and objects that the Draft EIR incorrectly notes these results.

The statement in the 2016 Big Bay Boom Water Quality Monitoring Report that sample collection was initiated approximately 5-minutes prior to the conclusion of the fireworks show is incorrect. This statement is an oversight by the report preparer, which is the same firm that prepared the water quality technical report for the proposed project. The actual sample collection scenario occurred in the following manner:

To allow for samples to be collected immediately adjacent to the fireworks barge at the end of the show, Amec Foster Wheeler staff constructed a sample collection apparatus consisting of a peristaltic pump contained within an enclosed plastic barrel. The pump's tubing extended from the peristaltic pump into the surface waters of the Bay, then back into a certified clean 1-gallon glass collection bottle located inside the barrel. The collection devices were attached to the side of the barges upon arrival at the launch site. There were two devices attached to each of two barges (the barge off of the Midway Museum and the barge off of Seaport Village). On each barge, one peristaltic pump was pre-programmed to begin collection at 9:20 pm and the other was set to begin collection at 9:22 pm. All the pumps were pre-programmed at the dock during the mobilization process at the G Street Mole Pier several hours before the fireworks show began. The goal of pre-programming the water sampling pumps for these two collection times was to ensure that samples were captured immediately following the 20-minute-long fireworks show that was planned to start at 9:00 pm. The field collection datasheets in the 2016 Big Bay Boom Final Report on pages 183 and 184 (of the 187-page PDF) verify that the "Time 0" post-show samples were collected at 21:20 and 21:22. The collection times were staggered by 2 minutes to ensure that samples would be collected

immediately at the end of the show, or as close as possible if the show start time was delayed by a few minutes.

This reference to samples being collected 5 minutes prior to the end of the show has been corrected in the 2016 Big Bay Boom Report and a revised report will be submitted to the Regional Water Quality Control Board (RWQCB) with a more accurate description of the post-show collection times. Because the samples actually were taken at the end of the show, they accurately reflect water quality impacts.

Response to Comment F-4

The comment states that the analysis of limited SeaWorld and Big Bay Boom monitoring data does not support the conclusion in the Draft EIR that the proposed project would not violate water quality standards or waste discharge requirements. The comment states that the monitoring data indicates water quality exceedances for copper.

This comment repeats information provided in the Draft EIR and states an objection that the analysis is not supported by monitoring data. There is no clear relationship between the fireworks display timing and copper levels in the surface waters. The Big Bay Boom monitoring shows that exceedances of the dissolved copper California Toxic Rule (CTR) criterion were just as likely to occur before the fireworks event as after the event. This is true whether the samples were analyzed for dissolved or total copper in the collected Bay water samples. A more detailed discussion is provided in response to comment F-5 below.

As discussed in Section 4.6, *Hydrology and Water Quality*, of the Draft EIR, water quality monitoring of the Big Bay Boom fireworks display events since 2013 has shown no substantial degradation of water quality when comparing ambient chemical levels (pre-show) with post-show levels. The proposed new fireworks display events would be substantially smaller than the Big Bay Boom and, therefore, would result in substantially less amounts of fireworks-generated chemical residues falling into the Bay. No sediment monitoring has been conducted as part of the existing Big Bay Boom monitoring program, but SeaWorld has conducted considerable sediment testing in Mission Bay, and its fallout zone is shallower and has more restrictive current and tidal flow compared to the anticipated launch sites for the proposed new fireworks display events. As the San Diego RWQCB noted in the General Permit, SeaWorld events likely represent the maximum firework pollutant loading conditions and cumulative effects in the San Diego region, including the Pacific Ocean, with respect to potential impacts of fireworks on water and sediment quality. While SeaWorld's testing has found an increase of some chemicals within the sediments in the fireworks fallout zone, the observed increase has not resulted in any toxicity or benthic community impacts. As such, it is anticipated that the proposed new fireworks display events would not result in any sediment toxicity or benthic community impacts, as these displays would be smaller, would occur much less frequently, and would be held in an area subject to greater current and tidal flow than the SeaWorld fireworks displays. Consequently, the Draft EIR determined that the proposed new fireworks display events would not violate any water quality standards or waste discharge requirements, and potential impacts would be less than significant.

Response to Comment F-5

The comment summarizes the results of the Big Bay Boom water quality monitoring for 2014, 2015, and 2016 for total copper and total dissolved copper. The comment states that some of the samples

in each of these monitoring years indicated copper exceedances of the CTR and were higher post event. The commenter further states that any additional amount of copper discharged into San Diego Bay would result in an exceedance of an applicable water quality standard because the Bay is listed as impaired for copper.

There is no clear relationship between the fireworks display timing and copper levels in the surface waters. The Big Bay Boom monitoring shows that exceedances of the dissolved copper CTR criterion were just as likely to occur before the fireworks event as after the event as detailed below. This is true whether the samples were analyzed for dissolved or total copper in the collected Bay water samples.

Specifically, dissolved copper analyses conducted following the 2014 Big Bay Boom Fireworks found no CTR exceedance of the dissolved copper criterion (3.1 micrograms per liter [$\mu\text{g/L}$]). Dissolved copper analyses conducted following the 2015 Big Bay Boom Fireworks found that all samples, whether collected before or after the show, exceeded the CTR dissolved copper criterion (3.1 $\mu\text{g/L}$). The pre-show samples ranged from 3.14 to 3.85 $\mu\text{g/L}$ and the post show samples ranged from 3.13 to 3.70 $\mu\text{g/L}$. Dissolved copper analyses conducted following the 2016 Big Bay Boom Fireworks at the Midway Museum launch site found no CTR exceedances either before the show or after. Dissolved copper analyses conducted following the 2016 Big Bay Boom Fireworks at the Seaport Village launch site found all three pre-show samples exceeded the CTR criterion ranging from 3.13 to 3.30 $\mu\text{g/L}$. Two of the five post-show samples (including site replicates) exceeded the dissolved copper CTR criterion (both in the "Time 0" samples) and ranged from 4.53 to 4.56 $\mu\text{g/L}$. While the "Time 0" post-show samples with dissolved copper concentrations of 4.53 and 4.56 $\mu\text{g/L}$ collected in 2016 adjacent to the Seaport Village fireworks barge exceeded the CTR criterion, and were the highest concentrations observed between 2014 and 2016, the "Time 0" post-show samples collected adjacent to the Midway Museum launch barge (2.47 and 2.39 $\mu\text{g/L}$) did not exceed the CTR dissolved copper criterion and were lower than the pre-show sample (3.05 $\mu\text{g/L}$).

Based upon these collective findings, there is no clear temporal relationship between the fireworks displays and copper levels in the surface waters within the sample collection footprint. Dissolved copper CTR criterion exceedances were just as likely to occur before the fireworks events as after the events. With regard to using the copper conversion factor (0.82), 40 CFR § 131.38 (note to Table 2 of paragraph (b)(2)) reads: "The term 'Conversion Factor' represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column." Using the copper conversion factor is not necessary since dissolved copper levels were analyzed for the Big Bay Boom monitoring event and these results can be compared directly to the CTR dissolved copper criterion of 3.1 $\mu\text{g/L}$. In addition, as was observed for dissolved copper measurements, the samples analyzed for total copper at each station within the study area were just as likely to be greater before the fireworks events as after the events. These findings represent the natural variability of copper levels in the surface waters within the study footprint based on dynamic environmental conditions.

As evidenced above, there is no clear connection between the copper levels observed in the Big Bay Boom samples and the fireworks displays. It is understood that portions of the Bay are Clean Water Act 303(d)-listed for copper and copper levels that exceed the CTR criterion have occurred in the collected Bay water samples; however, based upon the Big Bay Boom findings, it does not appear that the fireworks are the source of this copper; rather these observed copper levels reflect ambient conditions. As such, no changes to the Final EIR are required.

Response to Comment F-6

The comment cites the San Diego RWQCB's General Fireworks Permit, which concluded that larger firework events result in levels of certain pollutants above water quality criteria and have the potential to cause or contribute to an exceedance of sediment quality objectives of the permit. The comment states that larger fireworks events include Fourth of July events other than just the Big Bay Boom.

The section of the Fireworks General Permit Fact Sheet to which the comment refers specifically addresses the SeaWorld fireworks shows. The RWQCB was concerned that larger (than usual) shows conducted in the shallow, semi-enclosed embayment in Mission Bay where SeaWorld's launch platform is located would cause or contribute to an exceedance of narrative sediment quality objectives. As this does not refer to the Big Bay Boom or the San Diego Bay, no changes to the Final EIR are required.

Response to Comment F-7

The comment states that the Draft EIR's conclusion that the proposed new firework display events would not violate water quality standards or waste discharge requirements is undermined by the previously stated data.

Please see responses to comments F-3 through F-6. There has been no clear temporal pattern linking the copper levels observed in the Bay water samples to the Big Bay Boom fireworks displays. At individual collection locations, higher copper levels were sometimes found in pre-show samples and sometimes post-show for both total and dissolved forms of copper. In addition, for the 2016 Big Bay Boom monitoring event, while CTR exceedances (both pre- and post-show) were observed for the samples collected adjacent to the Seaport Village launch barge, no such exceedances were observed in the samples collected off of the Midway Museum (even though the collection operations were identical). No changes to the Final EIR are required.

The comment also states that the proposed ordinance "enables" fireworks events like the Big Bay Boom. This comment is incorrect. The proposed ordinance applies to all fireworks display events, including existing events that like the Big Bay Boom that are not subject to CEQA. Thus, rather than "enabling" existing events, the proposed ordinance requires events that otherwise would not be subject to environmental review under CEQA to comply with the conditions of approval set forth in the proposed ordinance. As discussed in the Draft EIR, the proposed ordinance will have beneficial, not adverse, impacts on the environment making existing fireworks display events subject to its provisions.

Response to Comment F-8

The comment states that mitigation measure MM-WQ-1 does not reduce water quality impacts discussed in comments F-2 through F-7 to a less-than-significant level and cites multiple case law citations.

The comment states an opinion regarding MM-WQ-1, but does not provide any facts or data in support of the opinion. Legal citations and attorney arguments do not constitute substantial evidence. Accordingly, no further response is possible or required.

Response to Comment F-9

The comment states that Operation Clean Sweep does not address water quality impacts from debris resulting from year-round fireworks shows or correlates to the type and scale of the impact caused by fireworks debris. The comment cites text from Appendix F of the Draft EIR regarding the estimated quantity of debris that would be expected to remain in the water following each proposed new Fourth of July fireworks display event. The comment suggests that the required General Fireworks Permit BMPs are generally ineffective based on post-event monitoring reports for all major fireworks events under the General Permit.

As stated in Section 15370 of the State CEQA Guidelines, mitigation can include “rectifying an impact by repairing, rehabilitating, or restoring the impacted environment” and “compensating for the impact by replacing or providing substitute resources or environments.” Mitigation measure MM-WQ-1 requires a series of actions by the fireworks organizer to collect fireworks trash and debris that makes up 50 percent of the net weight of the fireworks launched during the fireworks display event. These actions begin immediately after the fireworks display event and include follow-up trash collection efforts in the vicinity of the launch area the following day. In the event that less than 50 percent is collected, “Operation Clean Sweep” is intended to rectify or compensate for the remaining amount of fireworks trash and debris by recovering other trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront, thereby compensating for the impact by removing an equivalent amount of non-fireworks related trash and debris from these water bodies.

In addition, the comment incorrectly states the significance determination conclusions in Section 4.6, *Hydrology and Water Quality*, of the Draft EIR. As stated on page 4.6-36 in Section 4.6 of the Draft EIR, MM-WQ-1 would ensure that fireworks-generated debris is properly cleaned up and disposed of, thereby reducing the amount of unrecovered fireworks debris that could create or contribute substantial additional sources of polluted runoff and substantially degrade water quality. However, uncontrollable factors such as weather conditions, amount of paper incinerated, sunken material, or material that is blown onto land may affect the ability to recover all post-show debris related to fireworks on surface waters. Because of these various factors, the Draft EIR concludes that impacts would be significant and unavoidable. Accordingly, the Draft EIR adequately acknowledges the contribution of fireworks trash and debris to significant water quality impacts. No changes to the Final EIR are required.

Response to Comment F-10

The comment states that Chula Vista Bayfront fireworks will likely result in significant wildlife impacts, that USFWS recommends no fireworks display events occur at the Chula Vista Bayfront during the avian breeding season, that the Draft EIR offers only minimal restrictions to address wildlife agencies’ concerns, and that the restriction of concussion salutes during the first 25 percent of a display fails to ensure the remainder of the show will not result in significant wildlife impacts.

Section 4.3, *Biological Resources*, of the Draft EIR analyzes potential impacts on wildlife and concludes the proposed new Fourth of July fireworks display events at the Chula Vista and National City Bayfronts will have significant impacts on biological resources. The Draft EIR recommends specific mitigation measures to address these impacts and determined that the recommended measures would reduce impacts below a level of significance. The Draft EIR thus analyzes potential wildlife impacts and proposes mitigation measures for the three fireworks display events at the Chula Vista Bayfront, which were previously authorized by the Chula Vista Bayfront Master Plan

Settlement Agreement. Although the Fourth of July fireworks display event would occur during the avian breeding season, the Draft EIR indicates that the other two events at the Chula Vista Bayfront would occur outside the avian breeding season. The District also addresses concerns expressed by the wildlife agencies in the responses to comments they provided in Comment Letter B (USFWS) and Comment Letter E (CDFW). All potentially significant biological resources impacts would be less than significant with the implementation of mitigation, including the restriction on concussion salutes. No further response is required.

Response to Comment F-11

The comment states that the Draft EIR fails to substantiate how eelgrass surveys and potential subsequent mitigation will account for fireworks-related impacts. The comment also states that direct habitat destruction and impacts from fireworks residue and debris deposition would not be evident through spatial surveys and that long-term impacts on eelgrass would be significant and unmitigated.

The comment has raised concerns over the ability to detect impacts on eelgrass from fireworks display events and has stated that direct and indirect impacts would not be detectable through surveys. The proposed surveys would be completed in accordance with the California Eelgrass Mitigation Policy (CEMP) (NMFS 2014), as stated in the Draft EIR. The methods for survey and impact analysis under the CEMP are tailored to the detection of impacts based on the nature and scale of the potential effect. For the proposed activities, surveys would make use of sidescan sonar and bathymetric swath survey technologies that provide a comprehensive acoustic image of the seafloor in the area of potential impact. The image creates a raster image with a pixel size of approximately 6 centimeters on a side. At this resolution, the imagery allows for detection of vessel propeller scarring, grounding, and other direct impacts at a high resolution. As a result, surveys provide a good tool for detection of physical impacts associated with fireworks related activities. The CEMP provides explicit direction on mapping eelgrass impacts and mitigation of impacts inclusive of replacement ratios, monitoring methods, and success standards and progress milestones. This standard has been adopted by resource and regulatory agencies throughout the state in order to ensure consistency in methods for surveying, assessing impacts, mitigating, and monitoring of eelgrass mitigation.

Fireworks residue and debris deposition do not have a potential to affect eelgrass habitat at the potential discharge scales anticipated from the contemplated and ongoing activities. Eelgrass is a very resilient plant that is not particularly susceptible to marine sediment contaminants and has even been considered and tested as a potential tool for sediment bioremediation through capitalizing on root uptake and binding of metals and transformation of organic compounds. However, because of the rapid rate of growth, senescence, and degradation to detritus, eelgrass shows little promise for long-term sequestering conserved contaminants without eelgrass harvest. Eelgrass can persist and thrive in metal and organic compound enriched sediments and thus is not expected to be damaged by low-level discharges of pollutants. Relative to potential for eelgrass impact from debris deposition, at high levels, eelgrass may be damaged by debris accumulation due to smothering or loss of suitable substrate. This can happen with major macroalgal blooms or discharges of significant detrital wastes into the intertidal or subtidal environment (e.g., wood and pulp waste around mills and log storage areas in the Pacific Northwest). However, in general, eelgrass is a detrital trap and benefits from capture and stabilization of detritus in the beds in a manner that supplies carbon and other nutrients to the sediment through decay. Eelgrass is well adapted to accumulate low levels of debris and sediments within the beds as a result of the trapping

properties of the bed structure. In general, the majority of the debris in an eelgrass bed is derived from eelgrass leaf decay, but beds also regularly accumulate macroalgae, salp mucus strings, bryozoa, negatively buoyant anthropogenic wastes, and other debris. At low accumulation rates, this does not result in damage to eelgrass beds.

The conclusions of the Draft EIR with respect to potential eelgrass impacts (Impact-BIO-6) and recommendations for mitigation measure MM-BIO-3, including implementation of compensatory mitigation as required under the CEMP, remain unchanged. No changes to the Final EIR are required.

Response to Comment F-12

The comment states that the Draft EIR fails to analyze air quality and GHG emissions from visitor traffic and cites information provided in the Draft EIR, which explains the inability to assess traffic-related impacts associated with fireworks display events through a conventional traffic impact analysis. The comment asserts this is improper. The comment also quotes various sources regarding the large number of people attracted by the Big Bay Boom event.

The comment repeats information provided in the Draft EIR and does not identify in what way the methodology used in the Draft EIR to analyze potential transportation impacts is improper or provide any evidence in support of the comment's assertions. No alternative methodology is suggested in this comment. In addition, the information regarding the number of people who attend the Big Bay Boom and their use of public transit, shuttles and pre-purchased reserved parking is consistent with the information provided in the Transportation Assessment (Appendix J of the Draft EIR). As discussed in Section 4.10, *Transportation, Circulation, and Parking*, of the Draft EIR, the forecasted traffic impacts associated with the proposed new fireworks display events on the Chula Vista and National City Bayfronts are based on data gathered from previous Imperial Beach Fourth of July Show events and not Big Bay Boom. No further response is required.

Response to Comment F-13

The comment cites the California Code of Regulations and case law and states that the District must analyze what is reasonably feasible and provide adequacy, completeness and a good faith effort at full disclosure.

This comment cites sections of the California Code of Regulations and case law relating to environmental review under CEQA, but does not raise an environmental issue relating to the Draft EIR. As the comment relates to legal rather than environmental issues, no further response is required.

Response to Comment F-14

The comment cites an excerpt of the methodology provided in the Traffic Assessment (Appendix J). The comment states that the Big Bay Boom boasts a massive attendance and that the Big Bay Boom sponsors suggest spectators take public transit because of traffic impacts, although pre-purchased parking is available for the event. The comment identifies the free shuttle service provided by the District.

The comment repeats information provided in Appendix J of the Draft EIR. The comment also describes existing conditions related to the Big Bay Boom event, which are part of the

environmental setting, not the proposed project. The environmental impacts of the proposed project are fully disclosed in the Draft EIR. As discussed in Section 4.10, *Transportation, Circulation, and Parking*, of the Draft EIR, the proposed project would result in significant and unavoidable traffic impacts due to increases in vehicular, pedestrian, and bicycle volumes and temporary congestion, as well as an inadequate supply of parking. Mitigation measure MM-TRA-1, as described in Section 4.10 of the Draft EIR, requires implementation of an Event Transportation and Parking Management Plan to facilitate the movement of vehicular, pedestrian, and bicycle traffic. The Event Transportation and Parking Management Plan would further help to safely accommodate the additional vehicular, pedestrian, and bicycle traffic accessing the individual event locations and reduce potential conflicts between different modes of transportation, thereby improving the safety of roadway, bicycle, and pedestrian facilities. In addition, the Event Transportation and Parking Management Plan would improve vehicle, bicycle, and pedestrian circulation, consequently improving the performance of roadway, bicycle and pedestrian facilities. Regarding the significant impacts on parking, the Event Transportation and Parking Management Plan would include measures and tools to deal with parking, such as offsite parking arrangements, promotional programs with rideshare vendors, a joint event/transit ticketing program with MTS, and expanded shuttle operations, among others. Therefore, no change to the Final EIR is required.

Response to Comment F-15

The comment states that the Big Bay Boom is featured as an event that activates Port Tidelands and is intended to bring business to the Port tenants. The comment states the attendance for the Tidelands Activation Program is estimated at 500,000 people.

The Draft EIR agrees that the Big Bay Boom fireworks display event is a large event that attracts many spectators. The comment relates to an existing condition, not the effects of the proposed project. Therefore, the comment does not raise any environmental issues requiring a response.

Response to Comment F-16

The comment cites information from the Traffic Assessment (Appendix J) regarding the changes in traffic volumes that were observed prior to and just after the Big Bay Boom event.

The comment repeats information provided in Appendix J of the Draft EIR and does not raise any environmental issue regarding the adequacy of the analysis in Appendix J or in Section 4.10, *Transportation, Circulation, and Parking*, of the Draft EIR. Accordingly, no further response is warranted or possible.

Response to Comment F-17

The comment cites case law related to a lead agency being required to inform itself about different methodologies available. The comment also states that methodologies and data are available to assess traffic impacts and calculate vehicle miles traveled (VMT). The comment states that the Draft EIR identifies the additional information necessary to calculate VMT, and that this information is readily available. The comment states that the lack of analysis of GHG emissions or air quality impacts associated with spectator traffic violates CEQA.

This comment suggests that the Draft EIR ignored traffic impacts associated with the proposed new fireworks display events and that information is available to adequately calculate VMT. The potential impacts on transportation and traffic that may result from the proposed project are

analyzed in Section 4.10, *Transportation, Circulation, and Parking*, of the Draft EIR. The Draft EIR clearly describes the characteristics of the proposed new fireworks events that affect the methodology selected to analyze potential impacts. Among other information, the Draft EIR explains that VMT cannot be accurately estimated given a multitude of uncertainties in estimating the number of visitors, how visitors arrived at the event, how far patrons traveled, routes taken, where patrons parked, and whether or not patrons were at the viewing locations specifically for fireworks or there for other reasons. For instance, one could estimate overall attendance for the shows, but attendance information would need to be location-specific, include a breakdown of mode shares and travel distance and travel path, as well as cover all shows on all days, while also estimating the portion of visitation attributed directly to the shows and the portion of visitation attributed to the typical park area attendance. Assumptions could be made for each of the data requirements above; however, these assumptions would be based on region travel patterns or data associated with other events (such as concerts) and may not accurately project the VMT associated with the unique event being analyzed. Given these reasons, it would be too speculative to estimate VMT associated with the fireworks events and any results would be unreliable.

The *Berkeley* case the commenter cites also goes on to cite various sections of CEQA that support the approach taken in the Draft EIR. For example, State CEQA Guidelines Section 15144 states that a lead agency “must use its best efforts to find out and disclose all that it reasonably can,” and State CEQA Guidelines Section 15145 states, “if, after thorough investigation, a lead agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact.” The analysis satisfies its CEQA requirement to disclose and not speculate about VMT from visitor traffic.

Furthermore, the Draft EIR analyzes the potential impacts of the proposed new fireworks events on air quality in Section 4.2, *Air Quality and Health Risk*, and on GHG emissions in Section 4.4, *Greenhouse Gas Emissions, Climate Change, and Energy*. The analysis of air quality and GHG emissions from visitor traffic similarly satisfies its CEQA requirement to disclose and not speculate about air quality and GHG emissions and related impacts. Under Threshold 2 in Section 4.2 of the Draft EIR, analysis is provided that evaluates hourly background monitoring on both event and non-event days, and concludes that visitor-related vehicle traffic for infrequent fireworks display events has minimal effect on background air quality and results in minimal GHG emissions far below thresholds as identified in Section 4.4 of the Draft EIR. Thus, because the Draft EIR makes an effort to disclose all that it reasonably can, the Draft EIR is consistent with CEQA and no further analysis is warranted.

Response to Comment F-18

This comment concludes the comment letter and provides a contact name and information.

The District appreciates CERF’s interest in the proposed project. This comment does not raise any issues needing a response pursuant to CEQA.

4.4.7 Comment Letter G: Fireworks & Stage FX America

(619) 938-8277, Fax (619) 938-8273
 P. O. Box 488
 Lakeside, CA 92040

April 18, 2017

Matt Valerio
 Port of San Diego
 3165 Pacific Highway
 San Diego, CA 92101

Dear Mr. Valerio:

Thank you so much for the opportunity to discuss the proposed Fireworks Display Ordinance and allow us to comment on the draft EIR. We proudly support a clean San Diego and will do all we can to make sure that fireworks have a minimum impact on our vital ecosystems.

G-1

Attached are our initial comments and some questions. Some of the language is confusing and needs clarification. We hope we can provide any input to make these clear and easy to enforce. We have also included the Best Management Practices from Meeting Facilitators, LLC, a SDRWQB Permittee and the company we work with when doing shows on the harbor.

Please feel free to contact me with any questions you may have. We look forward to working with you to continue our fireworks tradition in a safe, clean and responsible manner.

Sincerely,

J. Scott Danielson, Sales & Operations Manager
 324170

Comments to Plan: C=Comment, Q=Question

E#S.2.3 Project Objectives Page ES3 Footnote 1.

G-2 | . . . and other display pieces that exceed the limits of explosive materials for classification as “consumer fireworks.” Q-Does this by reference exclude consumer fireworks?

G-3 | They also include fused set pieces containing components that together exceed 50 milligrams of flash powder. These devices do not contain ‘Flash Powder’.

G-4 | Table ES-1 Proposed New Fireworks Display Events . . .
Q-Only Chula Vista, National City and Chula Vista are listed. Does this preclude other singular commercial events or are those grandfathered in under the proposed ordinance?

G-5 | ES.4.2 Summary of Project Alternatives Alternative 2 Quiet Fireworks Pages ES-8 “and mine fireworks”
Mine Fireworks are inherently quiet and including them in the same class as salutes is incorrect.

G-6 | Footnote 2: “120 dB maximum A-weighted impulse sound pressure level as measured at a horizontal distance of 15 meters from the testing point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.”
Q - Is this measuring the lift of the firework or the break. As the break will occur several hundred feet in the air would it not be more appropriate to measure from a spectator area?

G-7 | Mitigation Measure(s) MM-AQ-2(d) 1. Chemical Composition B. All fireworks display events shall use alternative fireworks produced with pyrotechnic formulas which replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that such alternative fireworks are not commercially available.
Q-Can we reword to say that ‘as fireworks that replace perchlorate with other oxidizers become commercially available’ instead of requiring a variance since none currently exist.

G-8 | MM-BIO-1: Page ES-16 Implementation of Biological Resources (d) 2. Packaging A.C-Please add the phrase “Non-Required” before the word labels. Reason: We cannot remove State and Federal required labels prior to discharge.

G-9 | MM-BIO-1: Page ES17 (f) Best Management Practices (2) ~~barges shall be equipped with a fire-retardant debris barrier that extends six feet (6’) in height, with openings no larger than ¼ inch, around the perimeter of the fireworks launch area to contain debris.~~ Strike this entire sentence. Other than wires that should be secured to avoid displacement (see item 3), very little debris is generated at this area. The danger posed by such a barrier far outweighs any potential environmental benefit. What studies show that a 6’ barrier is any benefit? Would a 4’ barrier be effective? 2’? What if a portion of the barrier goes into the water from winds and waves generated by boat traffic and wind under tow?

- G-10 [Pages ES-19 (9) “Five Persons” is an arbitrary number that does not take into consideration the size of the display, the devices used or the weather conditions at the time of the display. While it is fine to require clean up, it should be at the discretion of the Fireworks Company as to the number required.
- G-11 [Pages ES-19 (10) “Within five (5) business days . . . ” This time is not adequate. Current state law allows for 10 days for reporting and they must allow time for the trash to dry prior to weighing. It didn’t go into the harbor wet.
- G-12 [Page ES-19 (10) “If the weight of the fireworks trash and debris collected is less than fifty percent (50 percent) of the net weight of Fireworks launched during the fireworks display event” Dependent upon the size and type of fireworks, the fireworks composition can exceed 95% of the weight of the fireworks and that will have been turned into smoke during the display. In some cases (comets and mines) it is 99.9% of the weight of the device and is total consumed while rising. It would be physically impossible to collect 50% of the weight in fireworks trash.
- G-13 [Pages ES-21 and ES-22 Implementation of biological species . . . We are unclear as to who is responsible for this based on confusing definitions.
- G-14 [Pages ES-31 & ES-32 Chemicals and Packaging . . . We cannot remove State and Federal required labels prior to discharge.
- G-15 [Page ES-33 – 6’ Wall: The danger posed by such a barrier far outweighs any potential environmental benefit.
- G-16 [Page ES-34 – Five Days same objection as before, This time is not adequate. Current state law allows for 10 days for reporting and they must allow time for the trash to dry prior to weighing. It didn’t go into the harbor wet. Dependent upon the size and type of fireworks, the fireworks composition can exceed 95% of the weight of the fireworks and that will have been turned into smoke during the display. In some cases (comets and mines) it is 99.9% of the weight of the device and is total consumed while rising. It would be physically impossible to collect 50% of the weight in fireworks trash.
- G-17 [Page ES-34 “Five Persons” is an arbitrary number that does not take into consideration the size of the display, the devices used or the weather conditions at the time of the display. While it is fine to require clean up, it should be at the discretion of the Fireworks Company as to the number required.
- G-18 [Page ES-37 Please clarify definitions for who is responsible for trash receptacles, etc.
- G-19 [Page ES-38 Cumulative Impacts – No allowance has been made for the consideration that fireworks debris is biodegradable.
- G-20 [Page ES-46 Transportation Related Conditions – Make sure that is on the sponsor.
- G-21 [Page 3-1 What is a sponsorship agreement? Who can sign it? Is it required for private events?

- G-22 3.3.4 Fireworks Chemical Constituents Table 3-3 The following compounds are not in use in commercial fireworks and may be prohibited and should be removed from this list:
- Cesium:
 - Lithium
 - Phosphorus (may be used in some Military ordinance but not in fireworks)
- It should be noted that the following chemicals are rarely used and being replaced in Commercial Fireworks
- Zinc
 - Antimony
- G-23 Page 3-7 We object to the term Chemical Residue
- G-24 Page 4.1 The only fireworks display event that currently occurs along the Coronado Bayfront is the Fireworks Show Over Glorietta Bay.
- This is incorrect. There are also private shows for Loews Coronado.
- G-25 Page 4.2-22 Particle Size Distribution. Fireworks made in India do not fall under the same stringent requirements as Fireworks made in the U. S. Hence the Khaparde study should be discounted, especially as to chemicals in the fireworks.
- G-26 Page 4.2-23 Fireworks Material Deliveries: This assumption is entirely incorrect. A typical delivery for an average show will arrive in a 16' parcel van (or smaller) from either Lakeside or Alpine. From Lakeside it is 50 miles round trip. This incorrect assumption is also reported on page 4.4-17
- G-27 Page 4.2-24 Visitor Traffic. This section should not apply or be considered relevant to the fireworks displays not associated with an advertised event such as the Big Bay Boom or San Diego Pops. 4.4-17
- G-28 Page 4.2-24-4.2-25 Health Risk Assessment. "Fireworks contain a mixture of ingredients and metals that are used to project and detonate the fireworks and generate colors. Fireworks can influence the particulate matter directly by emitting firework-related species (such as certain heavy metals) and other particles that include both light and heavy metals, elemental and organic carbon, and perchlorate compounds." Analyzing chemicals in the fireworks cannot be taken into assumption once they have functioned. Because a certain chemical may be included in a compound, once ignited it's form is changed and must be analyzed on that basis. Raw amounts of chemicals are NOT being discharged into the atmosphere or waterways.
- G-29 Page 4.3-1 Impact-BIO-2: Private shows should be exempt from most mitigation measures other than post show clean up as they do not generate foot traffic or trash from the public. Generally they are so small they make little or no impact.

- G-30 Page 4.3-43 Item 9: Requiring five persons per barge for cleanup regardless of the size of the display is punitive and not well thought out. There is a big difference between a Big Bay Boom barge and a San Diego Pops barge in terms of fireworks discharged, weight, debris, etc.
- G-31 Item 10: 5 Business days does not allow materials to dry to be weighed. State law requires 10 days for fireworks reports. State law should be followed.
- G-32 Page 4.3-44 Section X.07 Conditions of Approval. Small private events should be exempt from these items since members of the general public are not invited and no additional impact is generated from an audience. This would significantly impact San Diego's Convention and Tourist Business which is responsible for most non-4th of July Displays other than the San Diego Pops.
- G-33 4.3-47 While we do not dispute that some material does wind up in the bay, we must also take into account the biodegradable nature of the material. Much is like papier Mache and should quickly dissolve. This should be accounted for in the calculation.
- G-34 4.3-49 Effects or Proposed Ordinance on Existing Fireworks Display Events. It is stated that this would have no substantial adverse effect on existing fireworks displays but this assumption is incorrect. Mitigation requirements as proposed will cost Tens of Thousands of dollars for existing non-profit organizations like the San Diego Pops. They would require the Symphony to expend Thousands of Dollars in clean up personnel for armored shore line which is mostly inaccessible when post display clean up in the form of boat cleanup has already taken place.
- G-35 4.3-60 Effects of Proposed ordinance on Existing Fireworks Display Events: This section states that it "does not propose any change in the number or nature of the existing fireworks display events" but this isn't correct. It used a 2015 number that was exceeded in 2016. Since the small private fireworks displays like the Midway fluctuate depending on San Diego's vital tourist trade and have little or not impact on the port, a higher volume of these shows should be allowed. Also the ordinance does not allow for new Barge Shows to service the tourist trade should they arise. These generate both sales tax revenue and again have a small footprint comparatively to large shows like G-30 ig Bay Boom.
- G-36 4.5.2.1 Existing Hazards Related to Pyrotechnic Devices. Many of the chemicals listed, like Arsenic, while used in the distant past, are specifically banned from use in Fireworks. We suggest you speak with modern manufacturing companies to find out the chemicals they are using.
- G-37 4.6-34 Section 3 Wires: Wires are secured in a number of ways and not just tied to nails. A more secure way is to attach them to the mortar themselves. This section should be changed to "Wires should be secured to prevent them from being pulled out and falling into the water." Rather than prescribing a method

G-38

Section 9: Again no consideration is given to the size of the display in the number of persons required. This should be based on the size of the display, and not an arbitrary number. Also the number of persons assigned to operation clean sweep is arbitrary and does not take into account the size of the display. This should be based on show size, not barge Number. This would mean the symphony would have to provide 44 people to operation clean sweep while the Big Bay Boom would only have to provide 8.

G-39

Section 10: Reporting. Again an arbitrary number has been chosen that does not coincide with other agencies. This should be a minimum of 10 days.

General: Explanations and commentary are in blue.

G-40 Section .03 Definitions. This section is unclear on the roles of Fireworks Operators, Fireworks Organizers and Sponsors. Many sections are unclear as to who is responsible for what. We request that you clean up this section to better define those roles. Sponsors hire Fireworks Companies (licensed by the State of California) and Companies hire operators (licensed by the State of California). Customarily, and by contract, Sponsors provide Firing Sites, Security, etc. unless otherwise negotiated. This should be clearly defined in the ordinance.

G-41 “Alternative fireworks” as defined do not exist nor are any in commercial production that we are aware of. This section should be struck.

Section 5. Permits – Application

G-42 The 60 day requirement should be changed to a 10 day permit requirement like the Fire Department and State Law. We suggest instead of issuing permits on individual events, it might be simpler to issue a blanket permit like the Water Quality Board and receive reports. This will simplify making sure all requirements are met because permittees will have satisfied insurance and all other standard requirements in advance of being issued their annual permit.

G-43 Section 7. Location. There are other events such as conventions that launches fireworks from a barge not at any of the stated locations. Provisions should be made to service this vital convention business that generates millions of dollars in revenues.

G-44 Section B. U. S. S. Midway Museum – 23 events are not enough. This fluctuates between seasons. This will severely impact our revenues and cut out sales tax revenues generated by Fireworks Displays. Destination management companies will have their revenues impacted as well since they generally mark up our services to their clients. Since these shows have little or no impact on the port tenants or residents more displays should be allowed. We suggest that this be changed to 80 since these are low-impact with a high dollar return to the Midway and the Port.

G-45 Section C. San Diego Symphony Summer Pops; With the potential for their permanent new entertainment venue this number should be increased. We suggest a minimum of 50.

G-46 (d) Chemical Composition: Currently there are no Commercially Available fireworks that meet this requirement. This section should be struck on those grounds or worded that as they become commercially available they will be used on the bay.

2. Packaging

G-47 a. Please add the words ‘non-required’ labels to the section. There are certain Federal and State Labeling requirements and it would be illegal to remove them.

e. Protection of Sensitive Species and Habitat

G-48 3. Security: Please change to read For *'advertised or non-private'* Fireworks Display Events. Private shows like the Midway do not advertise or bring people into public viewing areas. Also, *'Fireworks Organizer'* should be changed to *'Sponsor'*. It is usually and customary for the Sponsor to provide security on displays and generally a matter of contract between Fireworks Companies and Sponsors.

G-49 4. Signage: For *'advertised or non-private'* Fireworks Display Events . . . Also, *'Fireworks Organizer'* should be changed to *'Sponsor'*, for the reasons listed above.

G-50 5. Education: Beginning not less than Seven (7) days before *'advertised or non-private'* Fireworks Display Events with public . . .". Also, *'Fireworks Organizer'* should be changed to *'Sponsor'*.

(f) Best Management Practices.

G-51 2. While well intentioned, please strike *Unless prohibited by the municipal fire marshal with jurisdiction over the Fireworks Display Even, barges shall be equipment with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the Fireworks launch area to contain debris.* This is simply a safety issue on many levels. From an operator safety standpoint encasing them in a 6' Enclosure with explosives is obviously unsafe. Also, most of the debris is not generated at this level. Lastly, hopefully we don't need to go into the physics of putting a big giant sail on a barge and trying to tug it on a breezy bay. The barrier will wind up in the water and create a potential maritime hazard.

G-52 3. Please make the following changes: Fires from the electric match placed in the Fireworks Fuse shall ~~be wrapped around nails that are installed on the racks~~ be secured in such a way to prevent wires from being pulled out and falling into the water. Wires are secured in a number of ways and not just tied to nails.

G-53 9. This section should be struck entirely or reworked. First of all, small shows are being discriminated against by this punitive rule. While you have allowed the Big Bay Boom to discharge 5,342 pounds of Fireworks, you are only requiring them to provide 20 man days for clean-up. The San Diego Symphony, conversely, fires 72% less Fireworks and produces much less debris but you are asking them to pay for 100 Man Days, or 80% more cost in bay clean up. This is arbitrary and unfair. Similar comparisons can be made to all other displays. Lastly, this will be delegated by contract to the Sponsor and so this wording should be incorporated. The Symphony will buy 100 man days by contract, not the Fireworks Vendor.

G-54 Section 10: Reporting. Again an arbitrary number has been chosen that does not coincide with other agencies. This should be a minimum of 10 days. Also this section provides the same punitive problem as section 9, asking for man power based on the numbers of barges and not the numbers of fireworks. You are asking the San Diego Symphony to provide 80% more man power for the privilege of firing 72% less fireworks. Also, by contract, this will not fall to the Fireworks Organizer but to the Sponsor and should be worded as such.

- G-55 [Section 11: Change the word *Fireworks Operator* to *Sponsor*. *Sponsors handle security, crowd control, etc. Fireworks Companies do not.*
- G-56 [(h) Event Transportation and Parking Management Plans. Change *Fireworks Organizer* to *Sponsor*. *Fireworks Companies do not undertake parking management, etc. That falls to sponsors.*
- G-57 [Section_.8 (c) Cost Recovery. *What is the fee?*

Response to Comment G-1

This comment is an introductory statement that thanks the District for the opportunity to review and comment on the Draft EIR and indicates that Fireworks America is providing comments on the Draft EIR and the proposed ordinance. The comment concludes by providing a contact name and information.

The District appreciates Fireworks America's interest in the proposed project. This comment does not raise any issues needing a response pursuant to CEQA.

Response to Comment G-2

This comment provides an excerpt from Draft EIR Section ES.2.3, page ES-3, footnote 1 and requests clarification on the Project Objectives with reference to exclusion of consumer fireworks.

The intent of the proposed project is to govern professional grade fireworks display events, rather than consumer fireworks sold to the public for general recreational use. Section 8.02(b)(11) of the District Code prohibits the discharge of fireworks by any person within a District park. This comment does not raise any environmental issues requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required.

Response to Comment G-3

The comment provides an excerpt from Draft EIR Section ES.2.3, page ES-3, footnote 1 and states that flash powder is not used in fused set pieces.

The referenced footnote of the Draft EIR identifies the U.S. Bureau of Alcohol, Tobacco, Firearms and Explosives general definition of a traditional fireworks display event (U.S. ATF 2016). The District understands that there might be some variation in the types of fireworks display used in the United States. This comment does not raise any environmental issues requiring a response pursuant to CEQA. No changes to the Final EIR are required.

Response to Comment G-4

The comment provides an excerpt from Draft EIR Section ES-1 and states that only Chula Vista, National City, and Chula Vista are listed. The comment also asks if this precludes other singular commercial events or if they are grandfathered in under the proposed ordinance.

The proposed project includes four proposed new fireworks display events in Chula Vista and National City, two of which would occur on the Fourth of July. The intent of the proposed project is to govern fireworks display events within the District's jurisdiction, including the existing events identified in Tables 2-1 and 2-2 of the Draft EIR. This comment does not raise an issue regarding the adequacy of the EIR and no response is required pursuant to CEQA. Therefore, no changes to the Final EIR are required.

To clarify, the proposed ordinance would govern existing and proposed new fireworks displays within San Diego Bay and Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the Districts tenants (see Draft EIR Section ES2.4 and the proposed ordinance). The proposed ordinance identifies locations where events can occur, subject to a permit, areas subject to District approval and not identified cannot be used for fireworks displays (see Section X.07(a) of the proposed ordinance. To the extent the comment's reference to being

“grandfathered in” under the proposed ordinance means not subject to the provisions of the proposed ordinance, there are no fireworks display events within the District’s jurisdiction that are exempt from the provisions of the proposed ordinance.

Response to Comment G-5

The commenter states that “mine fireworks” are too quiet to be considered in the same class as “salute fireworks.”

The descriptions of both the Quiet Fireworks Alternative and No Salute Fireworks Alternative have been updated to clarify that salutes are the only type of fireworks that are always specifically designed to be loud. The references to mines and rockets have been removed because these types of fireworks are not always especially loud. All fireworks permitted under the Quiet Fireworks Alternative would still be subject to the noise limit provided in the Draft EIR.

Response to Comment G-6

The comment requests clarification on whether noise measurements considered the lift or the break of the firework, and whether the measurement location was appropriate considering whether the lift or the break was measured.

The noise limit refers to the break noise; the Final EIR has been updated to clarify this. The purpose of having a fixed-distance measurement point is to provide a standard specification for fireworks’ noise levels that can provide a consistent limit for all fireworks regardless of actual launch location. Because the distance to a spectator area will vary from one launch location to the next, the use of a spectator area for noise assessment would provide inconsistent results between launch locations. Therefore, no change has been made to the Final EIR in response to this comment.

Response to Comment G-7

This comment asks for a rewording of the mitigation measure MM-AQ-2(d) 1. to require replacement of perchlorate with other oxidizers as they become commercially available, rather than requiring the permit applicant to establish that such alternative fireworks are not available. The comment does not address the adequacy of the EIR. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-8

The comment is requesting that the phrase “non-required” be added before the word “labels” in MM-BIO-1 (d)2.A (Section X.07 – Permits – Conditions of Approval) because state and federal required labels cannot be removed prior to discharge. The comment does not address the adequacy of the EIR. The District agrees with the commenter and, in response to this comment, the District has made the following revision to the mitigation measure MM-BIO-1:

“2. Packaging.

- A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all fireworks to be used in the event.”

and the proposed ordinance §7 (d):

2. Packaging.

- A. Prior to commencement of a Fireworks Display Event, the Fireworks Operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all Fireworks to be used in the event.

Response to Comment G-9

The comment requests that MM-BIO-1 (f)2 be modified to removed references to the 6-foot fire retardant debris barrier, and suggests that such a barrier would pose a risk. The comment further requests studies showing that a 6-foot barrier is effective in containing debris, and requests consideration of barriers of different heights. Please see response to comment J-9 below.

Response to Comment G-10

The comment states that the number of persons required for post-event cleanup (per MM-BIO-1 (f)9) does not take into account the size of the display and other conditions, and that the fireworks company should determine the number of persons required for cleanup at its discretion. The comment requests that the number of persons required to participate in clean-up of fireworks trash and debris should be at the discretion of the fireworks company. The clean-up of fireworks trash and debris required by MM-BIO-1 is required to mitigate the potential significant environmental impacts of the proposed new fireworks display events. Leaving the number of persons required to participate to the discretion of the fireworks company could be considered an improper deferral of mitigation under CEQA. The District has implemented this requirement on prior fireworks events and maintains this number is prudent for larger shows. In light of the importance of this mitigation measure, no change will be made in the Final EIR. Please see also response to comment G-30.

Response to Comment G-11

The comment states that the duration of 5 business days stated in MM-BIO-1 (f)10 is not adequate for reporting, and that state law allows 10 days for reporting. This comment does not address the adequacy of the EIR. In response to this comment the District has revised the requirement in the proposed ordinance §7(f) 10. to match State law and require reporting and weighing in 10 days, as follows:

- “10. Within ~~five~~ ten (510) business days after a Fireworks Display Event, the Fireworks Organizer shall provide the Executive Director with the photographs and written evidence of the weight of the Fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. ...”

And revisions to MM-BIO-1 in the Final EIR, as follows:

- “10. Within ~~five~~ ten (510) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the weight of the fireworks trash and debris collected is less than fifty percent (50 percent) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other

launch site used in the fireworks display event to participate in the next scheduled “Operation Clean Sweep” or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.”

Response to Comment G-12

This comment asks that consideration be given to the required collection of trash and debris weighing 50 percent of fireworks show weight be reconsidered because the fireworks components that turn to smoke can be up to 95 percent of the initial weight. The District has not received or been able to obtain any information supporting the identified level of combustible material within a firework. The analysis in the EIR presents a worst-case scenario as it assumes a greater amount of debris could enter the water. In the event less than 50 percent becomes debris, the associated clean up requirements result in additional trash collected from the Bay rectifying or compensating for any potential impact from debris within the Bay whether from the fireworks themselves or incidentally from operations or spectators of the events. In the absence of evidence showing that a smaller percentage of the weight of fireworks ends up as debris that falls to the surrounding land or waters, the requested change in the Final EIR is not warranted.

Response to Comment G-13

The comment states that the parties responsible for implementation of MM-BIO-2 are unclear.

Although the introductory paragraph of MM-BIO-2 indicates that both the fireworks organizer and the fireworks operator are responsible for its implementation, MM-BIO-2 requires compliance with certain provisions of the proposed ordinance that specifically identify which party is responsible for implementation. Therefore, no changes to the Final EIR are required.

Response to Comment G-14

The comment restates concerns about Section X.07 – Permits – Conditions of Approval (see comment G-8) as included in MM-WQ-1 related to removal of state and federal required labels. Please see response to comment G-8.

Response to Comment G-15

The comment restates concerns about Section X.07 – Permits – Conditions of Approval (see comment G-9) as included in MM-WQ-1 related to a 6-foot debris barrier. Please see response to comments G-9 and J-9.

Response to Comment G-16

The comment restates concerns about Section X.07 – Permits – Conditions of Approval as included in MM-WQ-1 that 5 business days is an insufficient time for reporting (see comment G-11), and about the collection of fireworks trash and debris equaling less than 50 percent of the net weight of fireworks launched (see comment G-12). Please see responses to comments G-11 and G-12.

Response to Comment G-17

The comment restates concerns about Section X.07 – Permits – Conditions of Approval as included in MM-WQ-1 requiring a cleanup crew of five persons (see comment G-10). Please see response to comment G-10.

Response to Comment G-18

The comment is requesting clarification related to responsibility for trash receptacles and collection as stated under MM-WQ-2 and Section X.07(f)(11) of the proposed ordinance. These provisions incorrectly state that the “Fireworks Operator” is responsible for increasing the number of trash receptacles at major viewing areas prior to a fireworks display event. The Final EIR and the proposed ordinance has been revised to state that the “Fireworks Organizer” is the party responsible for implementing this measure. This clarifying language is included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment G-19

The comment states that the cumulative analysis under Impact-C-WQ-1 does not acknowledge the biodegradable nature of fireworks debris. This comment asks that consideration be given to the biodegradable nature of fireworks materials under cumulative impacts. The District has not received or been able to obtain any information establishing the specific amount of biodegradable material in fireworks debris. Because a larger amount of biodegradable material in fireworks debris would reduce the potential adverse impact of fireworks debris on the environment, no change in the Final EIR is required.

Response to Comment G-20

The comment states that responsibility for implementation of MM-TRA-1 should be on the project sponsor. This comment does provide any explanation or justification for placing the responsibility for implementing MM-TRA-1 on the fireworks sponsor rather than on the fireworks organizer. Therefore, no changes to the Final EIR are required. For clarification, as identified in MM-TRA-2, implementation of this mitigation measure is the responsibility of the fireworks organizer not the sponsor. The sponsor may ultimately provide the funding used to pay for the event transportation and parking management plan, but it is the responsibility of the organizer to prepare and implement the plan.

Response to Comment G-21

The comment is requesting clarification of sponsorship agreements, signatories, and requirements as discussed in Section 3.1. A Sponsorship Agreement is an agreement by which the District agrees to provide funding or other support for an event.

Response to Comment G-22

The comment is requesting removal of cesium, lithium, and phosphorous from Table 3-3, as they are not used in commercial fireworks. The commenter further states that zinc and antimony are rarely used and are being replaced in commercial fireworks.

The list of fireworks chemical constituents summarized in the Draft EIR and Water Quality Technical report were obtained directly from the RWQCB's General Permit, Fact Sheet Table 1 (Page F-9). No changes to the Final EIR are required in response to this comment.

Response to Comment G-23

The comment objects to the term "chemical residue" as used in Section 3.3.3, subheading *Aerial Fireworks/Shells*.

The term "chemical residue" was taken directly from the RWQCB's General Permit Fact Sheet (Page F-7), which states, "Most of the incendiary elements and shell casings burn up in the atmosphere; however, portions of the casings and some internal structural components and chemical residue fall back to the ground or receiving water bodies..." No changes to the Final EIR are required in response to this comment.

Response to Comment G-24

The comment states that private shows for Loews Coronado also occur along the Coronado Bayfront, and that it is incorrect for the Draft EIR to state that the Fireworks Show Over Glorietta Bay is the only fireworks display event that currently occurs there.

In order to determine the baseline conditions at the time the NOP was issued for public review, the District reached out to regulatory agencies and all tenants and obtained all permits from the member cities and the RWQCB for firework display events that occurred within 2015. Based on this outreach, no shows were identified to occur at Loews Coronado in 2015. Therefore, fireworks display events at Loews Coronado are not included in the Draft EIR or the proposed ordinance as an existing show that requires a discretionary action or is anticipated to require a discretionary action by the District. However, as identified in Table 5-2 of the Draft EIR, Loews Coronado had one barge-based fireworks display event that occurred in 2014 and has been included in the cumulative analysis (Draft EIR, Chapter 5, *Cumulative Impacts*).

Response to Comment G-25

The comment suggests that the Khaparde study referenced on page 4.2-22 should be discounted, as the fireworks made in India are not governed by the same regulations and requirements as those made in the U.S.

The Khaparde study was only referenced to assist in estimating the way combusted particulate matter disperses in the atmosphere since dispersion of particulate matter is dependent on the size and weight of the particles created after burning of the fireworks. The Khaparde study was not used to estimate the total amount of emissions (e.g., pounds per day of PM10) or to determine what chemicals make up the fireworks themselves, but instead was used to estimate the size of the particles following the burning of the fireworks. Moreover, there are no requirements that fireworks used in these events be made in the United States. Therefore, because the Khaparde study was not used to determine what chemicals make up the fireworks, no changes are necessary to the analysis in the Draft EIR.

Response to Comment G-26

The comment states that the material deliveries described on pages 4.2-23 and 4.4-17 are incorrect, and that an assumption of a 16-foot parcel van from either Lakeside or Alpine should have been used.

This assumption was made because it was unknown at the time of analysis where fireworks materials would come from. It is reasonable to assume that materials come from China, and it is reasonable to assume that those fireworks would pass through the Port of Los Angeles and/or Long Beach. While this assumption may be conservative in light of the fact that fireworks may instead be delivered from Lakeside or Alpine, emissions from material deliveries are small (approximately one pound of PM10 on peak Fourth of July event day) and air quality impacts would remain unchanged if the assumption was changed. Therefore, no changes are necessary to the analysis in the Draft EIR.

Response to Comment G-27

The comment states that the visitor traffic analysis on page 4.2-24 should not apply to fireworks display events other than the Big Bay Boom or San Diego Pops concerts because of the lack of similar advertising.

The analysis of visitor traffic is qualitative and does not quantitatively attribute emissions to both advertised and non-advertised events. Instead, the analysis discusses both the limitations of numerically attributing vehicle traffic to events (as shown in Section 4.2.4.1 of the Draft EIR) and the fact that it is unlikely events contribute emissions that would contribute substantially to an existing or projected air quality standard (as discussed in Section 4.2, *Air Quality and Health Risk*, under Threshold 2 of the Draft EIR). The analysis of visitor traffic has no bearing on air quality or greenhouse gas impacts or analysis thereof. No changes are necessary to the analysis in the Draft EIR.

Response to Comment G-28

The comment states that the health risk assessment on pages 4.2-24 and 4.2-25 does not consider the changes in chemical compounds following ignition, and that raw chemicals are not being discharged into waterways or the atmosphere.

The health risk assessment is based on emission factors that were based on literature review. For example, modeling to determine the concentration of copper at downwind receptors was based on the emission factors presented in the Croteau et al. (2010) study, which estimated emission factors through air sampling in an airtight room after combustion. The analysis is not based on raw materials but instead on the estimated amount of metals and other compounds that are generated after the fireworks are combusted (or ignited). No changes are necessary to the analysis in the Draft EIR.

Response to Comment G-29

Related to Impact-BIO-2, the comment states that private shows should be exempt from most mitigation measures, except for post-show cleanup, because they do not generate foot traffic or public trash and are so small that they make little or no impact. The comment does not provide any evidence in support of these assertions. Impact BIO-2 relates to the proposed new fireworks display events at the Chula Vista and National City Bayfronts. The proposed new events are public, not

private, events and are of sufficient size to warrant the approach utilized in the Draft EIR. No changes in the Final EIR are required or warranted.

Response to Comment G-30

The comment states that requiring five persons per barge for clean-up, regardless of the size of the display, is punitive and not well thought out. This comment asserts that the requirement for five clean-up crew members per barge is too broad as it doesn't recognize the difference in possible events sizes, between Big Bay Boom for example and a Summer Pops show(s).

The requirement for the fireworks organizer to provide five persons per barge for post-display clean-up efforts does take into account the size of the show. The Big Bay Boom is the only fireworks display event that uses more than one barge; all other existing and proposed fireworks displays use one barge (or none). Therefore, except for the Big Bay Boom, the fireworks organizer for all other fireworks display events will be required to provide only five persons for the post-event clean-up effort.

Response to Comment G-31

The comment restates concerns about Section X.07 – Permits – Conditions of Approval as included in MM-BIO-1 about 5 business days being inadequate for reporting (see comment G-11). Please see response to comment G-11. Revisions to MM-BIO-1 have been made to revise 5 to 10 days as requested by the comment. This clarifying language is included in Chapter 3, *Errata and Revisions*, of the Final EIR.

Response to Comment G-32

The comment states that private events should be exempt from MM-BIO-2 because members of the general public are not invited and the events have no impact. The commenter further states that requiring implementation of MM-BIO-2 would harm San Diego's convention and tourist business.

This comment does not provide any evidence in support of its assertions and does not raise any environmental issues or address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project. Please see response to comment G-29.

Response to Comment G-33

Regarding the discussion on page 4.3-47 of debris entering the water, the commenter requests that the biodegradable nature of fireworks debris should be accounted for. Please see responses to comments G-12 and G-19 above.

Response to Comment G-34

The comment states that the conclusion on page 4.3-49 that the proposed ordinance would have no substantial adverse effect on existing fireworks displays is incorrect, and that mitigation compliance would cost tens of thousands of dollars for non-profit organizations like the San Diego Pops.

This comment does not provide any evidence in support of its assertions and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR

are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-35

The comment states that the Draft EIR's assertion that "The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events" is incorrect, as the Draft EIR uses numbers from 2015 that were exceeded in 2016. The commenter further states that a higher volume of small private fireworks display events should be allowed. Finally, the commenter states that the proposed ordinance does not allow for new barge shows in the future, which would generate sales tax revenue and have a small footprint.

The list of existing fireworks display events includes those events that occurred in or before 2015 because CEQA normally requires an EIR to establish the environmental setting based on conditions that exist at the time the NOP is published. This comment does not raise any environmental issues or address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-36

The comment states that some of the substances discussed in Section 4.5.2.1 of the Draft EIR were once used but are now banned from use, and suggests that modern fireworks manufacturing companies be consulted to determine the chemicals currently in use.

The list of fireworks chemical constituents summarized in the Draft EIR and Water Quality Technical report and were obtained directly from the RWQCB's General Permit, Fact Sheet Table 1 (Page F-9). Therefore, in order to provide an analysis consistent with the General Permit, no revisions to the Final EIR were made in response to this comment.

Response to Comment G-37

The comment notes that wires can be secured in a number of ways and suggests that language in MM-WQ-1 (f)3 be modified to allow different methods to do so, as follows: "Wires from the electric match placed in the fireworks fuse shall be ~~wrapped around nails that are installed on the racks~~ secured in such a way to prevent wires from being pulled out and falling into the water."

This comment does not address the adequacy of the EIR. In response to this comment the District has revised the requirement in the proposed ordinance §7(f) 3. as follows:

3. Wires from the electric match placed in the fireworks fuse shall be secured ~~wrapped around nails that are installed on the racks~~ to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event."

In addition, MM-WQ-1 has been revised as follows:

“(f) 3. Wires from the electric match placed in the fireworks fuse shall be ~~secured wrapped~~ secured wrapped around nails that are installed on the racks to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event.”

Response to Comment G-38

The comment restates concerns about Section X.07 – Permits – Conditions of Approval, as included in MM-BIO-1, requiring a cleanup crew of five persons (see comments G-10, G-17, and G-30). The commenter further clarifies that cleanup crew size should be based on show size rather than barge size. Please see response to comments G-10 and G-30.

Response to Comment G-39

The comment restates concerns about Section X.07 – Permits – Conditions of Approval, as included in MM-BIO-1, about 5 business days being inadequate for reporting (see comments G-11, G-16, and G-31). Please see response to comment G-11. Revisions to MM-BIO-1 have been made to revise five (5) to ten (10) days as requested by the comment.

Response to Comment G-40

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.03, Definitions. The commenter requests clarification on the roles and responsibilities of Fireworks Operators, Fireworks Organizers, and Sponsors, but does not identify any specific provision of the proposed ordinance that requires clarification. Accordingly, no further response is possible or warranted.

Response to Comment G-41

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.03, Definitions. The commenter states that “Alternative Fireworks” as defined do not exist and requests that the section be struck from the proposed ordinance. Please see response to comment G-7. The provisions in the proposed ordinance are intended to ensure the use of the least environmentally impactful type of fireworks available now and in the future.

Response to Comment G-42

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.05, Permits – Application. The commenter requests that the requirement that the application for a permit be filed 60 days prior to the event should be changed to 10 days, in accordance with fire department requirements and state law. The commenter further suggests that permits be issued annual permits rather than permits for individual events to ensure that insurance and other standard requirements can be met prior to issuance of an annual permit.

This comment does not raise any environmental issues or address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-43

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (a), Location of Fireworks Display Events. The commenter suggests that provisions should be made for other events that launch fireworks from barges at locations other than those discussed in the proposed ordinance.

This comment does not raise any environmental issues or address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-44

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (a)2B. The commenter states that 23 shows per year on or adjacent to the U.S.S. Midway Museum is insufficient and requests expansion to 80 events per year to avoid affecting revenue, because these shows have little or no impact on the port tenants or residents.

This comment does not raise any environmental issues or address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-45

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (a)2C. The commenter suggests expanding the number of allowed shows per year for the San Diego Symphony Summer Pops concerts to a minimum of 50 to accommodate the Pops' new permanent venue.

This comment does not raise any environmental issues or address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment G-46

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (d)1, Chemical Composition. The commenter states that fireworks described in this section are not currently commercially available, and requests that either the section be struck or be modified to allow that such fireworks would be used once they are commercially available. Please see response to comment G-7.

Response to Comment G-47

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (d)2, Packaging. The commenter

requests the addition of the phrase “non-required” to specify that only those labels not required by federal or state law shall be removed (see also comments G-8 and G-14).

Please see response to comment G-8. Revisions to MM-BIO-1 have been made to exclude labels mandated by State and Federal laws.

Response to Comment G-48

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (e)3, Security. The commenter requests modification of the text as follows:

Security. For advertised or non-private Fireworks Display Events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the ~~Fireworks Organizer~~ Sponsor shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays.

The requested changes do not relate to an environmental issue or to the adequacy or completeness of the EIR. In addition, the District does not believe that the requested changes are warranted or necessary. Nonetheless, the comment will be included in the material provided to the Board of Port Commissioners for their consideration of whether or not to adopt the proposed ordinance. No further response is required.

Response to Comment G-49

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (e)4, Signage. The commenter requests modification of the text as follows:

Signage. For advertised or non-private Fireworks Display Events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half-mile of nesting colonies or habitat areas for federally or state-listed species, the ~~Fireworks Organizer~~ Sponsor, in cooperation with the District, shall post temporary signage along primary access points to sensitive nesting colonies and habitat areas to identify safe viewing locations, to educate visitors on locations of sensitive wildlife habitats, to prevent viewers from trespassing into sensitive areas and to encourage appropriate viewing behavior.

The requested changes do not relate to an environmental issue or to the adequacy or completeness of the EIR. In addition, the District does not believe that the requested changes are warranted or necessary. Nonetheless, the comment will be included in the material provided to the Board of Port Commissioners for their consideration of whether or not to adopt the proposed ordinance. No further response is required.

Response to Comment G-50

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (e)5, Education. The commenter requests modification of the text as follows:

Education. Beginning not less than seven (7) days before advertised or non-private Fireworks Display Events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the ~~Fireworks Organizer~~ Sponsor shall implement a public education program using social media, press releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to reminds viewers of appropriate viewing behavior in and near sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).

The requested changes do not relate to an environmental issue, adequacy, or completeness of the EIR. In addition, the District does not believe that the requested changes are warranted or necessary. Nonetheless, the comment will be included in the material provided to the Board of Port Commissioners for their consideration of whether or not to adopt the proposed ordinance. No further response is required.

Response to Comment G-51

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)2. The comment restates concerns regarding a 6-foot debris barrier (see comments G-9 and G-15). The commenter further clarifies that such a barrier could potentially create a maritime hazard. Please see response to comment J-9.

Response to Comment G-52

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)3. The commenter restates concerns with specifying that wires be secured with a nail (see comment G-37) and suggests the following modification to the text: “Wires from the electric match placed in the fireworks fuse shall ~~be wrapped around nails that are installed on the racks~~ secured in such a way to prevent wires from being pulled out and falling into the water.” Please see response to comment G-37. Revisions to MM-WQ-1 and the proposed ordinance have been included to address this comment.

Response to Comment G-53

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)9. The commenter restates concerns about Section X.07 – Permits – Conditions of Approval as included in MM-BIO-1 requiring a cleanup crew of five persons (see comments G-10, G-17, G-30, and G-38). The commenter further clarifies that the size of cleanup crew will be delegated by contract to the Sponsor. Please see response to comments G-10 and G-30.

Response to Comment G-54

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)10. The comment restates concerns about Section X.07 – Permits – Conditions of Approval, as included in MM-BIO-1, about 5 business days being inadequate for reporting (see comments G-11, G-16, G-31, and G-39). The

comment further states that manpower requirements should not be based on the number of barges, but rather the number of fireworks used. The comment further states that the Sponsor, and not the Fireworks Organizer, will be responsible for compliance with this condition by contract. Please see response to comment G-11. Revisions to MM-BIO-1 have been revised to 5 to 10 days as requested by the comment. In addition, please see response to comment G-30 regarding the number of clean-up crew members.

In addition, this comment suggests that the responsibility for implementing this condition of the proposed ordinance be delegated to the sponsor rather than the organizer. This comment does not address the adequacy of the EIR and no response is required. Nonetheless, the District takes this opportunity to clarify that the “fireworks organizer” is identified as responsible for ensuring security. Please see Section X.03 of the proposed ordinance for definitions of the terms *Fireworks Operator*, *Fireworks Organizer*, and *Sponsor*.

Response to Comment G-55

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)(11). The comment requests changing “Fireworks Operator” to “Sponsor,” as fireworks companies do not handle tasks such as security and crowd control.

Please see response to comment G-18, which acknowledges that this provision of the proposed ordinance will be corrected to substitute the term “Fireworks Organizer” for the term “Fireworks Operator.”

Response to Comment G-56

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (g), Event Transportation and Parking Management Plan. The commenter requests changing “Fireworks Organizer” to “Sponsor” and states that fireworks companies do not undertake parking management.

Please see response to comment G-20. The requested changes do not relate to an environmental issue or to the adequacy or completeness of the EIR. In addition, the District does not believe that the requested changes are warranted or necessary. Nonetheless, the comment will be included in the material provided to the Board of Port Commissioners for their consideration of whether or not to adopt the proposed ordinance. No further response is required.

Response to Comment G-57

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.08, General Provisions, subsection (c), Cost Recovery, and asks what the fee will be. The District has not yet determined the amount of the fee. In the event the proposed ordinance is adopted by the Board of Port Commissioners, the District will establish the amount of any fees that are required pursuant to the Article 2, Cost Recovery, of the District Code.

4.4.8 Comment Letter H: H.P. Purdon

Port of San Diego
Big Bay Boom
An Independence Day Spectacular

May 1, 2017

San Diego Unified Port District
Wileen Manaois
Real Estate Development Department
3165 Pacific Highway
San Diego, CA 92101-1128

RE: DRAFT EIR FOR SAN DIEGO BAY FIREWORKS DISPLAY EVENTS

Dear Mr. Manaois:

This letter is to communicate the concerns we have regarding the Ordinance and Draft EIR as it pertains to the operation of the Port of San Diego Big Bay Boom July 4th Fireworks Show. The Big Bay Boom provides over \$500,000 of TOT funds to our community, has an attendance of over 500,000 and creates over \$10.6 million of economic impact for our region. It is continually ranked in the top 5 July 4th fireworks shows in the nation.

H-1 With that backdrop let me as the "Fireworks Organizer" (executive producer) of the event the concerns I have for the proposed Ordinance and subsequent EIR. I will not be addressing the many concerns the "Fireworks Operators" (Pyro Spectaculars & Pacific Tugboat Service) may have with the ordinance or EIR. They are the appropriate entities to address the actual fireworks displays and Best Management Practices for on the water operations of the event. My job is to provide for the various permitting, environmental responses, fund raising, sponsor contracts and fulfillment and budgeting issue to make the event successful.

Section__ .05 – PERMITS – APPLICATION

H-2 (a) The timing of the proposed date of 60 days in advance of July 4th is impossible to meet. The date for file the permit request would be May 4, 2017, for the July 4, 2017, show. I assume this will be waived for 2017.

H-3 (c) Our NPDES permit with the Water Boards (RWQCB) is done 9 months in advance of the next fireworks show along with the Best Management Practices agreement.

Section__ .07 – PERMITS – CONDITIONS OF APPROVAL

(f) Best Management Practices

H-4

NOTE: We have provided and paid for many years of water monitoring with each year's results being "no damage has been done to the water body" from our fireworks operations. This is an important result and should be noted.

H-5

7. The sweeps of the immediate area around the barges for the Big Bay Boom are conducted by 8 of the approximately 16 patrol barges. Two volunteer patrol boats per barge will conduct the sweep around the location of the barge after it has left the area. Pool skimmers are used to do this exercise.

H-6

8. Returning to the detonation zones and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris has been done in the past only to find after two tide changes very little if any fireworks debris was found. This is an expensive use of time and people with very little resulting debris found.

H-7

9. The morning after the event we have been conducting another sweep of the shoreline. We have used crews of at least 20 people for the 4 barge event. The debris collected has been weighed and photographed. Frankly, this is a very expensive use of time and people as there will have been two tide changes and little if any debris has been found in the past.

H-8

(h) Regarding the Event Transportation and Parking Management Plan (ETPMP), please find on the Big Bay Boom website (www.bigbayboom.com) an extensive outline on how the public can access the event with full transportation and parking options. This should suffice as the annual plan for the Port to review.

H-9

The general sense of the Draft EIR and Ordinance for San Diego Bay fireworks seems to put a lot of unnecessary burden on the Fireworks Operator and the Fireworks Operator. These burdens' will amount to increased costs and time to manage the event. This will undoubtedly require increased sponsor fees for all sponsors including the title sponsor, the Port of San Diego.

Best regards,

H.P. Purdon

H. P. "Sandy" Purdon
Executive Producer, Port of San Diego Big Bay Boom July 4th Fireworks Show

Response to Comment H-1

This comment is an introductory statement and briefly describes the Big Bay Boom event and states concerns with the proposed ordinance and Draft EIR.

The District has reviewed the letter regarding the proposed ordinance and the Draft EIR as it pertains to the operation of the Port of San Diego Big Bay Boom Fourth of July Fireworks Show. This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. The specific comments provided later in the comment letter are listed separately along with the District's individual responses below. No changes to the EIR are required.

Response to Comment H-2

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.05, Permits – Application, subsection (a). The comment states that it is not possible to submit the permit application 60 days in advance of the July 4, 2017, show. The comment assumes that this requirement would be waived for 2017.

This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the EIR are required. The District considers 60 days prudent to allow the District to review and process the application and is consistent with park permit requirements. In the event the proposed ordinance is adopted by the Board of Port Commissioners and becomes effective before the Fourth of July show for this year (2017), the District will determine what provisions of the proposed ordinance are possible to be implemented in light of the time constraints identified in the comment.

Response to Comment H-3

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.05, Permits – Application, subsection (c). The comment states that his National Pollutant Discharge Elimination System permit is done 9 months in advance of the next fireworks show along with the Best Management Practices agreement.

As required by this condition of the proposed ordinance, the National Pollutant Discharge Elimination System and the Best Management Practices agreement shall be submitted to the District along with the application. This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required.

Response to Comment H-4

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f). The comment notes that it has performed many years of water monitoring that have shown no damage done to the water body as a result of fireworks operations.

As identified in the Water Quality Technical Report (Appendix G) and Section 4.6, *Hydrology and Water Quality*, of the Draft EIR, the District has considered the water monitoring results conducted for the Big Bay Boom fireworks display event. This comment does not raise any environmental

issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the EIR are required

Response to Comment H-5

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)7. The comment states that sweeps of the immediate area around the barges for the Big Bay Boom are conducted by eight patrol barges, and that two volunteer patrol boats per barge conduct the sweeps using pool skimmers.

The comment describes aspects of the clean-up program for the immediate area around the barges for the Big Bay Boom Fireworks Display Event. This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the Final EIR are required.

Response to Comment H-6

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)8. The comment states that returning to detonation zones and quays, piers, and docks adjacent to the fireworks detonation zones has recovered very little if any fireworks debris in the past. The comment states that this is an expensive use of time with little result.

The District has reviewed the information from the Big Bay Boom Fireworks Display Event regarding the clean-up efforts that currently take place in the detonation zone and quays, piers and docks adjacent to the fireworks detonation zone. Notwithstanding the comment's concern that this clean-up activity does not recover a substantial amount of fireworks trash or debris, this activity is an important part of the comprehensive clean-up program required by the District in the Best Management Practices for fireworks display events. This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment H-7

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (f)9. The comment states that they have conducted sweeps of the shoreline the morning after the event and recovered very little debris in the past. The comment also states that this is an expensive use of time with little result.

The District has reviewed the information from the Big Bay Boom Event regarding the cleanup of the shoreline the morning after the event. Notwithstanding the comment's concern that this clean-up activity does not recover a substantial amount of fireworks trash or debris, this activity is an important part of the comprehensive clean-up program required by the District in the Best Management Practices for fireworks display events. This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

Response to Comment H-8

This comment refers to the text of the proposed ordinance as presented in Appendix D of the Draft EIR, Section X.07, Permits – Conditions of Approval, subsection (h). The comment requests that the District review the Big Bay Boom parking and transportation information available on its website at www.bigbayboom.com and suggests that this existing information should suffice as an Event Transportation and Parking Management Plan.

The District has reviewed the information regarding the Big Bay Boom Event Transportation and Parking Management Plan for informational purposes, but does not consider the information to be a substitute for the Event Transportation and Parking Management Plan required by the proposed ordinance. This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the EIR are required.

Response to Comment H-9

The commenter states that the proposed ordinance and Draft EIR places an unnecessary burden upon the Fireworks Operator and Fireworks Organizer and states that implementation of the proposed ordinance would amount to increased costs and time to manage the event, resulting in increased sponsor fees for all sponsors, including the Port of San Diego.

This comment does not raise any environmental issues and does not address the adequacy of the EIR requiring a response pursuant to CEQA. Therefore, no changes to the EIR are required. However, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

4.4.9 Comment Letter I: Pacific Tugboat Service

Pacific Tugboat Service

 San Diego, CA 92101-1128

RE: DRAFT EIR FOR SAN DIEGO BAY FIREWORKS DISPLAY EVENTS

Dear Mr. Manaois:

I-1 [This letter is to communicate the concerns we have regarding the proposed Ordinance and Draft EIR as it pertains to the operation of the Port of San Diego Big Bay Boom July 4th Fireworks Show. Historically, we have been subcontracted to provide barge services for launching the fireworks at various venues in and around San Diego and Los Angeles Counties.

I-2 [Although most of the language in the proposed Ordinance and draft EIR does not or should not apply to us (as a sub-contractor), the six-foot perimeter fence we see as problematic for the following reasons:

1. Safety
 - An all-around perimeter fence that is six feet off the deck of our barge would hinder if not prevent easy emergency egress from the barge in case of fire, injury or any number of unforeseen circumstances.
 - It may also hinder if not prevent first responders from gaining access to the barge.
 - A six-foot-high fence would block the vision of the tug captain on the busiest vessel traffic night of the year.
2. Costs Logistics
 - The fence will take time to install and uninstall for each event, which will take place pier-side and cannot be done while other work is going on.
 - Storage space for fence materials between events is non-existent and would have to be acquired
 - Cost to build the structure for each event is grossly out of budget and will add significant cost to each event.
 - Additional lookouts would be required for properly managing and maneuvering the barge.

I-3 [May we suggest, as a solution to these problem areas, either a lower barrier fence of say three feet or a "curtain" that can easily be raised and lowered as needed to contain debris (although this would likely increase the costs slightly).

Regards,

Skip Labiti

Risk Management
 (619) 533-7932
skip@pacifictugboats.com

Response to Comment I-1

The commenter states that it has concerns to communicate and that it has historically been subcontracted to provide barge services for various fireworks display events in San Diego and Los Angeles counties.

The District appreciates Pacific Tugboats interest in the proposed project. This is an introductory comment that does not raise any environmental issues requiring a response pursuant to CEQA. The specific comments that follow this introduction are listed separately along with the District's individual responses.

Response to Comment I-2

The commenter expresses concerns about the 6-foot perimeter fence, stating that an all-around perimeter fence that is 6 feet off the deck of its barge would hinder emergency access in case of fire or other emergency, and may hinder first responders from gaining access to the barge. The comment further states that the fence would block the vision of the tug captain during the busiest traffic vessel night of the year.

The comment also expresses concern relating to the cost of the fence, stating that installation and teardown of the fence will take time and could not be performed during other work, and that the cost to build the structure would add significant cost. The comment further states that storage space for fence materials do not currently exist and would have to be acquired. The comment also states that additional lookouts would be required for managing and maneuvering the barge. Please see response to comment J-9 below.

Response to Comment I-3

The commenter suggests lowering the height of the fence to 3 feet or replacing it with a curtain that could be raised or lowered to contain debris.

The requirement for a 6-foot-tall fireworks debris barrier is intended to prevent fireworks trash and debris from falling into the Bay and thereby to reduce potential adverse environmental impacts associated with trash and debris in the Bay. While a 3-foot barrier would be better than no barrier at all, the proposed height of the fireworks debris barrier is intended to contain the greatest amount of trash and debris possible. Although no changes to the EIR or the proposed ordinance will be made, this comment will be included in the materials presented to the Board of Port Commissioners for consideration in the decision whether or not to approve the proposed project.

4.4.10 Comment Letter J: Pyro Spectaculars, Inc.

May 2, 2017

Ms. Wileen Manaois
Principal, Development Services
Real Estate Development Department
San Diego Unified Port District
3165 Pacific Highway
San Diego, CA 92101-1128

Via: Email only to: wmanaois@portofsandiego.org

RE: San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project
UPD #EIR-2015-115; SCH #2015081013

Dear Ms. Manaois:

J-1

Pyro Spectaculars, Inc., ("Pyro") submits the following comments to the Draft EIR and the Proposed Fireworks Display Ordinance included as an Exhibit to the Draft EIR in the above referenced Project.

As a brief introduction, Pyro has been performing displays in the San Diego area for decades, and we are familiar with the sites and circumstances of most of the displays in the region over the past decades. We currently perform the Big Bay Boom display.¹ We actively participate in governmental activities related to fireworks and fireworks safety around California, in other states, and at national and international levels. We hold regular seminars and workshops on fireworks operations and safety for licensed operators, helpers, and fire authorities alike and have been instrumental in the development of multiple such training programs in California and the United States. We participate in several fireworks codes and standards groups including the National Fire Protection Association Technical Committee on Pyrotechnics; California State Fire Marshal's Fireworks and Special Effects Advisory Committees; and the American Pyrotechnics Association's Board of Directors as well as its Executive, Display, Proximate Pyrotechnics, Transportation, and Code Committees.

We respect the interests of the Port in regulating special events that involve public fireworks displays and understand the pressures that can be placed on any government agency by citizens and extreme activist groups and lawyers. Still, we must not lose sight of certain fundamental responsibilities each of us bears and the rights we enjoy. Among the responsibilities is to ensure the health, safety, and welfare of persons, property, and the environment; to not discriminate among persons on other than rational grounds;

¹ Pyro is not the company that set off all the fireworks at once.

J-1
cont. | and to not excessively, unnecessarily, or unfairly infringe upon their rights. Which brings us to our general comments of the Draft EIR and Ordinance.

General Comments

J-2 | The Proposed Fireworks Display Ordinance is overly broad. The fireworks subject matter is neither within the Port’s jurisdiction nor advisable for it to regulate in light of its lack of familiarity with fireworks law, regulation, standards, and operations. Fire authorities regulate fireworks in the cities within the Port District, the cities within the Port District regulate special events in their jurisdiction, and the Regional Water Quality Control Board regulates the Clean Water Act. See e.g., EIR Section 4.5.4.3.

J-3 | This Proposed Ordinance attempts to supersede and conflicts with the jurisdiction of those fire authorities, cities, and the Water Board. The Proposed ordinance is overreaching in these respects. By way of example, the Ordinance requires that the Water Board General Permit be obtained before the Port grants a permit. The water board permit requires certain best management practices, but the Ordinance goes on to require a substantially duplicate set of practices, and adding some requirements that create unsafe conditions. The Ordinance requires that a municipal fire authority “supervise” the display and determine things like “safe cool down periods.”² This duplication is unnecessary, and the additions are poorly advised. A simple requirement that the hosts of public events comply with existing law is the wisest approach since the cities, the Water Board, and the fire authorities already have regulations and processes in place. If the cities wish to delegate special event permitting to the Port, that would be their decision. Delegating fireworks and Clean Water Act permitting is not the same, because the Port does not have jurisdiction under state law to make laws regulating fireworks and the Water Board has jurisdiction over discharges to the waters of the Bay. Only cities, counties, and special districts that provide fire-related services may permit and thereby regulate fireworks operations under the California Fireworks Law.

J-4 | The Proposed Ordinance sets up yet another layer of regulation that duplicates and confuses long-existing patterns of regulation and permitting. Recent examples of the confusion among cities in the Port is that the Coronado Fire Marshal recently refused to consider an application for a fireworks display permit for unclear reasons, but mentioned the activity by the Port related to fireworks displays.

² NFPA 1123-14, Section 9.5.2 provides that personnel shall not enter the for a period of time the operator deems necessary for safety.

J-5

Another example of confusion is closer to the Port home. Recently, Pyro contracted with a customer that proposed a private fireworks display in the waters adjacent to Manchester Grand Hyatt. Port officials told Pyro a special events permit was required from the Port. The application for such permit is handled by the Real Estate Department, requires sixty days advance filing, and by the terms of the application may only be made by a tenant of the Port or a person authorized by the tenant to have all decision making authority for the tenant. The display was to take place sooner than sixty days as most private displays are scheduled and contracted less than sixty days in the future. Pyro filed an application with the Port, although the application Pyro was given was clearly intended for construction projects. The maps of the Port jurisdiction were consulted, and the display barge location itself was outside the mapped Jurisdiction of the Port although the people viewing the display, private guests of the hotel, were within Port leased land. There were no public advertising, no bleachers or other provisions for the public, no parking was planned or needed for the public. After several days, Pyro was informed that the display, being in the water, was not in the Port's jurisdiction. The Port told Pyro it would have to apply for a City of San Diego fireworks permit and obtain a California Coastal Development Permit or waiver/exclusion from the Coastal Commission.

As a result of the delays by the Port, Pyro was unable to meet the deadlines of the customer who made alternative plans. There is no need for the Proposed Ordinance and the permitting scheme it proposes. There is already a permitting process. If the Port demands a special event permit in addition or alternative to the permits currently available, the fireworks permits for the display should still be obtained from the responsible fire authority only. If the display is in the water, the Water Board already requires a permit and has a set of Best Management Practices in place for discharges from the fireworks. The Port only needs to require that those permits be obtained and consider the Coastal Development requirements in order to issue the special events permit. Small private events, like at the Manchester Grand Hyatt, that are not advertised to the public and for which no public accommodations are necessary, should not even require a special events permit from the Port. The EIR clearly establishes that there are no significant impacts from such small displays.

J-6

Although the Draft EIR language seems addressed to "Fireworks Display Events," the Proposed Ordinance is entitled "Fireworks Display Ordinance." There is a substantial difference between regulating the special event that includes a fireworks display and regulating the display itself. The Port may be qualified to regulate special events in its jurisdiction, notwithstanding the jurisdiction of Port cities to regulate special events. It is

J-6
cont. | not qualified or empowered to enforce or vary the laws, regulations, codes, and standards governing the operation of fireworks displays.

| In California, the State Fire Marshal is the agency authorized to develop and enforce the State Fireworks Law, Health and Safety Code, Sections 12500-12759. Cities, counties, and Special Districts that provide fire protection, prevention, or suppression services may adopt an ordinance or regulation to prohibit or regulate the sale, use, or discharge of fireworks within that special district as provided in Health and Safety Code Section 12541.1(a). The Port District is not so authorized because it does not provide fire-related services.

J-7 | The State Fire Marshal has developed a comprehensive set of regulations pertaining to fireworks and fireworks displays set out in Title 19, California Code of Regulations, Chapter 6. These regulations have been in place for many years. There is no provision for a Special Port District that does not provide fire related services to adopt such an ordinance as is proposed in the draft EIR. Even if there were such authority, regulation of fireworks operations is best left to those who are qualified to do so. Clearly, that is the rationale for limiting the entities that can regulate fireworks. These state fireworks regulations have been developed with years of experience and the cooperation and input of many experts in the field from both the industry and enforcement sides. It is wrong and contrary to California state law for the Port to try to assume jurisdiction over fireworks displays.

J-8 | Pyro has been training fire authorities in the safe permitting and inspection of fireworks displays for decades. We know that among the possible enforcement authorities, fire authorities, with the proper training and experience, are in the best position to understand safe pyrotechnic practices. Several of the provisions in the ordinance demonstrate our concerns with regulation of fireworks practices by non-subject-matter experts:

J-9 | 1) __.07,(f) - Best Management Practices. Placing a fence of any height around the discharge area on land, let alone on a barge, creates several risks to the fireworks operator, crew, emergency responders, and the vessel itself. The fence inhibits the crew from seeing the fireworks equipment in case of an emergency. The fence creates barriers to crew being able to escape from the barge in case of emergency. The fence inhibits emergency response personnel and equipment from accessing and boarding the vessel. The fence may cause burning objects to be bounced back onto the vessel, into the discharge area, into the crew possibly causing premature ignition of the

J-9
cont

fireworks and possible injury to the crew. If a fence were damaged, it could fall onto the fireworks equipment and impair other fireworks from being launched properly. NFPA 1123-14, Section 6.3.2.1 provides that for fireworks displays fired from floating platforms (barges), "A minimum of two separate egress paths shall be provided at all times." 6.3.2.3 provides, "Egress paths shall be clear and free of impediments." The very idea that a fence should be put around the fireworks discharge area on a barge demonstrates either a lack of understanding of even basic fireworks safety or a fundamental disregard for the safety of the personnel on the barge and those who may have to access the barge in an emergency. While allowing the fire marshal to prohibit such a fence would appeal to non-experts, it is the fireworks operator in charge of the display who is responsible for crew safety under state law and regulation. As the fireworks licensee, Pyro would not permit its operators to place barriers around the discharge site, and that refusal would violate this ordinance such that Pyro and the Operator would be liable. By trying to shift responsibility for safety to the fire marshal, the Port is attempting to make the fire marshal responsible and liable for the safety of the crew on a matter that is clearly contrary to existing fireworks codes and standards.

J-10

2) __.07,(f) - Best Management Practices. Requiring a wire to be wrapped around a nail seems like a simple enough requirement, but not all fireworks equipment has extra nails sticking out; most doesn't. In fact, protruding nails would be a great safety hazard on several levels, especially in the dark when the ordinance requires the crew to strike the display. The Port is not qualified to regulate fireworks, and has no legal basis for regulating the operation of the display. Even if such regulation by the Port were appropriate, it is far better to set a standard of performance that allows flexibility in the means of achieving the standard. Requiring that wires be secured is far superior to dictating how they must be secured, allowing for development of superior, safer methods.

J-11

3) __.07,(f) - Best Management Practices. __.07,(d),2,A. Requiring packaging, wrapping and labels to be removed and disposed of prior to commencement of the display again shows a lack of understanding of the fireworks law and good practices. In the event that some or all of the fireworks are not fired for some reason, the packaging and wrapping will be required to repack and identify the shells. Fireworks must be labeled under both state and federal law.

- J-12 4) Requiring boxes to be approved by California Department of Transportation creates an impossible requirement. US DOT regulates the boxes in which fireworks are transported. The state does not approve fireworks boxes.
- J-13 5) Requiring 50% of the weight (NEW?) of the fireworks to be picked up after the display, in the dark, from the water in the Bay or the Pacific Ocean is unreasonable and not supported by any substantial evidence in the draft EIR. Much of the materials that is related to the shells is burned or disintegrates in the performance of the devices. It is unreasonable to expect anyone to recover that much especially in tidal zones. It is also unreasonable to expect non-residents of the Port, or anyone for that matter, who may sponsor displays in the Port to attend the annual clean-up.
- J-14 6) __.07,(d),2,B. This section prohibits fireworks that have a plastic casing or are made up of more than 5% by mass of non-biodegradable inner components. What if the device is not shot into the air but remains on the ground? Why would that need to be made of biodegradable material? How is anyone to know what is inside an aerial shell or other device? Neither the display operator, the host, or the enforcing authority can make that determination without destroying the shell. Such information is not available from manufacturers or distributors of fireworks. Scientists, consultants, who know little to nothing about fireworks have fixated on absolute numerical specification without considering the practical and operational implications of their machinations.
- J-15 7) Throughout the ordinance, in designating the weights of the fireworks that can be used, the ordinance fails to state for the correct standard for fireworks weight. The mass of fireworks is correctly designated in Pounds Net Explosive Weight, or lbs. NEW. If this term is not used, then the full weight of the devices out of the packaging is implied. For example, under the Ordinance, section __.07(c)1,A, Big Bay Boom is limited to “a cumulative 5,342 pounds of fireworks.” Because the weight is not designated as NEW, the Ordinance would require approximately a 50% reduction of fireworks in the display. I doubt that this was the intention, but it is the result when regulators who know little about fireworks and explosives try to write laws that regulate fireworks.
- J-16 8) Section __.07,(d),1,A. The Big Bay Boom Event fireworks can “contain no more than 0.32% copper (Cu) per pound of explosive material.” Of course, “percent per pound” is a very unusual measurement. It is not clear how that might be applied here. We understand percentages, and we understand mass per pound, but percent per pound is vague at best. Perhaps the intention is to say that the net explosive material in all shells combined shall be no more

J-16
cont

that .32% copper. That seems to be what the alternative standard in the section is trying to say, no more than 17 lbs. of total copper emissions in the display. But then, we must wonder whether that weight (17 lbs.) was calculated using NEW (net explosive weight) or something else. It appears they were on the right track: 5342 lbs. NEW of fireworks x 0.0032 [.32%] = 17.09 lbs. So, these consultants understood the difference between the weight of the shell and the weight of its composition, and they still failed to set out the correct weight measure, NEW, throughout the Ordinance.

J-17

9) Clearly, the EIR relies heavily on the “study” written by Croteau, et al, in 2010, for its emission factors of various chemicals, particularly copper. See EIR, Section 4.2, page 4.2-22 *Fireworks Emission Sources and Source Strength Calculation, Direct Sources*. Croteau, an industrial hygienist, was studying emissions from small consumer fireworks used on stage in a uniquely bizarre clown show³. We should be clear on this point. The fireworks that were studied by Croteau are not like the fireworks used in public displays including displays in San Diego Bay. Quoting from the draft EIR, “The aerial shells from the largest existing fireworks display event, Big Bay Boom, are most similar in characteristics to the Roman Candle “B” projectile as measured following combustion testing performed in a burn room for this scientific journal article.” EIR, Section 4.2, page 4.2-22 *Fireworks Emission Sources and Source Strength Calculation, Direct Sources*. While it is always tempting to defer to scientific expertise and not read closely their reasoning, this single statement read by anyone with any knowledge of professional fireworks casts doubt on the quality of the Draft EIR as a whole and on the wisdom of relying on this massive 600 page⁴ report to regulate fireworks. We grant that understanding the differences between consumer and professional fireworks generally and between Roman candle projectiles and aerial shells specifically, may not be common knowledge. But, basing a fireworks law on a study that does not recognize those difference is not reasonable.

a) The projectile from the consumer Roman candle is a solid pellet of pyrotechnic composition about ½” or less in diameter. A professional

³ Cirque de Flambé is a group that performs live at ground level before a live audience with small fireworks in their hands and attached to props. There is nothing about this group that is like Big Bay Boom or any other fireworks display in the Bay. Here are examples of their performance – [Part 1](#). [Part 2](#). In Part 2, at about 00:35, notice the sparks falling right in front of the camera in the audience.

⁴ The supporting material is an additional 900 pages long.

- J-17 | aerial shell ranges from 2" to 10" in diameter. Even if projectile and shell
cont | were the same dimensions, they are not the same chemical makeup.
- J-18 | b) The difficulty for the drafters of the EIR is that without the fireworks in
| the study and the fireworks in the displays being comparable (they are
| not comparable), there is no basis for the regulation of copper to which
| the Port seems to be especially sensitive.
- J-19 | c) A projectile from any particular consumer Roman candle is not at all like
| any kind of aerial shell in any relevant characteristic. They could both be
| spheroidal, and they may both have some type of pyrotechnic
| composition, but the similarities fall off sharply there.
- J-20 | d) The other difficulty in mandating the percentage of a particular chemical
| like copper in the display is that it is not currently practicable to
| determine the percentages of each chemical in the thousands of varieties
| of shells available from a hundreds of foreign and domestic
| manufacturers in various countries. Manufacturers are loath to release
| precise formulations, making it almost impossible for the licensee, the
| operator, or the enforcers to determine what combination of fireworks
| would comply with this unusual standard.
- J-21 | e) In addition to Croteau, the Draft EIR cites other studies conducted in
| China and Europe as the basis for its model and results. But the details of
| the fireworks used in those studies are not revealed. In the United States,
| the U.S. Department of Transportation ("USDOT") restricts the chemicals
| that can be used in fireworks for transportation safety reasons. Consumer
| fireworks are further restricted by the U.S. Consumer Product Safety
| Commission ("CPSC"). There is no discussion in the Draft EIR of how
| regulation of fireworks formulations varies in these countries from the
| U.S. formulation restrictions or what adjustments should be made to
| account for these differences.
- J-22 | 10) Requiring that some type of environmentally friendly fireworks be used when
| those fireworks are clearly not yet practical or proven to be safe is putting
| the horse before the cart. It should not be required that we constantly prove
| a negative to get a fireworks permit. After more than a year of investigation
| and 600 pages of report, it should be easy to determine that such fireworks
| are only minimally available and only at many times the cost of conventional
| fireworks. The EIR does not establish that such fireworks would significantly
| change the environmental impact of the displays. The General Permit from
| the water board already has a more reasonable version of this requirement.

J-23 | 11) __.07, (f), 11 - Perhaps inadvertently, the Ordinance requires the Fireworks Operator to provide double the number of trash receptacles. We think this is likely intended for the Fireworks Organizer.

Fireworks Display Locations and Quantities

J-24 | We refer to the Proposed Ordinance, Sections __.07,(a) et seq. One of the most troubling aspects of the proposed ordinance is that it limits the locations where displays can take place and quantities without any substantial justification for that narrow restriction in the EIR. There does not appear to be any reason why the findings of the EIR, if correct, would not apply with like force to other displays that might be held in the Port jurisdiction at other times and places. There does not appear to be any reason to draw an arbitrary line around certain areas in the Bay that can have fireworks when the findings of the EIR are not location specific and would seem to apply throughout the Bay, perhaps beyond. There is no substantiation for limiting particular displays to particular quantities, and there is no provision for other displays not mentioned in the Ordinance or what quantities are appropriate for those displays.

J-25 | The EIR purports to scope particular recurring displays as well as particular hoped-for displays that may occur in the future as the Project. The Ordinance is not so limited in its effect. The Ordinance permits specific events with specific quantities of fireworks, at specific locations, and in limiting events to those locations, quantities, and times the Ordinance has effectively banned future displays at other locations, even locations that have historically been used for displays. One example is the Manchester Grand Hyatt where convention guests have frequently contracted for fireworks displays. The Manchester Grand Hyatt currently has two convention groups that intend to have fireworks display at the hotel, and the Ordinance as drafted would not allow those shows to take place. One of the groups is the American Pyrotechnic Association that is coming to the Port of San Diego largely because of the wonderful venue right at the hotel for fireworks displays. The Ordinance, however, permits displays at the venue just north in the bay, the Midway. What reason is there to prefer one location to the exclusion of the other or to exclude any other display that is not located within or proximate to an environmentally sensitive area.

J-26 | There is no map or chart attached to either the EIR or the Ordinance to assist in locating the precise jurisdiction of the Port compared to locations where barge based fireworks are launched, and no discussion of the effect of a barge being outside the Port's jurisdiction when the related event is in Port jurisdiction. It should be easy for the Port

J-26
cont | to designate eel grass areas where barge control should be implemented. (see Ordinance, section __.07,(g).

Distinction between Independence Day and Other Events

J-27 | It is not clear to Pyro what possible health, safety, welfare, or environmental consideration exists for distinguishing between events that celebrate patriotism around the Independence Day holiday and events occurring the rest of the year. We applaud the celebration of Independence Day, but we also applaud other free expression. We reject the suppression or restriction of other displays based on the time of year⁵ or the expression of content other than patriotic content in those displays.

J-28 | We ask, why is it acceptable to have a display somewhere in Imperial Beach on July 4 that has 456 lbs. (NEW?) of fireworks but U.S.S. Midway is limited to 235 lbs. on other than July 4? Why can a display on July 4 be 20 minutes long while a display on July 5 ten minutes long? Additionally, what reason is there to limit Independence Day displays to July 4? For example, this year July 4 is on Tuesday. People have to work on Wednesday. It is common for sponsors to have displays on Saturday or Sunday in such years to attract the most attendees, allow the most people to enjoy the display, bring customers to their businesses, book hotel rooms, and thereby have more volunteers available to work late or to work the next day, as with next day debris patrols required by the Water Board's General Permit, and redundantly by the Proposed Ordinance. There is no substantial evidence in the Draft EIR to support this discrimination and suppression of expression based on content or under the guise of environmental protection.

Protection of Species and Habitat - Section __.07,(e), et seq, and __.03 Definitions

J-29 | Pyro respects the effort being made to protect sensitive species and habitat. Pyro supports regulations that reasonably and lawfully give effect to those purposes. However, the Proposed Ordinance has blurred the distinction between an event and a display by defining a Fireworks Display Event too broadly in some respects and too

J-27
cont. | ⁵ Pyro recognizes that there is an interest in protecting avian species during their breeding periods. However, the draft EIR does not demonstrate that there would be a significant impact on birds from fireworks displays. Management of the public in sensitive areas would seem to be an ongoing requirement not limited to fireworks events and the burden of managing access to those areas should not be dumped on fireworks organizers. Perhaps there are environmental groups that could spend some of the resources protecting such areas.

J-29
cont | narrowly in others. This makes the ordinance confusing and subject to a variety of interpretations and misinterpretations.

J-30 | The plain meaning of the words in the Proposed Ordinance should be clear. A fireworks *display* involves the handling, possession, loading, staging, launching, and sometimes storage of fireworks.⁶ The fireworks *event* takes place where the audience and participants are located, park, and travel. This would be either the private or public group viewing the display.

J-30 | The definition of fireworks display event further confuses the meaning of *event* by declaring that any group exceeding twenty-five is the equivalent of viewing by the public. This makes no sense when it is applied to certain locations, like the Midway and hotels that have a large private group of viewers, but have none of the issues related to public parking, trash, encroachment on habitat, and similar public interests. Similarly, while the Midway and hotels are open to the public, the fireworks are not advertised to the public and the event itself is not open to the public. The concerns with public traffic in sensitive areas is just not present in such cases.

J-31 | We appreciate what appears to be a great effort on the part of Port personnel to address concerns raised by the environmental activist. But neither the activist nor the Port have lived in the existing regulatory, permitting, and enforcement world of fireworks the way we have. It is disappointing that the EIR team did not include fireworks professionals on a deep basis. The reason for that is not clear, unless we consider that those who make threats of lawsuits try to control the process as well as the result.

J-31 | The novelty of the approach to fireworks taken in this project, and particularly in the draft ordinance, is difficult to fully express. Throughout this state and the other states of this nation fireworks displays have been taking place in all kinds of locations for decades. Few have had any significant environmental effects. Those that have are covered by existing law and regulation. CEQA and the Coastal Development acts were made with projects in mind more impactful and significant than a few minute fireworks display. Most of those projects or developments last 24/7/365 for an indefinite time into the future. They warrant a close look. A display lasts about 20 minutes. That 20-minute

J-30
cont | ⁶ Displays do not routinely include the “detonating of fireworks.” Detonations in the fireworks vernacular mean malfunctions where the device “detonates” without rising into the air from its launching position. Fireworks are launched or ignited, not detonated, during the course of a display.

J-31
cont.

display would need to last 26,280 times longer to reach a single year of impact. We are all too quick to look at results from an EIR or an imagined impact without considering the infinitesimal action of a such a short display compared to protracted activities in our society. We are too quick to regulate or respond to complaints without recognizing that the fireworks displays are a form of expression that shouldn't be put aside by allowing some types of content, audience, location, weight, or length and banning or limiting others.

J-32

We request that the District Board seriously consider what it is doing to the existing regulatory scheme, the effects that this ordinance would have on all concerned including its own tenants and cities, and take great care to not encroach upon the regulatory authorities and jurisdiction that have been carefully in place for a very long time. No hypercritical interpretation of laws that were never intended to reach these types of events should be permitted to cause such a distortion of the existing regulatory schemes as this project would.

Respectfully submitted,
Pyro Spectaculars, Inc.

By: *Lauris Collins on behalf of*
Gary Brown, General Counsel
Licensed Pyrotechnic Operator

Response to Comment J-1

The District appreciates Pyro Spectaculars interest in the proposed project. This comment does not raise any environmental issues requiring a response pursuant to CEQA. The specific comments raised in the pages that follow this introduction are listed separately along with the District's individual responses.

Response to Comment J-2

This comment states the author's opinion that the proposed ordinance is overly broad and fireworks are not a subject within the District's regulatory jurisdiction. Because the comment makes only a general assertion and does not identify any specific aspect of the proposed ordinance that is overly broad, no further response to this portion of the comment is possible or necessary. The District has jurisdiction over land use and other activities that occur within the land and water areas conveyed to it pursuant to the San Diego Unified Port District Act, California Harbors & Navigation Code, Appendix 1. As discussed below in response to comment J-7, the District also has jurisdiction to adopt the proposed ordinance pursuant to California Health & Safety Code section 12541.1.

Response to Comment J-3

This comment repeats the author's opinion that the District does not have jurisdiction to regulate fireworks and asserts the proposed ordinance attempts to supersede and conflicts with the jurisdiction of other fire authorities, cities and the RWQCB. Please see responses to comments J-2 and J-7 regarding the District's jurisdiction to adopt the proposed ordinance. The proposed ordinance does not supersede or conflict with the regulations of other regulatory agencies. Instead, the proposed ordinance expressly defers to other regulatory agencies where appropriate, such as the provisions of the ordinance that address compliance with the RWQCB general permit, compliance with other required permits, compliance with applicable federal, state and municipal laws and regulations (Draft EIR, Appendix D, Proposed Fireworks Display Ordinance, Section X.07(i), (j), (k)) and preemption by applicable federal and state laws (Draft EIR, Appendix D, Section X.08(a)).

The comment further states the author's opinion regarding the wisdom of provisions of the proposed ordinance that the author believes duplicate other laws or permits and recommends the District simply require the hosts of public events to comply with existing law. This comment raises a policy issue, not an environmental concern or a question regarding the adequacy or completeness of the Draft EIR. Accordingly, the comment will be available for consideration by the Board of Port Commissioners when it makes its decision whether or not to adopt the proposed ordinance and no further response is required.

Response to Comment J-4

This comment repeats the author's opinion that the proposed ordinance contains provisions that duplicate other regulations. Please see response to comment J-3 above.

Response to Comment J-5

This comments describes an "example of confusion" concerning applicable regulations involving an application for a special events permit for a private fireworks display in the waters adjacent to the Manchester Grand Hyatt. The comment also repeats the author's opinion that the District should

leave the regulation of fireworks to other regulatory agencies and states small private fireworks display events should not be required to obtain even a special events permit. This comment raises a policy issue, not an environmental concern or a question regarding the adequacy or completeness of the Draft EIR. Accordingly, the comment will be available for consideration by the Board of Port Commissioners when it makes its decision whether or not to adopt the proposed ordinance and no further response is required. Please also see response to comment J-3 above.

Response to Comment J-6

This comment refers to language in the Draft EIR that refers to “Fireworks Display Events” and the proposed ordinance that is titled “Fireworks Display Ordinance” and states the District may be qualified to regulate special events, but is not qualified or empowered to regulate fireworks displays. Please see responses to comments J-3 and J-7. This comment raises a policy issue, not an environmental concern or a question regarding the adequacy or completeness of the Draft EIR. Accordingly, the comment will be available for consideration by the Board of Port Commissioners when it makes its decision whether or not to adopt the proposed ordinance and no further response is required.

