Subject: Results from the 2022 and 2023 Winter Monitoring Events for the SIYB Dissolved Copper TMDL

Introduction

This technical memorandum presents the results from the winter water quality monitoring events conducted in Shelter Island Yacht Basin (SIYB) in March 2022 and January 2023. These winter monitoring events were conducted to supplement the annual SIYB Dissolved Copper Total Maximum Daily Load (TMDL) compliance monitoring, which occurs in the summer. The purpose of the winter monitoring was to understand the seasonal variability of dissolved copper levels in SIYB and at the reference stations during a period of cooler water temperatures, and lower frequencies of hull cleaning and vessel usage relative to the summer months.

Sampling and Analysis Methods

The 2022 and 2023 SIYB TMDL winter monitoring events were conducted on March 22, 2022 and January 25, 2023, respectively¹. During each monitoring event, field water quality readings and surface water samples (1-meter below the surface) were collected from six stations within SIYB (SIYB-1 at the head of the basin through SIYB-6 at the mouth of the basin) and two reference stations in the main channel of San Diego Bay (SIYB-REF-1 and SIYB-REF-2). In addition, quality control samples were collected, which included an independent replicate sample at Station SIYB-1 (SIYB-1 [Rep]), a field blank, and an equipment rinsate blank. Sampling was conducted in accordance with procedures described in the Monitoring Plan (Wood Environment & Infrastructure Solutions, Inc. [Wood], 2021a and 2022a) and Quality Assurance Project Plan (QAPP; Wood, 2021b and 2022b). Sampling locations and methods were also consistent with those employed during the annual summer TMDL compliance monitoring. Field data sheets from each event, which include field measurements and field notes, are provided in Appendix A.

After collection, each water sample was sent to Weck Laboratories to be analyzed for dissolved and total copper and zinc, dissolved organic carbon (DOC), total organic carbon (TOC), and total suspended solids (TSS). Samples were analyzed following certified United States Environmental Protection Agency (USEPA) methods or Standard Methods (SM) in accordance with the Monitoring Plan and QAPP. Analytical methods, method detection limits, and reporting limits for each analysis are provided in the analytical chemistry laboratory reports in Appendix B.

A subset of samples (SIYB-1 through SIYB-6 and SIYB-REF-1) were also sent to the WSP Environmental Toxicology Laboratory (formerly known as the Wood Aquatic Toxicology Laboratory) for toxicity testing, as follows:

¹ Monitoring dates were selected based on tides (i.e., sampling to bracket slack high tide) and weather (i.e., <0.1-inch of rain and minimal flow in the 72 hours prior to sampling) in accordance with the SIYB TMDL Monitoring Plan (Wood, 2021a and 2022a). In addition, the 2022 winter monitoring event was not conducted until the end of March to allow sufficient time for dissolved copper levels to return to baseline conditions following completion of the In-Water Hull Cleaning Pause Study.

1. For the 2022 winter monitoring event, toxicity tests consisted of (1) a 48-hour chronic bioassay test using mussel larvae (*Mytilus galloprovincialis*) and (2) a 96-hour acute bioassay test using Pacific topsmelt (*Atherinops affinis*).
2. For the 2023 winter monitoring event, the 48-hour chronic bioassay test was conducted using mussel larvae (*Mytilus galloprovincialis*), consistent with all prior monitoring events. However, due to the many challenges experienced using Pacific topsmelt for toxicity testing in previous monitoring years (e.g., limited organism supply and availability, poor organism health and sensitivity), the acute bioassay test for the 2023 winter monitoring event was performed using the inland silverside (*Menidia beryllina*).²

As a follow-up to the Phase I toxicity identification evaluation (TIE) performed for Station SIYB-1 in August 2022, additional toxicant identification and confirmation (Phase II/III TIE) procedures, including a copper spiking study, were also conducted on the SIYB-1 sample collected during the 2023 winter monitoring event.

Toxicity tests were conducted in accordance with procedures described in USEPA 1995 and 2002. Test methods and specifications for each bioassay are included in the toxicity laboratory reports in Appendix C and the technical memorandum summarizing TIE efforts in Appendix D.

Monitoring Results – March 22, 2022

Chemistry

All chemistry results for the 2022 winter monitoring event are summarized in Table 1 and included in the analytical chemistry laboratory report in Appendix B-1. During the March 2022 event, dissolved copper concentrations in SIYB ranged from 2.6 µg/L at the outermost station (SIYB-6) to 11 µg/L at the innermost station (SIYB-1). Five of the six stations in SIYB had dissolved copper concentrations exceeding the USEPA National Recommended Water Quality Criterion Continuous Concentration (CCC) water quality objective (3.1 µg/L; Table 1). The 2022 winter basin-wide average dissolved copper concentration was 5.7 µg/L.

Chronic Toxicity

Results of the chronic mussel development tests conducted for the 2022 winter monitoring event are summarized in Table 2 and Appendix C-1. The greatest effect to mussel development was observed in the unfiltered and undiluted sample (i.e., 100% concentration) from Station SIYB-1, with a 12% decrease in the combined survival and normal mussel development endpoint relative to the laboratory control. While the effect was statistically significant using the USEPA 1995 traditional flow-chart statistical methods (i.e., Dunnett multiple comparison test), the effect was not significant using the Test of Significant Toxicity (TST) approach (USEPA, 2010). No statistically significant effects to mussel development were observed in any of the other unfiltered or 1.2-micrometer (µm) filtered samples (Table 2).

Acute Toxicity

Results of the acute topsmelt survival tests conducted for the 2022 winter monitoring event are summarized in Table 3 and Appendix C-1. There were no statistically significant effects to Pacific topsmelt survival observed in any samples tested, indicating that surface water samples collected in SIYB and at the reference station (SIYB-REF-1) were not acutely toxic to Pacific topsmelt.

² In previous monitoring years, there have been many challenges with using Pacific topsmelt for toxicity testing including limited test organism supply and availability, as well as poor organism health and sensitivity due to difficulties culturing these organisms in a laboratory setting. The inland silverside (*Menidia beryllina*) is a USEPA-approved alternate test species for Pacific topsmelt that is commonly used in environmental compliance testing nationwide (40 CFR Part 136).

Table 1. Chemistry Results for SIYB Surface Waters – March 22, 2022 Event

Station	Dissolved Copper (µg/L)	Total Copper (µg/L)	Dissolved Zinc (µg/L)	Total Zinc (µg/L)	DOC (mg/L)	TOC (mg/L)	TSS (mg/L)
SIYB-1	11	12	30	31	1.0	1.2	3 J
SIYB-2	5.4	6.1	15	17	0.91	1.0	7
SIYB-3	5.7	6.5	16	17	0.91	1.1	6
SIYB-4	5.3	6.0	16	17	1.0	1.1	6
SIYB-5	4.3	4.8	12	13	0.96	1.4	6
SIYB-6	2.6	3.0	8.2	8.7	0.92	1.1	4 J
SIYB-REF-1	2.2	2.5	6.9	7.6	0.91	0.95	10
SIYB-REF-2	2.5	2.8	7.7	8.4	0.95	0.97	9

Notes:

Values in **bold** are above the USEPA National Recommended Water Quality Criterion Continuous Concentration (CCC) for dissolved copper of 3.1 µg/L in marine waters. No values were above the CCC for dissolved zinc of 81 µg/L.

µg/L = microgram(s) per liter; DOC = dissolved organic carbon; J = estimated value; mg/L = milligram(s) per liter; REF = reference; SIYB = Shelter Island Yacht Basin; TOC = total organic carbon; TSS = total suspended solids; USEPA = United States Environmental Protection Agency

Monitoring Results – January 25, 2023

Chemistry

All chemistry results for the 2023 winter monitoring event are summarized in Table 4 and included in the analytical chemistry laboratory report in Appendix B-2. During the 2023 winter monitoring event, dissolved copper concentrations in SIYB ranged from 2.3 µg/L at the outermost station (SIYB-6) to 7.7 µg/L at the innermost station (SIYB-1). Five of the six stations in SIYB had dissolved copper concentrations exceeding the CCC water quality objective (3.1 µg/L; Table 4). The 2023 winter basin-wide average dissolved copper concentration was 5.2 µg/L.

Chronic Toxicity

Results of the chronic mussel development tests conducted for the 2023 winter monitoring event are summarized in Table 5 and Appendix C-2. Using the USEPA 1995 traditional flow-chart statistical methods (i.e., Dunnett multiple comparison test), significant effects to mussel development were observed in unfiltered and undiluted samples from Stations SIYB-1 (9.7% effect) and SIYB-2 (9.3% effect). However, these effects were not significant using the TST approach (USEPA, 2010).

Interestingly, the greatest effect to mussel development was observed in the undiluted sample from Station SIYB-1 that was filtered through a 1.2-µm mesh screen (28% effect). This effect was statistically significant using both the USEPA 1995 methods and the TST approach. During each chronic bioassay test performed for the SIYB TMDL, samples are filtered to remove potentially harmful native algae that might interfere with test organism performance; however, during the January 2023 event, the toxicity of the sample from Station SIYB-1 increased after filtration for unknown reasons. Further testing would be required to evaluate potential causes of the increased toxicity observed in the filtered sample.

No statistically significant effects to mussel development were observed in any of the other unfiltered or filtered samples collected in SIYB or at the reference station during the 2023 winter monitoring event (Table 5).

Toxicity Identification Evaluation for Chronic Toxicity at Station SIYB-1

Because chronic toxicity has been observed at Station SIYB-1 in almost every monitoring event during the SIYB TMDL Monitoring Program, a Phase I TIE was conducted during the August 2022

event to identify the likely class(es) of contaminants causing toxicity. Results of the Phase I TIE indicated that the observed toxicity was likely due to a cationic trace metal (WSP, 2023). Additional toxicant identification and confirmation (Phase II/III TIE) procedures were conducted on the SIYB-1 sample collected during the 2023 winter monitoring event.

Based on the results of the TIEs conducted in August 2022 and January 2023, multiple lines of evidence indicate that dissolved copper is a principal cause of toxicity to mussel embryos exposed to samples from Station SIYB-1. Key observations supporting this conclusion are as follows:

1. The addition of ethylenediaminetetraacetic acid (EDTA) during both the summer 2022 and winter 2023 monitoring events successfully removed toxicity in water from SIYB-1. This treatment is highly specific at chelating and thus reducing the toxicity of cationic trace metals, including copper.
2. Concentrations of dissolved copper are consistently elevated at SIYB-1 above values found to cause toxicity to mussel embryos as reported in the literature and based on results from the TMDL Monitoring Program.
3. Addition of copper to clean laboratory water and site water from SIYB-1 (Phase II/III TIE) resulted in comparable dose response curves and median effect concentration (EC_{50}) values. If another toxicant was present, these curves and EC_{50} values would be expected to diverge from each other.
4. Toxicity of water from SIYB is consistently observed above a threshold of approximately 8 $\mu\text{g/L}$. The dissolved copper measurement of 7.7 $\mu\text{g/L}$ at SIYB-1 during the winter 2023 sampling event is just below this threshold, thus likely explaining why there was only subtle chronic toxicity observed during this event.
5. The statistical correlation between dissolved copper and % effect on mussel embryo development over time is also strong and statistically significant.