Response to Comment J-7

This comment states the author’s opinion that the District is not authorized to adopt a fireworks ordinance or regulation because it does not provide fire-related services as required by California Health and Safety Code section 12541.1(a). The comment is incorrect. Health and Safety Code section 12541.1(a) provides as follows: “A special district which provides fire protection, prevention, or suppression services may adopt an ordinance or regulation to prohibit or regulate the sale, use, or discharge of fireworks within that special district.” The District is authorized by section 12541.1(a) to adopt the proposed ordinance because it is a special district that provides fire protection, prevention and suppression services within its jurisdiction through HPD. As discussed in the Draft EIR, HPD provides marine firefighting services in and around San Diego Bay. HPD has 130 sworn officers who are cross-trained as both land and marine firefighters and police officers. HPD patrol boats respond to fire emergencies on San Diego Bay and are equipped with fire-suppression equipment capable of handling both small and large vessel fires (Draft EIR, Section 4.9.2.1, pp. 4.9-2–4.9-3). Because the comment raises a legal issue, not an environmental issue relating to the Draft EIR, no further response is required.

Response to Comment J-8

This comment states that the commenter has been training fire authorities in safe permitting and inspection of fireworks for decades and serves as a general introduction to the specific comments that follow as comments J-9 through J-23. Please see responses to comments J-9 through J-23 below.

Response to Comment J-9

This comment states that the commenter objects to the Best Management Practice required by Section X.07(f)(2) of the proposed ordinance, which requires each fireworks barge to be equipped with a fire-resistant debris barrier around the perimeter of the fireworks launch area to contain debris, and that such a barrier would present a safety hazard to the fireworks operator, crew, emergency responders and the barge itself and conflicts with applicable regulations. Section X.07(f)(2) of the proposed ordinance included this requirement as part of the “Best Management

Practices” to be implemented for all display events in order to contain fireworks debris on the barge and to prevent the debris from falling into surrounding waters and adversely affecting environmental resources. The proposed ordinance acknowledges the concern expressed in this comment by providing that the debris barrier must be implemented “unless prohibited by the municipal fire marshal with jurisdiction over the Fireworks Display Event.” Because the number and type of fireworks and their launching equipment, as well as the size and layout of the barge, may vary from event to event, the proposed ordinance is a reasonable accommodation of the need to provide a safe working environment on the barge and the need to reduce potential significant adverse environmental impacts by ensuring that as much fireworks debris as possible is contained on the barge and does not fall into surrounding waters.

Response to Comment J-10

This comment objects to the Best Management Practice required by Section X.07(f)(3) of the proposed ordinance, which requires that wires from the electric match in the fireworks fuse be wrapped around nails installed on the racks to prevent wires from being pulled out and falling into the surrounding waters. Please see response to comment G-52 above.

Response to Comment J-11

This comment objects to the Best Management Practice required by Section X.07(f)(2) of the proposed ordinance, which requires all fireworks packaging material and debris to be properly disposed of in trash receptacles, because the packaging and wrapping may be required to repack fireworks that are not used in the display. Section X.07(f)(2) is intended to prevent fireworks packaging and debris from falling into the surrounding waters. It does not prohibit or interfere with a fireworks operator’s ability to retain packaging that may be needed to repack fireworks not used in a display and to deposit such packaging in a receptacle for later reuse as needed.

This comment also states that fireworks must be labeled under both federal and state law. The proposed ordinance will be revised to clarify that it does not require the removal of labels required by law, which is consistent with the provision of the proposed ordinance that specifically requires compliance with all applicable federal and state laws and regulations (Draft EIR, Appendix D, Section X.07(k)).

Response to Comment J-12

This comment objects to the Best Management Practice required by Section X.07(f)(2) of the proposed ordinance, which requires fireworks to be brought to the barge and loaded in their California Department of Transportation-approved shipping cartons, on the ground that the federal Department of Transportation regulates fireworks shipping cartons, not the California Department of Transportation. The first sentence of Section X.07(f)(2) of the proposed ordinance will be revised as recommended to refer to “U.S. Department of Transportation-approved shipping cartons.”

Response to Comment J-13

This comment objects to the Best Management Practices required by Section X.07(f)(7) – (10) of the proposed ordinance, which require the fireworks organizer to recover fireworks debris and other trash from the Bay in the amount of 50 percent of the net weight of the fireworks used in the event, on the ground that the amount required to be recovered is not supported by substantial evidence.

The amount of fireworks debris that the proposed ordinance requires the fireworks organizer to recover is based on an article titled *Fireworks and their Hazards* prepared by Thomas J. Poulton, M.D. and Kenneth L. Kosanke, Ph.D. dated June 1995.

This comment also states the author's opinion that it is unreasonable to require the recovery of that much trash because much of the material related to fireworks shells is burned or disintegrated in the display and non-residents of the District who sponsor fireworks display events should not be required to attend the District's annual clean-up. The District has been unable to identify any report, study, or other document that has determined what portion of fireworks shells is burned or disintegrated in a fireworks display and what portion is not destroyed and instead may fall to the surrounding land or waters. Unless facts, data or other evidence become available that would warrant a change in the amount of fireworks debris that must be recovered under the proposed ordinance, no change in the proposed ordinance is warranted.

The proposed ordinance does not require "non-residents" of the District or fireworks "sponsors" to participate in clean-up events. Section X.07(f)(7) – (10) of the proposed ordinance require the applicant for a fireworks display event permit to engage in a comprehensive series of actions intended to recover fireworks debris and other trash from the Bay in an amount of 50 percent of the weight of the fireworks used in the event. In the event the permit applicant's direct efforts to recover fireworks debris and trash immediately after an event and recover less than 50 percent of the weight of fireworks used, Section X.07(f)(10) requires the permit applicant to provide a crew to participate in the District's next scheduled annual "Operation Clean-up" to recover trash and debris from the Bay and the Imperial Beach oceanfront. Nothing in the proposed ordinance requires the participation of "non-residents" or "sponsors" of fireworks display events.

Response to Comment J-14

This comment objects to the Best Management Practice required by Section X.07(d)(2)(b) of the proposed ordinance, which prohibits fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than 5 percent of the mass of the shell or device, on the grounds that such information is not available from manufacturers or distributors of fireworks and the characteristics identified in this section of the proposed ordinance cannot be identified without destroying the shell. This requirement of the proposed ordinance is intended to protect water quality of the waters surrounding the fireworks launch area by prohibiting the use of fireworks that contain the specified non-biodegradable materials. Similar to CEQA's requirements that mitigation measures must be feasible, the District's intention in the proposed ordinance is to require Best Management Practices and other conditions that are feasible. The District is willing to consider modification of any provision of the proposed ordinance for which there is substantial evidence in the record that establishes it is infeasible. However, under CEQA, a lawyer's assertions or arguments alone do not constitute substantial evidence (see *Pala Band of Mission Indians v. County of San Diego* (1998) 68 Cal.App.4th 556, 578-580).

Response to Comment J-15

This comment states that the proposed ordinance fails to state the correct standard for fireworks weight. The proposed ordinance will be corrected to refer to the weight of fireworks that may be used in a fireworks display event as "net explosive weight" or "NEW."

Response to Comment J-16

This comment states that the requirement in Section .7(d)(1)(A) of the proposed ordinance that fireworks “contain no more than 0.32% copper (Cu) per pound of explosive material” is vague and that it is unclear if the calculations are based on net explosive weight. See response to comment J-15 that explains that the proposed ordinance will be corrected to refer to the weight of fireworks that may be used in a fireworks display event as “net explosive weight” or “NEW.” Also, the “per pound” language that the commenter finds vague was included to make clear the intent of the proposed ordinance, which is to limit copper emissions to 17 pounds per Big Bay Boom event. Lastly, as the comment correctly states, the intent of the language is to ensure that copper emissions from the Big Bay Boom event is limited to 0.32 percent of net explosive weight, or 17 pounds (e.g., 0.32 percent of 5,342 pounds net explosive weight is 17 pounds).

Response to Comment J-17

This comment states that the Draft EIR relies heavily on a study by Croteau, et al. in 2010 for its emission factors of various chemicals, including copper, but that the fireworks studied by Croteau are not like the fireworks used in public fireworks displays like those that will be subject to the proposed ordinance, which casts doubt on the quality of the Draft EIR as a whole and the wisdom of relying on the Draft EIR to regulate fireworks. The analysis presented in the Draft EIR is based on the best available science known and available at the time of analysis. The author is not aware of any studies that present emission factors for fireworks used in public fireworks displays. Studies to determine the air quality effects of public fireworks events in the United States are hard if not impossible to find, so we used the best available information, which was the peer-reviewed journal article the commenter mentions. Thus, because the air quality effects presented in the Draft EIR and the proposed ordinance’s reliance on these conclusions are based on the best available science known and available at the time of analysis, and because no other source for emission factors is known, no changes to the assumptions, emission factors, or conclusions thereof are required.

Response to Comment J-18

This comment states that there is no basis for the regulation of copper in the proposed ordinance because the fireworks in the Croteau study and the fireworks in the proposed fireworks displays are not comparable. Similar to comment J-17, the best available science from various sources, from not only the Croteau study the commenter cites, but also various other journal articles, online presentations, and the U.S. Department of Transportation table fireworks chemicals all mention the prominence of copper and copper compounds as a fireworks colorant or color agent. Copper is listed as an air toxic by California Air Resources Board and Office of Environmental Health Hazard Assessment and is known to acutely impact human respiratory systems, resulting in upper respiratory tract irritation and nausea. Knowing that copper is prevalent in fireworks and that copper is a known pollutant of concern, it would be both unwise and a violation of CEQA to dismiss copper emissions. While the commenter states that the fireworks used in the Croteau study are not comparable to public display fireworks, information concerning the copper content (as a percentage) of net explosive weight in public display fireworks is unknown, and information from the Croteau study is the best available and only information available.

Response to Comment J-19

This comment states that a projectile from any particular consumer Roman candle is not at all like any kind of aerial shell in any relevant characteristic. See responses to comments J-17 and J-18. The Croteau study is the best available science at the time of analysis. This comment only provides a criticism of the analysis but does not provide substantive evidence to dispute the assumptions and conclusions in the Draft EIR. The comment states that the fireworks used in the public fireworks displays are different than the fireworks assumed in the Croteau study, but offers no evidence to support this claim. No changes were made to the Draft EIR in response to this comment.

Response to Comment J-20

This comment states that an additional difficulty in mandating the percentage of a particular chemical like copper in a fireworks display event is that fireworks manufacturers are loathe to release precise formulations, making it impossible to determine what combination of fireworks would comply with this standard. It is understood that fireworks manufacturers tend to shy away from disclosing all ingredients in their fireworks. However, the U.S. Department of Transportation has a list of approved and prohibited chemicals that manufacturers must comply with, so it is assumed that at some level the operator could obtain a list of chemicals or get assurance from the manufacturer. Regardless, the commenter raises an issue regarding the economic or technical infeasibility of the copper reduction portion of the proposed ordinance. Accordingly, this comment will be included in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Response to Comment J-21

This comment states that the Draft EIR cites other studies conducted in China and Europe as the basis for models and results, but the details of the fireworks used in those studies are not revealed. This is a general comment that has no bearing on the analysis. The summaries of the studies conducted in China and Europe are provided for context only and do not affect the analysis in the Draft EIR. This comment also says there is no discussion in the Draft EIR of how regulation of fireworks formulations varies in these countries from the formulations restricted by the U.S. Department of Transportation and the U.S. Consumer Product Safety Commission, or what adjustments should be made to account for these differences. The analysis in the Draft EIR does not estimate effects and health risk from any formulations that are currently restricted in the U.S. The main pollutants of concern in the study—copper, as a component of overall particulate matter, and total particulate matter—are not affected by these restrictions, so no adjustments are necessary.

Response to Comment J-22

This comment states that requiring the use of some type of environmentally friendly fireworks, when those fireworks are not yet practical or proven to be safe, is putting the horse before the cart and such fireworks are only minimally available and cost many times more than conventional fireworks. CEQA does not require the District to adopt mitigation measures for the proposed new fireworks display events or conditions of approval in the proposed ordinance that are economically or technically infeasible. However, a claim that a requirement of the proposed ordinance is infeasible must be supported by substantial evidence. The Board of Port Commissioners will consider evidence of infeasibility prior to making its decision whether or not to certify the EIR and to adopt the proposed ordinance. However, under CEQA, a lawyer's assertions or arguments alone

do not constitute substantial evidence (see *Pala Band of Mission Indians v. County of San Diego* (1998) 68 Cal.App.4th 556, 578-580).

Response to Comment J-23

This comment states that Section X.07(f)(11) of the proposed ordinance may have inadvertently designated the Fireworks Operator as the party responsible for providing trash receptacles. This comment is correct and the proposed ordinance will be corrected to substitute the term “Fireworks Organizer” in place of the term “Fireworks Operator” in Section X.07(f)(11) of the proposed ordinance.

Response to Comment J-24

This comment states that the provisions of the proposed ordinance limit the locations where fireworks display events can take place. The Draft EIR was prepared in compliance with CEQA, which requires an EIR to include a description of the proposed project that provides the “precise location and boundaries of the proposed project” (see State CEQA Guidelines § 15124(a)). This requirement limits the scope of the Draft EIR to existing and proposed fireworks display events that take place, or are proposed to take place, at specific locations. Unknown future fireworks displays could not be included in the Draft EIR because their location, as well as their number, size, duration and frequency, among other things, are presently unknown and any attempt to assess their environmental impacts would be speculative. The scope of the proposed ordinance is similarly limited to existing and proposed fireworks display events whose locations and other material characteristics are known at this time.

The comment further correctly observes that there is no provision in the proposed ordinance for other fireworks display events that are not mentioned in the proposed ordinance. This comment raises a policy issue regarding the scope of the proposed ordinance, not an environmental issue or concern regarding the adequacy of completeness of the Draft EIR. Accordingly, this comment will be included in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Response to Comment J-25

This comment repeats the author’s concern that the proposed ordinance limits the fireworks display events that may occur in the future. Please see response to comment J-24 above. The comment also states that the proposed ordinance effectively bans fireworks display events at locations that historically have been used for such displays, such as the Manchester Grand Hyatt.

As indicated in response to comment J-24 above, District staff and consultants made extensive inquiries with the District tenants and regulatory and permitting agencies involved with fireworks display events in and around San Diego Bay and the Imperial Beach oceanfront to identify all fireworks display events that occurred on a regular basis in that area prior to commencement of preparation of the Draft EIR. Although convention guests at the Manchester Grand Hyatt may have periodically contracted for fireworks displays as stated in the comment, this location was not identified by the regulatory and permitting agencies as a site where existing fireworks display events occurred on a regular basis. This comment raises a policy issue regarding the locations at which fireworks display events will be allowed, not an environmental issue or concern regarding the adequacy of completeness of the Draft EIR. Accordingly, this comment will be included in the

materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Response to Comment J-26

This comment states there is no map or chart in the Draft EIR or the proposed ordinance that shows the jurisdiction of the District compared to locations where barge-based fireworks are launched. Figure 2-1 of the EIR depicts the location of the existing and proposed fireworks launch sites with the District jurisdiction overlaid on the figure.

The comment also states that there is no discussion of the effect of a barge being outside the District's jurisdiction when the related event is in District jurisdiction. A lead agency's obligation to comply with CEQA is not limited only to environmental effects that occur within the lead agency's jurisdiction. The Draft EIR complies with CEQA by analyzing the potential environmental impacts of fireworks display events that occur in and around San Diego Bay and the Imperial Beach oceanfront, involve barges loaded within the District's jurisdiction, require a discretionary decision by the District, or are conducted by District tenants.

The comment also states that it should be easy for the District to designate eelgrass areas where barge control should be implemented.

Section X.07(g) of the proposed ordinance requires "To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds." Additionally, Section X.07(g) further states that "...tug boat operators shall be made aware of shallow eelgrass and instructed not to use high trust in the vicinity of eelgrass beds. Figure 4.3-1 includes the Bay's eelgrass habitat to assist with identifying sensitive habitat areas in the Bay.

Response to Comment J-27

This comment says it is not clear why the District distinguishes between fireworks display events that occur on the Fourth of July and events that occur at other times throughout the year. This distinction is made throughout the Draft EIR and in the proposed ordinance because fireworks display events that occur on the Fourth of July are generally much larger and impactful, both in terms of number of pounds of fireworks used, duration of the event and number of spectators, than events that occur at other times during the year (Draft EIR, Chapter 2, *Environmental Setting*, Tables 2-1 and 2-2). The distinction between these two general types of events served as an effective way to organize the analysis of environmental impacts in the Draft EIR and the conditions of approval in the proposed ordinance. The comment's assertion that the use of this distinction constitutes discrimination and suppression of expression has no merit and does not raise an environmental issue or relate to the adequacy or completeness of the Draft EIR. Accordingly, no further response is warranted.

In a footnote, the comment also states the Draft EIR does not demonstrate that there would be a significant impact on birds from fireworks displays and the burden of managing access to sensitive areas should not be dumped on fireworks organizers. The direct and indirect significant impacts of the proposed new fireworks display events and the proposed ordinance on avian species are discussed in detail in Section 4.3, *Biological Resources*, of the Draft EIR at pages 4.3-27 through 4.3-34. The requirement to mitigate these significant effects is not "dumped on fireworks organizers" by the District, but is imposed pursuant to CEQA on the party (i.e., fireworks organizer) who proposes an event that may have an adverse impact on the environment. The comment's suggestion that

environmental groups could spend some of their resources protecting such areas raises a policy issue, not an environmental issue or concern regarding the adequacy of completeness of the Draft EIR. Accordingly, this comment will be included in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Response to Comment J-28

This comment asks why it is acceptable to allow fireworks display events at certain locations of certain sizes and durations on the Fourth of July, but not at other locations. The locations, sizes, duration and frequency of allowed for existing fireworks display events is based solely on their past occurrence. CEQA requires an EIR to identify the physical conditions in the vicinity of a proposed project at the time of commencement of environmental review. These existing conditions are referred to as the “environmental setting” and normally constitute the baseline physical conditions by which a lead agency determines whether an environmental impact is significant (State CEQA Guidelines § 15125(a)). The characteristics of existing fireworks display events, whether on the Fourth of July or other days throughout the year, are part of the environmental setting for purposes of the Draft EIR and were carried forward into the proposed ordinance.

The comment also states that there is no reason to limit Independence Day displays to July 4 because it is “common” for sponsors to have displays on Saturdays or Sundays if July 4 falls on a weekday. The proposed ordinance defines “Fourth of July Fireworks Display Event” as a fireworks display event that occurs annually on the Fourth of July (Draft EIR, Appendix D, p. 2) because in the District’s experience the existing Fourth of July fireworks display events have occurred on July 4, regardless of what day of the week July 4 occurs. The comment’s claim that this provision constitutes discrimination and suppression of expression does not raise an environmental issue or other concern regarding the adequacy or completeness of the Draft EIR. Accordingly, no further response is required.

Response to Comment J-29

This comment states that the author’s general opinion that the proposed ordinance defines a fireworks display event too broadly in some respects and too narrowly in other respects, which the author believes makes the proposed ordinance confusing and subject to misinterpretation. This comment is a general statement of opinion that does not refer to any specific section of the proposed ordinance and appears to be an introduction to other comments that follow. Therefore, no further response is possible or required.

Response to Comment J-30

This comment concerns the proposed ordinance’s definition of the meaning of “Fireworks Display Event” and its reference to any group of people exceeding 25 in number. The reference in the definition to any group exceeding 25 in number is intended to make the proposed ordinance consistent with Section 8.26 of the District Code, which makes it unlawful for any company, organization or group of persons, exceeding 25 in number, to conduct or participate in any celebration, exercise or demonstration on District property without a permit from the District. The comment’s objection to this provision raises a policy issue, not an environmental issue or concern regarding the adequacy of completeness of the Draft EIR. Accordingly, this comment will be included

in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

In a footnote, the comment states displays do not routinely include the “detonating of fireworks” and that the term detonation refers to a malfunction that results in the device not rising into the air from its launching position. The comment recommends use of the terms “launched” or “ignited” rather than “detonated.” Except where indicated otherwise, the District intends that words used in the proposed ordinance be given their plain meaning. The dictionary defines the word “detonate” to mean to explode with sudden violence or to cause to explode. The comment, including its recommendation to substitute the word “ignite” for the word “detonate” in the proposed ordinance, will be included in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Response to Comment J-31

This comment states the author’s general opinions regarding the regulation of fireworks display event, which involve policy issues and considerations, not an environmental issue or concern regarding the adequacy of completeness of the Draft EIR. Accordingly, this comment will be included in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Response to Comment J-32

This comment asks the Board of Port Commissioners to seriously consider the effect of the proposed ordinance on the existing regulatory scheme and the effects the proposed ordinance could have on its own tenants and cities, and to take great care not to encroach on the regulatory authorities and jurisdiction that have been in place for a very long time. This comment raises policy issues and considerations, not an environmental issue or concern regarding the adequacy of completeness of the Draft EIR. Accordingly, this comment will be included in the materials presented to the Board of Port Commissioners for their consideration when they make their decision whether or not to adopt the proposed ordinance.

Chapter MMRP

Mitigation Monitoring and Reporting Program

MMRP.1 Purpose

The purpose of this Mitigation Monitoring and Reporting Program (MMRP) is to ensure that the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events project implements mitigation measures for significant environmental effects, as required by the Final Environmental Impact Report (EIR) for the proposed project. Those mitigation measures have been integrated into this MMRP. The MMRP provides a mechanism for monitoring the mitigation measures in compliance with the EIR, and general guidelines for the use and implementation of the monitoring program are described below.

This MMRP is written in accordance with California Public Resources Code 21081.6 and Section 15097 of the California Environmental Quality Act (CEQA) Guidelines. California Public Resources Code Section 21081.6 requires the Lead Agency, for each project that is subject to CEQA, to adopt a reporting or monitoring program for changes made to the project, or conditions of approval, adopted in order to mitigate or avoid significant effects on the environment and to monitor performance of the mitigation measures included in any environmental document to ensure that implementation takes place. The San Diego Unified Port District (District) is the designated Lead Agency for the MMRP. The Lead Agency is responsible for review of all monitoring reports, enforcement actions, and document disposition. The Lead Agency will rely on information provided by a monitor as accurate and up to date and will field check mitigation measure status as required.

The District may modify how it will implement a mitigation measure, as long as the alternative means of implementing the mitigation still achieve the same or greater impact reduction. Copies of the measures shall be distributed to the participants of the monitoring effort to ensure that all parties involved have a clear understanding of the adopted mitigation measures and monitoring requirements.

MMRP.2 Format

Mitigation measures applicable to the proposed project include avoiding certain impacts altogether, minimizing impacts by limiting the degree or magnitude of the action and its implementation, and/or requiring supplemental structural controls. Within this document, approval mitigation measures are organized and referenced by subject category. Each of the mitigation measures has a numerical reference. The following items are identified for each mitigation measure.

- Mitigation Language and Numbering
- Mitigation Timing
- Methods for Monitoring and Reporting
- Responsible Parties

MMRP.2.1 Mitigation Language and Numbering

Provides the language of the mitigation measure in its entirety along with a corresponding number for identification.

MMRP.2.2 Mitigation Timing

The mitigation measures required for the project will be implemented at various times, including prior to the issuance of a fireworks permit, prior to each fireworks display event, during each fireworks display event, or following each fireworks display event.

MMRP.2.3 Methods for Monitoring and Reporting

The MMRP includes the procedures for documenting and reporting mitigation implementation efforts. The party responsible for implementing each of the mitigation measures varies. The District is responsible for all mitigation monitoring and reporting.

MMRP.2.4 Responsible Parties

For each mitigation measure, the party responsible for implementation, monitoring and reporting, and verifying successful completion of the mitigation measure is identified.

Table 1. Mitigation Monitoring and Reporting Program

Mitigation Measures	Timing and Methods	Responsible Parties
Air Quality and Health Risk		
<p>MM-AQ-1: Limit the Size of Overlapping New Fireworks Display Events in Compliance with the Conditions of the Proposed Ordinance. The fireworks organizer and operator are required to comply with the following air quality-related conditions of the proposed ordinance. Section X.07 – Permits – Conditions of Approval (c) Size of Fireworks Display Events. D. National City Fourth of July, not to exceed 400 pounds of fireworks E. Chula Vista Fourth of July, not to exceed 400 pounds of fireworks</p>	<p>Timing: Prior to issuance of a fireworks permit Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer and Fireworks Operator Monitoring and Reporting: Fireworks Organizer, Fireworks Operator Verification: District</p>
<p>MM-AQ-2: Implementation of Air Quality-Related Conditions of the Proposed Ordinance. The fireworks organizer and operator are required to comply with the following air quality-related conditions of the proposed ordinance. Section X.07 – Permits – Conditions of Approval (f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up: 1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use. (d) Fireworks Chemical Composition and Packaging. 1. Chemical Composition. B. All fireworks display events shall use alternative fireworks produced with pyrotechnic formulas which replace perchlorate with other oxidizers and propellants</p>	<p>Timing: Prior to and during each fireworks display event Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer and Fireworks Operator Monitoring and Reporting: Fireworks Organizer, Fireworks Operator Verification: District</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that such alternative fireworks are not commercially available.</p>		
Biological Resources		
<p>MM-BIO-1: Implementation of Biological Resources-Related Conditions of the Proposed Ordinance for Direct Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance. Section X.07 – Permits – Conditions of Approval (d) Fireworks Chemical Composition and Packaging. 2. Packaging. A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all fireworks to be used in the event. B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited. (f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up: 1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use. 2. Fireworks shall be brought to the barge and loaded in their California Department of Transportation (DOT)-approved</p>	<p>Timing: Prior to issuance of a fireworks permit, prior to, during, and following each fireworks display event Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer and Fireworks Operator Monitoring and Reporting: Fireworks Organizer, Fireworks Operator Verification: District</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the fireworks launch area to contain debris.</p> <ol style="list-style-type: none"> 3. Wires from the electric match placed in the Fireworks fuse shall be secured to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event. 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event. 5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway. 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning. 		

Mitigation Measures	Timing and Methods	Responsible Parties
<p>7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment.</p> <p>8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal.</p> <p>9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.</p> <p>10. Within ten (10) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the weight of the fireworks trash and debris collected is less than fifty percent (50 percent) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.</p>		
<p>(i) Compliance with San Diego Water Board General Permit.</p> <p>1. Prior to the Executive Director's issuance of a permit</p>		

Mitigation Measures	Timing and Methods	Responsible Parties
<p>pursuant to this article, the Applicant shall demonstrate that it has applied for coverage and has been enrolled under the San Diego Water Board General Permit.</p> <ol style="list-style-type: none"> <li data-bbox="243 331 995 516">2. The Applicant shall comply with all applicable terms, conditions and Best Management Practices required by the San Diego Water Board General Permit, which shall be incorporated into and considered in the terms, conditions and Best Management Practices of any permit issued by the Executive Director pursuant to this article. <li data-bbox="243 524 995 768">3. The Applicant shall submit to the District copies of all applications, plans, reports and other documentation required by the San Diego Water Board General Permit, including without limitation the Notice of Intent, Fireworks Best Management Practices Plan, Public Fireworks Display Log and the Public Display of Fireworks Post Event Report, within the time required for the submission of such reports to the San Diego Water Board. <p>(j) Compliance with Other Required Permits: Prior to the Executive Director’s issuance of a Permit pursuant to this article, the Applicant shall demonstrate that it has obtained and shall comply with all other permits and approvals required by federal, state and local laws and regulations including, without limitation, such permits and approvals as are required by the United States Coast Guard, California Coastal Act, the District Code, including Article 10 (Stormwater Management and Discharge Control), and the fire marshal of any city which has jurisdiction over all or any part of the activity allowed under said Permit.</p> <p>(k) Compliance with Laws: The Applicant shall comply with any and all applicable rules and regulations promulgated by the District, including without limitation the District Code, the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and with the laws, rules and regulations of the United States of America and the State of California, and of any department or agency thereof, and with the applicable ordinances, rules and regulations of any city which has jurisdiction over all or any part of the activity allowed under said Permit. The Applicant’s failure to comply with any applicable law,</p>		

Mitigation Measures	Timing and Methods	Responsible Parties
<p>ordinance, rule or regulation shall be cause for immediate revocation of said permit and for the denial of applications for future Permits.</p>		
<p>MM-BIO-2: Implementation of Biological Resources–Related Conditions of the Proposed Ordinance for Indirect Impacts. The fireworks organizer and operator are required to comply with the following biological resources–related condition of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(e) Protection of Species and Habitat. The following conditions shall apply to fireworks display events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:</p> <ol style="list-style-type: none"> 3. Security. For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays. In addition, the fireworks organizer shall provide security patrols of the water area to enforce the existing restrictions on access to unauthorized areas during such fireworks display events in the South Bay. 4. Signage. For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half-mile of nesting colonies or habitat areas for federally or state-listed species, the fireworks organizer, in cooperation with the District, shall post temporary signage along primary access points to sensitive nesting colonies and habitat areas to identify safe viewing locations, to educate visitors on locations of sensitive wildlife habitats, to prevent viewers from trespassing into sensitive areas and to encourage appropriate viewing behavior. 	<p>Timing: Prior to, during, and following each fireworks display event</p> <p>Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: District, Fireworks Organizer, Fireworks Operator</p> <p>Monitoring and Reporting: Fireworks Organizer, Fireworks Operator</p> <p>Verification: District</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>5. Education. Beginning not less than seven (7) days before fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall implement a public education program using daily announcements on social media, press releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to remind viewers of appropriate viewing behavior in and near sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).</p> <p>(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:</p> <p>11. For all Fourth of July fireworks display events and for Non-Fourth of July fireworks display events which are advertised to the public, the fireworks organizer shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.</p>		
<p>MM-BIO-3: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Direct Eelgrass Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance. Section X.07 – Permits – Conditions of Approval</p> <p>(g) Eelgrass Avoidance and Mitigation. For fireworks display events with launching sites located in shallow water with the potential for eelgrass to occur, fireworks barges shall be held in place by tugboats and shall not require temporary moorings. To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds. Pre-event and post-event eelgrass surveys shall be completed to identify the distribution of</p>	<p>Timing: Prior to, during, and following each fireworks display event</p> <p>Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer, Fireworks Operator</p> <p>Monitoring and Reporting: Qualified agent, approved by the District, Fireworks Organizer, Fireworks Operator</p> <p>Verification: District</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>eelgrass to assist tug operators and to assess any impacts to eelgrass that may occur. Through a pre-event training, tug operators shall be made aware of shallow eelgrass and instructed not to use high thrust in the vicinity of eelgrass beds. If an unanticipated impact to eelgrass occurs, this impact shall be mitigated by replacing the eelgrass at a ratio determined by the California Eelgrass Mitigation Policy.</p>		
<p>MM-BIO-4: Fireworks Biological Monitoring Plan. Not less than 30 days before any fireworks display event in the South Bay that would occur within 1 mile of sensitive avian nesting colonies, the fireworks organizer shall submit to the District an Avian Species Nesting Colony Monitoring Plan (Monitoring Plan). The Monitoring Plan shall be prepared by a qualified biologist and approved by the District in coordination with USFWS and CDFW. A qualified biologist is a person who, by reason of his or her knowledge of the natural sciences and the principles of wildlife biology, acquired by education and experience. The Monitoring Plan shall identify the monitoring protocol that will be used to assess the effectiveness of mitigation measures MM-BIO-1 and MM-BIO-2 and shall, at a minimum, include the following:</p> <ol style="list-style-type: none"> 1. A literature review which refines the proposed methodology. 2. A list of target species identified for each individual event based on the season of the event, proximity of the event to nesting colonies, sensitivity of species, and capacity for the fireworks display event to cause species disturbance/effects. 3. Species behavior and noise data shall be collected at least 1 hour prior to, during, and 1 hour after the fireworks display event. 4. Documentation of the following data: <ol style="list-style-type: none"> a. Site location, name of monitor, date and time of observations b. Number of adults, nests, and chicks observed within one-half mile of spectator viewing areas c. Sources of stressors (e.g., light, noise, trespass, debris) d. Unauthorized access within nesting colonies e. Counts of illegal pyrotechnics <p>Within 30 days following the completion of the fireworks display event, the qualified biologist shall prepare a Monitoring Report for submittal to the District that details the findings of the monitoring</p>	<p>Timing: A minimum of 30 days prior to, during, and within 30 days following each fireworks display event</p> <p>Method: Prepare a Monitoring Plan for fireworks display events in the South Bay that would occur within 1 mile of sensitive nesting colonies, conduct biological monitoring, and prepare a Monitoring Report documenting the results of the biological monitoring.</p>	<p>Implementation: Fireworks Organizer</p> <p>Monitoring and Reporting: Qualified agent, approved by the District, Fireworks Organizer</p> <p>Verification: District</p>

<p>results. This report shall include background/introduction, methods, results, discussion, and recommendations sections. The District shall provide a copy of the report to the USFWS and CDFW and shall coordinate with these agencies regarding the results and recommendations of the report. Based on the review of the reports for two consecutive years of monitoring, the District, in coordination with these agencies, shall determine whether continued monitoring is required.</p>		
Hydrology and Water Quality		
<p>MM-WQ-1: Implementation of Water Quality-Related Conditions of the Proposed Ordinance for Fireworks Debris. The fireworks organizer and operator are required to comply with the following water quality-related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(d) Fireworks Chemical Composition and Packaging.</p> <ol style="list-style-type: none"> 1. Chemical Composition. <ol style="list-style-type: none"> B. All fireworks display events shall use alternative fireworks produced with pyrotechnic formulas which replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that such alternative fireworks are not commercially available. 2. Packaging. <ol style="list-style-type: none"> A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels (excluding labels mandated by State or Federal laws) from all fireworks to be used in the event. B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited. <p>(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event</p>	<p>Timing: Prior to issuance of a fireworks permit, prior to, during, and following each fireworks display event</p> <p>Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer and Fireworks Operator</p> <p>Monitoring and Reporting: Fireworks Organizer, Fireworks Operator</p> <p>Verification: District</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>preparation, discharge and clean-up:</p> <ol style="list-style-type: none"> 1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use. 2. Fireworks shall be brought to the barge and loaded in their California Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the Fireworks launch area to contain debris. 3. Wires from the electric match placed in the fireworks fuse shall be secured to avoid strain (such as wrapped around nails that are on the racks, tied to the racks, or tied to the mortar) to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event. 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event. 5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, 		

Mitigation Measures	Timing and Methods	Responsible Parties
<p>including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway.</p> <ol style="list-style-type: none"> 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning. 7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment. 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal. 9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal. 10. Within ten (10) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the Fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the dry weight of the fireworks trash and debris collected is less than fifty percent 		

Mitigation Measures	Timing and Methods	Responsible Parties
<p>(50 percent) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.</p> <p>(i) Compliance with San Diego Water Board General Permit.</p> <ol style="list-style-type: none"> 1. Prior to the Executive Director's issuance of a permit pursuant to this article, the Applicant shall demonstrate that it has applied for coverage and has been enrolled under the San Diego Water Board General Permit. 2. The Applicant shall comply with all applicable terms, conditions and Best Management Practices required by the San Diego Water Board General Permit, which shall be incorporated into and considered in the terms, conditions and Best Management Practices of any permit issued by the Executive Director pursuant to this article. 3. The Applicant shall submit to the District copies of all applications, plans, reports and other documentation required by the San Diego Water Board General Permit, including without limitation the Notice of Intent, Fireworks Best Management Practices Plan, Public Fireworks Display Log and the Public Display of Fireworks Post Event Report, within the time required for the submission of such reports to the San Diego Water Board. <p>(i) Compliance with Other Required Permits: Prior to the Executive Director's issuance of a Permit pursuant to this article, the Applicant shall demonstrate that it has obtained and shall comply with all other permits and approvals required by federal, state and local laws and regulations including, without limitation, such permits and approvals as are required by the United States Coast Guard, California Coastal Act, the District Code, including Article 10 (Stormwater Management and Discharge Control), and the fire marshal of any city which has jurisdiction over all or any part of</p>		

Mitigation Measures	Timing and Methods	Responsible Parties
<p>the activity allowed under said Permit.</p> <p>(j) Compliance with Laws: The Applicant shall comply with any and all applicable rules and regulations promulgated by the District, including without limitation the District Code, the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and with the laws, rules and regulations of the United States of America and the State of California, and of any department or agency thereof, and with the applicable ordinances, rules and regulations of any city which has jurisdiction over all or any part of the activity allowed under said Permit. The Applicant’s failure to comply with any applicable law, ordinance, rule or regulation shall be cause for immediate revocation of said permit and for the denial of applications for future Permits.</p>		
<p>MM-WQ-2: Implementation of Water Quality–Related Conditions of the Proposed Ordinance for Human-Generated Trash and Litter. The fireworks organizer and operator are required to comply with the following water quality–related condition of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(f) Best Management Practices. Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:</p> <p>11. For all Fourth of July fireworks display events and for Non-Fourth of July fireworks display events which are advertised to the public, the fireworks organizer shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.</p>	<p>Timing: Prior to and following each fireworks display event</p> <p>Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer and Fireworks Operator</p> <p>Monitoring and Reporting: Fireworks Organizer, Fireworks Operator</p> <p>Verification: District</p>
Noise and Vibration		
<p>MM-NOI-1: Implementation of Noise-Related Conditions of the Proposed Ordinance. The fireworks organizer and operator are required to comply with the following noise related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(e) Protection of Sensitive Species and Habitat. The following</p>	<p>Timing: During each fireworks display event</p> <p>Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer and Fireworks Operator</p> <p>Monitoring and Reporting: Fireworks Organizer, Fireworks</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>conditions shall apply to Fireworks Display Events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:</p> <ol style="list-style-type: none"> 1. Location. Fireworks display events shall be located not less than one (1) mile from any federally or state-listed avian species nesting colony unless the maximum size of shells used in the event is limited to eight (8) inches. 2. Salutes. Fireworks display events shall not use concussion type, non-color shells such as “salutes” or “reports” during the initial twenty-five percent (25 percent) of the duration of any display (e.g., within the first 5 minutes of a 20-minute display). 		<p>Operator</p> <p>Verification: District</p>
Transportation, Circulation, and Parking		
<p>MM-TRA-1: Implementation of the Transportation-Related Conditions of the Proposed Ordinance. The fireworks organizer is required to comply with the following transportation-related condition of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(h) Event Transportation and Parking Management Plans. For all Fourth of July fireworks display events and for non-Fourth of July fireworks display events that are advertised to the public, the fireworks organizer shall prepare and submit an event transportation and parking management plan to the Executive Director for approval as part of the Application, which shall be designed to ensure safe and convenient access to public viewing areas while limiting conflicts between transportation modes and reducing impacts on surrounding transportation facilities to the maximum extent feasible. The Event Transportation and Parking Management Plan shall take into account anticipated attendance, existing transportation and parking facilities, and other concurrent public events in the surrounding areas, and shall include but is not limited to the following:</p> <ol style="list-style-type: none"> 1. Transportation management strategies, including but not limited to a public awareness program, traffic management and enforcement, incident management, and public transit and alternative modes of transportation management, which 	<p>Timing: Prior to, during, and following each fireworks display event</p> <p>Method: Implement conditions of approval per Fireworks Display Ordinance</p>	<p>Implementation: Fireworks Organizer</p> <p>Monitoring and Reporting: Fireworks Organizer</p> <p>Verification: District</p>

Mitigation Measures	Timing and Methods	Responsible Parties
<p>shall be implemented for the fireworks display event; and</p> <p>2. Parking management strategies, including but not limited to a public awareness program, coordination with parking vendors, offsite parking arrangements, designated areas for taxi and rideshare pick-up/drop-off, promotional programs with rideshare vendors, joint event ticketing programs with public transit agencies, and expanded shuttle operations.</p> <p>(i) Compliance with Other Required Permits: Prior to the Executive Director’s issuance of a Permit pursuant to this article, the Applicant shall demonstrate that it has obtained and shall comply with all other permits and approvals required by federal, state, and local laws and regulations including, without limitation, such permits and approvals as are required by the United States Coast Guard, California Coastal Act, the District Code, including Article 10 (Stormwater Management and Discharge Control), and the fire marshal of any city that has jurisdiction over all or any part of the activity allowed under said Permit.</p>

List of Tables	vi
List of Figures.....	xi
List of Acronyms and Abbreviations.....	xii
Executive Summary.....	ES-1
ES.1 Introduction	ES-1
ES.2 Project Description	ES-1
ES.3 Areas of Known Controversy/Issues Raised by Agencies and the Public	ES-7
ES.4 Issues to be Resolved.....	ES-7
Chapter 1 Introduction.....	1-1
1.1 Project Overview.....	1-1
1.2 Purpose of the California Environmental Quality Act and the Environmental Impact Report	1-1
1.3 Intended Uses of the Environmental Impact Report	1-2
1.3.1 Lead Agency’s Use of This Environmental Impact Report	1-2
1.3.2 Other Agencies Expected to Use This Environmental Impact Report	1-3
1.3.3 Program-Level Analysis.....	1-4
1.4 Scope and Content of the Draft Environmental Impact Report	1-4
1.4.1 Comments Received in Response to the Notice of Preparation	1-5
1.5 Organization of the Draft EIR.....	1-11
Chapter 2 Environmental Setting.....	2-1
2.1 Introduction	2-1
2.2 Regional Context.....	2-1
2.2.1 District.....	2-2
2.3 Existing Setting.....	2-3
2.3.1 Existing Fireworks Display Events	2-3
2.3.2 Fireworks Display Event Locations.....	2-10
2.3.3 Surrounding Conditions	2-13
Chapter 3 Project Description.....	3-1
3.1 Introduction	3-1
3.2 Project Objectives	3-2
3.3 Project Characteristics	3-2
3.3.1 Proposed Ordinance	3-3
3.3.2 Project Operations.....	3-4

3.3.3	Description of Pyrotechnic Devices	3-6
3.3.4	Fireworks Chemical Constituents	3-8
Chapter 4	Environmental Analysis	4-1
Introduction.....	4-1
Potential Environmental Impacts	4-1
Format of the Environmental Analysis	4-1
Section 4.1 Aesthetics and Visual Resources	4.1-1
4.1.1 Overview	4.1-1
4.1.2 Existing Conditions.....	4.1-2
4.1.3 Applicable Laws and Regulations.....	4.1-11
4.1.4 Project Impact Analysis.....	4.1-12
Section 4.2 Air Quality and Health Risk.....	4.2-1
4.2.1 Overview	4.2-1
4.2.2 Existing Conditions.....	4.2-3
4.2.3 Applicable Laws and Regulations.....	4.2-15
4.2.4 Project Impact Analysis.....	4.2-20
Section 4.3 Biological Resources	4.3-1
4.3.1 Overview	4.3-1
4.3.2 Existing Conditions.....	4.3-4
4.3.3 Applicable Laws and Regulations.....	4.3-16
4.3.4 Project Impact Analysis.....	4.3-23
Section 4.4 Greenhouse Gas Emissions, Climate Change, and Energy	4.4-1
4.4.1 Overview	4.4-1
4.4.2 Existing Conditions.....	4.4-1
4.4.3 Applicable Laws and Regulations.....	4.4-7
4.4.4 Project Impact Analysis.....	4.4-15
Section 4.5 Hazards and Hazardous Materials.....	4.5-1
4.5.1 Overview	4.5-1
4.5.2 Existing Conditions.....	4.5-1
4.5.3 Applicable Laws and Regulations.....	4.5-4
4.5.4 Project Impact Analysis.....	4.5-12
Section 4.6 Hydrology and Water Quality	4.6-1
4.6.1 Overview	4.6-1
4.6.2 Existing Conditions.....	4.6-3
4.6.3 Applicable Laws and Regulations.....	4.6-8
4.6.4 Project Impact Analysis.....	4.6-19

Section 4.7 Land Use and Planning	4.7-1
4.7.1 Overview	4.7-1
4.7.2 Existing Conditions.....	4.7-1
4.7.3 Regulatory Framework	4.7-5
4.7.4 Project Impact Analysis.....	4.7-11
Section 4.8 Noise and Vibration	4.8-1
4.8.1 Overview	4.8-1
4.8.2 Noise Fundamentals and Terminology	4.8-2
4.8.3 Existing Conditions.....	4.8-7
4.8.4 Applicable Laws and Regulations.....	4.8-12
4.8.5 Project Impact Analysis.....	4.8-16
Section 4.9 Public Services and Facilities	4.9-1
4.9.1 Overview	4.9-1
4.9.2 Existing Conditions.....	4.9-1
4.9.3 Applicable Laws and Regulations.....	4.9-10
4.9.4 Project Impact Analysis.....	4.9-14
Section 4.10 Transportation, Circulation, and Parking.....	4.10-1
4.10.1 Overview	4.10-1
4.10.2 Existing Conditions.....	4.10-3
4.10.3 Applicable Laws and Regulations.....	4.10-9
4.10.4 Project Impact Analysis.....	4.10-13
Chapter 5 Cumulative Impacts.....	5-1
5.1 Overview	5-1
5.2 Cumulative Methodology	5-3
5.2.1 Application of the List Method	5-4
5.2.2 Application of the Plan Method.....	5-6
5.2.3 Cumulative Project Lists.....	5-7
5.3 Cumulative Impact Analysis.....	5-9
5.3.1 Aesthetics and Visual Resources.....	5-10
5.3.2 Air Quality and Health Risk	5-14
5.3.3 Biological Resources	5-20
5.3.4 Greenhouse Gas Emissions, Climate Change, and Energy.....	5-27
5.3.5 Hazards and Hazardous Materials	5-32
5.3.6 Hydrology and Water Quality	5-36
5.3.7 Land Use and Planning.....	5-42
5.3.8 Noise and Vibration	5-46

5.3.9	Public Services and Facilities.....	5-50
5.3.10	Transportation, Circulation, and Parking.....	5-54
Chapter 6 Additional Consequences of Project Implementation		6-1
6.1	Introduction	6-1
6.2	Significant Irreversible Environmental Changes	6-1
6.3	Growth-Inducing Impacts	6-2
6.3.1	Economic Growth	6-3
6.3.2	Population Growth.....	6-3
6.3.3	Construction of Additional Housing.....	6-4
6.3.4	Removal of Obstacles to Population Growth	6-4
6.3.5	Summary of Growth-Inducing Impacts.....	6-4
6.4	Effects Found Not to Be Significant	6-5
6.4.1	Aesthetics.....	6-5
6.4.2	Agriculture and Forestry Resources.....	6-6
6.4.3	Cultural Resources	6-7
6.4.4	Geology and Soils.....	6-7
6.4.5	Hazards and Hazardous Materials	6-9
6.4.6	Hydrology and Water Quality	6-10
6.4.7	Land Use and Planning.....	6-11
6.4.8	Mineral Resources	6-11
6.4.9	Noise	6-11
6.4.10	Population and Housing.....	6-12
6.4.11	Public Services.....	6-13
6.4.12	Recreation.....	6-13
6.4.13	Transportation and Traffic.....	6-14
6.4.14	Utilities and Service Systems	6-15
Chapter 7 Alternatives to the Proposed Project		7-1
7.1	Overview	7-1
7.2	Requirements for Alternatives Analysis.....	7-1
7.3	Selection of Alternatives.....	7-2
7.4	Alternatives Considered.....	7-4
7.4.1	Alternatives Considered but Rejected	7-4
7.4.2	Alternatives Selected for Analysis.....	7-6
7.5	Analysis of Alternatives.....	7-7
7.5.1	Analysis of Alternative 1 – No Project Alternative.....	7-8
7.5.2	Analysis of Alternative 2 – Quiet Fireworks Display Events Alternative.....	7-11

7.5.3	Analysis of Alternative 3 – No Salute Fireworks Alternative	7-15
7.5.4	Environmentally Superior Alternative	7-18
Chapter 8 List of Preparers and Agencies Consulted		8-1
Chapter 9 References		9-1
Appendix A	Notice of Preparation and Initial Study/Environmental Checklist	
Appendix B	Comment Letters on Notice of Preparation	
Appendix C	California Department of Forestry and Fire Protection’s <i>Fireworks in California</i>	
Appendix D	Proposed Fireworks Display Ordinance	
Appendix E	Air Quality and Greenhouse Gas Calculations; Health Risk Assessment	
Appendix F	Biological Technical Study	
Appendix G	Water Quality Technical Report	
Appendix H	Noise Calculations	
Appendix I	Public Services Questionnaires	
Appendix J	Transportation Assessment	
Appendix K	Cumulative Development Projects

ES.1 Introduction

This chapter provides a summary of the Draft Environmental Impact Report (EIR) prepared for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (proposed project), prepared in compliance with the California Environmental Quality Act (CEQA). The San Diego Unified Port District (District) is the CEQA Lead Agency for the EIR and, as such, has the primary responsibility for evaluating the environmental effects of the proposed project and considering whether to approve or disapprove the proposed project in light of these effects.

As required by CEQA, this Draft EIR does the following: (1) describes the proposed project, including its location, objectives, and features; (2) describes the existing conditions at the project site and nearby environs; (3) analyzes the direct, indirect, and cumulative adverse physical changes that would occur in the existing conditions should the proposed project be implemented; (4) identifies feasible means of avoiding or substantially lessening the significant adverse effects; (5) provides a determination of significance for each impact after mitigation is incorporated; and (6) evaluates a reasonable range of feasible alternatives to the proposed project that would meet the basic project objectives and reduce a project-related significant impact.

This Executive Summary covers the following topics: (1) Project Description; (2) Areas of Controversy/Issues Raised by Agencies and the Public; and (3) Issues to Be Resolved, including significant environmental effects and the consideration of alternatives to the proposed project.

ES.2 Project Description

ES.2.1 Project Overview

The proposed project consists of (1) an ordinance establishing a District Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the District. Discretionary actions for fireworks display events that may require District approval include, but are not limited to, the following:

- Sponsorship agreement
- Special event permit
- Lease and lease amendment
- Tideland Use and Occupancy Permit
- Right of Entry Permit
- Coastal Act Categorical Determination of Exclusion
- Coastal Development Permit

Fireworks display events that require a discretionary action by the District or are operated by the District's tenants have been occurring on the Fourth of July and at other times throughout the year for more than a decade. The most prominent existing fireworks display events are the annual Fourth of July Big Bay Boom in San Diego Bay and the Fourth of July Imperial Beach Fireworks Show. Furthermore, the Fireworks Show Over Glorietta Bay is an existing display whose fireworks organizers may seek to obtain funding from the District in the future, which would require a discretionary action by the District. Existing fireworks display events that occur at other times throughout the year include those associated with the San Diego Symphony's Summer Pops concert series (multiple small displays) and the Our Lady of Rosary Church annual procession, along with the U.S.S. Midway Aircraft Carrier Museum (U.S.S. Midway Museum) (multiple small displays) and General Dynamics National Steel and Shipbuilding Company (NASSCO) displays. The four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts, are anticipated to require a future discretionary action by the District, as discussed further below.

ES.2.2 Fireworks Display Event Locations

Existing Fireworks Display Events

Existing fireworks display events currently occur at several locations within San Diego Bay, a natural harbor and deep-water port in southern San Diego County, and the Imperial Beach Oceanfront. San Diego Bay is an active maritime environment that provides passage and berthing for numerous types of boats and vessels, including small recreational boats that moor at dock marinas and open anchorage marinas within the Bay, mid-sized vessels such as private yachts and harbor cruise boats, and large vessels that consist of naval ships, cruise ships, cargo ships, and shipping barges. Fireworks display events within San Diego Bay take place off Shelter Island, Harbor Island, Centre City Embarcadero (which includes North Embarcadero, Central Embarcadero, and South Embarcadero), and the NASSCO ship repair facility. In addition, fireworks display events take place along the Coronado Bayfront within Glorietta Bay (an inlet of San Diego Bay adjacent to Coronado Island) and the Imperial Beach Oceanfront. A list of existing fireworks display events that occur in and around San Diego Bay and the Pacific Ocean near Imperial Beach annually and a summary of the activity associated with them are provided in Tables 2-1 and 2-2, respectively, of Chapter 2, *Environmental Setting*.

Proposed New Fireworks Display Events

There are currently no fireworks display events along the National City or Chula Vista Bayfronts. Along the National City Bayfront, it is anticipated that future fireworks display events would take place from a barge within view of Pepper Park because Pepper Park is the closest publicly accessible gathering space near the National City Bayfront. Pepper Park is located along Tidelands Avenue in National City. The site is adjacent to the Sweetwater Channel, north of the Sweetwater Marsh Unit of the San Diego Bay National Wildlife Refuge, which includes Paradise Creek to the east and D Street Fill to the south, south of the National City Marine Terminal, east of San Diego Bay, and west of Pier 32 Marina. Interstate 5 (I-5) runs northeasterly approximately 0.4 mile from the park site boundary. Pepper Park site access is provided via Tidelands Avenue, which turns into Goesno Place as it approaches the park. One fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the vicinity of Pepper Park.

Along the Chula Vista Bayfront, it is anticipated that fireworks display events would take place from a barge within view of both the Chula Vista Bayside Park and the Chula Vista Bayfront Park. Bayside Park is a waterfront park accessed by Bayside Parkway. It is bounded to the north by a boatworks facility, to the south by a man-made inlet that contains marinas, to the east by a recreational vehicle (RV) park, and to the west by San Diego Bay. Bayfront Park is on the south side of the man-made inlet and is bounded to the south and west by San Diego Bay and to the east by the marinas of the man-made inlet as well as vacant land. The park is accessed by Marina Way. I-5 is approximately 0.5 mile to the east of the Chula Vista Bayfront. A total of three fireworks display events (including one on the Fourth of July) along the Chula Vista Bayfront area are allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan and are anticipated to involve the placement of a single, temporary barge in the Bay in the vicinity of the two parks.

Proposed new fireworks display events are described below in more detail in Section ES.2.5, *Project Operations*.

ES.2.3 Project Objectives

The District has identified the following objectives for the proposed project.

1. To develop a District ordinance that establishes policies, performance standards, and other requirements that would be applied to fireworks display events that occur in and around San Diego Bay and the Pacific Ocean near Imperial Beach and require a discretionary action by the District or are operated by the District's tenants;
2. To allow for the continued occurrence of traditional fireworks display events¹ in and around San Diego Bay and the Pacific Ocean near Imperial Beach that require a discretionary action by the District or are operated by the District's tenants, including on the Fourth of July, providing a popular and region-wide way to celebrate and express civic pride;
3. To allow for the continued occurrence of existing and future occurrence of proposed new traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach that require a discretionary action by the District or are operated by the District's tenants in a manner that considers the health, safety, and welfare of people, property, and the environment; and
4. To continue to enhance the visitor-serving experience of viewing fireworks display events from various vantage points around District tidelands by providing safe, high-quality fireworks display events using existing and new fireworks technologies as they become available.

¹ A traditional fireworks display event involves the use of display fireworks that are defined by the U.S. Bureau of Alcohol, Tobacco, Firearms and Explosives as large fireworks used in fireworks display shows, generally under the supervision of a trained pyrotechnician. These fireworks are designed primarily to produce visible or audible effects by combustion, deflagration, or detonation. They include, but are not limited to, salutes containing more than 2 grains (130 milligrams) of flash powder, aerial shells containing more than 40 grams of pyrotechnic compositions (including any break charge and visible/audible effect composition but exclusive of lift charge), and other display pieces that exceed the limits of explosive materials for classification as "consumer fireworks." They also include fused set pieces containing components that together exceed 50 milligrams of flash powder. Display fireworks are classified as fireworks UN0333, UN0334, or UN0335 by the U.S. Department of Transportation (U.S. ATF 2016).

ES.2.4 Proposed Ordinance

As stated above, the proposed project consists of an ordinance to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants. The proposed ordinance addresses the following:

- Permit procedures and requirements for the conduct of fireworks displays
- Compliance with applicable federal, state, and local laws and regulations governing fireworks, including, but not limited to:
 - Code of Federal Regulations
 - Clean Water Act
 - California Health and Safety Code
 - California Code of Regulations
 - CEQA
 - California Coastal Act
- Compliance with applicable federal, state, and local plans and permits governing fireworks, including, but not limited to:
 - San Diego Regional Water Quality Control Board's (SDRWQCB's) General Permit for Public Display of Fireworks (Order No. R9-2011-0022)
 - District's Climate Action Plan
 - District's Stormwater Management and Discharge Control Code
 - Integrated Natural Resources Management Plan
 - Chula Vista Bayfront Master Plan Natural Resources Management Plan
- Consistency with the features and characteristics of each individual fireworks display event analyzed in this Draft EIR, including, but not limited to:
 - Allowable launch site locations for individual displays
 - Total pounds of fireworks for individual displays
 - Allowable shell size(s) for individual displays
 - Frequency of individual displays
 - Duration of individual displays
- Compliance with the applicable mitigation measures identified in the Mitigation Monitoring and Reporting Program for the proposed project

ES.2.5 Project Operations

A number of fireworks display events occur year-round in and around San Diego Bay and the Pacific Ocean near Imperial Beach. A list of these fireworks display events is provided in Table 2-1 of

Chapter 2, *Environmental Setting*. These fireworks display events would be subject to the proposed ordinance.

In addition to the existing fireworks display events, the proposed ordinance would govern four proposed new fireworks display events, including three displays along the Chula Vista Bayfront as allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and one Fourth of July display along the National City Bayfront. The three proposed fireworks display events along the Chula Vista Bayfront include one Fourth of July display and two non-Fourth of July displays. It is anticipated that the District would consider annually whether or not to provide event sponsorship and/or issue a Special Event Permit, Right-of-Entry Permit, Tideland Use and Occupancy Permit, Coastal Development Permit, Coastal Act Categorical Determination of Exclusion, or other similar approval for these proposed new fireworks display events. These proposed new fireworks display events are anticipated to last approximately 3 to 10 minutes for non-Fourth of July displays and 15 to 20 minutes for Fourth of July displays, and the fireworks are anticipated to be launched from barges within San Diego Bay. These proposed new fireworks display events would also be governed by the proposed ordinance. The proposed new fireworks display events are identified in Table ES-1, below.

Table ES-1. Proposed New Fireworks Display Events Requiring a Future Discretionary Action by the District

Time of Year	Approximate Number of Fireworks Display Events	Location(s) of Fireworks Display Event	Approximate Duration of Each Fireworks Display Event	Approximate Shell Size
January–March	1	• Chula Vista ¹	3–10 minutes	2–8 inches
April–June	—	—	—	—
July–September	2	• Chula Vista ² • National City ²	15–20 minutes	3–8 inches
October–December	1	• Chula Vista ¹	3–10 minutes	2–8 inches
TOTAL³	4			

¹ Non-Fourth of July display (smaller display)

² Fourth of July display

³ Total includes three fireworks display events along the Chula Vista Bayfront, as allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan.

Table ES-2 summarizes the total pounds of fireworks estimated in this Draft EIR for each proposed new fireworks display event. Because no fireworks display events currently occur along the National City or Chula Vista Bayfronts, the total pounds of fireworks used to produce these displays is not yet known. However, for the purposes of this Draft EIR, the total pounds of fireworks for the National City and Chula Vista Bayfronts Fourth of July fireworks display events is anticipated to be 456 pounds for each display, which is similar to the Fourth of July Imperial Beach Fireworks Show (see Table ES-2). For the proposed new non-Fourth of July fireworks display events that would occur along the Chula Vista Bayfront, the total pounds of fireworks was estimated by scaling the duration of the Fourth of July Imperial Beach Fireworks Show (20-minute display) by the number of minutes for each proposed new fireworks display event (assumed to range between 3 and 10 minutes with an average duration of 5 minutes, similar to existing displays operated by the San Diego Symphony

during the Summer Pops concert series and U.S.S. Midway Museum), which equals an estimated 114 pounds for each display. Because the proposed ordinance would require consistency with the features and characteristics of each individual fireworks display event analyzed in this Draft EIR, including, but not limited to, the total pounds of fireworks and durations for individual displays, the values provided in Table ES-2 represent the maximum allowable pounds of fireworks and durations for the proposed new displays along the Chula Vista and National City Bayfronts assumed in this Draft EIR. Similarly, because the proposed ordinance would also govern the existing fireworks display events identified above, the values provided in Chapter 2, Table 2-2, also represent the maximum allowable pounds of fireworks for each existing fireworks display event assumed in this Draft EIR. If an existing fireworks display event identified in Chapter 2, Table 2-2, is proposed to be modified in the future, a new additional fireworks display event is proposed that was not analyzed in this Draft EIR, or any of the characteristics provided in Table ES-1 (e.g., magnitude and/or duration) of the four proposed new fireworks display events are proposed to be modified, the fireworks display event will be subject to additional environmental review, pursuant to State CEQA Guidelines Section 15168(c).

Table ES-2. Summary of Activity Associated with the Proposed Fireworks Display Events

Fireworks Display Event	Day of Event	Number of Events	Pounds of Fireworks per Event	Pounds of Fireworks Annually	Number of Barges Used per Event
Chula Vista Bayfront ¹	Fourth of July plus two other shows	3	456 ¹ 114 ²	684	1
National City Bayfront ¹	Fourth of July	1	456 ¹	456	1

Source: District 2016

¹ The total pounds of fireworks display events in the Chula Vista Bayfront and National City Bayfront areas on the Fourth of July is anticipated to be 456 pounds, similar to the Fourth of July Imperial Beach Fireworks Show.

² The total pounds of non-Fourth of July fireworks events estimated by scaling the Fourth of July Imperial Beach Fireworks Show (20-minute event) by the number of minutes for each fireworks display event (assumed to average 5 minutes), which equals an estimated 114 pounds each.

Both existing and proposed new fireworks display events involve coordination between several agencies, organizations, and businesses, as detailed below. The definitions below pertain to terminology used in the description of fireworks display events in the following paragraphs and throughout this Draft EIR.

- *Sponsor* generally refers to an individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency, or other legal entity, or the agent or employee thereof, that contributes funds, services, or other similar goods to a *fireworks organizer* in support of a fireworks display event. The District has historically been a *sponsor* of several of the fireworks display events described below.
- *Fireworks organizer* generally refers to the individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency, or other legal entity, or the agent or employee thereof, proposing to conduct a fireworks display event. The *fireworks organizer* is typically responsible for obtaining all required funding, entitlements, and approvals for a fireworks display event, as well as contracting with a *fireworks*

operator to produce the fireworks display event. Historically, the District has entered into agreements with *fireworks organizers* in order to sponsor several of the fireworks display events described below.

- *Fireworks operator* generally refers to a State of California–licensed pyrotechnic operator who, by examination, experience, and training, has demonstrated the required skill and ability in the use and discharge of fireworks as authorized by the license granted. A *fireworks operator* is typically responsible for supplying, setting up, and detonating the pyrotechnic devices associated with a fireworks display event. The *fireworks operator* is also typically under contract with the *fireworks organizer* to produce the fireworks display event. Historically, the District has not had a direct relationship with the *fireworks operator*.

All existing and proposed new fireworks display events that either require a discretionary action by the District or that are operated by the District’s tenants would be subject to all applicable federal, state, and local laws and regulations governing fireworks as well as any additional requirements set forth in the proposed ordinance.

ES.3 Areas of Known Controversy/Issues Raised by Agencies and the Public

Section 15123 of the State CEQA Guidelines requires the summary of an EIR to include areas of controversy known to the Lead Agency, including issues raised by agencies and the public. The District circulated a Notice of Preparation (NOP) to solicit agency and public comments on the scope and content of the environmental analysis beginning on August 7, 2015, and ending on September 8, 2015. The NOP was mailed to public agencies, organizations, and other interested individuals to solicit their comments on the scope and content of the environmental analysis. The District also held a public scoping meeting on August 25, 2015, at the District’s Administration Building at 3165 Pacific Highway, San Diego, CA, 92101. The Initial Study/Environmental Checklist and NOP are included as Appendix A.

Seven comment letters were received during the NOP public review period. The primary issues raised were related to air quality, greenhouse gas emissions, water quality, and biological resources. A summary of all comments received is included in Table 1-2 of Chapter 1, *Introduction*, and all NOP comment letters are included in Appendix B of this Draft EIR.

ES.4 Issues to be Resolved

ES.4.1 Summary of Project Impacts

This Draft EIR examines the potential environmental effects of the proposed project, including information related to existing conditions, analyses of the types and magnitude of individual and cumulative environmental impacts, and feasible mitigation measures that could reduce or avoid environmental impacts. In accordance with Appendix G of the State CEQA Guidelines, the potential environmental effects of the proposed project were analyzed for the following areas.

- Aesthetics and Visual Resources
- Hydrology and Water Quality

- Air Quality and Health Risk
- Biological Resources
- Greenhouse Gas Emissions, Climate Change, and Energy
- Hazards and Hazardous Materials
- Land Use and Planning
- Noise and Vibration
- Public Services and Facilities
- Transportation, Circulation, and Parking

Table ES-3, presented at the end of this chapter, provides a summary of the environmental impacts that could result from implementation of the proposed project and feasible mitigation measures that would reduce or avoid the impacts. For each impact, Table ES-3 identifies the significance of the impact before mitigation, applicable mitigation measures, and the level of significance of the impact after the implementation of the mitigation measures. “Effects Found Not to be Significant,” in accordance with Section 15128 of the State CEQA Guidelines, are discussed further in Chapter 6, *Additional Consequences of Project Implementation*.

ES.4.2 Summary of Project Alternatives

The following alternatives are analyzed in detail in Chapter 7 of this Draft EIR. The objective of the alternatives analysis is to consider a reasonable range of potentially feasible alternatives to foster informed decision-making and public participation. The alternatives to the proposed project are summarized below.

Alternative 1 – No Project Alternative

The No Project Alternative is required by CEQA to discuss and analyze potential impacts that would occur if the proposed project was not implemented. Under the No Project Alternative, the proposed ordinance would not be adopted and no performance standards to regulate the environmental effects of existing fireworks display events occurring in San Diego Bay or the Imperial Beach Oceanfront would be implemented. In addition, the four proposed new fireworks display events along the National City and Chula Vista Bayfronts would not occur. However, all existing fireworks display events that require a discretionary approval by the District or are operated by the District’s tenants and have obtained all necessary agency permits, such as the General Permit from SDRWQCB, would continue to occur, including but not limited to those listed in Table 5-2, *Cumulative Fireworks Display Events*, in Chapter 5, *Cumulative Impacts*.

Alternative 2 – Quiet Fireworks Display Events Alternative

The Quiet Fireworks Display Events Alternative would require the proposed new fireworks display events along the National City and Chula Vista Bayfronts to be quiet fireworks display events that would not exceed a noise limit of 120 dBA.² For this type of fireworks display event, the pyrotechnicians design a fireworks package that relies on the quieter types of fireworks. These fireworks display events would eliminate the use of “salute,” rocket, and mine fireworks altogether (*salute* fireworks, also known as maroon fireworks, are fireworks designed to make a very loud bang and an intense flash of light) and instead focus on rich color effects and tight visual choreography in order to garner similar entertainment value out of the display. Generally, fireworks used in quiet

² 120 dB maximum A-weighted impulse sound pressure level as measured at a horizontal distance of 15 meters from the testing point at a height of 1 meter above the ground, using a Type 1 sound measuring device with a free-field microphone.

fireworks display events would include fountains, wheels, cakes (such as crossettes, comets, spinners or turbillions, colored stars, fish or bees, and falling leaves), Chinese lanterns, and lanceworks (United Kingdom Fireworks Review 2016). It is important to note that the use of these fireworks would create a quieter, but not silent, fireworks display event. In addition, quiet fireworks display events would involve fireworks that are concentrated closer to the ground with fewer aerial shells being employed due to the loud noise that can occur during propulsion of an aerial shell. Therefore, while these displays would be in the same locations as those specified for the proposed project (as detailed in Chapter 3, *Project Description*), i.e., on barges, because quiet fireworks display events would rely on fireworks that cannot achieve the same heights or the same magnitude as traditional fireworks displays they would not be as prominently visible and the viewing area would be smaller than that which exists for the proposed project. The Quiet Fireworks Display Events Alternative is intended to avoid or substantially lessen the significant noise impacts of the proposed project on nearby sensitive receptors.

Alternative 3 – No Salute Fireworks Alternative

Salute fireworks, which are fireworks specifically designed to create a loud bang and intense flash of light, are the loudest type of firework. The primary purpose of salute shells is to announce the beginning and end of the display and produce a loud, percussive effect. From a distance, these shells sound similar to cannon fire when detonated (NMFS 2006). While the noise level of these fireworks varies by type, a typical linear (unweighted) peak noise level directly below a 3-inch salute exploding at its normal altitude is 140 decibels (dB) (Journal of Pyrotechnics, Inc. 2012). The No Salute Fireworks Alternative would have the same characteristics as all of the fireworks display events that compose the proposed project, including the same total pounds of fireworks per event (as outlined in Table 3-2 in Chapter 3, *Project Description*), but would prohibit the use of salute fireworks and limit the noise produced by all fireworks during fireworks display events to a maximum of 140 dB.³ Rockets, mines, and all firework types described under the Quiet Fireworks Display Events Alternative would be allowed as long as they do not exceed the 140 dB noise limit. The No Salute Fireworks Alternative is intended to avoid or substantially lessen the significant noise impacts of the proposed project on sensitive receptors.

Environmentally Superior Alternative

Pursuant to CEQA, the EIR is required to identify the environmentally superior alternative. Although the No Project Alternative reduces the greatest number of significant impacts, CEQA requires that when the environmentally superior alternative is the No Project Alternative, another alternative should be identified. Therefore, as indicated in Table 7-2 of Chapter 7, *Alternatives to the Proposed Project*, the Quiet Fireworks Display Event Alternative would be the environmentally superior alternative. Because it would involve the use of quieter fireworks, the Quiet Fireworks Display Event Alternative would reduce the amount of noise generated by the proposed new fireworks display events, and therefore would reduce significant and unavoidable noise impacts compared to the proposed project. Therefore, as documented throughout the alternatives section, impacts associated with other resources, such as light and glare, biological resources, and transportation, circulation,

³ 140 dB linear (unweighted) peak sound pressure level as measured directly under the shell burst occurring at its normal altitude, using a Type 1 sound measuring device with a free-field microphone at a height of 1 meter above the ground.

and parking, would also be reduced. However, the Quiet Fireworks Display Events Alternative would not meet the fundamental project objectives.

Table ES-3. Project Impacts and Mitigation Measures

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
4.1 Aesthetics and Visual Resources				
Project Impacts				
New Source of Substantial Light or Glare	<i>Proposed New Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	Implementation of the proposed new fireworks display events would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	The effects of the proposed ordinance on existing fireworks display events would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.			
Cumulative Impacts				
The contribution of the proposed new fireworks display events and the proposed ordinance to cumulative aesthetics and visual resources impacts would not be cumulatively considerable.				
4.2 Air Quality and Health Risk				
Project Impacts				
Conflict with an Air Quality Management Plan	<i>Proposed New Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	Implementation of the proposed new fireworks display events would not conflict with or obstruct implementation of an applicable air quality plan.			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>	LS	No mitigation is required.	N/A
	The effects of the proposed ordinance on existing fireworks display events would not conflict with or obstruct			

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
Violate Air Quality Standard	<p>implementation of an applicable air quality plan.</p> <p><i>Proposed New Fireworks Display Events</i></p> <p>Impact-AQ-1: Emissions in Excess of PM2.5 Thresholds During Combined National City Bayfront and Chula Vista Bayfront Fourth of July Fireworks Display Events. Project emissions generated when the new National City Bayfront and Chula Vista Bayfront Fourth of July fireworks display events occur at the same time, before mitigation, would exceed the daily San Diego County Significance Level Thresholds (SLTs) for particulate matter 2.5 microns or less in diameter (PM2.5). The contribution of project-related emissions is considered significant because the project emissions would exceed the daily threshold that has been set by the San Diego Air Pollution Control District (SDAPCD) to attain the PM2.5 National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS).</p>	PS	<p>MM-AQ-1: Limit the Size of Overlapping New Fireworks Display Events with Compliance with the Conditions of the Proposed Ordinance. 4.3 Biological Resources				
Project Impacts				
Candidate, Sensitive, or Special-Status Species	<p><i>Proposed New Fireworks Display Events</i></p> <p>Impact-BIO-1: Potential Direct Impact on Marine Reptiles from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to green sea turtles because the turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on green sea turtles from fireworks-generated trash and debris that enter the water may be significant.</p> <p>Impact-BIO-2: Potential Indirect Impacts on Marine Reptiles from Increased Human and Boating Activity. The increase in boat traffic, particularly nighttime and out-of-channel traffic, would increase the potential for propeller strikes, which may cause injury to or death of green sea turtles. Increased boating activities could cause the animals to temporarily depart the project area before, during, and after the time of the proposed new fireworks display events to avoid higher vessel traffic. The increase in activity may also affect the turtles' foraging habits in that individuals may spend more time underwater, swim at greater speeds, and alter other life history traits leading to greater energy expenditure. The introduction of</p>	PS	<p>MM-BIO-1: Implementation of Biological Resources-Related Conditions of the Proposed Ordinance for Direct Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(d) Fireworks Chemical Composition and Packaging.</p> <p>2. Packaging.</p> <p>A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels from all fireworks to be used in the event.</p> <p>B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.</p> <p>(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:</p> <p>1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3)</p>	LS

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>human-generated trash could also cause injury to turtles if they mistakenly consume the waste, causing suffocation, starvation, or debilitation. These potential indirect impacts on marine reptiles may be significant.</p> <p>Impact-BIO-3: Potential Direct Impact on Avian Species from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to avian species because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on avian species from fireworks-generated trash and debris that enter the water may be significant.</p> <p>Impact-BIO-4: Potential Indirect Impacts on Special-Status Avian Species from Increased Human and Boating Activity. The proposed new fireworks display events have the potential to result in indirect impacts on special-status avian species, particularly California least tern and western snowy plover, as a result of increased foot traffic on sand dunes and beaches that can cause disturbance to nesting sites during and immediately after the proposed new fireworks display events. Additional indirect impacts potentially include increased trash associated with human use and noise associated with boating activity adjacent to nesting sites. The</p>		<p>minutes and all such trucks and equipment shall be shut down when not in use.</p> <ol style="list-style-type: none"> 2. Fireworks shall be brought to the barge and loaded in their California Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the fireworks launch area to contain debris. 3. Wires from the electric match placed in the Fireworks fuse shall be wrapped around nails that are installed on the racks to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event. 4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event. 5. Following the fireworks display event and upon expiration of any safety period required 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>introduction of human-generated trash could also cause injury to special-status birds because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. While many nesting sites for California least tern and western snowy plover in San Diego Bay are behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas may be significant.</p>		<p>by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway.</p> <ol style="list-style-type: none"> 6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. Fireworks operators shall photograph the barge prior to and after cleaning. 7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment. 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected 	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
			<p>prior to its disposal.</p> <p>9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.</p> <p>10. Within five (5) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the weight of the fireworks trash and debris collected is less than fifty percent (50 percent) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.</p> <p>(i) Compliance with San Diego Water Board General Permit.</p> <p>1. Prior to the Executive Director's issuance of a permit pursuant to this article, the Applicant</p>

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>federally protected wetlands of south San Diego Bay from fireworks-generated trash and debris that enter the water are considered significant.</p> <p>Impact-BIO-6: Potential Direct Impact on Eelgrass Habitat from Fireworks Barges and Tugboat Activity. The positioning of fireworks barges along the Chula Vista Bayfront over the shallow flats could result in direct impacts on eelgrass habitat and its nursery habitat functions, particularly at low tides. Impacts could occur as a result of temporary grounding or settling of barges and tugboats on the bottom at low tide. Additional impacts could occur from propeller wash or propeller drag from tugboats during barge maneuvering. Tugboats have large propellers and high thrust capacity that could dredge up eelgrass in shallow waters, even if grounding does not occur. Potential direct impacts on eelgrass habitat are considered significant.</p> <p>Impact-BIO-7: Potential Indirect Impact on Sensitive Habitat and Wetlands from Increased Human and Boating Activity. Increased boat traffic could result in minor damage to eelgrass beds through unauthorized anchoring and/or propeller dragging. Additionally, visitors that view the proposed new fireworks display events from kayaks or personal watercraft could drag these watercraft onto</p>		<p>shallow water with the potential for eelgrass to occur, fireworks barges shall be held in place by tugboats and shall not require temporary moorings. To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds. Pre-event and post-event eelgrass surveys shall be completed to identify the distribution of eelgrass to assist tug operators and to assess any impacts to eelgrass that may occur. Through a pre-event training, tug operators shall be made aware of shallow eelgrass and instructed not to use high thrust in the vicinity of eelgrass beds. If an unanticipated impact to eelgrass occurs, this impact shall be mitigated by replacing the eelgrass at a ratio determined by the California Eelgrass Mitigation Policy.</p>	

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>shorelines adjacent to coastal salt marshes and inadvertently damage eelgrass or marsh habitat. The proposed new fireworks display events could attract crowds to the Silver Strand State Beach, some of whom may trespass into restricted beach areas that are utilized by sensitive avian species. Potential impacts on habitats include trampling of vegetation and an increase of human-generated trash and litter. Indirect impacts on sensitive habitat and wetlands of south San Diego Bay would be significant.</p>			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>			
	<p>The effects of the proposed ordinance on existing fireworks display events would not have a substantial adverse effect on riparian habitat and/or other sensitive natural communities or wetlands.</p>	LS	No mitigation is required.	N/A
Interference with Wildlife Movement	<i>Proposed New Fireworks Display Events</i>			
	<p>Impact-BIO-8: Potential Indirect Impact on Usage of Nursery Sites from Increased Human Activity. Indirect impacts on protected avian species from proposed new fireworks display events, such as increased foot traffic in or adjacent to nesting sites, increased human-generated trash, and noise associated with boating activity, are potentially a greater threat than direct impacts. While many nesting sites for California least tern and western snowy plover in San Diego Bay</p>	PS	Implement MM-BIO-1 and MM-BIO-2	LS

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>are located behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts of proposed new fireworks display events on usage of nursery sites are considered potentially significant due to disturbance noted in nesting birds.</p>			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>			
	<p>The effects of the proposed ordinance on existing fireworks display events would not interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.</p>	LS	No mitigation is required.	N/A
<p>Conflicts with Local Policies or Ordinances Protecting Biological Resources/ Conflicts with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other Approved Local, Regional, or State Habitat Conservation Plan.</p>	<p><i>Proposed New Fireworks Display Events</i> Impact-BIO-9: Potential Conflict with the City of San Diego and Chula Vista MSCP Subarea Plans. The proposed new fireworks display events have the potential to result in significant direct and indirect impacts on habitat within the City of San Diego Multi-Habitat Planning Area and City of Chula Vista Multiple Species Conservation Program (MSCP) Preserve. Any impacts, whether direct or indirect, would be significant. Consequently, the proposed project would have the potential to conflict with the City of San Diego and City of Chula Vista MSCP Subarea Plans. Temporary Increase in Ambient Noise Levels	standards established in the applicable city of Imperial Beach, Chula Vista, and National City municipal codes.		<p>MM-NOI-1: Implementation of Noise-Related Conditions of the Proposed Ordinance. The fireworks organizer and operator are required to comply with the following noise related conditions of the proposed ordinance.</p> <p>Section X.07 – Permits – Conditions of Approval</p> <p>(e) Protection of Sensitive Species and Habitat. The following conditions shall apply to Fireworks Display Events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:</p> <ol style="list-style-type: none"> 1. Location. Fireworks display events shall be located not less than one (1) mile from any federally or state-listed avian species nesting colony unless the maximum size of shells used in the event is limited to eight (8) inches. 2. Salutes. Fireworks display events shall not use concussion type, non-color shells such as “salutes” or “reports” during the initial twenty-five percent (25 percent) of the duration of any display (e.g., within the first 5 minutes of a 20-minute display). 	SU
	<p><i>Proposed New Fireworks Display Events</i></p> <p>Impact NOI-1: Substantial Periodic or Temporary Increase in Ambient Noise Levels of the Proposed New Fireworks Display Events. For proposed new fireworks display events (both Fourth of July and non-Fourth of July events), these noise increases would occur at homes and the Grand Caribe Shoreline Park in the City of Coronado, west of the proposed National City and Chula Vista launch locations. Depending on the precise location of the proposed Chula Vista launch barge, substantial noise increases due to the proposed new Fourth of July fireworks display events may also occur at Loews Coronado Bay Resort. If the ultimate location of the launch barge for the proposed Chula Vista fireworks display event is closer to the Chula Vista Bayfront than was assumed in the analysis, then it is possible some significant impacts could also occur within the City of Chula Vista. Because the proposed new fireworks display events would occur at locations that do not currently have similar fireworks displays, the affected noise-sensitive receptors are not currently exposed to similar levels of fireworks noise and the impacts would be</p>			

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>significant. However, it is also noted that the impacts would be very infrequent (approximately three times per year) and would include the Fourth of July, which is a traditional nationwide event during which most people have a reasonable expectation and understanding that fireworks will occur.</p>			
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>			
	<p>The effects of the proposed ordinance on existing fireworks display events would not cause or contribute to any increase in ambient noise levels.</p>	LS	No mitigation is required.	N/A

Cumulative Impacts

The contribution of the proposed new fireworks display events and the proposed ordinance to noise impacts would not be cumulatively considerable.

4.9 Public Services and Facilities

Project Impacts

<p>Fire Protection and Emergency Services</p>	<i>Proposed New Fireworks Display Events</i>			
	<p>Implementation of the proposed new fireworks display events would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection and emergency services.</p>	LS	No mitigation is required.	N/A
	<i>Effects of Proposed Ordinance on Existing Fireworks Display Events</i>			
	<p>The effects of the proposed ordinance</p>	LS	No mitigation is required.	N/A

Issue	Impact	Significance Before Mitigation	Mitigation Measure(s)	Significance After Mitigation
	<p>on existing fireworks display events would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection and emergency services.</p>

Cumulative Impacts				
The contribution of the proposed new fireworks display event and the proposed ordinance to cumulative transportation, circulation, and parking impacts would not be cumulatively considerable.				
Notes: PS = Potentially significant; LS = Less than significant; SU = Significant and Unavoidable; N/A = Not applicable				

1.1 Project Overview

The proposed San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project (herein referred to as the proposed project) consists of (1) an ordinance establishing a San Diego Unified Port District (District) Code section (District Code section) to govern existing and proposed new fireworks display events that occur throughout the year in and around San Diego Bay and Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the District. The most prominent existing fireworks display events are the annual Fourth of July Big Bay Boom in San Diego Bay, the Fourth of July Imperial Beach Fireworks Show over the Pacific Ocean near Imperial Beach, and the Fireworks Show Over Glorietta Bay. Other existing displays include those associated with the U.S.S. Midway Aircraft Carrier Museum (U.S.S. Midway Museum), General Dynamics National Steel and Shipbuilding Company (NASSCO), San Diego Symphony's Summer Pops concert series, and Our Lady of Rosary Church Annual Procession.

This environmental impact report (EIR) discusses the environmental baseline conditions and evaluates the potential environmental impacts of the proposed project. This Draft EIR assumes the continuation of existing fireworks display events at the same location and of the same magnitude and duration.

In addition to the project overview provided above, this chapter briefly discusses (1) the purpose of the California Environmental Quality Act (CEQA) and this Draft EIR, (2) the intended uses of this Draft EIR, (3) the scope and content of this Draft EIR, and (4) the organization of this Draft EIR.

1.2 Purpose of the California Environmental Quality Act and the Environmental Impact Report

This Draft EIR evaluates the potential environmental effects of the proposed project and has been prepared in compliance with CEQA (Public Resources Code Section 21000 et seq.) and the procedures for implementation of CEQA set forth in the State CEQA Guidelines (California Code of Regulations Title 14, Section 15000 et seq.). This Draft EIR has also been prepared in compliance with the District's *Guidelines for Compliance with CEQA* (Resolution 97-191; Clerk Document No. 36294).

CEQA was enacted by the California legislature in 1970. As noted under State CEQA Guidelines Section 15002, CEQA has four basic purposes:

1. Inform governmental decision-makers and the public about the potential significant environmental effects of proposed activities.

2. Identify the ways in which environmental damage can be avoided or significantly reduced.
3. Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible.
4. Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

An EIR is an informational document that is intended to inform members of the public and agency decision-makers of the significant environmental effects of a proposed project, to identify feasible ways to reduce the significant effects of the proposed project, and to describe a reasonable range of feasible alternatives to the project that would reduce one or more significant effects and still meet the proposed project's objectives. In instances where significant impacts cannot be avoided or mitigated, the proposed project may nonetheless be carried out or approved if the approving agency finds that economic, legal, social, technological, or other benefits outweigh the unavoidable significant environmental impacts.

1.3 Intended Uses of the Environmental Impact Report

This section discusses the intended uses of this Draft EIR and includes (1) a list of agencies that would be expected to use this Draft EIR for decision-making, and (2) a list of required permits and other approvals that would be required to implement the proposed project. Environmental review and consultation requirements under federal, state, or local laws, regulations, or policies that are in addition to CEQA are discussed in the applicable individual resource sections within Chapter 4, *Environmental Analysis*.

1.3.1 Lead Agency's Use of This Environmental Impact Report

The District is the CEQA lead agency, as defined under State CEQA Guidelines Section 15367, because it has principal responsibility for carrying out or approving fireworks display events, subject to the proposed ordinance. As the lead agency, the District also has primary responsibility for complying with CEQA. As such, the District has analyzed the environmental effects of the proposed project, the results of which are presented in this Draft EIR. The Board of Port Commissioners, in its role as the decision-making body of the District, is responsible for certifying the Final EIR and approving the Findings of Fact and Statement of Overriding Considerations pursuant to Sections 15090–15093 of the State CEQA Guidelines prior to project approval.

This EIR is intended to be an informational document to be used by the District's Board of Port Commissioners, public agencies, stakeholder organizations and individuals, and the general public during the decision-making process for the proposed project. In accordance with the State CEQA Guidelines and the District's *Guidelines for Compliance with CEQA* (Resolution 97-191; Clerk Document No. 36294), this EIR will inform readers of the potential significant environmental effects of the proposed project, identify possible means of minimizing the significant effects, and describe a range of reasonable alternatives to the proposed project. The Board of Port Commissioners will consider the EIR, along with other substantial evidence in the administrative record, when making a decision on the proposed project.

In order to certify this EIR, the Board of Port Commissioners must find that it has been completed in compliance with CEQA (Public Resources Code §21000 et seq.), the State CEQA Guidelines (14 CCR §15000 et seq.), and the District's *Guidelines for Compliance with CEQA* (Resolution 97-191; Clerk Document No. 36294) Section VI, and that all information contained in this EIR was considered prior to approval of the proposed project.

Table 1-1 provides a summary list of the approvals and permits that would be required.

Table 1-1. List of Required Discretionary Actions by the District

Discretionary Action
Certification of Final EIR
Adoption of Findings of Fact
Adoption of Statement of Overriding Considerations
Adoption of Mitigation Monitoring and Reporting Program
Adoption of an Ordinance Establishing a San Diego Unified Port District Code Section to Govern Fireworks Display Events

1.3.2 Other Agencies Expected to Use This Environmental Impact Report

The operation of fireworks display events may require permits and authorization by other agencies including, but not limited to, the following.

- National Oceanic and Atmospheric Administration, National Marine Fisheries Service
- U.S. Army Corps of Engineers
- U.S. Coast Guard
- U.S. Fish and Wildlife Service
- California Coastal Commission
- California Department of Fish and Wildlife
- California State Lands Commission
- San Diego Regional Water Quality Control Board
- City of Chula Vista Fire Department
- City of Coronado Fire Department
- City of Imperial Beach Fire Department
- City of National City Fire Department
- City of San Diego Fire Department

As defined under State CEQA Guidelines Section 15386, a trustee agency is a state agency that has jurisdiction by law over natural resources affected by a project that are held in trust for the people

of the state of California. The California State Lands Commission (CSLC) and California Department of Fish and Wildlife (CDFW) are trustee agencies, as defined in State CEQA Guidelines Section 15386. CSLC has jurisdiction and management control over those public trust lands of the state received by the state upon its admission to the United States in 1850. CSLC has jurisdiction over submerged lands within San Diego Bay that are not under the jurisdiction of the District. Several of the barges for the existing fireworks display events are situated within CSLC jurisdiction. However, because the barges are not anchored or moored, a lease or any other similar approval is not required from CSLC (Collins pers. comm.).

It is anticipated that CDFW may have an interest in the proposed project; however, CDFW would not issue approvals or permits that would be required to implement the proposed project. There are no other trustee agencies for the proposed project as defined in State CEQA Guidelines Section 15386.

1.3.3 Program-Level Analysis

This Draft EIR provides a program-level analysis of the proposed District Code section governing fireworks displays and the potential future occurrence of four new proposed fireworks display events adjacent to the National City and Chula Vista Bayfronts. Because no applications for approval of the four proposed new fireworks display events have been submitted, some project details for each of the proposed new fireworks display events are not available at the time of this Draft EIR's preparation. The EIR includes assumptions regarding the total pounds of fireworks, duration, shell size, time of year, and barge location for each of the proposed new fireworks display events. Therefore, if, in the future, an existing fireworks display event is modified or a new fireworks display event is proposed that is different from the type of event analyzed in this Draft EIR, the fireworks display event will be subject to additional environmental review pursuant to State CEQA Guidelines Section 15168(c).

1.4 Scope and Content of the Draft Environmental Impact Report

As the CEQA lead agency, the District is responsible for determining the scope and content of this Draft EIR, a process referred to as "scoping." As part of the scoping process, the District considered the environmental resources present within the project area and in the surrounding areas and identified the potential environmental effects of the proposed project. To initiate the public scoping process for this Draft EIR, the District circulated a Notice of Preparation (NOP) in accordance with Section 15082 of the State CEQA Guidelines to solicit agency and public comments on the scope and content of the environmental analysis to be included in the Draft EIR. The 30-day public review period for the NOP began on August 7, 2015, and ended on September 8, 2015. The NOP was mailed to public agencies, organizations, and other interested individuals to solicit their comments on the scope and content of the environmental analysis. The District also held a public scoping meeting on August 25, 2015, at the District's Administration Building at 3165 Pacific Highway, San Diego, CA, 92101. Free public parking was available at the surface lot in front of the building, as well as adjacent to the building. Comments received in response to the NOP and during the public scoping meeting were used to determine the scope of this Draft EIR. The comments are summarized in Table 1-2, below. Based on the District's preliminary evaluation of the probable effects of the proposed

project and a thorough review of the comments on the NOP, the Draft EIR analyzes effects associated with the following resources:

- Aesthetics and Visual Resources
- Air Quality and Health Risk
- Biological Resources
- Greenhouse Gas Emissions, Climate Change, and Energy
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise and Vibration
- Public Services and Facilities
- Transportation, Circulation, and Parking

There are no agricultural, forestry, or mineral resources within the project area; therefore, the proposed project would not have an adverse effect on any of these resources. In addition, the proposed project would not have a significant adverse effect on cultural resources, geology and soils, population and housing, recreational facilities, or utilities and service systems. Chapter 6, *Additional Consequences of Project Implementation*, includes a brief analysis as to why impacts on agricultural and forestry resources, mineral resources, cultural resources, geology and soils, population and housing, recreational facilities, and utilities and service systems would not be significant, as discussed in the Initial Study/Environmental Checklist included in Appendix A of this Draft EIR.

1.4.1 Comments Received in Response to the Notice of Preparation

Several specific environmental issues were raised in the comments on the NOP. A summary of these comments and the sections where they are addressed in this Draft EIR are provided in Table 1-2. Only comments that pertain to the environmental scope of this Draft EIR are summarized. Copies of all NOP comment letters are provided in Appendix B of this Draft EIR and the NOP is included in Appendix A.

Table 1-2. Summary of NOP Comments Received

Commenter	Environmental Topic(s)	Location Where Addressed in This Draft EIR
State of California, Governor's Office of Planning and Research, State Clearinghouse and Planning Unit (SCH), August 7, 2015	Provides SCH# 2015081013 and notes which state agencies received a copy of the NOP.	N/A
California Department of Transportation (Caltrans), District 11, Jacob M. Armstrong, August 14, 2015	Any special events that may affect traffic on state facilities should be reviewed by Caltrans.	Section 4.11, <i>Transportation, Circulation, and Parking</i> Appendix J, <i>Transportation Assessment</i>
	An encroachment permit should be issued for any traffic control or management within Caltrans' right of way.	Section 4.11, <i>Transportation, Circulation, and Parking</i> Appendix J, <i>Transportation Assessment</i>
Federal Emergency Management Agency, Region 9, Gregor Blackburn, August 24, 2015	Review the current effective countywide Flood Insurance Rate Maps for the County of San Diego (Community Number 060284) and City of San Diego (Community Number 06029), May 16, 2012.	Section 4.7, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>
	The City of San Diego, San Diego County, California is a participant in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.	Section 4.7, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>
	Many NFIP participating communities have adopted floodplain management building requirements that are more restrictive than the minimum federal standards described in 44 CFR. Contact the local community's floodplain manager for more information on local floodplain management building requirements.	Section 4.7, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>
California Department of Fish and Wildlife, Region 5, Gail K. Sevrens, September 8, 2015	Concern with the potential direct and indirect effects of fireworks displays and the associated human disturbances on sensitive species that occur in and around the project area, including marine mammals, sea turtles, seabirds, shorebirds, and passerines.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Summarize results from past studies that have monitored wildlife responses to fireworks displays and the recommendations offered to avoid, minimize, or mitigate the effects on these species.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>

Commenter	Environmental Topic(s)	Location Where Addressed in This Draft EIR
	A comprehensive mitigation strategy should include developing a monitoring protocol for those sites determined to be most likely affected by fireworks displays.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The National Marine Fisheries Service document provides a useful resource on the types of effects analyses that should be incorporated into the Draft EIR.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Commenter suggests the inclusion of a number of different figures.	Chapter 3, <i>Project Description</i> Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The impact analysis should define the area where sound, light, and debris effects have a direct impact on wildlife and associated habitats.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The analysis should also define the distance that impacts can extend beyond the center of the detonation point.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Recommends that the detonation structures be located as far from sensitive resource use areas as possible to reduce the effects of noise, light, fall-out, and/or human intrusion on sensitive wildlife species.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The District should also consider altered habitat conditions when determining future locations of the fireworks detonation sites.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Evaluate the potential cumulative impacts on wildlife species of repeated nightly exposure from fireworks displays.	Chapter 5, <i>Cumulative Impacts</i>
	To avoid impacts on eelgrass meadows it is recommended that the District institute patrols or other methodologies to prohibit spectator motorized watercraft from entering these sensitive areas.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The Draft EIR should provide a thorough analysis of the need for an increase in the number of fireworks display events.	Chapter 3, <i>Project Description</i>
	Recommends consideration of an alternative that would set a limit on the number of events that can occur and/or reduces the number of events below what is currently allowed.	Chapter 7, <i>Alternatives to the Proposed Project</i>

Commenter	Environmental Topic(s)	Location Where Addressed in This Draft EIR
	The Draft EIR should include mitigation measures for all adverse project-related impacts on sensitive animals and habitats. Mitigation measures should emphasize avoidance and reduction of project impacts.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
California State Lands Commission, Cy R. Oggins, September 8, 2015	A thorough and complete project description should be included in the Draft EIR to facilitate meaningful environmental review of potential impacts, mitigation measures, and alternatives.	Chapter 3, <i>Project Description</i>
	Specific locations for firework discharge should be identified, as well as the estimated radius of potential chemicals.	Chapter 3, <i>Project Description</i> ; Section 4.2, <i>Air Quality and Health Risk</i> ; Section 4.7, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>
	The Draft EIR should evaluate the levels of chemical residues, including perchlorate, nitrate, and sulfur, that could be discharged into waters of the U.S./state on an annual basis due to the fireworks displays.	Section 4.7, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>
	Staff requests that mitigation be included to address surface debris cleanup by a boat crew the night of a fireworks show, surface and underwater cleanup by a boat crew and divers, and foot patrols to hunt for debris on area beaches.	Section 4.7, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>
	The Draft EIR should disclose and analyze all potentially significant effects (such as noise, water quality, and increases to light/glare) on sensitive species and habitats in and around the project area, including special-status wildlife, fish, and plants, and if appropriate identify feasible mitigation.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The District should conduct queries of the California Department of Fish and Wildlife's California Natural Diversity Database to identify any special-status plant or wildlife species that may occur in the project area.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The Draft EIR should also include a discussion of consultation with the CDFW and USFWS, including any recommended mitigation measures and potentially required permits identified by these agencies.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	A greenhouse gas (GHG) emissions analysis consistent with the California Global Warming Solutions Act (Assembly Bill 32) and required by the State CEQA Guidelines should be included in the Draft EIR.	Section 4.4, <i>Greenhouse Gas Emissions, Climate Change, and Energy</i>

Commenter	Environmental Topic(s)	Location Where Addressed in This Draft EIR
	The GHG analysis should identify a threshold of significance for GHG emissions, quantify the direct and indirect operational GHG emissions from the project, determine the significance of the impacts of those emissions, and, if impacts are significant, identify mitigation measures that would reduce them to the extent feasible.	Section 4.4, <i>Greenhouse Gas Emissions, Climate Change, and Energy</i>
	To avoid the improper deferral of mitigation, mitigation measures should either be presented as specific, feasible, enforceable obligations, or should be presented as formulas containing performance standards that would mitigate the significant effects of the project and that may be accomplished in more than one specified way.	Throughout EIR
	The District should identify and analyze a range of reasonable alternatives to the proposed project that would attain most of the project objectives while avoiding or reducing one or more of the potentially significant impacts.	Chapter 7, <i>Alternatives to the Proposed Project</i>
U.S. Fish and Wildlife Service, Region 8, Karen A. Goebel, October 6, 2015	Include in the Draft EIR a thorough review of the available literature pertaining to the potential or documented impacts of fireworks displays or similar punctuated disturbances on wildlife.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Commenter suggests the inclusion of a number of different figures.	Throughout EIR
	Recommends that the Draft EIR include information regarding the abundance and distribution of water birds that use San Diego Bay, Tijuana Estuary, and Imperial Beach.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Include in the Draft EIR detailed information regarding the number, location, and duration of baseline events that have occurred in recent years, and the number, location and duration of additional proposed events.	Chapter 3, <i>Project Description</i>
	The Draft EIR should include an analysis of the intensity and extent of light, sound, vibration, and debris/fallout anticipated as a result of the fireworks displays, based on the size and number of fireworks shells that will be used.	Section 4.1, <i>Aesthetics and Visual Resources</i> ; Section 4.2, <i>Air Quality and Health Risk</i> ; Section 4.8, <i>Noise and Vibration</i>
	The analysis of the effects of the proposed action should include an assessment of the areas where light, sound, vibration, and debris are expected to have a direct impact on wildlife.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>

Commenter	Environmental Topic(s)	Location Where Addressed in This Draft EIR
	The Draft EIR should include an analysis of the potential indirect effects of the fireworks displays on wildlife resources in the project area including, but not limited to, disturbance of or impacts on resources from spectators, and changes in water quality associated with debris or fallout from fireworks.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The Carlsbad Fish and Wildlife Office has previously recommended, and continues to recommend, that no fireworks displays occur within the Chula Vista Bayfront during the avian breeding season due to the close proximity to the abundance of sensitive wildlife resources that occur within and around the Sweetwater National Wildlife Refuge, the South San Diego Bay National Wildlife Refuge, and the Chula Vista Wildlife Reserve.	Chapter 3, <i>Project Description</i> ; Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	Recommended and continues to recommend that fireworks displays be minimized at the Loew's Coronado Resort during the avian breeding season due to the proximity of this hotel to protected least tern and snowy plover habitat at Silver Strand State Beach and Naval Base Coronado.	Chapter 3, <i>Project Description</i> ; Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The Draft EIR should include conservation measures to avoid and minimize the potential impacts of the project on sensitive wildlife.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>
	The Draft EIR should analyze the need for an increased number of fireworks displays.	Chapter 3, <i>Project Description</i> , and throughout EIR
	Recommends that the District consider limiting the number of fireworks displays that may occur throughout the year at approved launch sites.	Chapter 7, <i>Alternatives to the Proposed Project</i>
Coast Law Group, LLP, Sara S. Kent, September 23, 2015	A summary of substantial evidence of potentially significant water and air quality impacts from fireworks displays in the city of San Diego. Cites extracts from a number of documents that support the contention that fireworks discharges over water have the potential to cause significant environmental harm and affect water and air quality. These include, among others, the Draft Clean Water Act permit (federal and state); the Coastal Environmental Rights Foundation's comment letter dated April 11, 2011, to the San Diego Regional Water Quality Control Board (SDRWQCB) regarding Tentative Order No. R9-2011-0022; and an SDRWQCB report dated	Section 4.2, <i>Air Quality and Health Risk</i> Section 4.6, <i>Hydrology and Water Quality</i> Appendix G, <i>Water Quality Technical Report</i>

Commenter	Environmental Topic(s)	Location Where Addressed in This Draft EIR
	December 12, 2007, regarding a Sea World National Pollutant Discharge Elimination System permit amendment to establish water discharge requirements for discharges of waste from aerial fireworks displays into Mission Bay.	
	Provides a summary of substantial evidence of potentially significant wildlife impacts from fireworks displays in the city of San Diego. Includes extracts from a number of documents, including, among others, emails from Robert Patton to Richard Gilb regarding California least tern fireworks monitoring; newspaper articles linking black bird deaths to fireworks; applications for permits for small takes of marine mammals incidental to the launching of space launch vehicles, long-range ballistic missiles, and smaller missile systems at Kodiak Launch Complex, Alaska; and guidelines for managing fireworks in the vicinity of piping plovers and seabeach amaranth on the U.S. Atlantic coast.	Section 4.3, <i>Biological Resources</i> Appendix F, <i>Biological Technical Study</i>

1.5 Organization of the Draft EIR

The content and format of this Draft EIR are designed to meet the requirements of CEQA and State CEQA Guidelines Article 9. Table 1-3 summarizes the organization and content of the Draft EIR.

Table 1-3. Document Organization and CEQA Requirements

Draft EIR Chapter	Contents
Summary	Includes a brief summary of the proposed project; identifies each significant effect, including proposed mitigation measures and alternatives to reduce or avoid the effect; identifies the areas of controversy known to the lead agency, including issues raised by agencies and the public; and summarizes the issues to be resolved, including the choice among alternatives and whether or how to mitigate the significant effects (State CEQA Guidelines Section 15123).
Chapter 1 Introduction	Discusses the purpose of CEQA and this Draft EIR, the scope and content of this Draft EIR, the organization of this Draft EIR, and the intended uses of this Draft EIR (State CEQA Guidelines Section 15124(d)).
Chapter 2 Environmental Setting	Describes the overall existing physical conditions in the vicinity of the proposed project when the analysis was initiated, including existing fireworks display events that presently occur in and around San Diego Bay and the Imperial Beach Oceanfront. In addition, the specific existing conditions for each resource area are described in the applicable resource section in Chapter 4, <i>Environmental Analysis</i> (State CEQA Guidelines Section 15125).