Detailed methods and results from the TIE efforts conducted in January 2023 are presented in a technical memorandum in Appendix D.

Acute Toxicity

Results of the acute inland silverside survival tests conducted for the 2023 winter monitoring event are summarized in Table 6 and in Appendix C-2. There were no statistically significant effects to inland silverside survival observed in any samples tested, indicating that surface water samples collected in SIYB and at the reference station (SIYB-REF-1) were not acutely toxic to inland silversides.

Table 4. Chemistry Results for SIYB Surface Waters – January 25, 2023 Event

Station	Dissolved Copper (µg/L)	Total Copper (µg/L)	Dissolved Zinc (µg/L)	Total Zinc (µg/L)	DOC (mg/L)	TOC (mg/L)	TSS (mg/L)
SIYB-1	7.7	7.3	26	23	1.3	1.2	9

Quality Assurance and Quality Control Summary

Rigorous quality assurance (QA) and quality control (QC) procedures were implemented from the sample collection stage through the analysis and reporting stages, as described in the QAPP (Wood, 2021b and 2022b). Field QA checklists were used during each monitoring event to ensure that sample collection procedures were consistent at each station and all required field data were recorded properly (see Appendix A). Following sample collection, proper chain-of-custody (COC) procedures were used to identify sample analyses to be conducted, as well as document sample possession, transport, and condition upon receipt at the laboratory. COC forms are included with the laboratory reports in Appendices B and C.

All samples collected during the 2022 and 2023 winter monitoring events were submitted to the appropriate laboratory on the day of collection (toxicity) or the day after collection (chemistry). Samples were received in good condition at Weck Laboratories and WSP Environmental Toxicology Laboratory and analyzed within the required holding times. Both laboratories are accredited by the National Environmental Laboratory Accreditation Program (NELAP) and/or California Environmental Laboratory Accreditation Program (ELAP) for all analyses performed at the time they were conducted.

Analytical and toxicity results from both monitoring events underwent a thorough QA/QC evaluation and were deemed acceptable for reporting purposes, with qualifications noted in the laboratory reports in Appendices B and C. A summary of this evaluation and any potential impacts to data quality is provided below.

Chemistry

- Low-level detections of metals, organic carbon, and TSS were measured in the field and equipment rinsate blanks for both monitoring events.
 - This may indicate trace contamination from the field, Niskin sampler, and/or laboratory. The low-level concentrations of these analytes were negligible relative to the sample concentrations measured within SIYB and therefore not considered a significant data bias.

- DOC and TOC spike recoveries were outside of performance-based recovery limits for the 2022 winter monitoring event.
 - Matrix spike and matrix spike duplicate recoveries were below the laboratory's performance-based recovery limits for DOC and TOC, indicating possible matrix interference. These results are consistent with historical concentrations and are reported as measured. The data are flagged to indicate possible matrix interference. The laboratory control samples were within acceptance limits, indicating that the laboratory was in control and the data is acceptable.
- Dissolved zinc concentrations were slightly higher than the corresponding total zinc concentrations in several samples collected during the 2023 winter monitoring event.
 - Review of the method blank, equipment rinsate blank, and field blank results for zinc did not indicate any significant contamination that may have resulted during field filtration, and the corresponding dissolved copper analytical sequence did not show the same trend. Deviations likely resulted from slight differences in calibration when the samples were analyzed. These slight deviations are not considered significant enough to warrant resampling or retesting. The results were reported within acceptance criteria determined by the test method and standard operating procedure and therefore considered usable for their intended purposes and reported as provided by the laboratory.
- TSS was detected at low levels in method blanks analyzed for the 2023 winter monitoring event.
 - These low-level detections were estimated (i.e., below the reporting limit) and not considered a significant data bias.
- DOC values in several cases were higher than the TOC values reported for the same sample collected during the 2023 winter monitoring event.
 - Water samples for TOC and DOC analyses are dispensed to separate sample vials in the field, and laboratory analyses are conducted separately. Since the DOC and TOC are tested separately, they can have slight differences in calibration that can sometimes result in TOC levels being slightly lower than DOC levels. The magnitudes of these minor differences are in general agreement with results from previous events. Corresponding laboratory QA/QC samples met all QAPP limits, and concentrations measured in the associated laboratory blanks were non-detect. All results are considered usable for their intended data purposes and are reported as provided by the laboratory.

Raw analytical chemistry QC results and applicable data qualifiers are provided in the laboratory reports in Appendix B.

Toxicity

- Laboratory controls for the chronic mussel development tests conducted for the 2022 and 2023 winter monitoring events met the USEPA test acceptability criteria (TAC) of 50% or greater survival and 90% or greater proportion normal. All laboratory controls also met the ASTM TAC of 70% or greater for the combined survival and proportion normal endpoint. Chronic tests were performed in accordance with USEPA protocol guidelines, and no major deviations were required. All chronic mussel development test results from the 2022

and 2023 winter monitoring events were therefore considered valid and acceptable for reporting purposes.

- Acute toxicity tests conducted with Pacific topsmelt (winter 2022) and inland silversides (winter 2023) met the USEPA method TAC, with greater than 90% survival in the laboratory controls. Tests were performed in accordance with USEPA protocol guidelines, and no major deviations were required. All acute toxicity test results from the 2022 and 2023 winter monitoring events were therefore considered valid and acceptable for reporting purposes.
- Concurrent reference toxicant tests were conducted with both test organisms for the 2022 and 2023 winter monitoring events. All reference toxicant tests met the corresponding minimum TAC and were deemed valid. The calculated EC₅₀ values for the bivalve tests and median lethal effect concentration (LC₅₀) values for the Pacific topsmelt/inland silverside tests were within the acceptable range (i.e., within two standard deviations of the laboratory historical mean), indicating that the test organisms used during the 2022 and 2023 winter monitoring events were healthy and exhibited typical sensitivity to copper.

Detailed QA/QC summaries for the toxicity testing, including raw data and applicable qualifiers, are provided in each laboratory report in Appendix C.

FIELD SAMPLING QA CHECKLIST

Station Location: *5710 - ER*

Date/Time: *3/22/22 0745*

Mark each box with Y, N, or NA

PD = police dock
① = significant fuel slick around dock

Field Procedures

1. Station Occupation:

Vessel has been anchored (or tied off)	<i>Y</i>
Station GPS coordinates (approx. ± 3 m) and station identification verified and recorded	<i>P.D.</i>
Tide recorded	<i>NA</i>
Weather conditions recorded	<i>Y</i>
Surface water conditions (incl. currents) recorded (including H ₂ O clarity by Secchi disk)	<i>①</i>
Time of sampling recorded	<i>Y</i>
Water depth at sample site recorded	<i>NA</i>
General site observations recorded	<i>Y</i>
Check for boat cleaning operations in the area – if active, move to a new station	<i>not</i>

2. Sample Collection:

Field staff wearing fresh, powder-free nitrile gloves	<i>Y</i>
Vessel engine has been shut off for 3-5 minutes prior to sampling	<i>Y</i>
SWAMP protocols utilized to avoid sample contamination (i.e., clean hands/dirty hands technique)	<i>Y</i>
Sampling instrument given site water rinse prior to deployment	<i>NA</i>
Sample bottles correctly labeled and match the station identification	<i>Y</i>
Sample bottles correctly labeled with date and time in accordance with Table 10 in the QAPP	<i>Y</i>
Sample bottles are lab-certified, contaminant-free in accordance with Table 10 in the QAPP	<i>Y</i>
Sample bottles contain correct preservative in accordance with Table 10 in the QAPP	<i>Y</i>
Samples bottles and containers are the correct type in accordance with Table 10 in the QAPP	<i>Y</i>
Sampling depth delineated on sampling instrument with a clear marking (sampling must occur within 1 m of surface)	<i>NA</i>
Field water quality readings taken 3 times: when arriving on station, while water samples are collected and again while sample bottles are being filled	<i>NA</i>
Sampling depth recorded	<i>NA</i>
Sample bottles filled in the following order: metals, organics, toxicity	<i>Y</i>
Staff avoided contaminating samples at all times	<i>Y</i>
<u>Equipment rinsate blank</u> and field blank have been collected (if applicable)	<i>Y</i>
Site replicate (i.e., duplicate) collected (if applicable)	<i>NA</i>
PPE properly removed and disposed of upon station completion	<i>Y</i>

FIELD SAMPLING QA CHECKLIST

Station Location: SIYB-3

Date/Time: 3/22/22 1350

Mark each box with Y, N, or NA

Field Procedures

1. Station Occupation:

Vessel has been anchored (or tied off)	Y
Station GPS coordinates (approx. ± 3 m) and station identification verified and recorded	Y
Tide recorded	Y
Weather conditions recorded	Y
Surface water conditions (incl. currents) recorded (including H ₂ O clarity by Secchi disk)	Y
Time of sampling recorded	Y
Water depth at sample site recorded	Y
General site observations recorded	Y
Check for boat cleaning operations in the area – if active, move to a new station	Y

2. Sample Collection:

Field staff wearing fresh, powder-free nitrile gloves	Y
Vessel engine has been shut off for 3-5 minutes prior to sampling	Y
SWAMP protocols utilized to avoid sample contamination (i.e., clean hands/dirty hands technique)	Y
Sampling instrument given site water rinse prior to deployment	Y
Sample bottles correctly labeled and match the station identification	Y
Sample bottles correctly labeled with date and time in accordance with Table 10 in the QAPP	Y
Sample bottles are lab-certified, contaminant-free in accordance with Table 10 in the QAPP	Y
Sample bottles contain correct preservative in accordance with Table 10 in the QAPP	Y
Samples bottles and containers are the correct type in accordance with Table 10 in the QAPP	Y
Sampling depth delineated on sampling instrument with a clear marking (sampling must occur within 1 m of surface)	Y
Field water quality readings taken 3 times: when arriving on station, while water samples are collected and again while sample bottles are being filled	Y
Sampling depth recorded	Y
Sample bottles filled in the following order: metals, organics, toxicity	Y
Staff avoided contaminating samples at all times	Y
Equipment rinsate blank and field blank have been collected (if applicable)	NA
Site replicate (i.e., duplicate) collected (if applicable)	NA
PPE properly removed and disposed of upon station completion	Y

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Marisa Swiderski,

Enclosed are the results of analyses for samples received 3/23/22 with the Chain-of-Custody document. The samples were received in good condition, at 4.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
J	Estimated conc. detected <MRL and >MDL.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Marisa Swiderski,

Enclosed are the results of analyses for samples received 1/26/23 with the Chain-of-Custody document. The samples were received in good condition, at 4.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	filtered and acidified 01/25/2023
J	Estimated conc. detected <MRL and >MDL.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

**Results of Toxicity Testing for
Shelter Island Yacht Basin
Total Maximum Daily Load Monitoring**

**Sample Collection: March 22, 2022
Wood Project Number: 2015100111**

Submitted to:

**Wood Environment & Infrastructure Solutions, Inc.
9177 Sky Park Court
San Diego, CA 92123**

Testing Performed by:

wood.