Draft EIR Chapter	Contents
Chapter 3 Project Description	Contains both a map of the precise location and boundaries of the proposed project and its location relative to the region, lists the proposed project's central objectives and underlying purpose, and provides a detailed description of the proposed project's characteristics (State CEQA Guidelines Section 15124(a), (b), and (c)).
Chapter 4 Environmental Analysis	Describes the existing physical conditions for each resource area, lists the applicable laws and regulations germane to the specific resource, describes the impact assessment methodology, lists the criteria for determining whether an impact is significant, identifies the direct and indirect significant impacts that would result from implementation of the proposed project, and lists feasible mitigation measures that would eliminate or reduce the identified significant impacts (State CEQA Guidelines Sections 15125–15126.4).
Chapter 5 Cumulative Impacts	Defines the cumulative study area for each resource; identifies past, present, and reasonably foreseeable future projects with related impacts within each study area; and evaluates the contribution of the proposed project to a cumulatively significant impact. This chapter also lists feasible mitigation measures that would eliminate or reduce the identified significant cumulative impacts (State CEQA Guidelines Section 15130).
Chapter 6 Additional Consequences of Project Implementation	Discusses the way the proposed project could foster economic or population growth, either directly or indirectly, in the surrounding environment; describes the significant irreversible changes associated with the proposed project's implementation; and provides a brief discussion of the environmental resource impacts that were found to be not significant during preparation of this Draft EIR (State CEQA Guidelines Sections 15126.2(c) and (d), 15127, and 15128).
Chapter 7 Alternatives to the Proposed Project	Describes a reasonable range of alternatives to the proposed project, including the No-Project Alternative; compares and contrasts the significant environmental impacts of alternatives to the proposed project; and identifies the environmentally superior alternative (State CEQA Guidelines Section 15126.6).
Chapter 8 List of Preparers and Agencies Consulted	Lists the individuals and agencies involved in preparing this Draft EIR (State CEQA Guidelines Section 15129).
Chapter 9 References	Provides a comprehensive listing by chapter of all references cited in this Draft EIR (State CEQA Guidelines Section 15148).
Acronyms and Abbreviations	A list of acronyms and abbreviations is provided for the reader's reference immediately following the list of tables and figures in the Table of Contents.
Appendices	Presents additional background information and technical detail for several of the resource areas.

2.1 Introduction

This chapter provides a description of the overall physical environmental conditions in the vicinity of the proposed project, from both a local and regional perspective, as they existed at the time the Notice of Preparation was published on August 7, 2015.¹ Resource-specific existing conditions are described within each individual resource section of Chapter 4, *Environmental Analysis*. Chapter 4 also describes any inconsistencies with applicable plans.²

2.2 Regional Context

Existing public fireworks displays (also referred to as fireworks shows or events) are conducted throughout the year at various locations within the San Diego region, including areas adjacent to and within the District's jurisdiction, as part of national and community celebrations and other special events. Such existing displays have occurred on a regular basis for decades.

In addition to existing fireworks display events that occur within San Diego Bay and in the Pacific Ocean near Imperial Beach that require a discretionary action by the District or are operated by the District's tenants, landside and waterside fireworks display events also occur during regular activities and special events at other locations throughout the San Diego region, including entertainment theme parks and major league football and baseball stadiums. Additionally, fireworks displays and pyrotechnic special effects are periodically used in other venues, such as business grand openings and special events, public and private school homecoming and graduation events, sporting events, and local fairs. The most significant and widespread use of fireworks displays is primarily for Fourth of July celebrations. In addition, fireworks displays occur for other occasions throughout the year, such as events at SeaWorld, La Jolla Cove, Ocean Beach, San Ysidro, National City (Kimball Park), and Chula Vista (Olympic Training Center). The preferred setting for fireworks display sites is often on or adjacent to urban shorelines to provide public access and avoid the potential public safety and fire hazards associated with terrestrial display sites.

The proposed project is an ordinance that would govern existing and proposed new fireworks display events located in southwestern San Diego County adjacent to or within District-controlled areas that are surrounded by the incorporated cities of San Diego, Coronado, National City, Chula Vista, and Imperial Beach, all of which compose the District's member cities. The City of San Diego,

¹ State CEQA Guidelines Section 15125 states that an EIR must include "a description of the physical environmental conditions in the vicinity of the proposed project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will *normally* constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to provide an understanding of the significant effects of the proposed project and its alternatives" (emphasis added).

² For example, Section 4.2, *Air Quality and Health Risk*, contains a project consistency analysis with the applicable air quality plans.

which is the largest city in the region and within proximity to the fireworks display events, covers approximately 323 square miles and is home to an estimated population of approximately 1.37 million residents (SANDAG 2015). The City of San Diego is approximately 17 miles north of the U.S.-Mexico border and is bordered on the north by the cities of Del Mar and Poway and unincorporated San Diego County land; on the east by the cities of Santee, El Cajon, La Mesa, and Lemon Grove, and unincorporated County of San Diego land; to the south by the cities of Coronado, Chula Vista, and National City, and the U.S.-Mexico border; and to the west by the Pacific Ocean. The neighborhoods of the City of San Diego that are in the vicinity of the fireworks display events within San Diego Bay include Point Loma to the north (adjacent to Shelter Island), downtown San Diego, which includes Little Italy (adjacent to Harbor Island and North Embarcadero), and Barrio Logan, which is south and east of the South Embarcadero.

Across San Diego Bay from downtown San Diego, the City of Coronado is a small resort city of almost 14 square miles with approximately 24,000 residents (SANDAG 2015). Coronado is bordered on the north and east by San Diego Bay (and the City of San Diego beyond that) and on the south by the City of Imperial Beach, which connects to Coronado via the narrow strip of land known as the Silver Strand that is a part of the incorporated area of Coronado. The Pacific Ocean borders Coronado to the west.

National City is 5 miles south of downtown San Diego, on San Diego Bay, and 10 miles north of the U.S.-Mexico border. National City is bordered by the City of San Diego to the north and east, Chula Vista to the south, the unincorporated areas of Lincoln Acres and Bonita to the south and southeast, and San Diego Bay to the west. National City comprises approximately 9.2 square miles and has an estimated population of approximately 60,000 residents (SANDAG 2015).

Chula Vista is the second-largest city in San Diego County, with an area of approximately 52 square miles and a population of approximately 258,000 residents (SANDAG 2015). It is 7.5 miles from downtown San Diego and 7.5 miles from the U.S.-Mexico border. Chula Vista is bordered on the north by the cities of San Diego and National City and the unincorporated community of Bonita; to the north and east by unincorporated areas of San Diego County; and on the south by the City of San Diego. San Diego Bay borders Chula Vista to the west.

The City of Imperial Beach is a beach community in the southwestern-most corner of the continental United States and is bordered on the north by the City of Coronado and San Diego Bay, on the east by the City of San Diego, on the west by the Pacific Ocean, and on the south by the U.S.-Mexico border. It is a city of approximately 4.5 square miles with a population of approximately 27,000 residents (SANDAG 2015).

2.2.1 District

The mission of the District is to protect Tidelands Trust resources by providing economic vitality and community benefit through a balanced approach to maritime industry, tourism, water and land recreation, environmental stewardship, and public safety. The District was created with the San Diego Unified Port District Act (Port Act), adopted by the California State Legislature in 1962, as amended. The Port Act recognizes the Public Trust Doctrine and states that tidelands and submerged lands are to be used only for statewide public purposes. To this end, the District is charged with management of the tidelands and diverse waterfront uses along San Diego Bay that promote commerce, navigation, fisheries, recreation, and ecological preservation on the granted lands.

The District is one of several governmental agencies with jurisdiction over the land and water areas of San Diego Bay. The area of San Diego Bay encompassed by the historic mean high tide line amounts to approximately 14,951 acres of filled and submerged lands and an existing shoreline of approximately 54.01 miles in length (District 2015). These historic tideland areas are owned or controlled by the federal government, the State of California, local governments, and the District. Specifically, the District has been granted approximately 5,483 acres, or about 37 percent, of the tidelands on San Diego Bay. The shoreline frontage granted to the District approaches 33 miles, which is equivalent to 61 percent of the total San Diego Bay shoreline. Locations on San Diego Bay and the Imperial Beach Oceanfront in which fireworks display events currently occur and are proposed to occur are detailed below.

2.3 Existing Setting

2.3.1 Existing Fireworks Display Events

A number of existing fireworks display events that require a discretionary action by the District or are operated by the District's tenants occur year-round; however, the greatest number of fireworks display events occurs in the summer months from July to September. A list of existing fireworks display events that occur in and around San Diego Bay and the Pacific Ocean near Imperial Beach annually is provided in Table 2-1 below. A detailed description of these existing fireworks display events is provided below.

All of the existing fireworks display events identified in Table 2-1 are subject to applicable federal laws set forth in the Code of Federal Regulations, which are enforced by the U.S. Coast Guard (only for fireworks display events occurring within Navigable Waters of the U.S.), as well as state and local laws set forth in the California Department of Forestry and Fire Protection's *Fireworks in California* handbook (Appendix C), which are enforced by the responsible city fire department with jurisdiction over each fireworks display event. These fireworks display events are also conducted in accordance with the requirements of the San Diego Regional Water Quality Control Board's (SDRWQCB's) General Permit for Public Display of Fireworks (Order No. R9-2011-0022) (General Permit). The General Permit is discussed in more detail in Section 4.6, *Hydrology and Water Quality*, of this EIR and is included as Appendix G.

Table 2-1. Existing Fireworks Display Events Requiring a Discretionary Action by the District or Operated by the District’s Tenants

Time of Year	Approximate Number of Fireworks Display Events	Fireworks Display Event Tenant/Sponsor	Location(s) of Fireworks Display Event	Approximate Duration of Each Fireworks Display Event (minutes)	Approximate Shell Size (inches)
January–March	7	<ul style="list-style-type: none"> U.S.S. Midway (7) 	<ul style="list-style-type: none"> North Embarcadero¹ 	4–10	2–6 inch
April–June	8	<ul style="list-style-type: none"> Symphony Summer Pops (1) NASSCO (1) U.S.S. Midway (6) 	<ul style="list-style-type: none"> South Embarcadero² NASSCO 	3–10	2–6-inch
July–September	29	<ul style="list-style-type: none"> Symphony Summer Pops (19) Big Bay Boom (1) Fourth of July Imperial Beach (1) Fireworks Show Over Glorietta Bay (1) U.S.S. Midway (6) NASSCO (1) 	<ul style="list-style-type: none"> Shelter Island³ Harbor Island³ North Embarcadero^{4,3} Central Embarcadero³ South Embarcadero² Glorietta Bay⁴ NASSCO Imperial Beach Oceanfront⁴ 	15–20 (Fourth of July) and 3–10 (non-Fourth of July displays)	3–10-inch (larger displays [e.g., Fourth of July]) 2–6-inch (non-Fourth of July displays)
October–December	5	<ul style="list-style-type: none"> U.S.S. Midway (4) Our Lady of Rosary Church (1) 	<ul style="list-style-type: none"> North Embarcadero^{1,5} 	3–10 (intermittently during the 80-minute procession for Our Lady of Rosary Church Annual Procession)	2.5–6 inch
TOTAL	49				

Notes:

- ¹ U.S.S. Midway Museum (includes a total of 23 annual fireworks display events)
- ² Symphony Summer Pops concert display (includes a total of 20 annual fireworks display events)
- ³ Big Bay Boom, Fourth of July
- ⁴ Fourth of July display
- ⁵ Our Lady of Rosary Church Annual Procession

Table 2-2 summarizes the total pounds of fireworks used for each existing fireworks display event. The total pounds of fireworks for the Big Bay Boom, Fireworks Show Over Glorietta Bay, Fourth of July Imperial Beach Fireworks Show, San Diego Symphony Summer Pops concert displays, Our Lady of Rosary Church Annual Procession fireworks display event, and any fireworks displays associated with the U.S.S. Midway Aircraft Carrier Museum (U.S.S. Midway Museum) (multiple small shows) and General Dynamics National Steel and Shipbuilding Company (NASSCO) were determined through a review of the post-event reports submitted in compliance with SDRWQCB's General Permit for these displays, special event permits obtained from the District's five member cities, and data collected from the fireworks organizers, fireworks operators, and/or District tenants.

Table 2-2. Summary of Activity Associated with the Existing Fireworks Display Events

Fireworks Display Event	Day of Event	No. of events (2015)	Pounds of Fireworks per Event	Pounds of Fireworks Annually	No. of barges used per event
Big Bay Boom	Fourth of July	1	5,342	5,342	4
Fireworks Over Glorietta Bay Show	Fourth of July	1	397	397	1
Fourth of July Imperial Beach Fireworks Show	Fourth of July	1	456	456	0
Symphony Summer Pops Concert Display	non-Fourth	20	varies between 52.6 to 95 ¹	1,498 ¹	1
Our Lady of Rosary Church Annual Procession	non-Fourth of July	1	17.25	17.25	0
U.S.S. Midway Museum	non-Fourth of July	23	varies between 7.8 and 234.9	1,759	1 ²
General Dynamics NASSCO Ship Repair Facility	non-Fourth of July	2	157.5 and 281.6	439	0 ³

Source: SDRWQCB 2015; District 2016

Notes:

¹ Pounds of fireworks for the Symphony Summer Pops events for year 2015 was obtained from the fireworks organizer. The largest shows (95.0 pounds per show) were three shows during Labor Day weekend. The remaining 17 shows throughout the year are smaller (between 52.6 and 78.8 pounds per show), and all shows average 74.9 pounds per show (74.9 x 20 = 1,498).

² Fireworks for displays on the U.S.S. Midway Museum are detonated either off of a barge in San Diego Bay or off the end of flight deck of the Midway.

³ Fireworks for these displays are launched from the end of Pier 12.

Existing Fourth of July Fireworks Display Events

The following existing Fourth of July fireworks display events either currently require a discretionary action or are anticipated to require a discretionary action by the District.

Big Bay Boom

The Big Bay Boom is a large, multi-barge outdoor fireworks display event that takes place in North San Diego Bay on the Fourth of July. The District considers annually whether or not to provide event sponsorship for this free fireworks display event, which was first established in 2001. Given the

natural amphitheater provided by the various neighborhoods, parks, and commercial centers surrounding San Diego Bay, including Point Loma, Shelter Island, Harbor Island, Liberty Station, Little Italy, North Embarcadero, Central Embarcadero, South Embarcadero, and the Coronado Ferry Landing, the Big Bay Boom is viewed by thousands of people annually. In addition, other private viewing locations are available at the U.S.S. Midway Museum, Hornblower Cruises and Events, Flagship Cruises and Events, and the San Diego Maritime Museum.

This fireworks display event entails the strategic temporary placement of four barges (moved and held in place by tugboats) around San Diego Bay near Central Embarcadero, North Embarcadero, Harbor Island, and Shelter Island and does not require construction of any on-land support facilities. The barges are not moored and instead are held in place by tugboats at their designated locations. During the fireworks display event, the U.S. Coast Guard (USCG), San Diego Fire Department (SDFD), San Diego Harbor Police Department (HPD), and special patrol vessels provide safety on the water, while HPD and San Diego Police Department provide traffic coordination and public safety on land. The fireworks display event lasts approximately 18 minutes, after which the barges are removed and, once the Fire Marshal has determined it is safe to do so, cleanup is conducted. A detailed description of barge setup, preparation, and cleanup practices is provided below.

Barge Setup and Preparation

Preparation of this fireworks display event includes placing fireworks on barges, which are set up primarily by the fireworks operator at a loading facility yard in accordance with the special event permits issued by SDFD and under supervision by governing fire officials. The barges are inspected for safety issues by the Fire Marshal and fireworks operator. The fireworks, which are encased in paper, are then loaded onto the barges in their California Department of Transportation (Caltrans)-approved shipping cartons by the fireworks operator. An electric match is placed in the fireworks fuse, and the wire from the match is wrapped around nails to prevent the wires from being pulled into the air. Once the fireworks are prepared, all debris, including water bottles, paper wrappers, cardboard shipping boxes, fuses, wires, and wrapping, is removed from the barges and properly disposed of by the fireworks operator. The barges are then moved by tugboats to their designated locations. After reaching their designated locations, the barges are held in place by tugboats and a safety exclusion zone is established around each barge by USCG and/or the Fire Marshal, as appropriate. Public access is prohibited in this zone, and neither spectators nor occupied vessels not transporting fireworks technicians are allowed within the area until the Fire Marshal determines it is safe to do so after the conclusion of the fireworks display event.

Post-Fireworks Display Event Cleanup Practices

Once the fireworks display event is over, the fireworks operator and the Fire Marshal inspect the mortars and surrounding areas for any safety issues, such as unexploded firework components, in accordance with the requirements of Title 19 of the California Code of Regulations (CCR). The duration of this inspection varies but historically has been approximately 15 to 20 minutes. All unexploded fireworks on the barges are collected, handled, and disposed of by the fireworks operator in accordance with Title 19 of the CCR. No one is allowed into the safety zone until granted permission by the Fire Marshal (Perry pers. comm.). Once the site is cleared by the Fire Marshal, and consistent with the requirements of the General Permit, the fireworks operator focuses on picking up large debris on the barge to prevent it from blowing into the water. The barges are brought back into the loading/setup yard facility to be further cleaned and have the mortars removed by the fireworks operator. In addition, as soon as permission is granted by the Fire Marshal, and consistent

with the requirements of the SDRWQCB General Permit, the fireworks organizer and fireworks operator conduct a sweep of the fireworks detonation zone surrounding each of the four barges to gather and properly dispose of floating debris from spent fireworks. Any unexploded fireworks, including unexploded components, are collected, handled, and disposed of by the fireworks operator. Consistent with the SDRWQCB General Permit requirements, the fireworks detonation zone and shoreline areas adjacent to the four barge locations are inspected again for debris no later than 24 hours following the fireworks display event by the fireworks organizer. Any cardboard, paper, or other debris is removed. A contractor is also hired to pick up any litter left in the District's public parks beginning at midnight on the Fourth of July.

Fourth of July Imperial Beach Fireworks Show

The Fourth of July Imperial Beach Fireworks show is a small, single-location outdoor fireworks display event that takes place within the District's Coastal Development Permit jurisdiction in Imperial Beach on the Fourth of July. The District considers annually whether or not to provide event sponsorship for this free fireworks display event, which was first established in the early 2000s. Primary viewing locations for this event are from Portwood Pier Plaza, Dunes Park, and along the beach from Palm Avenue to Imperial Beach Boulevard. Thousands of people directly view this fireworks display event.

For this fireworks display event, fireworks are launched over the Pacific Ocean in Imperial Beach from the Imperial Beach Pier (Pier). During the fireworks display event, the City of Imperial Beach and San Diego County Sheriff's Department provide traffic coordination and public safety on land. The fireworks display event lasts approximately 18 minutes. After completion of the fireworks display event, and once the Fire Marshal has determined it is safe to do so, cleanup is conducted. A detailed description of Pier setup, preparation, and cleanup practices is provided below.

Pier Setup and Preparation

The fireworks display event on the Pier is set up primarily by the fireworks operator in accordance with the requirements of Title 19 of the CCR and is subject to review by the Imperial Beach Fire Department. Public access on the Pier is restricted beginning on the evening of July 3 and ending on the morning of July 5 to facilitate rack installation, occurrence of the fireworks display event, and cleanup after the fireworks display event. The Pier is inspected for safety issues by the Fire Marshal and fireworks operator, and fireworks are loaded onto the Pier in their Caltrans-approved shipping cartons onto racks by the fireworks operator. The wires used to trigger the fireworks are secured to the racks to prevent the wires from being pulled into the air. Once the fireworks are prepared, all debris, including water bottles, paper wrappers, cardboard shipping boxes, fuses, wires, and wrapping, is removed from the Pier and properly disposed of by the fireworks operator. A minimum safety zone is established around the Pier by USCG and/or the Fire Marshal, as appropriate. Public access is prohibited in this zone, and neither spectators nor occupied vessels not transporting fireworks technicians are allowed within the area until the Fire Marshal determines it is safe to do so after the conclusion of the fireworks display event.

Post-Fireworks Display Event Cleanup Practices

Once the fireworks display event is over, the fireworks operator and the Fire Marshal inspect the mortars and surrounding areas for any safety issues, such as unexploded firework components, in accordance with Title 19 of the CCR. The duration of this inspection varies but historically has been approximately 15 to 20 minutes. All unexploded fireworks on the Pier are collected, handled, and

disposed of by the fireworks operator in accordance with Title 19 of the CCR. No one is allowed into the safety zone until granted permission by the Fire Marshal. Once the site is cleared by the Fire Marshal, and consistent with the requirements of the SDRWQCB General Permit, the fireworks operator immediately picks up debris from and sweeps the decks of the Pier to prevent debris and solid waste from blowing off the Pier into the water. The fireworks organizer and the fireworks operator, along with City of Imperial Beach Lifeguard and Public Works staff, also conduct several sweeps of the fireworks detonation zone and waterline to gather and properly dispose of all remaining debris. Any unexploded fireworks, including unexploded components, are collected, handled, and disposed of by the fireworks operator in accordance with Title 19 of the CCR. Consistent with the SDRWQCB General Permit requirements, the fireworks detonation zone, adjacent shorelines, and areas surrounding the Pier are inspected again for debris no later than 24 hours following the fireworks display event by the fireworks organizer. Any cardboard, paper, or other debris is removed.

Fireworks Show Over Glorietta Bay

The Fireworks Show Over Glorietta Bay is a single-barge fireworks display event that takes place in the Glorietta Bay inlet of San Diego Bay annually on the Fourth of July. It is anticipated that the District would consider annually whether or not to provide event sponsorship for this free fireworks display event, which was first established in 1993. Thousands of people directly view the Fireworks Show Over Glorietta Bay from the expansive walkway that extends along the western edge of the bay from Glorietta Bay Marina to Glorietta Bay Park; from Glorietta Bay Park at the southwestern corner of Glorietta Bay; from the Naval Amphibious Base to the south of Glorietta Bay; from Coronado Municipal Golf Course on the northern side of Glorietta Bay; from the high-rise condominiums at the Coronado Shores complex immediately to the west of Glorietta Bay; and from vessels that are either moored at Glorietta Bay Marina or visit and anchor there for the fireworks display event. The fireworks display event can also be seen from a distance along San Diego Bay.

The Fireworks Show Over Glorietta Bay involves the temporary placement of a single barge at the southeastern corner of Glorietta Bay. The barge is moved into its location and held in place by a tugboat. The preparation and placement of the barge do not require construction of any on-land support facilities. During the event, USCG, HPD, and special patrol vessels provide safety on the water, while the Coronado Police Department provides traffic coordination and public safety on land. The fireworks display event lasts approximately 19 minutes, after which the barge is removed and cleanup is conducted. A detailed description of barge setup, preparation, and cleanup practices follows.

Barge Setup and Preparation

The barge is set up primarily by the fireworks operator at a loading facility yard in accordance with the permits issued by the City of Coronado Fire Department and under supervision of governing fire officials (i.e., Fire Marshal). The barge is inspected for safety issues by the Fire Marshal and fireworks operator. The fireworks, which are encased in paper, are then loaded onto the barge in their Caltrans-approved shipping cartons by the fireworks operator. An electric match is placed in the fireworks fuse, and the wire from the match is wrapped around nails to prevent the wires from being pulled into the air. Once the fireworks are prepared, all debris, including water bottles, paper wrappers, cardboard shipping boxes, fuses, wires, and wrapping, is removed from the barge and properly disposed of by the fireworks operator. The barge is then moved by tugboat to its designated location. After reaching its designated location, the barge is held in place by a tugboat

and a minimum safety exclusion zone is established around the barge by USCG and/or the Fire Marshal, as appropriate. Public access is prohibited in this zone, and neither spectators nor occupied vessels not transporting fireworks technicians are allowed within the area until the Fire Marshal determines it is safe to do so after the conclusion of the fireworks display event.

Post-Fireworks Display Event Cleanup Practices

Once the fireworks display event is over, the fireworks operator and the Fire Marshal inspect the mortars and surrounding areas for any safety issues, such as unexploded firework components, in accordance with the requirements of Title 19 of the CCR. The duration of this inspection varies but historically has been approximately 15 to 20 minutes. All unexploded fireworks are collected, handled, and disposed of by the fireworks operator in accordance with Title 19 of the CCR. No one is allowed into the safety zone until granted permission by the Fire Marshal (Szymanski pers. comm.). Once the site is cleared by the Fire Marshal, and consistent with the requirements of the SDRWQCB General Permit, the fireworks operator focuses on picking up large debris on the barge to prevent it from blowing into the water. The barge is then brought back into the loading/setup yard facility to be further cleaned and have the mortars removed by the fireworks operator. In addition, as soon as permission is granted by the Fire Marshal, and consistent with the requirements of the SDRWQCB General Permit, the fireworks organizer, fireworks operator, and/or the Coronado Lifeguard conduct a sweep of the fireworks detonation zone to gather and properly dispose of floating debris from spent fireworks. Any unexploded fireworks, including unexploded components, are collected, handled, and disposed of by the fireworks operator. Consistent with the SDRWQCB General Permit requirements, the fireworks organizer and/or the Coronado Lifeguard also conduct an inspection of the waterfront around Glorietta Bay to look for and remove any debris along the shoreline no later than 24 hours following the fireworks display event.

Other Existing Fireworks Display Events

A number of other existing fireworks display events that require a discretionary action by the District or are operated by the District's tenants occur in and around San Diego Bay throughout the year, including displays associated with the U.S.S. Midway Museum, NASSCO, San Diego Symphony Summer Pops concerts, and private events sponsored by organizations, such as the Our Lady of Rosary Church Annual Procession.

The Symphony Summer Pops is a concert series sponsored by the San Diego Symphony, which is held annually during the summer months at Embarcadero Marina Park South. The District considers annually whether or not to provide event sponsorship and issue a Tideland Use and Occupancy Permit, Lease, or other similar approval for this concert series, which includes fireworks display events. These concerts are held on most weekends from late June through August; however, not every concert is accompanied by a fireworks display event. When the concerts do include a fireworks display event, the pyrotechnics are launched from a barge located off Embarcadero Marina Park South in an area known as South Embarcadero. Each of these fireworks display events lasts approximately 5 minutes, with one show lasting approximately 10 minutes. It should be noted that the San Diego Symphony has applied for approval to construct a permanent year-round concert venue with the same number of fireworks display events that currently occur.

The Our Lady of Rosary Church Annual Procession is a private event sponsored by Our Lady of Rosary Church that involves the launching of fireworks from the Grape Street Pier while a procession marches down Harbor Drive, within the North Embarcadero area. The District considers

annually whether or not to issue a Special Event Permit for this fireworks display event. Fireworks for this display are launched intermittently during the 80-minute procession.

Other existing non-Fourth of July fireworks display events within and/or adjacent to the District's jurisdiction include those associated with the U.S.S. Midway Museum (multiple small shows) and NASSCO. The U.S.S. Midway Museum conducts up to 23 fireworks display events annually. Existing fireworks display events last approximately 3 to 10 minutes and are typically launched from the U.S.S. Midway flight deck or on a barge within San Diego Bay. NASSCO's two existing fireworks display events last approximately 10 minutes and are typically launched from the end of Pier 12 within San Diego Bay.

2.3.2 Fireworks Display Event Locations

Existing Fireworks Display Events

Existing fireworks display events currently occur at several locations within San Diego Bay, a natural harbor and deep-water port in southern San Diego County, and the Imperial Beach Oceanfront. San Diego Bay is an active maritime environment that provides passage and berthing for numerous types of boats and vessels, including small recreational boats that moor at dock marinas and open anchorage marinas within the Bay, mid-sized vessels such as private yachts and harbor cruise boats, and large vessels that consist of naval ships, cruise ships, cargo ships, and shipping barges. Fireworks display events within San Diego Bay take place off Shelter Island, Harbor Island, Centre City Embarcadero (which includes North Embarcadero, Central Embarcadero, and South Embarcadero), and the NASSCO ship repair facility. In addition, fireworks display events take place along the Coronado Bayfront within Glorietta Bay (an inlet of San Diego Bay adjacent to Coronado Island) and the Imperial Beach Oceanfront. Estimated existing fireworks display event launch locations are depicted in Figure 2-1 and are described below.

North San Diego Bay

North San Diego Bay fireworks display events occur primarily from barges placed adjacent to Shelter Island, Harbor Island, North Embarcadero, Central Embarcadero, and South Embarcadero. Existing displays occurring at these locations include Big Bay Boom, which occurs on the Fourth of July and includes the placement of four barges within the Bay adjacent to Shelter Island, Harbor Island, North Embarcadero, and the Central Embarcadero. Non-Fourth of July fireworks display events that occur in the north San Diego Bay include the San Diego Symphony Summer Pops concerts, which include 20 displays per year launched from a barge off Embarcadero Marina Park South in the South Embarcadero, and the Our Lady of Rosary Church Annual Procession fireworks display event, which takes place during the fall at the Grape Street Pier within the North Embarcadero area. In addition, the U.S.S. Midway Museum holds approximately 23 fireworks display events generally associated with private events, which take place either from the flight deck or off a barge within San Diego Bay in the North Embarcadero area. These locations are discussed below along with the fireworks display events that occur within them.

Shelter Island

Shelter Island is directly south of the community of Point Loma, north of Naval Air Station North Island, and east of the Space and Naval Warfare Systems Center. California State Route (SR) 209 runs northwesterly approximately 0.75 mile from the site boundary. The only fireworks display event

Figure 2-1
Estimated Existing and Proposed Fireworks Launch Sites
San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events EIR
66738 Page 524

that occurs near Shelter Island is the Big Bay Boom Fourth of July event, which entails the placement of a single, temporary barge just offshore of Shelter Island.

Harbor Island

Harbor Island is south of San Diego Lindbergh Field International Airport, north of Coronado Island, east of the Fleet Anti-Submarine Warfare Training Center, and across the Bay directly west of the County of San Diego Administration Center. North Harbor Drive is approximately 0.3 mile directly to the north of the site. The only fireworks display event that occurs near Harbor Island is the Big Bay Boom Fourth of July event, which entails the placement of a single, temporary barge just offshore of Harbor Island.

Centre City Embarcadero

The Centre City Embarcadero spans the length of San Diego Bay within the downtown San Diego area beginning at Laurel Street on the north end (just south of San Diego Lindbergh Field International Airport) and ending roughly at Park Boulevard, which is south of the Convention Center and north of the Tenth Avenue Marine Terminal. For the purposes of this EIR, the Centre City Embarcadero is broken down into three segments: North Embarcadero, Central Embarcadero, and South Embarcadero, as described below.

North Embarcadero

The North Embarcadero area is bounded by Laurel Street to the north, Pacific Highway to the east, San Diego Bay to the west, and the point where Harbor Drive turns east (just north of Ruocco Park and the Seaport Village) to the south. Fireworks display events that occur within the North Embarcadero include the Big Bay Boom Fourth of July event, which entails the placement of a single, temporary barge just offshore of the North Embarcadero, displays associated with private events at the U.S.S. Midway Museum, which are launched from the flight deck or off a barge within San Diego Bay, and the Our Lady of Rosary Church Annual Procession display, which occurs in the fall from the end of the Grape Street Pier. The Grape Street Pier is southeast of San Diego Lindbergh Field International Airport within the “Crescent Zone” of the North Embarcadero (the curvilinear portion of coastline that is bounded by the U.S. Coast Guard facility to the north and the Grape Street Pier to the south).

Central Embarcadero

The Central Embarcadero area comprises Seaport Village, an approximately 2-acre waterfront shopping and dining complex south of the intersection of Pacific Highway and West Harbor Drive. The Big Bay Boom Fourth of July event is the only fireworks display event that occurs within the Central Embarcadero area, and it entails the placement of a single, temporary barge just offshore of the Central Embarcadero.

South Embarcadero

The South Embarcadero includes the portion of the Centre City Embarcadero situated south of the Seaport Village and north of the Tenth Avenue Marine Terminal and is bounded by East Harbor Drive to the east. This area includes the San Diego Convention Center as well as several multi-story hotels. Fireworks display events that occur within the South Embarcadero include those associated with the San Diego Symphony’s Summer Pops concert series, which entail the placement of a single, temporary barge just offshore of the Embarcadero Marina Park South. Although one of the Big Bay

Boom barges is located closer to the Central Embarcadero area, the fireworks display event is visible from the South Embarcadero area, and viewers utilize the Embarcadero Marina Park South and public access areas to view the fireworks.

Coronado Bayfront

In the vicinity of the Fireworks Show Over Glorietta Bay fireworks display event, the Coronado Bayfront mostly comprises the publicly accessible Coronado Golf Course and Glorietta Bay. The Coronado Golf Course extends along the eastern shore of the Coronado Bayfront, south of the San Diego-Coronado Bay Bridge, and wraps around the Coronado Bayfront into Glorietta Bay. The Glorietta Bay inlet is adjacent to Coronado Island, north and west of the Naval Amphibious Base, east of SR-75, and south and west of the Coronado Municipal Golf Course. The only fireworks display event that occurs along the Coronado Bayfront is the Fireworks Show Over Glorietta Bay, a Fourth of July event that entails the placement of a single, temporary barge at the southeastern corner of Glorietta Bay. In addition, landside areas along the northern Coronado Bayfront, particularly Coronado Ferry Landing Park, are used as viewing areas for the Big Bay Boom Fourth of July event.

General Dynamics NASSCO Ship Repair Facility

Fireworks display events also currently occur at the NASSCO ship repair facility, which is located on tidelands adjacent to (west of) the Barrio Logan neighborhood, south of the San Diego-Coronado Bay Bridge, and north of Chollas Creek and Naval Base San Diego. Fireworks display events at NASSCO typically occur on Pier 12 in celebration of the launching of a new ship.

Imperial Beach Oceanfront

The Imperial Beach Pier is an approximately 1,300-foot-long pier located within the City of Imperial Beach, which is the southernmost city in San Diego County, just north of the U.S.-Mexico border. Access to the Pier is provided via Evergreen Avenue. The Pier is within the District's jurisdiction in Imperial Beach and is located along the oceanfront of Imperial Beach, south of Dunes Park, north of the Tijuana River National Estuarine Research Reserve, and west of the Portwood Pier Plaza. SR-75 runs northwesterly approximately 0.9 mile from the site boundary. The only fireworks display event that currently occurs at this site is the Fourth of July Imperial Beach Fireworks Show. For this event, fireworks are launched over the Pacific Ocean from the end of the Pier.

Proposed New Fireworks Display Events

National City Bayfront

While there are currently no existing fireworks display events along the National City Bayfront, it is anticipated that any future fireworks display events would take place within view of Pepper Park because Pepper Park is the closest publicly accessible gathering space near the National City Bayfront. Pepper Park is located along Tidelands Avenue in National City. The site is adjacent to the Sweetwater Channel, north of the Sweetwater Marsh Unit of the San Diego Bay National Wildlife Refuge, which includes Paradise Creek to the east and D Street Fill to the south, south of the National City Marine Terminal, east of San Diego Bay, and west of Pier 32 Marina. Interstate 5 (I-5) runs northeasterly approximately 0.4 mile from the park site boundary. Pepper Park site access is provided via Tidelands Avenue, which turns into Goesno Place as it approaches the park. One

fireworks display event, likely a Fourth of July event, may occur along the National City Bayfront and is anticipated to involve the placement of a single, temporary barge in the vicinity of Pepper Park.

Chula Vista Bayfront

While there are currently no existing fireworks display events along the Chula Vista Bayfront, it is anticipated that fireworks display events would occur within view of both the Chula Vista Bayside Park and the Chula Vista Bayfront Park. Bayside Park is a waterfront park accessed by Bayside Parkway. It is bounded to the north by a boatworks facility, to the south by a man-made inlet that contains marinas, to the east by a recreational vehicle (RV) park, and to the west by San Diego Bay. Bayfront Park is on the south side of the man-made inlet and is bounded to the south and west by San Diego Bay and to the east by the marinas of the man-made inlet as well as vacant land. The park is accessed by Marina Way. I-5 is approximately 0.5 mile to the east of the Chula Vista Bayfront. A total of three fireworks display events (including one on the Fourth of July) along the Chula Vista Bayfront area are allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan and are anticipated to involve the placement of a single, temporary barge in the Bay in the vicinity of the two parks.

2.3.3 Surrounding Conditions

The following discussion provides a brief overview of the land uses within the vicinity of the project areas where fireworks display events currently occur or are proposed to occur, as well as a discussion of the public viewing opportunities of the fireworks display events for each project area. A detailed discussion of the existing surrounding land uses can be found in Section 4.8, *Land Use and Planning*, of this Draft EIR. The discussion below focuses on landside publicly accessible viewing opportunities for the fireworks display events; however, the entire Bay and Pacific Ocean near Imperial Beach are also publicly accessible amenities for people on boats, including private boats, rental boats, or charter boats (e.g., harbor cruise boats). In addition, there are a number of restaurants and hotels that provide viewing opportunities for most of the locations within San Diego Bay and along the Imperial Beach Oceanfront.

Existing Fireworks Display Events

North San Diego Bay

The north San Diego Bay comprises an active waterfront with a diverse set of uses that represent the many industries that require access to waterfront areas. These include primarily tourist and recreational uses within Shelter Island and Harbor Island, which include many hotels, restaurants, marinas, and boat launches. North, Central, and South Embarcadero also provide tourist-oriented uses, such hotels and restaurants, but also include harbor cruise businesses, maritime museums, specialty retail facilities, shopping destinations, the B Street Cruise Ship Terminal, and the San Diego Convention Center.

Public viewing locations are plentiful within the north San Diego Bay, as there are many publicly accessible areas. These viewing locations include the following:

- Shelter Island
 - Shoreline Park—runs the entire bayside length of Shelter Island—adjacent to the Point Loma neighborhood of San Diego

- Harbor Island
 - Spanish Landing Park (on the mainland side)
 - Harbor Island Drive Park—a narrow parkway (mostly a waterfront promenade) along most of the Bayfront with a larger portion that includes green lawns and other amenities about mid-way along the west side of Harbor Island.
- North Embarcadero (the entire length of the North Embarcadero includes a publicly accessible waterfront pathway, but because barges would be placed nearer the southern end of the North Embarcadero, the following locations are concentrated in that area)
 - Tuna Harbor Park—located along the waterfront of the North Embarcadero and then continues out onto a pier off North Harbor Drive and south of the U.S.S. Midway Museum
 - Ruocco Park—located along the waterfront, just south of Tuna Harbor Park and north of Seaport Village
- Central Embarcadero
 - Seaport Village/The Headquarter—located where the shoreline of the waterfront turns east, includes large pedestrian pathways and a large collection of restaurants and specialty retail facilities
 - Embarcadero Marina Park North—a large park that extends into the Bay adjacent to Seaport Village and includes a waterfront walkway, large green lawns, benches, picnic tables, and other similar amenities
- South Embarcadero
 - Embarcadero Marina Park South—a large park that extends into the Bay adjacent to the Convention Center and includes a waterfront walkway, a public fishing pier, large green lawns, benches, picnic tables, and other similar amenities. This is also the location of the San Diego Symphony’s Summer Pops concert series.
- Coronado Bayfront—there are several large public parks on the Coronado Bayfront, directly across the Bay from the South Embarcadero, that provide excellent viewing opportunities for barges located in that area. These include Bayview Park, Centennial Park, Coronado Landing Park, and Coronado Tidelands Park.

Coronado Bayfront

Both the north and east shores of the Coronado Bayfront are in proximity to existing fireworks display events. Uses along the northern shore of the Coronado Bayfront include the Naval Air Station North Island and primarily single-family and multi-family residential uses that front the Bay along 1st Street between Alameda Boulevard and A Avenue. Commercial uses are concentrated toward the eastern end of the north Bayfront, including the Ferry Landing Marketplace, which includes a number of restaurants and small boutique or tourist-oriented shops. A hotel—the Coronado Island Marriott Resort and Spa—is located at the northeast corner of the Coronado Bayfront. Public open spaces along the north Bayfront include Bayview Park at I Avenue and 1st Street, Centennial Park at Orange Avenue and 1st Street, and Coronado Ferry Landing Park at B Avenue and 1st Street.

Land uses along the east shore of the Coronado Bayfront include a marina, boat rentals, yacht clubs, hotels, the Coronado Municipal Golf Course, high-rise condominiums, a community center and

public parks, and the U.S. Naval Amphibious Base. Public viewing opportunities along the eastern Coronado Bayfront include the waterfront pedestrian paths that are part of the Coronado Community Center located along the western side of Glorietta Bay as well as Glorietta Bay Park, located along the southwestern portion of Glorietta Bay, north of the U.S. Naval Amphibious Base.

General Dynamics NASSCO Ship Repair Facility

The NASSCO ship repair facility is located on tidelands adjacent to (west of) the Barrio Logan neighborhood, south of the San Diego-Coronado Bay Bridge, and north of Chollas Creek and Naval Base San Diego. The segment of the Bayfront spanning from the Coronado Bay Bridge to Chollas Creek is occupied largely by ship repair yards and is highly industrialized. The area consists of numerous ship repair docks, ships or ship parts in various stages of repair, cranes and other large equipment, and warehouse buildings. Land uses in the area surrounding the NASSCO ship repair facility include marine-related uses, while the waterside uses include specialized berthing. Public viewing opportunities are not provided for fireworks display events held at the NASSCO ship repair facility.

Imperial Beach Oceanfront

The Imperial Beach Oceanfront consists entirely of the beach, which is abutted predominantly by residential uses, including single-family homes, condominium complexes, and multi-family apartment complexes. Other nearby uses include hotels, restaurants, and retail shops. The beach is publicly accessible and provides a large, open area for public viewing opportunities. In addition to the beach, there are two beach-side publicly accessible parks. These include Dunes Park, approximately 800 feet north of the Pier, and Portwood Pier Plaza, directly adjacent to the Pier. While normally the Pier is a publicly accessible amenity in Imperial Beach, it is closed for safety reasons during fireworks display events because fireworks are launched from the Pier.

Proposed New Fireworks Display Events

National City Bayfront

The National City Bayfront is largely industrial and includes the National City Marine Terminal as well as a naval base. Only a small portion of the National City Bayfront is publicly accessible. Public viewing opportunities are limited to Pepper Park, which is approximately 0.4 mile from the San Diego Bay waterfront.

Chula Vista Bayfront

Large portions of the Chula Vista Bayfront area are dedicated to wildlife reserves and marshes. Other uses include public parks, a marina, an RV park, a salt works operation, and a boat repair facility. However, the middle of the Chula Vista Bayfront includes three publicly accessible parks in the vicinity of the waterfront, including Bayside Park, Bayfront Park, and Marina View Park, which is just east of Bayfront Park.

3.1 Introduction

The proposed project consists of (1) an ordinance establishing a San Diego Unified Port District (District) Code section (proposed ordinance) to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants, and (2) four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts and are anticipated to require a future discretionary action by the District. Discretionary actions for fireworks display events that may require District approval include, but are not limited to, the following:

- Sponsorship agreement
- Special event permit
- Lease and lease amendment
- Tideland Use and Occupancy Permit
- Right of Entry Permit
- Coastal Act Categorical Determination of Exclusion
- Coastal Development Permit

Fireworks display events that require a discretionary action by the District or are operated by the District's tenants have been occurring on the Fourth of July and at other times throughout the year for more than a decade. The most prominent existing fireworks display events are the annual Fourth of July Big Bay Boom in San Diego Bay and the Fourth of July Imperial Beach Fireworks Show. The Fireworks Show Over Glorietta Bay is an existing display whose fireworks organizers may seek to obtain funding from the District in the future, which would require a discretionary action by the District. Existing fireworks display events that occur at other times throughout the year include those associated with the San Diego Symphony's Summer Pops concert series (multiple small displays) and the Our Lady of Rosary Church annual procession, along with the U.S.S. Midway Aircraft Carrier Museum (U.S.S. Midway Museum) (multiple small displays) and General Dynamics National Steel and Shipbuilding Company (NASSCO) displays. Four proposed new fireworks display events, which would be located adjacent to the National City and Chula Vista Bayfronts, are anticipated to require a future discretionary action by the District, as discussed further below.

3.2 Project Objectives

The District has identified the following objectives for the proposed project:

1. To develop a District ordinance that establishes policies, performance standards, and other requirements that would be applied to fireworks display events that occur in and around San Diego Bay and the Pacific Ocean near Imperial Beach and require a discretionary action by the District or are operated by the District's tenants;
2. To allow for the continued occurrence of traditional fireworks display events¹ in and around San Diego Bay and the Pacific Ocean near Imperial Beach that require a discretionary action by the District or are operated by the District's tenants, including on the Fourth of July, providing a popular and region-wide way to celebrate and express civic pride;
3. To allow for the continued occurrence of existing and future occurrence of proposed new traditional fireworks display events in and around San Diego Bay and the Pacific Ocean near Imperial Beach that require a discretionary action by the District or are operated by the District's tenants in a manner that considers the health, safety, and welfare of people, property, and the environment; and
4. To continue to enhance the visitor-serving experience of viewing fireworks display events from various vantage points around District tidelands by providing safe, high-quality fireworks display events using existing and new fireworks technologies as they become available.

3.3 Project Characteristics

The proposed project consists of an ordinance to govern existing and proposed new fireworks display events that occur throughout the year in and around San Diego Bay and the Pacific Ocean near Imperial Beach that require a discretionary action by the District or that are operated by the District's tenants. These existing fireworks display events include the Fourth of July Big Bay Boom, Fourth of July Imperial Beach Fireworks Show, and Fireworks Show Over Glorietta Bay, along with several other events sponsored by the District, the District's tenants, and other organizations throughout the year. The fireworks display events are organized and/or sponsored by various fireworks organizers, and the fireworks displays are conducted by a number of licensed fireworks operators. Typically, fireworks associated with these displays are launched from piers, flight decks, and/or barges adjacent to and/or within the waters of San Diego Bay and the Pacific Ocean near Imperial Beach. Spectators for each of the fireworks display events typically gather in public areas

¹ A traditional fireworks display event involves the use of display fireworks that are defined by the U.S. Bureau of Alcohol, Tobacco, Firearms and Explosives as large fireworks used in fireworks display shows, generally under the supervision of a trained pyrotechnician. These fireworks are designed primarily to produce visible or audible effects by combustion, deflagration, or detonation. They include, but are not limited to, salutes containing more than 2 grains (130 milligrams) of flash powder, aerial shells containing more than 40 grams of pyrotechnic compositions (including any break charge and visible/audible effect composition but exclusive of lift charge), and other display pieces that exceed the limits of explosive materials for classification as "consumer fireworks." They also include fused set pieces containing components that together exceed 50 milligrams of flash powder. Display fireworks are classified as fireworks UN0333, UN0334, or UN0335 by the U.S. Department of Transportation (U.S. ATF 2016).

along District tidelands near the fireworks display event locations, utilizing the surrounding transportation network and public parking facilities. The four new fireworks display events included as part of the proposed project would be similar in duration and magnitude as the existing fireworks display events that occur in and around San Diego Bay and the Pacific Ocean near Imperial Beach.

3.3.1 Proposed Ordinance

As stated above, the proposed project consists of an ordinance to govern existing and proposed new fireworks display events that occur within San Diego Bay and the Imperial Beach Oceanfront that require a discretionary action by the District or that are operated by the District's tenants. The proposed ordinance is included as Appendix D. The proposed ordinance addresses the following:

- Permit procedures and requirements for the conduct of fireworks displays
- Compliance with applicable federal, state, and local laws and regulations governing fireworks, including, but not limited to:
 - Code of Federal Regulations
 - Clean Water Act
 - California Health and Safety Code
 - California Code of Regulations
 - California Environmental Quality Act (CEQA)
 - California Coastal Act
- Compliance with applicable federal, state, and local plans and permits governing fireworks, including, but not limited to:
 - San Diego Regional Water Quality Control Board's (SDRWQCB's) General Permit for Public Display of Fireworks (Order No. R9-2011-0022)
 - District's Climate Action Plan
 - District's Stormwater Management and Discharge Control Code
 - Integrated Natural Resources Management Plan
 - Chula Vista Bayfront Master Plan Natural Resources Management Plan
- Consistency with the features and characteristics of each individual fireworks display event analyzed in this Draft EIR, including, but not limited to:
 - Allowable launch site locations for individual displays
 - Total pounds of fireworks for individual displays
 - Allowable shell size(s) for individual displays
 - Frequency of individual displays
 - Duration of individual displays

- Compliance with the applicable mitigation measures identified in the Mitigation Monitoring and Reporting Program for the proposed project.

3.3.2 Project Operations

As discussed in Chapter 2, *Environmental Setting*, a number of existing fireworks display events occur year-round in and around San Diego Bay and the Pacific Ocean near Imperial Beach. A list of these fireworks display events, and a description of their operational characteristics, is provided in Tables 2-1 and 2-2 respectively, of Chapter 2, *Environmental Setting*. These fireworks display events would be subject to the proposed ordinance.

In addition to the existing fireworks display events, the proposed ordinance would govern four proposed new fireworks display events, including three displays along the Chula Vista Bayfront as allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and one Fourth of July display along the National City Bayfront. The three proposed fireworks display events along the Chula Vista Bayfront include one Fourth of July display and two non-Fourth of July displays. It is anticipated that the District would consider annually whether or not to provide event sponsorship and/or issue a Special Event Permit, Right-of-Entry Permit, Tideland Use and Occupancy Permit, Coastal Development Permit, Coastal Act Categorical Determination of Exclusion, or other similar approval for these proposed new fireworks display events. These proposed new fireworks display events are anticipated to last approximately 3 to 10 minutes for non-Fourth of July displays, and 15 to 20 minutes for Fourth of July displays, and the fireworks are anticipated to be launched from barges within San Diego Bay. These proposed new fireworks display events would also be governed by the proposed ordinance. The proposed new fireworks display events are identified in Table 3-1, below. Figure 2-1 depicts the estimated proposed barge locations along the Chula Vista and National City Bayfronts.

Table 3-1. Proposed New Fireworks Display Events Requiring a Future Discretionary Action by the District

Time of Year	Approximate Number of Fireworks Display Events	Location(s) of Fireworks Display Event	Approximate Duration of Each Fireworks Display Event	Approximate Shell Size
January–March	1	• Chula Vista ¹	3–10 minutes	2–8 inches
April–June	—	—	—	—
July–September	2	• Chula Vista ² • National City ²	15–20 minutes	3–8 inches
October–December	1	• Chula Vista ¹	3–10 minutes	2–8 inches
TOTAL³	4			

¹ Non-Fourth of July display (smaller display)

² Fourth of July display

³ Total includes three fireworks display events along the Chula Vista Bayfront, as allowed under the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan.

Table 3-2 summarizes the total pounds of fireworks estimated in this Draft EIR for each proposed new fireworks display event. As discussed in Chapter 2, *Environmental Setting*, the total pounds of fireworks for the existing fireworks display events identified in Table 2-2 was determined through a review of the post-event reports submitted in compliance with SDRWQCB's General Permit for these displays, special event permits obtained from the District's five member cities, and data collected from the fireworks organizers, fireworks operators, and/or District tenants. Because no fireworks display events currently occur along the National City or Chula Vista Bayfronts, the total pounds of fireworks used to produce these displays is not yet known. However, for the purposes of this Draft EIR, the total pounds of fireworks for the National City and Chula Vista Bayfronts Fourth of July fireworks display events is anticipated to be 456 pounds for each display, which is similar to the Fourth of July Imperial Beach Fireworks Show. For the proposed new non-Fourth of July fireworks display events that would occur along the Chula Vista Bayfront, the total pounds of fireworks was estimated by scaling the duration of the Fourth of July Imperial Beach Fireworks Show (20-minute display) by the number of minutes for each proposed new fireworks display event (assumed to range between 3 and 10 minutes with an average duration of 5 minutes, similar to existing displays operated by the San Diego Symphony during the Summer Pops concert series and U.S.S. Midway Museum), which equals an estimated 114 pounds for each display. Because the proposed ordinance would require consistency with the features and characteristics of each individual fireworks display event analyzed in this Draft EIR, including, but not limited to, the total pounds of fireworks and durations for individual displays, the values provided in Table 3-2, below, represent the maximum allowable pounds of fireworks and durations for the proposed new displays along the Chula Vista and National City Bayfronts assumed in this Draft EIR. Similarly, because the proposed ordinance would also govern the existing fireworks display events identified in Chapter 2, *Environmental Setting*, the values provided in Table 2-2 also represent the maximum allowable pounds of fireworks for each existing fireworks display assumed in this Draft EIR. If an existing fireworks display event identified in Table 2-2 is proposed to be modified in the future, a new additional fireworks display event is proposed that was not analyzed in this Draft EIR, or any of the characteristics provided in Table 3-2 (e.g., magnitude and/or duration) of the four proposed new fireworks display events are proposed to be modified, the fireworks display event will be subject to additional environmental review, pursuant to State CEQA Guidelines Section 15168(c).

Table 3-2. Summary of Activity Associated with the Proposed Fireworks Display Events

Fireworks Display Event	Day of Event	Number of Events	Pounds of Fireworks per Event	Pounds of Fireworks Annually	Number of Barges Used per Event
Chula Vista Bayfront ¹	Fourth of July plus two other shows	3	456 ¹ 114 ²	684	1
National City Bayfront ¹	Fourth of July	1	456 ¹	456	1

Source: District 2016

¹ The total pounds of fireworks display events in the Chula Vista Bayfront and National City Bayfront areas on the Fourth of July is anticipated to be 456 pounds, similar to the Fourth of July Imperial Beach Fireworks Show.

² The total pounds of non-Fourth of July fireworks events estimated by scaling the Fourth of July Imperial Beach Fireworks Show (20-minute event) by the number of minutes for each fireworks display event (assumed to average 5 minutes), which equals an estimated 114 pounds each.

Both existing and proposed new fireworks display events involve coordination between several agencies, organizations, and businesses, as detailed below. The definitions below pertain to terminology used in the description of fireworks display events in the following paragraphs and throughout this Draft EIR.

- *Sponsor* generally refers to an individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency, or other legal entity, or the agent or employee thereof, that contributes funds, services, or other similar goods to a *fireworks organizer* in support of a fireworks display event. The District has historically been a *sponsor* of several of the fireworks display events described below.
- *Fireworks organizer* generally refers to the individual, association, partnership, nonprofit organization, corporation, limited liability company, trustee, municipality, public agency, or other legal entity, or the agent or employee thereof, proposing to conduct a fireworks display event. The *fireworks organizer* is typically responsible for obtaining all required funding, entitlements, and approvals for a fireworks display event, as well as contracting with a *fireworks operator* to produce the fireworks display event. Historically, the District has entered into agreements with *fireworks organizers* in order to *sponsor* several of the fireworks display events described below.
- *Fireworks operator* generally refers to a State of California–licensed pyrotechnic operator who, by examination, experience, and training, has demonstrated the required skill and ability in the use and discharge of fireworks as authorized by the license granted. A *fireworks operator* is typically responsible for supplying, setting up, and detonating the pyrotechnic devices associated with a fireworks display event. The *fireworks operator* is also typically under contract with the *fireworks organizer* to produce the fireworks display event. Historically, the District has not had a direct relationship with the *fireworks operator*.

All existing and proposed new fireworks display events that either require a discretionary action by the District or that are operated by the District’s tenants would be subject to all applicable federal, state, and local laws and regulations governing fireworks as well as any additional requirements set forth in the proposed ordinance.

3.3.3 Description of Pyrotechnic Devices

Fireworks are a class of low-explosive pyrotechnic devices used for aesthetic or entertainment purposes. Fireworks devices take many forms to produce four primary effects: noise, light, smoke, and floating materials (e.g., confetti). Fireworks may be designed to burn with flames and sparks of various colors, including red, orange, yellow, green, blue, purple, and silver. Professional pyrotechnic devices used in fireworks display events can be grouped into three general categories: (1) aerial shells (i.e., paper and cardboard spheres or cylinders filled with pyrotechnic materials), (2) low-level comet and multi-shot devices, such as roman candles, and (3) set piece displays mounted on the ground.

Aerial Fireworks/Shells

Aerial fireworks typically either provide their own propulsion (e.g., a skyrocket using a solid rocket motor) or are launched into the air in an aerial shell by a mortar using a black powder lifting charge or propellant. Most of the incendiary elements and shell casings burn up in the atmosphere;

however, portions of the casings and some internal structural components and chemical residue fall back to the ground and/or receiving water bodies. The aerial shell typically consists of a cylinder or spherical cartridge, usually constructed of paper, plastic, or cardboard, and may include some plastic or paper internal components used to compartmentalize chemicals within the shell. The shell casing contains a burst charge, pyrotechnic material that emits prescribed colors when detonated, a fuse, and a black powder lift charge.

Aerial shells are often combined so as to make a great variety of sparkling shapes, often variously colored, when detonated. Colors in fireworks are usually generated by pyrotechnic stars (usually just called *stars*), which produce intense light when ignited. Stars contain five basic types of ingredients.

- A fuel, which allows the star to burn
- An oxidizer, which usually produces oxygen to support combustion of the fuel
- Color-producing chemicals
- A binder, which holds the pellet together
- A chlorine donor, which intensifies the color of the flame (sometimes the oxidizer can serve this purpose)

Attached to the bottom of an aerial shell is a lift charge of black powder. The lift charge and shell are placed at the bottom of a mortar buried in earth/sand or affixed to a wooden rack. When a fuse attached to the lift charge is ignited with an electric charge or heat source, the lift charge explodes and propels the shell through the mortar tube and into the air to a height determined by the amount of powder in the lift charge and the weight of the shell. As the shell travels skyward, a time-delayed secondary fuse eventually ignites the burst charge within the shell at peak altitude. The burst charge detonates, igniting and scattering the stars, which may, in turn, have small secondary explosions. Shells can be launched one at a time or in a barrage of simultaneous or quick-succession launches and are typically designed to detonate between 200 and 1,000 feet in the air.

As identified in Tables 2-1 and 3-1, aerial shells range in diameter from 2 inches to 10 inches for existing and proposed new fireworks display events within San Diego Bay and the Imperial Beach Oceanfront. The weight, height of the burst, burst radius, and burst delay of a firework is dependent upon the size of the shells (i.e., diameter of the shell). As the shell size increases, these characteristics also increase (Poulton and Kosanke 1995).

Low-Level Fireworks Devices

Low-level fireworks devices consist of stars packed linearly within a tube. When ignited, the stars exit the tube in succession, producing a fountain effect of single- or multi-colored light as the stars incinerate through the course of their flight. Typically, the stars burn rather than explode, thus producing a ball or trail of sparkling light to a prescribed altitude, where they simply extinguish. Sometimes they terminate with a small explosion similar to a firecracker. Other low-level devices emit a projected hail of colored sparks or perform erratic, low-level flight while emitting a high-pitched whistle. Some emit a pulsing light pattern or crackling or popping sound effects. In general, low-level launch devices and encasements remain on the ground or attached to a fixed structure and can be removed upon completion of the fireworks display event. Common low-level devices are

multi-shot devices, mines, comets, meteors, candles, strobe pots, and gerbs. They are designed to produce effects between 0 and 200 feet in the air.

Set Piece/Ground-Level Fireworks

Set piece or ground-level fireworks are primarily static in nature and remain close to the ground. They are usually attached to a framework crafted in the design of a logo or familiar shape, illuminated by pyrotechnic devices such as flares, sparklers, and strobes. These fireworks typically employ bright flares and sparkling effects and may also emit limited sound effects such as cracking, popping, or whistling. Set pieces usually are used in concert with low-level effects or an aerial show and sometimes act as a centerpiece for the fireworks display event. They may have some moving parts, but typically do not launch devices into the air. Set piece displays typically are designed to produce effects between 0 and 50 feet in the air.

3.3.4 Fireworks Chemical Constituents

Typical fireworks constituents include, but are not limited to, aluminum, antimony, barium, carbon, calcium, chlorine, cesium, copper, iron, potassium, lithium, magnesium, oxidizers (including nitrates, chlorates, and perchlorates), phosphorus, sodium sulfur, strontium, titanium, and zinc. The chemical constituents burn at high temperatures when a firework is detonated, which promotes incineration. The chemical constituents within the fireworks are scattered by the burst charge, which separates them from the fireworks casing and internal shell components. Combustion residue is produced in the form of smoke, airborne particulates, chemical pollutants, and debris, including paper, cardboard, cotton, metal, wires, fuses, and other similar components. A list of chemicals typically used in fireworks for fuels, oxidizers, binding agents, coloration effects, and sound effects is provided in Table 3-3, below. Based on literature review, the total net weight of non-chemical pyrotechnic materials (i.e., debris) in a firework shell is typically approximately one-half their gross weight (Poulton and Kosanke 1995).

Table 3-3. Fireworks Chemical Constituents

Symbol	Name	Purpose in Fireworks Usage
Al	Aluminum	Aluminum is used to produce silver and white flames and sparks. It is a common component of sparklers.
Ba	Barium	Barium is used to create green colors. It can also help stabilize other volatile elements.
C	Carbon	Carbon is one of the main components of black powder, which is used as a propellant. Carbon provides the fuel for a firework. Common forms include carbon black, sugar, or starch.
Ca	Calcium	Calcium is used to deepen colors. Calcium salts produce orange fireworks.
Cl	Chlorine	Chlorine is an important component of many oxidizers. Several of the metal salts that produce colors contain chlorine.
Cs	Cesium	Cesium compounds produce indigo color.
Cu	Copper	Copper compounds produce blue colors.
Fe	Iron	Iron is used to produce sparks. The heat of the metal determines the color of the sparks.

Symbol	Name	Purpose in Fireworks Usage
K	Potassium	Potassium compounds help to oxidize fireworks mixtures. Potassium nitrate, potassium chlorate, and potassium perchlorate are all-important oxidizers. The potassium content can impart a violet color to the sparks.
Li	Lithium	Lithium is a metal used to impart a red color. Lithium carbonate, in particular, is a common colorant.
Mg	Magnesium	Magnesium burns a very bright white, so it is used to add white sparks or improve the overall brilliance of a firework.
Na	Sodium	Sodium imparts a gold or yellow color; however, the color is often so bright that it frequently masks less intense colors.
O	Oxygen	Fireworks include oxidizers, which produce oxygen to promote burning. Oxidizers usually are nitrates, chlorates, or perchlorates. Sometimes the same substance is used to provide oxygen and color.
P	Phosphorus	Phosphorus burns spontaneously in air and is also responsible for some glow-in-the-dark effects. It may be a component of a firework's fuel.
S	Sulfur	Sulfur is a component of black powder and, as such, it is found in a firework's propellant/fuel.
Sb	Antimony	Antimony is used to create glitter effects.
Sr	Strontium	Strontium salts impart a red color. Strontium compounds are also important for stabilizing fireworks mixtures.
Ti	Titanium	Titanium metal can be burned as powder or flakes to produce silver sparks.
Zn	Zinc	Zinc is a bluish-white metal that is used to create smoke effects for fireworks and other pyrotechnic devices.

Introduction

Sections 4.1 through 4.10 of Chapter 4 of this Draft EIR contain a discussion of the potential significant environmental effects resulting from implementation of the proposed project, including information related to existing site conditions, criteria for determining significance of potential environmental impacts, analyses of the type and magnitude of environmental impacts, and feasible mitigation measures that would reduce or avoid significant environmental impacts.

Potential Environmental Impacts

This chapter provides an analysis of the following potential environmental impacts of the proposed project:

- 4.1, Aesthetics and Visual Resources
- 4.2, Air Quality and Health Risk
- 4.3, Biological Resources
- 4.4, Greenhouse Gas Emissions, Climate Change, and Energy
- 4.5, Hazards and Hazardous Materials
- 4.6, Hydrology and Water Quality
- 4.7, Land Use and Planning
- 4.8, Noise and Vibration
- 4.9, Public Services and Facilities
- 4.10, Transportation, Circulation, and Parking

It was determined during preparation of the Initial Study/Environmental Checklist (Appendix A) that the proposed project would have either a less than significant impact or no impact associated with the following topics: agriculture and forestry resources; cultural resources; geology and soils; mineral resources; population and housing; recreation; and utilities and service systems. These topics are described in Section 6.4, *Effects Not Found to be Significant*, of this Draft EIR.

Format of the Environmental Analysis

Each of the 10 environmental topic sections of this chapter includes the following subsections.

Overview

This subsection briefly describes the criteria considered in the particular resource section, summarizes the resources used to compile the information presented for the environmental

analysis, and summarizes the environmental effects of the proposed project and any feasible mitigation measures.

Existing Conditions

According to Section 15125 of the State CEQA Guidelines, an EIR must include a description of the existing physical environmental conditions in the vicinity of a project to provide the “baseline condition” against which project-related impacts are compared. Typically, the baseline condition is the physical condition that exists when the Notice of Preparation (NOP) is published; however, a different baseline may be used in specific cases where it is deemed appropriate. Unless otherwise indicated, the environmental setting described in each of the following sections will be the physical environmental conditions that existed in the vicinity of existing and proposed new fireworks display events in San Diego Bay and along the Imperial Beach Oceanfront on the date the NOP was published.

As discussed in Section 1.4, the NOP for the proposed project was issued on August 7, 2015. At the time the NOP was published, the existing conditions included 49 annual fireworks display events within the San Diego Bay and Imperial Beach Oceanfront that required a discretionary action by the District or that were operated by the District’s tenants. The existing fireworks display events are identified in Table 2-1 of Chapter 2, *Environmental Setting*.

Applicable Laws and Regulations

This subsection provides a summary of regulations, plans, policies, and laws at the federal, state, regional, and local levels that are relevant to the proposed project as they relate to the particular environmental resource area in discussion. Compliance with these applicable laws and regulations is mandatory unless noted otherwise within the analysis. Therefore, as it relates to the project impact analysis below, compliance is assumed because it is required by law, and mitigation would generally not be required when compliance with an existing law or regulation would ensure that a significant impact would not occur.

Project Impact Analysis

This subsection describes the methodology used for the analysis of the potential environmental impacts of the proposed project; identifies the criteria for determining the significance of potential impacts; and states a conclusion as to whether the environmental impacts would be considered significant and unavoidable, less than significant with mitigation incorporated, or less than significant, or indicates that no impact would occur (see definitions below). Each topic analyzed is divided into specific issues, based on potential impacts. The discussion of potential impacts is based on the applicable threshold of significance (see below) for each issue. Where potential impacts are significant, mitigation measures are identified, as feasible, to minimize, rectify, reduce, eliminate, or compensate for the significant impacts with the goal of reaching a less-than-significant impact determination.

Methodology

Each methodology subsection describes the means used to analyze potential impacts on a particular resource, discussing the steps followed and listing any studies relied on for arriving at conclusions as to significance.

Thresholds of Significance

Thresholds of significance are criteria used to assess whether potential environmental effects are significant. The significance criteria used in this analysis are primarily based on the recommendations provided in Appendix G of the State CEQA Guidelines. The thresholds of significance define the type, amount, and/or extent of an impact that would be considered a significant adverse change in the environment. The thresholds of significance for some environmental topics, such as air quality and noise, are quantitative, while those for other topics, such as aesthetics and visual resources, are qualitative. The thresholds of significance are intended to assist the reader in understanding how the significance of an impact is determined.

Project Impacts and Mitigation

The analysis of environmental impacts considers both the construction and operation of the proposed project. As required by Section 15126.2(a) of the State CEQA Guidelines, direct, indirect, short-term, long-term, onsite, and/or offsite impacts are addressed, as appropriate, for the environmental issue being analyzed. This Draft EIR utilizes the following terms to describe the level of significance of impacts identified during the course of the environmental analysis.

No Impact: This term is used when implementation of the proposed project would have no adverse effect on a resource.

Less than Significant: This term is used to refer to impacts resulting from implementation of the proposed project that are not likely to exceed the defined thresholds of significance, and potentially significant impacts that are reduced to a level that does not exceed the defined thresholds of significance after implementation of mitigation measures. In the latter case, the determination may also be stated as “less than significant with mitigation incorporated.”

Significant: This term is often used to refer to impacts resulting from implementation of the proposed project that exceed the defined thresholds of significance before identification of any mitigation measures. A “significant effect” is defined by Section 15382 of the State CEQA Guidelines as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment [but] may be considered in determining whether the physical change is significant.” For impacts that exceed a threshold of significance, mitigation measures that avoid or reduce the potential impact are identified, which may cause the impact to be reclassified as less than significant if it is sufficiently reduced, or the impact may remain significant, even after the application of feasible mitigation measures, in which case it is referred to as a significant and unavoidable impact (or unavoidable significant impact).

Significant and Unavoidable: This term is used to refer to significant impacts resulting from implementation of the proposed project that cannot be eliminated or reduced to below standards of significance through implementation of feasible mitigation measures.

Mitigation Measures

Section 15126.4 of the State CEQA Guidelines requires an EIR to “describe feasible measures which could minimize significant adverse impacts.” Mitigation includes avoiding an impact altogether, minimizing impacts, rectifying impacts, reducing or eliminating impacts over time, or compensating for impacts by replacing or providing substitute resources. The State CEQA Guidelines define

feasibility as “capable of being accomplished in a successful manner within a reasonable period of time taking into account economic, legal, social, technological, or other considerations.” This subsection lists the mitigation measures that could reduce the severity of impacts identified in the *Impact Analysis* subsection. Mitigation measures are the specific environmental requirements for implementation of the proposed project that will be included in the Mitigation Monitoring and Reporting Program and adopted as conditions of project approval.

Section 4.1

Aesthetics and Visual Resources

4.1.1 Overview

This section describes the existing aesthetic and visual conditions that could be adversely affected by the proposed project and discusses the applicable laws and regulations related to aesthetics and visual quality. The impact analysis contained in this section describes the potential impacts on aesthetics and visual resources associated with the proposed new fireworks display events. Impacts related to aesthetics and visual resources were considered significant if the proposed project would create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. Other potential impacts on aesthetic and visual resources, including (1) substantial adverse effects on designated scenic views, (2) substantially damaging scenic resources within a designated scenic highway, or (3) substantially degrading the existing visual character of the site and its surroundings, were analyzed in Section I of the Initial Study/Environmental Checklist (Appendix A), which is hereby incorporated by reference. The potential impacts were determined to be less than significant. The analysis and conclusions regarding these impacts are included in Chapter 6, Section 6.4, *Effects Not Found to Be Significant*.

Based on the analysis that follows, all impacts related to aesthetics and visual resources would be less than significant. No mitigation is required.

4.1.1.1 Concepts and Terminology

This section defines the key concepts and terminology used to describe existing aesthetic and visual conditions or the change in existing conditions after implementation of the proposed project. Although there may be more than one definition for any of these terms, these common definitions are used for analytical consistency.

View refers to visual access and obstruction, or whether it is possible to see a focal point or panoramic scene from an area. Views may be discussed in terms of foreground, middleground, and background. *Foreground* views are immediately presented to the viewer and include objects at close range that may tend to dominate the view. *Middleground* views occupy the center of the viewshed and tend to include objects that are the center of attention if they are large enough or visibly different from adjacent visual features. *Background* views include distant objects and other objects that make up the horizon. Objects in the background eventually fade to obscurity with increasing distance. In the context of background, the skyline or the ocean can be an important visual feature because objects above this point are highlighted against the background of the sky or water. These *skylined* elements are typically more evident to the viewer because of their inherent contrast.

Visual quality is evaluated according to the relative degree of vividness, intactness, and unity within a landscape, as modified by viewer preference and sensitivity. *Vividness* is the visual power or memorability of landscape components as they combine in striking and distinctive visual patterns. *Intactness* is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements; this factor can be present in well-kept urban and rural landscapes as well as

natural settings. *Unity* is the visual coherence and compositional harmony of the landscape considered as a whole; it frequently attests to the careful design of individual components in the landscape. High-quality views are highly vivid and relatively intact and exhibit a high degree of visual unity. Low-quality views lack vividness, are not visually intact, and possess a low degree of visual unity (Federal Highway Administration 1981).

The following additional definitions pertain to the terminology used in this visual analysis:

- *Aesthetics* generally refers to the identification of visual resources and the quality of what can be seen, or the overall visual perception of the environment.
- *Viewer sensitivity*, or viewer concern about noticeable changes to views, is based on the visibility of a scenic resource, proximity of viewers to the resource, relative elevation of viewers to the resource, frequency and duration of views, number of viewers, and types and expectations of the viewers.
- *Viewshed* is all of the surface area visible from a particular location or sequence of locations (e.g., roadway or trail).
- *Vista areas* are “points of natural visual beauty, photo vantage points, and other panoramas,” as depicted in the Port Master Plan (PMP) (District 2012:28)

4.1.2 Existing Conditions

4.1.2.1 Aesthetic Character and Site Features

Existing fireworks display events originate from barges, flight decks, and/or piers adjacent to and/or in the waters of North San Diego Bay, including areas adjacent to Shelter Island, Harbor Island, Centre City Embarcadero (which includes North Embarcadero, Central Embarcadero, and South Embarcadero), Glorietta Bay in Coronado, NASSCO ship repair facility, and the Imperial Beach Oceanfront. In addition, the proposed new fireworks display events would originate from barges adjacent to the National City and Chula Vista Bayfronts.

The sites for the existing and proposed new fireworks display events comprise primarily the waters within the Bay, consisting of calm waters that are characteristic of an enclosed and protected bay (versus the rougher waters of an open ocean). These sites are immediately surrounded by other maritime and recreational boating uses. In general, views of watercraft, ranging from small recreational craft to large vessels, such as container and general cargo vessels as well as U.S. naval vessels, are present primarily within foreground and middleground views. The remaining site occurs over the Pacific Ocean near Imperial Beach, consisting of open ocean and the beach. Along the oceanfront, views of watercraft, such as those seen in the Bay, are also present; however, they are generally farther out and part of the background views. All of these waterside sites are surrounded by or adjacent to developed, urbanized waterfronts. The aesthetic character of these waterfront areas is described below.

North San Diego Bay

Barges, flight decks, and/or piers used for existing fireworks display events are located within North San Diego Bay adjacent to Shelter Island, Harbor Island, and the Centre City Embarcadero. Most of

the waterfront land uses within these areas comprise tourist destinations and visitor-serving uses, such as hotels, restaurants, and marinas.

Shelter Island

Shelter Island proper is a long, narrow strip of land that is approximately 1 mile in length and less than 0.1 mile in width, connecting to the mainland at Point Loma via Shelter Island Drive. The only Fourth of July fireworks display event that currently occurs near Shelter Island is the Big Bay Boom, which entails the placement of a single temporary barge just offshore of Shelter Island. The visual character of Shelter Island is largely defined by the visitor-serving uses that occupy the island, with development concentrated along the island's western side. Development along Shelter Island is not dense, consisting primarily of low-rise (i.e., no more than three stories in height) but expansive hotels and yacht clubs and one- or two-story restaurants and retail stores that are separated from each other and/or the roadway by large surface parking lots. The buildings are contemporary in style. Many include beige or yellow stucco siding, while others have elements of island or "tiki" architectural styles, such as the use of dark woods, shutters, and/or steeply pitched and extended porch roofs.

Roadways and parking lots run the length of the middle of the island, providing public access to the waterfront parks, beaches, marinas, and boat launches. Waterfront parks, consisting primarily of wide green lawns, occupy the entire eastern side of the island, creating an open and accessible bayside area. Although the open green lawns are the most visually prominent component of the waterside parks, trees, public art (statues), play equipment, walking paths, picnic tables, and fishing piers also contribute to the views of the Bayfront areas. Several small-boat marinas with many boat slips occupy the area between Shelter Island and the mainland east and west of the segment of Shelter Island Drive that extends to the mainland. From a visual perspective, middleground and background views of small-boat marinas generally consist of a high concentration of regularly spaced (and usually white) boats topped by a forest of masts. In closer foreground views, individual features of the boats are evident, and the regular spacing of the boats is not distinguishable. The collection of masts, however, still forms a prominent and forest-like visual feature. The high concentration of masts may obscure but generally does not completely block views beyond the marinas.

Visitor-serving and recreational boating uses continue east of Shelter Island along Harbor Drive on the mainland between Shelter and Harbor islands. These uses include additional marinas, yacht sales, sportfishing services, and several restaurants. The structures housing these uses are sporadically positioned along the waterfront in one- or two-story structures of varying sizes and architectural styles and generally separated from each other by large surface parking lots. Similar to Shelter Island, there is no unifying context to this area.

Harbor Island

The shape and visual features of Harbor Island are similar to those of Shelter Island. Harbor Island proper consists of a long and narrow strip of land, approximately 1.5 miles long and less than 317 feet wide, that extends off the San Diego mainland via Harbor Island Drive. The clusters of development along Harbor Island are somewhat sparse and separated by large parking lots. In addition, Harbor Island includes several hotels that are about 10 stories in height, while other uses, primarily restaurants and marina boathouses, are generally single-story structures. A public walkway, bordered mostly by narrow strips of green lawn and the roadway, runs the entire length of Harbor Island along the Bay; however, there is a larger bayside park midway down the island's

western side. Several marinas occupy the water area between the island and the mainland along both the east and west sides of the island, creating visual elements similar to those described above for Shelter Island. Spanish Landing Park and former car rental lots occupy the landward side of the island north of the marinas. Spanish Landing Park is a long, narrow park that fronts the inlet between Harbor Island and the mainland on the western side of the island. The park includes a Bayfront promenade, picnic areas, play areas, public art, the Callaway Carillon bell tower, and a small beach. In addition, the former car rental lots occupy the eastern portion of the landward side of Harbor Island. This area has an industrial character to it. Expansive surface parking lots are dotted by small single-story warehouse buildings, out of which the car rental operations were managed. The Harbor Police Department administrative building and storage lot is also situated in this area. The promenade that begins in Spanish Landing Park continues through this side of the island; however, it is situated north of the car rental area, adjacent to North Harbor Drive; it is not directly adjacent to the Bay. The only fireworks display event that currently occurs near Harbor Island is the Big Bay Boom Fourth of July event, which entails the placement of a single temporary barge just offshore of Harbor Island.

Centre City Embarcadero

Centre City Embarcadero extends the length of San Diego Bay within the downtown San Diego area, beginning at Laurel Street on the north end (just south of San Diego International Airport [formerly known as Lindbergh Field]) and ending roughly at Park Boulevard, which is south of the Convention Center and north of the Tenth Avenue Marine Terminal. The Centre City Embarcadero is broken down into three segments: North Embarcadero, Central Embarcadero, and South Embarcadero, as described below. Overall, the visual character of the Centre City Embarcaderos reflects a diverse mix of uses and building types, which are characteristic of active waterfront and downtown environments. The specific visual character of each segment is described below.

North Embarcadero

The North Embarcadero is bounded by Laurel Street at its northern end and Seaport Village at its southern end. The landside features at the northern end are dominated by the manufacturing facilities and office buildings of Solar Turbines, an industrial use that manufactures industrial gas turbines for onshore and offshore electrical power generation, marine propulsion, and natural gas and oil production. Although somewhat obscured by vegetation, the cranes, piping, and scaffolding associated with Solar Turbines' operations are visible in the midst of the large, white, approximately two- or three-story warehouse/office buildings of the large multi-block facility.

Moving south, the industrial character of Solar Turbines transitions to institutional uses with the four-story Beaux-Arts/Spanish Revival-style San Diego County Administration Center, which features a prominent clock tower, pink stucco siding, and a red tiled roof. The building is situated in a park-like setting and surrounded by an expansive green lawn, fountains, and a splash park. The surrounding park and splash park are relatively low in profile, especially compared to the high-rise buildings in the surrounding area. The Administration Center has some visual prominence, given the long linear wading pool and fountains along the approximately 1,500-foot length of the site, which contrast with the undulating bright green, blue, and beige surfaces of the whimsically designed splash park.

The Administration Center is followed by a large hotel complex with multiple buildings that reach up to 14 stories in height. The remainder of the landside area of North Embarcadero is occupied by

administration buildings for the U.S. Navy, including multi-story buildings and single-story barracks-style facilities.

The waterfront side of North Embarcadero is characterized by concrete pedestrian pathways and wide drives/parking aisles that provide direct vehicular and pedestrian access to the piers and anchorages of the various maritime enterprises that are accessible from the North Embarcadero. Piers of varying lengths, widths, and materials punctuate the coastline of the North Embarcadero. The Grape Street Pier, which currently includes one fireworks display event per year, is located at the northern end of the North Embarcadero, within the “Crescent Zone” (the curvilinear portion of coastline that is bounded by the U.S. Coast Guard facility to the north and the Grape Street Pier to the south). The wooden pier is approximately 550 feet in length.

Various types of ships and boats also contribute to the character of the waterfront along the North Embarcadero, ranging from small to medium-sized yachts for harbor tours to the 19th-century merchant ship *Star of India*; the U.S.S. Midway Museum, which currently hosts public and private fireworks display events; and multi-story cruise ships and medium-sized commercial fishing vessels. The southern end of the North Embarcadero includes large public passive-use parks with green lawns, pedestrian pathways, public art, surface parking lots, and restaurants. Another marina is situated at the southern end of the North Embarcadero that houses a commercial fishing operation with more rustic-looking vessels that often have multiple booms with fishing nets attached. The Big Bay Boom Fourth of July event also currently occurs within the North Embarcadero area, involving the placement of a single temporary barge just offshore of the North Embarcadero.

Central Embarcadero

The Central Embarcadero includes the approximately 2-acre Seaport Village retail complex, which is situated within a waterfront park-like setting and includes a collection of low-rise (one- or two-story) freestanding buildings with a mix of architectural styles, including traditional Mexican, Spanish Revival, and Victorian. Seaport Village houses an assortment of tourist-oriented gift shops, art galleries, and restaurants, one of which is situated over the water at the northern end of the Central Embarcadero. In addition, the Central Embarcadero includes the publicly accessible Embarcadero Marina Park North, which is on a peninsula that extends into the Bay from Seaport Village. The park includes passive-use amenities such as pedestrian pathways, green lawns, benches, and shade trees. It also includes a large surface parking lot. The Big Bay Boom Fourth of July event is the only fireworks display event that currently occurs within the Central Embarcadero area. It entails the placement of a single temporary barge just offshore of the Central Embarcadero.

South Embarcadero

The South Embarcadero area is bounded on the north by the Seaport Village shopping center and on the south by the Tenth Avenue Marine Terminal. It comprises mostly hotels and the San Diego Convention Center.

Reflecting the South Embarcadero’s proximity to downtown and the San Diego Convention Center, high-rise hotels, featuring multiple glass-clad towers of 20 or more stories, are located to the southeast of Seaport Village. The two-story Convention Center is situated centrally within the South Embarcadero and dominates the majority of the area. The Convention Center features a modern architectural style, with an emphasis on horizontality. Two elongated segments extend off a central outdoor stairway. Building materials make heavy use of glass and concrete buttressing, with varying surface shapes, such as side-rounded glass walls on one story, slanted glass walls on another, and

vertical glass walls on another. The distinctive Sails Pavilion, with its white pointed fabric roof intended to be reminiscent of the sails and masts of a ship, is just north of center within the complex.

Embarcadero Marina Park South extends into the Bay from the Convention Center and, similar to its northern counterpart, includes a publicly accessible open space with a parking lot, green lawns, pedestrian pathways, and benches. This park also includes basketball courts and a public fishing pier. A recreational boat marina is located within the cove created by the two L-shaped segments that form Embarcadero Marina Park North and South. The southernmost end of the South Embarcadero area is occupied by another modern high-rise hotel. Existing fireworks display events within the South Embarcadero include those associated with the San Diego Symphony's Summer Pops concert series, which entail the placement of a single temporary barge just offshore of Embarcadero Marina Park South.

Coronado Bayfront

The northern and eastern shores of the Coronado Bayfront are located in the vicinity of existing fireworks display events. The north Bayfront area includes Naval Air Station North Island as well as residential and commercial uses. Typical of military bases, Naval Air Station North Island, which is not publicly accessible, is characterized by industrial features, including large swaths of concrete paving, used for storage areas or runways; large gray military vessels along the waterfront; and warehouse buildings. Residential uses are located east of Naval Air Station North Island and make up most of the rest of the north Bayfront area between Alameda and D Avenues. These residential uses comprise a mix of single-family houses and condominium buildings, ranging in height from one to two stories. East of D Avenue, the condominium complexes become larger, including several four-story residential buildings along 1st Street between D and B Avenues. The architecture of these buildings is reminiscent of the Hotel del Coronado, including a white façade topped by a red gabled roof pocked by frequent gabled dormers. This area also contains the Ferry Landing Marketplace, which is a collection of shops and restaurants that are housed in single-story buildings, reflecting the Cape Cod-style (cottages with natural wood siding and moderately pitched gable roofs). The marketplace is centered around the publicly accessible Coronado Ferry Landing Park, which comprises a green lawn, a small beach area fronting the Bay, and the Bayshore bikeway. Coronado Ferry Landing Park connects to Centennial Park, which is located off 1st Street and Orange Avenue via a Bayfront promenade. Centennial Park consists mostly of green lawns, walkways, and a small beach. Finally, the northeastern corner of Coronado is occupied by the sprawling complex of buildings that compose the Coronado Island Marriott Resort and Spa. The white three-story buildings are of a contemporary style. The property also includes multiple swimming pools and tennis courts.

The east Coronado Bayfront comprises large swaths of green lawns, associated with the publicly accessible Coronado Tidelands Park (north of State Route [SR] 75), which includes public art and a portion of the Bayshore bikeway, and the Coronado Municipal Golf Course (south of SR-75), as well as Glorietta Bay. Coronado Municipal Golf Course extends along the eastern shore of the Coronado Bayfront, south of the San Diego-Coronado Bay Bridge, and wraps around into Glorietta Bay. Similar to views of most golf courses, views of the Coronado Municipal Golf Course consist of an expansive manicured green lawn dotted by sand pits, trees, water features, and putting greens. The clubhouse is situated in the middle and includes a contemporary building with eclectic Mediterranean-style architectural embellishments, such as stucco siding, a red tiled roof, columns, and arched doorways.

The only fireworks display event that currently occurs along the Coronado Bayfront is the Fireworks Show Over Glorietta Bay, a Fourth of July event that entails the placement of a single temporary barge at the southeastern corner of Glorietta Bay. Glorietta Bay is a small bay, nestled within the southern end of Coronado Island where the island meets the Silver Strand. It connects to San Diego Bay at an opening within its eastern end. The entire waterside area of Glorietta Bay is occupied by a marina that includes regularly spaced white boats with tall masts. To the north/northeast, Coronado Municipal Golf Course, with characteristic expansive green lawns, sand pits, and trees, abuts Glorietta Bay. Additionally, there is a small stretch of beach along the southern tip of the golf course. The aesthetic character of the north-to-northwestern portion of the waterfront area is defined by the urban uses of downtown Coronado, including the landmark Hotel del Coronado, with its distinctive red coned roof and white stucco siding, as well as other high-rise hotels and/or condominium buildings, single-story yacht clubs, and surface parking lots. Most of the western waterfront area is dedicated to the Coronado Community Center, which includes a multi-building complex with contemporary single-story structures surrounded by parks, public art, and a swimming pool, as well as a boat launch ramp that provides public water access to Glorietta Bay. A large pier at the southern end of Glorietta Bay is occupied by an expansive U.S. Navy facility and includes a mass of many types of buildings (office, warehouse, and lodging), open storage areas, and a series of smaller piers to accommodate smaller naval vessels.

General Dynamics NASSCO Ship Repair Facility

Existing fireworks display events also occur at the NASSCO ship repair, which is located on tidelands adjacent to (west of) the Barrio Logan neighborhood, south of the San Diego-Coronado Bay Bridge and north of Chollas Creek and Naval Base San Diego. The segment of the Bay spanning from the Coronado Bay Bridge to Chollas Creek is occupied largely by ship repair yards. The character of the area is highly industrialized. Views of the area consist of numerous ship repair piers and docks, ships or ship parts in various stages of repair, cranes and other large equipment, and warehouse buildings.

Imperial Beach Oceanfront

Imperial Beach Pier is approximately 1,300 feet long and has a nautically themed fish restaurant at its western end. The Pier is surrounded by the open ocean and the beach. One fireworks display event currently takes place on the Fourth of July near the middle of Imperial Beach Pier. Along the oceanfront, views of watercraft, such as those seen in the Bay, are present; however, they are generally farther out and part of the background views. The Imperial Beach Oceanfront comprises a long (more than 1 mile) sandy beach that is bordered almost entirely by relatively dense residential development, including closely positioned one- or two-story single-family homes as well as several multi-story (not exceeding four stories), multi-family residential buildings. Small commercial uses, such as small restaurants, boutique shops, and hotels, are also near the waterfront, although these tend to be behind residential uses along Seacoast Drive.

National City Bayfront

Bayfront uses within National City are almost entirely industrial, with large portions dedicated to a U.S. Navy base and the National City Marine Terminal. The aesthetic character, therefore, is dominated by a smattering of wide low-profile (two- or three-story) warehouses. Concrete paving in the form of very large surface parking lots and other open storage areas also dominates the visual character of the area. Very little landscaping or other sources of greenery are available, with the

exception of Pepper Park, the Sweetwater Marsh Unit of the San Diego Bay National Wildlife Refuge, which includes Paradise Creek to the east and D Street fill to the south, minimal landscaping along the roadways, and some recreational fields within the naval base, which is not publicly accessible.

Chula Vista Bayfront

Large portions of the northern and southern Chula Vista Bayfront are undeveloped and dedicated to wildlife reserves and marshes. The northern and southern portions, which are not currently publicly accessible, are partially reserved for a wildlife buffer and, as such, appear as a natural vegetated landscape. The southern portion is occupied by a saltworks operation, which is distinguished by the vivid colors of the salt evaporation ponds. The colors are due to variable algal and salinity concentrations. The middle portion of the Chula Vista Bayfront is occupied by Bayfront parks, featuring green lawns, pedestrian pathways, picnic benches, boat launches, expansive surface parking lots, public art, a boat and superyacht refit and repair facility, a recreational vehicle park, two large marinas, and the Chula Vista Wildlife Reserve.

4.1.2.2 Designated Scenic Views

The PMP considers the scenic quality of the land within its jurisdiction and establishes District policies for maintenance of important public views. Within many of its precise plans, the District has identified vista areas—key public viewpoints from which to enjoy the scenic beauty of the Bay and other visible District features. Vista areas within the District’s jurisdiction are identified on the PMP’s precise plans by arrow symbols placed on the vista areas that point toward the intended view. The Public Recreation portion of Section III of the PMP explains that these symbols identify “points of natural visual beauty, photo vantage points, and other panoramas. It is the intent of [the PMP] to guide the arrangement of development on those sites to preserve and enhance such vista points” (District 2012:28).

All of the existing fireworks display events are located within San Diego Bay and the Imperial Beach Oceanfront area near land that is publicly accessible (e.g., waterfront promenades, beaches). Additionally, the proposed new fireworks display events would be located within South San Diego Bay, along the National City and Chula Vista Bayfronts. As such, all of the existing and proposed fireworks display events, with the exception of the proposed display along the National City Bayfront, are or would be visible from multiple designated vista areas. The only designated vista area within the National City Bayfront is at Pepper Park, which is adjacent to the Sweetwater River, but approximately 0.45 mile from the Bayfront and separated from the Bayfront by the National City Marine Terminal. Finally, there are no designated vista areas in the vicinity of the NASSCO facility.

4.1.2.3 Scenic Highways

SR-75 is a state-designated scenic highway where it crosses the San Diego-Coronado Bay Bridge and travels down the Silver Strand into Imperial Beach (Caltrans 2011). Views from the 200-foot-tall Coronado Bay Bridge are expansive in all directions. However, the bridge is open only to motor vehicles, there are no pullouts for viewing, and stopping on the bridge is prohibited by law. Also, the bridge has a speed limit of 50 miles per hour and a concrete guardrail that limits the view from lower-profile vehicles. Regardless, existing and proposed new fireworks display events occurring within San Diego Bay currently are or would be visible from the bridge. Views of existing fireworks display events occurring at the Imperial Beach Oceanfront may be visible on the horizon from the

portion of SR-75 that extends into Imperial Beach before turning east and connecting with Interstate 5; however, SR-75 is more than 0.5 mile inland from the oceanfront, and views are obstructed by the restricted naval property, houses, and other urban development. As such, views of the Imperial Beach Oceanfront from SR-75 are largely obscured.

4.1.2.4 Existing Lighting and Glare

Existing Ambient Light and Glare Conditions

There are two typical types of light intrusion. First, light that emanates from the interior of structures and passes out through windows. Second, light that projects from exterior sources, such as street, security, and landscape lighting. Light spillover is typically defined as the presence of unwanted or misdirected light on properties adjacent to the property being illuminated. Light spillover can be a nuisance in adjacent areas and diminish views of the clear night sky.

Glare is described as the distraction, discomfort, or impairment of vision caused by extreme contrasts in the field of vision where light sources, such as sunlight, lamps, luminaries, or reflecting surfaces, are excessively bright in relation to the general brightness of the surroundings. Glare also results from sunlight reflecting off flat building surfaces, with glass typically contributing the highest degree of reflectivity.

Lighting

Within the waters of San Diego Bay and the Pacific Ocean near Imperial Beach, existing sources of nighttime lighting are limited primarily to boats, such as harbor cruise yachts, container shipping vessels, and recreational boats.

The land area surrounding the Bay and the Pacific Ocean near Imperial Beach is highly urbanized and supports a mixture of commercial, industrial, recreational, residential, civic, and marine-related uses. The existing nighttime lighting environment surrounding the sites of the existing and proposed new fireworks display events consists mainly of ambient light produced by recreational facilities, interior and exterior building (residential, office, and commercial) lighting, highly ordered/structured lighting from streetlights, and transitory lighting from headlights on automobiles and transit-related (i.e., buses and trolleys) vehicles.

Commercial developments, such as large-scale hotel developments, also contribute to ambient lighting conditions. Exterior security lighting and interior operational lighting at hotels cause light spillover, which illuminates areas along the Bayfront.

Other significant sources of existing nighttime lighting include commercial, residential, and transit-related development in the downtown community. Several high-rise hotels and residential buildings contribute to ambient nighttime lighting conditions in the form of spillover light from exterior and interior security and operational lighting. Also, Petco Park, just north of the South Embarcadero, is a major contributor to nighttime lighting during the baseball season from both normal stadium lighting and occasional fireworks displays. Finally, transitory nighttime lighting from headlights on automobiles and transit-related (i.e., buses and trolleys) vehicles further contributes to ambient lighting conditions in the area. Overall, because the area is highly urbanized, existing ambient lighting levels are considered to be high.

Glare

A primary source of existing daytime glare at the sites of existing and proposed new fireworks display events is sunlight reflecting off the open waters of the Bay and Pacific Ocean. Glare from horizontal water surfaces is most prevalent in the early and late portions of the day when reflected sunlight is most likely to affect viewers. Another scattered source of daytime glare is sunlight reflecting off windows of boats docked at the marina, which produces minor amounts of glare.

Offsite glare conditions, which are not as prevalent as nighttime lighting, are generally moderate in the area surrounding the sites of the existing and proposed displays. The most noticeable sources of glare are the numerous mid- and high-rise hotels and residential developments inland of the sites of the existing and proposed displays. Glare occurs as a result of light reflecting off the architectural finishes of buildings. Glare conditions are most severe when light reflects off glass surfaces. Most of these high-rise buildings have highly finished surfaces, including window and glass façades, which result in noticeable amounts of daytime glare. Other sources of glare include sunlight reflecting off vehicles and delivery trucks traveling along Harbor Drive, Convention Way, and other surrounding roadways, which also produce minor amounts of transitory glare. Overall, existing daytime glare conditions surrounding the Bay and Imperial Beach Oceanfront are considered to be moderate.

Existing Fireworks Display Events Light and Glare Conditions

A number of fireworks display events currently occur within San Diego Bay and the Imperial Beach Oceanfront throughout the year. These existing fireworks display events occur for approximately 3 to 20 minutes each, depending on the show, and primarily at night, with the exception of the Our Lady of the Rosary Church annual procession, which occurs during daytime hours.¹ These existing fireworks display events occur in highly urbanized areas along San Diego Bay and the Imperial Beach Oceanfront where, as discussed above, the ambient nighttime lighting levels are considered high. Generally, the fireworks are launched to a height where their light considerably exceeds normal ambient lighting levels, creating brief but very bright flashes of light for the duration of the display, particularly during the finales when higher concentrations of fireworks are set off at one time. Existing fireworks display events are visible from sensitive land uses in the vicinity of the displays, such as public parks and open space, roadways, and residences.

Generally, park users are considered sensitive receptors to increases in light and glare because increases in light and glare can interfere with recreational activities. However, the majority of the existing fireworks display events are intentionally located proximal to public parks and open spaces in the Bay in order to maximize the viewing area of the fireworks display events. The vast majority of park visitors who are present during existing nighttime fireworks display events are there to view the displays, especially during the Fourth of July. For existing non-Fourth of July fireworks display events, such as those associated with the San Diego Symphony Summer Pops concerts, U.S.S. Midway Museum, and NASSCO, the displays constitute a brief (no more than 5- to 10-minute) increase in light and glare in the immediate vicinity of the event. However, these displays also make use of smaller shell sizes, resulting in less height and a smaller area of visibility. Furthermore, for the Symphony Summer Pops concert series, access to a portion of Embarcadero Marina Park South requires paid admission to attend the concerts and, as such, many users at Embarcadero Marina Park South are there for the Symphony Summer Pops concerts and expect to see the accompanying

¹ During the fireworks display event for the Our Lady of the Rosary Church annual procession, firework detonation occurs intermittently during the 80-minute procession.

fireworks display. In addition, as noted above, the Our Lady of the Rosary Church annual procession fireworks display event occurs during daylight hours, and the additional light generated by the fireworks is barely discernible from the bright ambient light conditions of any given day.

Residential uses are also considered sensitive receptors to increases in light and glare. The majority of the existing fireworks display events are at least 0.5 mile from the nearest residential uses. Although most of the fireworks display events are likely visible from the yards, rooftops, or windows of nearby residential uses in the vicinity of the displays, the light and glare generated by fireworks are not so intense as to intrude into the structures to the point that typical nighttime activities are disturbed (such as sleeping, watching television, etc.). The Fourth of July Imperial Beach Fireworks Show occurs near the middle of the Imperial Beach Pier, which is approximately 0.2 mile from nearby residential uses. This fireworks display event currently occurs once a year on the Fourth of July, which is a day on which fireworks display events historically occur. Any residents living in proximity to the Imperial Beach Pier who are disturbed by fireworks know to plan for them by being away or keeping windows and curtains closed. In addition, the fireworks display event occurring at the end of the Grape Street Pier for the Our Lady of the Rosary Church annual procession is approximately 0.3 mile from the nearest residential uses. However, this fireworks display event occurs during the day. Fireworks are detonated intermittently during the 80-minute processional as opposed to a concentrated period of time. Several fireworks display events are held at the U.S.S. Midway Museum throughout the year, which is approximately 0.2 mile from the nearest residential uses. These fireworks display events are generally associated with private events and take place either from the flight deck or off a barge within the North Embarcadero area. Additionally, two existing fireworks display events also occur at the NASSCO ship repair. Flashes of light produced by the fireworks are relatively infrequent and diminished by the already-bright ambient light of daylight. Finally, although light and glare produced by the existing fireworks display events are noticeable along nearby roadways, they are not so substantial that they impair driving or creates unsafe conditions.

4.1.3 Applicable Laws and Regulations

4.1.3.1 State

California Scenic Highway Program

The California Department of Transportation manages the California Scenic Highway Program, which was created in 1963 by the California legislature to preserve and protect scenic highway corridors from changes that would diminish the aesthetic value of lands adjacent to highways. The program includes a list of highways that are eligible for designation as scenic highways or that have been designated as such. The designation of a highway as scenic is based on how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes on the travelers' enjoyment of the view. State laws governing the Scenic Highway Program are found in the Streets and Highways Code, Sections 260 through 263.

4.1.3.2 Local

Port Master Plan

Section II of the PMP sets forth planning goals and related policies for development and operation of land within the District's jurisdiction. The goals and related policies pertinent to the aesthetic resources of the proposed project are presented below.

Goal II. The Port District, as trustee for the people of the State of California, will administer the tidelands so as to provide the greatest economic, social, and aesthetic benefits to present and future generations.

Goal VIII. The Port District will enhance and maintain the bay and tidelands as an attractive physical and biological entity.

- Each activity, development, and construction should be designed to best facilitate its particular function, which function should be integrated with and related to the site and surroundings of that activity.
- Views should be enhanced through view corridors, the preservation of panoramas, accentuation of vistas, and shielding of the incongruous and inconsistent.
- Establish guidelines and standards facilitating the retention and development of an aesthetically pleasing tideland environment free of noxious odors, excessive noise, and hazards to the health and welfare of the people of California.

Precise Plans

Section IV of the PMP provides specific guidance for land development within 10 geographic planning districts. These 10 precise plans include maps for each district, tables showing the acreages of various uses within the districts, and lists of projects planned within the districts. The precise plans also identify vista areas within each planning district that indicate points of natural visual beauty, photo vantage points, and other panoramas to be preserved and enhanced by the arrangement of development. Fireworks display events currently occur or are proposed within and/or adjacent to Planning District 1, Shelter Island/La Playa; Planning District 2, Harbor Island/Lindbergh Field; Planning District 3, Centre City Embarcadero; Planning District 4, Tenth Avenue Marine Terminal; Planning District 5, National City Bayfront; Planning District 6, Coronado Bayfront; Planning District 7, Chula Vista Bayfront; and Planning District 10, Imperial Beach Oceanfront. The PMP identifies multiple vista areas that have views of the existing and proposed fireworks display events within each of these planning districts, with the exception of the National City Bayfront, for which there is only one vista area.

4.1.4 Project Impact Analysis

4.1.4.1 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of impacts associated with aesthetics and visual quality resulting from implementation of the proposed project. The determination of whether an

aesthetics and visual quality impact would be significant is based on the thresholds described below and the professional judgment of the District as lead agency, supported by the recommendations of qualified personnel at ICF, all of which are based on the evidence in the administrative record.

Impacts are considered significant if the proposed project would result in any of the following:

1. Have a substantial adverse effect on a scenic vista, including, but not limited to, the vista areas designated by the District in the PMP.
2. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.
3. Substantially degrade the existing visual character or quality of the site and its surroundings.
4. Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

As discussed in the Initial Study/Environmental Checklist (Appendix A of this Draft EIR), implementation of the proposed project would have less-than-significant impacts on scenic vistas and the visual character and quality of the sites and no impacts on scenic resources within a state scenic highway. Those conclusions and the rationale that supports them are summarized in Chapter 6, Section 6.4, *Effects Not Found to Be Significant*. Therefore, only Threshold 4 is discussed in the impact analysis that follows.

4.1.4.2 Project Impacts and Mitigation Measures

Threshold 4: Implementation of the proposed project would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

Impact Discussion

The following impact analysis describes the specific impacts from new sources of substantial light or glare, associated with the proposed new fireworks display events, that would adversely affect day or nighttime views in the area.

Proposed New Fireworks Display Events

The proposed project includes the addition of up to four new fireworks display events per year along the National City and Chula Vista Bayfronts within south San Diego Bay. These proposed new fireworks display events would occur for approximately 3 to 20 minutes each, depending on the display. These proposed new fireworks display events would occur only at night, in highly urbanized areas along San Diego Bay where the ambient nighttime lighting levels are considered high. Generally, the fireworks would be launched to a height where their light would exceed the normal ambient lighting levels and create brief but very bright flashes of light for the duration of the show, particularly during the finales when higher concentrations of fireworks are set off at one time. As such, the proposed new fireworks display events would result in new sources of substantial light in the project areas for a very short period of time.

Although the proposed new fireworks display events would be visible from sensitive land uses, such as public parks and open space, roadways, and residences, in the vicinity of the displays, the light

generated by the fireworks would not result in substantial spillover light onto nearby uses such that those uses would be adversely affected (for impacts on biological resources, see Section 4.3, *Biological Resources*, of this Draft EIR).

As discussed in Section 4.1.2.4, above, park users are considered sensitive receptors to increases in light and glare because increased light and glare can interfere with recreational activities. However, as with the existing fireworks display events, the proposed new fireworks display events that would occur near National City and Chula Vista would intentionally be located near public parks and open spaces, such as Pepper Park in National City or Bayside Park in Chula Vista, in order to maximize the viewing area of the fireworks display events. The vast majority of park visitors who are present during nighttime fireworks display events are there to view the displays, especially during Fourth of July fireworks display events. Therefore, they would not be adversely affected by the proposed new Fourth of July fireworks display events. For the proposed new non-Fourth of July fireworks display events that would occur along the Chula Vista Bayfront, the displays would constitute a brief (approximately 5-minute) increase in light and glare in the immediate vicinity of the display, which would not result in a substantial disruption to recreational users of the park. As such, impacts on users of parks and open space during the proposed new fireworks display events would be less than significant.