**Wood Environment & Infrastructure Solutions, Inc.
Aquatic Toxicology Laboratory
4905 Morena Blvd., Suite 1304
San Diego, California 92117**

The Wood Aquatic Toxicology Laboratory is certified by the State of California Department of Health Services – Environmental Lab Accreditation Program (ELAP) under Certificate Number 3010. All test results were obtained following EPA Protocol guidelines and internal QA Program requirements. The data and test results have been reviewed and verified by the following laboratory representative:

Verified by: Steve Carlson Date: 5/24/22.

INTRODUCTION

Located in the Port of San Diego, Shelter Island Yacht Basin (SIYB) was issued an Investigative Order (R9-2011-0036, amended from Resolution No. R9-2005-0019) from the San Diego Regional Water Quality Control Board that requires annual monitoring for the SIYB Dissolved Copper Total Maximum Daily Load (TMDL) program. The monitoring program requires the performance of water column toxicity testing at 7 locations within the basin area. The 7 sample sites are tested for chronic toxicity with the mussel species *Mytilus galloprovincialis*, and for acute toxicity with the Pacific topsmelt species *Atherinops affinis*. Testing was conducted during March 2022 as part of a winter monitoring event.

Staff for Wood Environment & Infrastructure Solutions, Inc. (Wood) collected and delivered all 7 samples to Wood's in-house Aquatic Toxicology Laboratory located in San Diego, California. The samples were collected on March 22, 2022, and testing was initiated on March 23, 2022.

MATERIALS & METHODS

Sample Information

Client:	Port of San Diego
Project Name:	Shelter Island Yacht Basin Annual TMDL Monitoring
Monitoring Period:	March 2022 (winter event)
Sample IDs (7 sites):	SIYB-1, SIYB-2, SIYB-3, SIYB-4, SIYB-5, SIYB-6, and SIYB-REF-1
Sample Collection Date, Times:	3/22/2022, 09:30 – 15:50
Sample Receipt Date, Time:	3/22/2022, 17:40

Table 1. Water Quality Measured Upon Sample Receipt

Sample ID	Temp. (°C)	pH (units)	DO (mg/L)	Salinity (ppt)	Alkalinity (mg/L)	TRC (mg/L)
SIYB-1	13.7	7.74	7.9	32.9	124	<0.02
SIYB-2	13.0	7.74	8.0	32.8	123	0.03
SIYB-3	4.9	7.76	8.2	32.3	126	0.03
SIYB-4	1.9	7.77	8.6	32.5	122	<0.02
SIYB-5	3.9	7.77	8.2	32.5	121	<0.02
SIYB-6	2.2	7.76	8.2	32.5	123	<0.02
SIYB-REF-1	4.6	7.76	8.0	32.5	119	<0.02

DO = dissolved oxygen, TRC = total residual chlorine

Chronic Mussel Development Test Specifications

Test Period:	3/23/2022, 16:15 – 3/25/2022, 16:15
Test Organism:	<i>Mytilus galloprovincialis</i> (bivalve - mussel)
Test Organism Source:	Field-collected – Mission Bay (San Diego, CA)
Test Organism Age at start:	Fertilized embryos (<4 hours old)
Test Procedure:	48-hour embryo-larval development
Test Endpoint:	Combined survival & proportion normal (ASTM)
Test Concentrations:	Lab Control, 6.25, 12.5, 25, 50, and 100% sample
Treatment Concentrations:	Filter Control and 100% Filtered (1.2µm filter)
Lab Control/Dilution Water:	Natural seawater from the inlet at Scripps Institution of Oceanography (20-µm filtered)
Protocols Used:	EPA 1995 West Coast Manual (EPA/600/R-95/136); and ASTM 1998 (E 724-98).
EPA Test Acceptability Criteria:	Control: ≥50% survival; ≥90% proportion normal; and minimum significant difference (MSD) <25%
ASTM Test Acceptability Criteria:	Control: ≥70% combined survival/proportion normal
Reference Toxicant Test:	Lab Control, 2.5, 5.0, 10, 20, and 40 µg/L copper
Statistical Analysis Software:	CETIS™ v.1.9.3.0

Calculating the mussel test endpoint: Embryos within each test replicate are scored under a microscope by counting all larvae observed in the vial. Percent survival is evaluated by comparing the total number of larvae observed in each vial to an initial (time-zero) density count derived from 5 surrogate exposure chambers (vials) interspersed within the test and preserved immediately after adding embryos. Each larva is scored as normal or abnormal resulting in a second test endpoint; proportion normal. Normal development is exhibited by a clearly defined “D-shaped” shell with a clear straight line as a hinge, while abnormal development is exhibited by any clear abnormalities or differences to the normal “D-shaped” shell. This includes larva that have not fully developed a clear straight hinge (this is exhibited by a slightly curved hinge). Abnormal development was further enumerated to determine the magnitude of effect. The abnormal larvae were counted as having 1) a curved hinge, which indicates a moderate effect, or 2) more significant defects or abnormalities, which indicates a more severe effect. Examples of each of the larva (normal, abnormal with curved hinge, and abnormal with severe effects) are presented in Figure 1. A final combined surviving normal embryo endpoint is calculated by comparing the number of recovered normal embryos in each replicate test chamber to the average number of fertilized embryos counted in the time zero vials. Results for the combined

embryo development endpoint are presented herein in the main report, with supporting summaries and analyses of the individual percent survival and percent normal endpoints included in Appendix A

Figure 1. Images of Different Larva Development

1) Normal D-shape/straight hinge 2) Abnormal with curved hinge 3) Abnormal with severe effects

Pacific Topsmelt Acute Survival Test Specifications

Test Start Date, Time:	3/23/2022, 11:40 – 12:30
Test End Date, Time:	3/27/2022, 12:40 – 13:15
Test Organism:	<i>Atherinops affinis</i> (Pacific topsmelt)
Organism Source; Age at start:	Aquatic BioSystems (Fort Collins, CO); 14-days old
Test Procedure and Endpoint:	96-hour static-renewal acute survival test
Test Concentrations:	Lab Control, 25, 50, and 100% each sample
Replicates/Number of Organisms:	6 replicates/5 fish per replicate (30 fish/conc.)
Lab Control/Dilution Water:	Natural seawater collected from the inlet at Scripps Institution of Oceanography (34 ppt salinity)
USEPA Protocol:	EPA/821/R-02/012, 2002 Acute Manual
Test Acceptability Criteria:	≥90% mean survival in the control
Reference Toxicant Test:	Lab Control, 25, 50, 100, 200, and 400 µg/L copper
Statistical Software:	CETIS™ v1.9.3.0

RESULTS

Test results were evaluated using two USEPA methods of analysis. The results were first analyzed using the standard approach with multiple comparisons on a dilution series of concentrations to develop a No Observed Effect Concentration (NOEC). Then, the results were analyzed using the EPA Test of Significant Toxicity (TST) approach, as referenced in USEPA 2010. The TST approach applies a modified t-test that accounts for the statistical power of the test and the magnitude of the biological effect in determining the presence of toxicity. The instream waste concentration (IWC) is the 100% sample. The IWC is compared to the Control for statistical analysis. The TST results in a "Pass" if there are no biologically significant effects with the sample (non-toxic), or it will result in a "Fail" if there are significant effects (toxic).

Chronic Mussel Test:

For the chronic mussel development test, a standard dilution series of 6.25, 12.5, 25, 50, and 100% effluent was performed on the unfiltered sample from each of the 7 sites. For the chronic mussel test, the most significant effects were observed in site SIYB-1, where there was a 12% effect observed in the 100% undiluted sample compared to the Lab Control. This 12% effect was significant using the standard method of analysis, which resulted in a NOEC equal to the 50% concentration. However, using the TST method of analysis, this effect was not significant, resulting in a Pass with the TST. The other 6 sites all resulted in less than a 3.0% effect. Therefore, the other 6 sites resulted in a NOEC equal to 100% sample and a Pass with the TST. The chronic test results for the unfiltered samples are summarized and presented in Table 2.

The 100% concentration for each sample was also tested after filtering with a 1.2µm mesh screen to remove any potential algae or other native organisms. The 100% filtered sample was compared to a Filter Control (lab control water that received the same filtering treatment). The filtered samples produced similar results to the unfiltered samples. The most effect was observed in the SIYB-1 sample. However, the effect was only 6.9%, which is slightly less than the 12% effect observed in the unfiltered sample. The other 6 sites all resulted in less than a 3.0% effect. All 7 sites, though, resulted in a NOEC equal to 100% and a Pass with the TST. Summary results for the filtered samples are presented in Table 3.

As described in the Methods section, abnormal larvae were further enumerated as either having a curved hinge (moderate effect) or having clear abnormalities or defects (severe effect). During this round of testing, the frequency of curved hinges observed remained low as presented in Table 4. The greatest effect was observed in the 100% concentration of SIYB-1. There was 3.6% with curved hinges in the unfiltered 100% sample and 3.4% in the filtered 100% sample. All other sites and concentrations all had less than 1.0% with curved hinges.

All raw data and associated statistical analyses for the mussel tests are provided for reference in Appendix A.

Table 2. Summary of Chronic Mussel Test Results: Unfiltered Samples

Sample Concentration (%)	Sample ID / Combined Survival & Proportion Normal (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF-1
Lab Control	90.8	85.0	89.1	91.0	91.6	89.6	91.1
6.25	93.4	88.2	86.0	89.9	91.7	88.7	90.9
12.5	90.4	90.6	85.2	87.2	89.4	90.0	92.6
25	92.8	89.1	88.4	92.1	89.7	89.3	90.3
50	92.3	89.5	88.5	91.8	90.7	90.4	92.3
100	79.9	86.5	90.5	92.3	91.4	93.0	88.5
NOEC	50	100	100	100	100	100	100
EC ₅₀	>100	>100	>100	>100	>100	>100	>100
% Effect	12.0	-1.8	-1.6	-1.5	0.2	-3.8	2.9
TST Result	Pass	Pass	Pass	Pass	Pass	Pass	Pass

NOEC = the highest concentration tested that results in No Observed Effect

EC₅₀ = the concentration expected to cause a 50% adverse effect to the organisms

% Effect = the % effect of the IWC compared to control; a negative value indicates the IWC out-performed the control

TST = Test of Significant Toxicity; a "Pass" indicates no toxicity was observed with the sample

Table 3. Summary of Chronic Mussel Test Results: 1.2 µm Filtered Samples

Sample Concentration (%)	Sample ID / Combined Survival & Proportion Normal (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF-1
Filter Control	89.4	91.3	84.0	83.4	88.0	90.5	89.2
100 filtered	83.2	89.2	88.5	89.1	90.3	89.3	91.6
NOEC	100	100	100	100	100	100	100
% Effect	6.9	2.3	-5.4	-6.9	-2.6	1.4	-2.8
TST Result	Pass	Pass	Pass	Pass	Pass	Pass	Pass

NOEC = the highest concentration tested that results in No Observed Effect

% Effect = the % effect of the IWC compared to control; a negative value indicates the IWC out-performed the control

TST = Test of Significant Toxicity; a "Pass" indicates no toxicity was observed with the sample

Table 4. Summary of Chronic Mussel Test: Percentage of Curved Hinges

Acute Pacific Topsmelt Test:

For the acute topsmelt survival test, the 7 sample sites were tested along with 3 sets of Lab Controls. There was one Lab Control per two sample sites (except the SIYB-REF-1 site went with the final two sites). All 3 Lab Controls were valid with 90% or greater survival. Also, all 7 sample sites resulted in less than 4.0% effect when compared to the Lab Control. Therefore, all 7 sites resulted in a NOEC equal to the 100% concentration and a Pass with the TST analysis. A summary of the acute topsmelt test results is presented in Table 5. All raw data and associated statistical analyses for the topsmelt tests are provided for reference in Appendix B.

Table 5. Summary of Acute Topsmelt Test Results

Sample Concentration (%)	Sample ID / Mean Survival (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF-1
Lab Control	96.7	96.7	100	100	100	100	100
25	100	96.7	100	100	100	100	100
50	100	93.3	100	100	100	100	100
100	100	96.7	100	100	96.7	100	100
NOEC	100	100	100	100	100	100	100
LC ₅₀	>100	>100	>100	>100	>100	>100	>100
% Effect	-3.5	0.0	0.0	0.0	3.3	0.0	0.0
TST Result	Pass	Pass	Pass	Pass	Pass	Pass	Pass

NOEC = the highest concentration tested that results in No Observed Effect

LC₅₀ = the concentration expected to cause a lethal effect to 50% of the fish

% Effect = the % effect of the IWC compared to control; a negative value indicates the IWC out-performed the control

TST = Test of Significant Toxicity; a "Pass" indicates no toxicity was observed with the sample

QUALITY ASSURANCE

Samples were received by the lab in good condition the same day as collected. The samples were checked in, water quality measured, and then held in cold storage (4°C) until testing. Both chronic and acute tests were initiated the following day within the 36-hour holding time limit. For test organisms, the mussels were collected by Wood staff the morning of test initiation. The topsmelt were received by a commercial supplier 5-days prior to testing. The fish were held in-house and allowed to acclimate to test conditions. There was <10% mortality with the fish during holding, which is considered typical, as there is naturally some die-off of weaker fish within a population. The topsmelt were determined to be of good quality for initiating tests.

For the chronic mussel test, each sample was tested with its own Lab Control. All 7 Lab Controls met the EPA test acceptability criteria (TAC) of 50% or greater survival and 90% or greater proportion normal. All the Lab Controls also met the ASTM TAC of 70% or greater for the combined survival and proportion normal endpoint. All samples were analyzed for the combined endpoint to determine percent effects and TST results.

For the acute topsmelt test, there were 3 Lab Controls conducted with the 7 samples, and all 3 met the TAC of 90% or greater survival. Both acute and chronic tests were performed in accordance with EPA protocol guidelines and no major deviations were required during the testing period. Any minor deviations or errors made with recordings are noted on the raw bench sheets for both test species. A list of data qualifier codes is provided in Appendix C. Sample receipt information and chain of custody forms are provided in Appendix D.

Concurrent reference toxicant tests were conducted with both species. Both acute and chronic tests met the TAC and were deemed valid. The median effect concentration (EC_{50}) for both tests was within two standard deviations of the historical control chart mean for the laboratory. This indicates both the mussels and the topsmelt were healthy and resulted in typical sensitivity to the copper toxicant. A summary of the reference toxicant results for both species is presented in Table 6. Raw data, statistical analysis, and control charts for the reference toxicant tests are provided in Appendix E.

Table 6. Summary of Copper Reference Toxicant Test Results

Test Species & Endpoint	NOEC ($\mu\text{g/L}$)	EC_{50} ($\mu\text{g/L}$)	Historical EC_{50} \pm 2SD range ($\mu\text{g/L}$)
Chronic Mussel Combined Surviving/Normal Embryo Development	5.0	12.6	4.54 – 17.8
Acute Pacific Topsmelt 96-hour Survival	50	159	71.3 – 278

NOEC = the highest concentration tested that results in No Observed Effect

EC_{50} = the concentration expected to cause a 50% adverse effect to the test organisms

Historical EC_{50} = the mean EC_{50} for previous tests by the lab, presented as a range of \pm two standard deviations

 Batch ID: Mission Bay Collection (3/23/22)
 Test Type: Chronic Bivalve Development

Test Date: 3/23/22
 Analyst: AB

Task	
Spawning Induction	1230
Spawning Begins	1315
# Males/# Females	5/3
Spawn Condition	good
Fertilization Initiated	1345
Fertilization End/Eggs Rinsed	131000/1415
Embryo Counts	1500
Test Initiation	1615

Embryo Density Counts

per 100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1	300	55	60	64	65	61	610
Stock 2							
Stock 3							

Cell Division:

	% Divided
Stock 1	100%
Stock 2	
Stock 3	

Selected Stock:	1
-----------------	---

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

Stock Density
610
 500

Dil Factor
1.22

In 10 mL sample volume add 500 μ L of 500 embryos/mL stock to obtain 25 embryos/mL in test vials.

Bivalve Larval Survival and Development Test				Wood E&IS			
Batch ID: 12-7539-7101	Test Type: Development-Survival	Analyst:					
Start Date: 23 ²² Mar-22 16:15	Protocol: EPA/600/R-95/136 (1995)	Diluent: Natural Seawater					
Ending Date: 24 ²⁴ Mar-22 16:15	Species: Mytilis galloprovincialis	Brine: Not Applicable					
Duration: 25 ^{48h}	Source: Field Collected	Age:					
Sample ID: 01-9832-6686	Code: 22-W070	Client: Wood Environment and Infrastructure					
Sample Date: 22 Mar-22 10:30	Material: Seawater	Project: SIYB TMDL Monitoring					
Receipt Date: 22 Mar-22 17:40	Source: Shelter Island Yacht Basin						
Sample Age: 26 ^h (2.2 °C) 30 ^{hr}	Station: SIYB 6						
Comments: FC = Filtered Control (1.2um), 101 = 100% Filtered (1.2 um)							
Single Comparison Summary							
Analysis ID	Endpoint	Comparison Method	P-Value	Comparison Result			
11-8497-8412	Combined Proportion Normal	TST-Welch's t Test	1.4E-05	100% passed combined proportion normal			
10-2819-8685	Combined Proportion Normal	TST-Welch's t Test	8.1E-05	101% passed combined proportion normal			
Multiple Comparison Summary							
Analysis ID	Endpoint	Comparison Method	NOEL	LOEL	TOEL	TU	PMSD ✓
03-7275-9714	Combined Proportion Normal	Dunnett Multiple Comparison Test	100	> 100	n/a	1	5.67%
13-2255-2678	Proportion Normal	Dunnett Multiple Comparison Test	100	> 100	n/a	1	4.54%
06-3057-5365	Survival Rate	Steel Many-One Rank Sum Test	100	> 100	n/a	1	2.98%
Test Acceptability							
Analysis ID	Endpoint	Attribute	Test Stat	TAC Limits		Overlap	Decision
				Lower	Upper

APPENDIX C
List of Data Qualifier Codes

Data Qualifier Codes

QC1: Temperatures out of recommended range; corrective action taken

QC2: Temperatures out of recommended range; no action taken, test terminated

QC3: Test initiated on aeration due to anticipated drop in dissolved oxygen

QC4: Dissolved oxygen percent saturation <110

QC5: Survival counts not recorded due to poor visibility

QC6: Inadequate sample volume remaining; 50% renewal performed

QC7: Inadequate sample volume remaining; no renewal performed

APPENDIX D

Bivalve Larval Survival and Development Test

Wood E&IS

Test Type: Development-Survival
Protocol: EPA/600/R-95/136 (1995)

Organism: Mytilus galloprovincialis (Bay Mussel)
Endpoint: Combined Proportion Normal

Material: Total Copper
Source: Reference Toxicant-REF

Mean: 8.998
Sigma: n/a

Count: 18
CV: 35.30%

-2s Warning Limit: 4.535
+2s Warning Limit: 17.84

-3s Action Limit: 3.22
+3s Action Limit: 25.13

 Batch ID: Mission Bay Collection (3/23/22)
 Test Type: Chronic Bivalve Development

Test Date: 3/23/22
 Analyst: AB

Task	
Spawning Induction	1230
Spawning Begins	1315
# Males/# Females	5/3
Spawn Condition	good
Fertilization Initiated	1345
Fertilization End/Eggs Rinsed	+3 (1000/1415)
Embryo Counts	1500
Test Initiation	1615

Embryo Density Counts

per 100 µL

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 µL	Mean #/mL (x10)
Stock 1	300	55	60	64	65	61	610
Stock 2							
Stock 3							

Cell Division:

	% Divided
Stock 1	93.4
Stock 2	
Stock 3	

Selected Stock:	1
-----------------	---

Stock Density

Dil Factor

Adjust selected embryo stock to 500 embryos/mL.

Dilution Factor = Stock Density/mL/500

610
500

1.22

In 10 mL sample volume add 500 µl of 500 embryo/ml stock to obtain 25 embryos/mL in test vials.

C-2: January 25, 2023 Event

**Results of Toxicity Testing for:
Shelter Island Yacht Basin
Total Maximum Daily Load Monitoring**

**Sample Collection: January 25, 2023
Winter Sampling Event**

Submitted to:

**WSP USA Environment & Infrastructure, Inc.
9177 Sky Park Court
San Diego, CA 92123**

Testing Performed by:

**WSP USA Environment & Infrastructure, Inc.
Environmental Toxicology Laboratory
4905 Morena Blvd., Suite 1304
San Diego, CA 92117**

The WSP Environmental Toxicology Laboratory is certified by the State of California Department of Health Services – Environmental Lab Accreditation Program (ELAP) under Certificate Number 3010. All test results were obtained following EPA Protocol guidelines and internal QA Program requirements. The data and test results have been reviewed and verified by the following laboratory representative:

Verified by: Steve Carlson Date: 4/3/23.