Regarding effects on residential uses, the proposed new fireworks display event that would occur along the National City Bayfront would be at least 1 mile from the nearest residential uses, while the proposed new fireworks display events that would occur along the Chula Vista Bayfront would be approximately 0.75 mile from the nearest residential uses (east of Interstate 5). Although the proposed new National City and Chula Vista Bayfront fireworks display events would most likely be visible from the yards, rooftops, or windows of nearby residential uses, the light and glare would not be so intense as to intrude into the structures to the point that typical nighttime activities would be disturbed (such as sleeping, watching television, etc.). Overall, the proposed new fireworks display events would result in less-than-significant impacts on residential uses associated with light and glare.

Similarly, although the light and glare produced by the fireworks display events would be noticeable along nearby roadways, such as Interstate 5 in both National City and Chula Vista, they would not be so substantial that they would impair driving or create unsafe conditions.

Finally, the proposed new fireworks display events would not result in adverse effects on views in the area. Light generated by the fireworks would diminish almost immediately, and any momentary interruption of nighttime views would be almost immediately restored. Therefore, the proposed project would not result in an adverse impact on day or nighttime views related to the creation of a new source of light or glare. Impacts would be less than significant, and no mitigation measures are required.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events that create a new source of substantial light or glare. Therefore, the proposed ordinance would not result in any change to the existing condition. As such, the effects of the proposed ordinance on existing fireworks display events would not create a new source of substantial light or glare that would adversely affect day or nighttime views. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would not result in an adverse impact on day or nighttime views related to the creation of a new source of light. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not create a new source of substantial light or glare that would adversely affect day or nighttime views. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

4.2.1 Overview

This section describes the existing conditions and applicable laws and regulations for air quality and health risk. The section also discusses the proposed project’s potential to increase air pollutant emissions in the region. Impacts on air quality are considered significant if the proposed project were to (1) conflict with or obstruct implementation of the applicable air quality plan, (2) violate any air quality standard or contribute substantially to an existing or projected air quality violation, (3) result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard, (4) expose sensitive receptors to substantial pollutant concentrations, or (5) create objectionable odors affecting a substantial number of people.

Table 4.2-1 summarizes the significant impacts and mitigation measures discussed in this section.

Table 4.2-1. Summary of Significant Impacts and Mitigation Measures

Summary of Potentially Significant Impact(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
<p>Impact-AQ-1: Emissions in Excess of PM2.5 Thresholds During Combined National City Bayfront and Chula Vista Bayfront Fourth of July Fireworks Display Events</p>	<p>MM-AQ-1: Limit the Size of Overlapping New Fireworks Display Events with Compliance with the Conditions of the Proposed Ordinance, which require the new Fourth of July fireworks display events to not exceed 400 pounds each.</p> <p>MM-AQ-2: Implementation of Air Quality-Related Conditions of the Proposed Ordinance, which require truck delivery to not exceed 3 minutes of idling.</p>	<p>Less than Significant</p>	<p>The proposed ordinance contains conditions of approval intended to reduce and minimize air quality impacts associated with fireworks display events.</p> <p>The conditions would require limiting the size of overlapping Fourth of July fireworks display events to 400 pounds each, which reduces PM2.5 emissions below significance.</p> <p>In addition, the proposed ordinance includes air quality-related conditions such as requiring delivery trucks to not exceed 3 minutes of idling and using alternative fireworks that would burn cleaner and produce less smoke, which would provide some reduction in emissions.</p>

Summary of Potentially Significant Impact(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
<p>Impact-AQ-2: Cumulative Emissions in Excess of PM2.5 Thresholds During Combined New Fourth of July Fireworks Display Events</p>	<p>Implement MM-AQ-1 and MM-AQ-2.</p>	<p>Less than Significant</p>	<p>The proposed ordinance contains conditions of approval intended to reduce and minimize air quality impacts associated with fireworks display events.</p> <p>The conditions would require limiting the size of overlapping Fourth of July fireworks display events to 400 pounds each, which reduces PM2.5 emissions below significance.</p>

4.2.2 Existing Conditions

4.2.2.1 Climate and Atmospheric Conditions

Regional

San Diego Bay and the Imperial Beach Oceanfront are within the San Diego Air Basin (SDAB), which covers all of San Diego County. The SDAB is bordered by the Pacific Ocean to the west, the South Coast Air Basin (SCAB) to the north, the Salton Sea Air Basin to the east, and the U.S.–Mexico border to the south.

The climate in Southern California, including the SDAB, is controlled largely by the strength and position of a subtropical high-pressure cell over the Pacific Ocean. Areas within 3–5 miles of the coast, including the project site, experience moderate temperatures and comfortable humidity (SDAPCD 2010a). Precipitation is mostly limited to a few storms during the winter season. Winds in the vicinity of the project site usually are driven by the dominant land/sea breeze circulation system. During the day, regional wind patterns are dominated by onshore sea breezes. At night, wind generally slows, remains still, or reverses direction, traveling toward the sea.

The atmospheric conditions of the SDAB contribute to the region’s air quality conditions. Because of its climate, the SDAB experiences frequent temperature inversions. Typically, temperature decreases with height. However, under inversion conditions, temperature increases as altitude increases. Temperature inversions prevent the air close to the ground from mixing with the air at higher elevations. As a result, air pollutants are trapped near the ground. During the summer, the

interaction between the ocean surface and the lower layer of the atmosphere creates a moist marine layer. An upper layer of warm air mass forms over the cool marine layer, preventing air pollutants from dispersing upward. Additionally, hydrocarbons (HC) and nitrogen oxides (NO_x) react under strong sunlight and temperature, creating smog. Light and daytime winds, primarily from the northwest, further aggravate this condition by driving the air pollutants inland toward the warmer foothills. During the fall and winter, elevated carbon monoxide (CO) and NO_x levels usually occur on days with summer-like conditions (SDAPCD 2010b).

High air pollution levels in coastal communities of San Diego can often occur when polluted air from the SCAB, particularly from Los Angeles, travels southwest over the ocean at night and is brought on shore into San Diego by the sea breeze during the day. Smog transported from the SCAB is a key factor on more than 50 of the days San Diego exceeds clean air standards. Ozone (O₃) and its precursor emissions (HC and NO_x) are transported to San Diego during relatively mild Santa Ana weather conditions. During strong Santa Ana weather conditions, however, pollutants are pushed away from San Diego far out to sea. When smog is blown in from the SCAB at ground level, the highest O₃ concentrations are measured at coastal and near-coastal monitoring stations. When the transported smog is elevated, coastal sites may be passed over, and the transported ozone is measured farther inland and on the mountain slopes (SDAPCD 2010b).

Local

The proposed ordinance will apply to existing and proposed new fireworks display events in the northern portion of San Diego Bay, portions of southern San Diego Bay, and the Imperial Beach Oceanfront. In establishing background conditions, information from nearby meteorological and pollution monitoring stations is used to define climatic and air quality conditions in the project area. Pollution monitoring stations are discussed in Section 4.2.2.2 below.

The weather station closest to northern San Diego Bay is the San Diego/Lindbergh Field Station. High and low temperatures in summer average 74°F and 64°F and in winter average 65°F and 49°F, respectively (WRCC 2016a). Total annual precipitation at Lindbergh Field averages 10.13 inches (WRCC 2016b). Eighty-five percent of the rainfall occurs from November through March, with wide variations taking place in monthly and seasonal totals (NOAA 2004). Precipitation is rare in the summer months, as summer rainfall averages only 0.13 inch per year (WRCC 2016b).

The project proposes four new fireworks display events: three displays along the Chula Vista Bayfront and one Fourth of July display along the National City Bayfront. These fireworks display events are along the southern portion of San Diego Bay. The weather station closest to these fireworks display events is the Chula Vista station, which is approximately 4.5 miles to the southeast of the anticipated barge location for the National City fireworks display event, approximately 3.7 miles east of the anticipated barge location for the Chula Vista fireworks display event, and approximately 5.5 miles northeast of the existing Fourth of July Imperial Beach Show. The prevailing climatic conditions at Chula Vista are similar to San Diego/Lindbergh Field, as high and low temperatures in summer average 72°F and 62°F and in winter average 65°F and 45°F (WRCC 2016c), and total annual precipitation at averages 9.73 inches (WRCC 2016d).

Existing fireworks display events within the northern San Diego Bay portion of the project area are in the vicinity of two wind monitoring stations operated by the San Diego Air Pollution Control District (SDAPCD): Perkins Elementary School and San Diego/Lindbergh Field. Wind monitoring data recorded at the San Diego/Lindbergh Field Station indicate the predominant wind direction is

out of the west–northwest prominence at 6.33 miles per hour (mph) (2.83 meters per second [m/s]) with calm winds present approximately 0.84 percent of the time. During the most active fireworks display events season (June 1 through September 30), winds trend more west by northwest with periodic southern and northern winds, averaging 6.71 mph (3.00 m/s) with calm winds present approximately 0.55 percent of the time (Reeve pers. comm.). Winds at night (8 p.m.–10 p.m.) during the most active fireworks display events season are similar to the daily average—trending out of the west-northwest with periodic southern and northern winds—but at lower speeds (5.68 mph, or 2.54 m/s) than the daily average (Reeve pers. comm.). Wind monitoring data recorded at Perkins Elementary School indicate a prominence of westerly winds with periodic southwest winds that average 3.85 mph (1.72 m/s), with calm winds present approximately 13.3 percent of the time. During the most active fireworks display event season (June 1 through September 30), winds trend similar to the average over the year but are slightly stronger (4.81 mph, or 2.15 m/s) with calm winds present approximately 10.13 percent of the time. Winds at night (8 p.m.–10 p.m.) during the most active display season trend more west-northwest with periodic southwest winds, but winds tend to be lighter (3.80 mph, or 1.70 meters per second) than the daily average (Reeve pers. comm.). Wind velocity and direction varies over short distances, varies seasonally, and varies temporally throughout the day.

Fireworks display events within the southern ports of San Diego Bay, including the Fourth of July Imperial Beach Fireworks Show, are in the vicinity of the Chula Vista wind monitoring station, which is also operated by SDAPCD. Wind monitoring data recorded at Chula Vista indicate a prominence of westerly and southwesterly winds that average 3.85 mph (1.72 m/s), with calm winds present approximately 13.30 percent of the time. During the most active fireworks display event season (June 1 through September 30), winds trend similar to the average over the year but are slightly stronger (4.00 mph, or 1.79 m/s) with calm winds present approximately 10.13 percent of the time. Winds at night (8 p.m.–10 p.m.) during the most active display season trend west and southwest, but winds tend to be lighter (2.68 mph, or 1.20 meters per second) than the daily average (Reeve pers. comm.). While the Chula Vista station displays a more southwesterly pattern than the Lindbergh Field and Perkins School stations, each wind monitoring station displays a similar pattern; nighttime winds during the most active fireworks display events season tend to be calmer, which can affect how particulate emissions generated during fireworks display events disperse through the region. A more detailed description of meteorology and how winds affect particle dispersion in the Health Risk Assessment (HRA) is provided in Appendix E of this Draft EIR. Wind roses depicting wind directions, speeds, and frequency for the above-mentioned stations and time periods are also shown in Appendix E.

4.2.2.2 Air Quality Conditions

Regional

The Clean Air Act (CAA) requires the U.S. Environmental Protection Agency (EPA) to designate areas within the country as either attainment or nonattainment for each criteria pollutant based on whether the national ambient air quality standards (NAAQS) have been achieved. Similarly, the California CAA requires the California Air Resources Board (ARB) to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the California Ambient Air Quality Standards (CAAQS) have been achieved. If a pollutant concentration is lower than the state or federal standard, the area is classified as being in attainment for that

pollutant. If a pollutant concentration is higher than the state or federal standard, the area is considered a nonattainment area. If data are insufficient to determine whether a pollutant is violating the standard, the area is designated unclassified. Under the California CAA, areas are designated as nonattainment for a pollutant if air quality data show that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment. The attainment status of San Diego County is summarized in Table 4.2-2.

Table 4.2-2. Federal and State Attainment Status for San Diego County

Criteria Pollutant	Federal Designation	State Designation
Ozone (O ₃) (8-hour)	Nonattainment – Marginal	Nonattainment
Carbon Monoxide (CO)	Attainment/Maintenance	Attainment
Respirable Particulate Matter (PM ₁₀)	Attainment	Nonattainment
Fine Particulate Matter (PM _{2.5})	Unclassifiable/Attainment	Nonattainment
Nitrogen Dioxide (NO ₂)	Attainment	Attainment
Sulfur Dioxide (SO ₂)	Attainment	Attainment
Lead (Pb)	Attainment	Attainment
Sulfates	(No federal standard)	Attainment
Hydrogen Sulfide	(No federal standard)	Unclassified ¹
Visibility	(No federal standard)	Unclassified

Sources: ARB 2014, 2015; SDAPCD 2016a.

¹ At the time of designation, if the available data do not support a designation of attainment or nonattainment, the area is designated as unclassifiable.

Local

SDAPCD maintains and operates a network of ambient air monitoring stations throughout the county. The purpose of the monitoring stations is to measure ambient concentrations of the pollutants and determine whether the ambient air quality meets the CAAQS and NAAQS. Similar to the discussion of local climate and atmospheric conditions in Section 4.2.2.1 above, multiple monitoring stations are used to define background conditions for displays that occur in those areas. The ambient monitoring station closest to the northern and central San Diego Bay, where almost all of the existing firework display events occur, is the San Diego–Beardsley Street station (ARB 80142), which is adjacent the Perkins Elementary School in the Barrio Logan neighborhood.

The ambient monitoring station closest to the existing fireworks display event along the Imperial Beach Oceanfront and proposed new displays along the National City and Chula Vista Bayfronts is the Chula Vista station (ARB 80114). However, because attainment status is assigned for the entirety of San Diego County, and the largest fireworks display events occur in the San Diego Bay portion of the project area, ambient monitoring information from the San Diego–Beardsley Street station is considered representative of the fireworks display events in the northern and central parts of San Diego Bay, while the Chula Vista–East J Street station is considered representative of the proposed new fireworks display events in the southern parts of San Diego Bay.

Concentrations of pollutants from the nearby monitoring stations over the last 3 years (2013–2015) of complete data are presented in Table 4.2-3. Over the previous 3 years of available data, monitoring has shown the following pollutant concentrations trends at the San Diego–Beardsley Street station: the 8-hour O₃ CAAQS was exceeded twice in 2014, but did not exceed the NAAQS; 24-hour particulate matter (PM) less than or equal to 10 microns in diameter (PM₁₀) CAAQS was exceeded once in 2013, but did not exceed the NAAQS; and 24-hour PM less than or equal to 2.5 microns in diameter (PM_{2.5}) NAAQS was exceeded once in 2013. No violations of the CO CAAQS or NAAQS or the nitrogen dioxide (NO₂) CAAQS or NAAQS were recorded. Over the same period of record, monitoring has shown the following pollutant concentration trends at the Chula Vista station: the 8-hour O₃ CAAQS and NAAQS were exceeded once in 2014, while no other violations were recorded.

Table 4.2-3. Ambient Background Concentrations from the San Diego–Beardsley Street Monitoring Station

Pollutant Standards	2013	2014	2015	2013	2014	2015
1-Hour Ozone (O₃)

Source: ARB 2015; EPA 2015. Data compiled by ICF.

ppm = parts per million; $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

¹ An exceedance is not necessarily a violation. The precision or given number of decimal places varies for each state standard and depends on how the level of the standard is specified. In this case, ozone concentrations are rounded to 2 decimal places, so 0.093 rounds to 0.09, which does not exceed the CAAQS of 0.09.

Pollutants of Concern

Criteria Pollutants

As discussed above, the federal and state governments have established NAAQS and CAAQS, respectively, for six criteria pollutants: O₃, lead, CO, NO₂, sulfur dioxide (SO₂), and PM₁₀ and PM_{2.5}. Ozone and NO₂ are considered regional pollutants because they (or their precursors) affect air quality on a regional scale. Pollutants such as PM₁₀, PM_{2.5}, CO, SO₂, and lead are considered local pollutants that tend to accumulate in the air locally.

The primary pollutants of concern within San Diego Bay and the Imperial Beach Oceanfront are O₃ (including NO_x and reactive organic gases [ROGs]), CO, and PM. Principal characteristics surrounding these pollutants and the hazards they present to human health are discussed below.

- **Ozone**, or smog, is a photochemical oxidant that is formed when ROG and NO_x (both by-products of the internal combustion engine) react with sunlight. O₃ poses a health threat to those who already suffer from respiratory diseases as well as to healthy people. Additionally, O₃ has been tied to crop damage, typically in the form of stunted growth and premature death. O₃ can also act as a corrosive, resulting in property damage such as the degradation of rubber products. Meteorology and terrain play major roles in O₃ formation. Ideal conditions occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O₃ is considered a regional pollutant; high levels often occur downwind of the emission source because of the length of time between when the ROG form and when they react with light to change to O₃.
- **Organic Gases—Precursors to Ozone** include ROGs and volatile organic compounds (VOCs). HC are organic gases that are formed solely of hydrogen and carbon. ROGs include all HC except those exempted by ARB. Therefore, ROGs are a set of organic gases based on state rules and regulations. VOCs are similar to ROGs in that they include all organic gases except those exempted by federal law. Both VOCs and ROGs are emitted from incomplete combustion of HC or other carbon-based fuels. Combustion engine exhaust, oil refineries, and oil-fueled power plants are the primary sources of HC. Another source of HC is evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint. Generally speaking, and in this analysis, ROGs and VOCs are used interchangeably to refer to the HC that are a precursor to O₃ formation.

The primary health effects of HC result from the formation of O₃ and its related health effects. High levels of HC in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. There are no separate ambient air quality standards for ROGs. Carcinogenic forms of ROG are considered to be toxic air contaminants (TACs), which are described below. An example is benzene, which is a carcinogen.

- **Nitrogen Oxides** serve as integral participants in the process of photochemical smog production. The two major forms of NO_x are nitric oxide (NO) and NO₂. NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperature and/or high pressure. NO₂ is a reddish-brown irritating gas formed by the combination of NO and oxygen. NO_x acts as an acute respiratory irritant and increases susceptibility to respiratory pathogens. NO_x is a precursor to O₃ formation.

- **Carbon Monoxide** is a colorless, odorless, toxic gas produced by incomplete combustion of carbon substances, such as gasoline or diesel fuel. The primary adverse health effect associated with CO is interference with normal oxygen transfer to the blood, which may result in tissue oxygen deprivation.
- **Particulate Matter** consists of finely divided solids or liquids such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now recognized—inhalable coarse particles, or PM10, and inhalable fine particles, or PM2.5. Particulate discharge into the atmosphere results primarily from industrial, agricultural, construction, and transportation activities. However, wind on arid landscapes also contributes substantially to local particulate loading. Both PM10 and PM2.5 may adversely affect the human respiratory system, especially in those people who are naturally sensitive or susceptible to breathing problems.
- **Sulfur Dioxide** is a product of high-sulfur fuel combustion. Main sources of SO₂ are coal and oil used in power stations, in industries, and for domestic heating. Industrial chemical manufacturing is another source of SO₂, which is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. SO₂ also can cause plant leaves to turn yellow and can erode iron and steel. In recent years, SO₂ concentrations have been reduced by the increasingly stringent controls placed on stationary-source emissions of SO₂ and limits on the sulfur content of fuels.

Health Effects of Criteria Air Pollutants

Criteria air pollutants are recognized to have a variety of health effects on humans. Research by ARB shows that exposure to high concentrations of air pollutants can trigger respiratory diseases, such as asthma, bronchitis, and other respiratory ailments; and cardiovascular diseases. A healthy person exposed to high concentrations of air pollutants may become nauseated or dizzy, may develop a headache or cough, or may experience eye irritation and/or a burning sensation in the chest. O₃ is a powerful irritant that attacks the respiratory system, leading to the damage of lung tissue. Inhaled particulate matter, NO₂, and SO₂ can directly irritate the respiratory tract, constrict airways, and interfere with the mucous lining of the airways. Exposure to CO, when absorbed into the bloodstream, can endanger the hemoglobin, the oxygen-carrying protein in blood, by reducing the amount of oxygen that reaches the heart, brain, and other body tissues. PM10 can bypass the body's natural filtration system more easily than larger particles and can lodge deep in the lungs, while PM2.5 particles can deposit deep in the lungs and contain substances that are particularly harmful to human health. When air pollutant levels are high, children, the elderly, and people with respiratory problems are advised to remain indoors. Outdoor exercise also is discouraged because strenuous activity may cause shortness of breath and chest pains. A brief discussion of the criteria pollutants and their effects on human health and the environment is provided in Table 4.2-4.

Table 4.2-4. Health Effects Summary of the Major Criteria Air Pollutants

Pollutants	Sources	Primary Effects
Ozone (O ₃)	<ul style="list-style-type: none"> Atmospheric reaction of organic gases with NO₂ in sunlight 	<ul style="list-style-type: none"> Aggravation of respiratory and cardiovascular diseases Irritation of eyes Impairment of cardiopulmonary function Plant leaf injury
Nitrogen Dioxide (NO ₂)	<ul style="list-style-type: none"> Motor vehicle exhaust High temperature stationary combustion Atmospheric reactions 	<ul style="list-style-type: none"> Aggravation of respiratory illness Reduced visibility Reduced plant growth Formation of acid rain
Carbon Monoxide (CO)	<ul style="list-style-type: none"> Incomplete combustion of fuels and other carbon containing substances, such as motor exhaust Natural events, such as decomposition of organic matter 	<ul style="list-style-type: none"> Reduced tolerance for exercise Impairment of mental function Impairment of fetal development Death at high levels of exposure Aggravation of some heart diseases (angina)

Toxic Air Contaminants

TACs are pollutants that have no ambient standard but pose the potential to increase the risk of developing cancer or acute or chronic health risks. The most relevant TAC associated with a typical port's activities (e.g., vessels, trucks), is diesel particulate matter (DPM). Fireworks display events, such as the existing and proposed new displays, also include other emitted TAC sources, including hexavalent chromium (Cr+6), lead (Pb), and copper (Cu), as well as certain species of VOC, including formaldehyde, acetaldehyde, and acrolein. For TACs that are known or suspected carcinogens, ARB has consistently found that there are no levels or thresholds below which exposure is risk-free.

Therefore, no NAAQS or CAAQS exist for TACs. Individual TACs vary greatly in the risks they present. At a given level of exposure, one TAC may pose a hazard that is many times greater than another. TACs are identified and their toxicity is studied by the California Office of Environmental Health Hazard Assessment (OEHHA). Adverse health effects of TACs can be carcinogenic (cancer-causing), short-term (acute) noncarcinogenic, and long-term (chronic) noncarcinogenic. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders.

Sensitive Receptors

The impact of air pollutant emissions on sensitive members of the population is a special concern. Sensitive receptors are defined as locations where pollutant-sensitive members of the population may reside or where the presence of air pollutant emissions could adversely affect use of the land. ARB has identified the following people as the most likely to be affected by air pollution: children younger than 14, the elderly older than 65, athletes, and people with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive receptors (ARB 2005a). Locations that may contain a high concentration of these sensitive population groups include residential areas, hospitals, daycare facilities, elder-care facilities, elementary schools, and parks.

The proposed ordinance would govern existing and proposed new firework display events that originate from piers, flight decks, and/or barges adjacent to land within San Diego Bay, including adjacent to Shelter Island, Harbor Island, and the Centre City Embarcadero; Glorietta Bay in Coronado; NASSCO ship repair facility; National City Bayfront; Chula Vista Bayfront; and the Imperial Beach Oceanfront. Land uses vary widely in each of these neighborhoods and include residential areas, hospitals, daycare facilities, elder-care facilities, elementary schools, and parks. Primary viewing locations for Fourth of July fireworks display events are from adjacent parks and public spaces along San Diego Bay and the Imperial Beach Oceanfront. Viewing areas for all other non-Fourth of July fireworks displays events are generally more limited, but could include any place that has a view of the fireworks display events.

4.2.2.3 Background Air Quality and Health Risk

Background Regional Criteria Pollutant Emissions

ARB periodically develops existing and future year emission inventories for the entire state and for individual regions for the major sources of emissions in its Almanac of Emissions, including stationary sources (e.g., electric utilities, manufacturing, landfills), mobile sources (e.g., passenger vehicles, transit, goods movement), and area-wide sources (e.g., farming, windblown dust, construction). While ARB does not include emissions from fireworks display events themselves, ancillary sources, including tugs and on-road motor vehicles, are included in ARB's inventory and future year forecasts. An inventory of the most recent inventory year (2012) and future year 2020 and 2035 countywide and statewide projections is presented in Table 4.2-5 (ARB 2013). As shown, emissions of some pollutants trend downward, as regulations that are currently in place will reduce combustion-related emissions even as population increases. PM10 and PM2.5 increase slightly because even though combustion-related emissions decrease, fugitive dust from activities to support population growth (e.g., construction and demolition, farming) and vehicle travel (e.g., unpaved and paved road dust) increase, offsetting the decrease in combustion-related emissions.

Table 4.2-5. Estimate of Countywide and Statewide Emissions by Year (tons per day)

Emissions by Year	VOC	NO_x	CO	SO_x	PM10	PM2.5
San Diego County						
2012	126	114	527	2	73	20
2020	114	68	391	1	74	19
2035	111	49	359	2	77	21
Statewide						
2012	1,739	2,106	7,372	105	1,460	418
2020	1,561	1,553	5,669	82	1,502	411
2035	1,574	1,200	5,289	101	1,567	438

Background Regional Toxic Air Contaminants and Health Risk

ARB operates 17 monitoring stations to monitor air toxics within major urban areas. Various TACs that are present in fireworks display events are monitored, including species of VOC (including acetaldehyde, acrolein, and formaldehyde), polycyclic aromatic hydrocarbons, and metals (including Cr+6, Cu, and Pb). Of the 20 statewide stations, two are in the SDAB: Chula Vista and El Cajon. Although these stations are not near the northern or central parts of San Diego Bay, the Chula Vista station is near the southern portion of San Diego Bay. Because the Chula Vista station is the only station within proximity of San Diego Bay that monitors air toxics, data from the Chula Vista station are assumed to be representative of the background conditions for the proposed new fireworks display events. Toxics monitoring data from the Chula Vista station are summarized in Table 4.2-6. As shown in Table 4.2-6, background air toxics are small and are generally reduced between years 2000 and 2014. Note that the toxics monitoring values reported here are from Chula Vista, which is approximately 3 miles inland at the southern end of the Bay. Based on this information, ARB estimated the overall ambient risk from all air toxics in the SDAB at 607 chances per million in 2009, the majority of which (420 chances per million) were attributed to DPM (ARB 2009). Note that DPM is not directly monitored because an accepted measurement method does not currently exist, but ARB estimates concentrations based on monitored PM10 data and the results from several studies on chemical speciation of ambient data (e.g., ratio of DPM to monitored PM10).

Table 4.2-6. Air Toxics Monitoring Data from the Chula Vista Monitoring Station

Pollutant	Year 2014			Year 2000		
	Mean	Maximum	Cancer Risk	Mean	Maximum	Cancer Risk
Copper	0.023	0.052	<1	-	0.170	<1
Hexavalent Chromium	<0.001	<0.001	6	-	<0.001	16
Lead	0.012	0.063	0.1	-	0.170	-
Formaldehyde	0.002	0.004	13	0.002	0.005	16
Acetaldehyde	0.001	0.001	3	0.001	0.002	4
Acrolein	0.001	0.002	<1	-	-	-

Source: Compiled by ICF from the ARB Annual Toxics Summaries (ARB 2016a).

Notes:

Mean and maximum concentrations of copper, chromium, and lead are provided in $\mu\text{g}/\text{m}^3$; formaldehyde, acetaldehyde, and acrolein are provided in ppm.

Toxics samples are collected over a 24-hour period (midnight to midnight) every 12 days at 18 sites (20 sites before July 1995, 21 sites from July 1995 through July 2000) throughout California. There is usually a maximum of 31 values for a given toxics substance at a given site each year (<https://www.arb.ca.gov/adam/toxics/toxuses.html>).

- = value not available

Recently, the state released the California Communities Environmental Health Screening Tool (CalEnviroScreen), which provides a relative ranking of communities based on a selected group of environmental, health, demographic, and socioeconomic indicators. Neighborhoods near the project area, including those areas to the east of the middle portions of San Diego Bay, represent some of the highest rankings (e.g., worst air quality) in the state. For example, the Barrio Logan community just west/south (census tract 6073005000) and east/north of Interstate 5 (census tract 6073004900) is within the worst 96–100 percent in the state. In the South Bay, the community just southeast of the National City Bayfront and immediately east of Interstate 5 (census tract 6073012502) is within the worst 86–90 percent in the state, while the worst community near the Chula Vista Bayfront is the community just southeast of the Chula Vista Bayfront and immediately west and east of Interstate 5 (census tract 6073012600), which is within the worst 71–75 percent in the state. Twenty-six communities in the San Diego region have been identified as disadvantaged and will be the target of cap-and-trade investment to improve public health, quality of life, and economic opportunity (Cal/EPA 2014).

Note that while the results of CalEnviroScreen provide information on background pollution that allows the state to prioritize funding resources, the scoring results are not directly applicable to project-level or cumulative impact analyses required under CEQA. As such, the information provided by CalEnviroScreen cannot substitute for analyzing a specific project's cumulative impacts as required in a CEQA environmental review (Cal/EPA 2014). The information presented herein regarding CalEnviroScreen is for illustrative purposes only.

4.2.3 Applicable Laws and Regulations

The air quality management agencies of direct importance in the county are EPA, ARB, and SDAPCD. EPA has established federal air quality standards for which ARB and SDAPCD have primary implementation responsibility. ARB and SDAPCD are also responsible for ensuring that state air

quality standards are met. The following sections discuss federal, state, and local laws and regulations applicable to the proposed project.

4.2.3.1 Federal

Federal Clean Air Act

The CAA was first enacted in 1963 and has been amended numerous times in subsequent years (1967, 1970, 1977, and 1990). The CAA establishes the NAAQS and specifies future dates for achieving compliance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for local areas not meeting those standards. The plans must include pollution control measures that demonstrate how the standards will be met. Because the District is within the SDAB, it is in an area designated as nonattainment for certain pollutants that are regulated under the CAA.

The 1990 amendments to the CAA identify specific emission-reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable progress toward attainment and incorporation of additional sanctions for failure to attain or meet interim milestones. The sections of the CAA that would most substantially affect the development of the proposed project include Title I (Nonattainment Provisions) and Title II (Mobile-Source Provisions).

Title I provisions were established with the goal of attaining the NAAQS for criteria pollutants. Table 4.2-7 shows the NAAQS currently in effect for each criteria pollutant. The NAAQS were amended in July 1997 to include an 8-hour standard for O₃ and adopt a standard for PM_{2.5}. The 8-hour O₃ NAAQS was further amended in October 2015. EPA will designate O₃ attainment and nonattainment areas in late 2017.

Exceptional Events Rule

Exceptional events are events for which the normal planning and regulatory process established by the CAA is not appropriate. An exceptional event is defined as an event that affects air quality, is not reasonably controllable or preventable, is caused by human activity that is unlikely to recur at a particular location or a natural event, and is determined by EPA through the process established in these regulations to be an exceptional event. The exceptional events rule grants EPA the authority to exclude air quality monitoring data from regulatory determinations related to exceedances or violations of NAAQS and avoid designating an area based on certain events if the state adequately demonstrates that an exceptional event has caused an exceedance or violation of an NAAQS. EPA requires states to take reasonable measures to mitigate the impacts of an exceptional event. Fireworks display events can qualify as an exceptional event provided the state adequately demonstrates that fireworks display events caused the exceedance and that fireworks display events are significantly integral to traditional national, ethnic, or other cultural events (e.g., Fourth of July celebrations, Chinese New Year celebrations, Diwali)(40 Code of Federal Regulations Parts 50 and 51).

Table 4.2-7. Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	CAAQS¹	NAAQS²
Ozone (O ₃)	1 hour	0.09 ppm	--
	8 hour	0.070 ppm	0.070 ppm
Carbon Monoxide (CO)	1 hour	20 ppm (23,000 µg/m ³)	35 ppm (40,000 µg/m ³)
	8 hour	9.0 ppm	9 ppm
Nitrogen Dioxide (NO ₂)	1 hour	0.18 ppm (339 µg/m ³)	100 ppb (188 µg/m ³)
	Annual Arithmetic Mean	0.030 ppm	53 ppb
Sulfur Dioxide (SO ₂)	1 hour	0.25 ppm (655 µg/m ³)	75 ppb (196 µg/m ³)
	24 hour	0.04 ppm (105 µg/m ³)	0.14 ppm (368 µg/m ³)
Respirable Particulate Matter (PM ₁₀)	24 hour	50 µg/m ³	150 µg/m ³
	Annual Arithmetic Mean	20 µg/m ³	--
Fine Particulate Matter (PM _{2.5})	24 hour	--	35 µg/m ³
	Annual Arithmetic Mean	12 µg/m ³	12.0 µg/m ³
Sulfates	24 hour	25 µg/m ³	--
Lead (Pb)	30 day average	1.5 µg/m ³	--
	Calendar quarter	--	1.5 µg/m ³
	Rolling 3-Month Average	--	0.15 µg/m ³
Hydrogen Sulfide	1 hour	0.03 ppm	--
Vinyl Chloride	24 hour	0.01 ppm	--

Source: ARB 2016b

¹ The CAAQS for O₃, CO, SO₂ (1-hour and 24-hour), NO₂, PM₁₀, and PM_{2.5} are values not to be exceeded. All other California standards shown are values not to be equaled or exceeded.

² The NAAQS, other than O₃ and those based on annual averages, are not to be exceeded more than once a year. The O₃ standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For PM_{2.5}, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, is equal to or less than the standard.

ppm = parts per million by volume; ppb = parts per billion; µg/m³ = micrograms per cubic meter.

4.2.3.2 State

California Clean Air Act

The California CAA, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. The CAAQS incorporate additional standards for most of the criteria pollutants and set standards for other pollutants recognized by the state. In general, the California standards are more health protective than the corresponding NAAQS. California has also set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. Table 4.2-7 shows the CAAQS currently in effect for each criteria pollutant.

ARB and local air districts bear responsibility for achieving California's air quality standards, which are to be achieved through district-level air quality management plans that would be incorporated into the SIP. In California, EPA has delegated authority to prepare SIPs to ARB, which, in turn, has

delegated that authority to individual air districts. ARB traditionally has established state air quality standards, maintaining oversight authority in air quality planning, developing programs for reducing emissions from motor vehicles, developing air emission inventories, collecting air quality and meteorological data, and approving SIPs.

The California CAA substantially adds to the authority and responsibilities of air districts. The California CAA designates air districts as lead air quality planning agencies, requires air districts to prepare air quality plans, and grants air districts authority to implement transportation control measures. The California CAA also emphasizes the control of “indirect and area-wide sources” of air pollutant emissions. The California CAA gives local air pollution control districts explicit authority to regulate indirect sources of air pollution and to establish traffic control measures.

Diesel Fuel Regulation

With this rule, ARB set sulfur limitations for diesel fuel sold in California for use in on- and off-road motor vehicles (13 California Code of Regulations [CCR] 2281–2285; 17 CCR 93114). Harbor craft and intrastate locomotives were originally excluded from the rule, but were later included by a 2004 rule amendment (ARB 2005b). Under this rule, diesel fuel used in motor vehicles has been limited to 500 parts per million (ppm) sulfur since 1993. The sulfur limit was reduced to 15 ppm on September 1, 2006. A federal diesel rule similarly limited sulfur content nationwide to 15 ppm by October 15, 2006.

Toxic Air Contaminant Regulations

California regulates TACs primarily through the Tanner Air Toxics Act (Assembly Bill [AB] 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588). The Toxic Air Contaminant Identification and Control Act (AB 1807) created California’s program to reduce exposure to air toxics. The Air Toxics “Hot Spots” Information and Assessment Act (AB 2588) supplements the AB 1807 program by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks. In August 1998, ARB identified particulate emissions from diesel-fueled engines as TACs. In September 2000, ARB approved a comprehensive diesel risk reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. As an ongoing process, ARB reviews air contaminants and identifies those that are classified as TACs. ARB also continues to establish new programs and regulations for the control of TACs, including DPM, as appropriate. Among the programs and strategies ARB has developed to reduce diesel emissions for various sources, many of these are applicable to sources within San Diego Bay, including harbor craft (tugs) for displays that have fireworks launched from barges. Other displays, such as the Fourth of July Imperial Beach Fireworks Show, Our Lady of Rosary Church Annual Procession, various U.S.S. Midway Museum displays, and the NASSCO displays, are not barge-based, so no tugs are assumed.

4.2.3.3 Local

Port of San Diego

The Port Master Plan (PMP) is the governing land use document for physical development within the District; however, there are also other District programs that apply to air quality. The District developed the Green Port Program to support the goals of the Green Port Policy, which was adopted

in 2008. The Green Port Program supports resource conservation, waste reduction, and pollution prevention. The Clean Air Program is one key area of the Green Port Program, with the primary goal of reducing air emissions from District operations at its three marine terminals: the Cruise Ship Terminal, Tenth Avenue Marine Terminal, and National City Marine Terminal. The Clean Air Program seeks to voluntarily reduce criteria pollutants and greenhouse gas (GHG) emissions from current and future District operations through the identification and evaluation of feasible and effective control measures for each category of District emissions. The District has developed various control measures geared toward reducing emissions from the greatest contributors of air pollution. The District has identified control measures to achieve a reduction of pollutants from the largest sources, including shore power (to enable ships to turn off their engines and plug into electric power while docked), truck replacement/retrofits, replacement/retrofits of cargo handling equipment, and voluntary vessel speed reductions. The Clean Air Program will continue to be refined and be adapted to future changes in District operations (District 2008).

Through efforts at the international, federal, state, and local levels, air emissions from goods movement sources at the District have been greatly reduced. For example, between the 2006 and 2012 Emission Inventories, NO_x emissions were reduced 50 percent, DPM emissions were reduced 75 percent, and SO₂ emissions were reduced 94 percent (District 2014).

San Diego Air Pollution Control District

Local air pollution control districts have the primary responsibility for the development and implementation of rules and regulations designed to attain the NAAQS and CAAQS, as well as the permitting of new or modified sources, development of air quality management plans, and adoption and enforcement of air pollution regulations. SDAPCD is the local agency responsible for the administration and enforcement of air quality regulations in San Diego County.

Regional Air Quality Strategy and State Implementation Plan

ARB, SDAPCD, and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plan for attainment and maintenance of the ambient air quality standards in the SDAB. The San Diego Regional Air Quality Strategy (RAQS) outlines SDAPCD's plans and control measures designed to attain and maintain the state standards while SDAPCD submits San Diego County's portion of the SIP, which is designed to attain and maintain federal standards. The RAQS was initially adopted in 1991 and is updated on a triennial basis. The RAQS was updated in 1995, 1998, 2001, 2004, 2009, and the Final 2016 RAQS Revision (for O₃ CAAQS) was adopted in December 2016. The RAQS does not currently address the state air quality standards for PM₁₀ or PM_{2.5}. SDAPCD has also developed the air basin's input to the SIP, which is required under the federal CAA for areas that are out of attainment of air quality standards. Both the RAQS and SIP demonstrate the effectiveness of ARB measures (mainly for mobile sources) and SDAPCD's plans and control measures (mainly for stationary and area-wide sources) for attaining the O₃ NAAQS. The SIP is also updated on a triennial basis. For the 8-hour O₃ standard, SDAPCD submitted its 8-hour O₃ Redesignation Request and Maintenance Plan in December of 2012 and adopted the Final 2016 O₃ Attainment Plan and the Reasonably Available Control Technology (RACT) Demonstration in December 2016. In addition, the *Measures to Reduce Particulate Matter in San Diego County* report (December 2005) proposes measures to reduce PM emissions and recommends measures for further detailed evaluation and, if appropriate, future rule development

(or non-regulatory development, if applicable), adoption, and implementation in San Diego County, in order to attain PM CAAQS.

ARB is currently working on an update to the SIP and recently released a *Proposed 2016 State Strategy* for the SIP. This strategy describes proposed state measures to achieve the reductions necessary from the mobile sector and consumer products to meet O₃ and PM_{2.5} NAAQS over the next 15 years. The 2016 SIP update will incorporate regional SIPs (to be developed) as well as the Scoping Plan Update, California's Sustainable Freight Action Plan, the Short-Lived Climate Pollutant Strategy, and implementation of Senate Bill 375. ARB notes that while existing programs have achieved tremendous success in reducing NO_x emissions, further reductions are required. Proposed SIP measures include various measures relevant to goods movement and maritime operations, including working with EPA on a low-NO_x standard and finalizing the Phase 2 GHG standard for heavy trucks; further deployments of cleaner on- and off-road technologies; working with EPA on more stringent locomotive emission standards; working with IMO on Tier 4 vessel standards; incentivizing low-emissions vessel calls; and extending at-berth requirements to all vessels (ARB 2016b).

SDAPCD Rules and Regulations

SDAPCD is responsible for establishing and enforcing local air quality rules and regulations that address the requirements of federal and state air quality laws. SDAPCD develops control measures and rules for sources under SDAPCD authority, specifically stationary emission sources (including power plants, manufacturing and industrial facilities, stationary internal combustion engines, gas stations, landfills, and solvent-cleaning and surface-coating operations) and some area-wide sources (mostly residential sources, which are individually small and spread over a wide area, including water heaters, furnaces, architectural coatings, and consumer products). Typical projects that construct and operate sources under SDAPCD control are subject to the various SDAPCD rules and regulations. However, because the proposed project does not propose to construct or operate any source under the direct authority of SDAPCD, SDAPCD rules and regulations are not applicable to the proposed project. Nonetheless, some SDAPCD rules are relevant in that information presented therein is used in this analysis. For example, Regulation 2, Rule 20.2 established Air Quality Impact Analysis (AQIA) Trigger Levels, which set emission limits for non-major new or modified stationary sources, and Regulation 8, which establishes rules and procedures governing new, relocated, or modified emission units that may increase emissions of one or more TAC. While the proposed project is not necessarily subject to the requirements of either regulation, the AQIA Trigger Levels from Regulation 2, Rule 20.2, as well as the risk assessment guidelines and procedures from Regulation 8, are used in the analysis herein.

4.2.4 Project Impact Analysis

4.2.4.1 Methodology

Air quality impacts associated with the fireworks display events were assessed and quantified using industry standard methodology and peer-reviewed software tools, techniques, and emission factors. A summary of the methodology is provided below. A full list of assumptions and emission calculations can be found in Appendix E.

The analysis herein considers those sources that are directly or indirectly related to the fireworks display events. Direct effects are impacts that are a direct result of the fireworks display events and include the sources needed to operate the fireworks display events. Direct sources include the operation of the fireworks, the delivery of the fireworks and related materials, and tug and barge activity used to launch the fireworks. Indirect effects are effects that result from the proposed project but are not directly caused by project operation. Indirect sources include changes to the travel and circulation patterns on the regional roadway network from patrons accessing the fireworks display event viewing locations, usage of facilities at the fireworks display event viewing locations (e.g., water consumption, electricity consumption, and cleaning product use at bathrooms). The methodology used to estimate air quality-related impacts is discussed below and is similar to the methodology that was used to estimate GHG emissions and energy consumption, as described in Section 4.4, *Greenhouse Gas Emissions, Climate Change, and Energy*.

Background on Fireworks

Studies have found that the release of fireworks can be an important source category for atmospheric particulate matter (Vecchi et al. 2008). Research has found that fireworks can increase particulate matter (including PM10 and PM2.5) directly by emitting firework-related species and certain heavy metals, such as Cu and Pb, and other particles that include both light and heavy metals, elemental and organic carbon, and perchlorate compounds (Croteau et al. 2010). Additionally, the indirect effects of firework display events should be taken into consideration, which include re-suspended dust (if launched over land) and biomass combustion (fireworks made from paper, aerial shell, fuse, and other igniter material).

The fireworks emissions can be divided into those emissions that occur directly from the fireworks themselves and a biomass fraction, which is indirect emissions resulting from the incineration of materials made from paper and an igniter material. The direct fireworks mass fraction will be released at the top of the trajectory when the aerial shell explodes. This action is separated into a lift charge portion that occurs during initial lifting of the aerial firework followed by the release of the firework shell explosion near the top of the trajectory. The biomass (indirect) contribution is released near ground level. Each of these emission sources were explicitly modeled in estimating mass emissions and in the air dispersion model in estimating pollutant concentrations at nearby receptors.

Although firework-related emissions are relatively infrequent, they are highly concentrated and their influence can be seen in the national air quality observation network (Seidel and Birnbaum 2015). Both the direct and indirect influences of fireworks can contribute to PM10, PM2.5, and total metal emissions. In addition, fireworks can be an important source of perchlorate released into the environment, with potassium and ammonia perchlorate the most commonly used ingredient. The objective in this analysis is to quantify both the emissions and the resulting air concentrations, while fully documenting the important underlying assumptions and source of the emission factors used in the analysis. Furthermore, studies found that the sum of all gases comprise only 0.006 percent to 0.4 percent of the initial mass of fireworks (Croteau et al. 2010). Individual gaseous species, including VOC, would be even smaller. Based on this, VOC emissions from existing and future fireworks display events were assumed to be negligible and were not included in the analysis.

Fireworks Emission Sources and Source Strength Calculation

Direct Sources

Particle generation from the total combustion mass of an individual firework ranges from 5 to 13 percent of the total mass. Refined estimates of these emission factors for PM₁₀, PM_{2.5}, metals, criteria pollutants (VOC, NO_x, CO, and sulfur oxides [SO_x]), and VOC species (including formaldehyde, acetaldehyde, and acrolein) were available from the *Emission factors and exposures from ground-level pyrotechnics* scientific journal article from Croteau et al. (2010). The aerial shells from the largest existing fireworks display event, Big Bay Boom, are most similar in characteristics to the Roman Candle “B” projectile as measured following combustion testing performed in a burn room for this scientific journal article.

Indirect Sources

Tian et al. (2014) reported the fraction of the direct fireworks emissions, relative to the total PM₁₀ and PM_{2.5}, as 70.2 percent for PM₁₀ and 80.6 percent PM_{2.5}, with the remainder as biomass emissions. As such, the biomass emissions for PM₁₀ are 29.8 percent and for PM_{2.5} are 19.4 percent of the total for the size group. The net weight of pyrotechnic materials in aerial fireworks shells is typically about half their gross weight, and the amount of material available as biomass emissions was estimated as equal to the net explosive weight (or the weight of pyrotechnic materials) (Kosanke and Kosanke 1990). The biomass combustion profiles for PM₁₀ and PM_{2.5} were based on the values reported in Tian et al. (2014) and Akagi et al. (2011), respectively. Note that the “net explosive weight” shown in the Regional Water Quality Control Board permits is defined as the “the weight of all pyrotechnic compositions, explosives material, and fuse only” (22 CCR 67384.3). The “net explosive weight” does not include the paper, plastic, and inert substances that compose the shell and lifting charge. This assumption is consistent with the approach taken in Section 4.6, *Hydrology and Water Quality*.

Particle Size Distribution

The rate at which particulate matter is removed from the atmosphere and deposited to the ground is primarily a function of the particle sizes found following the explosion of the fireworks. The best information available on particle size distribution is available in a study by Khaparde et al. (2011) in which they measured the particles’ size mass distribution for eight size-bins ranging from a mean mass diameter size of 10 micrometers to 0.4 micrometer over multiple days. For purposes of this analysis, it was assumed that the particle size distribution information collected in the above-mentioned study by Khaparde et al. (2011) on October 28, 2008 during the most active fireworks display event period of the Diwali festival best corresponds to the aerial explosion firework activities during the existing and anticipated in the proposed new fireworks display events. The particle size distribution was used to model both deposition of particulate matter to the Earth’s surface and also the removal from the atmospheric mass concentration.

Amount of Fireworks

A summary of activity associated with the proposed new fireworks display events is presented in Table 3-2, and a summary of activity associated with existing fireworks display events is presented in Table 2-2. Note that the majority of the background research was performed based on the known

information and shell sizes from the 2015 Big Bay Boom event, which is the largest existing fireworks display event that occurs within San Diego Bay. Emission factors for each of the pollutants of concern was generated for the existing Big Bay Boom event, and fireworks emissions for the other fireworks display events were estimated by scaling emissions from the Big Bay Boom event by the amount of fireworks for the specific fireworks display event. The amount of fireworks for the proposed new Fourth of July fireworks display events along the National City and Chula Vista Bayfronts is assumed to be the same as the Fourth of July Imperial Beach Fireworks Show. The amount of fireworks for the proposed new non-Fourth of July fireworks display events along the Chula Vista Bayfront is assumed to be approximately 25 percent of the total pounds of fireworks for the Fourth of July Imperial Beach Fireworks Show.

Tugs and Barges

Fireworks for the proposed new fireworks display events would be launched from barges in the waters of southern San Diego Bay. Barges would be moved by tug boats to their designated locations along the Chula Vista and National City Bayfronts. The barges themselves would result in no emissions, but the tugs that move the barges would. Tug activity to move barges into place was estimated based on the distance from the Pacific Tugboats offices to the various locations throughout the Bay assuming tugs travel 6 mph, similar to in-harbor tug activity presented in the District's Emissions Inventory (District 2014). It was assumed that the tug's propulsion/main and auxiliary engines are active while moving barges into place. Tug activity to hold barges in place was based on information from the District, organizers, operators, and/or District tenants of fireworks display events and assumed that barges are active for a total of 4 hours. While holding barges in place, it was assumed that only the tug's auxiliary engines are active, while the propulsion/main engines remain off. It was assumed that the same activity to move the barges in place occurs once the fireworks display event is complete, as the barges and tugs return to Pacific Tugboat offices.

A summary of proposed new fireworks display events that are anticipated to use tugs and barges is presented in Table 3-2. As with existing fireworks display events, the barges would use tugs that are in the 400–1,100 horsepower range. The District's Emissions Inventory (District 2014) was used to find the appropriate model year and engine size for tugs that fit this horsepower range. To estimate tug emission factors, it was assumed that the average tug in this range is a 2004 model year with an 804-horsepower main engine and a 101-horsepower auxiliary engine. Tug emission factors are based on the zero-hour emission factors for model year 2004 tug engines, engine deterioration factors, fuel correction factors, useful life, and load factors for main propulsion and auxiliary tug engines as well as auxiliary barge engines based on the calculation methodology from the Port of Long Beach Inventory (Port of Long Beach 2014). It was conservatively assumed that tugs used during fireworks display events are fully deteriorated (e.g., at the end of their useful life). It is assumed that the methodology used to estimate emissions from tug and barge activity is the same for existing and proposed new fireworks display events.

Firework Material Deliveries

The fireworks are primarily manufactured overseas and are transported to the fireworks display events by truck from the port of entry. For purposes of analysis, it was assumed that firework materials are trucked from the Ports of Los Angeles and/or Long Beach to the project sites prior to or on the fireworks display event day. Emissions associated with delivery truck travel were estimated assuming a single 236-mile round-trip (118 miles one way) heavy-duty truck delivery for

each fireworks display event on the event day to and from the Port of Los Angeles. Exhaust emissions were based on emission factors from ARB's EMFAC software for heavy-duty "T7 Single Construction" tractor-trailer trucks operating in San Diego County in year 2017. Fugitive road dust emissions were based on the re-entrained paved road dust methodology from EPA (2011) along with methodological guidance published by ARB (2014).

Visitor Traffic

As noted in the memorandum provided by Chen Ryan (Appendix J), a traditional analysis of regional traffic patterns related to the fireworks display events cannot be accurately calculated for the fireworks display events due to the limitations of traffic modeling and the uniqueness of the fireworks display events. Rather, the traffic analysis focuses on how the transportation and parking demand patterns changed around San Diego Bay during sample Fourth of July and other non-Fourth of July fireworks display events, including observed changes in vehicle, pedestrian, and bicycle volumes. These volumes were counted only on the roadways and intersections providing immediate access to the viewing locations for the sample fireworks display events. In order to calculate visitor-related vehicle miles traveled (VMT), data would need to be collected that assess the number of visitors, how visitors arrived at the event, how far patrons traveled, routes taken, where patrons parked, and whether or not patrons were at the viewing locations specifically for fireworks or there for other reasons. Moreover, because the proposed new fireworks display events along the National City and Chula Vista Bayfronts do not currently occur, this data could not be collected. In discussing the air quality effects of visitor-related vehicle traffic, the analysis below provides a qualitative evaluation of background monitoring on both event and non-event days.

Studies indicate that PM concentrations in most urban areas are generally attributed to vehicle traffic, and PM concentrations diminish with distance, particularly beyond 1,000 feet (ARB 2005). Background PM concentrations are collected at the following monitoring stations in the region: Alpine, Downtown (Beardsley Street), El Cajon, Escondido, Otay Mesa, Camp Pendleton, and San Ysidro (SDAPCD 2016b). Of these stations, the only station within proximity of the project area is the Downtown (Beardsley Street) station, which is near existing fireworks display events that occur in the northern parts of San Diego Bay, particularly the Big Bay Boom event. No monitoring stations are close to the existing Fourth of July Imperial Beach Show or near the proposed new National City and Chula Vista fireworks display events. Thus, the Fourth of July Imperial Beach Show, although it is similar in size to the proposed new National City and Chula Vista fireworks display events, cannot be used to estimate the effects of the proposed new shows. However, even though the existing Big Bay Boom event is much larger and takes place in a different part of the Bay, the event does take place in proximity to a PM monitoring station (Downtown-Beardsley Street), which can be used to qualitatively assess the potential impact of the proposed project's vehicle traffic based on hourly monitoring data near an existing fireworks display event.

Health Risk Assessment

Based on a literature review, it was determined by the District that because of the short-term but highly concentrated emissions during and after fireworks display events (Seidel and Birnbaum 2015), the potential effects of key toxic pollutants present in many fireworks displays on sensitive populations viewing the displays should be analyzed.

Fireworks contain a mixture of ingredients and metals that are used to project and detonate the fireworks and generate colors. Fireworks can influence the particulate matter directly by emitting firework-related species (such as certain heavy metals) and other particles that include both light and heavy metals, elemental and organic carbon, and perchlorate compounds. Additionally, the indirect effects caused by the activities of fireworks display events should be taken into consideration. This would include re-suspended dust (if launched over land) and biomass combustion (fireworks made from paper, aerial shell, fuse, and other igniter material).

An HRA was performed to analyze the short-term (acute) health effects of the fireworks display events. In particular, the analysis was performed by using the largest existing fireworks display event, which is the Big Bay Boom. The Big Bay Boom was used to provide a comparison for all proposed new fireworks display events because the Big Bay Boom is by far the largest and most visited of the fireworks display events. Impacts from proposed new fireworks display events were estimated by scaling the Big Bay Boom fireworks display event by the new fireworks display event sizes. A detailed description of the methods and model inputs used in the HRA is provided in Appendix E of this Draft EIR.

The air quality model needed to assess the impacts from aerial fireworks display events must be capable of modeling near-instantaneous releases, atmospheric dispersion processes, and transport of the firework emissions. The standard EPA air dispersion model, AERMOD, does not have the capability to model near-instantaneous releases (i.e., releases over much less than 1 hour), nor does AERMOD include the energy from the detonation of the firework material; however, EPA does list on its Support Center for Regulatory Application the use of an alternative model intended for use in evaluating the potential air quality impacts from open burning and open detonation (OBOD) from solid propellants. The Department of Defense, U.S. Army, developed the OBOD model (version 1.3.24) to specifically address the disposal of ammunition either by burning or detonation of the munitions. OBOD uses cloud/plume rise dispersion and deposition algorithms for modeling instantaneous and quasi-continuous sources to predict the downwind transport and dispersion of pollutants released from an open detonation. This model is directly applicable for modeling firework releases after specifying the burst height of the fireworks aerial shell. Moreover, as noted in other risk assessment studies, most notably the Disneyland Health Risk Assessment (York Engineering, LLC 2007) the OBOD model was identified as the more appropriate model for the modeling of pyrotechnic displays. Note that the Disneyland study included both acute and chronic effects because the Disneyland fireworks display events occur at the same location regularly throughout the year.

OBOD was used to calculate the concentration of directly emitted criteria and TAC pollutants from the identified sources. Dispersion models such as OBOD require local meteorological parameters such as wind speed, stability class, mixing height, and temperature. Hourly averaged meteorological data from the Beardsley Street monitoring station was used as input to the OBOD model for the hour-specific event. Meteorological data for 1 week before and 1 week after the Fourth of July for the past 10 years (2007–2016) for 9 p.m. local daylight time were used to represent typical meteorology during a typical Big Bay Boom display. Over this period of record, the hourly average wind speed was 4.8 mph, wind direction was from 280 degrees (west-northwest), and the temperature was 67.5°F over the 9 p.m. to 10 p.m. time period.

OEHHA has established guidelines for determining the impact of acutely toxic substances. Short-term exposure risks are characterized in terms of a hazard index (HI). OEHHA and SDAPCD

generally recognize that an HI greater than 1.0 means that expected exposure levels have the potential to pose adverse health effects. HI levels less than 1.0 are considered safe from any adverse health effects. OEHHA has developed Reference Exposure Levels (RELs) for numerous chemicals, including 53 acute RELs, 82 chronic RELs, and 10 eight-hour RELs. Exposure averaging time for acute RELs is 1 hour. For 8-hour RELs, the exposure averaging time is 8 hours, which may be repeated. Chronic RELs are designed to address continuous exposures for up to a lifetime: the exposure metric used is the annual average exposure. By definition, an acute REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter [$\mu\text{g}/\text{m}^3$]) for the specified exposure duration on an intermittent basis (OEHHA 2015). Given the short-term and infrequent nature of the largest fireworks display events, assessing acute risk based on acute RELs is the most appropriate method of analysis. Acute RELs for chemicals released from firework activities are presented in Table 4.2-8. As noted, not every chemical or pollutant has an acute REL. For example, while Cr+6 is a known toxin, OEHHA has not developed an acute REL for Cr+6. Similarly, while DPM is a known carcinogen emission from sources, including project-related tugs, OEHHA has not developed an acute REL for tugs. Thus, while OEHHA, along with ARB and EPA, continues to examine the relationship between TAC exposure and short-term (acute) health effects, health studies to date have not provided sufficient exposure information to establish a short-term (acute) non-cancer health risk value for many chemicals, including Cr+6 and DPM. Short-term (acute) non-cancer health risk effects are only analyzed for pollutants that have been assigned risk values, as provided in Table 4.2-8.

When calculating acute risk, the maximum 1-hour ground level concentration (in $\mu\text{g}/\text{m}^3$) of a substance at a receptor is divided by the acute 1-hour REL (in $\mu\text{g}/\text{m}^3$) for the substance. For a single substance, this result of this calculation is called the Hazard Quotient. If a receptor is exposed to multiple substances that target the same organ system, then the Hazard Quotient for the individual substances are summed to obtain an HI for that target organ. Hazard Quotients for different target organs are not added.

Table 4.2-8. Acute Risk Factors for Fireworks-Related TACs

Pollutant	1-Hour Acute REL ($\mu\text{g}/\text{m}^3$)	Target Organ
Copper	100	Respiratory System
Sulfur Dioxide	196	Respiratory System
Nitrogen Dioxide	470	Respiratory System
Carbon Monoxide	23,800	Cardiovascular System
Formaldehyde	55	Eyes (sensory irritation)
Acetaldehyde	470	Eyes; Respiratory System (sensory irritation)
Acrolein	2.5	Eyes; Respiratory System (sensory irritation)
Diesel Particulate Matter	--	--
Hexavalent Chromium	--	--

4.2.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining significance of impacts associated with air quality resulting from the proposed project. The determination of whether an air quality impact would be significant is based on the applicable thresholds and the professional judgment of the District as Lead Agency, supported by the recommendations of qualified personnel at ICF, and relies wholly on the substantial evidence in the administrative record. Impacts would be considered significant if the project would do any of the following.

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Violate any air quality standard or contribute substantially to an existing or projected air quality violation.
3. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).
4. Expose sensitive receptors to substantial pollutant concentrations.
5. Create objectionable odors affecting a substantial number of people.

Appendix G of the State CEQA Guidelines further indicates the significance criteria established by the applicable air quality management or air pollution control district may be relied on to make the significance determinations.

Supplemental Thresholds

An EIR should disclose and evaluate the public health consequences associated with increasing air pollutants. Consequently, the following section summarizes the thresholds established by the County of San Diego (County), presents substantial evidence regarding the basis upon which they were developed, and also describes how they are used to determine whether project construction and operational emissions would result in a significant impact within the context of (1) interfering with or impeding attainment of CAAQS and NAAQS, or (2) causing or contributing to increased risks to human health.

Regional Thresholds for SDAB Attainment of State and Federal Ambient Air Quality Standards

As previously indicated, the State CEQA Guidelines state that the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the significance determination of whether a project would violate or impede attainment of air quality standards. Attainment status for each pollutant is assigned for the entire air basin. In San Diego, the SDAB is defined as “all of San Diego County” (see 17 CCR 60110). Therefore, the current attainment status for the entire San Diego region, which includes nonattainment status for ozone NAAQS and ozone CAAQS, PM10 CAAQS, and PM2.5 CAAQS, applies to the entire county.

Neither the District nor the Cities of San Diego, Coronado, Chula Vista, National City, or Imperial Beach have developed CEQA thresholds of significance for air quality and health risk.¹ Although SDAPCD has not developed specific thresholds of significance to evaluate construction and operational impacts within CEQA documents, SDAPCD's Regulation II, Rules 20.2 and 20.3 (new source review for non-major and major stationary sources, respectively), outline AQIA Trigger Levels for criteria pollutants for new or modified sources. Based on SDAPCD's AQIA Trigger Levels, as well as EPA rulemaking and CEQA thresholds adopted by SCAQMD, San Diego County has established screening-level thresholds (SLTs) to assist lead agencies in determining the significance of project-level air quality impacts within the county (as shown in Table 4.2-9). Although SDAPCD does not have VOC or PM2.5 AQIA Trigger Levels, the County has adopted a PM2.5 SLT based on EPA's "Proposed Rule to Implement the Fine Particle National Ambient Air Quality Standards" published on September 8, 2005, which is also consistent with SCAQMD's Air Quality Significance Thresholds (SCAQMD 2015), and a VOC SLT based on the threshold of significance for VOCs from the SCAQMD for the Coachella Valley. Emissions in excess of San Diego County's SLTs, shown in Table 4.2-9, would be expected to have a significant impact on air quality because an exceedance of the SLTs is anticipated to contribute to CAAQS and NAAQS violations in the county.

The County's SLTs are based on SDAPCD AQIA Trigger Levels, and these AQIA Trigger Levels are based on emissions levels identified under the New Source Review (NSR) program, which is a permitting program established by Congress as part of the CAA Amendments of 1990 to ensure that air quality is not significantly degraded by new or modified sources of emissions. The NSR program requires that stationary sources receive permits before construction begins and/or the use of equipment. By permitting large stationary sources, the NSR program ensures that new emissions would not slow regional progress toward attaining the NAAQS. SDAPCD implements the NSR program through Rules 20.2 and 20.3, and has concluded that the stationary pollutants described under the NSR program are equally significant as those pollutants generated with land use projects. SDAPCD's Trigger Levels were set as the total emission thresholds associated with the NSR program to help attain and maintain the NAAQS from new and modified non-major stationary sources.² SDAPCD's Trigger Levels take into account the region's attainment status, emission profile, inventory, and projections, and represent levels above which project-generated emissions could affect SDAPCD's and SANDAG's commitment to attain the state and federal standards in the region. Consistent with Section 15064.7(c) of the State CEQA Guidelines,³ the evidence in support of the air quality thresholds shown in Table 4.2-9 is deemed appropriate for their use in this analysis and in this location within the greater SDAB.

¹ The District is currently in the process of drafting CEQA thresholds of significance for all resources, including air quality. Until these thresholds are adopted, the District will continue to rely on established regional thresholds, which are based on substantial evidence summarized herein.

² San Diego Air Pollution Control District, Rule 20.2, Table 20.2-1, hereby incorporated by reference: <http://www.sdapcd.org/rules/Reg2pdf/R20-2.pdf>

³ "When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

Table 4.2-9. San Diego County Screening-Level Thresholds

Air Contaminant	Emission Rate		
	(pounds per hour)	(pounds per day) ¹	(tons per year)
Respirable Particulate Matter (PM10)	--	100	15
Fine Particulate Matter (PM2.5) ²	--	55	10
Nitrogen Oxides (NO _x)	25	250	40
Sulfur Oxides (SO _x)	25	250	40
Carbon Monoxide (CO)	100	550	100
Lead (Pb) ³	--	3.2	0.6
Volatile Organic Compounds (VOC) ⁴	--	75	13.7 ⁵

Source: SDAPCD Regulation II, Rule 20.2, County of San Diego 2007.

¹ According to San Diego County, the daily SLTs are most appropriate when assessing impacts from standard construction and operational emissions. Therefore, daily SLTs are used to evaluate project significance, while hourly and annual SLTs are provided for informational purposes only.

² Based on EPA's "Proposed Rule to Implement the Fine Particle National Ambient Air Quality Standards" published September 8, 2005, and also SCAQMD's Air Quality Significance Thresholds (SCAQMD 2015).

³ Lead and lead compounds.

⁴ County SLTs for VOCs were originally based on the threshold of significance for VOCs from SCAQMD for the Coachella Valley. The terms VOC and ROG are used interchangeably, although VOC is used in this table because the City and County use the term VOC.

⁵ 13.7 tons per year threshold is based on 75 pounds per day multiplied by 365 days per year and divided by 2,000 pounds per ton.

Health-Based Thresholds for Project-Generated Pollutants of Human Health Concern

An EIR should disclose and evaluate the public health consequences associated with increasing air pollutants. As discussed above, all criteria pollutants are associated with some form of health risk (e.g., asthma, asphyxiation). Adverse health effects associated with criteria pollutant emissions are highly dependent on a multitude of interconnected variables (e.g., cumulative concentrations, local meteorology and atmospheric conditions, and the number and character of exposed individuals [e.g., age, gender]). Moreover, O₃ precursors (ROG and NO_x) affect air quality on a regional scale. Health effects related to O₃ are therefore the product of emissions generated by numerous sources throughout a region. As part of the setting and updating of the NAAQS, EPA develops and considers quantitative characterizations of exposures and associated risks to human health or the environment, known as a Health Risk and Exposure Assessment (HREA), with recent air quality conditions and with air quality estimated to just meet the current or alternative standard(s) under consideration (EPA 2016). The HREA estimates population exposure to and resulting mortality and morbidity health risks associated with the full range of observed pollutant concentrations, as well as incremental changes in exposures and risks associated with ambient air quality adjusted to just meeting the existing NAAQS and just meeting potential alternative NAAQS under consideration (EPA 2014). However, existing models have limited sensitivity to small changes in criteria pollutant concentrations and, as such, translating project-generated criteria pollutants to specific health

effects would produce meaningless results. In other words, minor increases in regional air pollution from project-generated ROG and NO_x would have nominal or negligible impacts on human health.⁴

For this reason, an analysis of impacts on human health associated with project-generated regional emissions is not included in this analysis. Increased emissions of O₃ precursors (ROG and NO_x) generated by the proposed project could increase photochemical reactions and the formation of tropospheric O₃, which, at certain concentrations, could lead to respiratory symptoms (e.g., coughing), decreased lung function, and inflammation of airways. Although these health effects are associated with O₃, the impacts are a result of cumulative and regional ROG and NO_x emissions, and the incremental contribution of the proposed project to specific health outcomes from criteria pollutant emissions would be limited and cannot be solely traced to the proposed project. (See Threshold 3 and Chapter 5 for a discussion of regional cumulative impacts.)

Because localized pollutants generated by a project can directly affect adjacent sensitive receptors, the analysis of project-related impacts on human health focuses only on those localized pollutants with the greatest potential to result in a significant, material impact on human health. This is consistent with the current state-of-practice and published guidance by the California Air Pollution Control Officers Association (CAPCOA 2009), OEHHA (2015), SDAPCD (2006), and ARB (2000). These localized pollutants are (1) locally concentrated CO and (2) TACs. Locally adopted thresholds of significance for each pollutant are identified below. Note that a qualitative health-based analysis of criteria pollutants is briefly discussed under Threshold 4, but the health-based analysis focuses primarily on roadway CO and firework-related TACs, which are most often associated with adverse health outcomes (i.e., acute, chronic, and cancer risks) as opposed to the respiratory irritability outcomes typically seen from exposure to elevated concentrations of the criteria pollutants discussed above.

Local Micro-Scale Carbon Monoxide Concentration Standards

The significance of localized project impacts under CEQA depends on whether ambient CO levels in the vicinity of the project are above or below state and federal CO standards. If ambient levels are below the standards, a project is considered to have a significant impact if project emissions result in an exceedance of one or more of these standards. If ambient levels already exceed a state or federal standard, project emissions are considered significant if they increase 1-hour CO concentrations by 1.0 ppm or more or 8-hour CO concentrations by 0.45 ppm or more (SCAQMD 1993). The following are applicable local emission concentration standards for CO.

- CAAQS and NAAQS 1-hour CO standards of 20 and 35 ppm, respectively
- CAAQS and NAAQS 8-hour CO standard of 9.0 and 9 ppm, respectively

As in most urban areas, high short-term concentrations of CO, known as “hot-spots,” can be a problem in San Diego County. Hot-spots typically occur in areas of high motor vehicle use, such as in parking lots, at congested intersections, and along highways. Because elevated CO concentrations typically occur at locations with high traffic volumes and congestion, elevated CO concentrations are

⁴ As an example, the Bay Area Air Quality Management District’s Multi-Pollutant Evaluation Method requires a 3 to 5 percent increase in regional ozone precursors to produce a material change in modeled human health impacts. Based on 2008 ROG and NO_x emissions in the Bay Area, a 3 to 5 percent increase equates to over 20,000 pounds per day of ROG and NO_x.

often correlated with level of service (LOS) at intersections. LOS expresses the congestion level for an intersection and is designated by a letter from A to F, with LOS A representing the best operating conditions and LOS F the worst. Significant concentrations of CO sometimes occur (depending on temperature, wind speed, and other variables) at intersections where LOS is rated at D or worse.

In order to assess the potential for CO hot-spots at nearby intersections, the analysis herein uses the County's CO hot-spot screening criteria, which indicate that any project that would place receptors within 500 feet of a signalized intersection with peak-hour trips exceeding 3,000 trips and operating at or below LOS E must conduct a hot-spot analysis for CO. Likewise, projects that will cause road intersections with intersection peak-hour trips exceeding 3,000 trips to operate at or below LOS E must also conduct a CO hot-spot analysis.

Localized Toxic Air Contaminant Concentrations

Various forms of TACs are recognized as causing adverse health effects. The most abundant TAC in urban settings is DPM, which is a form of localized PM (see above) that is generated by diesel equipment and vehicle exhaust. DPM has been identified as a TAC by ARB and is particularly concerning because long-term exposure can lead to cancer, birth defects, and damage to the brain and nervous system. Other TACs are emitted from various other combustion and industrial processes. Studies indicate that PM concentrations in most urban areas are generally attributed to vehicle traffic, and PM concentrations diminish with distance, particularly beyond 1,000 feet (ARB 2005). With respect to fireworks, studies have found that fireworks display events can result in atmospheric particulate matter and associated species, such as certain heavy metals and other particles, which includes both light and heavy metals, elemental and organic carbon, and perchlorate compounds. The County has adopted incremental cancer and hazard thresholds to evaluate receptor exposure to DPM emissions, which are adapted from SDAPCD Regulation XII, Rule 1200. Projects that would result in exposure to TACs resulting in a maximum incremental cancer risk (MICR) greater than 1 in 1 million without application of Toxics best available control technology (BACT),⁵ MICR greater than 10 in 1 million with application of Toxics BACT, or a chronic and acute non-cancer health hazard index greater than 1 would be deemed as having a potentially significant impact related to health risks from DPM exposure. Because various Toxics BACTs are in place at the District—including ARB rules on vessels, shore power, and drayage trucks—the MICR of 10 in 1 million is utilized herein.

Criteria for Cumulative Impacts

Potential cumulative air quality impacts would result when cumulative projects' pollutant emissions would combine to degrade air quality conditions to below acceptable levels. This could occur on a local level, such as through increases in vehicle emissions at congested intersections, or at sensitive receptor locations due to concurrent construction activities; at a regional level, such as the potential impact of multiple past, present, and reasonably foreseeable projects on O₃ within the SDAB; or globally, such as the potential impact of GHG emissions on global climate change.

⁵ BACT is the level of air contaminant emission control or reduction required by state law and District rules for new, modified, relocated, and replacement emission sources. Examples of Toxics BACT include diesel particulate filters, catalytic converters, and selective catalytic reduction technology.

Neither the District, nor the cities of San Diego, Coronado, National City, Chula Vista, or Imperial Beach, nor SDAPCD has established quantitative thresholds to determine whether a project would have a cumulatively considerable contribution to air quality. The County of San Diego thresholds (see below), set forth by SDAPCD and SCAQMD, for cumulative air quality impacts are utilized for the analysis of the impacts of proposed project operations related to emissions on air quality. There is no construction required for the implementation of the proposed project. As such, a construction emissions analysis is not applicable.

The following thresholds are used to determine the cumulatively considerable net increase in emissions during the operation phase:

- A project that does not conform to the RAQS or has a significant direct impact on air quality with regard to operational emissions of PM10, PM2.5, NO_x, and/or ROG_s (i.e., an exceedance of SLT values indicated in Table 4.2-9) would be considered to have a cumulatively considerable net increase.
- Projects that cause road intersections to operate at or below LOS E for intersections with total cumulative with project peak-hour trips in excess of 3,000 trips and create a CO hot-spot would create a cumulatively considerable net increase of CO. Note that because the infrequent and dispersed nature of the fireworks display events, the traffic analysis did not analyze conventional traffic impact metrics, which would include intersection and roadway LOS, both of which would allow for a CO hot-spot analysis to be performed. Instead, because the transportation assessment concentrates on the level of change in travel and parking demand during the largest fireworks display events, the discussion of traffic-related impacts analyzes the overall change in travel demand and patterns and not the localized effects at a given intersection or roadway (i.e., CO-hotspot analysis).

4.2.4.3 Project Impacts and Mitigation Measures

Threshold 1: Implementation of the proposed project would not conflict with or obstruct implementation of an applicable air quality plan.

Impact Discussion

SDAPCD is required, pursuant to the NAAQS and CAAQS, to reduce emissions of criteria pollutants for which the County and air basin are in nonattainment (i.e., O₃, PM10, and PM2.5). The most recent SDAPCD air quality attainment plans are the 2016 RAQS Revision and the 2016 O₃ attainment plan. The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O₃, while the 2016 attainment plan include SDAPCD's plans and control measures for attaining the NAAQS for O₃. The 2009 RAQS projects future emissions and determines the strategies necessary for the reduction of stationary source emissions through regulatory controls. The RAQS relies on the emission projections and control measures outlined in the SIP. ARB mobile source emission projections and SANDAG growth projections are based on population and vehicle trends and land use plans developed by the region's cities and by the County of San Diego. The 2016 O₃ attainment plan represents SDAPCD's portion of the SIP. The SIP is a comprehensive plan of previously submitted plans, programs (such as monitoring, modeling, permitting, etc.), district rules, state regulations, and federal controls that describes how each nonattainment area in the state will meet NAAQS, as described 4.2.3.3, *Local*.

The test to assess project consistency is that if the project proposes development that is consistent with the growth anticipated by the relevant land use plans that were used in the formulation of the RAQS and SIP, the project would be consistent with the RAQS and SIP. Moreover, if the project is consistent with the overarching goals (i.e., to reduce emissions and attain NAAQS and CAAQS) and strategies (i.e., measures implemented to reduce emissions), then the project would be consistent with the RAQS and SIP. The PMP is the governing land use document for physical development under the jurisdiction of the District. No other land use plan or document exists that governs physical development within California State Lands Commission jurisdiction (Collins pers. comm.).

Proposed New Fireworks Display Events

The proposed project consists of an ordinance to govern existing and proposed new fireworks display events and includes four proposed new fireworks display events along the National City and Chula Vista Bayfronts. The proposed project does not propose any land or water use changes or any permanent structures to be erected. As shown in Table 4.2-10 below, fireworks display events result in minimal emissions of ozone precursors (VOC and NO_x) from the fireworks themselves. Moreover, emissions from the existing tug activity are already accounted for in the RAQS, SIP, Regional Transportation Plan, and the District's maritime inventory, and new tug activity would be minimal and limited to the four new fireworks display events throughout the year. No changes in land or water uses would occur as a result of the proposed project. The proposed project would not result in land or water use designations that would be incompatible with existing onsite PMP land or water use designations or with existing uses within California State Lands Commission jurisdiction, nor would it result in unanticipated growth. As described in Section 4.7, *Land Use and Planning*, the project would be consistent with the PMP and the Coastal Act, and would not conflict with applicable conservation plans within the Bay.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance requires fireworks display events to comply with all applicable laws and regulations and would not result in any change to the existing conditions in relation to applicable air quality plans. As such, the effects of the proposed ordinance on existing fireworks display events would not conflict with or obstruct implementation of an applicable air quality plan. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would not conflict with or obstruct implementation of an applicable air quality plan. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not conflict with or obstruct implementation of an applicable air quality plan. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance After Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impact would occur.

Threshold 2: Implementation of the proposed project would violate an air quality standard or contribute substantially to an existing or projected air quality standard.

Impact Discussion

The proposed new fireworks displays events would result in criteria pollutant and air toxic emissions from sources that are directly or indirectly related to the fireworks display events (including fireworks detonation, tug and barge activity, and material deliveries), and indirectly related to visitation, including potential changes in motor vehicle travel as discussed below. Therefore, the proposed project has the potential to create air quality impacts by violating an air quality standard or contributing substantially to an existing or projected air quality violation.

For the purposes of this analysis, this impact discussion considers circumstances in which the proposed project would result in impacts on air quality on a regional scale. This discussion focuses on all pollutants and whether project emissions would exceed the regional thresholds shown in Table 4.2-9. These thresholds are used to assess the sum of all project-related criteria pollutant emissions that occur at either the daily or annual time scale, regardless of where these activities occur within the SDAB. For example, even though emissions from fireworks and tugs would occur within San Diego Bay and emissions from fireworks deliveries would occur throughout the entire delivery route, their collective emissions are summed and compared to the regional thresholds shown in Table 4.2-9. This discussion is to ensure that new emissions would not slow regional progress toward attaining the air quality standards. The analysis concentrating on the localized effects of project-related emissions is contained within Threshold 4 below. A detailed description of these thresholds is described above under *Regional Thresholds for SDAB Attainment of State and Federal Ambient Air Quality Standards*.

The environmental setting in the project area includes a number of existing fireworks display events that require a discretionary action by the District or are operated by the District's tenants and occur year-round. The greatest number of these fireworks display events occur in the summer months

from July to September. These fireworks displays events result in criteria pollutant emissions from sources that are directly or indirectly related to the displays, including fireworks detonation, tug and barge activity, and material deliveries, and indirectly related to visitor motor vehicle travel. A description of each of these sources and associated emissions modeling are provided in Section 4.2.4.1. Criteria pollutant emissions associated with existing activity at the daily time scale (pounds per day) are presented in Table 4.2-10 and criteria pollutant emissions associated with existing activity at the annual time scale (tons per year) are presented in Table 4.2-11. As discussed above, potential impacts associated with the four proposed new fireworks display events per year were determined by scaling emissions from the Big Bay Boom event by the amount of fireworks for each proposed new display.

As shown in Table 4.2-10, emissions associated with existing Fourth of July fireworks display events exceed San Diego County's daily SLTs for SO_x, PM₁₀, and PM_{2.5} but emissions associated with existing non-Fourth of July fireworks display events are below daily San Diego County's SLTs for all pollutants.

As shown in Table 4.2-11, emissions associated with all existing fireworks display events throughout the year result in emissions far below annual San Diego County's SLTs for all pollutants. While fireworks display events are intense and can result in short-term impacts on air quality on fireworks display event days, the displays themselves are infrequent and temporary, and only the largest displays, specifically those on the Fourth of July, currently result in adverse, short-term impacts on air quality. Over the course of the year, long-term effects from these fireworks display events result in emissions far below annual thresholds.

Moreover, as discussed in Section 4.2.4.1, an analysis of regional traffic patterns cannot be accurately calculated for the fireworks display events. However, it is unlikely that vehicle traffic related to the largest fireworks display events results in emissions that would exceed the fireworks themselves and it is unlikely that these emissions would contribute substantially to an existing or projected air quality standard. In order to demonstrate the minimal air quality effects visitor-related vehicle traffic has on event days, the analysis herein provides a qualitative evaluation of hourly background monitoring on both event and non-event days. The proposed new National City and Chula Vista fireworks display events are assumed to be similar in terms of size to the existing Fourth of July Imperial Beach event. Therefore, traffic conditions associated with the Fourth of July Imperial Beach event would provide the most appropriate comparison to the proposed new fireworks display events. However, there is no air monitoring station in Imperial Beach; the closest monitoring station is the Chula Vista monitoring station, which is approximately 5.5 miles from the Fourth of July Imperial Beach event. Given this distance, it stands to reason that any emissions from visitor-related vehicle traffic for the Imperial Beach event is not captured by the Chula Vista monitoring station on event days, as visitors to the event are unlikely to drive in proximity to the Chula Vista station. Therefore, the Fourth of July Imperial Beach event cannot be used to provide a comparison to the proposed new events.

However, another large event, the Big Bay Boom, has viewing areas that are close to the San Diego-Beardsley Street (Barrio Logan) station that can be used to qualitatively evaluate the air quality effects of visitor traffic during the Big Bay Boom. The effects of the Big Bay Boom can then be used to estimate the air quality effects of visitor traffic associated with other shows, such as the proposed new fireworks display events. Given the proximity of the Beardsley Street station to the Big Bay Boom event, monitoring data from the Beardsley Street station on event days likely capture

emissions from visitor-related vehicle traffic. Therefore, using Beardsley Street station during the Big Bay Boom as a comparison (as discussed in Section 4.2.4.1) to background air monitoring data both before and after the events is discussed here. Hourly PM_{2.5} concentrations for July 4, 2015 were obtained from SDAPCD's Beardsley Street (Barrio Logan) station. Those data show that the peak hour PM_{2.5} concentration coincided with the Big Bay Boom event, during the 9 p.m.–10 p.m. hour. That PM_{2.5} concentration was 25.8 µg/m³, dropping to 6.1 µg/m³ the following hour (10 p.m.–11 p.m.), and averaging 5.8 µg/m³ for the 24-hour period. Data from 2013 and 2014 and the 3-year average are also shown in Table 4.2-12. This trend is consistent with other studies that found that while particulate concentrations peaked during and immediately after fireworks display events, concentrations typically decline to background levels within a day (Tian et al. 2014). In this case, concentrations declined to background levels 2 hours after the fireworks display event (4.9 µg/m³) on this day in 2015. PM_{2.5} concentrations on this holiday are most likely dominated by mobile source exhaust and road dust sources. For comparison, as shown in Table 4.2-12, for the “control days” (2 days before and 2 days after the Fourth of July), the background average was 5.5 µg/m³ for the 24-hour period. Thus, concentrations on the display day, which include the fireworks display event, were only slightly higher over the 24-hour period on these control days. As such, because background on the display day is lower than the weekday control day, vehicular traffic on the display day is likely lower than a typical day and is therefore unlikely to violate an air quality standard or contribute substantially to an existing or projected air quality standard.

Fourth of July Fireworks Display Events

Fourth of July National City Bayfront Fireworks Display Event

For purposes of this analysis, the Fourth of July National City Bayfront Fireworks Display Event is anticipated to be an approximately 456-pound display that takes place on one barge placed off the National City Bayfront. As shown in Table 4.2-13, daily criteria pollutant emissions from the National City Bayfront fireworks display event by itself would not exceed thresholds. As shown in Table 4.2-14, annual criteria pollutant emissions from the National City Bayfront fireworks display event by itself would not exceed thresholds.

Fourth of July Chula Vista Bayfront Fireworks Display Event

For purposes of this analysis, the Fourth of July Chula Vista Bayfront Fireworks Display Event is anticipated to be an approximately 456-pound display that takes place on one barge placed off the Chula Vista Bayfront. As shown in Table 4.2-13, daily criteria pollutant emissions from the Chula Vista Bayfront fireworks display event by itself would not exceed thresholds. As shown in Table 4.2-14, annual criteria pollutant emissions from the Chula Vista Bayfront fireworks display event by itself would not exceed thresholds.

However, as shown in Table 4.2-13, emissions during the combined new Fourth of July National City and Chula Vista Bayfront displays would exceed relevant San Diego County's SLTs for PM_{2.5}. Therefore, the proposed project would violate an air quality standard or contribute substantially to an existing or projected air quality violation during the combined Fourth of July fireworks display events (**Impact AQ-1**), and mitigation is required.

Based on the information above, it is assumed that the level of emissions stemming directly from the fireworks display events themselves is directly correlated with the pounds per event. Therefore, limiting the combined number of pounds would act to reduce emissions. In this instance, the

combined PM2.5 emissions during the combined new fireworks display events are approximately 3 pounds, or 6 percent, above the thresholds of 55 pounds per day. Therefore, reducing the total pounds for these events from 912 pounds (456 pounds [x] two fireworks display events) to approximately 800 pounds (400 pounds [x] two fireworks display events) would reduce PM2.5 emissions during the combined new fireworks display events to a level below significance.

Other Non-Fourth of July Fireworks Display Events

It is anticipated that Chula Vista Bayfront would host two non-Fourth of July fireworks display events throughout the year. It is assumed that these displays would be 3 to 10 minutes in length. For purposes of analysis, it is assumed that each would be a 114-pound fireworks display event that takes place on one barge placed off the Chula Vista Bayfront. As shown in Table 4.2-13, criteria pollutant emissions from the non-Fourth of July Chula Vista Bayfront display would not exceed thresholds.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance includes several conditions pertaining to limiting emissions related to air quality. The proposed ordinance limits delivery truck idling to 3 minutes and encourages the use of alternative fireworks produced with pyrotechnic formulas that replace perchlorate with other oxidizers and propellants that burn cleaner and produce less smoke. Furthermore, the proposed ordinance requires a reduction in the total amount of copper allowed in fireworks used for the Big Bay Boom event. The conditions of the proposed ordinance would ensure that emissions from existing fireworks display events are effectively reduced. As such, compliance with the proposed ordinance would improve existing conditions. Therefore, the effect of the proposed ordinance on existing fireworks display events would not violate an air quality standard or contribute substantially to an existing or projected air quality standard. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

Implementation of the proposed new fireworks display events would violate an air quality standard or contribute substantially to an existing or projected air quality violation during the Fourth of July fireworks display events (**Impact-AQ-1**). Potentially significant impact(s) include:

Impact-AQ-1: Emissions in Excess of PM2.5 Thresholds During Combined National City Bayfront and Chula Vista Bayfront Fourth of July Fireworks Display Events. Project emissions generated when the new National City Bayfront and Chula Vista Bayfront Fourth of July fireworks display events occur at the same time, before mitigation, would exceed the daily San Diego County SLTs for PM2.5. The contribution of project-related emissions is considered significant because the project emissions would exceed the daily threshold that has been set by SDAPCD to attain the PM2.5 NAAQS and CAAQS.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not violate an air quality standard or contribute substantially to an existing or projected air quality violation. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

MM-AQ-1: Limit the Size of Overlapping New Fireworks Display Events with Compliance with the Conditions of the Proposed Ordinance. The fireworks organizer and operator are required to comply with the following air quality-related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(c) Size of Fireworks Display Events.

D. National City Fourth of July, not to exceed 400 pounds of fireworks

E. Chula Vista Fourth of July, not to exceed 400 pounds of fireworks

MM-AQ-2: Implementation of Air Quality-Related Conditions of the Proposed Ordinance.

The fireworks organizer and operator are required to comply with the following air quality-related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(f) Best Management Practices. Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:

1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.

(d) Fireworks Chemical Composition and Packaging.

1. Chemical Composition.
 - B. All fireworks display events shall use alternative fireworks produced with pyrotechnic formulas which replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke and reduce pollutant waste loading to surface waters, unless the Applicant establishes in writing and to the satisfaction of the Executive Director that such alternative fireworks are not commercially available.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

The implementation of mitigation measure **MM-AQ-1** would require the limitation of the size of National City and Chula Vista Fourth of July fireworks display events to 400 pounds each, which will ensure that if the events overlapped the total pounds would not exceed 800 pounds. Therefore, when the new National City Bayfront and Chula Vista Bayfront Fourth of July fireworks display events occur at the same time they would not exceed the daily San Diego County SLTs for PM_{2.5}. Impacts would be reduced to a less-than-significant level.

Furthermore, the proposed ordinance contains several conditions of approval intended to limit impacts on air quality. Therefore, implementation of mitigation measure **MM-AQ-2** requires compliance with air quality-related conditions, such as limiting delivery truck idling to 3 minutes and shutting down trucks when not in use, and encourages the use of alternative fireworks produced with pyrotechnic formulas that replace perchlorate with other oxidizers and propellants that burn cleaner and produce less smoke. These conditions of the ordinance would provide some reduction in emissions. The exact amount of emissions reduction provided by these conditions cannot be quantified due to many variables (precise existing and future idling times, etc.) but the reductions would be modest and would further reduce the less-than-significant impact after the implementation of mitigation measure **MM-AQ-1**.

Note: Totals may not add exactly due to rounding.						

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 3: Implementation of the proposed project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.

Impact Discussion

Proposed New Fireworks Display Events

The SDAB is currently in nonattainment for O₃ under NAAQS and for O₃, PM10, and PM2.5 under CAAQS, as a result of past and present projects, and will be further impeded by reasonably foreseeable future projects (see Chapter 5, *Cumulative Impacts*). As discussed above and shown in Tables 4.2-13 and 4.2-14, new Fourth of July fireworks display events associated with the proposed project would result in criteria pollutant emissions above thresholds for PM2.5 during the combined new Fourth of July fireworks display events, but would be below thresholds for all other criteria pollutants and precursors thereof (**Impact AQ-1**). Also, criteria pollutant emissions for the other proposed new non-Fourth of July fireworks display events would be below thresholds for all nonattainment criteria pollutants and precursors regardless if both non-Fourth of July fireworks display events were to occur on the same day or on separate days.

The related fireworks display events, development projects, and temporary special events identified by the District that would occur within vicinity of San Diego Bay and the Imperial Beach Oceanfront are presented in Tables 5-1 and 5-2 of this EIR. The District has identified 53 related fireworks

display events that took place in 2015.⁶ These fireworks display events are the most relevant from a cumulative perspective in that they could potentially result in impacts similar to those of the proposed project (e.g., short-term CAAQS and acute impacts), particularly for those displays that occur on the Fourth of July. Operation of one or more of these fireworks display events could potentially overlap with some fireworks display events that are part of the proposed project on both Fourth of July and non-Fourth of July fireworks display event days. The related cumulative fireworks display events range in length from 2 to 45 minutes, while the 45-minute (1,200-pound) event off Embarcadero Marina Park South was a special event that did not occur on the Fourth of July and is not expected to occur on an ongoing basis. Each cumulative fireworks display event is anticipated to be much smaller than the Big Bay Boom, and while the largest cumulative fireworks display events (e.g., the 1,200-pound event off Embarcadero Marina Park South) may exceed some threshold levels (e.g., PM10 and PM2.5), emissions from all other cumulative events are assumed to be far below threshold levels for all pollutants and precursors. However, because the project's new Fourth of July fireworks display events would result in emissions that exceed threshold levels for nonattainment pollutants (PM2.5), and cumulative fireworks display events exceed threshold levels and ambient air quality standards for a nonattainment pollutant (PM2.5), the project would result in a cumulatively considerable net increase of a criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (PM2.5) (**Impact AQ-2**).

The other proposed new non-Fourth of July fireworks display events would be below thresholds for all nonattainment criteria pollutants and precursors regardless if both non-Fourth of July fireworks display events were to occur on the same day or on separate days. Therefore, the proposed non-Fourth of July events would not result in a cumulatively considerable net increase of any criteria pollutant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance includes several conditions intended to reduce adverse impacts on air quality. The proposed ordinance limits delivery truck idling to 3 minutes and encourages the use of alternative fireworks produced with pyrotechnic formulas that replace perchlorate with other oxidizers and propellants that burn cleaner and produce less smoke. Furthermore, the proposed ordinance requires a reduction in the total amount of copper allowed in fireworks used for the Big Bay Boom event. The conditions of the proposed ordinance would ensure that emissions from existing fireworks display events are effectively reduced. As such, compliance with the proposed ordinance would improve the existing condition. Therefore, the effect of the proposed ordinance on existing fireworks display events would not result in a cumulatively considerable net increase of a criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard. No significant adverse impacts would occur.

⁶ One barge-based fireworks display event associated with the Loew's Coronado Resort occurred in 2014. There were no events reported for 2015. However, this display was included because Loew's Coronado Resort historically has had fireworks display events in the past.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

Implementation of the proposed new fireworks display events would result in a cumulatively considerable net increase of PM_{2.5}, which is a nonattainment pollutant (**Impact-AQ-2**). Potentially significant impact(s) include:

Impact-AQ-2: Cumulative Emissions in Excess of PM_{2.5} Thresholds During Combined Fourth of July Fireworks Display Events. Project emissions during new Fourth of July fireworks display events, before mitigation, would exceed the threshold for PM_{2.5} and, when combined with other nearby past, present, and probable future projects, may result in a cumulatively considerable net increase of a criteria pollutant for which the region is in nonattainment under an applicable state ambient air quality standard. The contribution of project-related emissions is considered significant because the proposed project would exceed thresholds that have been set by SDAPCD to attain the CAAQS during Fourth of July fireworks display events.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effect of the proposed ordinance on existing fireworks display events would not result in a cumulatively considerable net increase in a nonattainment pollutant. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

Implement **MM-AQ-1** and **MM-AQ-2** as described under Threshold 2.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Impact-AQ-2 would be reduced to a level below significance after implementation of **MM-AQ-1** because mitigation would ensure that fireworks display event sizes would be limited to a level that would ensure the project-related PM_{2.5} emissions would be below thresholds. As shown in Table 4.2-15, after mitigation, the proposed project would not result in a cumulatively considerable net increase of a criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard due to project-related PM_{2.5} emissions. As such, impacts would be reduced to a less-than-significant level.

Implementation of mitigation measure **MM-AQ-2** requires compliance with air quality-related conditions, such as limiting delivery truck idling to 3 minutes and shutting down trucks when not in use, and encourages the use of alternative fireworks produced with pyrotechnic formulas that replace perchlorate with other oxidizers and propellants that burn cleaner and produce less smoke.

These conditions of the ordinance would provide some reduction in emissions. The exact amount of emissions reduction provided by these conditions cannot be quantified due to many variables (precise existing and future idling times, etc.) but the reductions would be modest and would further reduce the less-than-significant impact after the implementation of mitigation measure **MM-AQ-1**.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 4: Implementation of the proposed project would not expose sensitive receptors to substantial pollutant concentrations.

Impact Discussion

For the purposes of this analysis, this impact discussion considers circumstances in which the proposed project would result in impacts on air quality on a localized scale. This discussion focuses on pollutants of localized concern and whether the project would result in pollutant concentrations near project activities that exceed relevant pollution standards and/or whether pollutant concentrations would expose sensitive receptors to adverse health effects. Relevant state and federal pollutant standards are shown in Table 4.2-7. More simply, this discussion focuses on where geographically the emissions analyzed under Threshold 2 end up, and whether those emissions would create acute (short-term) or chronic (long-term) health effects at receptor locations. Acute (short-term) or chronic (long-term) health effects are discussed above under *Localized Toxic Air Contaminant Concentrations* in Section 4.2.4.2.

Toxic Air Contaminants

Proposed New Fireworks Display Events

The proposed new fireworks displays events would result in air toxic emissions from sources that are directly or indirectly related to the fireworks display events, particularly from fireworks detonation.

An HRA was performed to analyze the short-term (acute) health effects of the proposed new fireworks display events. The analysis is based on the Big Bay Boom, which was used as a comparison for all of the proposed new fireworks display events because the Big Bay Boom is by far the largest and most visited of the fireworks display events. The methodology used in the HRA was based on a literature review. The key toxic pollutants of most concern have acute health effects, the most prominent of which is Cu. Given the short-term and infrequent nature of the proposed fireworks display events, this analysis focuses solely on the short-term (acute) exposure and does not focus on the long-term (chronic) effects of the fireworks display events.

Acute exposures from all key toxic pollutants were considered to derive acute exposure assessment for the maximum exposed individual (MEI) receptor. Table 4.2-16 presents 1-hour air toxic pollutant concentrations and 1-hour acute hazard at the MEI associated with the 2015 Big Bay Boom event. As shown, the Big Bay Boom event currently results in acute risk in excess of the acute hazard threshold. Only elemental Cu along the respiratory pathway shows that a modeled concentration

exceeds the acute hazard index threshold of 1.0. None of the acute 1-hour concentration levels exceed the 1-hour CAAQS.

Fourth of July National City Bayfront Fireworks Display Event

The Fourth of July National City Bayfront fireworks display event would be a new approximately 456-pound display that would take place on one barge placed off the National City Bayfront. The risk levels shown in Table 4.2-16 provide a basis for estimating the anticipated emissions from the proposed project. As such, this 456-pound display is approximately 8.5 percent the size of the 2015 Big Bay Boom event. Assuming that concentrations of air toxics are scaled linearly by the size of the event, acute risk associated with the Fourth of July National City Bayfront fireworks display event would be far below the acute hazard threshold of 1.0 (1.4 acute risk for Big Bay Boom (x) 8.5 percent = 0.12 HI). Therefore, the Fourth of July National City Bayfront fireworks display event would not result in an acute risk at nearby receptors. The anticipated location for the Fourth of July National City Bayfront Fireworks Display Event is approximately 2.0 miles from the anticipated barge location associated with the proposed new Chula Vista fireworks display event along the Chula Vista Bayfront. In the event that the Fourth of July National City Bayfront fireworks display event and Chula Vista fireworks display event occurred concurrently at the same time, the events are far enough apart that a single receptor would not be exposed to emissions from both shows. Therefore, the proposed new Fourth of July fireworks display event at National City Bayfront would not expose sensitive receptors to substantial pollutant concentrations, including TACs. Impacts would be less than significant.

Fourth of July Chula Vista Bayfront Fireworks Display Event

Similar to the National City fireworks display event, the Fourth of July Chula Vista Bayfront fireworks display event would be a new 456-pound display that would take place on one barge placed off the Chula Vista Bayfront. Risk levels from this display would be similar that of the National City Fourth of July fireworks display event. Also, the events would take place approximately 7.0 miles south-southeast of the most southerly barge associated with the Big Bay Boom event along the South Embarcadero. Similarly, in the event that the proposed new Chula Vista and National City fireworks display events occur concurrently at the same time, the events are far enough apart that a single receptor would not be exposed to emissions from both fireworks display events in the future. Therefore, the proposed new Fourth of July fireworks display event at the Chula Vista Bayfront would not expose sensitive receptors to substantial pollutant concentrations, including TACs. Impacts would be less than significant.

Other Non-Fourth of July Fireworks Display Events

The two Chula Vista Bayfront non-Fourth of July fireworks display events would be small (approximately 114 pounds, or 2.1 percent of the Big Bay Boom, each) and the associated risk would be both small and at a far enough distance from other existing non-Fourth of July fireworks display events that a single receptor would not be exposed to emissions from multiple displays in the event that multiple displays occur concurrently in the future. Any acute exposure would be well below the acute hazard threshold of 1.0 (1.4 acute risk for Big Bay Boom (x) 2.1 percent = 0.03 HI). Therefore, the proposed new non-Fourth of July fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, including TACs. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance includes a condition pertaining to reducing copper content in the fireworks, which would help to reduce risk associated with the Big Bay Boom. Compliance with the proposed ordinance would improve the existing condition by reducing Cu in the fireworks, which would help to reduce the acute risk associated with the Big Bay Boom. Therefore, the effect of the proposed ordinance on existing fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, such as TACs. No significant adverse impacts would occur.

Table 4.2-16. Acute 1-hour Exposure Levels in Comparison to Air Quality Standards and Hazard Index for the 2015 Big Bay Boom Fireworks Display Event

Pollutant	Maximum Modeled Concentration ($\mu\text{g}/\text{m}^3$)	1-hour CAAQS/NAAQS ($\mu\text{g}/\text{m}^3$)¹	Exceed 1-hour CAAQS/NAAQS?	Maximum Acute Hazard Index²	Exceed Acute Hazard Index?³
Copper	138	--	--	1.4	<i>Yes</i>
Sulfur Dioxide	15.2	655/196	<i>No/No</i>	0.06	<i>No</i>
Nitrogen Dioxide	0.056	339/188	<i>No/No</i>	<0.001	<i>No</i>
Carbon Monoxide	0.057	23,800/40,000	<i>No/No</i>	<0.001	<i>No</i>
Formaldehyde	0.022	--	--	<0.001	<i>No</i>
Acetaldehyde	0.062	--	--	<0.001	<i>No</i>
Acrolein	0.005	--	--	<0.003	<i>No</i>

Source: Appendix E

¹ CAAQS and NAAQS are presented in Table 4.2-7.

² OEHHA has not published acute risk factors for hexavalent chromium.

³ The acute hazard index threshold is 1.0.

Carbon Monoxide Hot-spots

Elevated CO concentrations are typically found in areas with significant traffic congestion. CO is a public health concern because it combines readily with hemoglobin and reduces the amount of oxygen transported in the bloodstream, which can result in headaches, dizziness, fatigue, unconsciousness, and even death.

Proposed New Fireworks Display Events

The County recommends an analysis of localized CO concentrations associated with traffic congestion to ensure concentrations remain below CAAQS and NAAQS based on certain screening criteria (see Section 3.1.3.1 of the HRA in Appendix E).

The transportation assessment (Appendix J) analyzed the potential travel- and parking-related changes associated with fireworks display events in and around San Diego Bay and the Imperial Beach Oceanfront as a basis for estimating whether the proposed new fireworks display events along the National City and Chula Vista Bayfronts would result in traffic- or parking-related impacts.

Because it is most similar in size to the proposed new Fourth of July fireworks display events, the analysis looked at the Fourth of July Imperial Beach Fireworks Show, finding that changes in vehicular traffic at key intersections on the fireworks display event day was moderate in most locations, with an average increase of 46 percent, but bicycle and pedestrian activity were significantly increased by 578 percent and 1,993 percent, respectively. For roadway segments, changes in traffic volumes ranged between 14 percent and 92 percent, with an average increase of 37 percent.

The roadway segment that showed the greatest percentage increase in the sample Fourth of July fireworks display event day traffic volumes relative to non-event day conditions was Seacoast Drive between Elkwood Avenue and Daisy Avenue (92 percent increase relative to non-event day conditions), while the roadway segment with the highest volumes during the sample Fourth of July fireworks display event day was the Palm Avenue segment between 7th Street and Rainbow Drive (14 percent increase relative to non-event day conditions; 16,800 event day average daily traffic). However, the intersection with the highest peak hour volumes was the Imperial Beach Boulevard and Seacoast Drive intersection, which showed 2,228 vehicles during the peak 7:00 p.m.–11:00 p.m. period on the sample Fourth of July fireworks display event day. This intersection is the worst-case intersection on the sample Fourth of July fireworks display event day in terms of peak hour traffic volumes. To provide a conservative analysis of the worst-case CO concentrations that bicyclists, pedestrians, and the general public may be exposed to while viewing the fireworks display events or while exiting the viewing areas, CO concentrations were modeled at the Imperial Beach Boulevard and Seacoast Drive intersection assuming that the traffic volumes during this 4-hour window all occur during a single hour and the receptors are in the vicinity of the intersection (e.g., on the sidewalk) during this entire duration. Emissions factors were generated in EMFAC for the San Diego County fleet average operating in 2016. Emissions were based on a conservative assumption that all vehicles travel at 5 mph. Emission factors vary by meteorological conditions, and emissions were generated for a typical summertime minimum temperature (64°F) and humidity (70 percent).

Table 4.2-17 presents the results of the CO hot-spot modeling and indicates that implementation of the proposed project would not result in violations of the state or federal 1- or 8-hour CO standards. Consequently, the impact of traffic conditions from the proposed project on ambient CO levels is considered less than significant.

Note that while the analysis above to demonstrate the minimal effects of visitor VMT could not be based on traffic conditions associated with the Fourth of July Imperial Beach Fireworks Show given the distance to the monitoring station, the CO hot-spot analysis herein can use Imperial Beach as a comparison to determine hot-spot-related impacts because effects are localized and at the intersection in question, and not regional in nature like the VMT analysis.

Table 4.2-17. Modeled CO Levels Measured at Receptors in the Vicinity of the Affected Intersection

Intersection	Peak Event Day ^a	
	1-Hr	8-Hr
Imperial Beach Boulevard and Seacoast Drive	4.4	3.1
<i>Ambient Air Quality Standards (NAAQS/CAAQS)</i>	<i>35/20</i>	<i>9/9.0</i>
<i>Exceed Threshold?</i>	<i>No</i>	<i>No</i>

Source: Appendix E

^a Background concentrations of 3.0 and 2.4 ppm were added to the modeling 1- and 8-hour results, respectively.

Fourth of July Fireworks Display Events

The proposed new Fourth of July National City and Chula Vista Bayfronts fireworks display events are anticipated to have similar traffic volumes as the Fourth of July Imperial Beach Fireworks Show discussed above due to the similar size of the proposed new displays (approximately 456 pounds each) and singular fireworks launch site. Because the worst-performing intersection during the Fourth of July Imperial Beach Fireworks Show results in CO concentrations far below NAAQS and CAAQS, CO concentrations associated with the Fourth of July National City and Chula Vista Bayfronts fireworks display events would also be far below NAAQS and CAAQS. Therefore, the proposed new Fourth of July fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, including CO. Impacts would be less than significant.

Other Non-Fourth of July Fireworks Display Events

Similarly, the two Chula Vista Bayfront non-Fourth of July fireworks display events are anticipated to have lower traffic volumes than the Fourth of July Imperial Beach Fireworks Show because the displays would be much smaller (approximately 114 pounds each) and because fewer public viewing areas are available along the Chula Vista Bayfront. Because the worst-performing intersection during the Fourth of July Imperial Beach Fireworks Show event results in CO concentrations far below NAAQS and CAAQS, CO concentrations associated with the two non-Fourth of July Chula Vista Bayfront fireworks display events would also be far below NAAQS and CAAQS. Therefore, the proposed new non-Fourth of July fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, including CO. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance includes a condition of approval requiring implementation of an Event Transportation and Parking Management Plan, which would help to improve roadway conditions by reducing congestion and would act to reduce pollutant concentrations at nearby receptor locations. Compliance with the proposed ordinance would improve the existing condition by improving roadway conditions under the Event Transportation and Parking Management Plan, which would help to reduce CO concentrations associated with the fireworks display events. Therefore, the effects of the proposed ordinance on existing fireworks display events would not expose sensitive

receptors to substantial pollutant concentrations, such as CO. No significant adverse impacts would occur.

Criteria Air Pollutants

Proposed New Fireworks Display Events

High levels of criteria pollutants are associated with some form of health risk (e.g., asthma, asphyxiation). Adverse health effects associated with criteria pollutant emissions are highly dependent on a multitude of interconnected variables (e.g., cumulative concentrations, local meteorology and atmospheric conditions, the number and character of exposed individuals [e.g., age, gender]). Moreover, ozone precursors (VOC and NO_x) affect air quality on a regional scale. Health effects related to ozone are therefore the product of emissions generated by numerous sources throughout a region. As part of the setting and updating of the NAAQS, EPA develops and considers quantitative characterizations of exposures and associated risks to human health or the environment associated, known as an HREA, with recent air quality conditions and with air quality estimated to just meet the current or alternative standard(s) under consideration (EPA 2016). The HREA estimates population exposure to and resulting mortality and morbidity health risks associated with the full range of observed pollutant concentrations, as well as incremental changes in exposures and risks associated with ambient air quality adjusted to just meeting the existing NAAQS and just meeting potential alternative NAAQS under consideration (EPA 2014). However, existing models have limited sensitivity to small changes in criteria pollutant concentrations and, as such, translating proposed project-generated criteria pollutants to specific health effects would produce meaningless results. In other words, increases in regional air pollution from project-generated VOC and NO_x would have no effect on specific human health outcomes that could be attributed to specific project emissions. However, other criteria pollutant emissions, including CO, PM₁₀, and PM_{2.5}, generally affect air quality on a localized scale. Health effects related to localized pollutants are the product of localized sources and emissions generated by numerous sources throughout a region. Certain air quality models, particularly dispersion models, have the ability to translate project-generated localized pollutants to specific health effects.

Pollutant concentrations from existing fireworks display events, particularly the Big Bay Boom, were reviewed to determine whether the proposed new fireworks display events would result in impacts related to criteria pollutants. Similar to the health risk assessment (Table 4.2-16), the Big Bay Boom was used to provide a comparison for all proposed new fireworks display events because the Big Bay Boom is by far the largest and most visited of the fireworks display events. Table 4.2-18 presents 24-hour pollutant concentrations at the MEI for pollutants that have CAAQS or NAAQS. As shown, the Big Bay Boom currently results in PM_{2.5} concentrations that exceed both the 24-hour NAAQS (35 µg/m³) and CAAQS (30 µg/m³) and PM₁₀ concentration that exceed the 24-hour PM₁₀ CAAQS (50 µg/m³). As discussed in detail in Section 3.1.3 of the HRA in Appendix E, the OBOD model appears to exhibit an over-prediction bias, but without additional data points to make a more definitive modeled-to-monitored comparison, it is difficult to draw a clear conclusion as to the model's bias.

The projected increase in PM₁₀ and PM_{2.5} emissions is short term and limited only to the largest fireworks display event day. Moreover, PM_{2.5} NAAQS and CAAQS and PM₁₀ CAAQS exceedance only occur on the Fourth of July.

Table 4.2-18. 24-hour Exposure Levels in Comparison with State and Federal Air Quality Standards for the 2015 Big Bay Boom Fireworks Display Event

Pollutant	Maximum Modeled Concentration (µg/m³)	Background Concentration (µg/m³)	Modeled plus Background Concentration (µg/m³)	24-Hour NAAQS (µg/m³)	24-hour CAAQS (µg/m³)
PM _{2.5} ¹	79.1	14.1	93.2	35	30
PM ₁₀ ²	117.0	24.5	141.5	150	50
Sulfur Dioxide ³	0.63	0.8	1.4	---	105
Lead ⁴	0.055	0.4	0.43	---	---

Source: Appendix E

¹ Background concentrations are the maximum concentration at the Beardsley Street (Barrio Logan) station for Fourth of July 2013 through 2016.

² PM₁₀ concentrations are not continuously monitored at Beardsley Street. Thus, background PM₁₀ concentrations are calculated based on the ratio of 24-hour PM_{2.5} and PM₁₀ concentrations from the Beardsley Street (Barrio Logan) station for each year shown in Table 4.2-3, and the maximum concentration over the 2013–2016 period was used (which occurred in 2013).

³ Sulfur dioxide (in ppm) was obtained from the El Cajon monitoring station and converted to µg/m³ based on the 2.619 conversion factor from EPA.

⁴ Lead concentrations are the maximum from the El Cajon and Carlsbad stations.

Bold indicates an exceedance.

Fourth of July Fireworks Display Events

The proposed new Fourth of July National City and Chula Vista Bayfronts fireworks display events would be smaller than the Big Bay Boom event used as a comparison for this analysis.

Concentrations from the quantitative analysis for the Big Bay Boom were scaled for the National City and Chula Vista Bayfronts fireworks display events and are compared to the CAAQS and NAAQS in Table 4.2-19. As shown, concentrations would be far below 24-hour PM₁₀ and PM_{2.5} CAAQS and NAAQS. Therefore, the proposed new Fourth of July fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, including 24-hour PM₁₀ and PM_{2.5}. Impacts would be less than significant.

Table 4.2-19. 24-hour Exposure Levels in Comparison with State and Federal Air Quality Standards for the National City and Chula Vista Bayfront Fourth of July Fireworks Display Events

Pollutant	Maximum Modeled Concentration (µg/m³)	Background Concentration (µg/m³)	Modeled plus Background Concentration (µg/m³)	24-Hour NAAQS (µg/m³)	24-hour CAAQS (µg/m³)
PM2.5 ¹	6.8	14.1	20.9	35	30
PM10 ²	10.0	24.5	34.5	150	50
Sulfur Dioxide ³	0.1	0.8	0.8	---	105
Lead ⁴	0.005	0.4	0.4	---	---

Source: Appendix E

¹ Background concentrations are the maximum concentration at the Beardsley Street (Barrio Logan) station for Fourth of July 2013 through 2016.

² PM10 concentrations are not continuously monitored at Beardsley Street. Thus, background PM10 concentrations are calculated based on the ratio of 24-hour PM2.5 and PM10 concentrations from the Beardsley Street (Barrio Logan) station for each year shown in Table 4.2-3, and the maximum concentration over the 2013–2016 period was used (which occurred in 2013).

³ Sulfur Dioxide (in ppm) was obtained from the El Cajon monitoring station and converted to µg/m³ based on the 2.619 conversion factor from EPA.

⁴ Lead concentrations are the maximum from the El Cajon and Carlsbad stations.

Bold indicates an exceedance.

The proposed project would not significantly increase emissions of ozone precursors (VOC and NO_x), as fireworks-related emissions mainly include particulate matter, and fuel-related emissions from the tugs would be minimal. Regardless, project-generated ozone precursors could increase photochemical reactions and the formation of tropospheric ozone, which, at certain concentrations, could lead to respiratory symptoms (e.g., coughing), decreased lung function, and inflammation of airways. Although these health effects are associated with ozone, the impacts are a result of cumulative and regional VOC and NO_x emissions. However, the incremental contribution of the project to specific health outcomes related to criteria pollutant emissions would be limited and any effects thereof would be below any health-based significance threshold (e.g., NAAQS and CAAQS). Furthermore, while the incremental contribution could not be traced solely to the proposed project, the contribution of emissions attributable to the proposed project is considered less than significant after mitigation because the proposed project would result in emissions below thresholds that have been set by SDAPCD, which are designed to provide public health protection. The proposed project's contribution of emissions, including PM2.5, would be less than significant and operation of the proposed project would not result in adverse health effects associated with criteria pollutant emissions.

Other Non-Fourth of July Fireworks Display Events

The two non-Fourth of July Chula Vista Bayfront fireworks display events would be smaller than the Fourth of July fireworks display events modeled in Table 4.2-19 above (approximately 114 pounds each compared to approximately 456 pounds each); therefore, PM2.5 and PM10 concentrations would be less than those shown in Table 4.2-19 and far below PM10 and PM2.5 CAAQS and NAAQS. As such, the proposed new non-Fourth of July fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, including 24-hour PM10 and PM2.5. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance includes conditions intended to reduce adverse impacts on air quality. The proposed ordinance would require all fireworks display events to use alternative fireworks technologies that replace perchlorate with other oxidizers and propellants that burn cleaner, produce less smoke, and reduce pollutant waste loading, which would reduce PM10 and PM2.5 emissions. However, the feasibility and availability of these alternative fireworks is not yet known. As such, compliance with the proposed ordinance could improve the existing condition by ensuring that all fireworks display events implement the latest and greatest technologies. Therefore, the effects of the proposed ordinance on existing fireworks display events would not expose sensitive receptors to substantial pollutant concentrations, such as PM10 and PM2.5. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation**Proposed New Fireworks Display Events**

The proposed new fireworks display events would not expose sensitive receptors to substantial pollutant concentrations. Therefore, impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not expose sensitive receptors to substantial pollutant concentrations. Therefore, no significant adverse impacts would occur.

Mitigation Measures**Proposed New Fireworks Display Events**

No mitigation is required.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation**Proposed New Fireworks Display Events**

Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 5: Implementation of the proposed project would not create objectionable odors affecting a substantial number of people.**Impact Discussion****Proposed New Fireworks Display Events**

Although offensive odors rarely cause any physical harm, they can be unpleasant and lead to considerable distress among the public. This distress may often generate citizen complaints to local governments and air districts. Any project with the potential to expose the public to objectionable odors would be deemed as having a significant impact.

According to ARB's *Air Quality and Land Use Handbook*, land uses associated with odor complaints typically include sewage treatment plants, landfills, recycling facilities, and manufacturing (ARB 2005a). Odor impacts on residential areas and other sensitive receptors, such as hospitals, daycare centers, and schools, warrant the closest scrutiny, but consideration should also be given to other land uses where people may congregate, such as recreational facilities, work sites, and commercial areas.

Odor emitters include diesel exhaust from tug and barge activity, material deliveries, and any fumes generated during the fireworks themselves. However, odor impacts are limited to the vicinity immediately adjacent to tug activity, which is assumed to be a great enough distance from viewing locations not to result in objectionable odors that would affect a substantial number of people. Any odors would be infrequent and brief, and viewers of the proposed new fireworks display events would likely expect to experience these temporary odors. Thus, odor-related impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance does not include conditions pertaining to odor sources, and therefore would not result in any change to the existing condition in terms of odors. As such, the effects of the proposed ordinance on existing fireworks display events would not create objectionable odors affecting a substantial number of people. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation**Proposed New Fireworks Display Events**

The proposed new fireworks display events would not create objectionable odors affecting a substantial number of people. Impacts would be less than significant.

Section 4.3 Biological Resources

4.3.1 Overview

This section describes the existing conditions and applicable laws and regulations for biological resources, and analyzes the potential effect of the proposed project on candidate, sensitive, or special-status species, riparian habitat or other sensitive natural communities, federally protected wetlands, wildlife corridors and movement, and local policies, ordinances, and habitat conservation plans protecting biological resources.

The information contained in this section is based on the *Biological Technical Study for the San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project* prepared by Merkel & Associates (February 2017) found in Appendix F.

Table 4.3-1 summarizes the potentially significant impacts and mitigation measures discussed in detail in Section 4.3.4, *Project Impact Analysis*.

Table 4.3-1. Summary of Significant Biological Resources Impacts and Mitigation Measures

Summary of Potentially Significant Impact(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-BIO-1: Potential Direct Impact on Marine Reptiles from Fireworks-Generated Trash and Debris.	MM-BIO-1: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Direct Impacts, which require Specific Packaging Material, Best Management Practices, Compliance with San Diego Water Board General Permit, and Compliance with Other Required Permits.	Less than Significant	Implementation of these conditions of approval would ensure that fireworks-generated trash and debris are collected and disposed of, which would reduce this potential direct impact on green sea turtles to a less-than-significant level.
Impact-BIO-2: Potential Indirect Impacts on Marine Reptiles from Increased Human and Boating Human Activity.	MM-BIO-2: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Indirect Impacts, which require Cleanup, Security, Signage, and Education Measures.	Less than Significant	Implementation of the cleanup, security, signage, and education conditions of approval would reduce indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of green sea turtle habitat to less-than-significant levels.

Summary of Potentially Significant Impact(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-BIO-3: Potential Direct Impact on Avian Species from Fireworks-Generated Trash and Debris.	Implement MM-BIO-1.	Less than Significant	Implementation of these conditions of approval would ensure that fireworks-generated trash and debris are collected and disposed of, which would reduce this potential direct impact on avian species to a less-than-significant level.
Impact-BIO-4: Potential Indirect Impacts on Special-Status Avian Species from Increased Human and Boating Human Activity.	Implement MM-BIO-2.	Less than Significant	Implementation of the cleanup, security, signage, and education conditions of approval would reduce indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas to less-than-significant levels.
Impact-BIO-5: Potential Direct Impact on Sensitive Habitat and Wetlands from Fireworks-Generated Trash and Debris.	Implement MM-BIO-1.	Less than Significant	Implementation of these conditions of approval would ensure that fireworks-generated trash and debris are collected and disposed of, which would reduce this potential direct impact on sensitive habitat and wetlands to a less-than-significant level.
Impact-BIO-6: Potential Direct Impact on Eelgrass from Fireworks Barges and Tugboat Activity.	MM-BIO-3: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Eelgrass Impacts, which require Completion of Pre- and Post-Event Eelgrass Surveys, Conducting Tug Operator Training, and Controlling Thrust Rate and Angle to Minimize Propeller Wash.	Less than Significant	Implementation of this condition of approval would include requirements for fireworks barges and tugboats in the vicinity of eelgrass habitat, which would reduce this potential indirect impact to less-than-significant levels.

4.3.2 Existing Conditions

Existing fireworks display events that require a discretionary action by the District or that are operated by the District’s tenants occur within and/or adjacent to the District’s jurisdiction, particularly in and around the waters of San Diego Bay and the Pacific Ocean near Imperial Beach. Within San Diego Bay, these displays generally occur on barges, flight decks, and/or piers off of Shelter Island, Harbor Island, North Embarcadero, Central Embarcadero, South Embarcadero, within the Glorietta Bay inlet, and within the NASSCO ship repair facility. Within the Pacific Ocean, an existing fireworks display event occurs on the Imperial Beach Pier just off the coast of Imperial

Beach. The environmental setting for the entire San Diego Bay and coastal Imperial Beach has been included in the existing conditions to provide context for the following impact analysis. The impact analysis then focuses on the portions of the Bay (e.g., the south Bay) likely to be affected by the proposed new fireworks displays.

The sites for the proposed new fireworks display events are within and/or adjacent to the District's jurisdiction within San Diego Bay along the National City and Chula Vista Bayfronts. These proposed new displays are anticipated to occur on barges and/or piers within these locations. The biological impact analysis focuses on the various habitats, wildlife corridors, and wildlife present within San Diego Bay adjacent to and in the vicinity of the National City and Chula Vista Bayfront areas.

The analysis below makes use of existing biological information for San Diego Bay, including the San Diego Bay Integrated Natural Resources Management Plan (INRMP) prepared by the U.S. Navy in conjunction with the District (U.S. Navy 2013). Additionally, general information was drawn from surveys of the nearshore environment near Imperial Beach Pier, particularly from the 2011–2012 benthic habitat mapping for the U.S. Navy's Silver Strand Training Complex Boat Lanes (Merkel & Associates, Inc. 2011a, 2012), surveys performed offshore of the Imperial Beach Pier for nearshore beach nourishment (Merkel & Associates, Inc. 2011b), nearshore habitat mapping performed by San Diego Association of Governments (SANDAG 2002; Merkel & Associates, Inc. et al. 2004), studies completed for the Naval Base Coronado Naval Outlying Field in Imperial Beach (Tierra Data 2011; Merkel & Associates, Inc. 2014a), and beach monitoring performed in association with the regional beach nourishment program (Merkel & Associates, Inc. 2014b).

In addition, focused field investigations for marine mammals were conducted for this analysis during existing fireworks display events (Appendix F). Furthermore, prior observations of California least terns during existing fireworks display events in San Diego Bay and the Imperial Beach Oceanfront were used as a reference source for this analysis. Finally, a literature review was completed with a focus on effects of fireworks in coastal areas outside of the San Diego region, and the effects of pyrotechnics and loud sounds, in general, on marine resources. These additional references have been included in this analysis to supplement existing data sources for the proposed project.

4.3.2.1 Fireworks Display Events Setting

San Diego Bay Setting

San Diego Bay is a nearly enclosed, naturally formed embayment (Figure 4.3-1). The Bay was formed from the alluvial floodplains of the Otay, Sweetwater, and San Diego Rivers, and was historically shallow. The re-direction and channelization of the San Diego River beginning in the 1940s along with multiple dredging and channel-deepening projects have resulted in deep waters in the northern and central portions of the Bay (with deepest waters of 59 feet occurring at the mouth of the Bay), transitioning to shallow waters (less than 3 feet) at the southern end of the Bay (U.S. Navy 2013). The INRMP divides the Bay into multiple depth categories including: deep (> -20 feet mean lower-low water [MLLW]), moderately deep (-12 to -20 feet MLLW), shallow (-2.2 to -12 feet MLLW), and intertidal (-2.2 to +7.8 feet MLLW) (Figure 4.3-1). Currently, deep and moderately deep waters account for more than 50 percent of total Bay surface area (U.S. Navy 2013). In contrast, shallow subtidal habitat accounts for approximately 28 percent of Bay surface area, primarily in south San Diego Bay. Intertidal habitat currently accounts for only 7 percent of the Bay surface area.

The habitats of San Diego Bay are reflective of water depth and presence or absence of shoreline structures. More than 70 percent of the shoreline (45.4 miles out of a total 64.4 miles) of San Diego Bay is currently armored (U.S. Navy 2013). Armoring is primarily rock rip rap, but also includes vertical bulkhead walls, boat launch ramps, earthen dikes, and wharves. Additionally, there are over 130 acres of surface structures (e.g., piers, docks) within the Bay that currently shade intertidal and subtidal waters. The majority of the lands in the northern and central portions of the Bay are developed with a mix of commercial, recreational, and military uses.

The largest unarmored areas occur in the southern portion of the Bay. As such, the majority of undeveloped habitat also occurs in the southern portion of the Bay. Habitats in the southern portion of the Bay include southern coastal salt marsh, intertidal sand and mudflats, salt flats, and southern coastal foredune (Figure 4.3-1). The dominant vegetated subtidal habitat in San Diego Bay is eelgrass (*Zostera marina*); the most recent baywide eelgrass survey, completed in 2014, found 1,996 acres of eelgrass (Merkel & Associates, Inc. 2014c). This accounts for approximately 10.5 percent of the Bay surface area, with a majority of the total occurring in the shallow waters of the southern portion of the Bay. Salt marshes currently cover approximately 800 acres of the Bay, with a majority of this habitat composed of a network of marshes that form a non-contiguous patchwork in the south Bay (Figure 4.3-1). The marine habitats of San Diego Bay currently support several sensitive avian species, marine mammals, and reptiles. Habitats and sensitive species of San Diego Bay are described further below.

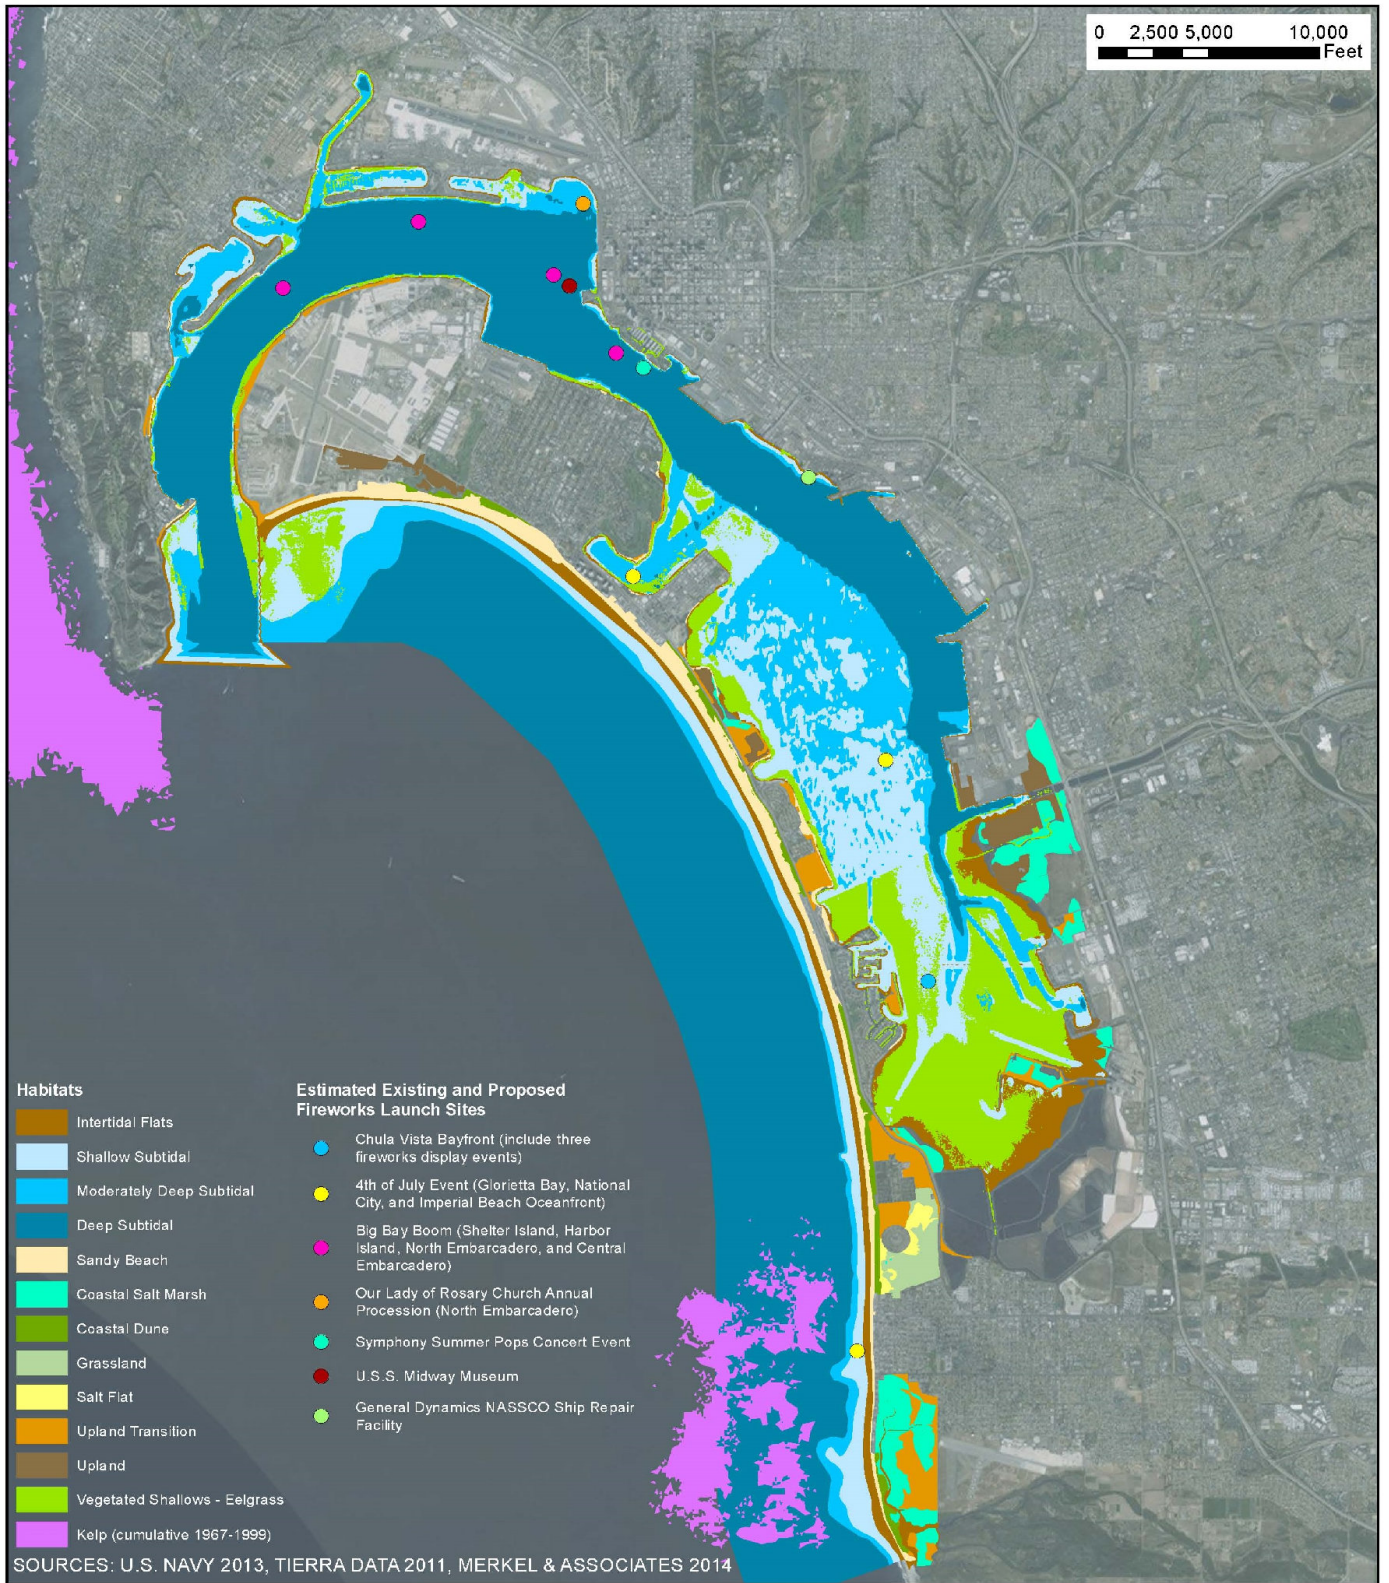

Coastal Imperial Beach Setting

The coastal Imperial Beach setting encompasses the beach and nearshore coastal waters adjacent to and surrounding Imperial Beach Pier. Within this area, the open coastal shoreline consists of a sand beach from north to south. Inland of the shoreline, approximately 0.6 mile to the north of the Pier, the uplands consist of ruderal, shrub, and grassland uplands within the U.S. Navy's Silver Strand Training Complex (Figure 4.3-1). Approximately 0.5 mile to the south of the Pier end and inland from the shore is the northern Oneonta Slough portion of the Tijuana River Estuary. This portion of the estuary is inland of a linear residential neighborhood along Seacoast Drive. The remaining environment away from the shoreline is urban developed lands. Finally, offshore of the Pier is a coastal environment supporting non-persistent kelp beds, sand, and cobble-bottom environments (Merkel & Associates, Inc. et al. 2004; Merkel & Associates, Inc. 2011b; SANDAG 2002).

4.3.2.2 Habitats

Subtidal Unvegetated Soft Bottom

The INRMP differentiates between shallow and deep subtidal habitat based on the biological values of these habitats (U.S. Navy 2013). Deep and moderately deep habitats maintain similar biological functions, while shallow habitat has the potential to support greater primary productivity and overall greater diversity of habitats and ecological communities. Within the Bay, unvegetated soft-bottom habitat consists of soft muds and silt, often overlying loose rubble along the edge of the hard shoreline revetments. Typical invertebrate species that inhabit these areas include burrowing bivalves (*Chione* spp., *Macoma nasuta*), the amphipod (*Grandidierella japonica*), bay ghost shrimp (*Neotrypaea* spp.), burrowing anemones (*Harenactis attenuata*), sabellid worms (Family Sabellidae), and tube-dwelling anemones. Other species typical of other non-vegetated areas of Southern California bays and harbors include sponges (*Phylum porifera*), nudibranchs and navanax (*Navanax*

inermis), sea hare (*Aplysia californica*), and bivalves including the invasive, nonnative Asian mussel (*Musculista senhousia*). Fish species typical of soft-bottom habitat include round stingray (*Urobatis halleri*), yellowfin goby (*Acanthogobius flavimanus*), and additional goby species (Family Gobiidae), barred sand bass and spotted sand bass (*Paralabrax nebulifer* and *Paralabrax maculatofasciatus*), specklefin midshipman (*Porichthys myriaster*), diamond turbot (*Pleuronichthys guttulatus*), and Pacific staghorn sculpin (*Leptocottus armatus*).

The majority of the nearshore environment off the Imperial Beach Pier supports unvegetated soft-bottom habitat of a principally sandy nature. Cobble beds occur near the Pier and are intermittently sanded over, unvegetated, or support poorly developed kelp canopy as described below. In addition, the soft-bottom habitat in this area supports chutes of shell hash and gravels.

Subtidal Vegetated Habitat

The vegetated, shallow subtidal habitat of San Diego Bay is dominated by eelgrass. Additionally, small amounts of widgeon grass (*Ruppia maritima*) occur in the warmer, shallow flats of south San Diego Bay. The baywide survey completed in 2014 indicated 1,996 acres of eelgrass is present within the Bay (Merkel & Associates, Inc. 2014c). Vegetated subtidal habitats are an essential component of Southern California's coastal marine environment. Eelgrass beds function as important habitat for a variety of invertebrate, fish, and avian species. For many species, eelgrass beds are an essential biological habitat component for at least a portion of their life cycles, providing resting and feeding sites along the Pacific Flyway for avian species, and nursery sites for numerous species of fish. Seagrass beds may be interspersed with red algae such as *Gracilaria verrucosa* and green algae, such as *Ulva* spp. Typical fish species associated with seagrass include pipefish (*Syngnathus* spp.), kelpfish (Family Clinidae), and surfperch (Family Embiotocidae) as well as schooling fish such as topsmelt (*Atherinops affinis*) and anchovy (*Anchoa* spp.).

Offshore of San Diego Bay, Pacific eelgrass (*Z. pacifica*) occurs near the entrance to San Diego Bay (Merkel & Associates, Inc. 2014c). To the southern end of the study area, kelp occurs intermittently on the cobble beds that are occasionally not sanded over and stable enough to support canopy kelp development. These beds are non-persistent and, over a 32-year period from 1967 to 1999, small fractions of the maximum extent of the beds had a maximum frequency of occurrence of only 19 percent of the survey years. The majority of the beds were represented less than 4 percent of the time (Merkel & Associates, Inc. et al. 2004; SANDAG 2002).

Open Water

The water column represents the largest habitat of San Diego Bay and the nearshore coastal area. This habitat is dominated by schooling fish species including topsmelt, northern anchovy (*Engraulis mordax*), and deepbody anchovy (*Anchoa compressa*). The occurrence of these species in open water is important to several species of piscivorous birds including pelicans, terns, loons, grebes, cormorants, and mergansers. These fish also provide an important forage base for numerous species of marine mammals.

Intertidal/Shallow Subtidal Riprap

As previously stated, an estimated 70 percent of the shoreline of San Diego Bay is armored, primarily with rock rip rap. The shoreline within the majority of the Bay is armored with rip rap to form a sloped revetment. Typical species observed along rip rap include native oyster (*Ostrea*

lurida), nonnative Pacific oyster (*Crassostrea gigas*), barnacles (*Balanus* spp.), mussels (*Mytilus* spp.), and tunicates such as *Styela plicata*. Tube-dwelling anemones (*Pachycerianthus* sp.) and tubed serpulid worms (Family Serpulidae) are also common. Crevices support spiny lobster (*Panulirus interruptus*). Rip rap supports a variety of algal species including *Egrecia menziesii*, *Sargassum* spp., *Ulva* spp., *Ceramium* spp., *Dictyota* spp., *Laurencia* spp., and *Enteromorpha* spp. (Davis et al. 2002). Fish species typically found along subtidal portions of rip rap are abundant and vary from the mouth of the Bay, which has more oceanic conditions, to protected marinas in the central and southern portions of the Bay. Species include opaleye (*Girella nigricans*), senioritas (*Oxyjulus californica*), garibaldi (*Hypsypops rubicundus*), rockfish (*Sebastes* spp.), spotted sand bass, and giant kelpfish (*Heterostichus rostratus*). Other structure-associated fish species likely to occur along this habitat include salema (*Xenistius californiensis*), juvenile black croaker (*Cheilotrema saturnum*), sargo (*Anisotremus davidsonii*), barred sand bass, and black surfperch (*Embiotoca jacksoni*) (U.S. Navy 2013).

Intertidal Flats

This habitat includes mudflats, sand flats, and salt flats that occur intertidally, typically along the unarmored shorelines of south San Diego Bay. Intertidal flats also occur in narrow bands along rip rap shorelines in quiescent coves and marinas of the Bay. This habitat provides an interface with open waters of the Bay, bringing tidal exchange to adjacent marshlands, and serving as outlets for stormwater runoff, nutrients, and sediment supply to the Bay. Intertidal flats are dominated by invertebrates that inhabit the sediments, providing an ample low-tide foraging area for shorebirds. As tides rise the flats become forage habitat for fish, dabbling waterfowl, and piscivorous birds. Common avian species along intertidal flats include sandpipers (*Calidris* spp.), willet (*Tringa semipalmata*), marbled godwit (*Limosa fedoa*), dowitchers (*Limnodromus* spp.), plovers (Family Charadriidae), eared grebe (*Podiceps nigricollis*), scaup (*Aythya* spp.), and surf scoter (*Melanitta perspicillata*). Fish species that forage on tidal flats during high tides include mullet (*Mugil cephalus*), California halibut (*Paralichthys californicus*), bat ray (*Myliobatis californica*), and gray smoothhound (*Mustelus californicus*).

Sandy Beach

This habitat includes coastal and bay sand beach environments that are located along narrow fringes between subtidal and supratidal habitats within areas of higher wave energy. The sand beach is best developed along the Silver Strand and Imperial Beach shoreline. The beach environments are generally heavily utilized by the public in areas that are publicly accessible and receive a much lower degree of use in areas that are found within non-recreational use Naval installations. Closed beach environments contain some southern coastal foredunes and are, in some instances, used as nesting and roosting environments for sensitive avian species and shorebirds.

Marshes

Coastal salt marsh habitat primarily occurs in south San Diego Bay and in the Tijuana Estuary as a series of noncontiguous remnants of once broader estuarine environments and restored wetlands. This fragmentation, along with channelization and redirection of rivers and creeks that historically drained into marshlands, and the threat of sea level rise, puts the remaining marshes at risk of decline. Many of the marshes in south San Diego Bay occur along unarmored shorelines, the largest of which is the E Street and Sweetwater Marsh complex south of the Sweetwater River Channel along the southeastern shoreline of the Bay within the San Diego Bay National Wildlife Refuge

(NWR). Other large marsh areas along unarmored shorelines include the D Street Fill, J Street Marsh, and Emory Cove. Finally, other marshes, including the Chula Vista Wildlife Reserve and within the South Bay Salt Ponds, have been restored and are currently protected from erosion by permeable dikes.

Marsh habitat provides important biological, water quality, and shoreline protection functions. Coastal salt marsh habitat is dominated by salt-tolerant vegetation including pickleweed (*Sarcocornia* and *Salicornia* spp.) and cordgrass (*Spartina foliosa*) that provides foraging habitat for numerous birds and nesting habitat for several sensitive avian species, particularly the federally and state-listed light-footed Ridgway's rail (*Rallus obsoletus levipes*) and the state-listed Belding's Savannah sparrow (*Passerculus sandwichensis beldingi*).

Upland Transition and Upland Areas

As mentioned previously, the majority of shoreline within San Diego Bay is armored. However, upland transition areas, particularly along unarmored shorelines, provide important foraging, roosting, and nesting habitat for birds. Among the most important upland transition areas are supratidal sand dunes and beaches adjacent to, and protected by, intertidal flats and marshes. These areas provide nesting habitat for additional sensitive avian species. Other transitional habitats adjacent to baylands include coastal scrub (maritime succulent scrub and sage scrub), created bay fills, and river mouths (where coastal salt marsh transitions to brackish, and riparian habitats). Ruderal lands supporting grasslands and saline flats are also present along the coastal strand environment. This is particularly true in the area of the Naval Outlying Field antenna array north of Imperial Beach Pier.

4.3.2.3 Wetlands and Sensitive Habitats

Wetlands, as defined by the U.S. Army Corps of Engineers (USACE), are present as coastal salt marshes, the largest of which are along the unarmored shorelines of south San Diego Bay. A small amount of freshwater and brackish marsh, as well as riparian scrub, occurs along the mouths of the creeks and rivers that enter the Bay and the wetlands of the Tijuana Estuary. The largest of the San Diego Bay wetlands include the Sweetwater River, Otay River, Chula Vista Wildlife Reserve, South San Diego Bay NWR, and Telegraph Creek. The brackish marsh and riparian scrub within the Bay and Imperial Beach Oceanfront are considered to have low functions and values based on a substantial alteration from historic conditions that has resulted from the channelization of river mouths into concrete-lined channels, and the highly urban setting through which the rivers flow to the Bay. The larger coastal salt marsh habitats represent a combination of remnants of historic wetlands and recently restored areas. This habitat is considered to have high biological, physical, and chemical functions and values. The marshes perform a high level of nutrient transformation, as rivers and creeks of the Bay drain into marsh vegetation. Coastal salt marshes within the Bay support complex biological communities and provide breeding habitat for several sensitive avian species.

Eelgrass is a rooted aquatic plant that inhabits shallow, soft-bottom habitats in quiet waters of bays and estuaries as well as sheltered coastal areas. It can form dense beds that provide substrate, food, and shelter for a variety of marine organisms. The majority of eelgrass beds in the Bay are found in water less than 20 feet deep, with light availability being the primary limiting factor for distribution and growth. Eelgrass beds are considered "special aquatic sites" under the Clean Water Act (CWA). Pursuant to the Magnuson-Stevens Fishery Conservation and Management Act, eelgrass is

designated as Essential Fish Habitat for various federally managed fish species within the Pacific Coast Groundfish and Pacific Coast Salmon Fisheries Management Plans (PFMC 2008). Eelgrass is also considered a habitat area of particular concern for various species within the Pacific Coast Groundfish Fisheries Management Plan.

4.3.2.4 Wildlife Corridors

The study area does not provide any terrestrial movement corridors, and no marine mammal, reptile, or fish migratory corridors occur within it. However, some marine fish species, such as anchovy, sardine, and topsmelt, likely move into and out of the Bay for spawning, nursery, and foraging. The southern portions of the Bay, including the South San Diego Bay Unit of the San Diego Bay NWR and South Bay Salt Ponds, provide stopover habitat for migrating waterfowl and shorebirds. San Diego Bay and the Imperial Beach shoreline, like all of California, is located within the Pacific Flyway. Several whale species migrate along the coast of California, including the California gray whale (*Eschrichtius robustus*). The peak northward migration of male gray whales occurs in mid-March, followed 2 months later by the second migration wave, which is composed of cows and calves. Whales typically do not occur within the immediate nearshore coastal waters of Imperial Beach or the adjacent Bay environment.

4.3.2.5 Candidate, Sensitive, and Special-Status Species

Special-status species are those plants or animals that have been officially listed, proposed for listing, or are candidates for listing as threatened or endangered under provisions of the Endangered Species Act (ESA) and the California Endangered Species Act (CESA), protected under the Marine Mammal Protection Act (MMPA), any animal species listed as a species of special concern or fully protected by the state, and plants listed on the California Rare Plant Ranking. Sensitive species also include those listed by local or regional jurisdictions. Species identified as protected, rare, sensitive, threatened, or endangered by the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), or California Department of Fish and Wildlife (CDFW) that are expected to be present in San Diego Bay and the Imperial Beach Oceanfront include multiple species of marine mammals, birds, and marine reptiles. The study area does not support any special-status or sensitive plant species. A list of the candidate, sensitive, and special-status wildlife species with a potential to occur within San Diego Bay and the Imperial Beach Oceanfront is provided in Table 4.3-2.

Terrestrial Wildlife

Birds

Four avian species listed by USFWS and/or CDFW as federally or state-listed as endangered or threatened have a high potential to occur within San Diego Bay and the Imperial Beach Oceanfront. These include California least tern (*Sternula antillarum brownii*), western snowy plover (*Charadrius alexandrinus nivosus*), light-footed Ridgway's rail, and Belding's Savannah sparrow.

The California least terns nests along the west coast of North America, from Baja California, Mexico, north to the San Francisco Bay area. California least terns are seasonal residents of San Diego Bay, typically arriving in mid- to late-April to nest at several colonies adjacent to San Diego Bay, and are generally present through August with September 15 marking the end of the season. California least terns can have two waves of nesting during this time period (CDFW 2016). California least terns

establish nesting colonies on sandy soils with little vegetation. Along the shores of San Diego Bay and south of the Imperial Beach Oceanfront, California least terns nest at multiple sites (Figure 4.3-2), including the runway ovals at San Diego International Airport; the airfield tarmac at Naval Air Station (NAS) North Island; on Delta and Echo Beaches at Naval Amphibious Base Coronado (NAB Coronado), which are managed by the U.S. Navy; on the D Street Fill; at the Chula Vista Wildlife Reserve; along the South Bay Salt Works levees and in Pond 11, which are managed by the District and USFWS; and along the beach of the Tijuana River National Estuarine Research Reserve south of the Imperial Beach Oceanfront. The most utilized nesting sites in 2015 were NAB Coronado (supporting between 707 and 779 nesting pairs), Tijuana River National Estuarine Research Reserve (supporting between 144 and 199 nesting pairs), the D Street Fill/Sweetwater Marsh NWR (supporting between 105 and 120 nesting pairs), and the San Diego International Airport (supporting between 8 and 18 nesting pairs) (Frost 2016). California least terns actively forage for fish in the waters adjacent to nesting colonies in San Diego Bay; foraging also occurs in open ocean waters and along the nearshore waters adjacent to beaches of Silver Strand and Imperial Beach.

The western snowy plover is a sparrow-sized, white and tan colored shorebird with dark patches on either side of the neck, behind the eyes, and on the forehead. The coastal western snowy plover population is defined as those individuals that nest adjacent to or near tidal waters and includes all nesting colonies on the mainland coast, peninsulas, offshore islands, adjacent bays, and estuaries. The breeding range of the coastal population of the western snowy plover extends along coastal beaches from the southern portion of Washington state to southern Baja California, Mexico. The recognized breeding season of the western snowy plover normally extends from March 1 through September 15. However, within San Diego Bay, USFWS reports that the core breeding season for plovers is March 1 through mid-July (Vissman pers. comm.). Western snowy plover nest along similar sandy flats and dunes as California least tern. In San Diego Bay, nesting occurs along the beach at NAS North Island, at NAB Coronado, which includes the entire beachfront north of Imperial Beach, and farther south along the Silver Strand Training Complex and the beaches of the Tijuana River National Estuarine Research Reserve. This species has not nested at the D Street Fill/Sweetwater Marsh NWR since 2000. Increasing amounts of vegetation along the shoreline have likely discouraged nesting at this location (Patton 2013).

The light-footed Ridgway's rail is a resident in coastal wetlands in Southern California and northern Baja California, Mexico. The species is threatened primarily by loss and degradation of the freshwater, brackish, and salt marsh habitat in which it breeds. The largest population of this species occurs in the Tijuana River National Estuarine Research Reserve. This location has typically supported greater than 100 breeding pairs, although estimates for the 2015 breeding season were 75 pairs (Zemba et al. 2014). Much smaller populations (fewer than five pairs) have been observed at other marsh locations in San Diego Bay including E, F&G, and J Street Marshes and the Sweetwater Marsh within the Chula Vista Bayfront region, and at the Otay River Mouth. The core breeding season for Ridgway's rails in San Diego Bay has been reported to be mid-February through mid-June and into July (Vissman pers. comm.).

Belding's Savannah sparrow ranges along the southern California coast from Santa Barbara County (Goleta Slough) in the north into Baja California, Mexico (near El Rosario) in the south. The species is unique in that it is a year-round resident of salt marshes and is reliant upon this habitat to meet all of its life cycle requirements. The species is threatened by loss and degradation of the salt marsh habitat in which it lives and breeds. In San Diego Bay, the largest population of Belding's Savannah sparrow is found at the Tijuana River National Estuarine Research Reserve (318 territories surveyed in 2015), the Sweetwater Marsh NWR (222 territories surveyed in 2015), and the south

San Diego Bay unit of the San Diego Bay NWR (158 pairs at the South Bay Salt Works and Otay River) (Zemba et al. 2015). Smaller populations are located in Paradise Marsh, F&G Street Marsh, and Chula Vista Wildlife Reserve.

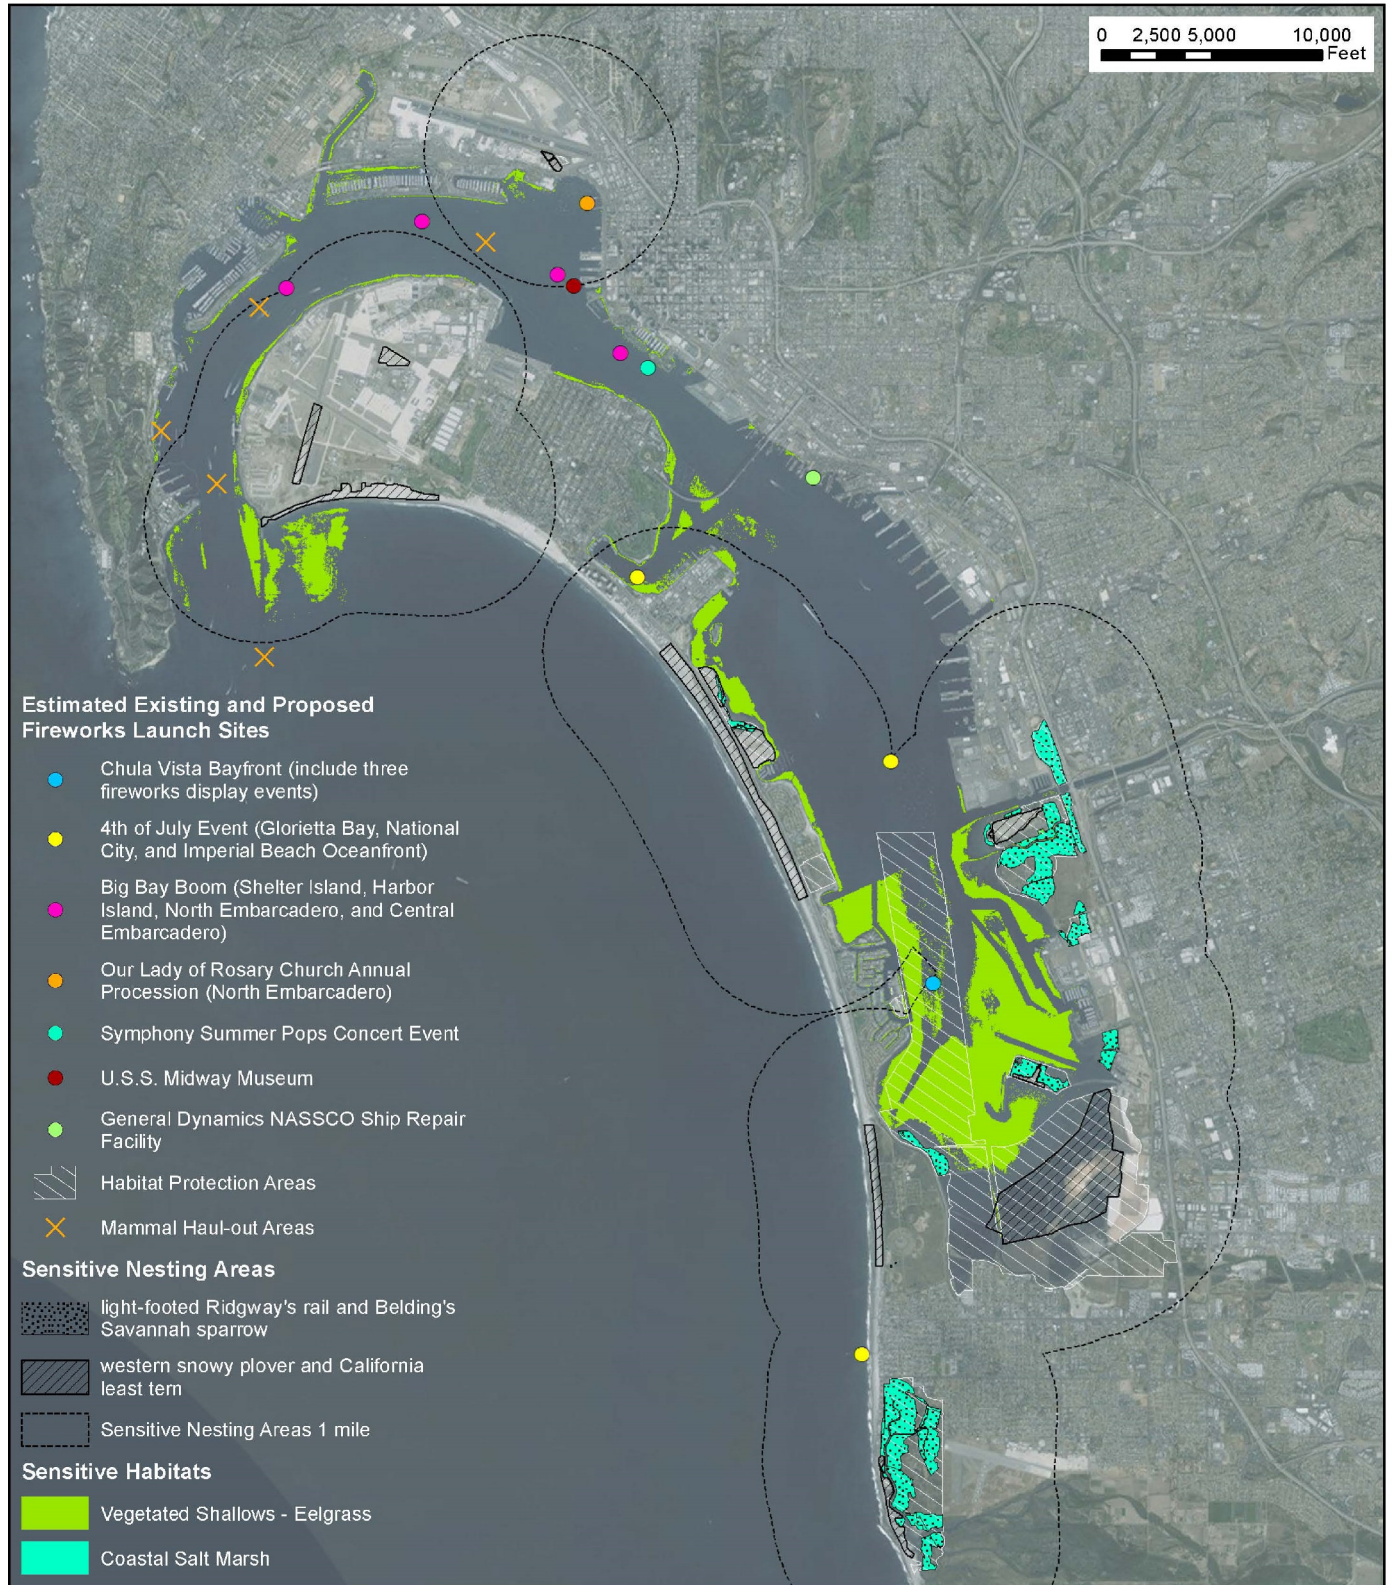

Other sensitive avian species with high potential to occur in the study area include California brown pelican (*Pelecanus occidentalis californicus*) and double-crested cormorant (*Phalacrocorax auritus*), both of which are protected at nesting colonies and at communal roosting areas. California brown pelicans roost in small groups throughout the Bay, particularly along Zuniga jetty, rip rap shorelines, and docks and piers in the northern portion of the Bay. Double-crested cormorants nest within San Diego Bay at the South Bay Salt Works. They roost and forage throughout the Bay. Other sensitive avian species known to nest on the South Bay Salt Works levees include elegant tern (*Thalasseus elegans*), Caspian tern (*Hydroprogne caspia*), and black skimmer (*Rynchops niger*) (Unitt 2004), all of which are protected at nesting colonies. These species nest on the ground in similar unvegetated sandy habitat as the California least tern. Sensitive raptors include osprey (*Pandion haliaetus*), northern harrier (*Circus cyaneus*), and American peregrine falcon (*Falco peregrinus anatum*), all of which are protected at nesting locations. Osprey is known to nest within San Diego Bay, with recent nests located at NAS North Island, the National City shoreline, and at the Chula Vista Wildlife Reserve. Northern harrier nests on the ground, within marshes and grasslands. This species has been known to nest in south San Diego Bay, within the Tijuana River National Estuarine Research Reserve and the Sweetwater Marsh NWR (Unitt 2004). Peregrine falcon has historically nested in Point Loma, on downtown San Diego buildings, and on the Coronado Bridge.

Marine Wildlife

Mammals

All marine mammals are protected under the MMPA of 1972, and some are also protected by the ESA of 1973. Marine mammal species may forage in the Bay but do not breed there (U.S. Navy 2013). Occurrences and probability of marine mammals within the Bay can be categorized into three levels, as follows (U.S. Navy 2013):

- Species known to regularly occur within San Diego Bay
 - California sea lion (*Zalophus californianus californianus*)
 - Coastal bottlenose dolphin (*Tursiops truncatus*)
- Species that are occasional to frequent visitors to San Diego Bay
 - Pacific harbor seal (*Phoca vitulina richardsi*)
 - Gray whale (*Eschrichtius robustus*)
- Species that have potential for isolated occurrences in San Diego Bay
 - Northern elephant seal (*Mirounga angustirostris*)
 - Long-beaked common dolphin (*Delphinus capensis*)
 - Pacific white-sided dolphin (*Lagenorhynchus obliquidens*)
 - Short-finned pilot whale (*Globicephala macrorhynchus*)
 - Minke whale (*Balaenoptera acutorostrata*)
 - Finback whale (*Balaenoptera physalus*)

California sea lion and, to a lesser extent, Pacific harbor seal are the two most common species of marine mammals that occur in San Diego Bay and adjacent coastal waters. Neither species breeds within San Diego Bay, but both spend time foraging and loafing in the waters of the Bay. California sea lions inhabit the entire western coast of North America from central Mexico through the Canadian coastline. The majority of the West Coast population is in the Bight because most sea lions breed at the Channel Islands (U.S. Navy 2013). California sea lions are highly sexually dimorphic. Males are larger, averaging 2.4 meters and 390 kilograms, while females only reach 2.0 meters and average 110 kilograms. Pronounced sagittal crests easily identify adult males. The coat color varies from sandy brown to dark brown. They feed on squid and a variety of schooling fish. Sea lions are frequently observed loafing on buoys, and foraging around bait barges and fishing piers (U.S. Navy 2013). California sea lions are year-round residents of San Diego Bay and are more common in the northern portion of the Bay. Individuals are rarely observed in the south Bay region, due to lack of haul out areas and minimal fishing activity (e.g., fishing piers and bait barges).

Harbor seals range from Alaska to Baja California, with a majority of the population occurring in northern waters (U.S. Navy 2013). Harbor seals prefer to loaf and forage in protected inlets and embayments. They eat multiple fish species as well as invertebrates such as octopus. The nearest breeding colony for this species is at the Children's Pool in La Jolla. While harbor seals will occasionally haul out and loaf on intertidal rip rap, they prefer to haul out on protected sandy and rocky beaches, and no large haul-out areas for this species occur in San Diego Bay. Harbor seals are less frequently encountered in San Diego Bay and nearshore waters, but they are not rare in the area. They are generally less social in the water than sea lions and are naturally less obvious or abundant in their presence. Similar to California sea lions, harbor seals are rarely observed in south San Diego Bay.

California gray whales are seasonal migrants, traveling up and down the coastline in offshore waters of the Pacific Ocean. They are the object of most of the whale watching in the area. They pass through the area twice during their yearly migrations. The peak northward migration of male gray whales occurs in mid-March, followed 2 months later by the second migration wave, which is composed of cows and calves. These whales migrate from wintering grounds in Baja California, Mexico, northward to Alaska. The southbound migration occurs in late December and January, from Alaska to Mexico. The gray whale does not breed in San Diego Bay or the immediate vicinity, and individuals enter the waters of San Diego Bay only on rare occasions. Individuals that do enter the Bay typically remain close to the entrance channel or in the northern portion of the Bay. Grey whales would not be present during the existing fireworks display events that occur during the summer months, nor do they travel to the southern portion of the Bay.

Coastal bottlenose dolphins are distributed world-wide in tropical and warm-temperate waters, including California, where separate coastal and offshore populations are known to exist (Caretta et al. 2004). California coastal bottlenose dolphins are found within about 1 kilometer of shore primarily from Point Conception south into Mexican waters. They are commonly observed traveling and foraging just outside of the surf zone along San Diego beaches. Bottlenose dolphins are regularly observed in the northern portion of San Diego Bay, particularly in the northern channels (U.S. Navy 2013). This species tends to stay within these relatively deep channels where prey is most abundant. However, bottlenose dolphins are rare visitors to southern portions of San Diego Bay. Other dolphin species, including Pacific white-sided dolphin and common dolphin, have been observed in the waters of San Diego Bay; however, these species are considered rare visitors within the Bay (U.S. Navy 2013).

Marine Reptiles

South San Diego Bay supports a population of eastern Pacific green sea turtles (*Chelonia mydas*) of between 16 and 61 individuals that primarily remain in the warm waters of south San Diego Bay, though some are known to leave the Bay to nest on the beaches of offshore islands of Mexico (Eguchi et al. 2010). Long-term acoustic tagging and satellite tracking studies by NMFS indicate that the population has historically congregated in the warm waters of the cooling water discharge channel at the now-closed South Bay Power Plant in south San Diego Bay. The shutdown of the South Bay Power Plant has made movements of turtles harder to predict. Recent tracking studies have noted turtles utilizing areas of the Bay much farther north than their historically recognized foraging areas, but are still primarily south of the Sweetwater River Channel (Bredvik et al. 2015). However, it is unlikely that green sea turtles extensively utilize the northern end of the Bay due to the cooler water temperatures relative to south San Diego Bay, a lack of eelgrass, and a paucity of alternative forage such as the red algae (*Gracilaria* sp.). Tracking data from 2016 indicate that the turtles' home range is south of the Sweetwater Channel, where they spend 95 percent of their time (District 2016). Regardless, very rare occurrences of the turtle in the north Bay cannot be ruled out given how little is known about turtle activities.

Table 4.3-2. Sensitive Wildlife Species with Potential to Occur within San Diego Bay and Imperial Beach Oceanfront

Common Name (<i>Scientific Name</i>)	Sensitivity Code & Status	Potential to Occur
Marine Reptiles		
Green Sea Turtle (<i>Chelonia mydas</i>)	FT	Low Potential
Birds		
Brant (<i>Branta bernicla</i>)	CDFW SSC	High Potential: Winters in south Bay along Chula Vista Bayfront
California Brown Pelican (<i>Pelecanus occidentalis californicus</i>)	CDFW FP	Moderate Potential: No nesting, roosts on rip rap, docks, pilings, etc.
Double-crested Cormorant (<i>Phalacrocorax auritus</i>)	CDFW WL	High Potential: Nests in South Bay Salt Works
Northern harrier (<i>Circus cyaneus</i>)	CDFW SSC	Moderate Potential: Nests in marshes in south Bay
Osprey (<i>Pandion haliaetus</i>)	CDFW WL	High Potential: Nests at NAS North Island and the Chula Vista Wildlife Reserve
American peregrine falcon (<i>Falco peregrinus anatum</i>)	CDFW FP, FWS BCC	Low Potential: May nest along Bayfront
Light-footed Ridgway's rail (<i>Rallus obsoletus levipes</i>)	CDFW FP, FWS BCC, FE, SE	High Potential: Nests in marshes of south Bay
Western snowy plover (<i>Charadrius alexandrinus nivosus</i>)	FT	High Potential: Nests on sand flats of Bay
California Least tern (<i>Sternula antillarum browni</i>)*	FE, SE	High Potential: Nests on sand flats of Bay
Caspian tern (<i>Hydroprogne caspia</i>)	FWS BCC	High Potential: Nests in South Bay Salt Works
Black skimmer (<i>Rynchops niger</i>)	CDFW SSC	High Potential: Nests in South Bay Salt Works
Elegant tern (<i>Thalasseus elegans</i>)	CDFW WL	High Potential: Nests in South Bay Salt Works
Belding's Savannah sparrow (<i>Passerculus sandwichensis beldingi</i>)	SE	High Potential: Nests in marshes of south Bay and Tijuana Estuary
Mammals		
Pacific harbor seal (<i>Phoca vitulina richardsi</i>)	MMPA	Moderate Potential: Forages in north Bay and is uncommon in the south Bay
California sea lion (<i>Zalophus californianus californianus</i>)	MMPA	High Potential: Forages and loafs in the north Bay with uncommon occurrences in the south Bay
Coastal bottlenose dolphin (<i>Tursiops truncatus</i>)	MMPA	Moderate Potential: Uncommon forager in deep channels of the north Bay
California gray whale (<i>Eschrichtius robustus</i>)	MMPA	Very Low Potential: Regular migrant in offshore waters, but uncommon in Bay and nearshore waters

Source: Appendix F

SE = state-listed as endangered; **FE** = federally listed as endangered; **FT** = federally listed as threatened; **CDFW SSC** = CDFW Species of Special Concern; **CDFW-FP** = CDFW Fully Protected Species; **CDFW-WL** = CDFW Watch List; **FWS-BCC** = USFWS Bird of Conservation Concern; **MMPA** = species protected by the Marine Mammal Protection Act

*Least terns are a migratory species found in the area from approximately April 1 through September 15 of each year.

4.3.3 Applicable Laws and Regulations

4.3.3.1 Federal

Coastal Zone Management Act of 1972

The U.S. Congress recognized the importance of meeting the challenge of continued growth in the coastal zone by passing the Coastal Zone Management Act in 1972. The act, administered by the National Oceanic and Atmospheric Administration's (NOAA) Office of Ocean and Coastal Resource Management, provides for management of the nation's coastal resources and balances economic development with environmental conservation.

The Coastal Zone Management Act outlines two national programs. The National Coastal Zone Management Program includes 34 coastal programs that aim to balance competing land and water issues in the coastal zone. The National Estuarine Research Reserve System creates field laboratories that provide a greater understanding of estuaries and how humans affect them. The overall program objectives of the act are to "preserve, protect, develop, and where possible, to restore or enhance the resources of the nation's coastal zone."

The Coastal Zone Management Act ensures that development projects in coastal areas are designed and sited in a manner that is consistent with coastal zone land uses, maximizes public health and safety, and ensures that biological resources (e.g., wetlands, estuaries, beaches, and fish and wildlife and their habitat) within the coastal zone are protected. The enforceable policies of that document are Chapter 3 of the California Coastal Act of 1976 (as amended). The California Coastal Commission enforces the Coastal Zone Management Act by certifying that the proposed project is consistent with the California Coastal Act.

Rivers and Harbors Act (Section 10)

Pursuant to Section 10 of the Rivers and Harbors Act, USACE is authorized to regulate structures within or over any navigable water of the United States (WoUS). The Rivers and Harbors Act Section 10 jurisdiction is defined as "those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use, to transport interstate or foreign commerce" (33 Code of Federal Regulations [CFR] 322). The San Diego Bay is considered a traditional navigable water regulated under Section 10 of the Rivers and Harbors Act. Static positioning of any fireworks barges using a temporary mooring is not proposed.

Endangered Species Act of 1973

Species listed as endangered and/or threatened by USFWS are protected under Section 9 of the federal ESA, which forbids any person to "take" an endangered or threatened species. *Take* is defined in Section 3 of the act as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." The term *harm* is defined as an "act which actually kills or injures wildlife," including through "significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife." The term *harass* means an act or omission that creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns, including breeding, feeding, or sheltering. (50 CFR 17.3). Sections 7 and 10 of the act may authorize "incidental take" for an otherwise lawful activity (a development project, for example) if it is determined that the activity would not jeopardize survival

or recovery of the species. Section 7 applies to projects where a federally listed species is present and there is a federal nexus, such as a federal CWA Section 404 permit (e.g., impacts on WoUS) that is required. Section 10 applies when a federally listed species is present but no federal nexus is present.

Marine Mammal Protection Act of 1972

The MMPA prohibits, with certain exceptions, the take of marine mammals in U.S. waters and by U.S. citizens on the high seas, and the importation of marine mammals and marine mammal products into the United States. Under the MMPA, *take* is defined as “to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal” (16 United States Code [USC] 1362) and further defined by regulation (50 CFR 216.3) as “to harass, hunt, capture, collect, or kill, or attempt to harass, hunt, capture, collect, or kill any marine mammal.” Congress passed the MMPA based on the following findings and policies: (1) some marine mammal species or stocks may be in danger of extinction or depletion as a result of human activities, (2) these species or stocks must not be permitted to fall below their optimum sustainable population level (depleted), (3) measures should be taken to replenish these species or stocks, (4) there is inadequate knowledge of the ecology and population dynamics, and (5) marine mammals have proven to be resources of great international significance.

The MMPA was amended substantially in 1994 to provide for: (1) certain exceptions to the take prohibitions, such as for Alaska Native subsistence, and for permits and authorizations for scientific research; (2) a program to authorize and control the taking of marine mammals incidental to commercial fishing operations; (3) preparation of stock assessments for all marine mammal stocks in waters under U.S. jurisdiction; and (4) studies of pinniped-fishery interactions. NMFS and USFWS administer the MMPA. Under the 1994 amendments to the MMPA, harassment was separated into two categories and is statutorily defined as any act of pursuit, torment, or annoyance that:

- Has the potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or
- Has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering but that does not have the potential to injure a marine mammal or marine mammal stock in the wild (Level B harassment).

Proposed projects must be analyzed to ensure that marine mammals protected under the MMPA would not be harassed or injured as a result of project activities. Any project activities that may result in Level A or B harassment or mortality would require consultation with NMFS under the MMPA.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was enacted in 1918 to prohibit the killing or transport of native migratory birds, or any part, nest, or egg of any such bird, unless allowed by another regulation adopted in accordance with the MBTA. A list of migratory bird species that are protected by the MBTA is maintained by USFWS, which regulates most aspects of the taking, possession, transportation, sale, purchase, barter, exportation, and importation of migratory birds. Under the MBTA, *take* means to kill, directly harm, or destroy individuals, eggs, or nests or to otherwise cause failure of an ongoing nesting effort. Permits are available under the MBTA through USFWS, and

authorization for potential take under the MBTA is addressed as part of the ESA Section 7 consultation process. The proposed project must be analyzed to ensure consistency with the MBTA, including avoidance of take of nesting birds, their eggs, or activities that may cause nest failure. This applies for both terrestrial and marine migratory species protected under the MBTA that may be directly or indirectly affected by the proposed project. Any potential take must be either permitted through consultation with USFWS or avoided and minimized through mitigation measures.

Clean Water Act

The Federal Water Pollution Control Act Amendments of 1972, commonly known as the CWA (33 USC 1251–1376), as amended by the Water Quality Act of 1987, is the major federal legislation governing water quality. The purpose of the CWA is to “restore and maintain the chemical, physical, and biological integrity of the nation’s waters.” Discharges into WoUS are regulated under CWA Section 404. WoUS include: (1) all navigable waters (including all waters subject to the ebb and flow of the tide); (2) all interstate waters and wetlands; (3) all other waters, such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sand flats, wetlands, sloughs, or natural ponds; (4) all impoundments of waters mentioned above; (5) all tributaries to waters mentioned above; (6) the territorial seas; and (7) all wetlands adjacent to waters mentioned above. Important applicable sections of the CWA are discussed below.

- **Section 303** requires states to develop water quality standards for inland surface and ocean waters and submit them to the U.S. Environmental Protection Agency for approval. Under Section 303(d), the states are required to list waters that do not meet water quality standards and to develop action plans, called total maximum daily loads, to improve water quality.
- **Section 304** provides for water quality standards, criteria, and guidelines.
- **Section 401** requires an applicant for any federal permit that proposes an activity that may result in a discharge to WoUS to obtain certification from the state that the discharge will comply with other provisions of the CWA. Certification is provided by the respective Regional Water Quality Control Board (RWQCB). A Section 401 certification from the San Diego RWQCB (SDRWQCB) would be required for the proposed project if a Section 404 permit and Rivers and Harbor Act (Section 10) permit are required.
- **Section 402** establishes the National Pollutant Discharge Elimination System (NPDES), a permitting system for the discharge of any pollutant (except for dredge or fill material) into WoUS. The NPDES program is administered by SDRWQCB. Conformance with Section 402 is typically addressed in conjunction with water quality certification under Section 401. All construction activities must be consistent with Section 402 of the CWA and avoid significant water quality-related impacts. See Section 4.6, *Hydrology and Water Quality*, for an analysis related to the proposed project’s impacts on water quality.
- **Section 404** provides for issuance of dredge/fill permits by USACE. Permits typically include conditions to minimize impacts on water quality. Common conditions include: (1) USACE review and approval of sediment quality before dredging; (2) a detailed pre- and post-construction monitoring plan that includes disposal site monitoring; and (3) requiring compensation for loss of WoUS. The project does not propose any fill or dredge.

National Wildlife Refuge System Administration Act of 1966

The National Wildlife Refuge System Administration Act of 1966 consolidated the various categories of lands, administered by the Secretary of the Interior through USFWS, into a single National Wildlife Refuge System. The act establishes a unifying mission for the Refuge System, a process for determining compatible uses of refuges, and a requirement for preparing comprehensive conservation plans. The act states, first and foremost, that the mission of the National Wildlife Refuge System be focused singularly on wildlife conservation. In addition, the Refuge Administration Act identifies six priority wildlife-dependent recreation uses, clarifies the Secretary's authority to accept donations of money for land acquisition, and place restrictions on the transfer, exchange, or other disposal of lands within the Refuge System (NOAA 2012).

San Diego Bay National Wildlife Refuge Final Comprehensive Conservation Plan and Environmental Impact Statement

The San Diego Bay National Wildlife Refuge is managed by USFWS as part of the National Wildlife Refuge System. A Comprehensive Conservation Plan is prepared pursuant to the National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997. USFWS manages the Sweetwater Marsh and South San Diego Bay Units of the San Diego Bay NWR in accordance with the approved August 2006 Comprehensive Conservation Plan. The Comprehensive Conservation Plan provides long-range guidance on refuge management through its vision, goals, objectives, and strategies. The Comprehensive Conservation Plan also provides a basis for a long-term adaptive management process including implementation, monitoring progress, evaluating and adjusting, and revising plans accordingly (USFWS 2006).

4.3.3.2 State

California Coastal Act of 1976

The California Coastal Act of 1976 recognizes California ports, harbors, and coastline beaches as primary economic and coastal resources and as essential elements of the national maritime industry. Decisions to undertake specific development projects, where feasible, are to be based on consideration of alternative locations and designs in order to minimize any adverse environmental impacts. The California Coastal Act is implemented by District for the land and water within its jurisdiction, subject to oversight by the Coastal Commission.

California Endangered Species Act

The CESA establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats. The CESA mandates that state agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy. For projects that affect both a state- and federally listed species, compliance with the federal ESA will satisfy the CESA if CDFW determines that the federal incidental take authorization is consistent with the CESA under California Fish and Game Code Section 2080.1. For projects that would result in a take of a state-only listed species, the project proponent must apply for a take permit under Section 2081(b).

California Fish and Game Code

The Fish and Game Code establishes the Fish and Game Commission, as authorized by Article IV, Section 20, of the Constitution of the State of California. The Fish and Game Commission is responsible, under the provisions of Sections 200–221, for regulating the take of fish and game, not including the taking, processing, or use of fish, mollusks, crustaceans, kelp, or other aquatic plants for commercial purposes. However, the Fish and Game Commission does regulate aspects of commercial fishing, including fish reduction; shellfish cultivation; take of herring, lobster, sea urchins, and abalone; kelp leases; leases of state water bottoms for oyster allotments; aquaculture operations; and other activities. These resource protection responsibilities involve the setting of seasons, bag and size limits, and methods and areas of take, as well as prescribe the terms and conditions under which permits or licenses may be issued or revoked by CDFW. The Fish and Game Commission also oversees the establishment of wildlife areas and ecological reserves and regulates their use, as well as setting policy for CDFW.

Sections 3503, 3503.5, 3505, 3800, and 3801.6 of the Fish and Game Code protect all native birds, birds of prey, and all nongame birds, including their eggs and nests, that are not already listed as fully protected and that occur naturally within the state. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptors (e.g., hawks, owls, eagles, falcons), including their nests or eggs. As defined in the Fish and Game Code, *take* means to hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill (Fish and Game Code Section 86).

CDFW is a lead state agency that manages native fish, wildlife, plant species, and natural communities for their ecological value and their benefits to people. CDFW oversees the management of marine species through several programs, some in coordination with NMFS and other agencies.

The California Eelgrass Mitigation Policy is administered by NMFS. The effects of the proposed project on any surrounding eelgrass beds and any compensatory mitigation would be addressed under the Southern California Eelgrass Mitigation Policy. In addition, CDFW jointly manages (with NMFS) the implementation of the Caulerpa Control Protocol, which requires a survey for Caulerpa be conducted before any bottom-disturbing activities.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act is the California equivalent of the federal CWA. It provides for statewide coordination of water quality regulations through the establishment of the State Water Resources Control Board (SWRCB) and nine separate RWQCBs that oversee water quality on a day-to-day basis at the regional/local level. The RWQCBs regulate actions that would involve “discharging waste, or proposing to discharge waste, within any region that could affect the water of the state” (Water Code Section 13260(a)), pursuant to provisions of the Porter-Cologne Act. Waters of the state (WoS) are defined as “any surface water or groundwater, including saline waters, within the boundaries of the state” (Water Code Section 13050 (e)).

The RWQCB also regulates WoS under Section 401 of the CWA. A Water Quality Certification or a waiver must be obtained from the RWQCB if an action would potentially result in any impacts on jurisdictional WoS. The proposed project must be analyzed to determine if it will result in any impacts on WoS, and any potential impacts would require an application for an RWQCB Water Quality Certification (or waiver), consultation with the RWQCB, and compensatory mitigation.

On June 1, 2011, SDRWQCB issued a General NPDES Permit for Residual Firework Pollutant Waste Discharges to Waters of the United States in the San Diego Region from the Public Display of Fireworks (No. R9-2011-0022) (General Permit) for residual firework pollutant waste discharges to WoUS in the San Diego region from the public display of fireworks. All fireworks displays conducted in San Diego Bay are required to comply with the General Permit.

4.3.3.3 Local

Port Master Plan

Through implementation of the Port Master Plan (PMP), the District maintains authority over tidelands and submerged lands conveyed in trust to the District by the California legislature. Any amendments to the PMP must be adopted by the Board of Port Commissioners and then certified by the California Coastal Commission. Under the certified PMP, the District has the authority to issue coastal development permits for projects within its jurisdiction. The PMP provides for the protection of biological resources and states that the District will remain sensitive to the needs of, and will cooperate with, other communities and other agencies in Bay and tideland development.

San Diego Unified Port District Code, Ordinance 19

Sections 55 and 56 of the San Diego Unified Port District Act require the Board of Port Commissioners to make and enforce necessary rules and regulations governing the use and control of all navigable waters, tidelands, and submerged lands within the District and to make and enforce certain local police and sanitary regulations relating to the District. As such, the adoption of Ordinance 19 established a system for the codification of District ordinances.

Ordinance 19 covers topics such as watercraft speed regulations, aquatic activities, anchoring or mooring in the Bay, regulations in the parks, diving activities, alcohol use, stormwater control, and fishing, among others. Specific to the proposed project, Sections 4.30, 4.35, 4.36, and 4.40 of Ordinance 19 establish restrictions for anchoring and mooring of vessels, such as fireworks barges, in the Bay, including identification of allowable anchoring activities and areas.

Chula Vista Bayfront Master Plan Natural Resources Management Plan

The Chula Vista Bayfront Master Plan Natural Resources Management Plan (NRMP) was prepared by the District and the City of Chula Vista and was adopted in May 2016. It contains goals, objectives, and strategies for promoting and enhancing natural resources within the 535-acre Chula Vista Bayfront area. It serves as an important environmental guidance and implementation document, applicable to all development within the Chula Vista Bayfront area. All projects, both public and private, will be evaluated by the District and City of Chula Vista relative to furthering the goals, objectives, standards, and strategies contained therein. The Chula Vista Bayfront Master Plan NRMP allows a maximum of three fireworks events to occur per year, all outside of California least tern nesting season (March 15 through August 31) except on the Fourth of July, which may be allowed if in full regulatory compliance and if nesting colonies are monitored during the event with any impacts reported to the Wildlife Advisory Committee, so they can be addressed.

San Diego Bay Integrated Natural Resources Management Plan

The District and U.S. Navy jointly implement the INRMP. This long-term strategy document provides direction and planning guidance for good stewardship of the natural resources within San Diego Bay. The INRMP does not carry regulatory authority, but rather includes objectives and policy recommendations to guide planning, management, conservation, restoration, and enhancement of the Bay ecosystem. The core strategies of the plan are to: (1) manage and restore habitats, populations, and ecosystem processes; (2) plan and coordinate projects and activities so that they are compatible with natural resources; (3) improve information sharing, coordination, and dissemination; (4) conduct research and long-term monitoring that supports decision-making; and (5) put in place a Stakeholder's Committee and Focus Subcommittees for collaborative, ecosystem-based problem-solving in pursuit of the goal and objectives.

City of San Diego Multiple Species Conservation Program Subarea Plan

In the City of San Diego, local habitat, species, and biological resources are protected under the City of San Diego Multiple Species Conservation Program (MSCP), which is implemented through the MSCP Subarea Plan (City of San Diego 1997). The City of San Diego MSCP Subarea Plan was developed to meet the requirements of the California Natural Communities Conservation Planning Act of 1992, and as such serves as the City of San Diego's approved local natural community conservation plan. To implement its portion of the MSCP preserve, the City of San Diego developed the Multi-Habitat Planning Area (MHPA), which is considered an urban preserve that delineates core biological resource areas and corridors targeted for conservation. MHPA lands are typically constrained by existing or approved development, and comprise linkages connecting several large areas of habitat. The closest designated MHPA is approximately 1.25 miles south of the proposed barge location for the fireworks display events along the Chula Vista Bayfront, and encompasses the southeastern portion of the South San Diego Bay Unit of the San Diego Bay NWR (USFWS 2006). The proposed project is not located within the City of San Diego MSCP; however, due to the close proximity of the MHPA to the proposed new fireworks display events, the proposed project's potential to result in indirect impacts on habitat within the City of San Diego MSCP is discussed in the impact analysis below.

City of Chula Vista Multiple Species Conservation Program Subarea Plan

The City of Chula Vista MSCP Subarea Plan was developed in February 2003 pursuant to the general outline developed by USFWS and CDFW to meet the requirements of the California Natural Communities Conservation Planning Act of 1992. The Subarea Plan is also consistent with the County of San Diego MSCP Subregional Plan and qualifies as a Subarea Plan document to implement the MSCP Subregional Preserve within the City of Chula Vista. The proposed project is not located within the City of Chula Vista MSCP Subarea Plan; however, due to the close proximity of the MSCP Preserve to the proposed new fireworks display events, the proposed project's potential to result in indirect impacts on habitat within the City of Chula Vista MSCP is discussed in the impact analysis below.

4.3.4 Project Impact Analysis

4.3.4.1 Methodology

The analysis below makes use of existing data sources discussed above for San Diego Bay and the Imperial Beach Oceanfront. In addition, focused field investigations that address the potential impacts of fireworks display events on marine mammals were conducted during the 2015 and 2016 Big Bay Boom (Appendix F). Furthermore, prior observations of the California least tern response to existing fireworks display events in San Diego Bay were used as a reference source for assessment of potential effects of the proposed new fireworks display events on this species. Finally, a literature review was completed with a focus on the effects of fireworks display events on coastal areas outside of the San Diego region, and the effects of pyrotechnics and loud sounds, in general, on marine resources.

Impacts on habitats and wildlife can be measured as direct and/or indirect. Direct impacts are those that have a direct impact on habitats or wildlife and occur contemporaneously with the action. Direct impacts of fireworks display events on wildlife have previously been defined by the fireworks analysis for the Monterey Bay National Marine Sanctuary (NMFS and MBNMS 2002) as immediate physical and physiological impacts such as abrupt changes in behavior, flight response, diving, evading, flushing, cessation of feeding, and physical impairment or mortality of wildlife. For the proposed project, direct impacts on wildlife and habitats can result from sound waves, light, and debris produced by the proposed new fireworks display events. These effects are evident at the time of or shortly after detonation of the fireworks display events. Debris produced by the proposed new fireworks display events also has a potential to result in direct effects on wildlife and habitats by littering and contaminating the surrounding environment. Finally, if chemical residue from detonated fireworks adversely affects water quality and sediment, it may directly affect habitats and wildlife. The direct chemical effects of the proposed new fireworks display events on water quality are analyzed in Section 4.6, *Hydrology and Water Quality*; however, the effects of water quality on habitats and species are analyzed below. The extent and direction of the direct impacts are dependent on the size and type of aerial fireworks shell being used, wind direction, relative humidity, cloud cover, temperature, and topography of the surrounding landscape.

Indirect impacts are effects that are caused by or will result from the proposed project at a later time, but are still reasonably certain to occur. For the proposed project, indirect impacts on habitats and wildlife can result from increased boat traffic, increased foot traffic in or adjacent to sensitive areas and wetlands, and human-generated debris associated with the public viewing fireworks display events.

4.3.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining significance of impacts associated with biological resources resulting from the implementation of the proposed project. The determination of whether a biological resource impact would be significant is based on the professional judgment of the District as Lead Agency supported by the recommendations of qualified personnel at ICF and Merkel and Associates, all of which is based wholly on the substantial evidence in the administrative record.

Impacts are considered significant if the project would result in any of the following:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW and USFWS.
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by CDFW, NMFS, or USFWS.
3. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA through direct removal, filling, hydrological interruption, or other means.
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.
5. Conflict with any applicable local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
6. Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

4.3.4.3 Project Impacts and Mitigation Measures

Threshold 1: Implementation of the proposed project would have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW and USFWS.

Impact Discussion

The primary direct impacts from fireworks display events on wildlife could include disturbance or alteration of behavior due to sound waves, light, or fireworks-generated debris. If chemical residue from fireworks adversely affects water quality, chemical residues introduced into the water from fireworks may also directly affect wildlife. The primary indirect impacts on wildlife could include disturbance or alteration of behavior due to increased boat traffic or human-generated trash and debris, including encroachment into sensitive nesting areas.

Marine Reptiles

San Diego Bay supports a small number of green sea turtles. A satellite tagging study of green sea turtles in San Diego Bay has been ongoing since 2008. Results indicate that habitat usage has shifted since the closure of the South Bay Power Plant. Turtles tagged and tracked before the closure of the power plant were most commonly found seasonally in the warm waters of the South Bay Power Plant cooling water discharge channel, on the south side of the Chula Vista Wildlife Reserve (Bredvik et al. 2015; Graham and Saunders 2014). In the years following closure of the power plant, tracking results indicate that the turtle activities may have shifted to the northern side of the Chula Vista Wildlife Reserve (the old cooling water intake), as well as more northerly areas in south San Diego Bay. Occasional observations from northern San Diego Bay and in nearshore coastal waters outside of the Bay have also been made as individuals travel north to exit and re-enter the Bay. Despite the change in home range and the increase in observations in the central and northern portions of the Bay, the resident population of green sea turtles remains predominantly in the far southern end of

San Diego Bay. Tracking data from 2016 indicate that the turtles' home range is south San Diego Bay, where they spend 95 percent of their time (District 2016). Therefore, the following discussion focuses on the population of green sea turtles known to occur in San Diego Bay.

Direct Impacts

Proposed New Fireworks Display Events

As described above, the majority of turtles in San Diego Bay occur in the southern end of the Bay. There are no fireworks display events that currently occur in south San Diego Bay. The proposed new fireworks display events would include up to three fireworks display events along the Chula Vista Bayfront, as allowed by the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and one Fourth of July fireworks display event along the National City Bayfront. Direct impacts on green sea turtles from the proposed new fireworks display events could include disturbance or alteration of behavior due to sound waves, light, or debris. Also, the introduction of fireworks-generated trash and debris could cause injury to turtles because the green sea turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation.

Merkel & Associates, Inc. (Appendix F) found no peer-reviewed literature that evaluates the direct response of marine reptiles to commercial fireworks display events. However, Zhang (2002) found that sound pressures in the range produced by fireworks generally decouple at the air-water interface. This suggests that increased noise from fireworks display events would minimally affect turtles in the water as the sound dissipates through water. Additionally, increased light levels would only be apparent to turtles surfacing to breathe at the time of the fireworks detonation. Based on the small number of proposed new fireworks display events in the southern portion of the Bay where green sea turtles are known to congregate, a decoupling of aerial detonation sound and light, limited number of turtles, and the limited time turtles spend above the surface of the water, direct impacts on green sea turtles due to sound waves and light would be less than significant.

Fireworks-generated trash and debris could cause injury to green sea turtles because the turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. This is a potentially significant impact (**Impact-BIO-1**). Mitigation measure **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts associated with fireworks-generated trash and debris. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Implementation of **MM-BIO-1** would ensure that fireworks-generated trash and debris are collected and disposed of and that the use of non-biodegradable fireworks components is limited, which would reduce this potential direct impact on green sea turtles to a less-than-significant level.

Other potential direct impacts on marine reptiles may occur if chemical residues that might fall into surface waters adversely affect water quality during and after the fireworks display events. These chemicals and metals, when present in large enough concentrations, have potential to accumulate in sediments, leach into groundwater, and negatively affect the health of humans and other organisms (Appendix F). However, results of water quality testing following the Big Bay Boom, as well as the

more extensive and long-term SeaWorld fireworks display events, have shown no or limited temporal or spatial relationships in chemical levels, with the majority of constituents tested occurring at concentrations below detectable levels. Perchlorate is the only chemical of concern that has consistently been measured in post-fireworks display event water quality testing. Perchlorate, used as an oxidizer in propellants for fireworks, is recognized as an environmental contaminant that can harm fish and humans. Concentrations of perchlorate found in post-fireworks water quality samples for the Big Bay Boom and SeaWorld fireworks display events have been substantially less than 10 microgram per liter ($\mu\text{g/L}$) (i.e., less than 0.01 milligram per liter [mg/L]) and were generally in the 1–2 $\mu\text{g/L}$ range, which is several orders of magnitude below the 10- to 100- mg/L range found to cause toxicity in fish and aquatic organisms in laboratory studies (Appendix F). Further toxicity testing and benthic community studies completed following SeaWorld fireworks display events indicate that the SeaWorld fireworks fallout zone is not degraded in comparison with adjacent reference sites (Appendix F). For these reasons, potential direct impacts on marine reptiles associated with reduced water quality from the proposed new displays would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval that would reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront. The proposed ordinance requires implementation of post-display cleanup practices consistent with the requirements of SDRWQCB's General Permit, removal of fireworks packaging, implementation of best management practices, and a reduction in the amount of non-biodegradable fireworks components that can be used. The proposed ordinance also includes a condition of approval that would require the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan for each fireworks display event consistent with the requirements of SDRWQCB's General Permit. These conditions would require additional clean-up of fireworks-generated trash and debris from existing fireworks display events and that the use of non-biodegradable fireworks components is limited, thereby ensuring that green sea turtles are not injured by mistakenly consuming waste. The proposed ordinance would not result in any other changes to the existing fireworks display events that would adversely affect green sea turtles. Therefore, the effects of the proposed ordinance on existing fireworks display events would not have a substantial adverse direct effect on marine reptiles. No significant adverse impacts would occur.

Indirect Impacts

Proposed New Fireworks Display Events

Marine reptiles in south San Diego Bay may also be indirectly affected by increased boat traffic and human-generated trash entering the marine environment associated with the proposed new fireworks display events. Although the speed limit for vessels south of the Sweetwater Channel is 5 miles per hour, the potential increase in boat traffic, particularly nighttime and out-of-channel traffic, would increase the potential for propeller strikes, which may cause injury to or death of green sea turtles. Increased boating activities could cause the animals to temporarily depart the project area before, during, and after the time of the fireworks display events to avoid higher vessel

traffic. The increase in activity may also affect the turtles' foraging habits in that individuals may spend more time underwater, swim at greater speeds, and alter other life history traits leading to greater energy expenditure. The introduction of human-generated trash could also cause injury to turtles because the turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. These potential indirect impacts on marine reptiles may be significant (**Impact-BIO-2**). During fireworks display events, the Harbor Police Department currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, the Harbor Police Department would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. In addition, the proposed ordinance contains several conditions of approval to reduce potential impacts on the biological resources of San Diego Bay. Implementation of **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup, security, signage and education measures. Implementation of **MM-BIO-2** would ensure that significant indirect impacts on green sea turtles from increased boat traffic and human-generated trash and debris would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval to reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront, including the implementation of cleanup, security, and education measures. Compliance with the proposed ordinance would improve the existing condition by ensuring that boat traffic and human-generated trash during existing fireworks display events would not have any indirect effects on marine reptiles. Therefore, the effects of the proposed ordinance on existing fireworks display events would not have a substantial adverse indirect effect on marine reptiles. No significant adverse impacts would occur.

Birds

Several studies have observed the behavioral changes of sensitive avian species during fireworks display events. A literature review of these existing studies and research was conducted, with the results summarized below. Four avian species that are federally or state-listed as endangered or threatened by USFWS and/or CDFW have a high potential to occur within and adjacent to San Diego Bay. These include California least tern, western snowy plover, light-footed Ridgway's rail, and Belding's Savannah sparrow. The nesting sites of these four species are within audible and visual range of the proposed new fireworks display events and have the potential to be affected. Nesting areas for listed species are illustrated in Figure 4.3-2. Other avian species that are potentially affected include California brown pelican and double-crested cormorant, as these species nest and/or roost in the Bay. Several additional species of terns and black skimmer nest at sites that also support California least tern. As such, these species may be similarly affected by the proposed new fireworks display events.

A review of relevant literature shows that several studies have observed the behavioral changes of sensitive avian species during existing fireworks display events. The impact analysis below relies on

the results of the existing studies to draw conclusions of the potential effects on avian species from the proposed new fireworks display events along the National City and Chula Vista Bayfronts.

Direct Impacts

Proposed New Fireworks Display Events

Direct impacts on sensitive avian species within the project area could include disturbance or alteration of behavior due to sound and light from fireworks display events. The flash and noise from the proposed new fireworks display events are expected to generate a physiologic response of stress within birds. This response would be particularly notable in birds that are night roosting (e.g., California least terns, and to a lesser extent western snowy plovers), as the normal physiological state of birds at rest is low anxiety. For nest-tending or roosting birds, especially at night, stress and alarm levels could be heightened by unanticipated noise and light displays. This stress can result in increased vocalizations, shifting on nests, and movement off nests, including running or flight, and larger-scale colony alarm. Additionally, the introduction of fireworks-generated trash and debris could cause injury to sensitive avian species because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Sensitive bird species within San Diego Bay and along the Silver Strand could be affected by the proposed new fireworks display events in the Bay along the National City Bayfront and Chula Vista Bayfront.

Due to only a small quantity of published research on the effects of fireworks display events directly relating to California least tern and other sensitive avian species present within the Bay, the literature review was expanded to include potential effects of fireworks display events on marine bird and shorebird species in general.

Within San Diego Bay, an unpublished report produced by the San Diego Zoo's Institute for Conservation Research studied the California least tern population at NAB Coronado both before (July 3, 2014) and during the Fireworks Show Over Glorietta Bay on July 4, 2014 (Boylan and Nordstrom 2014). The study looked at sections of two colonies (one closest to and one farthest from the fireworks display event) on July 3 and 4, 2014. The colony at Delta Beach North was located approximately 1 mile from the detonation site, and the colony at the southern portion of the NAB Coronado was located approximately 3 miles from the detonation site. An analysis of flying and calling behavior and routine monitoring data did not identify any adverse effects on the terns from the Fireworks Show Over Glorietta Bay. The study did find, however, that the indirect effects of the Fourth of July activities, such as vehicular activities, foot traffic, and illegal fireworks on the nearby Silver Strand State Beach, caused the majority of the disturbance.

A similar result was reported by Robert Patton, a consulting biologist with the San Diego Zoological Society, as a result of monitoring commissioned in 2009 by the District and San Diego Regional Airport Authority over several recent large-scale fireworks display events, such as the Big Bay Boom. The monitoring was started due to concerns raised by USFWS and CDFW. Informal emails from Mr. Patton (dated 2009 through 2011) detail a notable response to disturbances from fireworks display event noise and light by a habituated California least tern colony at San Diego International Airport. Mr. Patton noted over several years of monitoring that, during the Big Bay Boom fireworks display, roosting terns shifted to higher activity levels in response to the fireworks display events. Some terns initiated running or flying in response to fireworks display events, while birds also increased alarm call vocalizations. However, during each monitoring year, the majority of the flock (≥ 75 percent of total birds) remained in place for the duration of the fireworks display event and the remainder returned and settled within 30 to 60 minutes of completion of the display.

Mr. Patton indicated that fireworks display events could pose a threat, particularly for disturbed chicks and fledglings that could run into roadways or traffic. However, Mr. Patton specified that there is “no observed clear evidence of lasting negative effects [of fireworks display events].” Finally, Mr. Patton indicated that the habituation of the San Diego International Airport least tern colony to loud noises from aircraft make applicability of monitoring results across colonies difficult, and that “colonies elsewhere with less habituation to noises would be expected to react more than those at the airport.” Neither study completed in San Diego Bay detected a direct link of fireworks display events to mortality of adults or chicks or to a decrease in productivity of nesting pairs.

Additional studies have been conducted outside San Diego Bay. A document produced by USFWS titled *Guidelines for Managing Fireworks in the Vicinity of Piping Plovers at Sea Beach Amaranth on the U.S. Atlantic Coast* (1997) states that there have been several situations where fireworks discharged on the beach close to the nesting least terns (*Sterna antillarum*) caused the birds to abandon nests. An August 1993 fireworks display event in New Jersey caused permanent abandonment of a least tern colony approximately 0.15 mile away, and a 1994 New Jersey fireworks display event caused temporary abandonment and displays of distress by terns within a colony approximately 0.75 mile away. These studies, while cited by USFWS, are unpublished and information regarding the size and duration of the fireworks displays and the proximity of displays to nesting colonies is not available. As a result, correlations cannot be drawn between New Jersey and San Diego Bay fireworks display events.

Another study by the Bureau of Land Management, CDFW, USFWS, and NMFS (Weigand and McChesney 2008) focused on populations of breeding seabirds on Gualala Point Island, Sonoma County, California. The study focused on Brandt’s cormorant (*Phalacrocorax penicillatus*) and examined potential responses and effects on reproductive success from a July 6 fireworks display event. Observations documented a visible response by nesting seabirds on Gualala Point Island, located approximately 1.1 miles from the fireworks detonation site. Surveys during the fireworks display event showed that Brandt’s cormorants quickly changed from resting to erect postures at the first fireworks, followed by birds moving about or departing from the island. Western gulls in the study area also flushed, circled, and called during the fireworks display event. During the study period, 90 Brandt’s cormorant nests were documented on Gualala Point Island. Of these, seven nests (35 percent of nest failures) were abandoned in the 2 days between July 5 and July 7, and another seven nests were abandoned between July 7 and July 12. These losses contrasted with the abandonment of only six nests (30 percent of nest failures) for the 30-day period from June 5 to July 5. Two of the nine nests monitored from the adjacent mainland were abandoned between July 6 and July 8. The high rate of Brandt’s cormorant nest abandonment between July 5 and July 7, and possibly nest abandonment from July 7 to July 12, were reported to likely be the result of fireworks disturbance. However, the Gualala seabirds that were studied roost and nest in an offshore island that does not receive the same level of ongoing human disturbance as the San Diego Bay and Silver Strand populations of sensitive avian species.

Finally, a study by Shamoun-Baranes et al. (2011) in the Netherlands used weather radar to study the flight response of birds during New Year’s Eve fireworks display events. The study observed hot spots of activity over lakes, wetlands, and river floodplains. Flight altitudes increased rapidly during the first 15 to 20 minutes after the beginning of the fireworks display event (at midnight), and then slowly decreased, with the main disturbance period lasting about 45 minutes. The study did not identify the size and duration of fireworks displays, and did not quantify the distances of nature reserves and lakes (where waterfowl concentrate) from fireworks displays. Rather, the study focused on a broad area near DeBilt, Netherlands, which is adjacent to multiple Natura 2000

designated lakes and wetlands. The study also noted that fireworks are available for consumer purchase in the Netherlands around New Year's Eve, and may be legally lit for a small period of time between December 31 and January 1 each year, with the largest concentration lit at midnight on New Year's Eve. Therefore, it can be assumed that the fireworks included both large public displays as well as abundant small-scale personal displays deployed over a small time period. The study did not expect fireworks display events to be directly lethal to birds; however, confounding factors, such as disorientation or flying in inclement weather, could potentially result in harm.

Monitoring studies completed at California least tern nesting colonies in San Diego Bay note some limited response of California least terns to noise and light from existing fireworks display events; however, these studies indicate that the majority of birds in the colonies remain in place or return shortly after the fireworks display events. No incidence of death or injury of birds has been reported during any of the monitoring studies completed. The evidence presented from studies within the Bay, the urbanized setting of nesting colonies and roosting locations within the Bay, and the distance of these sites from the existing fireworks display events indicate that sensitive and non-sensitive avian species experience a moderate level of temporary disturbance from noise and light associated with fireworks display events.

Based on results from these multiple studies and surveys, it is apparent that seabirds and shorebirds show some direct physiological stress response, such as increased vocalizations, change in body position, running, and flushing, to the loud noises and increased light associated with fireworks display events. The studies indicated that the response is likely greater for birds that are not habituated to human noise and disturbance. As such, it can be assumed that the close proximity of nesting and roosting sensitive birds to urban locations in San Diego Bay and along the Silver Strand (that include a commercial airport and multiple naval facilities) likely habituates them to higher levels of noise and light patterns. None of the studies indicated direct mortality of birds or a decrease in productivity associated with fireworks display events, and no study indicated long-term changes in behavior (e.g., colony abandonment) related to fireworks display events.

The San Diego Bay and/or Silver Strand nesting and roosting locations for sensitive avian species, including California least tern, western snowy plover, California brown pelican, double-crested cormorant, Caspian and elegant terns, and black skimmers in San Diego Bay and along the Silver Strand adjacent to the Imperial Beach Oceanfront, are in moderately to highly urbanized settings. The proposed new fireworks display events along the National City and Chula Vista Bayfronts would occur approximately 1 mile from California least tern and western snowy plover nesting colonies. Additionally, the proposed new fireworks display events would occur approximately 1.5 miles from other nesting sites in south San Diego Bay at the South Bay Salt Works (which support double-crested cormorant and multiple other tern species) and adjacent coastal salt marshes (which support Belding's Savannah sparrow and light-footed Ridgway's rail, as well as multiple sensitive raptor species). The proposed new Fourth of July fireworks display events would occur during the avian breeding season, while the smaller two proposed new non-Fourth of July fireworks display events would occur during periods when these avian species are not nesting and the California least terns are not present in the region (mid-September through March).

The ESA defines the term *harm* to include "any act which actually kills or injures fish or wildlife," and emphasizes that "such acts may include significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife." *Harassment* is defined as "an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not

limited to, breeding, feeding, or sheltering” (50 CFR 17.3). Under these definitions, it does not appear that the levels of disturbance or stress generated from the fireworks display events translate to a level of harm or harassment for avian species. There is no evidence from the studies completed to date that fireworks displays harm or harass sensitive avian species (e.g., they are unlikely to result in direct mortality of birds, a decrease in productivity, or long-term changes in behavior such as colony abandonment), and, therefore, it does not appear that the proposed new fireworks display events along the National City and Chula Vista Bayfronts would result in take of federally listed avian species as defined in the ESA.

While it does not appear that fireworks display events result in harm or harassment to sensitive avian species as defined under the ESA, the results from studies and surveys do indicate these species experience temporary disturbance from fireworks. Disturbance exists when a stimulus induces physiologic stress or behavioral response in an organism. In particular, disturbance may affect nesting or roosting birds in response to both noise and light stressors. As described in Section 4.3.4.2, *Thresholds of Significance*, biological resources impacts would be considered significant if the proposed project would have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species, including sensitive avian species. Based on the information presented above, the proposed new fireworks display events may result in short-term and infrequent changes in behavior in sensitive avian species as a result of disturbance from fireworks. However, the proposed new fireworks display events are not anticipated to result in any long-term or permanent substantial adverse effects on avian species because temporary disturbance from noise and light would be short term and infrequent and would not result in direct mortality of birds, a decrease in productivity, or long-term changes in behavior (e.g., colony abandonment). As such, any temporary disturbance would not be considered a substantial adverse effect on a sensitive species. Therefore, impacts would be less than significant.