INTRODUCTION

Located in the Port of San Diego, Shelter Island Yacht Basin (SIYB) was issued an Investigative Order (R9-2011-0036, amended from Resolution No. R9-2005-0019) from the San Diego Regional Water Quality Control Board that requires annual monitoring for the SIYB Dissolved Copper Total Maximum Daily Load (TMDL) program. The monitoring program requires the performance of water column toxicity testing at 7 locations within the basin area. Chronic toxicity is monitored with a marine invertebrate species, while acute toxicity is monitored with a marine fish species. Chronic testing has routinely used the mussel species *Mytilus galloprovincialis*, and acute testing has previously been performed with the Pacific topsmelt *Atherinops affinis*. However, due to the many challenges experienced using Pacific topsmelt during previous years (limited test organism supply and availability, difficulties in culturing and holding in a laboratory environment, and overall organism health and sensitivity), acute toxicity testing was performed using the Inland silverside minnow *Menidia beryllina*, a USEPA-approved alternate marine fish species, for the most recent winter monitoring event conducted in January 2023.

Staff from WSP USA Environment & Infrastructure, Inc. (WSP; formerly known as Wood Environment & Infrastructure Solutions, Inc.) collected and delivered all 7 samples to WSP's in-house Environmental Toxicology Laboratory located in San Diego, California. The samples were collected on January 25th, 2023, and both acute and chronic testing was initiated on January 26th, 2023.

MATERIALS & METHODS

Sample Information

Client:	Port of San Diego
Project Name:	Shelter Island Yacht Basin Annual TMDL Monitoring
Monitoring Period:	January 2023 (Winter event)
Sample IDs (7 sites):	SIYB-1, SIYB-2, SIYB-3, SIYB-4, SIYB-5, SIYB-6, and SIYB-REF-1
Sample Collection Date, Times:	1/25/23, 08:00 to 14:00
Sample Receipt Date, Time:	1/25/23, 12:40 (1 st batch) and 17:00 (2 nd batch)
Water Quality Measurements:	See Table 1 (measured upon sample receipt at lab)

Table 1. Water Quality Measured Upon Sample Receipt

Sample ID	Temp. (°C)	pH (units)	DO (mg/L)	Salinity (ppt)	Alkalinity (mg/L)	TRC (mg/L)
SIYB-1	15.7	7.83	9.1	32.9	109	0.03
SIYB-2	15.7	7.83	8.5	32.8	112	<0.02
SIYB-3	14.9	7.92	8.8	32.7	111	NR
SIYB-4	17.8	7.92	8.4	32.8	108	0.02
SIYB-5	15.8	7.92	8.2	32.7	110	<0.02
SIYB-6	16.1	7.88	8.1	32.6	114	0.06
SIYB-REF-1	15.6	7.90	7.8	32.3	107	0.02

Chronic Mussel Development Test Specifications

Test Period:	1/26/23, 17:30 – 1/28/23, 16:00
Test Organism:	<i>Mytilus galloprovincialis</i> (bivalve - mussel)
Test Organism Source:	Field-collected – Mission Bay (San Diego, CA)
Test Organism Age at Start:	Fertilized embryos (<4 hours old)
Test Procedure:	48-hour embryo-larval development
Test Endpoint:	Combined survival & proportion normal (ASTM)
Test Concentrations:	Lab Control, 6.25, 12.5, 25, 50, and 100% sample
Treatment Concentrations:	Filter Control and 100% Filtered (1.2 µm filter)
Lab Control/Dilution Water:	Natural seawater from the inlet at Scripps Institution of Oceanography (20-µm filtered)
Test Protocols Used:	EPA 1995 West Coast Manual (EPA/600/R-95/136); and ASTM 1998 (E 724-98).
EPA Test Acceptability Criteria:	Control: ≥50% survival; ≥90% proportion normal; and minimum significant difference (MSD) <25%
ASTM Test Acceptability Criteria:	Control: ≥70% combined survival/proportion normal
Reference Toxicant Test:	Lab Control, 2.5, 5.0, 10, 20, and 40 µg/L copper
Statistical Analysis Software:	CETIS™ v.2.1.3.5

Calculating the mussel test endpoint: Embryos within each test replicate are scored under a microscope by counting all larvae observed in the vial. Percent survival is evaluated by comparing the total number of larvae observed in each vial to an initial (time-zero) density count derived from 5 surrogate exposure chambers (vials) interspersed within the test and preserved immediately after adding embryos. Each larva is scored as normal or abnormal resulting in a second test endpoint: proportion normal. Normal development is exhibited by a clearly defined "D-shaped" shell with a clear straight line as a hinge, while abnormal development is exhibited by any clear abnormalities or differences to the normal "D-shaped" shell. This includes larva that have not fully developed a clear straight hinge (this is exhibited by a slightly curved hinge). Abnormal development was further enumerated to determine the magnitude of effect. The abnormal larvae were counted as having 1) a curved hinge, which indicates a moderate effect, or 2) more significant defects or abnormalities, which indicates a more severe effect. Examples of each of the larva (normal, abnormal with curved hinge, and abnormal with severe effects) are presented in Figure 1. A final combined surviving normal embryo endpoint is calculated by comparing the number of recovered normal embryos in each replicate test chamber to the average number of fertilized embryos counted in the time zero vials. Results for the combined embryo development endpoint are presented herein in the main report, with supporting summaries and full analyses of the individual percent survival and percent normal endpoints included in Appendix A

Figure 1. Images of Bivalve Embryo Development Showing Normal vs Abnormal Morphology

1) Normal D-shape/straight hinge 2) Abnormal with curved hinge 3) Abnormal with severe effects

Inland Silverside Acute Survival Test Specifications

Test Start Date, Time:	1/26/23, 12:15 – 13:12
Test End Date, Time:	1/30/23, 11:00 – 11:45
Test Organism:	<i>Menidia beryllina</i> (Inland Silverside minnow)
Organism Source; Age at Start:	Aquatic BioSystems (Fort Collins, CO); 12-days old
Test Procedure and Endpoint:	96-hour static-renewal acute survival test
Test Concentrations:	Lab Control, 25, 50, and 100% each sample
Replicates/Number of Organisms:	6 replicates/5 fish per replicate (30 fish/conc.)
Lab Control/Dilution Water:	Natural seawater collected from the inlet at Scripps Institution of Oceanography (34 ppt salinity)
USEPA Protocol:	EPA/821/R-02/012, 2002 Acute Manual
Test Acceptability Criteria:	≥90% mean survival in the control
Reference Toxicant Test:	Lab Control, 25, 50, 100, 200, and 400 µg/L copper
Statistical Software:	CETIS™ v.2.1.3.5

RESULTS

Test results were evaluated using two USEPA methods of analysis. The results were first analyzed using the traditional EPA statistical approach with multiple comparisons on a dilution series of concentrations to develop a No Observed Effect Concentration (NOEC) as described in the EPA documents (EPA 1995 and EPA 2002). Then, the results were analyzed using the newer EPA Test of Significant Toxicity (TST) approach, as referenced in USEPA 2010. The TST approach applies a modified t-test that accounts for the statistical power of the test and the magnitude of the biological effect in determining the presence of toxicity. The instream waste concentration (IWC) is the 100% sample, which is compared to the Control for statistical analysis. The TST results in a "Pass" if there are no effects or effects are considered to not be biologically significant in the sample (non-toxic), or it will result in a "Fail" if there are significant effects (toxic).

Chronic Mussel Test:

For the chronic mussel test, embryos were exposed to a serial dilution series of 6.25, 12.5, 25, 50, and 100% unfiltered sample from each of the 7 sites. Significant effects were observed for embryos exposed to water from Site SIYB-1 and Site SIYB-2. Site SIYB-1 had a 9.7% effect observed in the 100% undiluted sample when compared to the Lab Control, and SIYB-2 had a 9.3% effect in the 100% undiluted sample. Both the 9.7% and 9.3% effects were statistically significant using the traditional EPA method of analysis, resulting in a NOEC equal to the 50% concentration. However, the newer TST approach showed no biologically significant effects, resulting in a Pass result. Samples from the other 5 sites all resulted in less than a 1.0% effect, resulting in a NOEC equal to 100% sample and a Pass with the TST. The chronic test results for the unfiltered samples are summarized and presented in Table 2.

The 100% concentration for each sample was also tested after filtering with a 1.2 micron (μm) mesh screen to remove any potential algae or other native organisms. The 100% filtered sample was compared to a Filter Control (lab control water with the same filtered treatment). The greatest effect was observed in the SIYB-1 sample with a 28.1% effect which resulted in a Fail with the TST. The filtering process appeared to increase the toxicity of the sample (the effect rose from 9.7% to 28.1% when filtered). Samples from the other 6 sites all resulted in less than an 11% effect resulting in a Pass using the TST. Summary results for the filtered samples are presented in Table 3.

As described in the Methods section, abnormal larvae were further enumerated as either having a curved hinge (moderate effect) or having clear abnormalities or defects (severe effect). During this round of testing, the frequency of curved hinges observed remained low as presented in Table 4. The greatest effect was observed in the 100% concentration of SIYB-1, with 8.1% with curved hinges in the unfiltered 100% sample and 20.9% with curved hinges in the filtered sample. There was also 5.4% with curved hinges observed in the 100% filtered sample of SIYB-2. All other samples and concentrations resulted in less than 1.0% with curved hinges. All raw data and statistical analyses for the mussel tests are provided for reference in Appendix A.