In addition, the proposed ordinance includes a noise and light reduction requirements for fireworks display events that would occur during the breeding season, which would further reduce the temporary disturbance experienced by avian species. Furthermore, in accordance with the Chula Vista Bayfront Settlement Agreement and Natural Resources Management Plan (May 2016), Fourth of July fireworks display events that would occur within the Chula Vista Bayfront area during the least tern nesting season are required to monitor the nesting colonies and be in full regulatory compliance with all applicable water quality and species protection regulations. This further supports the conclusion above that, with the implementation of the specific noise and light reduction requirements included in the proposed ordinance, temporary disturbances to avian species would be less than significant.

Additionally, the introduction of fireworks-generated trash and debris is also considered a potential direct impact of fireworks display events. Direct impacts on avian species from fireworks-generated trash and debris that enter the water may be significant because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation (**Impact-BIO-3**). Mitigation measure **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts associated with fireworks-generated trash and debris. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB’s General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a

comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Implementation of **MM-BIO-1** would ensure that fireworks-generated trash and debris are collected and disposed of and that the use of non-biodegradable fireworks components is limited, which would reduce this potential direct impact on avian species to a less-than-significant level.

Other potential direct impacts on birds may occur if chemical residues that might fall into surface waters adversely affect water quality during and after the fireworks display events. These chemicals and metals, when present in large enough concentrations, have potential to accumulate in sediments, leach into groundwater, and negatively affect the health of humans and other organisms (Appendix F). However, results of water quality testing following the Big Bay Boom, as well as the more extensive and long-term SeaWorld fireworks display events, have shown no or limited temporal or spatial relationships in chemical levels, with the majority of constituents tested occurring at concentrations below detectable levels. Concentrations of perchlorate found in post-fireworks water quality samples for the Big Bay Boom and SeaWorld fireworks display events have been substantially less than 10 µg/L (i.e., less than 0.01 mg/L) and were generally in the 1-2 µg/L range, which is several orders of magnitude below the 10- to 100-mg/L range found to cause toxicity in fish and aquatic organisms in laboratory studies (Appendix F). Further toxicity testing and benthic community studies completed following SeaWorld fireworks displays indicate that the SeaWorld fireworks fallout zone is not degraded in comparison with adjacent reference sites (Appendix F). For these reasons, as well as the fact that birds spend less time in the water as compared to fish and other aquatic organisms, potential direct impacts on birds associated with reduced water quality from the proposed new displays would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval to reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront. The proposed ordinance requires implementation of post-display cleanup practices consistent with the requirements of SDRWQCB's General Permit, removal of fireworks packaging, implementation of best management practices, and a reduction in the amount of non-biodegradable fireworks components that can be used. The proposed ordinance also includes a condition of approval that would require the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan for each fireworks display event consistent with the requirements of SDRWQCB's General Permit. These conditions would require additional cleanup of fireworks-generated trash and debris from existing fireworks display events and that the use of non-biodegradable fireworks components is limited, thereby ensuring that avian species are not injured by mistakenly consuming waste. Additionally, the proposed ordinance includes a number of noise and light reduction requirements for fireworks display events, including existing displays that would occur during the breeding season. Compliance with the proposed ordinance would improve the existing condition by minimizing the disturbance experienced by avian species during existing fireworks display events and ensuring that noise and light from existing displays would not have any substantial adverse direct effects on avian species within San Diego Bay and the Imperial Beach Oceanfront. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in a direct significant adverse impact on avian species. No significant adverse impacts would occur.

Indirect Impacts

Proposed New Fireworks Display Events

Indirect impacts on sensitive avian species can include disturbance associated with increased boat and foot traffic in the vicinity of nesting and roosting locations, as well as human-generated trash. Fireworks spectators may trespass onto closed avian nest sites or roosting areas in order to obtain private viewing locations. This presently occurs at a low level during intensive Bay use periods such as summer holidays and weekends. However, under typical evenings, the trespass onto colony nesting sites by the public is low, particularly at night. During the proposed new fireworks display events, however, the likelihood of trespass would increase.

The study on NAB Coronado (Boylan and Nordstrom 2014) suggests that increased boat and foot traffic, trespass, and human-generated trash and debris during fireworks display events were possibly a greater threat to sensitive avian species than those associated with temporary noise and light disturbances from the fireworks themselves. Boylan and Nordstrom noted that illegal fireworks ignited immediately adjacent to nesting colonies, as well as increased foot traffic on sand dunes and beaches, caused the majority of disturbance to nesting California least tern during and immediately after fireworks display events. Additional indirect impacts could include increased trash associated with human use and noise associated with boating activity adjacent to nesting sites. The introduction of human-generated trash could also cause injury to sensitive birds because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. While many nesting sites for California least tern and western snowy plover in and around San Diego Bay are behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas may be significant (**Impact-BIO-4**). During fireworks display events, the Harbor Police Department currently assigns units to major patrol areas and deploys additional units on tidelands including bicycle and vessel units (Brick pers. comm.). The landside patrols provide law enforcement within the landside viewing areas, while the special patrol vessels provide law enforcement on the water. Consistent with its current operational practices, the Harbor Police Department would continue to deploy special patrol vessels and conduct in-water law enforcement during fireworks display events. These existing procedures ensure that boating laws are properly enforced in the Bay. In addition, the proposed ordinance contains several requirements that would reduce potential impacts on the biological resources of San Diego Bay. Implementation of **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-2** would reduce potentially significant indirect impacts on avian species from human trespass, increased boat traffic, and human-generated trash and debris to less-than-significant levels.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval to reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront, including the implementation of cleanup, security, signage, and education measures. Compliance with the proposed ordinance would improve the existing condition by reducing the indirect effects of trespass, increased boat traffic, and

human-generated trash on avian species during existing fireworks display events. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in any indirect significant adverse impacts on avian species. No significant adverse impacts would occur.

Marine Mammals

As with avian species, several studies have been completed to observe the potential for behavioral changes of marine mammals during fireworks display events. The impact analysis below relies on the results of the literature review of existing studies and surveys to draw conclusions regarding the potential effects on marine mammals from the proposed new fireworks display events along the National City and Chula Vista Bayfronts.

Direct Impacts

Proposed New Fireworks Display Events

Pacific harbor seals and California sea lions are very likely to occur within San Diego Bay. Neither species breeds within San Diego Bay, but both spend time foraging and loafing in the waters of the Bay. They are most common in the northern portion of the Bay, substantially decreasing in occurrence in the south Bay region where large schools of pelagic fish and opportunistic foraging and haul-out locations are reduced. California sea lions are rarely observed in the south Bay region. Similarly, while harbor seals occasionally haul out and loaf on intertidal rip rap, they prefer to haul out on protected sandy and rocky beaches, and no large haul-out areas for this species occur in San Diego Bay. This species is rarely observed in the south Bay region. Furthermore, several species of cetaceans, such as whales and dolphins, have low potential to occur in northern San Diego Bay, but have little likelihood of occurring in the south Bay in the vicinity of the proposed new fireworks display events along the National City and Chula Vista Bayfronts.

There are a number of reports that detail the responses of Californian sea lions and harbor seals to fireworks display events, and some peer-reviewed literature that describes the effects of non-pyrotechnic sources of sound and light on marine mammals. In order to provide a comprehensive review of this issue, a literature search was expanded to include non-pyrotechnic noise and light sources.

An observational study was performed before, during, and after the Big Bay Boom fireworks display event on July 4, 2015, to evaluate the behavior of hauled-out sea lions in response to the fireworks display event. The investigation was performed at the San Diego Bay Bait Barge in north San Diego Bay offshore of the Point Loma Naval installation, approximately 1.6 miles from the closest fireworks barge. Results indicated that sea lions experienced a moderate level of disturbance in response to the noise and light of the Big Bay Boom. This disturbance was indicated by increased vocalizations, head lifting, shifting position, and, in some cases, departing from the bait barge to adjacent waters. However, the study noted that this response was less than or commensurate to the response of the sea lions to ordinary boat traffic and people walking on the bait barge, and much less than intraspecific harassment of subordinate animals by large bull sea lions. A large percentage of vocalizations was due to aggressive bull sea lions challenging each other noisily, and several animals were observed diving into the water in response to challenges from large bulls. Disturbance associated with the 2015 Big Bay Boom was most noticeable following the initial detonations of fireworks; however, sea lions remaining on the bait barge settled into resting position for the duration of the fireworks display event. While focused studies have not been completed at other sites within the Bay, it is likely that fireworks display events that are generally shorter in duration

and/or are farther from marine mammal haul-out areas result in a smaller and less apparent disturbance response in marine mammals.

On July 4, 2016, another observational marine mammal monitoring study was conducted before, during, and after the existing Big Bay Boom fireworks display event. Similar to the 2015 Big Bay Boom observational study, the California sea lion response to the 2016 existing Big Bay Boom event was monitored. The 2016 monitoring also occurred at the San Diego Bay Bait Barge in north San Diego Bay. During the 2016 monitoring, California sea lions were constantly alerted by the public from boats approaching close to and stopping by the resting California sea lions, people in boats yelling at the sea lions, and aircraft flying in the vicinity. In the minute prior to the beginning of the survey, a fishing vessel docked at the northern end of the eastern bait barge to watch the Big Bay Boom fireworks. As they tied up to the dock, they yelled, raised their arms, and lunged at the 17 California sea lions that were hauled out and resting. This caused all 17 of the California sea lions to alert and flush into the water. No California sea lions returned to this location during the study. Disturbances to California sea lions from the Big Bay Boom fireworks caused all California sea lions within the study area to immediately alert and flush into the water. California sea lions did not return to the study area for the remainder of the observation period (40 minutes after the fireworks). It was also noted that all the California sea lions flushed from the west barge (outside of the study), as well. In contrast to the east bait barge, a small number of California sea lions (seven) returned to the northern end of that bait receiver approximately 10 minutes after the fireworks display ended. In contrast to the 2016 Big Bay Boom, the 2015 study for the Big Bay Boom fireworks display reported the majority of California sea lions remaining on the bait barge (Merkel & Associates 2015). Additionally, the 2015 study used vocalizations as an indicator for disturbance to California sea lions. This indicator was not used in the 2016 study because prior to the fireworks display the two study groups of California sea lions were sleeping or resting with only a few vocalizations recorded from only two adult males when shifting their resting position. The inconsistent response of California sea lions to the existing Big Bay Boom fireworks display at the bait barge from 2015 and 2016 indicates a variability in tolerance levels of disturbance from fireworks by California sea lions. Despite continuous disturbances to California sea lions at the bait barges—including natural, public, daily bait barge operations, and annual fireworks display events—California sea lions continue to return to and haul out in large numbers at the bait barges, including since the inception of the Big Bay Boom fireworks display in 2001.

It should be noted that the marine mammal observational studies at the San Diego Bay Bait Barge focused on animals in a very urban setting. The San Diego Bay Bait Barge is in an area of the Bay that receives a high level of boating and human activity. Recreational boats of all sizes regularly tie up at the bait barge and people walk along the bait barge to purchase bait and to fish. As such, the sea lion population at the bait barge is accustomed to human presence and noises from boat engines and people. While the recent studies did not involve long-term monitoring of the sea lion haul-out at the bait barge, they do provide a good insight into the response of the local population of sea lions to fireworks display events. Other smaller haul-out areas occur on channel marker buoys and Zuniga Jetty, with a few small intermittent haul-outs also being within marina environments. No established haul-out areas are located in south San Diego Bay, and sea lions have a very low likelihood of occurrence in the vicinity of the proposed Chula Vista and National City Bayfront fireworks displays.

Results from the San Diego Bay studies are comparable to those of other studies including ongoing work in the Monterey Bay National Marine Sanctuary (MBNMS). In Monterey, the fireworks are detonated from a barge approximately 0.5 mile from the breakwater, where birds and marine mammals regularly haul out and/or rest. The barge in Monterey Bay is nearly 1 mile closer to

marine mammals than the bait barge observed in San Diego Bay during the Big Bay Boom event. Studies completed within the MBNMS (NMFS and MBNMS 2002) and the subsequent Environmental Assessment and proposed federal ruling (NMFS and MBNMS 2006; NMFS 2012) indicate that disturbance resulting from fireworks display events would be, at most, short-term flushing and evacuation of non-breeding haul-out sites by California sea lions and harbor seals in Monterey Bay. In the nearly two decades of observing sea lions at the City of Monterey's Fourth of July celebration, the following general observations were made: (1) sea lions become quiet and watchful as soon as fireworks commence; (2) juveniles begin leaving the breakwater as soon as the fireworks begin; (3) large bulls and the remaining adults depart to the water after an aerial salute or quick succession of loud effects; (4) individuals usually begin to return to the breakwater haul-out within a few hours of the end of the fireworks display event; and (5) sea lions are present on the breakwater at pre-fireworks display event numbers by the following morning (NMFS 2012). None of the studies within the MBNMS that directly observed California sea lions and/or harbor seals during fireworks display events found substantial long-term effects on these marine mammals. Studies at Vandenberg Air Force Base similarly indicate that the percentage of seals leaving the haul-out increases with noise levels up to approximately 100 A-weighted decibels (dBA), after which almost all seals enter the water; however, during many launches, marine mammals are not disturbed (U.S. Air Force 2013). Noise in the Vandenberg Air Force Base studies was generated from missile launches and not fireworks.

Studies completed in other marine areas have been inconclusive. Weigand and McChesney (2008) studied the effects of fireworks display events on harbor seals on Gualala Island, Sonoma County, California. The study did not find conclusive evidence of the effects of fireworks display events on the seals. Low-tide census counts were completed once per day during a 12-day study period. The study found that, in general, counts declined through the study period, with the lowest count found on the day of the fireworks display event. Furthermore, just before the Gualala fireworks display event began and while the island was still visible, observers did not locate any harbor seals from either vantage point on Gualala Point Island. Therefore, a link between a decline in numbers over the study period and the fireworks display event was not determined.

Recently, NMFS ruled on a request for an incidental harassment authorization from the St. George Reef Lighthouse Preservation Society (NMFS 2015). The Society proposes to conduct aircraft operations, lighthouse renovation, and light maintenance activities on the St. George Reef Light Station on Northwest Seal Rock off the coast of Northern California in the Pacific Ocean. The station currently supports populations of marine mammals including California sea lion and Pacific harbor seal, among other species. NMFS ruled that small evidence of disturbance to marine mammals, including alertness, head turning, or movement of less than 1 meter, in response to noise and activity was not considered to be harassment. Rather, NMFS ruled that only pinnipeds that move greater than 1 meter (3.3 feet) or change the speed or direction of their movement in response to the presence of humans or human-related noise and activity are considered behaviorally harassed.

In addition to direct behavioral disturbance, there has been concern that loud noises (such as from explosive detonations) could affect the physiology (e.g., hearing) of marine mammals (Weilgart 2007, 2011). A study published by Koper and Plön (2012) suggested high-intensity underwater sound can affect marine mammals by causing stress, perceptual interference, behavioral changes, and chronic responses, and indirect effects on predator species as a consequence of a change in prey distribution or abundance due to direct effects of sound on the prey. However, unlike underwater detonations or pile driving, fireworks display events are aerial. Zhang (2002) modeled the transmission of sound from air to water and found that sound pressures in the range produced by

fireworks display events generally decouple at the air-water interface. Studies completed at Vandenberg Air Force Base indicated no physiological response on the hearing of harbor seals following rocket launches with A-weighted Sound Exposure Levels between 96 and 104 dBA (NMFS 2002). Based on an analysis of existing data, NMFS adopted a conservative estimate of an A-weighted airborne sound intensity level of 128 dBA to elicit physiological damage to marine mammals within the MBNMS. Studies in the MBNMS and the recent studies in San Diego Bay associated with the 2015 Big Bay Boom indicate that the sound level of fireworks display events at haul-outs were in the range between 70 and 85 dBA (Merkel & Associates, Inc. 2015; NMFS 2012). Additional noise monitoring near haul outs in San Diego Bay during the 2016 Big Bay Boom fireworks display indicated 1-minute average (Leq) sound levels ranging from 57 to 76 dBA and maximum (Lmax) levels ranging from 62 to 89 dBA (ICF and MTS 2016). These data suggest that, for the current duration and configuration of the Big Bay Boom, the sounds generated by fireworks display events were not great enough to damage hearing of marine mammals at the habitual haul-out locations in the northern portion of the Bay. Notably, the peak sound levels at the San Diego Bait Barge during the course of monitoring were not generated by the 2015 fireworks display event, but by intraspecific aggression by vocalizing bull sea lions (Merkel & Associates, Inc. 2015). This indicates that noise generated by larger fireworks display events such as the Big Bay Boom does not likely result in long-term or permanent effects on cetaceans or pinnipeds in the water. It is reasonable to extrapolate downward and conclude that smaller scale fireworks display vents would have a lesser effect.

Results from the recent marine mammal study completed in San Diego Bay, along with the body of literature pertaining to the effects of fireworks display events and other loud noises on marine mammals, indicate that marine mammals experience a moderate level of temporary disturbance from noise and light associated with fireworks display events close to marine mammal haul-out areas. Based on the information above, fireworks display events do not appear to result in any long-term or permanent substantial adverse effects on marine mammals because temporary disturbance from noise and light is short term and infrequent and does not result in direct mortality, permanent behavioral changes, or physiological effects. However, as discussed above, this level of disturbance results in temporary disruption of behavioral patterns; nonetheless, in most instances, this disturbance is not considered harassment according to the recent NMFS ruling (NMFS 2015). The level of disturbance is likely to be lower for fireworks display events that are shorter in duration and/or located farther from known marine mammal haul-out areas. There is no evidence that long-term harm comes to disturbed sea lions or seals from such fireworks display events.

Implementation of the proposed new fireworks display events could result in potential direct impacts on marine mammals primarily from fireworks-generated debris, light, and noise. Similar to those for avian species, potential direct impacts on marine mammals could include increased noise and light from the proposed new displays, which could result in elevated stress response. In addition, the introduction of fireworks-generated trash and debris could cause injury to marine mammals because the marine mammals may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. As discussed above, Pacific harbor seals and California sea lions are very likely to occur within San Diego Bay. Neither species breeds within San Diego Bay, but both spend time foraging and loafing in the waters of the Bay. However, as described above, both species are most common in the northern portion of the Bay, substantially decreasing in occurrence in the south Bay region. Additionally, due to the lack of haul-out areas in south San Diego Bay, increased light levels would only be apparent to marine mammals surfacing to breathe at the time of the fireworks detonation, further reducing the likelihood for disturbances to marine mammals.

Furthermore, several species of cetaceans, such as whales and dolphins, have a very low potential to occur in south San Diego Bay, especially in the vicinity of the proposed new fireworks display events along the National City and Chula Vista Bayfronts. Therefore, based on the limited presence of marine mammals and lack of haul-out areas in the southern portion of the Bay, the proposed new fireworks display events are not expected to result in disturbances to these species from increased noise and light associated with the displays. Consequently, the noise and light generated by the proposed new fireworks display events would not result in a significant direct impact on marine mammals.

Additionally, although marine mammals have a low potential to occur in the south Bay, marine mammals, if present, may inadvertently consume fireworks-generated trash and debris that enter the water, which could cause suffocation, starvation, or debilitation. Compared to other marine wildlife, marine mammals are less likely to consume trash and debris. Instead, the majority of injury to marine mammals from trash and debris is from entanglement (in fishing lines, nets, plastic bags, etc.) as marine mammals are curious and explore new items in their environment (Sea Lion Center 2017). Impacts on marine mammals from fireworks-generated trash and debris is unlikely due to low potential for occurrence of these species in the area, the relatively discriminating forage behavior of marine mammals, and the fact that the type of debris produced by fireworks (e.g., cardboard, paper, plastic casings) is not likely to cause entanglement. Therefore, direct impacts on marine mammals from fireworks-generated trash and debris would be less than significant.

Additionally, **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts associated with fireworks-generated trash and debris. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Implementation of **MM-BIO-1** would further reduce the potential for marine mammals to inadvertently consume fireworks-generated trash and debris.

Other direct potential impacts on marine mammals may occur if chemical residues that might fall into surface waters adversely affect water quality during and after the fireworks display events. These chemicals and metals, when present in large enough concentrations, have the potential to accumulate in sediments, leach into groundwater, and negatively affect the health of humans and other organisms (Appendix F). However, results of water quality testing following the Big Bay Boom, as well as the more extensive and long-term SeaWorld fireworks display events, have shown no or limited temporal or spatial relationships in chemical levels, with the majority of constituents tested occurring at concentrations below detectable levels. Concentrations of perchlorate found in post-fireworks water quality samples for the Big Bay Boom and SeaWorld displays have been substantially less than 10 µg/L (i.e., less than 0.01 mg/L) and were generally in the 1-2 µg/L range, which is several orders of magnitude below the 10- to 100-mg/L range found to cause toxicity in fish and aquatic organisms in laboratory studies (Appendix F). Further toxicity testing and benthic community studies completed following SeaWorld fireworks displays indicate that the SeaWorld fireworks fallout zone is not degraded in comparison with adjacent reference sites (Appendix F). For these reasons, potential direct impacts on marine mammals associated with reduced water quality from the proposed new displays would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval that would reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront. The proposed ordinance requires specific packaging materials, best management practices, and implementation of post-display cleanup practices consistent with the requirements of the General Permit, as well as a reduction in the amount of non-biodegradable fireworks components that can be used. These measures would ensure that fireworks-generated trash and debris from existing fireworks display events are collected and disposed of and that the use of non-biodegradable fireworks components is limited, thereby ensuring that marine mammals are not injured by mistakenly consuming waste. Additionally, the proposed ordinance includes a number of noise and light reduction requirements for fireworks display events. Furthermore, the proposed ordinance requires all fireworks organizers to obtain all necessary permits from the appropriate regulatory agencies. Compliance with the proposed ordinance would improve the existing condition by minimizing the disturbance experienced by marine mammals during existing fireworks display events and ensuring that noise and light from existing displays would not have any substantial adverse direct effects on marine mammals within San Diego Bay and the Imperial Beach Oceanfront. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in a direct significant adverse impact on marine mammals. No significant adverse impacts would occur.

Indirect Impacts

Proposed New Fireworks Display Events

Indirect impacts on marine mammals from proposed new fireworks display events could include disturbance associated with increased boat and foot traffic and increased human-generated trash and debris. A study by Wells and Scott (1997) linked the increase of boating activities over holidays and in particular the Fourth of July weekend to an increase in the number of injuries to marine mammals (dolphins and manatees). While the species in that study differ from those present in San Diego Bay, the proposed new nighttime fireworks display events in San Diego Bay are anticipated to result in an increase in vessel activities on the four nights when the proposed new fireworks display events occur. Consequently, the potential for collisions to occur increases. The Wells and Scott (1997) study did not link injuries directly to fireworks display events, but to increased boat traffic over the summer holiday weekend. Other studies (Janik and Thompson 1996; Mattson et al. 2005; Nowacek et al. 2001) have described pronounced behavioral response of dolphins (increased swimming speed, diving, and evasive maneuvers) to the presence of personal watercraft. None of these studies focused specifically on the effects of increased nighttime boating traffic from fireworks display events; however, the potential increased use of water craft associated with the proposed new fireworks display events is considered a potential indirect effect.

Conversely, observations at the MBNMS found that increased human usage (e.g., boating, kayaking, fishing, diving, swimming, surfing, picnicking, beach combing and tidepooling) of waters adjacent to fireworks display events increased gradually over the hours leading to fireworks display events (NMFS 2012). This human usage occurred in areas of the MBNMS with the highest levels of human activity. Marine mammals in the area were observed to temporarily depart the area during the hours immediately prior to the beginning of the fireworks display event. However, NMFS noted that

boaters traveled slowly and followed boating regulations, and that marine mammals returned to haul-out areas following fireworks display events. No direct observations of disturbance or injury from human activity were noted.

In San Diego Bay, similar to the MBNMS, the proposed new fireworks display events are located in areas of relatively high existing boating and human use associated with recreational, commercial, and military activities. However, after dark, recreational boating activity is much less common and nighttime boating speeds are typically much slower than daytime boating speeds. Boating activity generally increases during holidays and weekends, which consequently results in a higher risk of animal collision that is not associated with fireworks display events.

As discussed above, Pacific harbor seals and California sea lions are most common in the northern portion of the Bay where a majority of the haul-out areas are located, substantially decreasing in occurrence in the south Bay due to the lack of haul-out areas. Additionally, cetaceans such as whales and dolphins have a very low potential to occur in the vicinity of the proposed new fireworks display events. Therefore, based on the limited presence of marine mammals and lack of haul-out areas in the southern portion of the Bay, the proposed new fireworks display events are not expected to result in disturbances to these species from increased boating and human activity. In addition, although marine mammals have a low potential to occur in the south Bay, marine mammals, if present, may mistakenly consume human-generated trash and debris, which could cause suffocation, starvation, or debilitation. This is unlikely due to the low potential for occurrence of these species, the relatively discriminating forage behavior of marine mammals, and the fact that the type of human-generated debris (e.g., bottles, cans, food wrappers) is not likely to cause entanglement. Therefore, the proposed new fireworks display events would not result in a significant indirect impact on marine mammals.

Additionally, **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup and education measures. Implementation of **MM-BIO-2** would further reduce the potential for the proposed new fireworks display events to result in indirect effects on marine mammals.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval that would reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront, including the implementation of cleanup and education measures. Compliance with the proposed ordinance would improve the existing condition by reducing potential indirect effects on marine mammals associated with increased boating and human activity and increased human-generated trash during existing fireworks display events. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in a significant adverse indirect impact on marine mammals. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Implementation of the proposed project would have a substantial adverse effect, either directly or through habitat modifications, on a species identified as a candidate, sensitive, or special-status

species in local or regional plans, policies, or regulations, or by CDFW and USFWS. Potentially significant impact(s) include:

Impact-BIO-1: Potential Direct Impact on Marine Reptiles from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to green sea turtles because the turtles may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on green sea turtles from fireworks-generated trash and debris that enter the water may be significant.

Impact-BIO-2: Potential Indirect Impacts on Marine Reptiles from Increased Human and Boating Activity. The increase in boat traffic, particularly nighttime and out-of-channel traffic, would increase the potential for propeller strikes, which may cause injury to or death of green sea turtles. Increased boating activities could cause the animals to temporarily depart the project area before, during, and after the time of the proposed new fireworks display events to avoid higher vessel traffic. The increase in activity may also affect the turtles' foraging habits in that individuals may spend more time underwater, swim at greater speeds, and alter other life history traits leading to greater energy expenditure. The introduction of human-generated trash could also cause injury to turtles if they mistakenly consume the waste, causing suffocation, starvation, or debilitation. These potential indirect impacts on marine reptiles may be significant.

Impact-BIO-3: Potential Direct Impact on Avian Species from Fireworks-Generated Trash and Debris. The introduction of fireworks-generated trash and debris could cause injury to avian species because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. Direct impacts on avian species from fireworks-generated trash and debris that enter the water may be significant.

Impact-BIO-4: Potential Indirect Impacts on Special-Status Avian Species from Increased Human and Boating Activity. The proposed new fireworks display events have the potential to result in indirect impacts on special-status avian species, particularly California least tern and western snowy plover, as a result of increased foot traffic on sand dunes and beaches that can cause disturbance to nesting sites during and immediately after the proposed new fireworks display events. Additional indirect impacts potentially include increased trash associated with human use and noise associated with boating activity adjacent to nesting sites. The introduction of human-generated trash could also cause injury to special-status birds because the birds may mistakenly consume the waste, which could cause suffocation, starvation, or debilitation. While many nesting sites for California least tern and western snowy plover in San Diego Bay are behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts related to increased boat traffic, foot traffic, and human-generated trash and debris in the vicinity of nesting and roosting areas may be significant.

Mitigation Measures

Proposed New Fireworks Display Events

MM-BIO-1: Implementation of Biological Resources-Related Conditions of the Proposed Ordinance for Direct Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(d) Fireworks Chemical Composition and Packaging.

2. Packaging.

- A. Prior to commencement of a fireworks display event, the fireworks operator shall remove and properly dispose of all packaging, wrapping and labels from all fireworks to be used in the event.
- B. Fireworks that include a plastic outer casing or non-biodegradable inner components that make up more than five (5) percent of the mass of the shell or device are prohibited.

(f) Best Management Practices (BMPs). Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:

1. Fireworks display events on barges shall be set up at a loading facility in accordance with the requirements and under the supervision of the municipal fire department with jurisdiction over the event. Barges shall be inspected for leaks and other potential safety issues. Idling time for delivery trucks and loading equipment shall not exceed three (3) minutes and all such trucks and equipment shall be shut down when not in use.
2. Fireworks shall be brought to the barge and loaded in their California Department of Transportation (DOT)-approved shipping cartons. Fireworks shall be encased in paper to prevent spillage of loose compounds. All packaging material and debris, including fuses, wires, shipping cartons and other wrapping, shall be properly disposed of in trash receptacles as the fireworks display event is set up. Unless prohibited by the municipal fire marshal with jurisdiction over the fireworks display event, barges shall be equipped with a fire-retardant debris barrier that extends six feet (6') in height, with openings no larger than ¼ inch, around the perimeter of the Fireworks launch area to contain debris.
3. Wires from the electric match placed in the fireworks fuse shall be wrapped around nails that are installed on the racks to prevent wires from being pulled out and falling into the water. Wire cables connected to computer firing equipment modules shall also be properly secured to ensure they remain on the barge during the fireworks display event.
4. Once the fireworks are prepared for launch, all trash and debris shall be removed from the barge while it is at the loading facility and prior to the barge being moved into position. No loose material shall be allowed on the barges during the fireworks display event.
5. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the fireworks display event, the fireworks operator shall pick up all loose material on the barge, including all trash and debris resulting from the discharge of the fireworks, to prevent it from being discharged into the water while the barge is underway.
6. Upon return to the loading facility, the fireworks operator shall clean the barge of all fireworks related material and shall photograph and properly dispose of all fireworks trash and debris. Unexploded fireworks and related components shall be collected and disposed of by the fireworks operator in accordance with all applicable regulations. fireworks operators shall photograph the barge prior to and after cleaning.

7. Following the fireworks display event and upon expiration of any safety period required by the municipal fire marshal with jurisdiction over the event, the fireworks organizer shall provide cleanup crews and boats to conduct sweeps of the fireworks detonation zone to gather any floating debris from spent fireworks using hand held fishnets, pool skimmers, or other similar equipment.
 8. The morning after the fireworks display event, the fireworks organizer shall conduct another sweep of the fireworks detonation zone and quays, piers and docks adjacent to the fireworks detonation zone to remove fireworks trash and debris. The fireworks organizer shall collect, bag, weigh and photograph all trash and debris collected prior to its disposal.
 9. The morning after the fireworks display event, the fireworks organizer shall perform a cleanup of the shoreline using crews of not fewer than five persons per barge on the shoreline adjacent to each barge location. Each crew member shall be equipped with trash bags and a trash grabber. The fireworks organizer shall collect, bag, weigh, and photograph all trash and debris collected prior to its disposal.
 10. Within five (5) business days after a fireworks display event, the fireworks organizer shall provide the Executive Director with the photographs and written evidence of the weight of the fireworks trash and debris collected pursuant to subdivisions (5) through (9) above. If the weight of the fireworks trash and debris collected is less than fifty percent (50%) of the net weight of fireworks launched during the fireworks display event, the fireworks organizer shall offset the remaining amount by providing a crew of not fewer than two (2) persons for each barge or other launch site used in the fireworks display event to participate in the next scheduled "Operation Clean Sweep" or other District-sponsored clean-up event prior to the end of the calendar year to recover trash and debris from San Diego Bay and/or the Imperial Beach Oceanfront.
- (h) Compliance with San Diego Water Board General Permit.
1. Prior to the Executive Director's issuance of a permit pursuant to this article, the Applicant shall demonstrate that it has applied for coverage and has been enrolled under the San Diego Water Board General Permit.
 2. The Applicant shall comply with all applicable terms, conditions and Best Management Practices required by the San Diego Water Board General Permit, which shall be incorporated into and considered in the terms, conditions and Best Management Practices of any permit issued by the Executive Director pursuant to this article.
 3. The Applicant shall submit to the District copies of all applications, plans, reports and other documentation required by the San Diego Water Board General Permit, including without limitation the Notice of Intent, Fireworks Best Management Practices Plan, Public Fireworks Display Log and the Public Display of Fireworks Post Event Report, within the time required for the submission of such reports to the San Diego Water Board.
- (i) Compliance with Other Required Permits: Prior to the Executive Director's issuance of a Permit pursuant to this article, the Applicant shall demonstrate that it has obtained and shall comply with all other permits and approvals required by federal, state and local laws and regulations including, without limitation, such permits and approvals as are required by

the United States Coast Guard, California Coastal Act, the District Code, including Article 10 (Stormwater Management and Discharge Control), and the fire marshal of any city which has jurisdiction over all or any part of the activity allowed under said Permit.

- (j) **Compliance with Laws:** The Applicant shall comply with any and all applicable rules and regulations promulgated by the District, including without limitation the District Code, the Chula Vista Bayfront Master Plan Settlement Agreement and Natural Resources Management Plan, and with the laws, rules and regulations of the United States of America and the State of California, and of any department or agency thereof, and with the applicable ordinances, rules and regulations of any city which has jurisdiction over all or any part of the activity allowed under said Permit. The Applicant's failure to comply with any applicable law, ordinance, rule or regulation shall be cause for immediate revocation of said permit and for the denial of applications for future Permits.

MM-BIO-2: Implementation of Biological Resources–Related Conditions of the Proposed Ordinance for Indirect Impacts. The fireworks organizer and operator are required to comply with the following biological resources–related condition of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

- (e) **Protection of Species and Habitat.** The following conditions shall apply to fireworks display events that occur between February 15 and September 15 (i.e., avian breeding season) and are located less than one (1) mile from any federally or state-listed avian species nesting colonies:
3. **Security.** For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one-half mile of unprotected (i.e., unfenced) federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall provide a minimum of two professional security guards to direct persons away from and to discourage trespass into sensitive nesting areas or habitat during such displays.
 4. **Signage.** For fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) that occur within one half-mile of nesting colonies or habitat areas for federally or state-listed species, the fireworks organizer, in cooperation with the District, shall post temporary signage along primary access points to sensitive nesting colonies and habitat areas to identify safe viewing locations, to educate visitors on locations of sensitive wildlife habitats, to prevent viewers from trespassing into sensitive areas and to encourage appropriate viewing behavior.
 5. **Education.** Beginning not less than seven (7) days before fireworks display events with public viewing areas (i.e., parks, promenades, publicly accessible piers, and other similar facilities) located within one-half mile of federally or state-listed nesting colonies or habitat areas, the fireworks organizer shall implement a public education program using social media, press releases, and information posted at parks, boat launch facilities, marinas, yacht clubs and other viewing locations, to educate potential viewers regarding appropriate viewing and boat docking areas, to discourage trespass into sensitive wildlife habitat, and to reminds viewers of appropriate viewing behavior in and near

sensitive nesting colonies and habitat areas (e.g., appropriate disposal of trash, prevention of illegal fireworks, and safe boating procedures).

- (f) Best Management Practices. Fireworks display events shall implement the following BMPs for fireworks display event preparation, discharge and clean-up:

11. For all Fourth of July fireworks display events and for Non-Fourth of July fireworks display events which are advertised to the public, the fireworks operator shall double the number of trash receptacles at major viewing areas prior to each fireworks display event; trashcans shall be emptied and parks and viewing areas shall be cleaned following the event.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Direct impacts on marine reptiles and avian species could occur from the introduction of fireworks-generated trash and debris that may enter the water, which could cause injury to these species because they may mistakenly consume the waste, potentially causing suffocation, starvation, or debilitation (**Impact-BIO-1** and **Impact-BIO-3**). However, **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Implementation of **MM-BIO-1** would ensure that fireworks-generated trash and debris are collected and disposed of, which would reduce this potential direct impact on green sea turtles and avian species to a less-than-significant level.

Indirect impacts on marine reptiles could occur as a result of increased boat traffic and human-generated trash entering the marine environment (**Impact-BIO-2**). Additionally, indirect impacts on sensitive avian species include disturbance associated with increased human activity in the vicinity of nesting colonies, as well as human-generated trash and debris (**Impact-BIO-4**). However, **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, including the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-2** would ensure that significant indirect impacts on green sea turtles and avian species from increased boat traffic, trespass, and human-generated trash and debris would be less than significant.

Furthermore, in accordance with the Chula Vista Bayfront Settlement Agreement and Natural Resources Management Plan (May 2016), proposed new fireworks display events that would occur within the Chula Vista Bayfront area during the least tern nesting season, which would include a Fourth of July event, are required to monitor the nesting colonies and be in full regulatory compliance with all applicable water quality and species protection regulations.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 2: Implementation of the proposed project would have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by CDFW, NMFS, or USFWS.

Threshold 3: Implementation of the proposed project would have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA through direct removal, filling, hydrological interruption, or other means.

Impact Discussion

The primary direct impacts from the proposed new fireworks display events on habitat of San Diego Bay could include increased trash from discharged shells, including paper and cardboard waste and the remains of fuses, as well as reduced water quality. Additionally, fireworks barges and tugboats that maneuver and hold the barges into place could damage eelgrass. The primary indirect impacts on habitats and wetlands of San Diego Bay could include increased boat traffic, increased foot traffic in sensitive areas, and human-generated debris.

Direct Impacts

Proposed New Fireworks Display Events

Fireworks-Generated Trash and Debris

Fireworks display events can result in a substantial amount of paper, cardboard, and some cotton, metal, and plastic waste. In San Diego Bay, fireworks for the proposed new displays would be launched from barges, and the waste resulting from exploded shells could fall primarily into the waters of the Bay. It is anticipated that some of this debris would sink to the bottom, and a smaller amount would wash onto adjacent shorelines. The exact total volume of trash and debris that would be generated by the proposed new fireworks display events in south San Diego Bay is unknown; however, it is estimated that the net weight of pyrotechnic materials in an aerial fireworks shell (Class B) is typically about half (i.e., 50 percent) the total weight (Appendix F). According to the Water Quality Technical Report prepared for the proposed project (Appendix G), the weight of the debris recovered from the detonation barges combined with the dry weight of the debris collected from the surrounding waters should equal approximately one-half of the total display weight. Therefore, if the total weight of recovered debris is less than this, it can be assumed that this unaccounted portion remains in the water and surrounding habitat.

Furthermore, the fallout area for the aerial debris is determined by local wind conditions. While this area is variable between sites and events, long-term studies performed within the MBNMS indicate that the bulk of the debris will fall to the surface within a 0.5-mile (0.8-kilometer) radius of the launch site (NMFS 2012). NMFS noted that heavier trash, such as cardboard casings, land closer to the launch site, while lighter trash, such as cotton and plastic waste, travel farther propelled by winds. The MBNMS conducted surveys of solid debris on surface waters, beaches, and subtidal habitat and found no visual evidence of acute or chronic impacts on the environment or wildlife (NMFS and MBNMS 2006). However, cleanup activities immediately following fireworks display

events did collect debris in some instances (including cardboard cylinders, disks, and shell case fragments; paper strips and wadding; plastic wadding, disks, and tubes; aluminum foil; cotton string; and even whole unexploded shells) from waters and beaches of Monterey Bay.

The majority of wetlands and sensitive habitats (e.g., eelgrass beds) within San Diego Bay occur in the southern portion of the Bay. The largest of the San Diego Bay wetlands include the Sweetwater River, Otay River, Chula Vista Wildlife Reserve, South San Diego Bay NWR, and Telegraph Creek. Eelgrass coverage varies annually, and represents approximately 10 percent of the habitat within the Bay. Salt marshes occur over approximately 800 acres of the Bay, or approximately 4 percent of the habitat within the Bay (U.S. Navy 2013). The proposed new fireworks display events are anticipated to take place off barges that would be moved to their locations and held in place by a tugboat. Based on the trash generation percentages described above, it can be assumed that approximately 228 pounds of debris would be generated by each of the proposed new Fourth of July fireworks display events and approximately 57 pounds of debris would be generated by each of the proposed new non-Fourth of July fireworks display events, some of which may remain in the water following the display and potentially degrade sensitive habitats or wetlands within the south Bay.

Fireworks-generated trash and debris could degrade sensitive habitats and wetlands. Direct impacts on sensitive habitats and federally protected wetlands of south San Diego Bay from fireworks-generated trash and debris that enter the water may be significant (**Impact-BIO-5**). Mitigation measure **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts associated with fireworks-generated trash and debris. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Implementation of **MM-BIO-1** would reduce the amount of fireworks-generated trash and debris that enters or remains in the Bay and would limit the use of non-biodegradable fireworks components. Furthermore, the anticipated wide dispersal of any remaining amount of largely cellulose-based trash and debris generated from the proposed new fireworks display events is not anticipated to result in a reduction in the amount or quality of sensitive habitats or wetlands within the Bay. Accordingly, direct impacts on sensitive habitats and federally protected wetlands in San Diego Bay due to fireworks-generated trash and debris would be less than significant with implementation of the conditions of approval contained in the proposed ordinance (**MM-BIO-1**).

Reduced Water Quality

Potential impacts on marine waters, habitats, and wetlands could also occur as a result of chemical residues that might fall into surface waters and affect water quality during and after the fireworks display events. Results of water quality testing following the Big Bay Boom, as well as the more extensive and long-term SeaWorld fireworks display events, have shown no or limited temporal or spatial relationships in chemical levels, with the majority of constituents tested occurring at concentrations below detectable levels. Perchlorate is the only chemical of concern that has consistently been measured in post-fireworks display water quality testing. Perchlorate, used as an oxidizer in propellants for fireworks, is recognized as an environmental contaminant that can harm fish and humans. However, concentrations of perchlorate found in post-fireworks water quality samples for the Big Bay Boom and SeaWorld displays have been substantially less than 10 µg/L (i.e.,

less than 0.01 mg/L) and were generally in the 1-2 µg/L range, which is several orders of magnitude below the 10- to 100-mg/L range found to cause toxicity in laboratory studies (Appendix F). Further toxicity testing and benthic community studies completed following SeaWorld fireworks display events indicate that the SeaWorld fireworks fallout zone is not degraded in comparison with adjacent reference sites (Appendix F). For these reasons, direct impacts of reduced water quality on habitats and wetlands of San Diego Bay from the proposed new fireworks display events would be less than significant.

Eelgrass

The subtidal waters of south San Diego Bay are typically shallow (ranging between -2.2 and -12 feet MLLW) (U.S. Navy 2013). An unvegetated moderately deep water channel provides safe navigation from the central portion of the Bay to the Chula Vista Marina. Two westerly branches to the Chula Vista Marina channel also occur; one extends to Emory Cove on the west side of the Bay and the other dead-ends into the shallow subtidal flats of the south Bay. An additional unvegetated channel occurs at the former South Bay Power Plant intake channel. Outside of these channels, the shallow flats of the south Bay support extensive eelgrass beds in very shallow to moderately shallow waters. In addition, eelgrass habitat provides important nursery habitat functions for fish and invertebrates and also provides substrate supporting eggs for various invertebrate species.

The positioning of fireworks barges over the shallow flats could result in direct impacts on eelgrass habitat and its nursery habitat functions, particularly at low tides. Impacts could occur as a result of temporary grounding or settling of barges and tugboats on the bottom at low tide. Additional impacts could occur from propeller wash or propeller drag from tugboats during barge maneuvering. Tugboats have large propellers and high thrust capacity that could dredge up eelgrass in shallow waters, even if grounding does not occur. This could result in temporary and/or permanent losses of eelgrass habitat. The potential for direct impacts on eelgrass is considered to be significant (**Impact-BIO-6**). Mitigation measure **MM-BIO-3** requires implementation of a biological resources-related condition of approval of the proposed ordinance that requires measures to avoid direct eelgrass impacts, as well as to monitor for and mitigate any unanticipated eelgrass impacts that do occur. This condition of approval requires completion of pre- and post-event eelgrass surveys where shallow water eelgrass occurs in areas at or near the fireworks launch sites; conducting tug operator training to ensure that the operators are advised of the eelgrass concern and take prudent steps to minimize risks such as remaining outside of eelgrass areas to the extent practicable; and controlling thrust rate and angle to minimize propeller wash. **MM-BIO-3** would reduce potential direct impacts on sensitive eelgrass habitat to less-than-significant levels.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several requirements that would reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront. The proposed ordinance requires specific packaging materials, best management practices, and implementation of post-display cleanup practices consistent with the requirements of the General Permit, as well as a reduction in the amount of non-biodegradable fireworks components that can be used. These measures would ensure that fireworks-generated trash and debris from existing fireworks display events are collected and disposed of and that the use of non-biodegradable fireworks components is limited. In

addition, the proposed ordinance includes a condition of approval that would require completion of pre- and post-event eelgrass surveys, conducting tug operator training to ensure that the operators are advised of the eelgrass concern, and controlling thrust rate and angle to minimize propeller wash. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in any direct significant adverse impacts on sensitive habitats or wetlands. No significant adverse impacts would occur.

Indirect Impacts

Proposed New Fireworks Display Events

San Diego Bay is an active military, commercial, and recreational port located in an urban setting. The majority of the shoreline of the Bay is developed. The proposed new fireworks display events could draw a large number of visitors and to the Bay, and the majority of visitors would view fireworks display events from the developed shorelines and parklands along the National City and Chula Vista Bayfronts. The potential increased number of visitors would likely result in increased amounts of human-generated trash and debris from picnics and parties along the shoreline, some of which could wash into adjacent Bay waters.

As mentioned, shallow vegetated habitat (e.g., eelgrass) occurs in the vicinity of the proposed new fireworks display events along the National City and Chula Vista Bayfronts. Increased boat traffic could result in minor damage to eelgrass beds through unauthorized anchoring and/or propeller dragging. The proposed new fireworks display events in south San Diego Bay are not anticipated to occur immediately adjacent to salt marshes; however, visitors that view the fireworks display events from kayaks or personal watercraft could drag watercraft onto shorelines adjacent to coastal salt marshes and inadvertently damage eelgrass or marsh habitat. Additionally, the proposed new fireworks display events could potentially attract crowds to the Silver Strand State Beach, some of whom may trespass into restricted beach areas that are utilized by sensitive avian species. Potential impacts on habitats may include trampling of vegetation and an increase of human-generated trash and litter.

Indirect impacts on habitats of San Diego Bay, including Silver Strand State Beach, from increased human-generated trash and debris, as well as inadvertent damage of sensitive habitats and wetlands (e.g., eelgrass and coastal salt marshes) caused by boat or foot traffic into these areas, may be significant (**Impact-BIO-7**). The proposed ordinance contains several requirements that would reduce potential impacts on the biological resources of San Diego Bay. Implementation of **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-2** would reduce potentially significant indirect impacts on wetlands and sensitive habitat from human trespass, increased boat traffic, and human generated trash and debris to less-than-significant levels.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval to reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront, including the implementation of cleanup, security, signage, and education measures. Compliance with the proposed ordinance would

improve the existing condition by reducing the potential indirect effects of trespass, increased boat traffic, and human-generated trash and debris during existing fireworks display events on sensitive habitat or wetlands. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in any significant adverse indirect impacts on sensitive habitats or wetlands. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would have a substantial adverse effect on riparian habitat and/or other sensitive natural communities identified in local or regional plans, policies, or regulations, or by CDFW, NMFS, or USFWS. The proposed new fireworks display events would also have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA through direct removal, filling, hydrological interruption, or other means. Potentially significant impact(s) include:

Impact-BIO-5: Potential Direct Impact on Sensitive Habitat and Wetlands from Fireworks-Generated Trash and Debris. The waste resulting from exploded fireworks shells could fall primarily into the waters of San Diego Bay. It is anticipated that some of this debris could sink to the bottom, and a smaller amount could wash onto adjacent beaches and shorelines. Direct impacts on sensitive habitats and federally protected wetlands of south San Diego Bay from fireworks-generated trash and debris that enter the water are considered significant.

Impact-BIO-6: Potential Direct Impact on Eelgrass Habitat from Fireworks Barges and Tugboat Activity. The positioning of fireworks barges along the Chula Vista Bayfront over the shallow flats could result in direct impacts on eelgrass habitat and its nursery habitat functions, particularly at low tides. Impacts could occur as a result of temporary grounding or settling of barges and tugboats on the bottom at low tide. Additional impacts could occur from propeller wash or propeller drag from tugboats during barge maneuvering. Tugboats have large propellers and high thrust capacity that could dredge up eelgrass in shallow waters, even if grounding does not occur. Potential direct impacts on eelgrass habitat are considered significant.

Impact-BIO-7: Potential Indirect Impact on Sensitive Habitat and Wetlands from Increased Human and Boating Activity. Increased boat traffic could result in minor damage to eelgrass beds through unauthorized anchoring and/or propeller dragging. Additionally, visitors that view the proposed new fireworks display events from kayaks or personal watercraft could drag these watercraft onto shorelines adjacent to coastal salt marshes and inadvertently damage eelgrass or marsh habitat. The proposed new fireworks display events could attract crowds to the Silver Strand State Beach, some of whom may trespass into restricted beach areas that are utilized by sensitive avian species. Potential impacts on habitats include trampling of vegetation and an increase of human-generated trash and litter. Indirect impacts on sensitive habitat and wetlands of south San Diego Bay would be significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not have a substantial adverse effect on riparian habitat and/or other sensitive natural communities identified in local or regional plans, policies, or regulations, or by CDFW, NMFS, or USFWS. In addition, the

effects of the proposed ordinance on existing fireworks display events would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA through direct removal, filling, hydrological interruption, or other means. No significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

Implement **MM-BIO-1** and **MM-BIO-2** as described under Threshold 1.

MM-BIO-3: Implementation of the Biological Resources-Related Conditions of the Proposed Ordinance for Direct Eelgrass Impacts. The fireworks organizer and operator are required to comply with the following biological resources-related conditions of the proposed ordinance.

Section X.07 – Permits – Conditions of Approval

(g) Eelgrass Avoidance and Mitigation. For fireworks display events with launching sites located in shallow water with the potential for eelgrass to occur, fireworks barges shall be held in place by tugboats and shall not require temporary moorings. To the extent practicable, barges shall be located in unvegetated deep water channels outside of eelgrass beds. Pre-event and post-event eelgrass surveys shall be completed to identify the distribution of eelgrass to assist tug operators and to assess any impacts to eelgrass that may occur. Through a pre-event training, tug operators shall be made aware of shallow eelgrass and instructed not to use high thrust in the vicinity of eelgrass beds. If an unanticipated impact to eelgrass occurs, this impact shall be mitigated by replacing the eelgrass at a ratio determined by the California Eelgrass Mitigation Policy.

Level of Significance after Mitigation

Potential direct impacts on marine habitats, sensitive habitats, and wetlands include increased trash from discharged shells, including paper and cardboard waste, and the remains of fuses (**Impact-BIO-5**). In addition, direct impacts on eelgrass could potentially occur as a result of temporary grounding or settling of barges and tugboats on the bottom at low tide, as well as from propeller wash or propeller drag from tugboats during barge maneuvering (**Impact-BIO-6**). Potential indirect impacts on sensitive habitat and wetlands include physical damage, boat traffic, and trash and debris from increased human activity during the proposed new fireworks display events (**Impact-BIO-7**). These potential indirect impacts could occur at eelgrass beds and salt marshes primarily in south San Diego Bay, as well as restricted beach areas that are utilized by sensitive avian species at Silver Strand State Beach. The proposed ordinance contains several conditions of approval that would ensure the protection of the biological resources of San Diego Bay. Mitigation measures **MM-BIO-1** and **MM-BIO-2** require implementation of the biological resources-related conditions of the proposed ordinance, which include cleanup measures, education, signage, and security patrols employed to encourage visitors to remain in designated viewing areas and to employ safe boating procedures. In addition, **MM-BIO-3** requires completion of pre- and post-event eelgrass surveys, conducting tug operator training to ensure that the operators are advised of the eelgrass concern, and controlling thrust rate and angle to minimize propeller wash for potential direct impacts on eelgrass habitat. Implementation of **MM-BIO-1** through **MM-BIO-3** would ensure that significant

direct and indirect impacts on these sensitive habitats would be reduced to less-than-significant levels.

Threshold 4: Implementation of the proposed project would interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

Impact Discussion

Potential physiological and behavioral responses to proposed new fireworks display events by resident and migrating avian, marine mammal, and marine reptile species within the project area are analyzed under Threshold 1 above. The analysis under Threshold 1 focused on impacts on specific wildlife, including marine mammals, marine reptiles, and birds. The following analysis focuses on whether the proposed new fireworks display events would interfere substantially with the movement of native resident or migratory fish or wildlife species or established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. In addition, eelgrass habitat provides important nursery habitat functions for fish and invertebrates and also provides substrate supporting eggs for various invertebrate species.

Direct Impacts

Proposed New Fireworks Display Events

San Diego Bay does not provide any terrestrial movement corridors, and no marine mammal, reptile, or fish migratory corridors occur within it. However, the southern portions of the Bay, including the South San Diego Bay Unit of the San Diego Bay NWR, provide stopover habitat for migrating waterfowl and shorebirds. Additionally, the south San Diego Bay also provides nesting habitat for migratory avian species, and green sea turtles swim in and out of the Bay, as well. There are no existing fireworks display events requiring a discretionary action by the District or operated by the District's tenants occurring in south San Diego Bay. The proposed new fireworks display events would be close to sensitive wetland habitats within San Diego Bay that provide stopover habitat for migrating waterfowl and shorebirds and nesting habitat for sensitive avian species.

As discussed above, the evidence presented from the studies and surveys evaluated in the literature review and described under Threshold 1 above indicates that noise and light produced by fireworks display events do disturb California least terns at their nesting colonies. Studies have not shown birds to abandon nests; however, increases in running, flying, and alarm calls in response to fireworks display events have been observed, indicating a moderate level of temporary disturbance. As described in Section 4.3.4.2, *Thresholds of Significance*, biological resources impacts would be considered significant if the proposed project would interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites. Based on the information presented under Threshold 1 above, the proposed new fireworks display events are not anticipated to interfere substantially with the movement of any avian species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites (i.e., nesting colonies) because temporary disturbance from noise and light would be short term and infrequent and would not result in direct mortality of birds, a decrease in productivity, or long-term

changes in behavior (e.g., colony abandonment). Additionally, the proposed ordinance includes a number of noise and light reduction requirements for fireworks display events that would occur during the breeding season, which would further reduce the temporary disturbance experienced by migrating avian species.

As discussed above and in Appendix F, sound pressures in the range produced by fireworks display events generally decouple at the air-water interface. This suggests that increased noise from fireworks display events would minimally affect marine mammals and marine reptiles in the water that would potentially be migrating through San Diego Bay. Additionally, increased light levels would only be apparent to marine mammals and marine reptiles surfacing to breathe at the time of the fireworks display events as they pass along the National City and Chula Vista Bayfronts. As mentioned, based on the limited presence of marine mammals and lack of haul-out areas in the southern portion of the Bay, potential disturbances to these species from increased noise and light associated with the proposed new fireworks display events is further reduced. As such, the proposed new fireworks display events would not interfere substantially with the movement of any marine species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

It is not anticipated that fireworks-generated trash and debris would result in a change in migration patterns or abandonment of migration corridors. Overall, due to a lack of defined movement corridors within the study area and the short duration of fireworks display events, they are unlikely to result in long-term alteration of migratory patterns or abandonment of nesting sites. Consequently, it is not anticipated that fireworks-generated debris, light, and noise would alter the migratory patterns of any species or render nesting sites inhospitable. Therefore, direct impacts of the proposed new fireworks display events on wildlife corridors, movement of resident and migratory species, and usage of nursery sites would be less than significant.

Furthermore, the proposed ordinance requires the removal and proper disposal of all fireworks packaging materials, best management practices, and implementation of post-display cleanup practices consistent with the requirements of the General Permit, as well as a reduction in the amount of non-biodegradable fireworks components that can be used. The proposed ordinance also includes a number of noise and light reduction requirements for fireworks display events that occur during the nesting season. Compliance with the proposed ordinance would reduce the potential effects of fireworks noise and light on migrating and nesting species and ensure that fireworks-generated trash and debris are collected and disposed of and that the use of non-biodegradable fireworks components is limited, which would further reduce the potential for the proposed new fireworks display events to result in changes in migration patterns or abandonment of migration corridors. As discussed under Thresholds 2 and 3 above, impacts on eelgrass beds and its nursery habitat functions from potential propeller wash or launch barge grounding at the Chula Vista Bayfront launch site located over or near eelgrass would be considered a significant effect (**Impact-BIO-6**). This could result in temporary and/or permanent losses of eelgrass. However, implementation of **MM-BIO-3**, which requires implementation of the biological resources-related conditions of the proposed ordinance related to eelgrass, includes pre- and post-event eelgrass surveys, tug operator training to ensure that the operators are advised of eelgrass concerns, and thrust rate and angle requirements to minimize propeller wash for potential direct impacts on eelgrass habitat and its nursery functions. Impacts would be reduced to less-than-significant levels.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval that would reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront. The proposed ordinance requires implementation of post-display cleanup practices consistent with the requirements of SDRWQCB's General Permit, as well as a reduction in the amount of non-biodegradable fireworks components that can be used. The proposed ordinance also includes a condition of approval that would require the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan for each fireworks display event consistent with the requirements of SDRWQCB's General Permit. These conditions would require additional cleanup of fireworks-generated trash and debris from existing fireworks display events and that the use of non-biodegradable fireworks components is limited, thereby reducing the potential for migrating marine reptiles, avian species, and marine mammals to be injured by mistakenly consuming waste. Additionally, the proposed ordinance includes a number of noise and light reduction requirements for fireworks display events, including existing displays that would occur during the breeding season. Compliance with the proposed ordinance would improve the existing condition by minimizing the disturbance experienced by avian species, marine mammals, and marine reptiles during existing fireworks display events and ensuring that noise and light from existing fireworks display events would not alter the migratory patterns of any species or render nesting sites inhospitable within San Diego Bay and the Imperial Beach Oceanfront. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in any significant adverse direct impacts on wildlife corridors, movement of resident and migratory species, or usage of nursery sites. No significant adverse impacts would occur.

Indirect Impacts

Proposed New Fireworks Display Events

As stated above, San Diego Bay does not provide any terrestrial movement corridors, nor any marine mammal, reptile, or fish migratory corridors. However, the southern portions of the Bay, including the South San Diego Bay Unit of the San Diego Bay NWR, provide stopover habitat for migrating waterfowl and shorebirds. Additionally, the south San Diego Bay also provides nesting habitat for migratory avian species. Marine mammals only rarely occur in the south Bay region, but green sea turtles occasionally migrate in and out of the Bay. The proposed new fireworks display events would be closer to sensitive wetland habitats within the Bay that provide stopover habitat for migrating waterfowl and shorebirds and nesting habitat (e.g., wildlife nursery sites) for sensitive avian species.

Indirect impacts from human-generated debris, increased boat traffic, and human disturbance during and immediately after the proposed new fireworks display events could affect movement of resident or migrating species or use of nursery sites. As discussed under Threshold 1 above, indirect impacts on sensitive avian species from proposed new fireworks display events, such as increased foot traffic in or adjacent to nesting sites, increased human-generated trash, and noise associated with boating activity are potentially a greater threat to avian species than direct impacts. While many nesting sites for California least tern and western snowy plover in San Diego Bay are located behind fences or in secured areas, others are not, and even fenced sites are accessible by water.

Therefore, indirect impacts of the proposed new fireworks display events on wildlife corridors and movement of resident and migratory species are considered less than significant due to the short-term disturbance and would not result in changes in migratory movement or abandonment of stopover areas along migratory routes. However, indirect impacts on usage of nursery sites are considered potentially significant due to disturbance noted in nesting birds (**Impact-BIO-8**).

Mitigation measure **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-2** would reduce potentially significant indirect impacts on the usage of nursery sites by avian species to less-than-significant levels.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval to reduce potential impacts on the biological resources of San Diego Bay and the Imperial Beach Oceanfront, including the implementation of cleanup, security, signage, and education measures. Compliance with the proposed ordinance would improve the existing condition by reducing the indirect effects of human trespass, increased boat traffic, and human-generated trash and debris during existing fireworks display events on wildlife corridors, movement of resident and migratory species, and usage of nursery sites. Therefore, the effects of the proposed ordinance on existing fireworks display events would not result in any significant adverse indirect impacts on wildlife corridors, movement of resident and migratory species, or usage of nursery sites. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites. Potentially significant impact(s) include:

Please see the discussion regarding **Impact-BIO-1** through **Impact-BIO-4**.

Impact-BIO-8: Potential Indirect Impact on Usage of Nursery Sites from Increased Human Activity. Indirect impacts on protected avian species from proposed new fireworks display events, such as increased foot traffic in or adjacent to nesting sites, increased human-generated trash, and noise associated with boating activity, are potentially a greater threat than direct impacts. While many nesting sites for California least tern and western snowy plover in San Diego Bay are located behind fences or in secured areas, others are not, and even fenced sites are accessible by water. Therefore, indirect impacts of proposed new fireworks display events on usage of nursery sites are considered potentially significant due to disturbance noted in nesting birds.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

Mitigation Measures

Proposed New Fireworks Display Events

Implement **MM-BIO-1** and **MM-BIO-2** as described under Threshold 1.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

There is the potential for indirect impacts on sensitive avian species from proposed new fireworks display events, such as increased foot traffic in or adjacent to nesting sites, increased human-generated trash, and noise associated with boating activity. Indirect impacts of proposed new fireworks display events on usage of nursery sites are considered potentially significant due to disturbance noted in nesting birds (**Impact-BIO-8**). Mitigation measure **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance for indirect impacts, which include the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-2** would reduce potentially significant indirect impacts on the usage of nursery sites by avian species to less-than-significant levels.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 5: Implementation of the proposed project would conflict with any applicable local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Threshold 6: Implementation of the proposed project would conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

Impact Discussion

Proposed New Fireworks Display Events

The applicable local land use plans, policies, ordinances, or regulations of the District, adopted for the purpose of protecting biological resources, are the PMP, San Diego Unified Port District Code, Chula Vista Bayfront Master Plan NRMP, and INRMP. The District and the U.S. Navy Southwest Division maintain and implement the INRMP. The INRMP catalogues the plant and animal species around the Bay and identifies habitat types with the purpose of ensuring the long-term health, recovery, and protection of San Diego Bay's ecosystem in concert with economic, Naval, recreational, navigational, and fisheries needs. In addition, the District has established goals to protect, preserve, and enhance natural resources in San Diego Bay in Section II of the PMP, Planning Goals (Goal XI). The proposed new fireworks display events are within PMP Planning District 5 (National City Bayfront) and Planning District 7 (Chula Vista Bayfront).

In addition, while no fireworks display events are proposed within either Planning District 8 (Silver Strand South) or Planning District 9 (South Bay Salt Lands), the proposed new fireworks display events have the potential to result in indirect impacts on sensitive habitat within these Planning Districts. As discussed in Section 4.8, *Land Use and Planning*, the proposed project is consistent with the overarching goals of the PMP, including those pertaining to the protection of biological resources. Additionally, the proposed project is consistent with the Chula Vista Bayfront NRMP and the INRMP. Accordingly, the proposed project would not conflict with these local land use plans, policies, ordinances, or regulations protecting biological resources.

The District is not subject to the land use plans, regulations, or policies of the five member cities in which it has land under its jurisdiction, which include the cities of San Diego, Coronado, National City, Chula Vista, and Imperial Beach. For a single location development project, it is easy to isolate potential impacts and determine the applicable land use regulations binding on that project. In the case of a project that occurs entirely within the District's jurisdiction, the PMP would be the binding land use plan. However, because of the potential regional effects of the fireworks display events associated with the proposed project, potential direct and indirect impacts may extend beyond the location of the actual displays and affect biological resources in neighboring jurisdictions. For these reasons, the local policies and ordinances protecting biological resources for each of the five member cities should also be considered, as applicable.

San Diego and Chula Vista MSCPs

There are several other adopted habitat or natural community conservation plans that apply in the surrounding area. In the City of San Diego, local habitat, species, and biological resources are protected under the City's MSCP, which is implemented through the MSCP Subarea Plan (City of San Diego 1997). The City's MSCP Subarea Plan was developed to meet the requirements of the California Natural Communities Conservation Planning Act of 1992, and as such serves as the City's approved local natural community conservation plan. To implement its portion of the MSCP preserve, the City developed the MHPA, which is considered an urban preserve that delineates core biological resource areas and corridors targeted for conservation. The project sites are generally several miles outside the boundary of the nearest MHPA. The closest designated MHPA is approximately 1.25 miles south of the proposed barge location for the fireworks display events along the Chula Vista Bayfront, and encompasses the southeastern portion of the South San Diego Bay Unit of the San Diego Bay NWR (USFWS 2006). As discussed under Thresholds 3 and 4 above, the new fireworks display events proposed along the National City and Chula Vista Bayfronts in south San Diego Bay may result in direct impacts on this habitat from fireworks-generated trash and debris. Additionally, future fireworks display events proposed along the National City and Chula Vista Bayfronts may result in a number of indirect impacts, including minor damage to eelgrass beds as a result of unauthorized anchoring and/or propeller dragging associated with increased boat traffic, as well as from visitors who inadvertently enter eelgrass or salt marsh habitat while dragging their kayaks or other personal watercraft onto shorelines adjacent to coastal salt marshes. In addition, the proposed new fireworks display events may attract crowds to the Silver Strand State Beach, some of whom may trespass into sensitive beach areas that are utilized by sensitive avian species. Potential indirect impacts on habitats include trampling of vegetation and an increase of human-generated trash and litter. Other potential indirect impacts include inadvertent damage to sensitive habitats and wetlands (e.g., eelgrass and coastal salt marshes) caused by boat or foot traffic into these areas.

Additionally, portions of the Sweetwater Marsh Unit of the San Diego Bay NWR are within the Chula Vista MSCP planning subarea, particularly the eastern portion of the Otay River Valley (City of Chula Vista 2003). Similar to the City of San Diego MSCP Subarea Plan, the Chula Vista MSCP Subarea Plan was prepared to meet the requirements of the Natural Communities Conservation Planning Act of 1992 and serves as the City's approved local natural community conservation plan. The Chula Vista MSCP Subarea Plan identifies land targeted for conservation and designates that land for placement within their MSCP Preserve. As mentioned, the proposed new fireworks display events along the National City and Chula Vista Bayfronts may result in direct impacts on habitat within the Sweetwater Marsh Unit of the San Diego Bay NWR from fireworks-generated trash and debris. Additionally, these proposed new fireworks display events may potentially result in indirect impacts on habitat, particularly eelgrass beds, as a result of increased visitor and boat activity before, during, and after the fireworks display events. Any impacts on City of San Diego MHPA or City of Chula Vista MSCP Preserve lands, whether direct or indirect, would be significant. Consequently, the proposed project has the potential to conflict with the City of San Diego and City of Chula Vista MSCP Subarea Plans (**Impact-BIO-9**). As discussed above under Thresholds 2 and 3, **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1**

also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Additionally, **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance that would reduce potential indirect impacts on biological resources, including the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-1** and **MM-BIO-2** would reduce potentially significant direct impacts on habitat from fireworks-generated trash and debris and indirect impacts on habitat from human trespass, increased boat traffic, and human-generated trash and debris to less-than-significant levels. Consequently, potential impacts on City of San Diego MHPA or City of Chula Vista MSCP Preserve lands would also be reduced to a less-than-significant level. As such, the proposed project would not conflict with these two natural community conservation plans.

San Diego Bay National Wildlife Refuge

Particular areas in south San Diego Bay are also designated national wildlife refuges and reserves. One of these refuges is the San Diego Bay NWR, which is managed by USFWS. Accordingly, the applicable conservation and management plan for this refuge is also considered in the analysis. The San Diego Bay NWR consists of the Sweetwater Marsh and South San Diego Bay Units, which are collectively managed by USFWS through the San Diego Bay National Wildlife Refuge Comprehensive Conservation Plan (2006). This plan was prepared jointly with an Environmental Impact Statement in compliance with the National Environmental Policy Act. As mentioned, proposed new fireworks display events along the National City and Chula Vista Bayfronts may result in significant direct impacts on sensitive habitat within the San Diego Bay NWR from fireworks-generated trash and debris. Additionally, the South San Diego Bay Unit of the San Diego Bay NWR provides stopover habitat for migrating waterfowl and shorebirds. The south San Diego Bay also provides nesting habitat for migratory avian species, and marine turtles swim in and out of the Bay, as well.

It is not anticipated that fireworks-generated debris, light, and noise will alter the migratory patterns of any species, nor render nesting sites inhospitable. However, as discussed under Threshold 1, the proposed National City and Chula Vista Bayfronts fireworks display events would potentially result in significant direct impacts on green sea turtles present within south San Diego Bay from the introduction of fireworks-generated trash and debris, which could cause suffocation, starvation, or debilitation if these species mistakenly consume the waste.

Additionally, these proposed new fireworks display events may also potentially result in significant indirect impacts on sensitive habitat within the San Diego Bay NWR due to increased visitor and boat activity. The large number of visitors is likely to result in increased amounts of human-generated trash and debris from picnics and parties along the shoreline, some of which could wash into adjacent Bay waters and degrade sensitive habitat. Increased boat traffic could result in minor damage to eelgrass beds through unauthorized anchoring and/or propeller dragging. Although these proposed new fireworks display events would not occur immediately adjacent to salt marshes, visitors that view the fireworks display events from kayaks or personal watercraft could drag watercraft onto shorelines adjacent to coastal salt marshes and inadvertently damage eelgrass or marsh habitat. The increase in boating activity, particularly nighttime and out-of-channel boat traffic, would also increase the potential for propeller strikes with green sea turtles. Increased boating activities could cause the animals to temporarily depart the project area before, during, and after the time of the proposed new fireworks display events to avoid higher vessel traffic. The increase in activity may also affect the turtles' foraging habits in that individuals may spend more time underwater, swim at greater speeds, and alter other life history traits leading to greater energy

expenditure. The introduction of human-generated trash could also cause injury to turtles if they mistakenly consume the waste, which could also cause suffocation, starvation, or debilitation. These potential direct and indirect impacts on sensitive habitat and green sea turtles present within the San Diego Bay NWR would be significant. Consequently, the proposed project would have the potential to conflict with the San Diego Bay National Wildlife Refuge Comprehensive Conservation Plan (**Impact-BIO-10**).

As discussed above under Thresholds 1, 2, and 3, **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Additionally, **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance that would reduce potential indirect impacts on biological resources, including the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-1** and **MM-BIO-2** would reduce potentially significant direct impacts on green sea turtles and habitat from fireworks generated trash and debris and indirect impacts on green sea turtles and habitat from human trespass, increased boat traffic, and human-generated trash and debris to less-than-significant levels. Consequently, potential impacts on the San Diego Bay NWR would also be reduced to a less-than-significant level. As such, the proposed project would not conflict with this habitat conservation plan.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. Within San Diego Bay and the Imperial Beach Oceanfront, the City of San Diego and City of Chula Vista MSCP Subarea Plans and San Diego National Wildlife Refuge Comprehensive Conservation Plan apply to sensitive habitat and species present within the southern portion of the Bay. The proposed ordinance contains several requirements that would reduce potential impacts on biological resources. These include requirements for specific packaging materials, best management practices, and implementation of post-display cleanup practices consistent with the requirements of the General Permit, and a reduction in the amount of non-biodegradable fireworks components that can be used, as well as implementation of cleanup, security, signage, and education measures. Additionally, the proposed ordinance requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan. Consequently, the effects of the proposed ordinance on existing fireworks display events would not conflict with adopted habitat conservation plans, natural community conservation plans, or other approved local, regional, or state habitat conservation plans. As such, no significant adverse impact would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would conflict with applicable local policies or ordinances protecting biological resources. Additionally, the proposed project would conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan. Potentially significant impact(s) include:

Impact-BIO-9: Potential Conflict with the City of San Diego and Chula Vista MSCP Subarea Plans. The proposed new fireworks display events have the potential to result in significant direct and indirect impacts on habitat within the City of San Diego MHPA and City of Chula Vista MSCP Preserve. Any impacts, whether direct or indirect, would be significant. Consequently, the proposed project would have the potential to conflict with the City of San Diego and City of Chula Vista MSCP Subarea Plans.

Impact-BIO-10: Potential Conflict with the San Diego Bay National Wildlife Refuge Comprehensive Conservation Plan. The proposed new fireworks display events have the potential to result in direct and indirect impacts on sensitive habitat and green sea turtles present within the San Diego Bay NWR, which would be considered significant. Consequently, the proposed project would have the potential to conflict with the San Diego Bay National Wildlife Refuge Comprehensive Conservation Plan.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not conflict with applicable local policies or ordinances protecting biological resources or with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan. No significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

Implement **MM-BIO-1** and **MM-BIO-2** as described under Threshold 1.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events may result in direct and indirect impacts on sensitive habitats and wildlife species within the City of San Diego MHPA, City of Chula Vista MSCP Preserve, and San Diego Bay NWR (**Impact-BIO-9** and **Impact-BIO-10**). Mitigation measure **MM-BIO-1** requires implementation of the biological resources-related conditions of the proposed ordinance for direct impacts. These conditions of approval require the fireworks operator to remove and properly dispose of all packaging, a reduction in the amount of non-biodegradable fireworks

components that can be used, implementation of best management practices, and compliance with SDRWQCB's General Permit, including post-fireworks display event cleanup of debris and solid waste. **MM-BIO-1** also requires the fireworks organizer, with the assistance of the fireworks operator, to prepare and implement a comprehensive Fireworks Best Management Practices Plan pursuant to SDRWQCB's General Permit. Additionally, **MM-BIO-2** requires implementation of the biological resources-related conditions of the proposed ordinance that would reduce potential indirect impacts on biological resources, including the implementation of cleanup, security, signage, and education measures. Implementation of **MM-BIO-1** and **MM-BIO-2** would reduce potential direct and indirect impacts on wildlife species and habitat within the City of San Diego MHPA, City of Chula Vista MSCP Preserve, and San Diego Bay NWR to less-than-significant levels. Compliance with the proposed ordinance, as required by **MM-BIO-1** and **MM-BIO-2**, would ensure that the proposed new fireworks display events would not conflict with applicable local policies or ordinances protecting biological resources or conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan. Therefore, impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Greenhouse Gas Emissions, Climate Change, and Energy

4.4.1 Overview

This section describes the existing conditions and applicable laws and regulations for greenhouse gas (GHG) emissions, climate change, and energy use. It analyzes whether the proposed project would result in emissions that are (1) consistent with the District's Climate Action Plan (CAP) reduction targets and consistent with regulatory programs outlined in the Scoping Plan and adopted by the California Air Resources Board (ARB) or other California agencies to reduce GHG emissions in 2020; (2) consistent with the post-2020 reduction targets set forth through California Executive Order (EO) S-03-05 and EO B-30-15 and consistent with plans, policies, and regulations promulgated to reduce GHG emissions post-2020; and whether the project would (3) expose property and persons to the physical effects of climate change, including, but not limited to, flooding, public health risk, wildfire risk, or other impacts resulting from climate change. This section also quantifies operational energy consumption and evaluates whether the proposed project would result in the wasteful, inefficient, and unnecessary consumption of energy.

The proposed project would not result in any significant impacts related to GHG emissions, climate change, or energy use.

4.4.2 Existing Conditions

This section provides a discussion of the existing understanding of global climate change and GHG emissions. It also provides a discussion of energy resources as they relate to fireworks display events.

4.2.1.1 Climate Change and Greenhouse Gases

The proposed new fireworks display events would occur within San Diego Bay, which is within the San Diego Air Basin (SDAB). As discussed below, GHGs are global pollutants that contribute to global warming of the Earth's lower atmosphere.

Overview of Global Climate Change

The phenomenon known as the *greenhouse effect* keeps the atmosphere near the Earth's surface warm enough for the successful habitation of humans and other life forms. GHGs associated with the *greenhouse effect* include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), perfluorinated carbons (PFCs), sulfur hexafluoride (SF₆), and hydrofluorocarbons (HFCs), in addition to water vapor. These six gases are also identified as GHGs in Section 15364.5 of the State CEQA Guidelines.

Sunlight in the form of infrared, visible, and ultraviolet light passes through the atmosphere. Some of the sunlight striking the Earth is absorbed and converted to heat, which warms the surface. The

surface emits infrared radiation to the atmosphere where some of it is absorbed by GHGs and re-emitted toward the surface. Human activities that emit additional GHGs to the atmosphere increase the infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and amplifying the warming of the Earth (Center for Climate and Energy Solutions 2011).

Increases in fossil fuel combustion and deforestation have exponentially increased concentrations of GHGs in the atmosphere since the Industrial Revolution. Rising atmospheric concentrations of GHGs in excess of natural levels enhance the greenhouse effect, which contributes to global warming of the Earth's lower atmosphere. This warming induces large-scale changes in ocean circulation patterns, precipitation patterns, global ice cover, biological distributions, and other changes to the Earth system that are collectively referred to as *climate change*.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs). Criteria air pollutants and TACs occur locally or regionally, and local concentrations respond to locally implemented control measures. However, the long atmospheric lifetimes of GHGs allow them to be transported great distances from sources and become well mixed, unlike criteria air pollutants, which typically exhibit strong concentration gradients away from point sources. GHGs and global climate change represent cumulative impacts (i.e., GHG emissions contribute, on a cumulative basis, to the significant adverse environmental impacts of global climate change).

Principal Greenhouse Gases

The GHGs listed by the Intergovernmental Panel on Climate Change (IPCC) (CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆) (2014) are discussed in this section in order of abundance in the atmosphere, and the principal characteristics surrounding these pollutants are discussed below. Note that PFCs are not discussed because those gases are generated primarily by industrial processes, which are not part of the proposed project. California law and the State CEQA Guidelines contain a similar definition of GHGs (Health and Safety Code Section 38505(g); 14 California Code of Regulations [CCR] Section 15364.5). Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic (human-made) sources. Consequently, the primary GHGs of concern associated with the project are CO₂, CH₄, N₂O, HFCs, and SF₆.

- **Carbon Dioxide (CO₂)** enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, respiration, and also as a result of other chemical reactions (e.g., manufacture of cement). CO₂ is also removed from the atmosphere (or “sequestered”) when it is absorbed by plants as part of the biological carbon cycle.
- **Methane (CH₄)** is emitted during the production and transport of coal, natural gas, and oil. CH₄ also results from livestock and other agricultural practices and by the decay of organic waste in municipal solid waste landfills.
- **Nitrous Oxide (N₂O)** is emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.
- **Hydrofluorocarbons (HFCs)** are anthropogenic chemicals used in commercial, industrial, and consumer products and have high global warming potential (GWP [see below]). HFCs are generally used as substitutes for ozone-depleting substances in automobile air-conditioners and refrigerants.

- **Sulfur hexafluoride (SF₆)**, a human-made chemical, is used as an electrical insulating fluid for power distribution equipment, in the magnesium industry, in semiconductor manufacturing, and also as a tracer chemical for the study of oceanic and atmospheric processes.

Methods have been set forth to describe emissions of GHGs in terms of a single gas to simplify reporting and analysis. The most commonly accepted method to compare GHG emissions is the GWP methodology defined in the IPCC reference documents. IPCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of carbon dioxide equivalent (CO₂e), which compares the gas in question to that of the same mass of CO₂ (which has a GWP of 1 by definition). The GWP values used in this report are based on the IPCC Fourth Assessment Report (AR4) and United Nations Framework Convention on Climate Change reporting guidelines and defined in Table 4.4-1 (IPCC 2007). The AR4 GWP values are used in ARB's California inventory and Assembly Bill (AB) 32 Scoping Plan estimate update as well as in the Port of San Diego's GHG emissions inventory (ARB 2016a; ARB 2014; District 2013).

Table 4.4-1 lists the GWP of CO₂, CH₄, N₂O, HFCs, and SF₆; their lifetimes; and abundance in the atmosphere.

Table 4.4-1. Lifetimes, GWPs, and Abundance of Significant GHGs

Gas	GWP (100 years)	Lifetime (years) ¹	Atmospheric Abundance
CO ₂	1	50–200	400 ppm
CH ₄	25	9–15	1,834 ppb
N ₂ O	298	121	328 ppb
HFC-23	14,800	222	18 ppt
HFC-134a	1,430	13.4	84 ppt
HFC-152a	124	1.5	3.9 ppt
SF ₆	22,800	3,200	8.6 ppt

Sources: Myhre et al. 2013; Blasing 2016; IPCC 2007.

¹ Defined as the half-life of the gas.

ppm = parts per million; ppb = parts per billion; ppt = parts per trillion.

Greenhouse Gas Inventories

A GHG inventory is a quantification of all GHG emissions and sinks¹ within a selected physical and/or economic boundary. GHG inventories can be performed on a large scale (e.g., for global and national entities) or on a small scale (e.g., for a particular building or person). Although many processes are difficult to evaluate, several agencies have developed tools to quantify emissions from certain sources.

Table 4.4-2 outlines the most recent global, national, statewide, and local GHG inventories to help contextualize the magnitude of potential project-related emissions.

¹ A GHG sink is a process, activity, or mechanism that removes a GHG from the atmosphere.

Table 4.4-2. Global, National, State, and Local GHG Emissions Inventories

Emissions Inventory	CO₂e (metric tons)
2010 IPCC Global GHG Emissions Inventory	52,000,000,000
2014 EPA National GHG Emissions Inventory	6,870,000,000
2014 ARB State GHG Emissions Inventory	441,500,000
2012 County of San Diego GHG Emissions Inventory	34,670,000
2010 City of San Diego GHG Emissions Inventory	13,091,591
2006 Port of San Diego GHG Emissions Inventory ¹	826,429

Sources: IPCC 2014; EPA 2016; ARB 2016a; Energy Policy Initiatives Center 2015; City of San Diego 2015; District 2013.

¹ The Port of San Diego's GHG emissions inventory is based on the 2013 Climate Action Plan rather than the District's 2012 Maritime Air Emissions Inventory because the Climate Action Plan provides a more comprehensive inventory of the District's activities and GHG emissions profile.

EPA = U.S. Environmental Protection Agency

Impacts of Global Climate Change

Climate change is a complex phenomenon that has the potential to alter local climatic patterns and meteorology. Although modeling indicates that climate change will result in sea-level rise (SLR) (both globally and regionally) as well as changes in climate and rainfall, among other effects, there remains uncertainty with regard to characterizing precise *local* climate characteristics and predicting precisely how various ecological and social systems will react to any changes in the existing climate at the local level. Regardless of this uncertainty, it is widely understood that substantial climate change is expected to occur in the future, although the precise extent will take further research to define. Consequently, the entire San Diego region, including the project area, will be affected by changing climatic conditions.

Research efforts coordinated through ARB, the California Energy Commission (CEC), the California Environmental Protection Agency, the University of California system, and others are examining the specific changes to California's climate that will occur as the Earth's surface warms. Potential impacts include rising sea levels along the California coastline; extreme heat conditions; an increase in heat-related human deaths, infectious diseases, and respiratory problems caused by deteriorating air quality; reduced snow pack and streamflow in the Sierra Nevada, affecting winter recreation and water supplies; a potential increase in the severity of winter storms, affecting peak streamflows and flooding; changes in growing season conditions that could affect California agriculture, causing variations in crop quality and yield; and changes in the distribution of plant and wildlife species due to changes in temperature, competition from colonizing species, changes in hydrologic cycles, changes in sea levels, and other climate-related effects.

With respect to the San Diego region, The San Diego Foundation's *A Regional Wake-Up Call* (2013), which summarizes the CEC's *Climate Change-Related Impacts in the San Diego Region by 2050* paper (CEC 2009), provides a summary of potential climate change impacts in the region (Ocean Protection Council 2013), which include the following:

- **Increased temperatures:** The San Diego region will see hotter and drier days and more frequent, prolonged heat waves. Average annual temperatures are expected to increase 1.5°F–4.5°F (CEC 2009; The San Diego Foundation 2013).

- **Reduction in air quality:** Hotter and drier days create more air pollution by raising ozone levels. This can exacerbate asthma and other respiratory and cardiovascular diseases (CEC 2009).
- **Introduction of new public health issues:** Warmer temperatures year-round could lead to growing mosquito populations, increasing the regional occurrence of West Nile virus and potentially introducing tropical diseases such as malaria and dengue fever (CEC 2009).
- **Reductions in fresh water:** Water and energy demand will increase, while extended and more frequent droughts will cause traditional sources of fresh water supplies to diminish. Reduced local and regional precipitation could shrink water supplies by 20 percent or more, while water demand is expected to increase 37 percent. There could be an 18 percent water shortage by 2050 (CEC 2009; The San Diego Foundation 2013).
- **Increased rate of wildfires:** Drier weather may increase the frequency and size of wildfires, with an estimated 20 percent increase in the number of days with ideal fire conditions (CEC 2009; The San Diego Foundation 2013).
- **Rising sea levels:** Projected SLR, coastal erosion, and increasing storm surges may collapse fragile sea cliffs, shrink beaches, and destroy coastal property and ecosystems. Sea levels are expected to rise 12 to 16 inches by 2020 (CEC 2009; The San Diego Foundation 2013), 24 inches by 2050, and 65.7 inches by 2100, relative to 2000 conditions (Ocean Protection Council 2013; Coastal and Ocean Working Group of the California Climate Action Team 2013).

Sea Level Rise

Projected SLR as an effect of climate change is expected to increase the number of areas that experience coastal flooding along San Diego Bay in the future. Coastal and low-lying areas, such as the project area, are particularly vulnerable to future SLR. More specifically, SLR is a concern for the future, particularly in combination with future storm events and coastal flooding. A scenario with 100-year flood flows that coincide with high tides, taking into account SLR over a 50- or 100-year horizon, would dramatically increase the risk of flooding in the project vicinity.

Specifically regarding SLR, the San Diego Bay Vulnerability Assessment conducted by ICLEI– Local Governments for Sustainability found that the greatest concern from SLR will be an increase in the kind of flooding that the region already experiences due to waves, storm surge, El Niño events, and very high tides. Furthermore, starting around mid-century, San Diego Bay may become more susceptible to regularly occurring inundation of certain locations and assets. The most vulnerable sectors in the community include stormwater management, wastewater collection, shoreline parks and public access, transportation facilities, commercial buildings, and ecosystems (ICLEI 2012). According to the map in the San Diego Bay Vulnerability Assessment report, various locations within San Diego Bay are within the SLR hazard zone for 2050.

The Coastal and Ocean Working Group of the California Climate Action Team developed the *State of California Sea-Level Rise Guidance Document* for state agencies to incorporate SLR into planning and decision-making for projects in California. The document was developed in response to Governor Schwarzenegger’s EO S-13-08, issued on November 14, 2008, which directed state agencies to plan for SLR and coastal impacts. That EO also requested the National Research Council (NRC) to issue a report on SLR to advise California on planning efforts. The final report from NRC, *Sea-Level Rise for the Coasts of California, Oregon, and Washington*, was released in June 2012. The *State of California Sea-Level Rise Guidance Document* was last updated in March 2013 with the scientific findings of the 2012 NRC report.

In the Coastal and Ocean Working Group of the California Climate Action Team SLR guidance document (Coastal and Ocean Working Group of the California Climate Action Team 2013), three SLR projections, based on time periods (2030, 2050, and 2100), were selected for south of Cape Mendocino using 2000 as the baseline. Table 4.4-9 provides a summary of the SLR projections relevant to the project area during the life of the proposed project, which, for purposes of this analysis, is assumed to be 2050.

4.2.1.2 State and Regional Energy Resources and Use

California has a diverse portfolio of energy resources that produced 2,335.5 trillion British thermal units² (BTUs) in 2012.³ Excluding offshore areas, the state ranked third in the nation in crude oil production in 2012, producing the equivalent of 1,143.8 trillion BTUs. The state also ranked fourth in the nation in conventional hydroelectric generation (23,755 megawatt hours [MWh]) and first in the nation for net electricity generation from renewable resources. Other energy sources in the state include natural gas (277.7 trillion BTUs), nuclear (193.9 trillion BTUs), and biofuels (24.3 trillion BTUs) (U.S. Energy Information Administration 2014).⁴

According to the U.S. Energy Information Administration (2014), California consumed approximately 7,612 trillion BTUs of energy in 2012. Per capita energy consumption (i.e., total energy consumption divided by the population) in California is among the lowest in the country, with 201 million BTU in 2012, which ranked 49th among all states. Natural gas accounted for the majority of energy consumption (32 percent), followed by motor gasoline (22 percent), distillate and jet fuel (14 percent), interstate electricity (11 percent), and nuclear and hydroelectric power (6 percent), with the remaining 15 percent coming from a variety of other sources (U.S. Energy Information Administration 2014). The transportation sector consumed the highest quantity of energy (38.5 percent), followed by the industrial and commercial sectors.

Per capita energy consumption, in general, is declining because of improvements in energy efficiency and design. However, despite this reduction in per capita energy use, the state's total overall energy consumption (i.e., non-per capita energy consumption) is expected to increase over the next several decades because of growth in population, jobs, and vehicle travel. For example, electricity usage is anticipated to grow about 9 to 15 percent over the next decade (2015–2025) (CEC 2014).

San Diego County is served by San Diego Gas and Electric (SDG&E), which provides energy service to more than 3.4 million customers (i.e., 1.4 million accounts) in the county and portions of southern Orange County. The utility has a diverse power production portfolio, composed of a variety of renewable and non-renewable sources. Energy production typically varies by season and by year. Regional electricity loads tend to be higher in the summer because the higher summer temperatures drive increased demand for air-conditioning. In contrast, natural gas loads are higher in the winter because the colder temperatures drive increased demand for natural gas heating.

² One BTU is the amount of energy required to heat 1 pound of water by 1°F at sea level. BTU is a standard unit of energy that is used in the United States and is on the English system of units (foot-pound-second system).

³ Note that 2012 data are the most recent available at the U.S. Energy Information Administration website, at http://www.eia.gov/state/seds/sep_prod/pdf/P5.pdf. Accessed July 25, 2015.

⁴ No coal production occurs in California.

In 2014 (most recent year for which California Renewables Portfolio Standard [RPS] data are available), more than 36 percent of the electricity SDG&E supplied was from renewable sources, compared to less than 1 percent in 2002 (California Public Utilities Commission 2016). Over the last 3 years, SDG&E customers have reduced their electricity use by more than 911 million kilowatt hours (kWh) and their gas usage by more than 1.8 million therms (Sempra Energy Company 2014).

4.4.3 Applicable Laws and Regulations

This section summarizes federal, state, and local laws and regulations related to GHG emissions, climate change, and energy resources that are applicable to the proposed project.

4.4.3.1 Federal

Climate change is widely recognized as an imminent threat to the global climate, economy, and population. The U.S. Environmental Protection Agency (EPA) has acknowledged potential threats imposed by climate change in a Cause or Contribute Finding, which found that GHG emissions contribute to pollution that threatens public health and welfare—a necessary finding prior to adopting new vehicle emissions standards to reduce GHG emissions. Federal climate change regulation under the federal Clean Air Act (CAA) is currently under development for both existing and new sources. Despite the actions discussed below, there is still no comprehensive, overarching federal law specifically related to the reduction of GHG emissions.

U.S. Environmental Protection Agency Mandatory Reporting Rule for GHGs (2009)

On September 22, 2009, EPA released its final Greenhouse Gas Reporting Rule (Reporting Rule). The Reporting Rule is a response to the fiscal year 2008 Consolidated Appropriations Act (H.R. 2764; Public Law 110-161), which required EPA to develop “mandatory reporting of greenhouse gases above appropriate thresholds in all sectors of the economy.” The Reporting Rule applied to most entities that emit 25,000 metric tons of CO₂e or more per year. Starting in 2010, facility owners were required to submit an annual GHG emissions report with detailed calculations of facility GHG emissions. The Reporting Rule also mandates recordkeeping and administrative requirements in order for EPA to verify annual GHG emissions reports.

Greenhouse Gas and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles (2016)

In August 2016, EPA adopted a second round of standards for medium- and heavy-duty vehicles to cut carbon pollution and improve fuel efficiency from trucks. The Phase 2 program will reduce CO₂ emissions starting in model year 2018 and fuel consumption and GHG emissions from tractor trailers as much as 24 percent once fully implemented for certain truck types.

Energy Policy Act of 2005

The Energy Policy Act of 2005, implemented by the U.S. Department of Energy, establishes a comprehensive, long-term energy policy. The Energy Policy Act addresses energy production in the U.S., including oil, gas, coal, and alternative forms of energy, as well as energy efficiency and tax incentives. Energy efficiency and tax incentive programs include credits for the construction of new

energy-efficient homes, production or purchase of energy-efficient appliances, and loan guarantees for entities that develop or use innovative technologies that avoid the production of GHGs.

4.4.3.2 State

California has adopted statewide legislation to address various aspects of climate change, GHG mitigation, and energy efficiency. Much of this establishes a broad framework for the state's long-term GHG and energy reduction goals and climate change adaptation program. The former and current governors of California have also issued several EOs related to the state's evolving climate change policy. Summaries of key policies, EOs, regulations, and legislation at the state level that are relevant to the project are provided below in chronological order.

Assembly Bill 1493—Pavley Rules (2002, amendments 2009)/Advanced Clean Cars (2011)

Known as Pavley I, AB 1493 provided the nation's first GHG standards for automobiles. AB 1493 required ARB to adopt vehicle standards that will lower GHG emissions from new light-duty autos to the maximum extent feasible beginning in 2009. Additional strengthening of the Pavley standards (referred to previously as *Pavley II* and now referred to as the *Advanced Clean Cars [ACC]* measure) was adopted for vehicle model years 2017–2025 in 2012. Together, the two standards are expected to increase average fuel economy to roughly 54.5 miles per gallon in 2025.

Senate Bills 1078/107/X 1-2—Renewables Portfolio Standard and Renewable Energy Resources Act (2002, 2006, 2011)

Senate Bills (SBs) 1078 and 107, California's RPS, obligated investor-owned utilities, energy service providers, and Community Choice Aggregations to procure an additional 1 percent of retail sales per year from eligible renewable sources until 20 percent is reached by 2010. The California Public Utilities Commission and CEC are jointly responsible for implementing the program. SB X 1-2, called the California Renewable Energy Resources Act, obligates all California electricity providers to obtain at least 33 percent of their energy from renewable resources by 2020. As of 2015, SDG&E's renewable procurement was 35.2 percent. As noted below, SB 350 increased the RPS to 50 percent for 2030.

Senate Bill 350 (2015)

SB 350 (De Leon, also known as the "Clean Energy and Pollution Reduction Act of 2015") was approved by the California legislature in September 2015 and signed by Governor Brown in October 2015. Its key provisions are to require the following by 2030: (1) an RPS of 50 percent and (2) a doubling of efficiency for existing buildings.

Executive Order S-03-05 (2005) and Executive Order B-30-15 (2015)

EO S-03-05 is designed to reduce California's GHG emissions to (1) 2000 levels by 2010, (2) 1990 levels by 2020, and (3) 80 percent below 1990 levels by 2050. EO B-30-15 was signed in 2015 and is designed to reduce California's GHG emissions to 40 percent below 1990 levels by 2030.

Assembly Bill 32—California Global Warming Solutions Act (2006)

AB 32 codified the state's GHG emissions target by requiring California's global warming emissions to be reduced to 1990 levels by 2020. Since being adopted, ARB, CEC, the California Public Utilities Commission, and the California Building Standards Commission have been developing regulations that will help the state meet the goals of AB 32 and EO S-03-05. The Scoping Plan for AB 32 identifies specific measures to reduce GHG emissions to 1990 levels by 2020 and requires ARB and other state agencies to develop and enforce regulations and other initiatives to reduce GHG emissions. The AB 32 Scoping Plan, first adopted in 2008, comprises the state's roadmap for meeting AB 32's reduction target. Specifically, the Scoping Plan articulates a key role for local governments by recommending that they establish GHG emissions-reduction goals for both their municipal operations and the community that are consistent with those of the state (i.e., approximately 15 percent below current levels) (ARB 2008).

ARB re-evaluated its emissions forecast in light of the economic downturn and updated the projected 2020 emissions to 545 million metric tons of carbon dioxide equivalent (MTCO_{2e}). Two reduction measures (Pavley I and RPS [12 to 20 percent]) that were not previously included in the 2008 Scoping Plan baseline were incorporated into the updated baseline, further reducing the 2020 statewide emissions projection to 507 million MTCO_{2e}. The updated forecast of 507 million MTCO_{2e} is referred to as the AB 32 2020 baseline. An estimated reduction of 80 million MTCO_{2e} is necessary to lower statewide emissions to the AB 32 target of 427 million MTCO_{2e} by 2020 (ARB 2014).

ARB approved the *First Update to the Scoping Plan* on May 22, 2014 (ARB 2014). The first update includes both a 2020 element and a post-2020 element. The 2020 element focuses on the state, regional, and local initiatives that are being implemented now to help the state meet the 2020 goal. ARB is currently working on a second update to the Scoping Plan to reflect the 2030 target established in EO B-30-15, noting that "California has already made great progress in driving the development of clean technologies thanks to programs developed under AB 32 and other important legislation; the 2030 target will ensure that success continues beyond 2020" (ARB 2015).

Senate Bill 32, California Global Warming Solutions Act of 2006: Emissions Limit, and Assembly Bill 197, State Air Resources Board, Greenhouse Gases, Regulations (2016)

SB 32 (Pavley) requires ARB to ensure that statewide GHG emissions are reduced to at least 40 percent below the 1990 level by 2030, consistent with the target set forth in EO B-30-15. The bill specifies that SB 32 shall become operative only if AB 197 (Garcia) is enacted and becomes effective on or before January 1, 2017. AB 197 creates requirements to form the Joint Legislative Committee on Climate Change Policies; requires ARB to prioritize direct emission reductions from stationary sources, mobile sources, and other sources and consider social costs when adopting regulations to reduce GHG emissions beyond the 2020 statewide limit; requires ARB to prepare reports on sources of GHGs, criteria air pollutants, and toxic air contaminants; establishes 6-year terms for voting members of ARB; and adds two legislators as non-voting members of ARB. Both bills were signed by Governor Brown in September 2016.

ARB recently released its Draft 2017 Scoping Plan Update, which builds on the programs set in place as part of the previous Scoping Plan that was drafted to meet the 2020 reduction targets per AB 32. The Draft 2017 Scoping Plan Update proposed meeting the 2030 goal by accelerating the focus on zero and near-zero technologies for moving freight; continued investment in renewables; greater

use of low-carbon fuels, including electricity and hydrogen; stronger efforts to reduce emissions of short-lived climate pollutants (CH₄, black carbon, and fluorinated gases); further efforts to create walkable communities with expanded mass transit and other alternatives to traveling by car; continuing the cap-and-trade program; and ensuring that natural lands become carbon sinks to provide additional emissions reductions and flexibility in meeting the target. The Scoping Plan also recommends that local governments aim to achieve community-wide efficiency of 6 MTCO_{2e} per capita by 2030 and 2 MTCO_{2e} per capita by 2050 in local climate action planning. These efficiency targets would replace the “15 percent from 2008 levels by 2020” approach recommended in the initial Scoping Plan, which allowed local governments to grow in a sustainable manner (ARB 2016a). The Draft 2017 Scoping Plan Update is currently out for public review. ARB will hold various public meetings as part of the process.

Assembly Bill 1383 (2016), Short-Lived Climate Pollutants, Methane Emissions, Dairy and Livestock, Organic Waste, Landfills

AB 1383 requires ARB to approve and implement a plan to reduce CH₄ by 40 percent, fluorinated gases (F-gases) by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030. AB 1383 establishes specific targets for reducing organic waste in landfills (50 percent by 2020 and 75 percent by 2025 compared to 2014). The legislation also adopted regulations to reduce CH₄ emissions from livestock manure management operations and dairy management operations, which would take effect in 2024.

Executive Order S-01-07—Low Carbon Fuel Standard (2007)

EO S-01-07, the Low-Carbon Fuel Standard (LCFS), mandates (1) that a statewide goal be established to reduce the carbon intensity of California’s transportation fuels by at least 10 percent by 2020. The EO initiates a research and regulatory process at ARB. The LCFS regulation does not apply to certain transportation applications, including locomotives and ocean-going vessels (OGVs). Note that the majority of the emissions benefits due to the LCFS come from the production cycle (upstream emissions) of the fuel rather than the combustion cycle (tailpipe). As a result, LCFS-related reductions are not included in this analysis of combustion-related emissions of CO₂.

Senate Bill 375—Sustainable Communities Strategy (2008)

SB 375 provides for a new planning process that coordinates land use planning, regional transportation plans, and funding priorities in order to help California meet the GHG reduction goals established in AB 32. SB 375 requires regional transportation plans (RTPs), developed by metropolitan planning organizations, to incorporate a “sustainable communities strategy” (SCS). The goal of the SCS is to reduce regional vehicle miles traveled (VMT) through land use planning and consequent transportation patterns. SB 375 also includes provisions for streamlined CEQA review for some infill projects such as transit-oriented development.

The final reduction targets from ARB require the San Diego Association of Governments (SANDAG) to identify strategies to reduce per capita GHG emissions from passenger vehicles by approximately 7 percent by 2020 and 13 percent by 2035 over base year 2005. SANDAG’s 2050 RTP and SCS, which detail steps the region will take to reduce GHG emissions to state-mandated levels, were originally adopted by SANDAG on October 28, 2011 (SANDAG 2011). However, because of a legal challenge to the CEQA document, the RTP and SCS were revised and adopted by SANDAG on October 9, 2015 (SANDAG 2015).

State CEQA Guidelines (2010)

The State CEQA Guidelines require lead agencies to describe, calculate, or estimate the amount of GHG emissions that would result from a project. Moreover, the State CEQA Guidelines emphasize the necessity to determine potential climate change effects of a project and propose mitigation as necessary. They do not prescribe or recommend a specific analysis methodology or provide quantitative criteria for determining the significance of GHG emissions. However, the State CEQA Guidelines do confirm the discretion of lead agencies to determine appropriate significance thresholds but require the preparation of an EIR if “there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with adopted regulations or requirements” (Section 15064.4).

State CEQA Guidelines Section 15126.4 includes considerations for lead agencies related to feasible mitigation measures to reduce GHG emissions, which may include, among others, measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency’s decision; implementation of project features, project design, or other measures that are incorporated into the project to substantially reduce energy consumption or GHG emissions; off-site measures, including offsets that are not otherwise required, to mitigate a project’s emissions; and measures that sequester carbon or carbon-equivalent emissions.

State CEQA Guideline Section 15183.5(a) provides that a lead agency may analyze and mitigate significant effects of GHG emissions at a programmatic level, such as in a plan targeted to reduce GHG emissions. Additionally, the section allows for tiering off and incorporating by reference the environmental analysis done for such plans.⁵ Subdivision (b) of Section 15183.5 also states that a plan to reduce GHG emissions may be used to find that a project’s incremental contribution to the cumulative effect of GHG emissions is not cumulatively considerable if the project complies with the adopted plan and mitigation program. Subdivision (b) of Section 15183.5 provides that such a plan should (1) quantify GHG emissions over a specific time period resulting from activities within a defined geographic area; (2) establish a level below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable; (3) identify and analyze GHG emissions resulting from specific actions or categories of actions within the defined geographic area; (4) specify measures or a group of measures, including performance standards, that if implemented on a project-by-project basis would collectively achieve the specified emissions level; (5) establish a mechanism to monitor the plan’s progress; and (6) be adopted in a public process following environmental review. Such plans may be used in the cumulative impact analysis of later projects, but such later project analysis must identify those requirements specified in the plan that apply to the project and, if those requirements are not otherwise binding and enforceable, incorporate them as mitigation measures.