Table 2. Summary of Chronic Mussel Test Results: Unfiltered Samples

Sample Concentration (%)	Sample ID / Combined Survival & Proportion Normal (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF-1
Lab Control	84.0	87.7	85.9	85.4	76.4	88.1	83.9
6.25	86.3	85.2	87.4	87.9	82.1	87.1	87.4
12.5	87.0	84.9	88.8	84.7	83.5	87.4	87.3
25	87.0	84.8	86.3	87.4	76.0	88.8	85.2
50	85.0	86.0	88.1	86.7	86.0	87.8	82.7
100	75.9*	79.6*	89.5	84.6	82.0	89.0	85.9
NOEC	50	50	100	100	100	100	100
EC ₅₀	>100	>100	>100	>100	>100	>100	>100
% Effect	9.7	9.3	-4.2	0.9	-7.4	-1.0	-2.4
TST Result	Pass	Pass	Pass	Pass	Pass	Pass	Pass

* An asterisk indicates a statistically significant effect using the traditional EPA statistical approach

NOEC = the highest concentration tested which results in No Observed Effect (using the traditional approach)

EC₅₀ = the concentration expected to cause a 50% adverse effect to the organisms

% Effect = the % effect of the IWC compared to control; a negative value indicates the IWC outperformed the control

TST = Test of Significant Toxicity; a "Pass" indicates no toxicity was observed with the 100% sample concentration

Table 3. Summary of Chronic Mussel Test Results: 1.2 µm Filtered Samples

Sample Concentration (%)	Sample ID / Combined Survival & Proportion Normal (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF-1
Filter Control	85.1	85.0	84.9	88.8	75.6	82.0	83.3
100 filtered	61.2*	75.6	87.2	82.7	83.9	87.3	83.4
NOEC	<100	100	100	100	100	100	100
% Effect	28.1	11.0	-2.8	7.0	-11.0	-6.5	-0.1
TST Result	Fail	Pass	Pass	Pass	Pass	Pass	Pass

NOEC = the highest concentration tested which results in No Observed Effect

% Effect = the % effect of the IWC compared to control; a negative value indicates the IWC outperformed the control
TST = Test of Significant Toxicity; a "Pass" indicates no toxicity was observed with the sample

A **bold** value with asterisk resulted in a significant effect using both the traditional approach and the TST approach

Table 4. Summary of Chronic Mussel Test: Percentage with Curved Hinges

Acute Inland Silverside Test:

The 96-hour acute fish test was conducted using the Inland Silverside minnow (*Menidia beryllina*), which is an EPA-approved marine fish species. Acute testing was conducted on all 7 sample sites with a dilution series of 25, 50, and 100% for each sample location. Also, there were three sets of Lab Controls, one with SIYB-1 and 2, one with SIYB-3 and 4, and one with SIYB-5, 6, and Ref. Mean survival in the three Lab Controls ranged from 93.3% to 100%, exceeding the EPA TAC of 90% survival. Mean survival in all concentrations of the 7 sample sites also ranged from 93.3% to 100%. With less than a 7.0% effect when compared to the Lab Controls, all 7 sites resulted in a NOEC equal to the 100% concentration, and all 7 sites Passed the TST analysis. A summary of the acute Inland Silverside test results is presented in Table 5. All acute raw data and statistical analyses are presented in Appendix B.

Table 5. Summary of Acute Inland Silverside Test Results

Sample Concentration (%)	Sample ID / Mean Survival (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF-1
Lab Control	93.3	93.3	96.7	96.7	100	100	100
25	96.7	96.7	93.3	96.7	100	100	100
50	100	96.7	96.7	96.7	100	96.7	100
100	100	100	97.2	96.7	93.3	100	100
NOEC	100	100	100	100	100	100	100
LC ₅₀	>100	>100	>100	>100	>100	>100	>100
% Effect	-7.1	-7.1	-0.6	0.0	6.7	0.0	0.0
TST Result	Pass	Pass	Pass	Pass	Pass	Pass	Pass

NOEC = the highest concentration tested which results in No Observed Effect (using the traditional approach)

LC₅₀ = the concentration expected to cause a lethal effect to 50% of the fish

% Effect = the % effect of the IWC compared to control; a negative value indicates the IWC outperformed the control

TST = Test of Significant Toxicity; a "Pass" indicates no toxicity was observed with the sample

QUALITY ASSURANCE

Samples were received by the WSP laboratory in good condition the same day as collected. The samples were checked in, water quality measured, and then held in cold storage (4-6°C) until testing. Both chronic and acute tests were initiated the following day within the 36-hour holding time limit. For test organisms, mussels were collected locally by WSP staff the day of the test initiation (January 26th, 2023). The marine fish species (Inland Silverside) were received by a commercial supplier (Aquatic BioSystems in Fort Collins, Colorado) two days prior to test initiation. The fish were held in-house and allowed to acclimate to test conditions over a 48-hour period. There was greater than 10% mortality during the initial 24-hours of receiving the fish. However,

there was less than 2% mortality during the next 24-hour period prior to testing. The fish were deemed healthy and acceptable for testing. The acute tests conducted with the Silverside minnows met the EPA method TAC with greater than 90% survival in all three Lab Controls. Therefore, the acute test results were deemed valid and acceptable for reporting.

For the chronic mussel test, each sample site was tested with its own Lab Control. All 7 Lab Controls met the EPA TAC of 50% or greater survival and 90% or greater proportion normal. The Lab Controls also met the ASTM TAC of 70% or greater for the combined survival and proportion normal endpoint. All samples were analyzed for the combined endpoint to determine percent effects and statistical results using the TST. All chronic mussel test results were deemed valid for reporting.

Both acute and chronic tests were performed in accordance with EPA protocol guidelines and no major deviations were required or noted during this testing period. Any minor deviations or errors made with recordings are noted on the raw bench sheets for both test species. A list of data qualifier codes is provided in Appendix C. Sample receipt information and chain of custody forms are provided in Appendix D.

Concurrent reference toxicant tests were conducted with both test organisms. Both the acute fish test and the chronic mussel test had Lab Controls that met the EPA method TAC and were thus deemed valid. The median effect concentration for the mussels (EC_{50}) and lethal effect concentration for the fish species (LC_{50}) were within two standard deviations of the historical control chart means for the laboratory. This indicates that the mussels and Inland Silversides both produced a typical response or sensitivity to the copper toxicants. A summary of the reference toxicant results for both species is presented in Table 6. Raw data, statistical analyses, and control charts for the reference toxicant tests are provided in Appendix E.

Table 6. Summary of Copper Reference Toxicant Test Results

Test Species & Endpoint	NOEC ($\mu\text{g/L}$)	EC_{50}/LC_{50} ($\mu\text{g/L}$)	Historical EC_{50}/LC_{50} \pm 2 SD range ($\mu\text{g/L}$)
Chronic Mussel Combined Surviving/Normal Embryo Development	5.0	7.73	4.72 - 17.8
Acute Inland Silverside 96-hour Survival	100	168	116 - 351

NOEC = the highest concentration tested which results in No Observed Effect

SD = Standard deviation, $\mu\text{g/L}$ = micrograms per liter

EC_{50} = the concentration expected to cause a 50% adverse effect to the test organisms (mussels)

LC_{50} = the concentration expected to cause a 50% lethal effect to the test organisms (fish)

Historical EC_{50}/LC_{50} = the mean EC_{50}/LC_{50} for previous testing by the lab, presented as a range of \pm 2 SD

APPENDIX A
Chronic Mussel Development Test
Raw Data & Statistical Analyses

Bivalve Summary Tables
For Combined, %Survival, & %Normal Endpoints

Summary Results for Chronic Bivalve Tests

Final

Client: WSP USA Environment & Infrastructure

Project ID: Shelter Island Yacht Basin TMDL Monitoring

Species: *Mytilus galloprovincialis* (Mussel)

Endpoint: Combined Survival & Normal Development

Unfiltered Sample:

Test Concentration (% Sample)	Sample ID / Combined Survival & Normal Development (%)						
	SIYB-1	SIYB-2	SIYB-3	SIYB-4	SIYB-5	SIYB-6	SIYB-REF
Lab Control	84.0	87.7	85.9	85.4	76.4	88.1	83.9
6.25	86.3	85.2	87.4	87.9	82.1	87.1	87.4

% Effect	9.7	9.3	-4.2	0.9	-7.4	-1.0	-2.4
TST Result	Pass	Pass	Pass	Pass	Pass	Pass	Pass

NOEC = the highest Concentration tested with No Observed Effect (using standard method of analysis).

% Effect = the percent effect in the 100% sample compared to the Lab Control. A negative value indicates the 100% sample outperformed the Lab Control.

TST = Test of Significant Toxicity (Pass/Fail) in 100%. A Pass indicates no significant effects were observed.

Filtered Sample:

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mirson Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1							
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density
800
 500

Dil Factor
1.6

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T01 = 195$, $T02 = \frac{168}{1.6} = 105$, $T03 = 175$, $T04 = 192$, $T05 = 184$
 $\bar{X} = 183$

Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per 100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1							
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density

800

500

Dil Factor

1.6

Adjust selected embryo stock to 500 embryos/mL.

Dilution Factor = Stock Density/mL/500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T01 = 195$, $T02 = 175$, $T03 = 175$, $T04 = 192$, $T05 = 184$

$\bar{X} = 183$

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AB

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/ ⁵⁰ 100 μ L	Mean #/ ⁵⁰ mL (x10)
Stock 1							
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density

800
500

Dil Factor

1.6

Adjust selected embryo stock to 500 embryos/mL.

Dilution Factor = Stock Density/mL/500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T0_1 = 195$, $T0_2 = \overset{168}{175}$, $T0_3 = 175$, $T0_4 = 192$, $T0_5 = 184$
 $\bar{x} = 183$

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density

800

500

Dil Factor

1.6

Adjust selected embryo stock to 500 embryos/mL.

Dilution Factor = Stock Density/mL/500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1							
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density

800

500

Dil Factor

1.6

Adjust selected embryo stock to 500 embryos/mL.

Dilution Factor = Stock Density/mL/500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T0_1 = 195$, $T0_2 = 175$, $T0_3 = 175$, $T0_4 = 192$, $T0_5 = 184$

$\bar{x} = 183$

① vials with total counts >300 were accidentally inoculated twice.
However, this did not affect the final Percent or Proportion results.

APPENDIX C
List of Data Qualifier Codes

Test Qualifier Codes

- QC1: Temperatures out of recommended range; corrective action taken
- QC2: Temperatures out of recommended range; no action taken, test terminated
- QC3: Test initiated on aeration due to anticipated drop in dissolved oxygen
- QC4: Dissolved oxygen percent saturation <110
- QC5: Survival counts not recorded due to poor visibility
- QC6: Inadequate sample volume remaining; 50% renewal performed
- QC7: Inadequate sample volume remaining; no renewal performed
- QC8: Organisms received at a temperature outside of recommended range of test specifications. Temperature changed more than 3 degrees Celsius within a 24-hour period.
- QC9: Organisms received at a salinity outside of 3 ppt of recommended test specifications. Acclimated to appropriate salinity within a 24-hour period.

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/ ⁵⁰ 100 μ L	Mean #/ ⁵⁰ mL (x10)
Stock 1						16	160
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density

800

Dil Factor

1.6

Adjust selected embryo stock to 500 embryos/mL.

Dilution Factor = Stock Density/mL/500

500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T0_1 = 195$, $T0_2 = \overset{168}{175}$, $T0_3 = 175$, $T0_4 = 192$, $T0_5 = 184$

$\bar{x} = 183$

Subject: Mussel Embryo Toxicity Identification Evaluation (TIE) Results for 2023 Winter Monitoring for the SIYB Dissolved Copper TMDL – Site SIYB-1

Sampling and Analysis Methods

A winter monitoring event supporting the Shelter Island Yacht Basin (SIYB) Dissolved Copper Total Maximum Daily Load (TMDL) was conducted on January 25, 2023. Consistent with prior TMDL monitoring efforts, surface water samples (1-meter below the surface) were collected from six stations within SIYB (SIYB-1 at the head of the basin through SIYB-6 at the mouth of the basin) and two reference stations in the main channel of San Diego Bay (SIYB-REF-1 and SIYB-REF-2).

Samples of surface water from Sites SIYB-1 through SIYB-6 and SIYB-REF-1 were tested for toxicity using (1) a 48-hour chronic bioassay test using mussel larvae (*Mytilus galloprovincialis*) and (2) a 96-hour acute bioassay test using inland silverside minnow (*Menidia beryllina*). In addition to toxicity, water samples were also analyzed for total and dissolved copper and zinc, dissolved organic carbon (DOC), total organic carbon (TOC), and total suspended solids (TSS).

Statistically significant effects¹ were observed to mussel embryo development in site water from the inner portion of SIYB during the 2023 winter monitoring event. Toxicity was observed at Sites SIYB-1 and SIYB-2 with a 9.7 and 9.3% effect, respectively relative to that observed in the laboratory controls based on the combined normal/surviving embryo endpoint. Toxicity to mussel embryos or larval fish was not observed in undiluted, unfiltered samples collected from any of the other stations in SIYB or the reference station (SIYB-REF-1). Consistent with previous events, a gradient of dissolved copper was observed in SIYB with the highest concentration of 7.7 micrograms per liter (µg/L) corresponding with the highest percent effect observed for the mussel embryo test at Site SIYB-1.

In addition to routine standard toxicity testing, a Toxicity Identification Evaluation (TIE) was conducted during the winter 2023 monitoring event, following up on a prior TIE performed on water collected from the same location (SIYB-1) in August of 2022. The original TIE treatments were considered Phase I toxicant characterization methods to identify the general characteristics and class(es) of contaminants responsible for toxicity. Based on the specificity of the ethylenediaminetetraacetic acid (EDTA) treatment and supporting results from the other Phase I methods of the initial TIE, there was a high degree of confidence that the toxicant of interest in unmanipulated receiving water from SIYB-1 was a cationic trace metal. Additional evidence

¹ Note that effects were significant using the USEPA 1995 traditional flow-chart statistical methods (i.e., Dunnett multiple comparison test). However, these effects were not significant using the Test of Significant Toxicity (TST) approach (USEPA, 2010).

suggested copper was the primary toxicant of concern based on measured concentrations of dissolved copper in the unmanipulated sample relative to toxicity effects data reported in the literature for mussel embryos, along with concurrent reference toxicant results using copper chloride, both suggesting thresholds for toxicity due to copper were exceeded in the water from the inner portion of SIYB.

Based on the results of the Phase I testing performed in August 2022, a targeted Phase I characterization approach, along with Phase II/III identification/confirmation treatments were applied during the winter 2023 sampling event as summarized herein.

TIE Approach and Methods

Phase I Toxicity Identification Evaluation (Targeted TIE)

Evaluating the cause of toxicity in site water from SIYB was performed in accordance with a set of standardized TIE procedures following United States Environmental Protection Agency (USEPA) guidance (USEPA, 1996). The Phase I TIE treatments conducted in August 2022 consisted of seven different standard treatments, while a more targeted Phase I approach was performed in January 2023 based on results obtained from the initial TIE indicating copper as a primary toxicant of interest (Table 1). The targeted TIE in January 2023 included addition of EDTA due to the high specificity of this treatment for cationic trace metals. These procedures included re-running a 0.45- μ m filtered treatment as well as metal chelation treatments (10 and 25 milligrams per liter [mg/L] EDTA) on samples from SIYB-1 and testing concurrently with routine toxicity tests.

Table 1. Phase I Toxicant Characterization Treatments for SIYB

Phase I Procedure	Primary Compounds Addressed/Purpose	Summer 2022	Winter 2023
Baseline (unmanipulated sample)	None. Used for treatment effectiveness comparison. Two baseline samples were tested in different areas among all test chambers.	X	X
Filtration (0.45 μ m)	Pollutants associated with particles, and algae and/or microorganism effects	X	X
Aeration	Volatile or oxidizable compounds; surfactants	X	--
C8 Column Solid-Phase Extraction	Non-polar organics and metal chelates. *These columns can remove some metals, so this step helps verify metals versus organics.	X	--
C8 Column Solvent Elution	Recovers toxicity due to non-polar organics	X	--
Cation Exchange Column	Removes cationic compounds including various trace metals	X	--
Oxidant Reduction (STS Addition) – 10 and 25 mg/L	Constituents reduced by sodium thiosulfate; also chelates some cationic trace metals	X	--
Metal Chelation (EDTA Addition) – 10 and 25 mg/L	Divalent cationic metals	X	X

Notes: μ m = micrometer(s); EDTA = ethylenediaminetetraacetic acid; mg/L = milligram(s) per liter; -- not tested; SIYB = Shelter Island Yacht Basin; STS = sodium thiosulfate

Each of the Phase I treatments summarized in **Table 1** were performed on both the SIYB-1 sample and clean laboratory water as a method control to assess whether the treatments themselves may cause negative effects. The TIE tests were performed using 5 replicates for each treatment, consistent with that used for the TMDL compliance tests. Each replicate was also assigned a random number, and vials for the entire TIE placed in randomized numeric order in the environmental chamber throughout the test period. The vials remained in random order throughout the scoring process to endure a “blind” unbiased approach.

Phase II/III Toxicity Identification/Confirmation (Copper Spiking Study)

TIE Phases II and III were conducted to specifically define and confirm those constituents responsible for toxicity in a sample following characterization of the class of contaminant during Phase I (USEPA, 1993a,b). Based on the Phase I TIE results for SIYB-1 during the summer 2022 sampling event, a targeted combined Phase II/III approach was performed to specifically further identify and confirm the degree to which copper may or may not be contributing to mussel embryo toxicity in the receiving water collected in the winter of 2023. These steps focused on conducting a series of copper addition experiments to the ambient water of SIYB. A series of 5 concentrations of copper were incrementally added to three samples as follows:

- 1) Undiluted water from SIYB-1;
- 2) 50% diluted water from SIYB-1; and
- 3) Clean filtered laboratory seawater. This third sample is equivalent to a standard copper reference toxicant test used to evaluate the sensitivity of mussel embryos over time at the WSP laboratory as a standard quality assurance (QA) and quality control (QC) measure.

A summary of the Phase II/III Toxicant Identification/Confirmation Copper Spiking Study and associated concentrations is provided in **Table 2**.

Table 2. Phase II/III Toxicant Identification/Confirmation – Copper Spiking Study

Procedure	Concentrations
Cu Spike in 100% Undiluted Water from SIYB-1	0, 2.5, 5.0, 10.0, 20.0, and 40.0 µg/L Cu
Cu Spike in 50% Diluted Water from SIYB-1	0, 2.5, 5.0, 10.0, 20.0, and 40.0 µg/L Cu
Cu Spike in Filtered Laboratory Control Water (Standard Reference Toxicant Test)	0, 2.5, 5.0, 10.0, 20.0, and 40.0 µg/L Cu

Notes: µg/L = microgram(s) per liter; % = percent; Cu = copper

A comparison of the toxic dose responses between these three samples was used to assess the degree of toxicity related specifically to copper in the ambient undiluted seawater. For example, if the median effective concentrations (EC₅₀s) for copper are similar among all three samples, results would suggest that most or all of the observed toxicity in the SIYB-1 water may be attributable to copper. If adding copper to the ambient samples from SIYB results in a flatter curve (less toxic) than that observed in the clean laboratory seawater, then one would conclude that either the site water has a stronger binding capacity for copper, or that some other compound must be contributing to the observed effects. If addition of copper to the site water results in a greater effect than expected, then additive toxicity with other compounds would be suggested.

Measurements of DOC and pH were also measured in both the laboratory control water and all samples from SIYB to assess the potential for copper binding.

TIE Results

Phase I Toxicity Identification Evaluation (Targeted TIE)

A summary of toxicity results for the Phase I TIE conducted in January 2023 is shown in **Figure 1**. A summary of dissolved copper concentrations is provided in **Figure 2** (see **Appendix D**). Raw data and statistical analyses for the Phase I TIE are provided for reference in **Appendix A**. Results for all method controls and unmanipulated laboratory control water resulted in $\geq 90\%$ mean proportion normal embryo development indicating no negative effects on the embryos due to any of the treatments applied. All controls also resulted in $> 80\%$ mean combined proportion normal development and survival rate, further demonstrating that treatments did not have detrimental effects to mussel embryos. TIE results presented in **Figure 1** summarize the mean % combined proportion normal development of surviving embryos. Error bars for each treatment represent the 95% confidence intervals.

A baseline test conducted on the unmanipulated SIYB-1 sample resulted in a toxic effect of 13.3% for the combined proportion normal and survival endpoint compared to the laboratory control. This was similar to the effects observed in the separate sample tested at the same time for the routine TMDL winter monitoring toxicity tests, which had an effect of 9.7%. Filtration of the sample to 0.45 micrometers to remove particulates and associated contaminants bound to the particles resulted in a comparable toxic effect of 10.3% for combined proportion normal survivors. This result reconfirms that the toxic compound of interest is in a dissolved water-soluble form. The measured dissolved copper in the filtered sample (7.0 $\mu\text{g/L}$) was very similar to that measured in the same sample filtered in the field (7.7 $\mu\text{g/L}$) for the routine TMDL monitoring indicating consistency in the methods.

The EDTA treatment is one of the most contaminant-specific Phase I TIE methods. EDTA is an organic chelating agent that preferentially binds with divalent cationic metals, such as copper, nickel, lead, zinc, cadmium, mercury, and other transition metals (Garvan, 1964). Studies have demonstrated that when a metal is bound to the EDTA molecule, the toxicity of the metal is greatly reduced (e.g., Sunda and Guillard, 1976).

Consistent with results observed during the TIE conducted in the summer of 2022, toxicity in the winter 2023 sample from SIYB-1 was again removed following the addition of EDTA, as shown in **Figure 1**. The mean proportion of normal surviving embryos in the EDTA-treated samples was comparable to that in the laboratory method controls.

The concentrations of dissolved copper in the 10 and 25 mg/L EDTA treatments were 0.25 and 0.23 $\mu\text{g/L}$ respectively as shown in **Figure 2**, confirming that this treatment effectively bound the freely dissolved fraction of this trace metal. These concentrations of copper are well below that expected to cause toxicity to mussel embryos and corresponded with the reduced effects observed following addition of EDTA to the SIYB-1 sample.

Figure 1. Phase I TIE Results for SIYB-1 (January 2023) – Mean Combined Proportion Normal Surviving Embryos ±95% Confidence Intervals

Figure 2. Phase I TIE Results for SIYB-1 (January 2023) – Dissolved Copper Concentrations

Phase II/III Toxicity Identification Evaluation (Copper Spiking Study)

A summary of toxicity results for the Phase II/III TIE copper spiking study is shown in **Figure 3**. Raw data and statistical analyses are provided for reference in **Appendix B**.