Western Climate Initiative/California Cap-and-Trade Program (2010/2011)

On October 20, 2011, ARB adopted the final cap-and-trade program for California. The California cap-and-trade program is a market-based system with an overall emissions limit for affected sectors. Examples of affected entities include CO₂ suppliers, in-state electricity generators, hydrogen production, petroleum refining, and other large-scale manufacturers and fuel suppliers. The cap-and-trade program is currently regulating more than 85 percent of California’s emissions.

⁵ Note that this analysis does not tier off or rely on any previous CEQA analysis conducted for a GHG plan.

Compliance requirements began according to the following schedule: (1) electricity generation and large industrial sources by 2012 and (2) fuel combustion and transportation by 2015. Cap-and-trade allowance auction proceeds are used to fund a variety of investments. The first 3-year investment plan prioritizes (1) sustainable communities and clean transportation (including low-carbon freight equipment, with specific emphasis on efforts that would be beneficial for disadvantaged communities located near ports, railyards, freeways, and distribution centers), (2) energy efficiency and clean energy, and (3) natural resources and waste diversion (ARB 2013).

Tractor-Trailer Greenhouse Gas Regulation/ Phase 2 Heavy-Duty Greenhouse Gas Emission Standards (2013/2017 in progress)

ARB approved the Tractor-Trailer Greenhouse Gas Regulation to reduce GHG emissions by requiring the use of aerodynamic tractors and trailers that are also equipped with low rolling resistance tires. The regulation applies to certain Class 8 tractors manufactured for use in California and is harmonized with the parallel EPA and National Highway Traffic Safety Administration heavy-duty truck standards. This regulation could reduce fuel consumption and GHG emissions from new heavy-duty trucks between 4 and 5 percent per year between 2014 and 2018 (EPA 2015). Upon EPA and National Highway Traffic Safety Administration's adoption of Phase 2, ARB plans to approve the California Phase 2 program in late 2017.

Assembly Bill 2076, Reducing Dependence on Petroleum

CEC and ARB are directed by AB 2076 (passed in 2000) to develop and adopt recommendations for reducing dependence on petroleum. A performance-based goal is to reduce petroleum demand to 15 percent less than 2003 demand by 2020.

State CEQA Guidelines, Appendix F

Appendix F of the State CEQA Guidelines contains energy conservation measures that promote the efficient use of energy for projects. In order to ensure that energy impacts are considered in project decisions, CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. The analysis in this section considers the expected energy use of the proposed project as well as measures to reduce the project's energy consumption.

The goal outlined in Appendix F of the State CEQA Guidelines is to conserve energy through the wise and efficient use of energy. The means of achieving this goal include the following:

- Decreasing overall per capita energy consumption;
- Decreasing reliance on natural gas and oil; and
- Increasing reliance on renewable energy sources.

4.4.3.3 Local

The AB 32 Scoping Plan does not provide an explicit role for local air districts in implementing AB 32 but it does state that ARB will work actively with air districts in coordinating emissions reporting, encouraging and coordinating GHG reductions, and providing technical assistance in quantifying reductions. The ability of air districts to control emissions (both criteria pollutants and

GHGs) is provided primarily through permitting as well as through their role as the CEQA lead or commenting agency, the establishment of CEQA thresholds, and the development of analytical requirements for CEQA documents. To date, the San Diego Air Pollution Control District has not developed specific thresholds of significance with regard to the GHG emissions in CEQA documents. Additionally, as discussed in Section 4.4.3.2, under SB 375, SANDAG must prepare an SCS in conjunction with its RTP that reduces VMT and encourages more compact, complete, and efficient communities in the future.

Port of San Diego Clean Air Program

The District developed the Green Port Program to support the goals of the Green Port Policy, which was adopted in 2008. The Green Port Program supports resource conservation, waste reduction, and pollution prevention. The Clean Air Program is one key area of the Green Port Program, with the primary goal of reducing GHG emissions and other air emissions from District operations at its three marine terminals: the Cruise Ship Terminal, Tenth Avenue Marine Terminal, and National City Marine Terminal. The Clean Air Program seeks to voluntarily reduce emissions through the identification and evaluation of feasible and effective control measures. Through this program, the District has identified control measures to achieve a reduction of pollutants from the largest sources, including shore power (to enable ships to turn off their auxiliary engines and plug into electric power while docked), truck replacement/retrofits, replacement/retrofits of cargo-handling equipment (CHE), and voluntary vessel speed reductions (VSR). The Clean Air Program will continue to be refined and adapted to future changes in District operations.

Port of San Diego Climate Action Plan

As noted above, ARB encourages local governments to adopt a reduction goal for municipal operations emissions and move toward establishing similar goals for community emissions that parallel the state's commitment to reducing GHG emissions (ARB 2008). The District adopted a CAP in December 2013. The CAP includes an inventory of existing (2006) and projected emissions in 2020, 2035, and 2050 and identifies the District's GHG reduction goals and measures to be implemented to support meeting the statewide reduction goals set forth in AB 32 (i.e., 1990 levels by 2020). District-wide 1990 emissions were not quantified, given the activity data gaps; instead, a base year of 2006 was used to calculate reductions needed at the District to reach 1990 levels by 2020. Consistent with AB 32 targets, a 10 percent reduction target (471.3 million MTCO_{2e} in 2006 and estimated 426.6 million MTCO_{2e} in 1990 statewide) was used as the District-wide reduction target for 2020.⁶

The CAP's 2020 projections and reduction targets (1990 levels) for each activity are based on growth projections specific to each tenant and activity type. For example, the CAP assumes a 3 percent annual growth in maritime-related uses between 2006 and 2020. Thus, the CAP and its reduction targets are specific to the District's geography, type and intensity of uses, and future year projected conditions. Table 4.4-3 provides the CAP's 2006 baseline, projected future year (2020) GHG emissions, and future year GHG emission targets (1990 levels) by activity within the District's jurisdiction. As shown, District-wide emissions are expected to increase from 826,429 MTCO_{2e} in 2006 to 1,039,699 MTCO_{2e} in 2020 without implementation of any CAP or state measures.

⁶ The CAP also includes projected emissions and some reduction policies to achieve the reduction target of 25% less than 2006 baseline levels by 2035 but does not yet quantify those reductions.

Table 4.4-3. GHG Emissions (Metric Tons per Year) by Activity Shown in the CAP

Category	Activity	GHG Emissions By Category and District Activity Type			Percentage Reduction to Achieve 1990 Levels – Specific to the District	
		2006 Baseline	2020 BAU	1990 ¹ Levels	2006 Baseline	2020 BAU
Port Operations	Port Operations	37,164	38,930	33,533	10%	14%
Maritime	Ocean-going Vessels	55,162	72,786	49,773	10%	32%
	Recreational Boating	80,441	118,252	72,583	10%	39%
	Other Terminal Activity ²	89,242	109,859	80,524	10%	27%
	Total Maritime	224,845	300,897	202,880	10%	33%
Other	Industrial	137,426	138,258	124,001	10%	10%
	Shipbuilding	123,725	123,545	111,638	10%	10%
	Lodging	137,429	249,852	124,004	10%	50%
	Other	165,840	188,217	149,639	10%	20%
	Total Other	564,420	699,872	509,282	10%	27%
Total Port-wide		826,429	1,039,699	745,695	10%	28%

Source: Table ES-2 of the CAP (District 2013)

¹ The CAP presents only the 2020 target (1990 levels) for broad source types (electricity and natural gas, transportation, water, and waste) and does not clearly present the emissions target for each activity (OGVs, shipbuilding, etc.) in the main body of the CAP. However, these emission estimates are presented in the CAP appendices (Table ES-2).

² “Other Terminal Activity” includes cargo handling equipment, commercial harbor craft, locomotives, heavy-duty trucks (for transport of goods to/from OGVs), cruise terminal transportation, and terminal tenant operations.

In order to reach the CAP’s target of achieving 745,695 MTCO_{2e} by 2020 (1990 levels), District-wide emissions would need to be reduced by 10 percent below 2006 baseline levels and 28 percent below 2020 business-as-usual (BAU) levels. To achieve the requisite reductions, the CAP includes various reduction measures related to transportation and land use, alternative energy generation, energy conservation, waste reduction and recycling, and water conservation and recycling, a few of which are specific to the proposed project.

A critical aspect of having a CAP that fits the criteria within State CEQA Guidelines Section 15183.5 is to having reduction targets that align with statewide goals. The CAP’s reduction targets parallel the state’s commitment to reducing GHG emissions by 2020 in AB 32 and go even further by identifying targets for a specific location based on projected emissions specific to the District’s geographic location as well as specific activity types and their associated sources. Therefore, because the CAP targets align with statewide goals for 2020, the CAP is consistent with AB 32.

Port of San Diego Green Port Program and Green Port Policy (BPC Policy No. 736)

The Board of Port Commissioners adopted the Green Port Policy in 2007. This policy establishes guiding principles to achieve long-term environmental, societal, and economic benefits through resource conservation, waste reduction, and pollution prevention. The policy provides the overall framework for the Green Port Program. The Green Port Program is an umbrella program designed to achieve the District's environmental sustainability goals in six key areas: water, energy, air, waste management, sustainable development, and sustainable business practices. It was established in early 2008 to achieve the objectives outlined in the Port of San Diego's Green Port Policy. Policy objectives include the following:

- Minimize, to the extent practicable, environmental impacts directly attributable to operations on San Diego Bay and in the tidelands.
- Strengthen the District's financial position by maximizing the long-term benefits of energy and resource conservation.
- Prevent pollution and improve personal, community, and environmental health.
- When possible, exceed applicable environmental laws, regulations, and other industry standards.
- Ensure a balance of environmental, social, and economic concerns are considered during planning, development, and operational decisions.
- Define and establish performance-driven environmental sustainability objectives, targets, and programs.
- Monitor key environmental indicators and consistently improve performance.
- Foster socially and environmentally responsible behavior through communications with employees, tenants, stakeholders, and the community.
- Collaborate with tenants to develop an integrated, measurable, bay-wide environmental sustainability effort.

The Green Port Program focuses primarily on things the District can do to be more environmentally sustainable, such as using less water and being more energy efficient in its own operations. The District also works with its tenants (businesses that lease land from the District), local environmental groups, and others around San Diego Bay to identify ways they can support the Green Port Program.

4.4.4 Project Impact Analysis

4.4.4.1 Methodology

GHG- and energy-related impacts associated with the proposed new fireworks display events were assessed and quantified using industry-standard methodology and peer-reviewed software tools, techniques, and emission factors. A summary of the methodology is provided below. A full list of assumptions and emission calculations can be found in Appendix E.

The analysis herein considers those sources that are directly or indirectly related to the proposed new fireworks display events. Direct effects are impacts that are a direct result of the proposed new fireworks display events and include the sources needed to operate the fireworks display events. Direct sources include operation of the fireworks display events, the delivery of the fireworks and related materials, and tugboat and barge activity related to launching the fireworks. Indirect effects would result from changes that would not occur without the proposed project and would not be directly caused by project operations. Indirect sources include changes to travel and circulation patterns on the regional roadway network from patrons while accessing the fireworks display event viewing locations and usage of facilities at the fireworks display event viewing locations (e.g., sources related to water consumption, electricity consumption, and cleaning product use at bathrooms).

The methodology used to estimate GHG emissions discussed below is the same that was used to estimate criteria pollutant and TAC emissions, as described in Section 4.2, *Air Quality and Health Risk*. In addition to the potential direct and indirect GHG and energy-related impacts associated with the proposed new fireworks display events, the impact analysis describes the effect of the proposed ordinance on existing fireworks display events in relation to GHG emissions and energy usage.

Background on Fireworks

A detailed summary of firework science is provided in Section 4.2, *Air Quality and Health Risk*. The majority of the effects are related to particulate matter (e.g., particulate matter 10 microns in diameter or less [PM10] and particulate matter 2.5 microns in diameter or less [PM2.5]) and not gases (e.g., CO₂). To estimate GHG emissions, firework-related CO₂ emissions were estimated to be 37 percent of the number of pounds of fireworks, based on emission factors for the potassium perchlorate propellant oxidizer fuel category within the open-burning and open-detonation model that was used in the health risk assessment (see Section 4.2). Emissions of non-CO₂ GHGs (N₂O and CH₄) are likely to be minor. For instance, studies found that detonation favored particulate forms of nitrogen species over gaseous forms, suggesting that oxygen released during combustion was quickly consumed by fuels in the pyrotechnics (Croteau et al. 2010; Radojevic 2003). Moreover, studies found that the sum of all gases comprise only 0.006 to 0.4 percent of the initial mass of fireworks (Croteau et al. 2010). Thus, the individual gases that are most prevalent in the atmosphere, such as N₂O and CH₄, would be even smaller. Based on this, gaseous non-CO₂ compounds, including N₂O and CH₄, from proposed new fireworks display events were assumed to be negligible and were not included in the analysis.

Tugboats and Barges

The assumptions used in relation to tugboat and barge activity for the proposed new fireworks display events are based on available information for existing fireworks display events that currently occur in San Diego Bay. The proposed new fireworks display events would launch fireworks from barges adjacent to and/or in the waters of southern San Diego Bay. Barges would be moved by tugboats to their designated locations along the Chula Vista and National City Bayfronts. The barges themselves result in no emissions, but the tugboats that move the barges do. Estimates of tugboat activity related to moving barges into place were based on the distance from the Pacific Tugboat Service offices to various locations throughout the Bay, assuming tugboats travel 6 mph, similar to the in-harbor tugboat activity data presented in the District's Emissions Inventory (District 2014). It was assumed that the tugboat's propulsion/main and auxiliary engines would be

active while moving the barges into place. Tugboat activity information related to holding the barges in place was based on data from the District, organizers, operators, and/or District tenants associated with fireworks display events and assumed that the barges would be active for a total of 4 hours. While holding barges in place, it was assumed that only the tugboat's auxiliary engines would be active, and the propulsion/main engines would remain off. It was assumed that the same activity that occurred when the barges were moved into place would occur once the fireworks display event is complete and the barges and tugboats return to the Pacific Tugboat Service offices.

A summary of proposed new fireworks display events that are anticipated to use tugboats and barges is presented in Table 3-2. As with existing fireworks display events, the barges would use tugboats that are in the 400–1,100 horsepower range. The District's Emissions Inventory (District 2014) was used to find the appropriate model year and engine size for tugboats that fit that horsepower range. To estimate tugboat emissions factors, it was assumed that the average tugboat in that range would be a 2004 model with an 804-horsepower main engine and a 101-horsepower auxiliary engine. Tugboat emissions factors are based on zero-hour emissions factors for model year 2004 tugboat engines, engine deterioration factors, fuel correction factors, useful life, and load factors for main propulsion and auxiliary tugboat engines as well as auxiliary barge engines, based on the calculation methodology from the Port of Long Beach Inventory (Port of Long Beach 2014). It was conservatively assumed that tugboats used during the proposed new fireworks display events would be fully deteriorated (i.e., at the end of their useful life). It is assumed that the methodology used to estimate emissions from tugboat and barge activity would be the same for existing and proposed new fireworks display events.

Firework Material Deliveries

The fireworks are manufactured primarily overseas and transported to the fireworks display events by truck from the port of entry. For purposes of analysis, it was assumed that firework materials would be trucked from the Ports of Los Angeles and/or Long Beach to the project area prior to or on the day of the proposed new fireworks display events. Emissions associated with delivery truck travel were estimated by assuming a single 236-mile, round-trip (118 miles one way), heavy-duty truck delivery for each event on the event day to and from the Port of Los Angeles. Exhaust emissions were based on emissions factors from ARB's EMFAC software for heavy-duty "T7 Single Construction" tractor-trailer trucks operating in San Diego County in 2017.

Visitor Traffic

As noted in the Transportation Assessment provided by Chen Ryan (Appendix J), regional traffic patterns related to the fireworks display events cannot be accurately analyzed because of the limitations of traffic modeling and the uniqueness of the events. Rather, the traffic analysis focuses on how transportation and parking demand patterns changed around San Diego Bay and the Imperial Beach Oceanfront during existing fireworks display events, including observed changes in vehicle, pedestrian, and bicycle volumes. These volumes were counted only on roadways and intersections that provide immediate access to viewing locations for the sample existing fireworks display events. In order to calculate visitor-related VMT, data would need to be collected that assess the number of visitors, how visitors arrived at the event, how far patrons traveled, routes taken, where patrons parked, and whether or not patrons were at the viewing locations specifically for the fireworks or for other reasons. As discussed in Section 4.2, *Air Quality and Health Risk*, because the proposed new fireworks display events along the National City and Chula Vista Bayfronts do not

currently occur, VMT data could not be collected. In discussing the air quality effects of visitor-related vehicle traffic, the analysis below provides a qualitative evaluation of background monitoring on both event and non-event days.

Studies indicate that particulate matter (PM) concentrations in most urban areas are generally attributed to vehicle traffic, and PM concentrations diminish with distance, particularly beyond 1,000 feet (ARB 2005). Background PM concentrations are collected at the following monitoring stations in the region: Alpine, Downtown (Beardsley Street), El Cajon, Escondido, Otay Mesa, Camp Pendleton, and San Ysidro (San Diego Air Pollution Control District 2016). Of these stations, the only station within proximity of the project area is the Downtown (Beardsley Street) station, which is near existing fireworks display events that occur in the northern parts of San Diego Bay, particularly the Big Bay Boom event. No monitoring stations are near the existing Fourth of July Imperial Beach Fireworks Show or near the proposed new National City and Chula Vista fireworks display events. Thus, the Fourth of July Imperial Beach Fireworks Show, which is similar in size to the proposed new National City and Chula Vista fireworks display events, cannot be used to estimate the effects of the proposed new shows because no monitoring station is close to the Fourth of July Imperial Beach Fireworks Show. However, even though the existing Big Bay Boom event is much larger and takes place in a different part of the Bay, the event does take place in proximity to a PM monitoring station (Downtown [Beardsley Street]), which can be used to qualitatively assess the potential impact of the proposed project's vehicle traffic based on hourly monitoring data near an existing display event.

Energy Consumption

The energy analysis evaluates potential impacts on energy consumption associated with fuel consumption from tugboats and barges as well as material deliveries associated with the proposed new fireworks display events. Fuel consumption associated with visitor motor vehicle travel is discussed qualitatively. Energy use was calculated by converting the GHG emissions predicted by the GHG analysis, using the rate of CO₂ emissions per gallon of combusted diesel, which was assumed to be 10.21 kilograms per gallon consumed (Climate Registry 2015). The estimated fuel consumption was converted to BTUs, assuming an energy intensity of 129,488 BTUs per gallon of diesel (Argonne 2015).

GHG Emissions Scenarios

Given the recent adoption of SB 32, as well as the scientific evidence that additional GHG reductions are needed through 2050 to stabilize CO₂ concentrations, impacts associated with the proposed project for both 2020 (AB 32) and the post-2020 period (SB 32) are considered in the analysis.⁷

⁷ The Association of Environmental Professionals' Climate Change Committee recommended in the *Beyond 2020: The Challenge of Greenhouse Gas Reduction Planning by Local Governments in California (Beyond 2020)* white paper, incorporated herein by reference, that CEQA analyses for most land use development projects can continue to rely on current thresholds for the immediate future but that general plans and long-term projects should consider "post-2020 emissions consistent with 'substantial progress' along a post-2020 reduction trajectory toward meeting the 2050 target." *Beyond 2020* further recommends that the "significance determination...should be based on consistency with 'substantial progress' along a post-2020 trajectory." This point is further clarified in the more recent *Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California* white paper that stated "the best measure of whether an individual project is providing its fair share of GHG reductions or efficiency levels is whether that project is supporting 'substantial progress' toward the statewide reduction targets over time, not whether the project is meeting a milestone target many years in the future, such as for 2050."

4.4.4.2 Thresholds of Significance

Climate change is a global problem, and GHGs are global pollutants, unlike criteria air pollutants (such as ozone precursors), which are primarily pollutants of regional and local concern. Given their long atmospheric lifetimes, GHGs emitted by countless sources worldwide accumulate in the atmosphere. No single emitter of GHGs is large enough to trigger global climate change on its own. Rather, climate change is the result of the individual contributions of countless past, present, and future sources. Therefore, GHG impacts are inherently cumulative, and the analysis below is a cumulative impact analysis.

Greenhouse Gases

The State CEQA Guidelines do not indicate what amount of GHG emissions would constitute a significant impact on the environment. Instead, they authorize the lead agency to consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence (State CEQA Guidelines Sections 15064.4(a) and 15064.7(c)).

A number of agencies throughout the state, including multiple air districts (not including the San Diego Air Pollution Control District), have drafted and/or adopted varying threshold approaches and guidelines for analyzing GHG emissions and climate change in CEQA documents. However, none of these are binding; they are only recommendations for consideration by CEQA lead agencies. Some commonly used threshold approaches include (1) consistency with a qualified GHG reduction strategy, (2) performance-based reductions,⁸ (3) numeric “bright-line” thresholds, and (4) efficiency-based thresholds.

Summary of “Newhall Ranch” Supreme Court Decision

The recent California Supreme Court decision in the *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife, the Newhall Land and Farming Company* (November 30, 2015, Case No. S217763) (hereafter *Newhall Ranch*), confirmed that the use of BAU analysis (i.e., 29 percent below business as usual), a performance-based approach, would be satisfactory. However, for a project-level analysis that uses ARB’s statewide BAU targets, substantial evidence must be presented to support the use of those targets for a particular project at a specific location. The court notes that this may require examination of the data behind the statewide model and adjustment to the levels of reduction from BAU used for project evaluation. To date, neither ARB nor any lead agencies have provided any guidance on how to adjust AB 32’s statewide BAU target for use at the project level.

The *Newhall Ranch* decision suggested several approaches for determining the significance of GHG emissions that may be appropriate as alternatives to the “percentage below BAU” approach but did not foreclose other methodologies that may be used by lead agencies. In any case, the decision affirmed that “thresholds only define the level at which an environmental effect ‘normally’ is considered significant; they do not relieve the lead agency of its duty to determine the significance of an impact independently.” Some of the court’s suggested approaches are introduced next and discussed more thoroughly in the context of the proposed project below.

⁸ Performance-based reductions include the “percentage below business-as-usual” threshold approach and are generally based solely on statewide targets, which have been used widely in the past. This approach was the subject of the *Newhall Ranch* case and presently is subject to uncertainty until the issues raised by the California Supreme Court ruling are resolved.

- **Consistency with a Qualified GHG Emissions Reduction Plan.** Use of a GHG emissions reduction plan, consistent with State CEQA Guidelines Section 15183.5, for a particular geographic area.
- **Quantitative Thresholds.** Use of a quantitative threshold (such as the Bay Area Air Quality Management District's (BAAQMD's) bright-line threshold).⁹
- **Compliance with Regulatory Programs.** This approach would include an assessment of the project's compliance with regulatory programs designed to reduce GHG emissions from particular activities (e.g., building efficiency, transportation, water usage). To the extent that a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by ARB or other state agencies, the lead agency could appropriately rely on their use to show that the project is reducing emissions consistent with AB 32 and, thus, that emissions are less than significant.
- **CEQA Streamlining.** Certain land use projects (such as residential, mixed-use, and transit priority projects) could use SB 375's expressed allowance for streamlining transportation impacts, based on the metropolitan regional SCS to streamline the analysis of emissions from cars and light trucks. Under any methodology, the *Newhall Ranch* case recognizes that if GHG emission impacts are still significant after adoption of all feasible mitigation measures and consideration of project alternatives, the lead agency may adopt a statement of overriding considerations with the appropriate findings.

Applicability of Available Thresholds

In light of the recent *Newhall Ranch* decision, the following section discusses each applicable approach and analyzes its specific applicability to the proposed project.

Performance-Based Reductions

Performance-based thresholds are based on a percentage reduction from a projected future condition. For example, reducing future BAU emissions by the AB 32 target of 29 percent (below 2020 BAU levels) through a combination of state measures, project design features (e.g., renewable energy), or mitigation is a performance-based threshold. The performance-based approach is based on the project's reduction in emissions from an unmitigated condition. Other lead agencies have adopted performance-based targets that are all tied to the AB 32 target of achieving 1990 levels by 2020, but the prescribed percentage reduction can vary, depending on the version of the Scoping Plan and targets therein that were used. For example, San Joaquin Valley Air Pollution Control District recommends a 29 percent reduction, which is based on the 2008 Scoping Plan, while Sacramento Metro Air Quality Management District previously recommended a 21.7 percent reduction from a projected no-action taken (NAT) scenario,¹⁰ which is based on the 2011 re-adopted Scoping Plan, whose emission targets vary slightly from 2008 to account for revised estimates for future fuel and energy demand. With the *Newhall Ranch* decision, relating a given project to the achievement of state reduction targets most likely requires adjustments to ARB's statewide BAU

⁹ Note that while *Newhall Ranch* did not explicitly discuss efficiency-based thresholds; they are a form of quantitative threshold and therefore are included in the *Applicability of Available Thresholds* discussion herein.

¹⁰ The NAT scenario does not include any state regulations designed to reduce GHG emissions, including improvements to the Title 24 standards, RPS, LCFS, or Pavley rules.

model, not only to isolate new development emissions but also to consider unique geographic conditions that would be required to use the BAU performance-based methodology for a specific project. To date, this type of adjustment to the statewide BAU target has not been formulated and, therefore, is not appropriate for the project's analysis. The primary value of a performance-based target, as indicated in *Newhall Ranch*, is that it can provide a scenario by which to evaluate the effectiveness of a project's efficiency and conservation measures to reduce GHG emissions. As such, future year targets can be used to benchmark performance, using either statewide or regional emission targets, to determine a project's fair share of mitigation.

Compliance with a Qualified GHG Reduction Plan

Under this approach, a qualified plan may be used in the cumulative impact analysis for later projects when the analysis "identifies those requirements specified in the plan that apply to the project." For a GHG reduction plan to be considered a qualified plan, it must meet certain criteria established under State CEQA Guidelines Section 15183.5 (b), also specified above. Consequently, if a project is consistent with a local CAP that was created to meet AB 32's GHG targets, then the project would be considered consistent with statewide GHG reduction goals for 2020. Additionally, if a CAP was adopted that was consistent with the state's overall goals for post-2020, including the downward trajectory, as clarified in EO B-30-15 and EO S-03-05, and a project is consistent with that CAP, it would be considered consistent with the state's post-2020 GHG emissions strategy. Section 15183.5 also specifies that the project's CEQA analysis "must identify those requirements specified in the plan that apply to the project and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project." The District adopted a CAP in 2013 that sets forth GHG 2020 and 2035 reduction targets and reduction measures to achieve these targets.

For 2020, the CAP meets the requirements of State CEQA Guidelines Section 15183.5, as specified in Appendix A of the CAP. The CAP quantifies existing and projected GHG emissions by sector¹¹ and activity type¹² and identifies and analyzes GHG emissions reductions from the same time period within the District. The CAP establishes a 10 percent reduction goal for the District for 2020; below that goal, the contribution of GHG emissions from activities covered by the plan would not be cumulatively considerable. The GHG emissions reduction goal and measures also serve as the CAP's performance standards, with accompanying reduction targets or performance standards across six categories.¹³ The CAP also specifies measures that, if implemented on a project-by-project basis, collectively achieve the GHG emissions reduction goals for the District.¹⁴ The plan and its effectiveness are regularly monitored through a process known as *adaptive management* to ensure that it is achieving the GHG emissions reduction goals.¹⁵ The CAP was adopted through a lengthy public process, and a CEQA exemption was adopted by the District (with an initial study) prior to the

¹¹ Sectors include electricity, natural gas, on-road transportation, off-road equipment, water usage and wastewater, and waste.

¹² Activities include industrial, shipbuilding, lodging, ocean-going vessels, recreational boating, other terminal activities, port operations, the convention center, and other activities within the District.

¹³ Categories include energy efficiency, alternative energy, transportation and land use, water, waste, and miscellaneous.

¹⁴ Implementation of the measures and performance standards is specified in Appendices A and F of the CAP as well as Board of Port Commissioners Policy 750, which is incorporated herein by reference.

¹⁵ Board of Port Commissioners Policy 750.

CAP's adoption. For the proposed project, consistency with the CAP is appropriate for 2020 to determine whether significant GHG emissions impacts would result. However, because the CAP does not include post-2020 reduction quantification, consistency with the CAP is not an appropriate threshold of significance for post-2020 GHG emissions.

Quantitative Thresholds

Numerical Bright-Line

In general, numerical bright-line thresholds identify the point at which additional analysis and mitigation of project-related GHG emissions impacts is necessary. Currently, bright-line thresholds have been developed for commercial projects, residential projects, and stationary sources. Commercial and residential bright-line thresholds are typically based on a market capture rate or a gap analysis,¹⁶ which is tied back to AB 32 reduction targets (1990 levels by 2020).¹⁷ These bright-line thresholds reflect local or regional land use conditions, particularly residential and commercial density and access to transit. For example, the BAAQMD's bright-line threshold of 1,100 MTCO_{2e} captures land use conditions present in the Bay Area at the time of analysis and does not necessarily reflect conditions in other areas of the state, including within the District, that may display varying land use patterns and densities. A stationary source bright-line threshold of 10,000 MTCO_{2e} has been adopted by multiple air districts and other agencies as part of the permitting process, and the South Coast Air Quality Management District (SCAQMD) currently recommends use of the same threshold for permitted source projects when SCAQMD is the lead agency.

A numerical bright-line value, based solely on District-wide projects, does not yet exist. Moreover, no bright-line threshold has been formally adopted by an air district or other lead agencies for use in the San Diego region. Various bright-line numerical threshold have been drafted, proposed, or adopted throughout the state, and these vary greatly by agency and by purpose. For example, numerical thresholds range from the 900 MTCO_{2e} screening level referenced in the California Air Pollution Control Officers Association (CAPCOA) white paper (CAPCOA 2008), to the 1,100 MTCO_{2e} adopted by BAAQMD (BAAQMD 2011), to the 10,000 MTCO_{2e} stationary bright-line threshold adopted by BAAQMD (BAAQMD 2011) and Sacramento Metropolitan Air Quality Management District (SMAQMD) (SMAQMD 2016), to the 100,000-ton CO_{2e} level adopted by the Mojave Desert Air Quality Management District, based on the federal permit triggers (MDAQMD 2016). CAPCOA's 900 MTCO_{2e} screening level is the lowest numerical threshold drafted, recommended, or adopted in the state.

The 900 MTCO_{2e} screening level is used as a theoretical approach to identify projects that require further analysis and potential mitigation. The screening level identifies projects that would result in sufficiently low GHG emissions that would be less than cumulatively considerable without mitigation. This 900 MTCO_{2e} screening-level threshold was not devised to include emissions associated with larger goods movement projects or industrial processes that are typically associated with larger District projects but may be appropriate for small maritime projects or other land use types, including small visitor-serving commercial projects or intermittent uses. Furthermore, the

¹⁶ The gap analysis demonstrates the reductions needed at the residential and commercial land use levels to achieve state targets. Capture is the process of estimating the portion of projects that would result in emissions that would exceed a significance threshold and would be subject to mitigation.

¹⁷ The AB 32 Scoping Plan identifies specific measures to reduce GHG emissions to 1990 levels by 2020.

stationary bright-line threshold of 10,000 MTCO₂e is not appropriate for the proposed project because the project is not a typical industrial stationary source with a single point of emissions (e.g., a single exhaust pipe or release point) but may be appropriate for stationary-source activities (e.g., boilers). Because the proposed project is not an industrial stationary-source project, established industrial bright-line numerical thresholds are not appropriate and are not used in the analysis. However, the 900 MTCO₂e screening-level threshold is considered, as discussed below.

Efficiency-Based Threshold

Another type of quantitative threshold is an efficiency-based threshold. Efficiency-based thresholds represent the GHG efficiency needed for development to achieve California's GHG emissions target established under AB 32. Although the *Newhall Ranch* decision did not specifically recommend the efficiency-based approach, the ruling did note that numerical bright-line threshold approaches may be appropriate for determining significance of GHG emissions and emphasizing the consideration of GHG efficiency. Efficiency-based thresholds are typically calculated by dividing emissions associated with residential and commercial uses (also termed the "land use sector" in the Scoping Plan) within the state (or a certain geographic area) by the sum of jobs and residents within the same geography. The sum of jobs and residents is called the "service population." A project's service population is defined as the people who work and live within the project site. Because typical efficiency-based thresholds are based on the land use sector (residential and commercial uses) and account only for land use-related emissions and residential population and employment, they may be misleading to use for industrial uses, recreational projects, stationary-source projects,¹⁸ or marine terminal projects¹⁹ because these types of uses are specifically excluded from the land use sectors and typically do not directly propose housing or result in population growth. Therefore, no threshold has been adopted or proposed to date that would address recreational and intermittent types of projects. Therefore, the efficiency-based methodology is not used for the proposed project.

Compliance with Regulatory Programs

Another approach for determining whether a project would result in significant GHG emissions impacts is determining whether a proposed project is in compliance with regulatory programs designed to reduce GHG emissions from particular activities. To the extent a project complies with or exceeds those programs adopted by ARB or other state agencies, a lead agency could rely on this compliance to show less-than-significant impacts. However, such analysis is applicable only within the area governed by the regulations. For example, consistency with regulations that address building efficiency would not suffice when determining that the project would not have significant GHG emissions from transportation. The proposed project's compliance with regulatory programs adopted by ARB or other state agencies is used, in part, for the proposed project's GHG emissions analysis.

¹⁸ See the Bay Area Air Quality Management District's October 2009 Threshold Options and Justification Report for additional evidence: <http://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines>.

¹⁹ An example of appropriate use of an efficiency-based threshold at the port would be for a large visitor-serving commercial project (i.e., has a jobs-based component consistent with the efficiency-based threshold) that accommodates population and employment growth in a way that is consistent with the emissions limit established under AB 32.

Newhall Ranch specifically mentions consistency with both SCS (per SB 375) and AB 32, which are discussed below. Also, other recent case law mentions the need to demonstrate consistency with the long-term targets in B-30-15 (2030) and S-03-05 (2050), which are also addressed below.

- **Compliance/Consistency with AB 32 (2020).** A lead agency could also assess a project's consistency with AB 32 in whole or part by looking to compliance with regulatory programs designed to implement AB 32. To the extent a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by ARB or other state agencies, a lead agency could appropriately rely on their use to show compliance with performance-based standards adopted to fulfill the statewide goal for reducing GHG emissions.
- **Consistency with EO B-30-15 (2030) and EO S-03-05 (2050) Targets and Planning.** A lead agency could also assess a project's consistency with the targets in the EOs and with current planning for the post-2020 period or substantial progress toward these goals over time. At present, the regulatory framework to achieve the 2030 target is in its infancy and is not sufficiently robust to support a consistency argument, but consistency with the targets is nevertheless a potential approach.

CEQA Streamlining

The *Newhall Ranch* ruling affirmed that CEQA expressly allows streamlining under SB 375 of certain residential, commercial, and mixed-use projects that are consistent with the limits and policies specified in an applicable SCS. The ruling pointed out that a qualifying project need not additionally analyze GHG emissions from cars and light trucks. In San Diego, the SCS is contained within SANDAG's recently adopted 2050 RTP/SCS (SANDAG 2015). Projects eligible for this streamlining can "tier" off the RTP/SCS EIR for CEQA purposes. However, the proposed project would not be eligible for streamlined review because it does not meet the qualifying criteria defined in SB 375.

Post-2020 Thresholds

Although the *Newhall Ranch* decision did not rule on whether a post-2020 climate change analysis is required for CEQA documents, the decision mentioned that consistency with 2020 goals will become a less definitive guide over time, and consistency with long-term emission reduction targets may be needed in the near future. The state recently adopted SB 32, which adopts the interim reduction target to reduce GHG emissions by 40 percent below 1990 levels by 2030 in EO B-30-15. Further, EO S-03-05 has set forth a long-term reduction target to reduce GHG emissions to 80 percent below 1990 levels by 2050. ARB released its Draft 2017 Scoping Plan Update and is working on the 2030 Scoping Plan, which outlines the state's proposed framework for meeting the 2030 target set by SB 32. The Draft 2017 Scoping Plan Update is currently out for public review and is therefore not yet adopted. Thus, there is no current adopted statewide GHG emissions reduction plan or framework thereof that extends beyond 2020.

The Draft 2017 Scoping Plan Update, along with previous work by the state and the District, has shown the District's and state's interest in adopting regulatory programs and frameworks designed to support meeting statewide post-2020 reduction goals. Meeting the ambitious targets in SB 32 and EO S-03-05 will require substantial effort at the state, regional, and local levels. Lacking an adopted post-2020 plan, the Association of Environmental Professionals (AEP) (2015, 2016) recommends that CEQA GHG analyses evaluate project emissions in light of the trajectory of state climate change legislation and assess their "substantial progress" toward achieving longer-term reduction targets identified in available plans (e.g., CAPs), legislation, or executive orders. The best measure is thus

substantial progress toward long-range targets and not necessarily meeting milestone targets many years in the future, such as for 2050. Moreover, although there are no proposed or adopted significance thresholds for analyzing post-2020 emissions for development projects in California, the updated Scoping Plan does recommend that local governments aim to achieve a community-wide goal of no more than 6 MTCO_{2e} per capita by 2030 and no more than 2 MTCO_{2e} per capita by 2050. Although these thresholds are neither adopted nor explicitly relevant to the proposed project, this does indicate ARB's overall intent of highlighting and promoting efficiency statewide. However, there are no thresholds that are explicitly applicable to fireworks display events or other intermittent and infrequent recreational events.

Threshold Approach

As discussed above, there are multiple potential thresholds and methodologies for evaluating project-level GHG emissions consistent with CEQA, depending on the circumstances of a given project. Although efforts at framing GHG significance issues have not yet coalesced into any widely accepted set of numerical significance thresholds across the state and within the region, a range of alternative approaches does exist.

The proposed new fireworks display events could occur as soon summer 2017. However, 2020 is an obvious GHG benchmark year that aligns with the timeline employed in development of the bright-line threshold levels and set forth in both AB 32 and the District's CAP. Use of 2020 as a target or milestone year for GHG emissions reductions per AB 32 as a significance criterion is widely employed and was further validated in *Newhall Ranch* for projects with 2020 or pre-2020 timelines (AEP 2016). Beyond 2020, the next statewide target or milestone year is 2030, as originally set by EO B-30-15, adopted in SB 32, and addressed in recent ARB movement on the Scoping Plan update (ARB 2016b). The proposed project would remain in operation well beyond 2020, and given the recent adoption of SB 32 and court direction regarding EO S-03-05, this analysis assumes that the post-2020 target or milestone year is 2050.

Based on the available threshold concepts recommended by air districts or other lead agencies and recent case law, the thresholds of significance that will be applied to the proposed project's GHG emissions for both the 2020 and post-2020 periods are as follows:

- For 2020, impacts from the proposed project's GHG emissions would be considered less than significant if the proposed project is found to be:
 - (1) Below relevant bright-line thresholds, including the 900 MTCO_{2e} screening level;
 - (2) Consistent with the District CAP (a qualified GHG reduction plan), including the reduction targets and reduction measures specified therein; and
 - (3) Consistent with regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies.

The analysis for 2020 is both quantitative with respect to the bright-line threshold, CAP, and AB 32 consistency and qualitative with respect to compliance with the CAP's measures and regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies. The analysis for consistency with regulatory programs applies only to the individual area addressed by the regulatory program. If the proposed project is determined to be (1) consistent with relevant bright-line threshold; (2) consistent with the District's CAP, including reduction targets therein (see Table 4.4-4); and (3) consistent with regulatory programs adopted by ARB or other agencies to

reduce GHG emissions, then the proposed project's cumulative contribution of GHG emissions would be considered less than significant for 2020. Conversely, if the proposed project is determined to be inconsistent with the relevant bright-line threshold or inconsistent with measures listed in the CAP, or is inconsistent with or will interfere with or obstruct implementation of regulatory programs adopted by ARB or other state agencies to reduce GHG emissions, then the proposed project's cumulative contribution of GHG emissions would be considered significant, and feasible mitigation measures would be required.

Table 4.4-4. Estimate of Annual Greenhouse Gas Emissions during Existing Fireworks Display Events (metric tons per year and per event)

Emission Source	Project MTCO_{2e}
Fourth of July	
<i>Fireworks</i>

As mentioned above, the 900 MTCO_{2e} screening level is lowest numerical threshold drafted, recommended, or adopted in the state and serves as a conservative screening criterion for determining which projects require further analysis and identification of project design features or potential mitigation measures with regard to GHG emissions. No threshold has been adopted specific to analyzing fireworks display events. This 900 MTCO_{2e} level was developed to provide a screening criterion for small land use development projects (e.g., residences, offices) that include

land use–related emissions sources (e.g., passenger vehicles, building energy). This screening criterion can be used to provide a tool for comparing proposed project-related emissions to the lowest and most conservative threshold currently recommended in the state for analyzing typical land use projects. Additionally, the mere fact that a project exceeds a bright-line significance criterion does not necessarily indicate that the project would generate a significant unavoidable impact. In the same sense, the mere fact that a project would not exceed a bright-line significance criterion does not necessarily indicate that the project would result in a less-than-significant impact.

These bright-line thresholds are screening criteria, and the analysis must be combined with further discussion in substantiating significance conclusions. As discussed above, use of the bright-line screening levels is the first step in discussing the significance of proposed project emissions.

The thresholds of significance that will be applied to the proposed project’s GHG emissions for the post-2020 period are as follows:

- For the post-2020 period, impacts from the proposed project’s GHG emissions would be less than significant if the proposed project is found to be:
 - (1) Below relevant bright-line thresholds, including the 900 MTCO_{2e} screening level;
 - (2) Consistent with the state’s overall reduction targets (including SB 32) for post-2020; and
 - (3) Consistent with regulatory programs adopted by ARB or other California agencies for post-2020 GHG emissions.²⁰

Based on the available threshold concepts recommended by expert agencies and the “substantial progress” approach, the analysis for the post-2020 time period is both quantitative with respect to consistency with bright-line threshold levels and long-term reduction targets and qualitative with respect to consistency with the measures and regulatory programs outlined, adopted, or proposed by ARB or other California agencies. Proposed project emissions are compared to relevant threshold levels and in the context of the state’s overall reduction targets for the post-2020 period. The analysis for consistency with regulatory programs applies only to the individual area addressed by the regulatory program. In keeping with the guidance provided in *Newhall Ranch* that the extent to which a project’s design features comply with or exceed the regulations outlined in the Scoping Plan or by state agencies, a lead agency could appropriately rely on showing compliance with performance-based standards (e.g., future reduction targets) adopted to fulfill a statewide plan for the reduction or mitigation of GHG emissions.

Note that the 900 MTCO_{2e} screening threshold discussed above is based on consistency with the AB 32 reduction target. Although the 900 MTCO_{2e} screening threshold is not intended to be used for determining the consistency of emissions with post-2020 reduction targets, including SB 32, it can serve as a proxy for providing a valuable quantitative screening level to determine whether project emissions would be low enough to make the possibility of generating a level of GHGs that would be cumulatively considerable highly unlikely.

Climate Change

Recent court cases have concluded that an EIR need not evaluate the environment’s effect on a

²⁰ Because the CAP does not yet quantify reductions for 2035, it is not relied on for the post-2020 analysis.

project, often referred to as “Reverse CEQA.”²¹ In one case that discussed the issue of SLR directly, the California Second District Court of Appeal held that, although an EIR must analyze the environmental effects that may result from a project, an EIR is not required to examine the effects of the environment, such as SLR, on a project (see *Ballona Wetlands Land Trust v. City of Los Angeles*, 201 Cal. App. 4th 455). In its decision, the court called into question the validity of portions of the State CEQA Guidelines that require consideration of impacts of the environment on a project. The *Ballona* decision potentially eliminates the need for lead agencies to consider the impacts of climate change on proposed projects. The *Ballona* decision did not, however, call into question the State CEQA Guidelines amendments enacted in 2010 that address the analysis and mitigation of the potential impacts on the environment associated with a project’s GHG emissions.

Although the California Supreme Court denied review of the *Ballona* decision,²² the issue of the environment’s effect on a project was raised once again in *California Building Industry Association v. Bay Area Quality Management District*, Supreme Court Case No. S213478. The California Supreme Court ruled on December 17, 2015, that CEQA does not direct agencies to analyze the environment’s effects on a project unless the project would exacerbate existing environmental hazards or certain specific exemptions apply. However, the project sites are within the Coastal Zone and, pursuant to EO S-13-08, the California Coastal Commission considers the potential impacts of SLR on a proposed project in determining consistency with the Coastal Act. Accordingly, the California Coastal Commission adopted SLR policy guidance in 2015 that provides an overview of the best available science on SLR and a recommended methodology for addressing SLR in California Coastal Commission planning and regulatory actions (California Coastal Commission 2015).

Specifically regarding SLR, the San Diego Bay Vulnerability Assessment conducted by ICLEI - Local Governments for Sustainability found that the greatest concern with respect to SLR will be an increase in the nature of flooding that a region already experiences from waves, storm surge, El Niño events, and exceptionally high tides. Furthermore, starting around mid-century, San Diego Bay may become more susceptible to regularly occurring inundation of certain locations and assets, some of which are being planned and built today. As a result, this longer-term risk of inundation should be a concern in today’s decision-making. The most vulnerable sectors in the community include stormwater management, wastewater collection, shoreline parks and public access, transportation facilities, commercial buildings, and ecosystems (ICLEI 2012).

Accordingly, a discussion of the issue has been provided below using the following criterion:

- Would the project place people or structures at substantial risk of harm due to predicted climate change effects, particularly SLR?

Energy Consumption

Based on State CEQA Guidelines Appendix F, environmental considerations may include those listed below.

²¹ See *South Orange County Wastewater Authority v. City of Dana Point* (2011), 196 Cal.App.4th 1604; *Ballona Wetlands Land Trust v. City of Los Angeles* (2011), 201 Cal.App.4th 455; *Baird v. County of Contra Costa* (1995), 32 Cal.App.4th 1464, 1468 (Baird); *City of Long Beach v. Los Angeles Unified School Dist.* (2009), 176 Cal.App.4th 889 (Long Beach).

²² On March 21, 2012, the California Supreme Court denied case review and depublication requests submitted by several environmental organizations.

- The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project, including construction, operation, maintenance, and/or removal. If appropriate, the energy intensiveness of materials may be discussed;
- The effects of the project on local and regional energy supplies and on requirements for additional capacity;
- The effects of the project on peak- and base-period demands for electricity and other forms of energy;
- The degree to which the project complies with existing energy standards;
- The effects of the project on energy resources; and
- The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

The State CEQA Guidelines recommend that the discussion of applicable energy impacts focus on whether the project would result in the wasteful, inefficient, or unnecessary consumption of energy because this may constitute an adverse effect on energy resources. Efficiency projects that incorporate conservation measures to avoid wasteful energy usage facilitate long-term energy planning and avoid the need for unplanned or additional energy capacity. Accordingly, based on the criteria outlined in State CEQA Guidelines Appendix F, the proposed project would cause significant impacts related to energy if it would lead to a wasteful, inefficient, and unnecessary usage of direct or indirect energy.

As discussed in Section 4.2.3, energy legislation, policies, and standards adopted by California and local governments were enacted and promulgated for the purpose of reducing energy consumption and improving efficiency (i.e., reducing wasteful and inefficient use of energy). Therefore, for the purposes of this analysis, *wasteful* and *inefficient* are defined as circumstances in which the project would conflict with applicable state or local energy legislation, policies, and standards. Accordingly, if the project were to conflict with legislation, policies, or standards designed to avoid wasteful and inefficient energy usage, it would result in a significant impact related to energy resources and conservation. Accordingly, a discussion of the issue has been provided below using the following criteria:

- Would the project result in the wasteful, inefficient, or unnecessary use of energy?
- Would the project require or result in the construction of new energy system infrastructure or the expansion of existing infrastructure, the construction of which could cause significant environmental effects?

4.4.4.3 Project Impacts and Mitigation Measures

Threshold 1: For the years up to and including 2020, the project (1) would be below the relevant bright-line threshold (2) would be consistent with the District CAP, and (3) would be in compliance with plans, policies, and regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies for the purpose of reducing the emissions of GHGs.

Impact Discussion

The four proposed new fireworks display events have the potential to generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. The proposed new displays would result in GHG emissions associated with fireworks detonation, tugboat and barge activity, and material deliveries. Further, viewers accessing the Bayfronts may change motor vehicle travel patterns on fireworks display event days; this is discussed qualitatively below.

A number of existing fireworks display events that require a discretionary action by the District or are operated by the District's tenants occur year-round, with the greatest number of displays in the summer months from July to September. These existing fireworks display events result in GHG emissions from sources that are directly or indirectly related to the displays, including fireworks detonation, tugboat and barge activity, material deliveries and indirectly related to visitor motor vehicle travel. The estimate of existing fireworks emissions serves as the basis for estimating fireworks emissions associated with the proposed new displays; emissions are scaled by the number of pounds per display. The methodology for delivery trucks and tugboats is based on existing conditions; there is one tugboat per barge, and the tugboat is active for 4 hours per display. A detailed description of each of these sources and associated emissions modeling are provided in Section 4.4.4.1.

Because the sum of all GHG emissions is analyzed on an annual time scale, the exact timing of the displays is not of concern; instead, the GHG emissions and climate change analysis is most concerned with the sum of all emissions over the course of a year and how those emissions would comply with existing District-wide and statewide plans, policies, and programs adopted for the purpose of reducing the emissions of GHGs.

Table 4.4-4, above, presents annual GHG emissions (metric tons per year) associated with all existing fireworks display events over the course of a year. As shown in Table 4.4-4, the sum of all existing fireworks display events results in an estimated 42 MTCO_{2e}, most of which (21 MTCO_{2e} from tugboats, 20 MTCO_{2e} from trucks) is emitted from diesel-related sources. Emissions from the fireworks themselves are low because fireworks-related GHG emissions factors are low. The majority of fireworks-related emissions under existing conditions are therefore already accounted for in the District's CAP. For example, the tugboat annual operating hours shown in the District's Maritime Emissions Inventory (District 2014) and the CAP (District 2013) include tugboat and barge activity associated with the current fireworks display events because the tugboat activity is performed by Pacific Tugboat Service, which is an existing District tenant. Although the CAP does not include fireworks and delivery emissions, these emissions are small and amount to an estimated 1.66 and 19.63 MTCO_{2e} per year under existing conditions, respectively. Furthermore, as discussed in Section 4.4.4.1 and in detail in Section 4.2, *Air Quality and Health Risk*, regional traffic patterns

cannot be accurately analyzed for the fireworks display events. However, it is unlikely that vehicle traffic related to the proposed new Fourth of July and non-Fourth of July fireworks display events would result in more emissions than the actual fireworks display events, which themselves are minor. As discussed in Section 4.2, *Air Quality and Health Risk*, based on a comparison of background air monitoring data on both event and non-event days, vehicular traffic on the fireworks display event day would most likely be lower than on a typical non-event day. Thus, GHG emissions associated with vehicle traffic are expected to be far below relevant thresholds; consistent with the District CAP, including the reduction targets and reduction measures specified therein; and consistent with regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies.

Proposed New Fireworks Display Events

The proposed project includes four new fireworks display events per year in San Diego Bay that would be governed by the proposed ordinance. It is anticipated that both the National City and Chula Vista Bayfronts would host a Fourth of July fireworks display event, while the Chula Vista Bayfront would host two other non-Fourth of July fireworks display events throughout the year.

Compliance with Bright-Line Threshold

Table 4.4-5 presents annual GHG emissions (metric tons per year) associated with the proposed new fireworks display events. As shown in Table 4.4-5, annual emissions from all proposed new fireworks display events would be minor (less than 7 MTCO_{2e}), and the magnitude would be below the relevant screening threshold, both individually and when summed over the entire year.

Similar to existing fireworks display events, emissions from the fireworks themselves would be low because the primary source of emissions would be the combustion of tugboat and truck fuel. As discussed under Threshold 2 in Section 4.2, *Air Quality and Health Risk*, background emissions on the display day would be lower than they would be on the weekday “control” day.” Thus, vehicular traffic on the display day would most likely be lower than it would be on a typical day and therefore unlikely to result in emissions that would not be in compliance with GHG reduction plans, policies, and regulations.

The proposed project would not propose any construction or permanent sources of emissions. The proposed new fireworks display events are expected to remain in operation through 2050. Fireworks-related emissions would be low and, most likely, would not change in the future. Tugboat-related emissions would also be low and, most likely, would not change over the short term, even as the tugboat population that services vessels and barges in the Bay is retrofitted or remanufactured. However, over the long term, the state and District will move toward zero and near-zero technologies such as biodiesel, hybrid-electric, and liquefied natural gas technologies, which would reduce emissions from project-related tugboat uses. Each of these technologies would reduce GHG emissions but, in the case of biodiesel, might increase nitrogen oxides (NO_x). Therefore, as zero and near-zero tugboat technologies reduce emissions, project-related GHG emissions would decline through the life of the project. GHG emissions would begin to trend downward, consistent with the need for deeper reductions post-2020, as promulgated in SB 32.

Table 4.4-5. Estimate of Annual Greenhouse Gas Emissions during Proposed New Fireworks Display Events (metric tons per year and per event)

Consistency with CAP

As mentioned above, the proposed project consists of adding four new fireworks display events per year within San Diego Bay. Emissions from the proposed new displays would benefit from actions already undertaken by the District to reduce emissions from maritime sources, including retrofitting tugboats with cleaner technologies that, although do not reduce GHG emissions, reduce criteria pollutant and TAC emissions. The District's CAP does include numerous measures to reduce GHG emissions from District operations, including both maritime and landside sources. The CAP takes into account growth in District-wide activity from all sectors over time. For example, cargo associated with the maritime sector, which includes tugboat activity, is assumed to increase 3 percent annually through 2020 and 3.2 percent annually between 2020 and 2030. As discussed below, the proposed ordinance would ensure that the project would be consistent with the CAP and the targets and measures therein. Moreover, emissions associated with the proposed new fireworks display events would be minor and substantially below the chosen bright-line threshold level and any bright-line threshold level drafted, adopted, or considered in this state. Thus, project emissions

would not alter current District trajectory toward meeting its 2020 GHG reduction targets. For perspective, the 6.63 MTCO_{2e} associated with the proposed new fireworks display events is equivalent to the emissions from about 1.4 passenger vehicles driven for 1 year or the electricity usage of 0.7 home for 1 year. Impacts associated with GHG emissions through 2020 would be less than significant.

The proposed project's consistency with applicable CAP measures is discussed in Table 4.4-6. As shown in Table 4.4-6, the proposed project would implement applicable measures in the CAP, which would be enforced through compliance with the proposed ordinance.

Table 4.4-6. Project Consistency with Applicable Port CAP Measures for 2020

No.	Measure Description	Project Consistency Analysis
TA3	Implement emissions reduction strategies at loading docks through electrification of docks or idling reduction systems for use while at loading docks.	Consistent. The proposed ordinance includes a condition of approval that requires all commercial delivery vehicles associated with existing and proposed new shows to limit idling times to 3 minutes, which is beyond that required by state law.
TR3	Vehicle Idling: Enforce state idling laws for commercial vehicles, including delivery and construction vehicles.	Consistent. The proposed ordinance includes a condition of approval that requires all commercial delivery vehicles associated with existing and proposed new shows to limit idling times to 3 minutes, which is beyond that required by state law.

Notes:

TA: Transportation and Land Use CAP Measures – Alternative-Fuel Vehicles;; TR: Roadway System Management.

Consistency with Regulations and Regulatory Programs Adopted by ARB or Other State Agencies

As shown in Table 4.4-7, the proposed new fireworks display events would be consistent with several measures from the Scoping Plan as well as other measures being implemented by EPA and ARB (e.g., Phase 2 trucks).

Table 4.4-7. Project Consistency with AB 32 Scoping Plan and Other ARB Measures for 2020

No.	Measure Description	Project Consistency Analysis
Scoping Plan Measures		
T-1	Advanced Clean Cars	Consistent. State program that requires no action at the local or project level. Benefits related to visitation car travel will be realized.
T-2	Low-Carbon Fuel Standard	Consistent. State program that requires no action at the local or project level. Benefits will be realized.
T-4	Vehicle Efficiency Measures 1. Tire Pressure 2. Fuel Efficiency Tire Program 3. Low Friction Oil 4. Solar Reflective Automotive Paint and Window Glazing	Consistent. State program that requires no action at the local or project level. Benefits related to visitation car and delivery truck travel will be realized.
T-7	Heavy-Duty Vehicle GHG Emissions Reduction 1. Tractor-Trailer GHG Regulation 2. Heavy-Duty GHG Standards for New Vehicles and Engines (Phase I)	Consistent. State and federal programs that require no action at the local or project level. Benefits related to delivery truck travel will be realized.
-	Pavley (AB 1493)	Consistent. See T-1 and T-2. State program that requires no action at the local or project level. Benefits related to project-related visitation car travel will be realized.
-	Heavy-Duty (Tractor-Trailer) GHG Regulation and Phase 2 Truck Standards	Consistent. See T-7. State and federal programs that require no action at the local or project level. Benefits related to project-related delivery truck travel will be realized.
-	OGV Fuel Switch Regulation (to 0.1% sulfur fuel)	Consistent. See T-6. State program that requires 0.1% sulfur fuel use for all vessel activity within California's regulated waters (i.e., within 24 nautical miles of shore), including project-related tugboats. Implementation started January 1, 2014.

Notes:		
T = Transportation Measures; E = Electricity Measures; W = Water Measures; H = High GWP Measures		

Consistency with Other Regulations

The Clean Air Program, one of six key areas addressed by the District's Green Port Program, focuses on initiatives to reduce air pollution from District operations and includes various strategies that the District is employing to reduce GHG emissions from its largest sources, including shore power, truck replacement/retrofits, replacement/retrofits of CHE, and the voluntary VSR program. The District, through its Green Port Program, will continue to implement actions to reduce GHG emissions in the future. The project would implement the relevant Green Port Program and Clean Air Program control measures, including drayage truck replacement and retrofits, replacement and retrofits of CHE, VSR, and shore power, as well as through implementation of the CAP. The proposed project would not involve goods movement and does not propose any permanent structures or emissions

sources. The proposed project is consistent with the District's Green Port and Clean Air Programs because the proposed new fireworks display events would comply with current and potential future ARB regulations developed and included as part of the Green Port Program and Clean Air Program and assumed in the CAP, as described above in Table 4.4-7. Therefore, the proposed project would be consistent with both the overarching Green Port Program and the more specific Clean Air Program as well as statewide actions and plans to reduce GHG emission from all sectors of the economy.

Impact Determination through 2020

The state is well on its way to reaching 2020 targets and expected to meet the AB 32 targets in 2020 with recently adopted state regulations. Although new projects may add emissions, overall District and California GHG emissions need to be on a downward trend. The proposed project would not involve goods movement and does not propose any permanent structures or emissions sources. The proposed project would comply with adopted regulations and regulatory programs and result in emissions that would be far below the lowest bright-line threshold used in the state. The proposed project would be consistent with, and would not impede progress toward meeting, District and statewide GHG reduction targets in 2020. Through compliance with the proposed ordinance, the proposed project would ensure that project-related GHG emissions would be consistent with the CAP and would comply with plans, policies, and regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies for the purpose of reducing the emissions of GHGs. Therefore, impacts associated with GHG emissions through 2020 would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. Furthermore, the proposed ordinance would include conditions of approval that would impose limits on delivery truck idling to ensure that both air quality and GHG emissions from existing fireworks display events would be effectively reduced. As such, compliance with the proposed ordinance would improve the existing condition by ensuring that GHG emissions would be limited. Therefore, the effect of the proposed ordinance on existing fireworks display events would be consistent with the applicable CAP measures (Table 4.4-6) and various ARB and EPA measures (Table 4.4-7). No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

For the years up to and including 2020, the magnitude of emissions from the proposed new fireworks display events would be below the chosen screening level, would be consistent with the District CAP and reduction measures specified therein, and would comply with plans, policies, and regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies for the purpose of reducing the emissions of GHGs. Therefore, impacts would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

For the years up to and including 2020, the effect of the proposed ordinance on existing fireworks display events would not result in GHG emissions that would exceed the chosen screening level, would be consistent with the District CAP and reduction measures specified therein, and would comply with plans, policies, and regulatory programs outlined in the Scoping Plan and adopted by ARB or other California agencies for the purpose of reducing the emissions of GHGs. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Effect of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 2: Beyond 2020, the proposed project (1) would be below the relevant bright-line threshold, (2) would be consistent with the state's overall reduction targets identified in SB 32 and EO S-03-05, and (3) would be in compliance with plans, policies, and regulatory programs adopted by ARB or other California agencies for post-2020 for the purpose of reducing emissions of GHGs.

Impact Discussion

As discussed in Threshold 1, the proposed new fireworks display events have the potential to generate GHG emissions, either directly or indirectly. The proposed new fireworks displays events would result in GHG emissions associated with fireworks detonation, tugboat and barge activity, and material deliveries. Emissions from these shows would continue beyond the 2020 timeframe.

Proposed New Fireworks Display Events

The proposed project would include four new fireworks display events per year in San Diego Bay that would be governed by the proposed ordinance. It is anticipated that both the National City and Chula Vista Bayfronts would host a Fourth of July fireworks display event, while the Chula Vista Bayfront would host two other non-Fourth of July fireworks display events throughout the year.

Compliance with Bright Line Threshold

As shown in Table 4.4-5, above, the proposed new fireworks display events would emit an estimated 7 MTCO_{2e} per year, which, whether summed individually (by event) or over the entire year (sum of all events), is far below any bright-line threshold, including the 900 MTCO_{2e} screening level discussed above. Moreover, although the 900 MTCO_{2e} threshold level was devised to analyze the consistency of project emissions with AB 32's 2020 targets, adjustments to this 900 MTCO_{2e} level to account for the increased stringency required for the District and state to meet 2030 and 2050 reduction targets (i.e., adjusting the threshold down to capture more projects) would not change any conclusions herein given the low level of project-related GHG emissions. Therefore, the magnitude of the proposed new fireworks display events would be below the most relevant bright-line threshold.

Consistency with Post-2020 Reduction Targets and "Substantial Progress"

Although the District's CAP and ARB's Scoping Plan mention some potential post-2020 strategies, as of the date this analysis was prepared, emissions savings from these post-2020 strategies are not quantified. SB 32 establishes a statewide target for 2030 GHG emissions reduction levels consistent with EO B-30-15 (40 percent below 1990 levels by 2030). Although SB 32 established a statutory target for post-2020 analyses, there are currently no adopted plans or measures that specifically prescribe how the 2030 target will be reached. Various guidance and white paper documents are in circulation that discuss potential near- and long-term strategies to reduce emissions from all sources, including sources associated with the proposed new fireworks display events, such as tugboats. The District's CAP and ARB's Scoping Plan First Update are some recent examples that include proposed, recommended, or adopted actions to reduce emissions over the long term. The proposed project would not include goods movement activity. Therefore, unlike other maritime-related projects at the District, ARB's Sustainable Freight Strategy and Action Plan are not relevant to the analysis herein.

Post-2020 – Consistency with the District CAP

The District's CAP includes strategies and prescribes a 25 percent reduction goal (below 2006 levels) for 2035 but does not yet include prescribed reduction measures to achieve a post-2020 target. Because the CAP did not estimate reductions from these strategies beyond 2020, emphasis is placed on consistency with the overarching goals of the CAP (to reduce GHG emissions) rather than the specific reductions attached to each strategy. In this sense, it is not considered a qualifying plan for post-2020 purposes, as described in State CEQA Guidelines Section 15183.5; therefore, the post-2020 analysis does not rely on compliance with the CAP to determine whether the project's impacts would be cumulatively considerable for post-2020 GHG emissions. The CAP does include some post-2020 measures to develop renewable energy on the tidelands by both 2035 and 2050 and pursue off-site GHG reduction strategies, but none are directly applicable to the proposed project.

Post-2020 – Consistency with the State's Overall Reduction Targets, including SB 32 and EO S-03-05

A number of studies discuss potential mechanisms for limiting California's economy-wide emissions to the equivalent of 40 percent below the 1990 level by 2030 and 80 percent below the 1990 level by 2050. For instance, ARB and other state agencies are developing GHG emissions reduction scenarios for 2030 that would set the state on the course toward its 2050 GHG emissions reduction goal (CEC 2015). Other studies include a report by the California Center for Science and Technology (2012), a California Department of Transportation report that discusses GHG emissions reductions

from the transportation sector alone (California Department of Transportation 2016), and a study published in *Science* that analyzes the changes that will be required to reduce GHG emissions to 80 percent below 1990 levels by 2050 (*Science* 2012). In general, these studies reach similar conclusions. Deep reductions in GHG emissions can be achieved only with significant changes in electricity production, transportation fuels, and industrial processes (e.g., decarbonizing electricity production, electrifying transportation, implementing widespread adoption of low-carbon or no-carbon transportation fuels, electrifying non-transportation direct fuel uses, increasing energy efficiency, avoiding waste emissions, increasing carbon sequestration, replacing high GWP gases, and other measures).

The systemic changes that will be required to achieve the 2030 and 2050 GHG reduction goals set forth by SB 32 (2030) and EO S-03-05 (2050) will require significant policy, technical, and economic solutions. Decarbonization of the transportation fuel supply will require electric and plug-in hybrid electric vehicles to make up the vast majority of light-duty vehicles. Some changes, such as the use of biofuels to replace petroleum for aviation, cannot be accomplished without action by the federal government. Furthermore, achieving the 2050 GHG reduction goals will require California to increase the amount of electricity that is generated by renewable generation sources dramatically and, correspondingly, advance the deployment of energy storage technology and smart-grid strategies, such as price-responsive demand and the smart charging of vehicles. This would entail a significant redesign of California's electricity system.

In qualitatively evaluating the project-related emissions for consistency with EO S-03-05 and EO B-30-15, it is important to note that these broad-scale shifts in how energy is produced and used are outside of the control of the project and the District. The changes necessitated by the state's long-term climate policy will require additional policy and regulatory changes, which are unknown at this time. As a consequence, the extent to which the project-related emissions and resulting impacts will be mitigated through implementation of such changes is not known. Furthermore, implementation of such additional policy and regulatory changes is in the jurisdiction of state-level agencies (e.g., ARB), not the District or the project.

The four proposed new displays are expected to emit approximately 7 MTCO_{2e} per year. These proposed new fireworks display events would be infrequent and short term, resulting in low levels of emissions. Emissions from fossil fuel-related sources (e.g., tugboats and delivery trucks) would decline through the life of the project as new technologies are adopted and implemented District-wide and as existing and future regulations reduce fuel consumption and emissions over time. Therefore, the project would support progress toward, and not hinder achievement of, the 2030 and 2050 GHG reduction goals of EO S-03-05 and SB 32.

Post-2020 – Consistency with Regulations and Regulatory Programs Adopted by ARB or Other State Agencies

Specifically, at the state level, ARB's Scoping Plan provides insight into the strategies that will very likely be included and adopted into long-term planning documents in the near future. The Draft 2017 Scoping Plan Update builds on the programs set in place as part of the previous Scoping Plan that was drafted to meet the 2020 reduction targets per AB 32. The Draft 2017 Scoping Plan Update proposed meeting the 2030 goal by accelerating the focus on zero and near-zero technologies for moving freight; continuing investment in renewables; greater use of low-carbon fuels, including electricity and hydrogen; stronger efforts to reduce emissions of short-lived climate pollutants (CH₄,

black carbon, and fluorinated gases); further efforts to create walkable communities with expanded mass transit and other alternatives to traveling by car; continuing the cap-and-trade program; and ensuring that natural lands become carbon sinks to provide additional emissions reductions and flexibility in meeting the target (ARB 2016b).

For purposes of discussing post-2020 GHG emissions, the new emissions presented in Table 4.4-5 are minor and reflect only the state measures that are applicable at the time of analysis. Recently adopted regulations (e.g., Phase 2 trucks) will reduce emissions beyond the levels shown in Table 4.4-5. Project consistency with the Draft 2017 Scoping Plan strategies is discussed in Table 4.4-8. The proposed project would be consistent with ARB's strategies for post-2020 and impacts are considered less than significant.

Table 4.4-8. Project Consistency with 2017 Draft Scoping Plan Update for 2030

Policy	Project Consistency Analysis
RPS 50% and Doubling of Energy Efficiency Requirements per SB 350	This policy is not applicable.
Low-Carbon Fuel Standard	Consistent Prior to Mitigation. State program that requires no action at the local or project level. Benefits related to project-related visitation and delivery truck travel will be realized independently.
Mobile-Source Strategy (Cleaner Technology and Fuels [CTF])	Consistent Prior to Mitigation. State program that requires no action at the local or project level. Benefits related to project-related visitation and delivery truck travel will be realized independently.
Short-lived Climate Pollutants per AB 1383	This policy is not applicable.
California Sustainable Freight Action Plan	This policy is not applicable.
20% Refinery Sector	This policy is not applicable.
Post-2020 Cap-and-Trade Program	This policy is not applicable.
Source: ARB 2016b	

Impact Determination Beyond 2020

As discussed above, further implementation of major District-wide and statewide measures would reduce annual operational GHG emissions from the proposed new fireworks display events over the life of the project. For example, GHG emissions from truck deliveries would be reduced as the recently adopted Phase 2 truck fuel efficiency standards are phased in, beginning in model year 2021. Because project-related emissions would be minor and would trend downward over time, GHG emissions reductions associated with the proposed new fireworks display events would demonstrate substantial progress and a downward trajectory relative to BAU emissions. Through compliance with the proposed ordinance, the proposed project would ensure that project-related GHG emissions would be consistent with the CAP and would comply with post-2020 plans, policies, and regulatory programs drafted or adopted by ARB or other California agencies for the purpose of reducing emissions of GHGs. This downward trend over time would be consistent with the need for deeper reductions post-2020, consistent with long-term reduction targets promulgated in SB 32 and EO S-03-05. Therefore, because emissions from the proposed new fireworks display events would be below the chosen bright-line threshold and the proposed project would comply with plans,

policies, and regulations aimed at reducing GHG emissions beyond 2020 targets, impacts associated with GHG emissions beyond 2020 would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. Furthermore, the proposed ordinance would include conditions of approval that would impose limits on delivery truck idling to ensure that both air quality and GHG emissions from existing fireworks display events would be effectively reduced. As such, compliance with the proposed ordinance would improve the existing condition by ensuring that GHG emissions would be limited. Therefore, the effect of the proposed ordinance on existing fireworks display events would support progress toward, and not hinder achievement of, the 2030 and 2050 GHG reduction goals of EO S-03-05 and SB 32 and be consistent with Draft 2017 Scoping Plan Update strategies, as discussed in Table 4.4-8. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

For the years beyond 2020, the magnitude of GHG emissions associated with the proposed new fireworks display events would be below the chosen screening level, would be consistent with the state's overall reduction targets identified in SB 32 and EO S-03-05, and would be in compliance with all plans, policies, and regulatory programs adopted by ARB or other California agencies for post-2020 for the purpose of reducing emissions of GHGs. Therefore, impacts would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

For the years beyond 2020, the effect of the proposed ordinance on existing fireworks display events would not result in GHG emissions that would exceed the chosen screening level, would be consistent with the state's overall reduction targets identified in SB 32 and EO S-03-05, and would be in compliance with all plans, policies, and regulatory programs adopted by ARB or other California agencies for post-2020 for the purpose of reducing emissions of GHGs. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Effect of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 3: Implementation of the proposed project would not exacerbate any existing and/or projected damage to the environment, including existing structures and sensitive resources, due to predicted climate change effects, particularly sea level rise.

Impact Discussion

Proposed New Fireworks Display Events

CEQA does not require an analysis of how existing environmental conditions will affect a project's future users or residents (see *California Building Industry Assoc. v. Bay Area Air Quality Management District* [Dec. 17, 2015] Cal.4th). However, the proposed new fireworks display events would be within the Coastal Zone. Pursuant to EO S-13-08, the California Coastal Commission or the District will consider this issue in determining consistency with the Coastal Act (see Section 4.7, *Land Use and Planning*, for a detailed discussion of the proposed project's consistency with the Coastal Act). Therefore, the extent to which existing environmental conditions will affect a project's future users and infrastructure, particularly in terms of SLR, is discussed herein.

As discussed above, several impacts on the environment are expected throughout California as a result of global climate change. The extent of these effects is still being defined as climate modeling tools become more refined. Regardless of the uncertainty in precise predictions, it is widely understood that substantial climate change is expected to occur in the future. Potential climate change impacts in the area include, but are not limited to, SLR, extreme heat events, increased water and energy consumption, and changes in species distribution and range.

Projected SLR as an effect of climate change is expected increase the number of areas that experience coastal flooding along San Diego Bay in the future. Coastal and low-lying areas, such as the project sites, are particularly vulnerable to future SLR. More specifically, SLR is a concern for the future, particularly in combination with future storm events and coastal flooding. A scenario with 100-year floodflows that coincide with high tides, taking into account SLR over a 50- or 100-year horizon, would dramatically increase the risk of flooding in the project vicinity. The concern here is the impact on the project from SLR, as opposed to the impact of the project on SLR.

Historically, the mean sea-level trend in San Diego was 2.13 millimeters per year, with a 95 percent confidence interval of +/- 0.19 millimeter per year, based on monthly mean sea-level data from 1906 to 2015. This is equal to a change of 0.70 feet in 100 years.

SLR is anticipated to accelerate over the next century. The June 2012 National Research Council report *Sea-Level Rise for the Coasts of California, Oregon, and Washington*, which was used in the

California Coastal Commission's *Sea Level Rise Policy Guidance* (California Coastal Commission 2015), projects SLR south of Cape Mendocino to be 0.13 to 0.98 foot (4 to 30 centimeters) by 2030, 0.39 to 2.0 feet (12 to 61 centimeters) by 2050, and 1.38 to 5.48 feet (42 to 167 centimeters) by 2100, as shown in Table 4.4-9. Note that this report was updated in March 2013, but the projections did not change.

Table 4.4-9. Sea-Level Rise Elevation and Projections at National City and Chula Vista Bayfront Locations

Year	Existing Tidal Datum ¹		Sea-Level Rise Projection ²		Project Elevation Relative to Projection ³ – Permanent SLR		Project Elevation Relative to Projection ⁴ – plus Storm Surge	
	Elevation above MSL	MHHW Elevation above MSL	Lower End	Upper End	Lower End	Upper End	Lower End	Upper End
2030	9.32	2.76	0.13	0.98	6.43	5.58	4.03	3.18
2050	9.32	2.76	0.39	2.00	6.17	4.56	3.77	2.16
2100	9.32	2.76	1.38	5.48	5.18	1.08	2.78	-1.32

¹ MHHW elevation above MSL based on the difference between MHHW (5.64 feet) and MSL (2.89 feet). Obtained from: <https://www.portofsandiego.org/maritime/check-port-and-harbor-conditions/424-tides-and-currents.html>.

² Based on projections for south of Cape Mendocino. Obtained from: http://www.opc.ca.gov/webmaster/ftp/pdf/docs/2013_SLR_Guidance_Update_FINAL1.pdf.

³ Based on the difference between site elevation, mean high water elevation above MSL and SLR projects. For example, the lower end elevation at South Embarcadero for 2030 is calculated as follows: 9.32 – 2.76 – 0.13 = 6.43 feet.

⁴ Based on the difference between permanent SLR above MHHW and 100-year (1% return probability) surge events. For example, the lower-end elevation for 2030 is calculated as follows: 6.43 – 2.40 = 4.03 feet. Surge event obtained from: <http://tidesandcurrents.noaa.gov/est/curves.shtml?stnid=9410170>.

MSL = mean sea level; MHHW = mean higher high water

Based on the best available science, there is potential for San Diego Bay inundation near the end of the century if sea levels rise in pace with the “high” projections. Nevertheless, after mid-century, the projections of SLR become more uncertain. These projections vary with future projections, due in part to modeling uncertainties but primarily the uncertainties about future global GHG emissions and the modeling of land-ice melting rates. Therefore, for projects with timeframes beyond 2050, it is especially important to consider adaptive capacity, impacts, and risk tolerance to guide decisions about whether to use the low or high end of the ranges presented.

Although elevations in relation to San Diego Bay vary throughout the project area, the elevations assumed in recent District work near the National City Marine Terminal are used herein to represent the National City and Chula Vista Bayfront locations. The most recent data state that the lowest bulkheads near the National City Marine Terminal are approximately 9 feet above mean sea level.

Table 4.4-9 shows project site elevations and SLR projections for the 2030, 2050, and 2100 timeframes; however, for purposes of this analysis, the life of the proposed project is assumed to be 2050. The San Diego Bay portion of the project area is situated above sea level (approximately 9 feet above existing mean sea level), preventing any adverse effects from SLR until the upper end of the

2100 timeframe for storm-surge events (temporary inundation). This is well beyond the life of the project. Therefore, during the life of the proposed project (2050), the proposed locations for the new fireworks display events would remain well above sea level (approximately 4.56 to 6.43 feet above projection elevations by 2050 without storm surge).

No significant impacts would occur from SLR through the reasonably foreseeable life of the project. Note that the information presented in Table 4.4-9 and herein, particularly projected SLR beyond the life of the project in 2100, is for informational purposes only. Furthermore, the proposed project does not propose construction of any structures that would expose property to the effects of SLR through the life of the project. The fireworks display events would use barges that would be temporarily held in place by tugboats, which would not be affected by SLR. Viewing locations associated with the proposed project would be inhabited only temporarily. The fireworks display events would be temporary and infrequent in nature and could be cancelled, postponed, or moved if necessary. As such, given the temporary nature of the project and because no SLR impacts are identified through the life of the project (2050), the proposed project would not put people at substantial risk of harm due to predicted climate change effects.

In addition to SLR, a range of other potential climate change impacts may affect the proposed project, including increased temperatures, heat-stress days, and changing water supplies. However, implementation of the proposed project would not lead to an increase in wildfires, on-site flooding, or a direct increase in surrounding temperatures. The proposed project does not propose the construction of any structures that would redirect potential SLR floodflows in a manner that would affect the biological or built environment. Moreover, although regional water supplies are subject to potential future climate change effects, the proposed project does not propose any significant increase in water consumption, with consumption being limited to typical uses associated with spectators for the displays (restroom use, drinking). As such, the proposed project would not exacerbate any existing and/or projected damage to the environment, including existing structures and sensitive resources, due to predicted climate change effects, particularly SLR.

Effect of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. Furthermore, the proposed ordinance does not include conditions pertaining to climate change effects, including SLR, and therefore would not result in any change to the existing conditions. As such, the effect of the proposed ordinance on existing fireworks display events would not exacerbate any existing and/or projected damage to the environment, including existing structures and sensitive resources, due to predicted climate change effects, particularly SLR.

Threshold 4: Implementation of the proposed project a) would not result in the wasteful, inefficient, or unnecessary use of energy and b) would not require or result in the construction of new energy system infrastructure or the expansion of existing infrastructure, the construction of which could cause significant environmental effects.

Impact Discussion

Proposed New Fireworks Display Events

Wasteful, Inefficient, or Unnecessary Use of Energy

This impact analysis follows the guidance put forth by Appendix F of the State CEQA Guidelines. As noted in that appendix, the means for achieving the goal of conserving energy include the following:

1. Decreasing overall per capita energy consumption;
2. Decreasing reliance on fossil fuels such as coal, natural gas, and oil; and
3. Increasing reliance on renewable energy sources.

CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. The proposed new fireworks display events would consume primarily diesel fuel during tugboat activity associated with placing and holding the barges in position and delivering fireworks to the National City and Chula Vista Bayfronts. As indicated in Table 4.4-10, energy use associated with the proposed new displays is estimated to result in the short-term and periodic consumption of 81 million BTUs of fuel. This represents a small demand on local and regional fuel supplies, which would be easily accommodated with existing supplies, and only a fraction (0.000000003 percent) of statewide consumption (estimated to be 2,335.5 trillion BTU in 2012). Moreover, this demand for fuel would have no noticeable effect on peak or baseline demand for energy because it would occur only periodically during fireworks display evenings. Therefore, operation of the four proposed new fireworks display events would not result in a wasteful, inefficient, and unnecessary usage of direct or indirect energy and would not require or result in the construction of new energy system infrastructure or the expansion of existing infrastructure, the construction of which could cause significant environmental effects.

Table 4.4-10. Estimated Energy Consumption Associated with the Proposed New Display Events

Source	Million BTUs/year ^a
<i>Diesel</i>	
Tugboats	41
Deliveries	40
Total	81

Source: Appendix E

^a Energy is provided in million BTUs for comparison purposes.

BTUs can be converted to gallons of diesel using the following formula: 129,488 BTU/1 gallon of diesel.

As shown in Table 4.4-11, compliance with the proposed ordinance would ensure consistency with the District’s CAP and related state GHG emissions-reduction regulations. For this reason, the proposed project would be consistent with the questions raised in Appendix F of the State CEQA Guidelines. Therefore, impacts would be less than significant.

Table 4.4.-11. Proposed Project Comparison to State CEQA Guidelines Appendix F

Project Impact Considerations from Appendix F	Project Applicability and Analysis
Energy requirements and energy use efficiencies by amount and fuel type for each stage of the project.	Applies. See Table 4.4-10, which breaks down diesel energy use. As indicated, the proposed project would increase the need for fossil fuels, such as diesel fuel, compared to existing conditions. However, this increase would be minor.
Effects on local and regional energy supplies and the need for additional capacity.	Applies. There would be no adverse effects on local or regional energy supplies. The proposed project would not result in any infrastructure or electricity needs. The only energy needs would come in the form of minor amounts of diesel.
Effects of the project on peak- and base-period demands for electricity and other forms of energy.	Applies. The proposed project would not result in any infrastructure or electricity needs. Because operations associated with the proposed new fireworks display events would be temporary and infrequent in nature, the proposed project would not involve a substantial amount of electricity or other energy demand that would affect peak- and base-period demand.
Degree to which the project complies with existing energy standards.	Applies. The proposed project does not propose the construction of any infrastructure or buildings that would be subject to efficiency standards. Phase 2 truck standards would reduce delivery-related fuel and energy consumption over time.
Effects of the project on energy resources.	Applies. The proposed project would not result in an adverse impact on energy resources. There are sufficient energy resources available to support the proposed project, including the minor amount of additional energy demand required to support the proposed new fireworks display events.
Projected transportation energy use requirements and overall use of efficient transportation alternatives.	Applies. The proposed project would increase the need for fossil fuels compared to baseline conditions because it would result in tugboat and delivery activity during four new barge-based fireworks display events; however, these energy sources currently exist, and their impact is negligible. The proposed project would not require new sources of fossil fuels.

Effect of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District’s tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. Furthermore, the proposed ordinance includes conditions of approval that would impose limits on delivery truck idling to ensure that both air quality and GHG emissions from existing fireworks display events would be effectively reduced, which may also reduce energy-related emissions. As such, compliance with the proposed ordinance would improve the existing condition by ensuring that energy consumption would be limited. Therefore, the effect of the proposed ordinance on existing fireworks display events would not result in the wasteful, inefficient, or unnecessary use of energy and would not require or result in the construction of new energy system infrastructure or the expansion of

existing infrastructure, the construction of which could cause significant environmental effects. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

Operation of the proposed new fireworks display events would not result in the wasteful, inefficient, or unnecessary use of energy, nor would it result in the construction of new energy system infrastructure or the expansion of existing infrastructure, the construction of which could cause significant environmental effects. Impacts would be less than significant.

Effect of Proposed Ordinance on Existing Fireworks Display Events

The effect of the proposed ordinance on existing fireworks display events would not result in the wasteful, inefficient, or unnecessary use of energy, nor would it result in the construction of new energy system infrastructure or the expansion of existing infrastructure, the construction of which could cause significant environmental effects. No significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Proposed Ordinance Changes to Existing Fireworks Display Events

No mitigation is required.

Level of Significance After Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Proposed Ordinance Changes to Existing Fireworks Display Events

No significant adverse impacts would occur.

4.5.1 Overview

This section describes the existing conditions and applicable laws and regulations for hazards and hazardous materials, followed by an analysis of the proposed project's potential to (1) create a significant hazard to the public or environment through the routine transport, use, or disposal of hazardous materials; (2) create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment; and (3) impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

All other potential hazards and hazardous materials impacts, including hazardous materials impacts on an existing or proposed school, being located on a hazardous materials site, safety hazards for people residing or working in the vicinity of an airport, and hazards associated with wildland fires, were analyzed in Section VIII of the Initial Study/Environmental Checklist (Appendix A), which is incorporated by reference. Potential impacts were determined to be less than significant. The analysis and conclusions regarding these impacts are included in Chapter 6, Section 6.4, *Effects Not Found to be Significant*. This section does not address surface water contaminants, air pollutants, or health risk assessment. Water contaminants are discussed in Section 4.6, *Hydrology and Water Quality*. Air pollutants and the health risk assessment are discussed in Section 4.2, *Air Quality and Health Risk*.

Based on the analysis that follows, all impacts related to hazards and hazardous materials would be less than significant. No mitigation is required.

4.5.2 Existing Conditions

The following section describes the existing hazards and hazardous materials conditions associated with fireworks as well as the emergency response plans and procedures of the District's member cities within the vicinity of existing and proposed new fireworks display events in San Diego Bay and the Imperial Beach Oceanfront.

4.5.2.1 Existing Hazards Related to Pyrotechnic Devices

All fireworks contain carbon and sulfur, which are necessary for burning. In addition, during the manufacture of fireworks, a range of substances are added, such as arsenic, manganese, sodium oxalate, aluminum, iron dust powder, potassium perchlorate, strontium nitrate, and barium nitrate, which act as stabilizers and oxidizers and add color. If not handled properly and in accordance with federal and state regulations, hazards related to pyrotechnic devices include structure, vehicle, and outdoor fires as well as fireworks-related injuries (National Fire Protection Association 2016). Additionally, the burning of fireworks releases air pollutants, particularly sulfur dioxide, carbon dioxide, carbon monoxide, and particulate matter, along with several metal salts (e.g., aluminum, manganese, cadmium) (Gouder and Montefort 2014). Criteria air pollutants are recognized to have a variety of hazardous health effects on humans.

An acute air toxics health risk assessment and ambient air quality assessment were prepared to evaluate the potential acute health risk impacts of toxic air contaminant emissions from the proposed new fireworks display events (see Appendix E). The results of the health risk assessment and air quality assessment are discussed in Section 4.2, *Air Quality and Health Risk*.

4.5.2.2 Emergency Response Plans

San Diego County

In San Diego County, the overall county response to disasters is coordinated through the Unified San Diego County Emergency Services Organization, Office of Emergency Services. The organization is composed of the 18 cities within the county and provides for a single operational area for coordination of disaster activities. The Office of Emergency Services and the Unified Disaster Council of the Unified San Diego County Emergency Services Organization produced the San Diego County Operational Area Emergency Operations Plan, which is used by the County of San Diego and all cities within the county to respond to major emergencies and disasters. This plan addresses such issues as hazardous materials management, bio-terrorism, and joint preparedness activities.

The police and fire departments for the cities of San Diego, Coronado, National City, Chula Vista, and Imperial Beach are encouraged to adopt the County's Operational Area Emergency Operations Plan, with modifications, as appropriate for their city.

San Diego Unified Port District

The District plans ahead for emergencies with its Emergency Operations Center (EOC) Guidebook, which outlines the management framework for the EOC Team, which is composed of designated District staff members. The District's EOC Team coordinates with on-scene incident managers and emergency response organizations to acquire, allocate, and track resources; manage and share information; establish response priorities among incidents; provide legal and financial support; and liaison with other jurisdictions and other levels of government.

The guidebook provides guidance for coordinating communications and deploying essential resources. Because of the support nature of the District's EOC Team, initial actions and EOC responsibilities are tailored to address the unique requirements and responsibilities of the District.

City of San Diego

The City of San Diego Fire-Rescue Department is responsible for the preparation, maintenance, and execution of Emergency Management Plans. The City of San Diego has a Multi-Hazard Functional Plan and an EOC to provide emergency response services throughout the City. The City makes regular modifications to the Emergency Management Plans as hazards, threats, population, land uses, or other factors change. The plan identifies resources available for emergency response and establishes coordinated action plans for specific emergency situations, including earthquake, fire, major rail and roadway accidents, flooding, hazardous materials incidents, terrorism, and civil disturbances. The City coordinates emergency response activities through its EOC. County, state, and federal emergency response resources are also located within San Diego and available to assist the EOC if a situation demands additional support. The EOC is staffed 24 hours a day by both public safety and other City personnel to coordinate emergency response activities.

City of Coronado

The City of Coronado Emergency Operations Plan provides a comprehensive emergency management system for the effective management of emergency incidents. The City of Coronado Emergency Information Guide, dated January 1994, designates the State Route 75 bridge and Silver Strand as the primary evacuation routes in the City and includes a map depicting how traffic on the City's other arterial and collector streets would access these evacuation routes. Pedestrians as well as passengers on ferry boats, water taxis, and private boats or aircraft from North Island Naval Air Station may evacuate across the Bay by using possible secondary routes.

City of National City

In the City of National City, the National City Fire Department provides fire control, emergency medical, rescue, fire protection, and educational services. National City integrated the federal National Incident Management System into the emergency management system by providing all EOC staff members with appropriate National Incident Management System training. EOC staff members may perform multiple functions when the EOC is activated. The EOC manages the Department Operations Centers when activated, which, in turn, manages the field operations. The EOC requests additional resources from the County EOC when necessary. National City adopted an updated Emergency Operations Plan in May 2010. The plan describes a comprehensive emergency management system that provides for a planned response to disasters (e.g., natural disasters, technological incidents, nuclear incidents). The plan describes the overall responsibilities for protecting life and property and ensuring the overall well-being of the population. The plan also identifies the sources of outside support that might be provided by other jurisdictions as well as the private sector (City of National City 2011).

City of Chula Vista

Emergency response services in the City of Chula Vista are provided by the Chula Vista Fire Department. In the event of a community disaster or emergency, the Chula Vista Fire Department operates an EOC. The EOC is staffed by emergency personnel and trained City of Chula Vista staff members, with the purpose of supporting residents during disasters by focusing on life safety, evacuation needs, and public utility and infrastructure maintenance. Services provided by the Chula Vista Fire Department include emergency medical services, hazardous materials response, and disaster preparedness, among others. The City of Chula Vista does not have an adopted Emergency Response Plan, but rather relies on the County's Operational Area Emergency Operations Plan.

City of Imperial Beach

The Imperial Beach Fire Department is responsible for protecting the lives and property of the citizens of Imperial Beach against hazards that are caused by fire, explosion, or natural disasters. The department responds to calls for various emergency services, including structure fires, wildland fires, vehicle fires, hazardous material incidents, traffic collisions, emergency medical aids, and public service requests. The City of Imperial Beach does not have an adopted Emergency Response Plan, but rather relies on the County's Operational Area Emergency Operations Plan.

4.5.3 Applicable Laws and Regulations

4.5.3.1 Federal

Resource Conservation and Recovery Act

Hazardous waste in California is regulated primarily under the authority of the federal Resource Conservation and Recovery Act (RCRA) (42 United States Code [USC] 6901 et seq.). The RCRA was established in 1976 to protect human health and the environment, reduce waste, conserve energy and natural resources, and eliminate hazardous waste. Under the authority of the RCRA, the regulatory framework for managing hazardous waste, including requirements for entities that generate, store, transport, treat, or dispose of hazardous waste, is found in 40 Code of Federal Regulations (CFR) 260–299. Other applicable federal laws and regulations include the following:

- **49 CFR 172 and 173:** These regulations establish standards for the transport of hazardous materials and hazardous wastes. The standards include requirements for labeling, packaging, and shipping hazardous materials and hazardous wastes as well as training requirements for personnel who complete shipping papers and manifests.
- **40 CFR Subchapter I—Solid Wastes:** These regulations implement the provisions of the Solid Waste Act and RCRA. They also establish the criteria for the classification of solid waste disposal facilities (landfills), hazardous waste characteristic criteria and regulatory thresholds, hazardous waste generator requirements, and requirements for the management of used oil and universal wastes.

Department of Transportation Hazardous Materials Regulations (49 CFR 100–185)

U.S. Department of Transportation (DOT) Hazardous Materials Regulations cover all aspects of hazardous materials packaging, handling, and transportation. Parts 107 (Hazard Materials Program), 130 (Oil Spill Prevention and Response), 172 (Emergency Response), 173 (Packaging Requirements), 177 (Highway Transportation), 178 (Packaging Specifications), and 180 (Packaging Maintenance) would all apply to goods movement to and from the proposed project and/or surrounding uses.

Enforcement of these DOT regulations is shared by each of the following administrations under delegations from the Secretary of the DOT:

- **Research and Special Programs Administration** is responsible for container manufacturers, reconditioners, and retesters and shares authority over shippers of hazardous materials.
- **Federal Highway Administration** enforces all regulations pertaining to motor carriers.
- **Federal Railroad Administration** enforces all regulations pertaining to rail carriers.
- **Federal Aviation Administration** enforces all regulations pertaining to air carriers.
- **U.S. Coast Guard (USCG)** enforces all regulations pertaining to shipments by water.

U.S. Coast Guard Marine Safety Program

Pursuant to 33 CFR 100, USCG implements the Marine Safety Program, which is designed to ensure the safety of vessels and recreational boaters on navigable U.S. waters during fireworks display events. USCG issues marine event notifications to sponsors of public fireworks display events that

have the potential to endanger marine safety. An application for the marine event must be submitted to USCG no later than 135 days prior to the event if the applicant does not meet the criteria specified in 33 CFR 100.15(c) or 60 days prior to the event if the applicant does meet the criteria. After issuing a marine event notification for the fireworks display event, USCG is authorized to promulgate special local regulations as necessary to ensure public safety on navigable waters immediately prior to, during, and immediately after the approved fireworks display event. Such regulations may include a restriction on or control of the movement of vessels through a specified fireworks display event area.

Department of Homeland Security Chemical Facility Anti-Terrorism Standards

On October 4, 2006, the U.S. Department of Homeland Security (DHS) Appropriations Act of 2007 was signed into law. Under Section 550 of the Appropriations Act of 2007, DHS finalized chemical facility anti-terrorism standards on November 2, 2007. Facilities possessing any of the 335 chemicals of interest in quantities at or above screening threshold quantities must complete an electronic “top screen” questionnaire that determines whether further assessments and security plans should be developed to ensure safety. The information should allow DHS to determine the potential for and possible consequences of a terrorist attack and assess the possible risks if dangerous chemicals are stolen. Pyrotechnic technicians and businesses that use or store certain chemicals listed in Part 27 of the standards are subject to DHS review. Operators may not use dangerous or explosive chemicals that are not on the list without DHS review and consideration of safety.

4.5.3.2 State

California State Department of Toxic Substances Control

In light of the risks to public health and the environment posed by perchlorate releases, the California legislature adopted the Perchlorate Contamination Prevention Act of 2003, amending Chapter 6.5 of Division 20 of the Health and Safety Code and requiring the California Department of Toxic Substances Control to adopt regulations specifying best management practices for perchlorate and perchlorate-containing substances. The perchlorate best management practices regulations were adopted on December 31, 2005, and are contained in California Code of Regulations (CCR) Title 22, Social Security Division 4.5, Environmental Health Standards for the Management of Hazardous Waste Chapter 33, Best Management Practices for Perchlorate Materials Article 1, Sections 67384.1–67384.11. In Section 67384.8(c), Special Best Management Practices for Flares and Pyrotechnic Perchlorate Materials, the regulations provide that “Within twenty-four (24) hours of a public display of fireworks or the use of dangerous fireworks, the pyrotechnics operator, in addition to complying with CCR Title 19, Section 1003, shall, to the extent practical, collect any stars and un-ignited pyrotechnic material found during the required inspection of the entire firing range.”

Hazardous Waste Control Act (Health and Safety Code Section 25100 et seq.)

The Department of Toxic Substances Control is responsible for the enforcement of the Hazardous Waste Control Act (California Health and Safety Code Section 25100 et seq.), which creates the framework under which hazardous wastes are managed in California. The law provides for the development of a state hazardous waste program that administers and implements the provisions of the federal RCRA cradle-to-grave waste management system in California. It also provides for the

designation of California-only hazardous waste and development of standards that are equal to or, in some cases, more stringent than federal requirements. The regulations that follow help to enforce the Hazardous Waste Control Act.

Environmental Health Standards for the Management of Hazardous Waste (22 CCR Division 4.5, Section 66001 et seq.)

CCR Title 22, Division 4.5, Section 66001 et seq., establishes requirements for the management and disposal of hazardous waste in accordance with the provisions of the California Hazardous Waste Control Act and federal RCRA.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (California Health and Safety Code, Chapter 6.11, Sections 25404–25404.9)

This program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of the environmental and emergency response programs and provides authority to the Certified Unified Program Agency (CUPA). The CUPA for San Diego County is the San Diego County Department of Environmental Health's Hazardous Materials Division (HMD). HMD has the responsibility and authority to implement and enforce the requirements listed in Chapter 6.5 (commencing with Section 25100), Chapter 6.67 (commencing with Section 25270), Chapter 6.7 (commencing with Section 25280), Chapter 6.95 (commencing with Section 25500), and Sections 25404.1 and 25404.2, including the following programs, which are applicable to the proposed project:

- **California Accidental Release Prevention Program.** This program requires any business that handles more than threshold quantities of an extremely hazardous substance to develop a Risk Management Plan. The Risk Management Plan is implemented by the business to prevent or mitigate releases of regulated substances that could have offsite consequences through hazard identification, planning, source reduction, maintenance, training, and engineering controls.
- **Hazardous Waste Generator Program.** This program regulates businesses that generate any amount of a hazardous waste. Proper handling, recycling, treating, storing, and disposing of hazardous waste are key elements to this program.

Workplace Safety (California Labor Code, Division 5, Parts 1, 6, 7, and 7.5)

The California Labor Code regulates the workplace to ensure appropriate training on the use and handling of hazardous materials and the operation of equipment and machines that use, store, transport, or dispose of hazardous materials. Division 5, Part 1, Chapter 2.5, ensures that employees who are in charge of handling hazardous materials are appropriately trained. Division 5, Part 6, governs the operation and care of hazardous material storage tanks and boilers. Division 5, Part 7, ensures that employees who work with volatile flammable liquids are outfitted in appropriate safety gear and clothing. Division 5, Part 7.5, otherwise referred to as the California Refinery and Chemical Plant Worker Safety Act of 1990, was enacted to prevent or minimize the consequences of catastrophic releases of toxic, flammable, or explosive chemicals. The establishment of process safety management standards is intended to eliminate, to a substantial degree, the risks to which workers are exposed in petroleum refineries, chemical plants, and other related manufacturing facilities.

California Department of Forestry and Fire Protection Fireworks in California Handbook

The *Fireworks in California* handbook was prepared by the California Department of Forestry and Fire Protection and includes a compilation of all relevant national and state standards related to fireworks (Appendix C). The Health and Safety Codes direct the California State Fire Marshal to prepare regulations governing the use of fireworks in California. The law provides a general framework around which more detailed regulations have been developed. The objective of the *Fireworks in California* handbook is to provide a publication that will enhance the safe use of pyrotechnic material and be a reference source for enforcement and fire prevention personnel as well as licensees. The laws and regulations that follow are identified in the *Fireworks in California* handbook and are directly applicable to the proposed project.

California Health and Safety Code, Sections 12500–12759 (State Fireworks Law)

California's Fireworks Law, passed in 1938, established the Office of the State Fire Marshal as the only fireworks classification authority in California. Fireworks are classified through laboratory analysis, field examinations, and the test firing of items. As part of the program, the State Fire Marshal requires the licensing of all pyrotechnic operators, fireworks manufacturers, importer-exporters, wholesalers, retailers, and public display companies. Pyrotechnic operators who discharge fireworks at public displays or launch high-powered and experimental rockets must also pass a written examination and provide proof of experience.

The state's Explosives Law authorizes the State Fire Marshal to adopt regulations for the safe use, handling, storage, and transportation of explosives. Under those regulations, local law enforcement agencies track the location of storage magazines within their jurisdictions through a permit process. Special exemptions have been provided within the regulations to allow for limited possession and storage of some explosives, such as black powder, which is used by hunters and the sporting community.

California Fire Code, Chapter 56, Explosives and Fireworks

Chapter 56 of the California Fire Code governs the possession, manufacture, storage, handling, sale, and use of explosives, explosive materials, fireworks, rockets, emergency signaling devices, and small arms ammunition. Exceptions include:

1. The Armed Forces of the U.S., USCG, or National Guard.
2. Explosives in forms prescribed by the official U.S. Pharmacopoeia.
3. The possession, storage, and use of small arms ammunition where packaged in accordance with DOT packaging requirements.
4. The possession, storage, and use of not more than 1 pound (0.453 kilogram) of commercially manufactured sporting black powder, 20 pounds (9 kilograms) of smokeless powder, and 10,000 small arms primers for hand loading small arms ammunition for personal consumption.
5. The use of explosive materials by federal, state, and local regulatory, law enforcement, and fire agencies acting in their official capacities.

6. Special industrial explosive devices that in the aggregate contain less than 50 pounds (23 kilograms) of explosive material.
7. The possession, storage, and use of blank industrial-power load cartridges where packaged in accordance with DOT packaging regulations.
8. Transportation in accordance with DOT 49 CFR Parts 100–185.
9. Items preempted by federal regulations.
10. Items preempted by state law and/or regulations.

Title 19, California Code of Regulations, Chapter 6. Fireworks

Article 3 of Chapter 6 of the CCR dictates that no person shall engage in any type of fireworks activities without having submitted an application for and having obtained a license from the State Fire Marshal in accordance with the provisions of the chapter. Exceptions include licensed pyrotechnic operators, basic commercial, restricted commercial, and rockets, first class, who may employ unlicensed assistants. Licensed special effects and theatrical pyrotechnicians may employ unlicensed assistants. Unlicensed assistants shall perform only when under the direct, immediate, and constant supervision of the licensee when handling fireworks and pyrotechnic compositions. In addition, when applying for a permit under Health and Safety Code Section 12640(e), an applicant shall submit the following information and evidence to the authority having jurisdiction:

1. The name of the organization sponsoring the display, together with the names and license numbers of persons actually in charge of the display.
2. The date and time of day the display is to be held.
3. The exact location planned for the display.
4. The size and number of all fireworks to be discharged, including the number of set pieces, shells, and other items. Shells shall be designated by diameter, specifying single, multiple break, or salute.
5. The manner and place of storage of all fireworks prior to, during, and after the display.
6. Diagram of the grounds on which the display is to be held, showing the point at which the fireworks are to be discharged; the location of all buildings, roads, and other means of transportation; the lines behind which the audience will be restrained; and the location of all nearby trees, telegraph or telephone lines, or other overhead obstruction.
7. Proof that satisfactory workers' compensation insurance is carried for all employees in compliance with Labor Code Section 3700.
8. If the permit is for a public display or special effects, documentary proof of conformance with Sections 12610 and 12611, Health and Safety Code.
9. A State Fire Marshal's license for the public display of fireworks, under Health and Safety Code Sections 12575, 12576, or 12577. No permit for a public display of any type shall be granted unless a public display license, general, special, or limited, has been first obtained from the State Fire Marshal.
10. The name and license number of the wholesaler who supplied all items used in the display.