The copper toxicity dose response curves for all three treatments tested (laboratory control water, 50% diluted SIYB-1 sample, and undiluted SIYB-1 sample) are shown together on the same figure for comparison. The curves for all three treatments are similar, although a slightly steeper curve was observed for the laboratory control water spiked with copper indicating greater sensitivity. Resulting EC_{50} values for dissolved copper were 9.9 $\mu\text{g/L}$ in the laboratory control water and ranged from 11.3 to 11.9 $\mu\text{g/L}$ in the two copper-spiked SIYB-1 samples.

The sensitivity of mussels to copper was slightly greater in laboratory control water as would be expected given a lower concentration of natural organic material in filtered laboratory water compared to ambient waters thereby reducing the bioavailability and toxicity of copper and other trace metals. The measured concentration of DOC in the laboratory control water (1.1 mg/L) was slightly less than that in the SIYB-1 sample (1.3 mg/L) collected during the winter 2023 sampling event.

The close correspondence between the three different dose response curves and EC_{50} values provides strong evidence that dissolved copper alone is the primary toxicant of concern. If a different toxicant was present in the SIYB sample these curves and EC_{50} values would not be expected to be so similar.

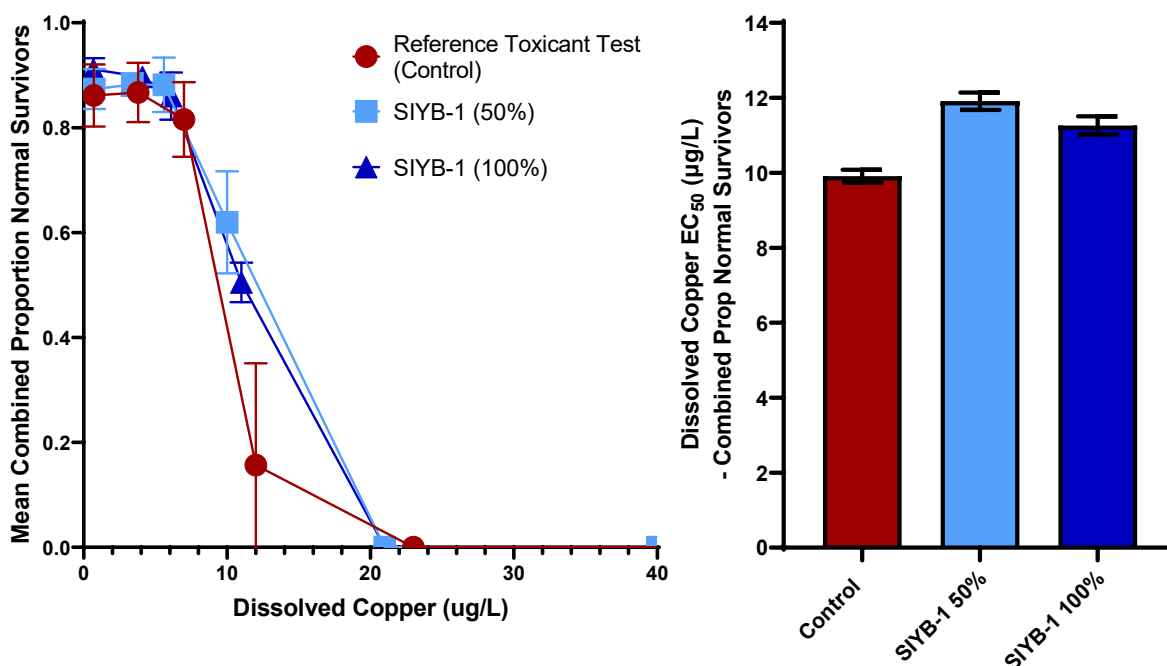

Figure 3. SIYB TIE Phase II/III Copper Spiking Study – Copper Dose Response for Proportion Normal Surviving Embryos (left) and Calculated Copper EC_{50} Values $\pm 95\%$ CI (right)

Conclusions

Multiple lines of evidence indicate that dissolved copper is a principal cause of toxicity to mussel embryos exposed to samples from SIYB-1. Key observations supporting this conclusion are as follows:

1. The addition of EDTA during both the summer 2022 and winter 2023 monitoring events successfully removed toxicity in water from SIYB-1. This treatment is highly specific at chelating and thus reducing the toxicity of cationic trace metals, including copper.
2. Concentrations of dissolved copper are consistently elevated at SIYB-1 above values found to cause toxicity to mussel embryos as reported in the literature and based on results from the TMDL Monitoring Program (**Figure 4**).
3. Addition of copper to clean laboratory water and site water from SIYB-1 (Phase II/III TIE) resulted in comparable dose response curves and EC₅₀ values. If another toxicant was present, these curves and EC₅₀ values would be expected to diverge from each other.
4. Toxicity of water from SIYB is consistently observed above a threshold of approximately 8 µg/L as shown in **Figure 4**. The dissolved copper measurement of 7.7 µg/L at SIYB-1 during the winter 2023 sampling event is just below this threshold, thus likely explaining why there was only subtle chronic toxicity observed during this event.
5. The statistical correlation between dissolved copper and % effect on mussel embryo development over time is also strong and statistically significant as shown in **Figure 5**.

Figure 4. Dissolved Copper Levels and Chronic Toxicity Over Time at SIYB-1 and SIYB-2

* Note that effects on mussel embryo development observed in March 2022 at Site SIYB-1 and at Sites SIYB-1 and SIYB-2 in January 2023 were statistically significant using the traditional USEPA flow-chart statistical methods (i.e., Dunnett multiple comparison test). However, effects were not significant using the TST approach.

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1						16	160
Stock 2	500						
Stock 3	500	21	19	11	13	16	160

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

Stock Density
600
 500

Dil Factor
1.6

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T0_1 = 195$, $T0_2 = \overset{168}{175}$, $T0_3 = 175$, $T0_4 = 192$, $T0_5 = 184$
 $\bar{X} = 183$

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AB

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1						16	160
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

Stock Density
800
 500

Dil Factor
1.6

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T01 = 195, T02 = 168, T03 = 175, T04 = 192, T05 = 184$
 $\bar{X} = 183$

Bivalve Larval Survival and Development Test

WSP Laboratory

Batch ID: 03-3101-3021	Test Type: Development-Survival	Analyst:
Start Date: 26 Jan-23 17:30	Protocol: EPA/600/R-95/136 (1995)	Diluent: Diluted Natural Seawater
Ending Date: 28 Jan-23 16:00	Species: Mytilis galloprovincialis	Brine: Not Applicable
Test Length: 46h	Taxon:	Source: Field Collected Age:

Sample ID: 03-1218-4809	Code: 23-W026	Project: Toxicity Identification Evaluation
Sample Date: 25 Jan-23 14:00	Material: Total Copper	Source: Shelter Island Yacht Basin
Receipt Date: 25 Jan-23 17:00	CAS (PC):	Station: SIYB-1
Sample Age: 27h (15.7 °C)	Client: SIYB	

Comments: Reference toxicant test made with undiluted SIYB water from SIYB-1. For analysis, nominal copper concentrations were replaced with actual concentrations measured by Weck Laboratories.

Final Review: AC 3/31/23

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1						16	160
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

Stock Density
 $\frac{800}{500}$

Dil Factor
 $\frac{1.6}{1.6}$

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T01 = 195$, $T02 = \frac{168}{16} = 10.5$, $T03 = 175$, $T04 = 192$, $T05 = 184$
 $\bar{X} = 183$

Bivalve Larval Survival and Development Test

WSP Laboratory

Batch ID: 19-8763-2112	Test Type: Development-Survival	Analyst:
Start Date: 26 Jan-23 17:30	Protocol: EPA/600/R-95/136 (1995)	Diluent: Diluted Natural Seawater
Ending Date: 28 Jan-23 16:00	Species: Mytilis galloprovincialis	Brine: Not Applicable
Test Length: 46h	Taxon:	Source: Field Collected Age:

Sample ID: 07-9263-5687	Code: 23-W026	Project: Toxicity Identification Evaluation
Sample Date: 25 Jan-23 14:00	Material: Total Copper	Source: Shelter Island Yacht Basin
Receipt Date: 25 Jan-23 17:00	CAS (PC):	Station: SIYB-1 (50%)
Sample Age: 27h (15.7 °C)	Client: SIYB	

Comments: Reference toxicant test made with 50% diluted SIYB water from SIYB-1. For analysis, nominal copper concentrations were replaced with actual concentrations measured by Weck Laboratories.

 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/100 μ L	Mean #/mL (x10)
Stock 1						16	160
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

Stock Density
800
 500

Dil Factor
1.6

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T01 = 195$, $T02 = 168$, $T03 = 175$, $T04 = 192$, $T05 = 184$
 $\bar{x} = 183$

QA Review:

AG 2/9/23

Final Review:

SC 3/9/23

Embryo-Larval Development Test

Stock Preparation Worksheet

Test Species: M. galloprovincialis
 Batch ID: 1/26/23 Mission Bay Collection
 Test Type: 48hr Bivalve Development

Test Date: 1/26/2023
 Analyst: AG

Task	
Spawning Induction	1430
Spawning Begins	1510
# Males/# Females	515
Spawn Condition	good
Fertilization Initiated	1600
Fertilization End/Eggs Rinsed	1620/1640
Embryo Counts	1700
Test Initiation	1730

Embryo Density Counts

per ²⁰100 μ L

Stock #	Stock Volume (mL)	Rep 1	Rep 2	Rep 3	Rep 4	Mean #/ ³⁰ 100 μ L	Mean #/mL (x10) ⁵⁰
Stock 1						16	16
Stock 2	500						
Stock 3	500	21	19	11	13	16	800

Cell Division:

	% Divided
Stock 1	
Stock 2	90
Stock 3	98

Selected Stock: 3

Stock Density
 $\frac{800}{500}$

Dil Factor
 $\frac{1.6}{1.6}$

Adjust selected embryo stock to 500 embryos/mL.
 Dilution Factor = Stock Density/mL/500

In 10 mL sample volume add 500 μ L of 500 embryo/mL stock to obtain 25 embryos/mL in test vials.

Notes:

$T0_1 = 195$, $T0_2 = \frac{168}{16} = 175$, $T0_3 = 175$, $T0_4 = 192$, $T0_5 = 184$

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Chris Stransky,

Enclosed are the results of analyses for samples received 1/27/23 with the Chain-of-Custody document. The samples were received in good condition, at 3.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Notes and Definitions

Item	Definition
A-01	filtered and acidified 01/25/2023
J	Estimated conc. detected <MRL and >MDL.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
%REC	Percent Recovery
Dil	Dilution
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.