Hazardous Materials Transportation, Title 13, California Code of Regulations

Selected sections of Title 13 of the CCR, including Section 1150, Sections 1160 through 1164, Section 1166, and Section 1167, establish regulations for the transportation of hazardous materials and explosives such as fireworks. These sections cover the designation of routes and stopping places, en route inspections, detours, the labeling of hazardous materials, and other transportation regulations.

4.5.3.3 Regional

San Diego County Code, Title 6, Division 8

The San Diego County Code of Regulatory Ordinances, under Title 6, Division 8, Chapters 8 through 11, establishes the HMD as the local CUPA. The HMD inspects businesses or facilities that handle or store hazardous materials, generate hazardous waste, generate medical waste, and own or operate underground storage tanks.

4.5.3.4 Local

City of San Diego Municipal Code, Article 5, Division 56

Article 5, Division 56, of the City of San Diego Municipal Code regulates explosives and fireworks. The City adopted Sections 5601.1 through 5608.1.1 of the California Fire Code without change pursuant to Section 55.0101(a) of the municipal code. Under this division of the municipal code, it is unlawful for any person to possess, store, manufacture, offer for sale, sell at retail, use, or explode any fireworks within the incorporated City limits. However, fireworks may be part of a public display when permitted by the City and conducted by a State of California licensed pyrotechnic operator.

City of San Diego Special Event Permit

In San Diego, a Special Event Permit is required for an organized activity that incorporates the use of:

- City public streets, sidewalks, and rights-of-way; and/or
- City public parks or other City public property; and/or
- Outdoor private property, including parking lots, only when the property is part of a Special Event Venue that includes City public property and permission has been received by the property owner/manager (for example, a parking lot used as part of a street festival venue).

All activities associated with the use of pyrotechnics must be reviewed and approved by the San Diego Fire Department, in compliance with the International Fire Code, as amended by the State of California and City of San Diego. Examples include indoor and outdoor fireworks, lasers, model rocket launches, and special effects using pyrotechnical devices. A permit and full demonstration to the State Fire Marshal prior to the event date is required. As part of the permit requirements, onsite stand-by and inspection services may be required because of the size, complexity, and/or unique safety issues regarding the activities associated with the event.

City of Coronado Municipal Code, Title 20, Chapter 20.16

Under Chapter 20, Chapter 26.10, of the City of Coronado Municipal Code, it is unlawful for any person to commence, conduct, manage, participate in, or sponsor a public display of fireworks without an operations permit for public displays of fireworks.

City of Coronado Operations Permit: Public Displays of Fireworks

An operations permit is required for the activities set forth in Title 20, Operations Permits, of the Coronado Municipal Code. The activities described in Title 20 require regulation by the City of Coronado to protect and promote the health, safety, and public peace of the community. An operations permit for public displays of fireworks is required under Chapter 20.16 of Title 20. An application for a public display of fireworks operations permit must be filed no later than 14 days prior to the proposed date of the public fireworks display. The Director of Fire Services is authorized to issue the public displays of fireworks operations permit.

City of Coronado Special Event Permit

Individuals and organizations wishing to hold an event in City-owned facilities or on public rights-of-way shall obtain a Special Event Permit from the City Manager's Office or Recreation Services, depending on the size or type of event. Review of the Special Event Permit application by City staff and/or the City Council ensures the event will be held safely with minimum disruption to the surrounding community, and that the cost of the event is borne by its sponsors. A special event is any scheduled or planned non-emergency event occurring within the City of Coronado that can reasonably be expected to require increased or modified emergency or non-emergency services or support by the City government and personnel. There are three types of special events that require approval by the City Manager and/or City Council: Major Events, Moderate Events, and Minor Events.

City of National City Municipal Code, Title 10, Chapter 10.16

Under Title 10, Chapter 10.16, of the National City Municipal Code, it is unlawful to discharge, fire, use, possess, or store any or all types and manner of fireworks, including firecrackers, bombs, rockets, torpedoes, Roman candles, or any other type or manner of fireworks or substances designed or intended for pyrotechnic displays, in the City. The City Council, upon application of any person, may issue a permit for the public display of fireworks under the direct supervision of a person who has been examined and approved by the State Fire Marshal. All such displays of fireworks shall be located, discharged, or fired so as, in the opinion of the City Council, not to be hazardous to surrounding property or endanger any person or persons.

City of National City Temporary Use Permit

Temporary Use Permits are used for certain special activities, events, or structures that are beneficial to the public for limited periods of time even though they would not comply with building, fire, zoning, or other local codes, if they were permanent. Chapter 15.60 of the National City Municipal Code regulates these permits. In general, for any organized activity that uses public property, facilities, parks, sidewalks, streets, or any public rights-of-way, applicants need to obtain this permit. In some cases, activities or events taking place on private property also require a Temporary Use Permit. Temporary Use Permits include submittal of information such as staging required, roadways

used and/or closed for the event, times, and other information. These Temporary Use Permits are forwarded to City departments such as the fire department for review and emergency planning purposes (Hernandez pers. comm.).

There are three types of Temporary Use Permits for different uses and activities: Class A, Class B, and Class C. Class A activities require City Council approval and include activities such as block or holiday parties, fairs, and musical concerts/festivals. Class B activities are subject to conditions and City codes, as applicable, and include activities such as mobile trailers for offices on active construction sites or for temporary classrooms. Class C activities are subject to Business License Regulations and include activities such as Christmas tree sale lots, garage sales, and special promotion/outdoor sales. The City may also attach any conditions and/or limitations deemed necessary to protect public health, safety, and welfare. Such conditions may include hours of use, security, trash collection and disposal, and traffic control. The City will also notify the applicant of any supplemental permits and provisions that may be required, such as a County environmental health permit, fire permit, or fireworks permit.

City of National City Fireworks Permit

For special events requiring a Temporary Use Permit that propose to include a fireworks display, a fireworks permit must be obtained from the National City Fire Department in addition to the Temporary Use Permit. The fireworks permit must be obtained at least 2 weeks prior to the event. The National City Fire Department has absolute authority, control, and decisions over all fireworks and/or pyrotechnic displays for which it issues a permit. An inspection from the fire department must be obtained prior to any ignition of any fireworks.

City of Chula Vista Municipal Code Title 2, Chapter 2.66

Under Title 2, Chapter 2.66, of the Chula Vista Municipal Code, it is unlawful to discharge any firearm or fireworks ("fireworks" shall mean any composition or device for the purpose of producing a visible or an audible effect by combustion, deflagration, or detonation) without the written consent of the City.

City of Chula Special Event Permit

The City of Chula Vista maintains Special Event Guidelines, which outline the Special Event Permit process and any special event-related permit types, as well as the requirements for event infrastructure, operational plans (e.g., medical, traffic control), community outreach, and insurance. The Special Event Permit process is managed by the Office of Communications and supported by the Special Events Management Team. The permit process involves submitting a permit application to the Office of Communication, which is responsible for reviewing and issuing the Special Event Permit. There are a number of different special event-related permits that may be issued independent of, or in addition to, a Special Event Permit. Examples of special event-related permits include alcohol use permits, building permits (for temporary structures), and a firework/pyrotechnic/special effect/laser permit. The proposed event venue, activities, components, attendance, and unique circumstance of the event are contributing factors to the final determination of the required permit types.

City of Chula Vista Firework/Pyrotechnic/Special Effect/Laser Permit

A firework/pyrotechnic/special effect/laser permit is one of the special event-related permits outlined in the City of Chula Vista's Special Event Guidelines. This permit may be issued independent of, or in addition, to a Special Event Permit, and is required for all activities associated with the use of pyrotechnics and open flames and must be reviewed and approved by the Chula Vista Fire Department in compliance with the California Fire Code as amended by the State of California and City of Chula Vista. Examples of activities in this category include outdoor fireworks, lasers, model rocket launches, open flame activities such as fire walking, and special effects using pyrotechnical devices. As part of the permit requirements, onsite stand-by and inspection services may be required due to the size, complexity, and/or unique safety issues regarding the activities associated with the event.

City of Imperial Beach Special Event Permit

A Special Event Permit is required for any organized activity held completely or partially on public land (excluding recreation centers) or an event requiring adjacent parking or traffic variances or activity on privately owned property when the property is not designed or intended for that activity. The Imperial Beach Fire Department must be notified as part of the special event permit application process whether the special event includes fireworks.

4.5.4 Project Impact Analysis

4.5.4.1 Methodology

The following impact analysis evaluates the effects from fireworks-related hazards and hazardous materials associated with the proposed new fireworks display events. Based on the existing conditions described above, the impact analysis assesses the potential direct and indirect impacts from fireworks-related hazards and hazardous materials and determines whether the proposed new fireworks display events would result in a significant impact, pursuant to the applicable thresholds listed below.

4.5.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of impacts associated with hazards and hazardous materials resulting from implementation of the proposed project. The determination of whether a hazard and/or hazardous material impact would be significant is based on the professional judgment of the District as lead agency, supported by the recommendations of qualified personnel at ICF, all of which is based on the evidence in the administrative record.

Impacts are considered significant if the proposed project would result in any of the following:

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

3. Emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school.
4. Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment.
5. For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport, public use airport, or private airstrip, result in a safety hazard for people residing or working in the project area.
6. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.
7. Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including areas where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

The analysis of whether the proposed project would have a significant impact related to hazards and hazardous materials under Thresholds 3, 4, 5, and 7 is provided in Section VII of the Initial Study/Environmental Checklist (Appendix A of this Draft EIR), which determined that the proposed project would result in less-than-significant impacts. The analysis and conclusions therein are incorporated by reference into this section of the Draft EIR and are summarized in Chapter 6, *Additional Consequences of Project Implementation*. Therefore, only Thresholds 1, 2, and 6 are discussed in the impact analysis that follows.

4.5.4.3 Project Impacts and Mitigation Measures

Threshold 1: Implementation of the proposed project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Threshold 2: Implementation of the proposed project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Impact Discussion

Proposed New Fireworks Display Events

The proposed new fireworks display events would be temporary and infrequent in nature and, therefore, would not require the transport, use, and disposal of hazardous materials on a routine basis. On-land facilities are not required, and no construction on land or in the water is proposed as part of the project. As such, no permanent facilities involving the routine transport, use, or disposal of hazardous materials are included as part of the proposed project.

Although no permanent, continuous operations would occur, the proposed new fireworks display events would require the infrequent transport, delivery, and placement of fireworks on barges within

and/or adjacent to San Diego Bay up to four times per year. The fireworks would be set up at a loading facility yard, in accordance with the California Department of Forestry and Fire Protection's *Fireworks in California* handbook (Appendix C), which is enforced by the responsible city fire department with jurisdiction over each show. In accordance with Title 19 of the CCR, all fireworks operators are required to obtain a fireworks license from the California Department of Forestry and Fire Protection, Office of the State Fire Marshal, in order to operate a fireworks display event in California. Because the proposed new fireworks display events would be temporary and infrequent in nature; would be required to comply with the state and local laws set forth in the *Fireworks in California* handbook, as enforced by the responsible city fire departments; and would be required to comply with existing federal, state, and local regulations, the proposed new fireworks display events would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Required compliance with existing laws and regulations would ensure that the potential for a significant hazard to occur from routine transport, use, or disposal of hazardous materials associated with fireworks would be less than significant.

The proposed new fireworks display events would be required to maintain a safety zone around the fireworks launch sites. This safety zone delineates the area in which public access is prohibited; neither spectators on land nor vessels in the water are allowed within the zone during the time the fireworks are being launched. This safety zone is established by USCG and/or the State Fire Marshal, as appropriate, around the barge from which the fireworks are launched. Once the fireworks display event is over, the fireworks operator and the State Fire Marshal would inspect the mortars and surrounding areas for any safety issues, such as unexploded firework components, in accordance with the requirements of Title 19 of the CCR. All unexploded fireworks, including unexploded components, would be collected, handled, and disposed of by the fireworks operator in accordance with Title 19 of the CCR. Additionally, no one would be allowed into the safety zone until granted permission by the State Fire Marshal of the responsible city (Szymanski pers. comm.). Once the site is cleared, the fireworks operator would proceed with post-fireworks display event cleanup practices, consistent with the general permit and as required by the proposed ordinance, including collecting any unexploded fireworks and floating debris from spent fireworks. As such, because of the temporary and infrequent nature of the proposed new fireworks display events, as well as the highly regulated manner in which fireworks are allowed to be launched, the proposed new fireworks display events would not result in a significant hazard to residents or workers in the vicinity of the fireworks display events. Required compliance with existing laws and regulations would ensure that the potential for a significant hazard to occur from routine transport, use, or disposal of hazardous materials associated with fireworks would be less than significant.

As discussed above, no construction is proposed as part of the project. As such, typical construction-related hazardous materials, including gasoline, oil, other vehicle-related fluids, paints, solvents, and metals, would not be used. It is possible that gasoline, oil, and other vehicle-related fluids could be released by trucks on land during the transport of pyrotechnic devices or by tugboats or other vessels in the water during operation of a fireworks display event. However, compliance with federal (including DOT Hazardous Materials Regulations [49 CFR 100-185]), state (including Title 19 of the CCR), and local regulations, in combination with oversight by licensed fireworks operators and responsible city fire departments, would ensure that all hazardous materials associated with fireworks are used, stored, and disposed of properly. As such, potential impacts related to a hazardous materials release during the proposed new fireworks display events would be less than

significant. Water contaminants are discussed in Section 4.6, *Hydrology and Water Quality*, and air pollutants are discussed in Section 4.2, *Air Quality and Health Risk*.

Based on the information above, the proposed new fireworks display events would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous waste or the release of hazardous materials associated with fireworks. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance does not include any conditions pertaining to fireworks-related hazards or hazardous materials above and beyond the federal, state, and local laws and regulations that currently exist and, therefore, would not result in any change to the existing condition in terms of these issues. As such, the effects of the proposed ordinance on existing fireworks display events would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous waste or the release of hazardous materials associated with fireworks. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials or the release of hazardous materials associated with fireworks. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials or the release of hazardous materials associated with fireworks. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No significant adverse impacts would occur.

Threshold 6: Implementation of the proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Impact Discussion

The proposed new fireworks display events would be located in areas where existing emergency response times for fire protection, emergency medical services, and police protection meet adopted standards, as indicated in Section 4.9, *Public Services and Facilities*. The proposed new fireworks display events would be temporary and infrequent in nature. In addition, the proposed project does not include any characteristics (e.g., permanent road closures) that would physically impair or otherwise interfere with emergency response or evacuation in the vicinity of the proposed new fireworks display events. Ongoing implementation and updating of relevant Emergency Operations Plans would ensure an adequate response to emergencies and evacuation plans as growth occurs and reduce the potential for interfering with emergency plans.

Proposed New Fireworks Display Events

As discussed in Section 4.10, *Transportation, Circulation, and Parking*, fireworks display events generate increased levels of vehicle, pedestrian, and bicycle traffic, with moderately increased levels of vehicle traffic and significantly increased levels of pedestrian and bicycle traffic observed to occur during Fourth of July fireworks display events. Such additional pedestrian and bicycle traffic can be anticipated to occur during the proposed new fireworks display events along the National City and Chula Vista Bayfronts. As a result, the potential exists for pedestrian and bicycle traffic to overflow into adjacent roadways and intersections, which, in turn, could impede vehicle circulation and temporarily impair emergency response.

The National City Fire Department would provide fire protection and emergency services during the proposed new Fourth of July fireworks display event along the National City Bayfront on the barge and within the landside viewing areas in the City. The City of National City requires Temporary Use Permits for special events, which include submittal of information such as the staging required, roadways used and/or closed for the event, times, and other information. The Temporary Use Permits are forwarded to City departments such as the fire department for review and emergency planning purposes (Hernandez pers. comm.). The City may attach any conditions and/or limitations to the Temporary Use Permit deemed necessary to protect public health, safety, and welfare. Such conditions may include hours of use, security, trash collection and disposal, and traffic control. A fireworks permit from the National City Fire Department would also be required for the proposed new fireworks display event. The fireworks permit must be obtained at least 2 weeks prior to the fireworks display event. The National City Fire Department has absolute authority, control, and decisions over all fireworks and/or pyrotechnic displays for which it issues a permit. An inspection from the fire department must be obtained prior to any ignition of any fireworks. In addition, the National City Police Department implements an operational plan and a traffic plan to respond to any emergencies during special events, such as a fireworks display event. Consistent with its current

practice, the National City Police Department would implement an operational plan and a traffic plan during the proposed new Fourth of July fireworks display event in National City.

Regarding the proposed new fireworks display events along the Chula Vista Bayfront, the Chula Vista Fire Department would provide fire protection and emergency services during both the Fourth of July and non-Fourth of July displays on the barge and within the landside viewing areas in the City. The City currently maintains Special Event Guidelines, which outline the Special Event Permit process, any special event-related permit types, and any requirements for the special event, such as an operational plan. There are multiple types of operational plans that may be required as part of the Special Event Permit issued by the City, including medical and transportation operational plans. Events with a higher potential risk are required to implement an appropriate medical operational plan to address the specific needs of the attendees and/or participants. The Chula Vista Police Department in conjunction with the City of Chula Vista Public Works/Traffic Engineering staff determines if a transportation operational plan is required. The transportation operational plan would require traffic control in order to facilitate vehicular, bicycle, and pedestrian movement on City streets and public rights-of-way that would potentially be affected by the event. These operational plans are developed for each special event application approval. In accordance with the City's Special Event Guidelines, medical operational plans specific to each proposed new fireworks display event would be implemented if deemed necessary through the Special Event Permit process; therefore, response times to the sites of these proposed new displays are not relevant as emergency/medical response units would be strategically assigned per each proposed new fireworks display event in order to maintain effective response. In addition, there are a number of different special event-related permits that may also be issued independent of, or in addition to, a Special Event Permit. A firework/pyrotechnic/special effect/laser permit is one of the special event-related permits outlined in the City of Chula Vista's Special Event Guidelines. This permit is required for all activities associated with the use of pyrotechnics and open flames and must be reviewed and approved by the Chula Vista Fire Department in compliance with the California Fire Code as amended by the State of California and City of Chula Vista. As part of the permit requirements, onsite stand-by and inspection services may be required due to the size, complexity, and/or unique safety issues regarding the activities associated with the event. In accordance with the City's Special Event Guidelines, medical and transportation operational plans specific to each proposed new fireworks display event would be implemented if deemed necessary; therefore, response times to the sites of these proposed new displays are not relevant as response units would be strategically assigned per each proposed new fireworks display event in order to maintain effective emergency response.

Additionally, the proposed new fireworks display events along the National City and Chula Vista Bayfronts would be required to comply with all federal, state, and local laws and regulations governing fireworks, including, but not limited to, the laws and regulations set forth in the *Fireworks in California* handbook, which is enforced by the responsible city fire department with jurisdiction over each display, as well as any special event permit requirements of the National City and Chula Vista Fire Departments.

Because the proposed new fireworks display events would occur within San Diego Bay, other emergency response services would be provided by the Harbor Police Department (HPD), which would employ special patrol vessels to ensure safety on the water during these new fireworks display events, as necessary. HPD currently provides police protection, law enforcement, and marine firefighting services in and around San Diego Bay for the District. Event-specific regulatory and enforcement services are also provided by USCG for all fireworks display events that occur within

San Diego Bay. USCG uses event-specific information to coordinate with HPD on the position and location of personnel and assets. Therefore, because of the temporary and infrequent nature of the proposed new fireworks display events, as well as the highly regulated manner in which fireworks displays are allowed to occur, the proposed new fireworks display events would not impair implementation of an adopted emergency response plan. The impacts would be less than significant.

Furthermore, as discussed in Section 4.10, *Transportation, Circulation, and Parking*, the implementation of mitigation measure **MM-TRA-1** requires compliance with the traffic-related conditions of the proposed ordinance, which require implementation of an Event Transportation and Parking Management Plan before, during, and after each proposed new fireworks display event. Implementation of **MM-TRA-1** would further improve circulation around the viewing locations by employing traffic control personnel to facilitate the movement of vehicular, pedestrian, and bicycle personnel, thereby reducing the potential for delay that might impede emergency response.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The proposed ordinance would govern fireworks display events that require a discretionary action by the District or are operated by the District's tenants. The proposed ordinance does not propose any change in the number or nature of the existing fireworks display events. The proposed ordinance contains several conditions of approval to reduce potential environmental impacts, including implementation of an Event Transportation and Parking Management Plan for publicly advertised fireworks display events. The Event Transportation and Parking Management Plan would include transportation demand and parking management strategies, such as providing event traffic control and promoting the use of public transit. This would alleviate congestion around the locations of the individual existing displays and reduce the potential for delay that might impede emergency response times. Compliance with the proposed ordinance may improve the existing condition by ensuring adequate circulation and emergency access on the roadway network surrounding the existing fireworks display events. As such, the effects of the proposed ordinance on existing fireworks display events would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. No significant adverse impacts would occur.

Level of Significance Prior to Mitigation

Proposed New Fireworks Display Events

The proposed new fireworks display events would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

The effects of the proposed ordinance on existing fireworks display events would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Therefore, no significant adverse impacts would occur.

Mitigation Measures

Proposed New Fireworks Display Events

No mitigation is required.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No mitigation is required.

Level of Significance after Mitigation

Proposed New Fireworks Display Events

Impacts would be less than significant.

Effects of Proposed Ordinance on Existing Fireworks Display Events

No impacts would occur.

4.6.1 Overview

This section describes the existing conditions and applicable laws and regulations for hydrology and water quality, followed by an analysis of the proposed project's potential to: (1) violate water quality standards or waste discharge requirements, (2) create or contribute runoff water that would exceed existing or planned stormwater drainage systems or provide substantial sources of polluted runoff, and (3) substantially degrade water quality. All other hydrology and water quality issues were addressed in Section IX of the Initial Study/Environmental Checklist (Appendix A) and were determined to be less than significant, including impacts on groundwater supplies, drainage patterns, place housing within a 100-year flood hazard area, and tsunamis, seiches, and mudflows. The analysis and conclusions regarding these impacts are also summarized in Chapter 6, Section 6.4, *Effects Not Found to be Significant*.

Information in this section is summarized from the *San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project Water Quality Technical Report*, which was prepared by Amec Foster Wheeler Infrastructure, Inc. in February 2017 and is provided as Appendix G and incorporated by reference herein.

Table 4.6-1 summarizes the significant impacts and mitigation measures discussed in this section.

Table 4.6-1. Summary of Significant Impacts and Mitigation Measures

Summary of Potentially Significant Impact(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-WQ-1: Surface Water Pollutant Related to Fireworks Debris for the Proposed New Fireworks Display Events	MM-WQ-1: Implementation of the Water Quality–Related Conditions of the Proposed Ordinance, which require the use of alternative fireworks, specific packaging material, best management practices, compliance with SDRWQCB General Permit, and compliance with other required permits	Significant and Unavoidable	Compliance with the water quality–related conditions of the proposed ordinance, which require the use of alternative fireworks, implementation of best management practices, compliance with SDRWQCB’s General Permits requirements and other required permits will reduce the potential for fireworks related debris to pollute surface waters. However, due to uncontrollable factors such as weather conditions, amount of paper incinerated, sunken material, or material that is blown onto land may affect the ability to recover all post-show debris impacts related to fireworks on surface waters would remain significant and unavoidable.

Summary of Potentially Significant Impact(s)	Summary of Mitigation Measure(s)	Level of Significance After Mitigation	Rationale for Finding After Mitigation
Impact-WQ-2. Surface Water Pollutant Related to Increased Human-Generated Trash and Litter for the Proposed New Fireworks Display Events	MM-WQ-2: Implementation of the Water Quality–Related Conditions of the Proposed Ordinance for Human-Generated Trash and Litter, which require additional trash receptacles and clean up at major viewing areas during publicly advertised fireworks display events	Less than Significant	Compliance with the proposed ordinance would require the fireworks operator to double the number of trash receptacles and clean up at major viewing areas, which would reduce the amount of human-generated trash and litter that could potentially enter San Diego Bay and degrade the water quality. In addition, the District maintains parks and other public areas within its jurisdiction during the Fourth of July fireworks display events, which would continue to be provided for the proposed new events. Therefore, impacts are reduced to a level less than significant.

4.6.2 Existing Conditions

Fireworks display events requiring a discretionary action by the District or operated by the District’s tenants currently occur on the Fourth of July and other days throughout the year at various locations adjacent to and in the waters of San Diego Bay and the Pacific Ocean near Imperial Beach. The existing fireworks display events are described in detail in Chapter 2, *Environmental Setting*, of this Draft EIR. Figure 2-1 shows the locations of the existing and proposed new fireworks launch sites in San Diego Bay and the Imperial Beach Oceanfront.

4.6.2.1 Surface Water Hydrology

The project area is under the regulatory authority of the San Diego Regional Water Quality Control Board (SDRWQCB). The San Diego region is divided into 11 hydrologic units (HUs) for administrative purposes. Each of the HUs flow from elevated regions in the east to lagoons, estuaries, or bays in the west and feature similar water quality characteristics and issues. With the exception of the Fourth of July Imperial Beach Fireworks Show, which takes place from the middle of the Imperial Beach Pier in the Pacific Ocean, the existing and proposed new fireworks display events that would be governed by the proposed ordinance occur adjacent to and in the waters of the San Diego Bay Watershed Management Area (WMA), which contains the Pueblo San Diego HU,

Sweetwater HU, and Otay HU, as shown on Figure 4.6-1. The Pacific Ocean shoreline is within the Tijuana River WMA.

San Diego Bay Watershed

The San Diego Bay WMA encompasses a 444-square-mile area (approximately 284,500 acres) that extends eastward from San Diego Bay for more than 50 miles to the Laguna Mountains. The WMA ranges in elevation from sea level at San Diego Bay to a maximum elevation of approximately 6,000 feet above sea level at the eastern boundary. Most of the WMA land area generally lies north of the Tijuana River WMA, south of the San Diego River WMA, west of the Anza Borrego WMA, and east of the Pacific Ocean. SDRWQCB-prepared Water Quality Control Plan for the San Diego Basin (SDRWQCB 1994) (Basin Plan) defines the San Diego Bay WMA as containing three HUs: (1) the Pueblo San Diego (Pueblo) HU, (2) the Sweetwater River (Sweetwater) HU, and (3) the Otay River (Otay) HU.

The source of most freshwater input to San Diego Bay is surface runoff from urban areas and intermittent flow from rivers and creeks during rain events. Dams and extensive use of groundwater over the past century in the Sweetwater and Otay Rivers have significantly reduced the input from these rivers to the Bay.

Pueblo San Diego Hydrologic Unit (908.00)

The Pueblo HU encompasses approximately 60 square miles and has no central stream system. The Basin Plan identifies the Pueblo HU as the smallest of the three San Diego Bay HUs, covering approximately 38,000 acres. It is the most developed and most densely populated watershed in the San Diego Bay Watershed Management Area. It contains three hydrologic areas (HAs): Point Loma (908.1), San Diego Mesa (908.2), and National City (908.3). Major water features are Chollas Creek, Paleta Creek, and San Diego Bay. Most of the water from the Pueblo HU drains to San Diego Bay, although a portion of the Point Loma HA drains directly to the Pacific Ocean.

Sweetwater River Hydrologic Unit (909.00)

The Sweetwater HU is the largest of the three San Diego Bay HUs, encompassing over 415 square miles. Three main drainage areas are included within the Sweetwater HU: Lower Sweetwater HA (Hydrologic Subareas 909.11, 909.12, and 908.32),¹ Middle Sweetwater HA (909.20), and Upper Sweetwater HA (909.30). It has four major water bodies: Sweetwater River, Sweetwater Reservoir, Loveland Reservoir, and San Diego Bay. Portions of the San Diego Bay National Wildlife Refuge, including the Sweetwater Marsh, are in the Sweetwater HU. Much of this watershed is occupied by undeveloped lands in the Cleveland National Forest, Cuyamaca Rancho State Park, and the unincorporated communities of Pine Valley, Descanso, Alpine, and the Viejas Indian Reservation. The Cleveland National Forest, Cuyamaca Rancho State Park, and Viejas Indian Reservation are regulated separately, and the Responsible Parties² do not have authority to require their participation or to implement Municipal Permit requirements.

¹ Telegraph Canyon Channel is in HSA 909.11, but drains directly to San Diego Bay rather than to the Sweetwater River. Hydrologic Subarea 908.32, while technically in the Pueblo HU, drains to the Sweetwater River, so it is considered part of the Sweetwater HU.

² In this document, the Co-permittees within the San Diego Bay Watershed Management Area and the California Department of Transportation are collectively referred to as Responsible Parties.

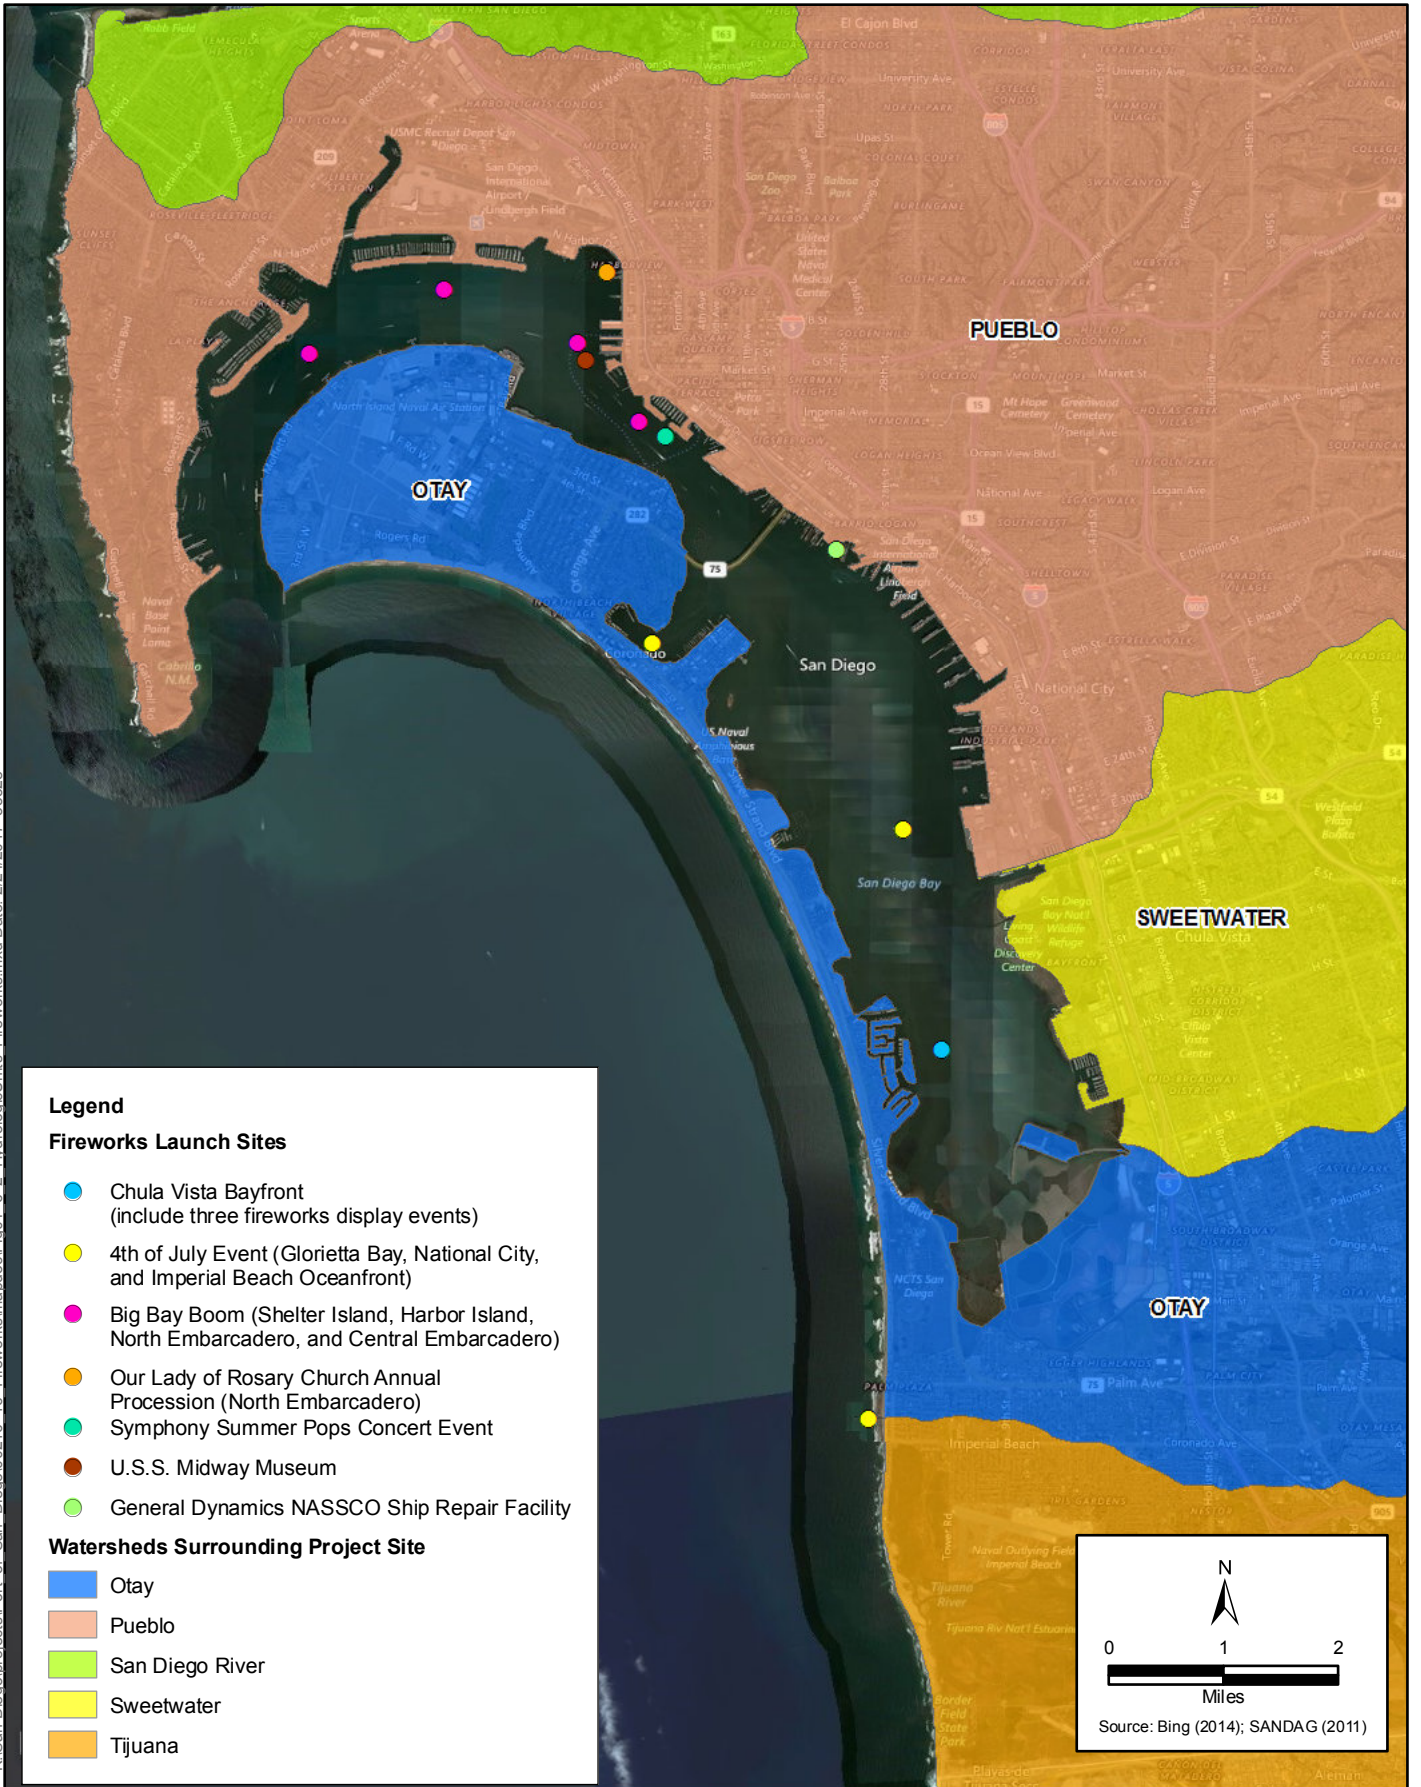

Figure 4.6-1
Hydrologic Units in the Project Area
San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events EIR
 66738 Page 749

Otay River Hydrologic Unit (910.00)

The Basin Plan identifies the Otay HU as the second largest of the three San Diego Bay HUs. The Otay HU consists of three HAs: Coronado (910.10), Otay Valley (910.20), and Dulzura (910.30). It comprises nearly 160 square miles and includes four major water bodies: the Upper and Lower Otay Reservoirs, Otay River, and San Diego Bay. The two reservoirs supply drinking water, wildlife habitat, and recreational opportunities. The Otay HU includes portions of San Diego Bay and the San Diego Bay National Wildlife Refuge, the Rancho Jamul Ecological Reserve, the Otay Valley Regional Park, and approximately 23,000 acres that provide habitat for endangered plant and animal species as part of the San Diego County Multiple Species Conservation Program.

Table 4.6-2 shows the hierarchical structure of HU, HA, and Hydrologic Subarea.

Table 4.6-2. Project Vicinity Hydrologic Units, Hydrologic Areas, and Hydrologic Subareas

Hydrologic Unit	Hydrologic Areas	Hydrologic Subareas
Pueblo San Diego (908.00)	Point Loma (908.10)	N/A
	San Diego Mesa (908.20)	Lindbergh (908.21)
		Chollas (908.22)
	National City (908.30)	El Toyon (908.31)
Paradise (908.32)

Pacific Ocean Shoreline

As mentioned, the Fourth of July Imperial Beach Fireworks Show occurs from the middle of the Imperial Beach Pier in the Pacific Ocean. The Pacific Ocean shoreline is part of the Tijuana River WMA, which covers a range of natural ecosystems. The watershed originates in the 6,000-foot-elevation, pine forest-covered mountains in east San Diego County and extends to the tidal saltwater estuary at the mouth of the Tijuana River and sandy beaches along the Pacific Ocean shoreline in the west.

4.6.2.2 Surface Water Quality

San Diego Bay and the Pacific Ocean are the receiving water bodies for existing fireworks display events, while the Bay would be the receiving water body for the proposed new fireworks display events. The surface water quality of these water bodies is described below.

San Diego Bay

Tides in San Diego Bay are classified as mixed diurnal/semi-diurnal, with a dominant semi-diurnal component. Generally, San Diego Bay has two low and two high tides per day, on an approximately two-week spring-neap tidal cycle that is associated with the phase of the moon. Tidal exchange in San Diego Bay exerts control over flushing, salt and heat balances, and water residence time. The ebb and flow of tides mix ocean and San Diego Bay waters, and produce currents, induce changes in salinity, and alternately expose and inundate portions of the shoreline. Tidal flushing and mixing are important for maintaining water quality and moderating water temperature that has been affected by exchange with the atmosphere or by heating.

Water quality in San Diego Bay is influenced by processes and activities that take place within the San Diego Bay and the watershed HUs, including through tidal flushing and currents, as well as from freshwater inflows. Water quality characteristics (e.g., salinity, temperature, and dissolved oxygen) form a gradient within San Diego Bay: waters in the northern Bay have conditions similar to those of the ocean; the central Bay is intermediate in character; and the southern Bay is strongly affected by shallow depths, fresh water inflows, and insulation. The turbidity (i.e., the amount of particulate matter in suspension in the water column) of San Diego Bay waters is affected by phytoplankton blooms; inputs of fine sediments from surface runoff during and after storms; and sediment resuspension by winds, waves, and human activities. Consequently, an increase in turbidity can decrease light penetration and the level of primary biological production. Turbidity in San Diego Bay varies both by time and by location.

Pacific Ocean

The Pacific Ocean shoreline in the vicinity of the Fourth of July Imperial Beach Fireworks Show lies within the Southern California Bight. Oceanographic conditions within the Southern California Bight are influenced by the Southern California Countercurrent, which is a large-scale eddy of the California Current, and the California Undercurrent, which is a northward-flowing current that occurs inshore and beneath the California Current. Local-scale current patterns are complex and reflect the effects of local winds, tidal circulation, regional climatic events, and seasonal cycles in seawater properties and stratification.

There are four primary sources for nearshore currents: (1) wave-driven currents, (2) wind-driven surface currents moving approximately in the direction of the wind, (3) tidal currents that trend parallel to shore and switch direction with the falling or rising tide, and (4) currents near the mouth of coastal lagoons that result from river flow and/or tidal exchange within coastal wetlands. There are two types of surf zone currents: longshore currents and onshore/offshore currents.

Water quality within the Pacific Ocean reflects natural seasonal patterns. During late spring through fall, solar heating preferentially warms the ocean surface, resulting in depth-related gradients in water temperature (thermocline). Strong density gradients (pycnocline), related primarily to the water temperature changes with depth, restrict vertical mixing of the water column, which strongly affects the depth distribution of most water quality parameters. During winter and early spring, the strength of the vertical stratification decreases in response to weaker solar heating, mixing by winter storms, and upwelling.

Upwelling is initiated when northern winds displace surface waters offshore, resulting in replacement by colder, deeper waters with lower dissolved oxygen concentrations and higher salinity and nutrient concentrations. Upwelling is generally present from late March through July in the San Diego County area. Downwelling occurs when southern winds push offshore waters toward the shore, thus pushing nearshore surface waters down and causing warmer waters and lower salinity than are typical for deeper waters. Seasonal upwelling and downwelling affect marine water quality along the San Diego coast.

Additionally, stormwater runoff from coastal rivers and streams adds freshwater that can cause large turbidity plumes and reductions in near-surface salinity up to several miles from shore. River and stream discharges also add suspended sediments, nutrients, bacteria and other pathogens, and chemical contaminants to nearshore waters.

Beneficial Uses for Surface Waters

SDRWQCB has region-wide and water body-specific beneficial uses, and has set numeric and narrative water quality objectives for several pollutants and parameters for specific surface waters in its region. The beneficial uses of the receiving surface waters and water bodies for existing and proposed new fireworks display events—Pacific Ocean and San Diego Bay—are shown in Table 4.6-3.

Table 4.6-3. Beneficial Uses of Receiving Surface Waters or Water Bodies for Existing and Proposed New Fireworks Display Events

Water Body	Designated Beneficial Uses
Pacific Ocean	Water contact recreation, non-contact recreation, wildlife habitat, industrial service supply, navigation, commercial and sport fishing, preservation of biological habitats of special significance, rare, threatened or endangered species, marine habitat, migration of aquatic organisms, spawning, reproduction, and/or early development, shellfish harvesting and aquaculture.
San Diego Bay	Water contact recreation, non-contact recreation, wildlife habitat, industrial service supply, navigation, commercial and sport fishing, preservation of biological habitats of special significance, rare, threatened or endangered species, estuarine habitat, marine habitat, migration of aquatic organisms, spawning, reproduction, and/or early development and shellfish harvesting.

Source: SDRWQCB 2011a

San Diego Bay sediments are impaired for several constituents. A total of 172 acres of San Diego Bay are designated as impaired, containing toxic sediments and/or degraded benthic communities due to both point and nonpoint sources. The principal constituents of concern for surface water quality in the project area include chlorinated pesticides, polycyclic aromatic hydrocarbon (PAH), polychlorinated biphenyl (PCB), and heavy metals.

The Pacific Ocean shoreline near the site of the Fourth of July Imperial Beach Fireworks Show (i.e., Imperial Beach Pier) has one Clean Water Act (CWA) Section 303(d) listing for a chemical contaminant (PCBs in fish tissue), but no listings for either toxicity or benthic community effects. The Pacific Ocean shoreline, Tijuana HU, is also on the Section 303(d) list for bacteria contamination.

4.6.3 Applicable Laws and Regulations

4.6.3.1 Federal

Federal Emergency Management Agency

The Federal Emergency Management Agency (FEMA) administers the National Flood Insurance Program to provide subsidized flood insurance to communities that comply with FEMA regulations limiting development in floodplains. FEMA also issues Flood Insurance Rate Maps that identify which land areas are subject to flooding. These maps provide flood information and identify flood hazard zones in the community. The design standard for flood protection is established by FEMA. FEMA's minimum level of flood protection for new development is the 100-year flood event, also described as a flood that has a 1-in-100 chance of occurring in any given year.

Additionally, FEMA has developed requirements and procedures for evaluating earthen levee systems and mapping the areas affected by those systems. Levee systems are evaluated for their ability to provide protection from 100-year flood events, and the results of this evaluation are documented in the FEMA Levee Inventory System. Levee systems must meet minimum freeboard standards and must be maintained according to an officially adopted maintenance plan. Other FEMA levee system evaluation criteria include structural design and interior drainage.

Clean Water Act

The primary goals of the CWA are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and to make all surface waters fishable and swimmable. The U.S. Environmental Protection Agency (EPA) is the lead federal agency responsible for water quality management. The CWA of 1972 (33 U.S. Code [USC] 1251–1387) is the primary federal law that governs and authorizes water quality control activities by EPA as well as the states. The federal CWA of 1977 (33 USC 1251 et seq.), which amended the federal Water Pollution Control Act of 1972, established the basic structure for regulating discharges of pollutants into the waters of the United States (not including groundwater). Under the CWA, it is unlawful for any person to discharge any pollutant from a point source into navigable waters, unless a National Pollutant Discharge Elimination System (NPDES) permit is obtained and implemented within compliance. In addition, the CWA requires the states to adopt water quality standards for receiving water bodies and to have those standards approved by EPA. Water quality standards consist of designated beneficial uses for

a particular receiving water body (e.g., wildlife habitat, agricultural supply, fishing), along with water quality criteria necessary to support those uses.

Section 303: Impaired Water Bodies (303(d) list) and Total Maximum Daily Loads

Under Section 303(d) of the CWA, the State Water Resources Control Board (SWRCB) is required to develop a list of impaired water bodies that do not meet water quality standards (promulgated under the National Toxics Rule [NTR] or the California Toxics Rule [CTR]) after the minimum technology-based effluent limitations have been implemented for point sources. Lists are to be priority ranked for development of a total maximum daily load (TMDL). A TMDL is a calculation of the total maximum amount of a pollutant that a water body can receive on a daily basis and still safely meet water quality standards. The California RWQCBs and EPA are responsible for establishing TMDL waste-load allocations and incorporating improved load allocations into water quality control plans, NPDES permits, and waste discharge requirements. Section 305(b) of the CWA requires that states assess the status of water quality conditions within the state in a report to be submitted every 2 years.

Both CWA requirements are being addressed through the development of a 303(d)/305(b) Integrated Report, which would address both an update to the 303(d) list and a 305(b) assessment of statewide water quality. SWRCB developed a statewide 2010 California Integrated Report based upon the Integrated Reports from each of the nine RWQCBs. The 2010 California Integrated Report was approved by the SWRCB at a public hearing on August 4, 2010, and EPA issued its final decision and approval on October 11, 2011.

All of the 303(d) listed impaired waters with potential to be affected by the proposed project would be evaluated as part of this Draft EIR, and mitigation measures would be implemented if necessary to protect waters from further impairment.

Section 303: List of Water Quality Limited Segments

SWRCB approved the 2010 Integrated Report (CWA Section 303(d) List/305(b) Report) on August 4, 2010 (SWRCB 2014). On November 12, 2010, EPA approved the 2010 California 303(d) List of Water Quality Limited Segments.

The following is summary of San Diego Bay and Pacific Ocean Section 303(d)-listed locations for sediment chemistry, water chemistry, benthic community effects, or sediment toxicity impairments only for areas near fireworks display events. The bacterial impairments listed below are not a constituent of concern for fireworks display events and are provided for informational purposes only.

- San Diego Bay: 303(d)-listed for impaired Ocean, Commercial, and Sport Fishing (COMM) (PCBs)
- San Diego Bay Shoreline, North of 24th Street Marine Terminal: 303(d)-listed for impaired marine habitat (MAR) (benthic community effects and sediment toxicity)
- San Diego Bay Shoreline, Seventh Street Channel: 303(d)-listed for impaired MAR (benthic community effects and sediment toxicity)
- San Diego Bay Shoreline, at Americas Cup Harbor: 303(d)-listed for impaired Estuarine Habitat beneficial use (EST) (copper)
- San Diego Bay Shoreline, near Submarine Base: 303(d)-listed for impaired MAR (benthic community effects, sediment toxicity, and toxicity)

- San Diego Bay, Shelter Island Yacht Basin: 303(d)-listed for impaired EST (dissolved copper)
- San Diego Bay Shoreline, 32nd Street San Diego Naval Station: 303(d) listed for impaired MAR (benthic community effects and sediment toxicity)
- San Diego Bay Shoreline, at Harbor Island (East Basin): 303(d) listed for EST (copper)
- San Diego Bay Shoreline, at Harbor Island (West Basin): 303(d)-listed for impaired EST (copper)
- San Diego Bay Shoreline, at Marriott Marina: 303(d)-listed for impaired EST (copper)
- San Diego Bay Shoreline, at Spanish Landing: 303(d)-listed for impaired Contact Water Recreation (REC-1) and Shellfish Harvesting (SHELL) (total coliform)
- San Diego Bay Shoreline, Between Sampson and 28th Streets: 303(d)-listed for impaired MAR (copper and PAHs), COMM (mercury and PCBs), and warm freshwater habitat (zinc)
- San Diego Bay Shoreline, Downtown Anchorage: 303(d)-listed for impaired MAR (benthic community effects and sediment toxicity)
- San Diego Bay Shoreline, near Chollas Creek: 303(d)-listed for impaired MAR (benthic community effects and sediment toxicity)
- San Diego Bay Shoreline, near Coronado Bridge: 303(d)-listed for impaired MAR (benthic community effects and sediment toxicity)
- San Diego Bay Shoreline, near Switzer Creek: 303(d)-listed for impaired MAR (chlordan and PAHs)
- San Diego Bay Shoreline, Vicinity of B Street and Broadway Piers: 303(d)-listed for impaired MAR (benthic community effects and sediment toxicity) and REC 1 and SHELL (total coliform)
- San Diego Bay Shoreline, Chula Vista Marina: 303(d)-listed for impaired EST (copper)
- Pacific Ocean Shoreline, Imperial Beach Pier: 303(d)-listed for impaired REC 1 (fecal coliform and total coliform) and COMM (PCBs)³
- San Diego Bay Shoreline, at Coronado Cays: 303(d)-listed for impaired EST (copper)
- San Diego Bay Shoreline, at Glorietta Bay: 303(d)-listed for impaired EST (copper)

National Pollutant Discharge Elimination System

The NPDES permit program was established by the CWA to regulate discharges to surface waters of the United States. Federal NPDES permit regulations have been established for broad categories of discharges, including point-source municipal and industrial discharges and nonpoint-source stormwater runoff. NPDES permits generally identify effluent and receiving water limits on allowable concentrations and/or mass emissions of pollutants contained in the discharge; prohibitions on discharges not specifically allowed under the permit; and provisions that describe required actions by the discharger, including industrial pretreatment, pollution prevention, self-monitoring, or other activities. Permits issued pursuant to the NPDES are implemented at the state and local levels.

³ This listing (Decision ID 5535) is based upon PCB levels in fish tissue (a perch species). One station was sampled on Imperial Beach Pier in either March 1999 or April 2000. The tissue sample result exceeded the Office of Environmental Health Hazard Assessment Screening Value of 20 nanograms per gram.

Oil Pollution Act

The Oil Pollution Act (OPA) was signed into law in August 1990, largely in response to rising public concern following the Exxon Valdez oil spill in Prince William Sound, Alaska. The OPA improved the nation's ability to prevent and respond to such incidents by expanding the federal government's ability to respond with funding and other resources. The OPA also created the national Oil Spill Liability Trust Fund, which funds responses to spill incidents.

In addition, the OPA provided new requirements for contingency planning, by both government and industry; it expanded the National Oil and Hazardous Substances Pollution Contingency Plan in a three-tiered approach: (1) the federal government must direct all public and private responses for certain types of spill events. (2) area committees (composed of federal, state, and local government officials) must develop detailed and location-specific area contingency plans. and (3) owners or operators of vessels and certain facilities that pose a serious threat to the environment must prepare their own facility response plans.

The OPA also increased penalties for regulatory noncompliance, broadened the response and enforcement authorities of the federal government, and preserved state authority to establish laws governing oil spill prevention and response.

National Toxics Rule and California Toxics Rule

EPA adopted the NTR on December 22, 1992, and amended it on May 4, 1995, and November 9, 1999. Approximately 40 NTR criteria are also applied in California.

On May 18, 2000, EPA adopted the CTR. This rule prescribed new toxics criteria for California, incorporated the previously adopted NTR criteria that were applicable in the state, and specified water quality criteria for priority pollutants. The CTR was amended on February 13, 2001.

Endangered Species Act

The Endangered Species Act does not authorize any action that results in the taking of a threatened or endangered species or any action that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code Sections 2050 to 2097) or the Federal Endangered Species Act (16 USC 1531–1544). The Endangered Species Act requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the state. The discharger is responsible for meeting all requirements of the Endangered Species Act.

United States Coast Guard Marine Safety Program

The U.S. Coast Guard (USCG), pursuant to 33 Code of Federal Regulations (CFR) 100, implements the Marine Safety Program, which is designed to ensure the safety of vessels and recreational boaters on navigable U.S. waters during fireworks display events. USCG issues marine event permits to sponsors of public fireworks display events that have the potential to endanger marine safety. An application for approval of marine event must be submitted to USCG for approval no later than 135 days prior to the event if the applicant does not meet criteria specified in 33 CFR 100.15(c), or 60 days prior to the event if the applicant does meet the criteria. After approving plans for a fireworks display event, USCG is authorized to promulgate special local regulations as necessary to ensure public safety on navigable waters immediately prior to, during, and immediately after the

approved fireworks display event. Such regulations may include a restriction on or control of the movement of vessels through a specified fireworks display event area.

Department of Homeland Security Chemical Facility Anti-Terrorism Standards

On October 4, 2006, the U.S. Department of Homeland Security (DHS) Appropriations Act of 2007 was signed into law. Under Section 550 of the Appropriations Act of 2007, DHS finalized chemical facility anti-terrorism standards on November 2, 2007 (Perry et al. 2007). Facilities possessing any of the 335 chemicals of interest in quantities at or above screening threshold quantities must complete an electronic “top screen” questionnaire that determines whether further assessments and security plans should be developed to ensure safety. The information should allow DHS to determine the potential for and possible consequences of a terrorist attack, and to assess the possible risks if dangerous chemicals are stolen. Pyrotechnic technicians and businesses act as chemical storage facilities and use and store some of the chemicals listed in Part 27 of the standards, and so are subject to DHS review. Operators may not use dangerous or explosive chemicals not on the list without DHS review and consideration of safety.

4.6.3.2 State

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (embodied in the California Water Code) of 1969 (Porter Cologne Act) is California’s statutory authority for the protection of water quality. Under the Porter-Cologne Act, the state must adopt water quality policies, plans, and objectives that protect its waters for the use and enjoyment of the people. Under the California Water Code, the State of California is divided into nine regions governed by RWQCBs that, under the guidance and review of SWRCB, implement and enforce provisions of the California Water Code and the CWA. The project site is located in Region 9, the San Diego region, and governed by SDRWQCB.

The Porter-Cologne Act also requires waste dischargers to notify the RWQCBs of their activities through the filing of Reports of Waste Discharge and authorizes SWRCB and the RWQCBs to issue and enforce waste discharge requirements, NPDES permits, Section 401 water quality certifications, or other approvals.

Section 13050 of the California Water Code defines what is considered pollution, contamination, or nuisance. Briefly defined, *pollution* means an alteration of water quality such that it unreasonably affects the beneficial uses of water. *Contamination* means an impairment of water quality to the degree that it creates a hazard to public health. *Nuisance* is defined as anything that is injurious to health, is offensive to the senses, or is an obstruction to property use, and which affects a considerable number of people.

State Implementation Policy

On March 2, 2000, SWRCB adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California*. This State Implementation Policy (SIP) applies to discharges of toxic pollutants into the inland surface waters, enclosed bays, and estuaries of California subject to regulation under the state’s Porter-Cologne Act and the federal CWA. Such regulation may occur through the issuance of NPDES permits or other relevant regulatory approaches. The SIP establishes a standardized approach for permitting discharges of toxic

pollutants to non-ocean surface waters in a manner that promotes statewide consistency. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. The RWQCB's General Permit implements the requirements of the SIP with regard to potential water quality-related impacts associated with fireworks display events over or near water bodies.

Office of the California State Fire Marshal

California's Fireworks Law, which was passed in 1938, established the Office of the State Fire Marshal as the fireworks classification authority in the state. The state's Explosives Law authorizes the California State Fire Marshal to adopt regulations for the safe use, handling, storage, and transportation of fireworks in California. Fireworks are classified through laboratory analysis, field examinations, and test firing of fireworks items. The State Fire Marshal requires licensing of all pyrotechnic operators, manufacturers, importer-exporters, wholesalers, retailers, and public display companies. Pyrotechnic operators who discharge fireworks at public displays or launch high-powered and experimental rockets must also pass a written examination and provide proof of experience. The laws and regulations governing the transportation, use, and storage of fireworks in California are contained in the following.

- State Fireworks Law, California Health and Safety Code, Sections 12500–12728
- State Fireworks Regulations, California Code of Regulations (CCR) Title 19, Chapter 6
- Storage, CCR Title 27, Part 55, Subpart K
- Hazardous Materials Transportation, CCR Title 13

California State Department of Toxic Substances Control

In light of the risks to public health and the environment posed by perchlorate releases, the California Legislature adopted the Perchlorate Contamination Prevention Act of 2003, amending Chapter 6.5 of Division 20 of the Health and Safety Code and requiring the California Department of Toxic Substances Control to adopt regulations specifying best management practices (BMPs) for perchlorate and perchlorate-containing substances. The perchlorate BMP regulations were adopted on December 31, 2005, and are contained in CCR Title 22, Social Security Division 4.5, Environmental Health Standards for the Management of Hazardous Waste Chapter 33, Best Management Practices for Perchlorate Materials Article 1, Sections 67384.1–67384.11. In Section 67384.8(c), Special Best Management Practices for Flares and Pyrotechnic Perchlorate Materials, these regulations provide that: “[w]ithin twenty-four (24) hours of a public display of fireworks or the use of dangerous fireworks, the pyrotechnics operator, in addition to complying with CCR Title 19, Section 1003, shall, to the extent practical, collect any stars and un-ignited pyrotechnic material found during the required inspection of the entire firing range.”

4.6.3.3 Local

San Diego Integrated Regional Water Management Plan

In the San Diego region, there is a complex array of water supply, water management, water quality protection, pollution prevention, habitat protection, flood protection, and recreational needs. Water management plans have been developed within the region to address these needs. However, jurisdictional and water management conflicts exist among the individual water management plans,

and many challenges exist to identifying, addressing, and resolving water management issues. The Integrated Regional Water Management Plan (IRWMP) was developed in 2007 to bring stakeholders together and coordinate a regional approach to water management issues, pursuant to statewide IRWMP Guidelines established by SWRCB and the State of California Department of Water Resources in 2004 and updated in 2007. In addition, the 2013 Final Draft IRWMP is now available.

Water Quality Control Plan for the San Diego Basin

RWQCBs are required to develop and periodically update a water quality control plan or basin plan (SDRWQCB 2011b). A water quality control plan establishes water quality objectives for the ground and surface waters of the region and includes an implementation plan describing the actions by SDRWQCB and others that are needed to achieve and maintain these water quality objectives. The project area falls under the Water Quality Control Plan for the San Diego Basin.

As defined in the Porter-Cologne Act, water quality objectives are the established limits or levels of chemical constituents allowable in water (SDRWQCB 2011b). The designation of water quality objectives must satisfy all of the applicable requirements of the Porter-Cologne Act and the CWA. Through water quality objectives, SDRWQCB provides for the reasonable protection of beneficial uses, considering existing water quality, environmental, and economic factors. Beneficial uses applicable to the receiving waters within the San Diego region are listed in Table 4.6-4.

Table 4.6-4. San Diego Basin Plan Beneficial Uses

Discharge Point	Receiving Water Name	Beneficial Use
Various	Coastal Waters (Pacific Ocean, Enclosed Bays and Estuaries, Harbors, and Lagoons)	<ul style="list-style-type: none"> • Industrial service supply (IND) • Navigation (NAV) • Contact water recreation (REC-1) • Non-contact water recreation (REC-2) • Commercial and sport fishing (COMM) • Biological habitats of special significance (BIOL) • Estuarine habitats (EST) • Wildlife habitat (WILD) • Preservation of rare, threatened, or endangered species (RARE) • Marine habitat (MAR) • Aquaculture (AQUA) • Migration of aquatic organisms (MIGR) • Spawning (SPWN) • Shellfish harvesting (SHELL)
Various	Inland Surface Waters	<ul style="list-style-type: none"> • Municipal and domestic supply (MUN) • Agricultural supply (AGR) • Industrial service supply (IND) • Industrial process supply (PROC) • Groundwater recharge (GWR) • Hydropower generation (POW) • Contact water recreation (REC-1) • Non-contact water recreation (REC-2) • Biological habitats of special significance (BIOL) • Cold freshwater habitat (COLD) • Wildlife habitat (WILD) • Spawning (SPWN) • Preservation of rare, threatened, or endangered species (RARE)

SDRWQCB Municipal Stormwater Permit (Order No. R9-2013-0001)

The Municipal Stormwater Permit (Order No. R9-2013-0001 as amended by Order Nos. R9-2015-001 and R9-2015-0100) is an NPDES permit issued that requires the owners and operators of municipal separate storm sewer systems (MS4s) within the San Diego region to implement management programs to limit discharges of pollutants and non-stormwater discharges to and from their MS4 from all phases of development. The Municipal Stormwater Permit requires the District and other “co-permittees” to develop watershed based Water Quality Improvement Plans (WQIPs). The Municipal Stormwater Permit emphasizes watershed program planning and program outcomes. The intent of the Permit is to enable each jurisdiction to focus its resources and efforts to: reduce pollutants in stormwater discharges from its MS4, effectively prohibit non-stormwater discharges to its MS4, and achieve the interim and final [Water Quality Improvement Plan] numeric goals.

National Pollutant Discharge Elimination System Permit (General Permit)

The General NPDES Permit for Residual Firework Pollutant Waste Discharges to Waters of the United States in the San Diego region from the Public Display of Fireworks (No. R9-2011-0022) (General Permit) covers the point-source discharge of residual firework pollutant waste to surface waters, and requires users of fireworks to obtain coverage under the General Permit prior to the public display of fireworks. A copy of the General Permit, the Notice of Intent, and post-event reporting forms are included as attachments to Appendix G.

CWA Section 301(a) broadly prohibits the discharge of any pollutant to waters of the United States, except in compliance with an NPDES permit. Fireworks residue waste discharged into surface waters constitutes discharge of a pollutant from a point source within the meaning of the CWA. Therefore, coverage under an NPDES permit is required before residual firework pollutant wastes can be lawfully discharged.

EPA and SDRWQCB have classified these types of discharges as minor discharges. In accordance with Section 2200, Title 23 of the California Code of Regulations, discharges regulated by the Order are determined to be Category 3. The threat to water quality and complexity of the discharge is determined to be Category 3C.⁴

Section 122.48 of the NPDES permit program requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code Sections 13267 and 13383 authorize RWQCBs to require technical and monitoring reports. The General Permit provides monitoring and reporting requirements to implement federal and state requirements.

The current General Permit was valid until May 31, 2016. Following the expiration date, the provisions set forth are to re-evaluated and re-established or updated as needed. Dischargers covered under this order at the time of expiration would continue to be covered until coverage becomes effective under a reissued permit. Upon reissuance of this order by the RWQCB, dischargers may need to seek re-enrollment under the revised order. Discharger categories and monitoring requirements are discussed in more detail in the General Permit contained in Appendix G.

SeaWorld San Diego (SeaWorld) is currently the only Category 1 discharger in the San Diego region. SeaWorld is required to conduct a higher level of monitoring and reporting than Category 2 dischargers because of the high number of events it conducts each year adjacent to Mission Bay.

Category 2 entities are all other dischargers of fireworks of any net explosive weight from a single event or multiple events to any surface water of the United States within the San Diego region.

Category 1 Dischargers

All Category 1 dischargers monitor the receiving water body to assess compliance with receiving water limits. The compliance monitoring may be performed independently by individual dischargers, collaboratively through participation in a coalition that monitors San Diego Bay or Mission Bay, or both, as determined by SDRWQCB. Monitoring of both sediment and water quality is

⁴ Category 3C is defined as “Those discharges of waste that could degrade water quality without violating water quality objectives, or could cause a minor impairment of designated beneficial uses” and “dischargers having no waste treatment systems or that must comply with best management practices” (California Code of Regulations, Title 23, Division 3, Chapter 9, Waste Discharge Reports and Requirements, Article 1. Fees).

required, as outlined in the General Permit Attachment E, Section IX.C. Water quality testing includes chemistry analysis of (at a minimum) conventional nutrients (including total phosphorus and perchlorate), semivolatile organic compounds (bis-phthalate), and metals (total and dissolved). Sediment testing includes chemical analysis, toxicity testing, and assessment of benthic community condition, no less than once every 3 years.

Category 2 Dischargers

Category 2 dischargers are not required to perform monitoring unless otherwise determined by SDRWQCB, based on the considerations outlined in General Permit, Attachment E, Section IX.B.2. Best Management Practices Required by the General Permit.

All dischargers (i.e., fireworks display event organizers) covered under the General Permit are required to prepare a Fireworks Best Management Practices Plan (FBMPP). The FBMPP can be in any of the following forms.

1. An official document or manual with full descriptions, figures, etc.
2. A brief letter or notice describing or listing the BMPs to be implemented for health and safety at the event.
3. A map or image describing and indicating where BMPs will be implemented before, during, and after the event.

The information needed to prepare an FBMPP is provided as an attachment to the *San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events Project Water Quality Technical Report* (Appendix G).

Reporting

The General Permit contains the following reporting requirements.

- **Public Fireworks Display Event Log.** Dischargers shall maintain a written log for each public fireworks display event containing the information as described in Section V.C. of the General Permit. The log shall be completed within 5 days following each public fireworks display event and shall be made available to SDRWQCB upon request.
- **Post Firework Display Event Reporting.** No later than 30 calendar days following each public fireworks display event, the discharger shall complete the Public Display of Fireworks Post Event Report Form and make it available to SDRWQCB upon request. A copy of the Public Display of Fireworks Post Event Report Form is provided as an attachment to Appendix G.

Compliance

As stated in the General Permit, compliance is determined as follows.

This Order requires the use of minimum BMPs to control and abate the discharge of pollutant wastes from public fireworks events to surface waters in the San Diego Region. Proper implementation of the BMPs will assure the protection of water and sediment quality within the receiving waters. Dischargers enrolled under this Order are expected to comply with all water and sediment quality objectives through the implementation of BMPs. Compliance will be determined by evaluating the proper implementation of the minimum BMPs and their effectiveness in preventing and minimizing pollutant waste loading from public fireworks events to surface waters. Compliance will also be evaluated using information obtained under the monitoring and reporting program of this Order.

San Diego Bay Watershed Water Quality Improvement Plan

The Municipal Stormwater Permit requires the development of the San Diego Bay WQIP. The purpose of the WQIP is to guide the District and other Phase I Municipalities' Jurisdictional Runoff Management Plans (JRMPs) toward improving water quality in MS4 discharges and receiving waters. In the WQIP, priorities and goals are established and each jurisdiction identified strategies to assist in attaining the goals. This approach establishes the foundation that the District uses to develop and implement its JRMP. The District implements the WQIP in collaboration with other local agencies that have jurisdiction within the San Diego Bay Watershed Management Area, which comprises three hydrologic units: Pueblo San Diego, Sweetwater River, and Otay River.

Jurisdictional Runoff Management Plan

Under the Municipal Stormwater Permit, each jurisdiction is to prepare a JRMP. Each JRMP must contain a component that addresses issues related to construction activities and a component that addresses issues related to existing development. Additionally, each co-permittee prepares and submits an annual report that describes the implementation of programs and strategies to reduce the discharge of pollutants of concern to the MS4 and receiving waters to the maximum extent practicable.

The District's JRMP serves as an informational document that provides an overall account of the program to be conducted by the District during the 5-year life of the Municipal Permit. The District's JRMP has been developed to meet the conditions of the Municipal Permit and to assist the District in achieving the goals identified in the WQIP. District-specific WQIP-based strategies have been incorporated into the JRMP. The JRMP program's focus is on controlling stormwater discharges to the MS4 with the overall goal of achieving receiving water quality improvements. The JRMP utilizes District-specific jurisdictional activities as well as watershed-based strategies. Enforcement of the JRMP helps to prevent stormwater pollutants from entering into the local storm drains and ultimately San Diego Bay.

San Diego Harbor Safety Plan

The San Diego Harbor Safety Plan is designed to provide mariners using the waters of San Diego Bay an up-to-date guide to critical navigation issues that will enhance vessel safety, with the ultimate goal of pollution prevention and protection of the region's valuable resources. This plan has been developed by the San Diego Harbor Safety Committee as mandated in the California Oil Spill Prevention and Response Act of 1990 (OSPR Act) (Government Code Sections 8574.1 et seq.). The goals of the OSPR Act are to improve the prevention, removal, abatement, response, containment, clean up, and mitigation of oil spills in the marine waters of California. The OSPR Act and its implementing regulations (14 CCR 800-802) created harbor safety committees for the major harbors of California to "plan for the safe navigation and operation of tankers, barges, and other vessels within each harbor" by preparing "a harbor safety plan, encompassing all vessel traffic within the harbor."

The plan sections include the following.

- **Emergency Response Procedures.**
- **Best Maritime Practices.**
- **Geographic Boundaries.** A detailed description of the geographical boundaries of the harbor.

- **Harbor Conditions.** A description of existing and expected conditions of weather, tidal ranges, and other factors.
- **Aids to Navigation and Navigational Hazards.** An evaluation and list of the aids to navigation in the harbor, and list of navigational hazards.
- **Anchorage and Anchorage Management.** A description of the existing anchorages and any limitations to those anchorages.
- **Communications.** A review and evaluation of the adequacy of current ship-to-ship and ship-to-shore communications used in the harbor area.
- **Vessel Traffic Patterns.** A description of the types of vessels that call on the ports or facilities within the harbor area, and an assessment of current safety issues.
- **Tug Escort/Tug Assist.** A description of the usage of tug escorts in the harbor, including a procedure for a case-by-case determination of need, based on specific criteria.
- **Vessel Traffic Service.** A description of the San Diego Marine Information Systems for the harbor area.
- **Bridge Management Requirements.** An assessment of the physical limitations affecting vertical and horizontal clearances.
- **Competitive Aspects.** An identification and discussion of the economic impacts of implementing the provisions of the plan.
- **Project Funding.**
- **Enforcement.** An analysis of enforcement, and suggested mechanisms to ensure that the provisions of the plan are fully and uniformly enforced with regularity.
- **Harbor Safety Committee Recommendations and Accomplishments.** Includes Recommendations and actions taken to implement recommendations.
- **Implementation.** Provides an overview of implementation avenues for the recommendations contained in the Harbor Safety Plan.
- **Applicable Regulations and Guidelines.** Includes Underkeel Clearance Guidelines, Non-Tank Oil Spill Contingency Plan regulations, and Tug Escort regulations.
- **Miscellaneous.** Pilotage Evaluation Report, Ballast Water Regulations, Limited Visibility Guidelines, and Underwater Pipelines.

4.6.4 Project Impact Analysis

4.6.4.1 Methodology

The proposed new fireworks display events would occur adjacent to or in the waters of San Diego Bay along the National City and Chula Vista Bayfronts; therefore, these activities could result in potential impacts on the ambient water quality of the Bay. Potential impacts on surface water quality include: (1) activities associated with the setup, deployment, and demobilization of fireworks launch features (e.g., barges and tugs); (2) residual fireworks-related chemicals falling on surface waters; and (3) discharge of paper and other debris items that may fall into surface waters

during the launch and detonation operations. Impacts of the proposed new fireworks display events on surface water quality were analyzed using available information on potential existing sources of pollution and water quality conditions in the project study area. These conditions were then compared to potential project-related sources of pollution during proposed new fireworks display events, such as combustion residue, airborne particulates, chemical pollutants, and debris such as paper, cardboard, wires, fuses, and plastic. Because fireworks display events do not currently occur along the National City and Chula Vista Bayfronts, no water quality data could be collected to assess the potential water quality impacts associated with these proposed new displays. However, the existing Big Bay Boom and SeaWorld fireworks display events monitoring programs have both conducted post-event receiving water monitoring in coastal water bodies. This water quality monitoring provides the most relevant information to assess potential effects of fireworks on surface waters in the San Diego Bay region. Therefore, to understand the potential water quality impacts associated with the proposed new fireworks display events, the results of the Big Bay Boom and SeaWorld water quality monitoring were utilized to identify potential project-related water quality impacts. Additionally, information was gathered by conducting literature searches and contacting SDRWQCB.

Potential water quality impacts associated with the proposed new fireworks display events were evaluated by comparing post-fireworks display event water quality monitoring results for the Big Bay Boom and SeaWorld fireworks display events to (1) ambient (pre-show) conditions, (2) applicable water quality standards, and (3) findings of scientific studies and monitoring programs. Receiving waters with CWA Section 303(d) impaired water quality were identified, along with the impairment (pollutant/stressor) and an indication of whether the impairment has the potential to be further affected by the proposed new fireworks display events.

4.6.4.2 Thresholds of Significance

The following significance criteria are based on Appendix G of the State CEQA Guidelines and provide the basis for determining the significance of impacts associated with hydrology and water quality resulting from implementation of the proposed project. The determination of whether a hydrology and water quality impact would be significant is based on the professional judgment of the District as Lead Agency supported by the recommendations of qualified personnel at ICF, all of which is based on the evidence in the administrative record.

Impacts are considered significant if the proposed project would result in any of the following.

1. Violate any water quality standards or waste discharge requirements.
2. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level.

3. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or siltation on or off site.
4. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site, substantially affecting the existing environment.
5. Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.
6. Otherwise substantially degrade existing water quality.
7. Place housing within a 100-year flood hazard area such that the existing environment is substantially affected.
8. Place within a 100-year flood hazard area structures that would impede or redirect flood flows such that the existing environment is substantially affected.
9. Expose people who are already present or structures already in existence to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.
10. Contribute to inundation by seiche, tsunami, or mudflow.

As discussed in the Initial Study/Environmental Checklist Section IX (Appendix A), Thresholds 2, 3, 4, and 7 through 10 are not included in the analysis below, as it was determined that the proposed project would not result in significant impacts related to groundwater supplies, drainage patterns, housing being placed within flood hazard areas, people or structures being exposed to harm or damage from flooding as a result of the failure of a levee or dam, or inundation by seiche, tsunami, and mudflow. Those conclusions and the rationale that supports them are summarized in Chapter 6, Section 6.4, *Effects Not Found to be Significant*. Therefore, only Thresholds 1, 5, and 6 are discussed in the impact analysis that follows.

4.6.4.3 Project Impacts and Mitigation Measures

Threshold 1: Implementation of the proposed project would not violate any water quality standards or waste discharge requirements.

Threshold 6: Implementation of the proposed project would otherwise substantially degrade water quality.

Impact Discussion

Potential Impacts of Fireworks Chemical Residues on Surface Waters

Water Quality Testing for Existing Fireworks Display Events

Fireworks display events conducted over water have the potential to affect surface water quality in a number of ways, including from chemical residues that might fall back into surface waters during

and after the fireworks display event and discharge of fireworks-related debris into surface waters from the launch sites and following shell detonation.

In general, most aerial firework shells typically consist of a cylindrical or spherical cartridge, usually constructed of paper, plastic, or cardboard, and may include some plastic or paper internal components used to compartmentalize chemicals within the shell. Most of the incendiary elements and shell casings burn up in the atmosphere; however, portions of the casings and some internal structural components and chemical residue fall back to the ground or receiving water bodies. A firework combustion residue is produced in the form of smoke, airborne particulates, chemical pollutants, and debris such as paper, plastic, cardboard, wires, and fuses. This combustion residue and unignited pyrotechnic material, including duds and misfires, can fall into surface waters. The results of studies that have analyzed the potential effects of existing fireworks display events on water quality within San Diego Bay, as well as other locations in the San Diego region and the United States, are detailed below.

Big Bay Boom Monitoring Program

While no water quality monitoring is required for the Big Bay Boom per the requirements of the General Permit for a Category 2 discharger (see Section 4.6.3, *Applicable Laws and Regulations*), voluntary pre- and post-show water quality monitoring has been conducted annually for the Big Bay Boom fireworks display event since 2013 by the fireworks organizer. For consistency, the Big Bay Boom water quality monitoring program has used the same list of fireworks-related chemicals of concern identified for Category 1 dischargers in the General Permit.⁵ The 2013–2015 monitoring efforts included collection of post-event samples after the Fire Marshal gave the “all-clear” signal (typically 20 minutes following the fireworks display event). For the 2016 monitoring program, pump systems were deployed directly on the downwind side of two fireworks barges that collected samples immediately (within 1 to 2 minutes) following the end of the fireworks display event.

In each annual Big Bay Boom monitoring report, analytical data were evaluated as follows: (1) results were compared with CTR ambient water quality criteria, (2) a comparison was made between the pre- and post-event concentration levels, and (3) the chemistry results were evaluated based on the distance from the fireworks barge. Table 4.6-5 shows the chemicals that were analyzed for San Diego Bay, and Table 4.6-6 presents an overview of the water quality monitoring program for the Big Bay Boom.

⁵ Under the General Permit, all Category 1 dischargers are required to prepare a Water and Sediment Monitoring Plan and conduct comprehensive water and sediment quality monitoring. For fireworks display events, SeaWorld is currently the only Category 1 discharger in the San Diego region. SeaWorld is required to conduct a higher level of monitoring and reporting than Category 2 dischargers because of the high number of events they conduct each year. Category 2 entities are all other dischargers of fireworks of any net explosive weight from a single event or multiple events to any surface water of the United States within the San Diego region.

Table 4.6-5. Water Chemistry Analytical Testing for San Diego Bay

Conventional, Nutrient	Semivolatile Organic Compound	Metals (Total and Dissolved)
Total phosphorous, total perchlorate	Bis-phthalate	Arsenic, barium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, potassium, selenium, silver, thallium, tin, titanium, vanadium, zinc

Table 4.6-6. Big Bay Boom Monitoring Program Elements (2013–2016)

Monitoring Year	Monitoring Program Overview
2013	<ul style="list-style-type: none"> • North Embarcadero site only • Samples collected 300 feet, 600 feet, and 900 feet downwind of fireworks launch barge in the upper 1 meter of water • Samples collected as soon as possible after receiving the “all clear” from the Fire Marshal (referred to as time 0), and at 30 minutes and 60 minutes
2014	<ul style="list-style-type: none"> • Harbor Island site only • Samples collected 0 feet, 25 feet, and 50 feet, and downwind of fireworks launch barge in the upper 1 meter of water • Samples collected as soon as possible after receiving the “all clear” from the Fire Marshal (referred to as time 0)
2015	<ul style="list-style-type: none"> • Harbor Island site only • Samples collected 0 feet, 25 feet, and 50 feet, downwind of the fireworks launch barge in the upper 1 meter of water • Samples collected as soon as possible after receiving the “all clear” from the Fire Marshal (referred to as time 0)
2016	<ul style="list-style-type: none"> • North Embarcadero and South Embarcadero sites (two barges) • Samples collected 0 feet, 25 feet, and 50 feet downwind at both fireworks barges in the upper 1 meter of water • Two 0-foot samples collected adjacent to both barges immediately following the fireworks display event • 25-foot and 50-foot samples collected at both barge sites as soon as possible after receiving the “all clear” from the Fire Marshal

Source: Appendix G

The following provides an overview of the voluntary Big Bay Boom water quality monitoring efforts from 2013 through 2016. Figures 4.6-2 through 4.6-5 compare pre-fireworks display event versus post-fireworks display event chemistry results for the 2013–2016 monitoring events, respectively. These figures present the analytical results for six chemical analytes (copper, zinc, mercury, molybdenum, phosphorous, and perchlorate) of the 21 analytes tested (results for all chemical tests are contained in Appendix G). These six analytes were selected because of their importance as contaminants of concern in San Diego Bay (i.e., CWA Section 303(d) listings or TMDLs), a heightened level of concern identified in the General Permit (i.e., perchlorate analyses), or, in the case of molybdenum, the lack of other local sources that may help confirm an increased concentration level

due to fireworks residues. In addition, the other chemical analytes that were tested but not analyzed in this section were not detected at levels that warrant further discussion/analysis.

2013 Monitoring Program

The 2013 water quality evaluation found limited relationships between the pre- and post-show results based on distance from the fireworks barge as well as time following the fireworks show in that there were no apparent trends or cause and effect relationships across analytes for (1) different time periods or (2) distances from the deployment barge (Figure 4.6-2). The average concentration levels for copper, zinc, and mercury observed at all three distances from the fireworks barge were below ambient water quality criteria levels of concerns. The metals measured with no available criteria levels (e.g., molybdenum) were found to be at similar concentrations in the water column in pre-show and post-show samples. This was also found to be the case for phosphorus. One chemical of concern, perchlorate, was detected at low levels at all three sampling locations; however, it was also detected in the pre-show sample in 2013.

2014 Monitoring Program

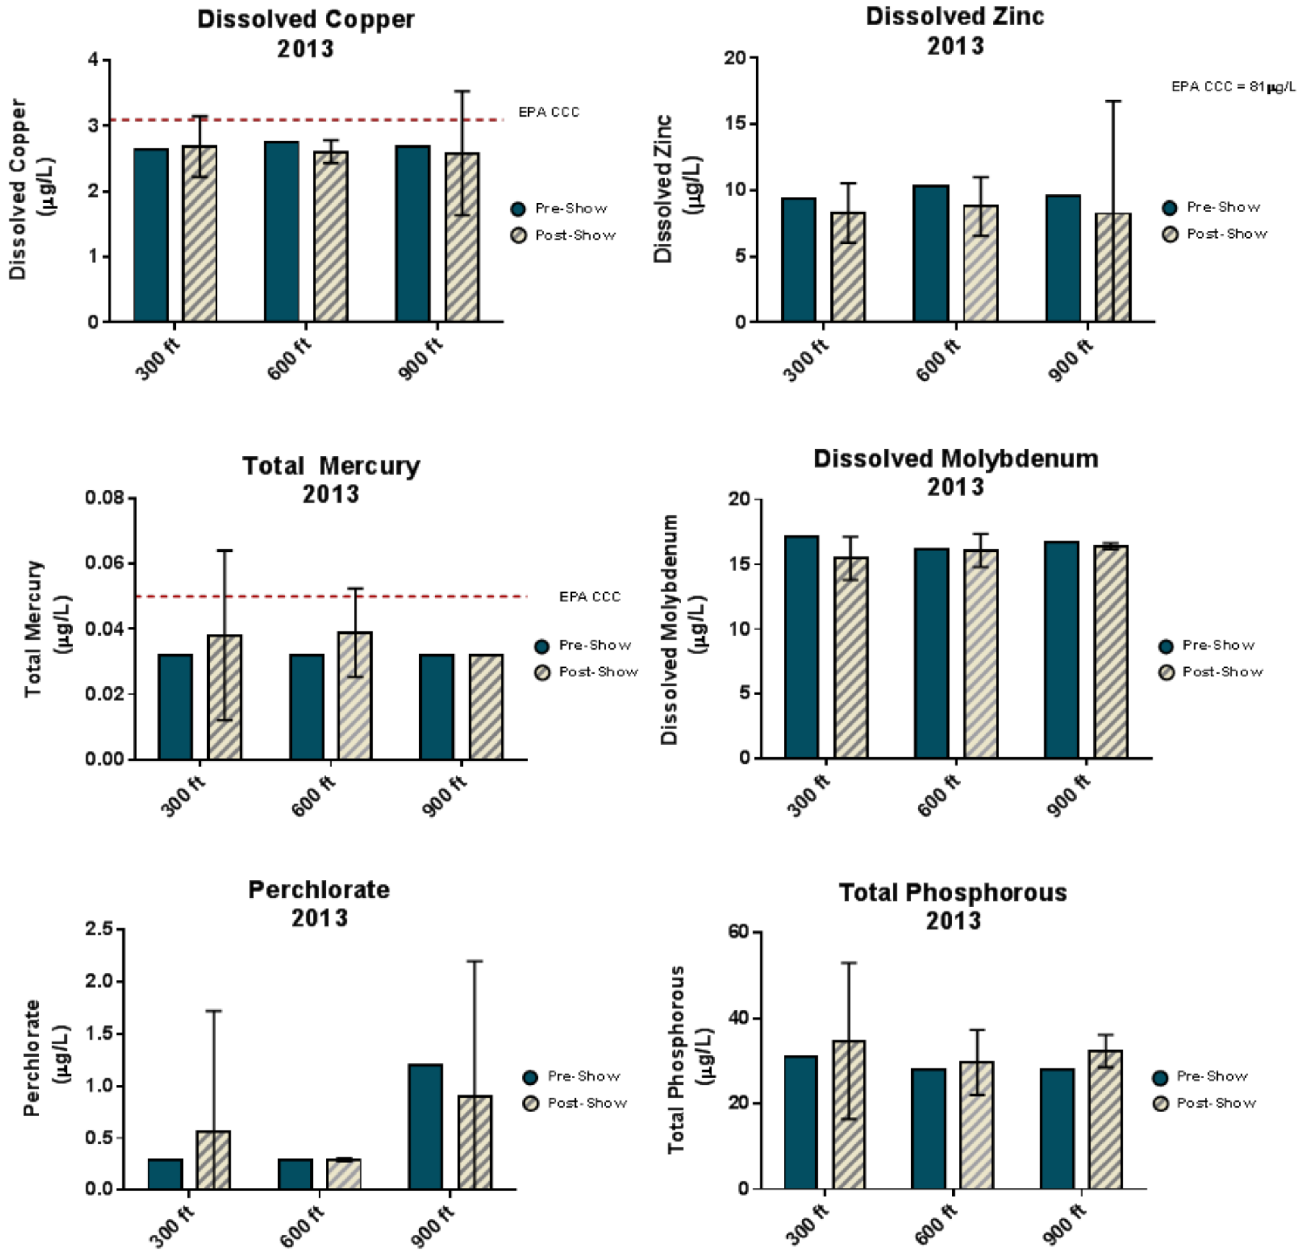

The 2014 Big Bay Boom monitoring showed no clear relationships between the pre- and post-show results based on distance from the fireworks barge (Figure 4.6-3), except for perchlorate. The concentration levels for copper, zinc, and mercury observed at all three distances from the fireworks barge were below ambient water quality criteria levels of concerns. The metals measured with no available criteria levels (e.g., molybdenum) were found to be at similar concentrations in the water column in pre-show and post-show samples. This was also found to be the case for phosphorus during the 2014 monitoring event.

Perchlorate showed an increase in both the 25-foot and 50-foot collection sites compared with the pre-fireworks display event baseline. While perchlorate was detected in some post-fireworks display event samples, the concentrations observed were very low (slightly above the method detection limit of 0.29 micrograms per liter [$\mu\text{g/L}$]). Although there is no CTR criterion for perchlorate, the highest concentration of perchlorate detected (1.4 $\mu\text{g/L}$) is orders of magnitude lower than the 10 to 100 milligrams per liter (mg/L) range found to cause sublethal effects on freshwater fish in laboratory tests.

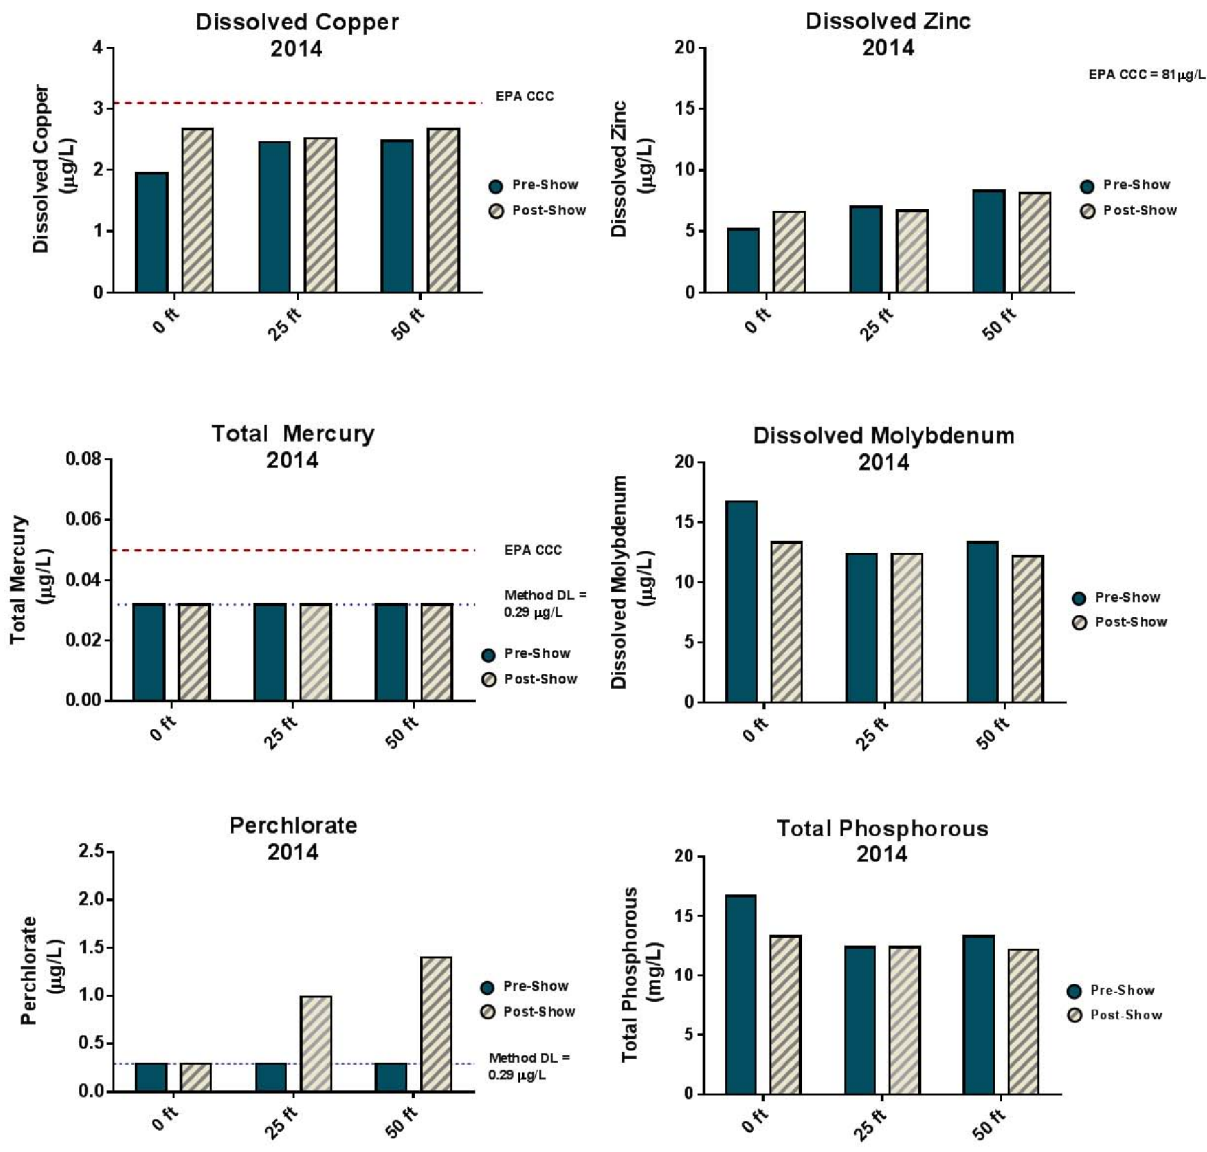

2015 Monitoring Program

Limited relationships between the pre- and post-show results based on distance from the fireworks barge as well as time following the fireworks show were observed during the 2015 monitoring event (Figure 4.6-4). Except for copper and mercury, all constituent concentrations were below CTR criteria levels or were similar to pre-fireworks display event baseline levels. Additionally, concentrations of both trace metals were in fact slightly greater in pre-show versus post-show samples. Although copper and mercury concentrations exceeded chronic CTR criteria, there was no pre- or post-fireworks display event trend indicating that the fireworks display event was responsible for the observed exceedances. Furthermore, concentrations were well below acute CTR criteria maximum concentration levels. The metals measured with no available criteria levels (e.g., molybdenum) were found to be at similar concentrations in the water column in pre-show and post-show samples. This was also found to be the case for phosphorus.

Unlike 2014, perchlorate levels were all non-detect in 2015 compared to the established method detection limit. It should be noted, however, that the method detection limit in 2014 (0.29 $\mu\text{g/L}$) was

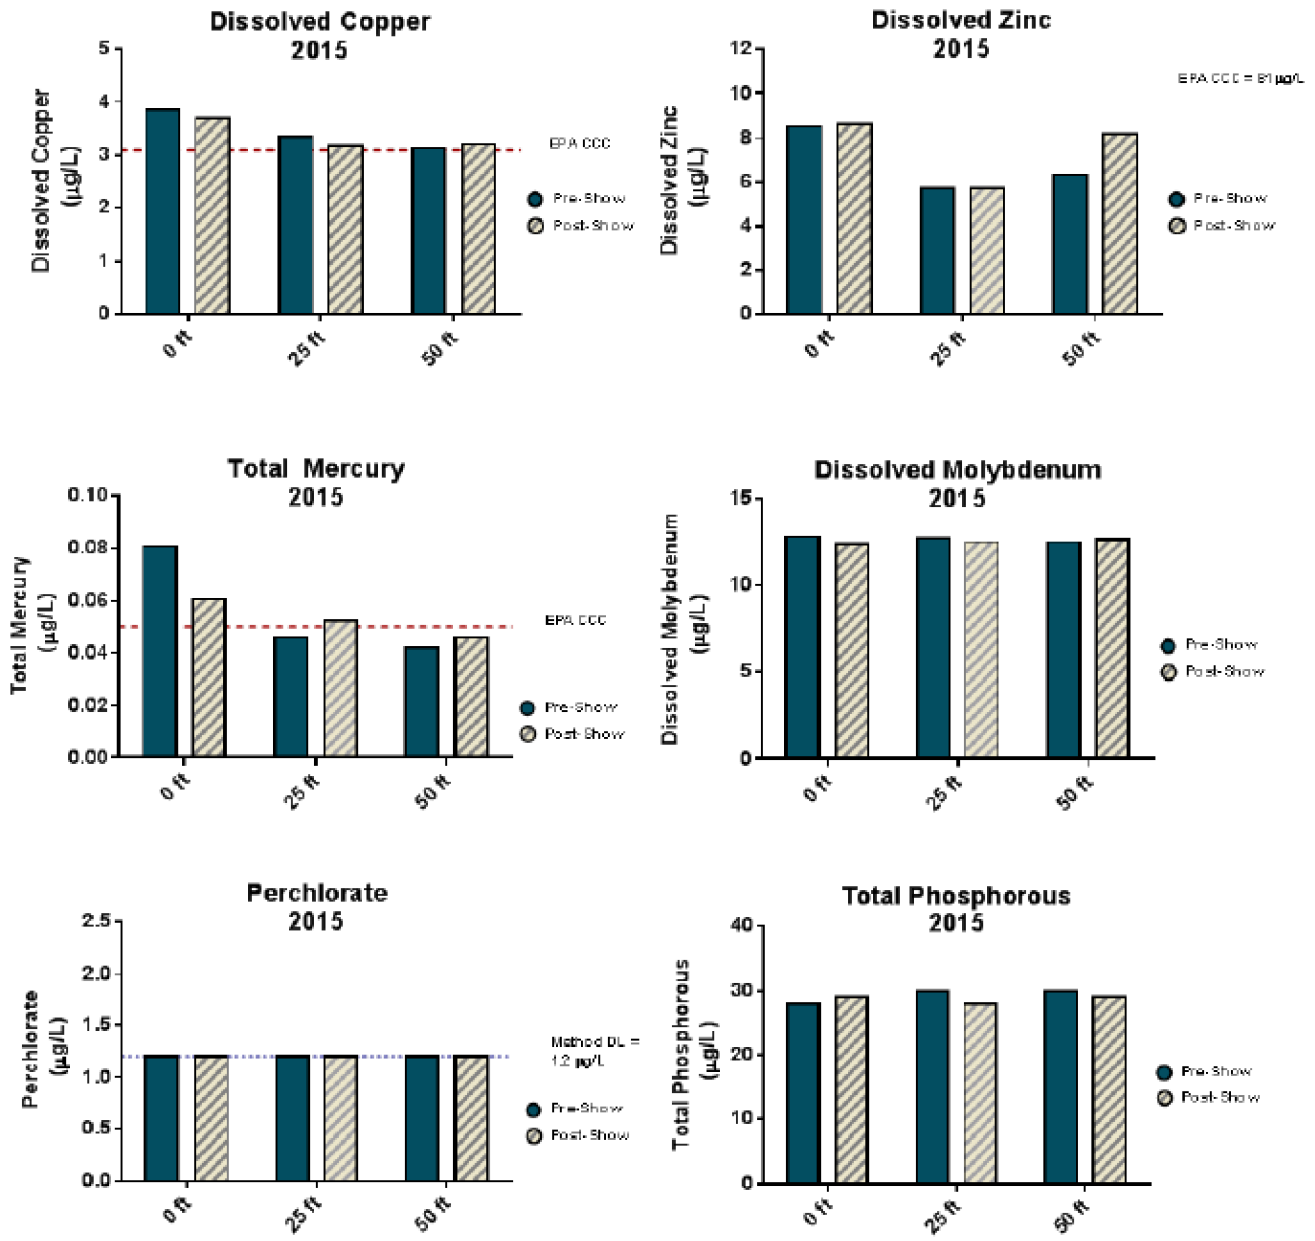

Mean values ±95 percent confidence intervals for post-show analyses (n=3; time 0, 30 min. post-show, and 60 min. post-show). Bars shown for the pre-show samples represent a single value at each sampling location.

Bars represent results for a single value at each sampling location.

San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events EIR

Bars represent mean results for duplicate values at each sampling location; one sample from each of the two monitored barges. Error bars represent the range of values observed at the two barges.

Figure 4.6-5
 Select Water Quality Measurements for the Big Bay Boom in 2016 Pre- and Post-Show
 San Diego Bay and Imperial Beach Oceanfront Fireworks Display Events EIR

lower than the 2015 detection limit (1.2 µg/L).⁶ The higher detection limit in 2015 may be the reason that the results were non-detect.

2016 Monitoring Program

Limited relationships between the pre- and post-show results—based on distance from the fireworks barge as well as time following the fireworks show—in metal levels were observed in the Big Bay Boom 2016 monitoring data (Figure 4.6-5). Dissolved copper was the only metal detected at a concentration that exceeded a CTR water quality criterion; however, it did so in both the pre-fireworks display event and post-fireworks display event samples. The metals measured with no available criteria levels (e.g., molybdenum) were found to be at similar concentrations in the water column in pre-show and post-show samples. Phosphorus levels were similar in pre-show and post-show samples collected at 0 feet and 50 feet from the fireworks barge. The post-show phosphorus level in the 25-foot sample was slightly higher compared to the pre-show sample, but only slightly above the detection limit.

Low levels of perchlorate were detected in most pre-fireworks display event and post-fireworks display event samples collected in 2016. The post-fireworks display event samples collected adjacent to the fireworks barges appear to show increased perchlorate levels compared with pre-fireworks display event levels. The maximum post-fireworks display perchlorate concentration observed was 6.4 µg/L, which is well below the levels that have been shown by researchers to result in toxic effects on aquatic organisms in laboratory toxicity tests (10 to 100 mg/L).

Big Bay Boom Monitoring Summary

Overall, chemical levels observed during the Big Bay Boom monitoring events have shown limited changes in water quality with regard to collection time or distance from the fireworks barge. The one exception is perchlorate, which has shown a slight pattern of increased concentration in some post-fireworks display event samples; however, the results have been variable. The post-show perchlorate levels since 2013 ranged from non-detect to a maximum concentration of approximately 6.4 µg/L in 2016 (at time 0 immediately adjacent to one of the barges). The concentrations were generally in the 1–2 µg/L range over this monitoring period. There is no water quality CTR criterion for perchlorate in surface waters, and perchlorate results detected in the Big Bay Boom monitoring programs are considerably lower compared with the levels that have produced effects in toxicity tests (10 to 100 mg/L).

With regard to the other chemicals analyzed (metals and organics), there were no discernible patterns observed with relation to the sampling distance from the fireworks barge or the collection time following the existing Big Bay Boom fireworks display events.

SeaWorld Monitoring Program

SeaWorld is classified as a Category 1 discharger under the General Permit. As such, SeaWorld was required to prepare a Water and Sediment Monitoring Plan and conduct comprehensive water and sediment quality monitoring of its launch site adjacent to Fiesta Island on Mission Bay. The nightly firework display events at SeaWorld are generally performed during the summer months, between

⁶ The analytical laboratory reported the following with regard to the 2015 perchlorate detection limits, “Due to matrix interference, a 40x dilution was reported for Perchlorate for seven samples. However, results were non-detect for all samples at lower dilutions but QA/QC criteria were not met due to the internal standard failing.” The laboratory was able to achieve lower detection limits during the other three sampling events.

April and September. Since 1985, a total of approximately 3,800 fireworks events have been performed. Under the current SeaWorld Master Plan update, approved by the California Coastal Commission in 2001, SeaWorld may present up to 150 fireworks events per year, with an anticipated average between 110 and 120 events per year.

Because of SeaWorld's history of fireworks display events dating back for decades, the large number of fireworks display events conducted on a yearly basis, and the fact that the fireworks are barge-launched in the same general location in a shallow, enclosed basin with reduced circulation, SeaWorld fireworks display events likely represent the maximum firework pollutant loading conditions and cumulative effects (i.e., the "worst-case scenario") in the San Diego region, including the Pacific Ocean, with respect to potential impacts of fireworks on water and sediment quality.

SeaWorld has performed extensive water and sediment quality monitoring at its launch site in Mission Bay since 2011. It began more intensive monitoring of the fireworks fallout zone in 2008. The enhanced monitoring program includes sediment chemistry and toxicity analyses, and benthic community conditions (Appendix G). Recent sediment testing has been conducted using the multiple lines of evidence approach outlined in the SWRCB California Sediment Quality Objectives program.

A general summary of SeaWorld's monitoring results is presented below.

- Except for perchlorate and bis-phthalate, results of water chemistry sampling of regular SeaWorld events to date have shown little evidence of pollutants within the receiving water column at levels above applicable water quality criteria or detected reference site levels.
- Based on water quality data obtained to date, it is unlikely that single fireworks display events of a size smaller than SeaWorld's Fourth of July and Labor Day fireworks display events would cause exceedances of applicable water quality criteria in the water column of receiving waters.
- SeaWorld's sediment monitoring in Mission Bay found increased metal levels within the fireworks zone when compared with a reference site (metals included barium, chromium, cobalt, copper, molybdenum, potassium, selenium, silver, thallium, titanium, and vanadium). Sediment grain size and concentration analysis found correlations for barium, cobalt, chromium, copper, titanium, and vanadium. The data from sediment testing indicate an increase over time of these specific chemicals within the sediment in the fireworks fallout area when compared to the reference site sediments.

In addition, beginning in 2008, SeaWorld has been conducting a more comprehensive assessment of the aquatic environment near its launch site by Fiesta Island in Mission Bay to identify any potential effects attributable to fireworks display events. The assessment has included amphipod and polychaete toxicity tests and benthic infaunal community analyses.
