

***San Diego Bay Integrated Natural Resources Management Plan***

**Part V: Appendices**

## **Appendix A: Acronyms**

ACH	America's Cup Harbor
ASW	Anti-Submarine Warfare
BMP	Best Management Practice
CCA	California Coastal Act
CCC	California Coastal Commission
CCMP	California Coastal Management Plan
CDFG	California Department of Fish and Game
CDPH	California Department of Public Health
CDPR	California Department of Parks and Recreation
CEQ	Council on Environmental Quality
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CNPS	California Native Plant Society
CVN	Ocean Control Carrier (concept)
CVWR	Chula Vista Wildlife Reserve
CWA	Clean Water Act
CZARA	Coastal Zone Act Reauthorization Amendments
CZMA	Coastal Zone Management Act
DDT	Dichloro-diphenyl-trichloroethane
DNA	Deoxyribonucleic Acid
EA	Environmental Assessment
EIR	Environmental Impact Report
EIS	Environmental Impact Statement
EPA	US Environmental Protection Agency
ESA	Endangered Species Act
FISC	US Navy Fleet and Industrial Supply Center
FY	Fiscal Year
GIS	Geographic Information System
IMO	International Maritime Organization
INRMP	Integrated Natural Resources Management Plan
LCP	Local Coastal Plan
LHA	Amphibious Assault Ship (General-Purpose)
LHD	Amphibious Assault Ship (Multi-Purpose)
MHHW	Mean Higher High Water
MHWS	Mean High Water, Spring
MLLW	Mean Lower Low Water
MLWS	Mean Low Water, Spring
MMPA	US Marine Mammal Protection Act
MOU	Memorandum of Understanding
MPA	Marine Protected Areas
MPRSA	Marine Protection, Research and Sanctuaries Act
MRFSS	Marine Recreational Fishery Sportfishing Survey
MSCP	Multiple Species Conservation Plan
NAB	Naval Amphibious Base
NASNI	Naval Air Station North Island
NAVSTA	Naval Station

NCMT	National City Marine Terminal
NEP	National Estuary Program
NEPA	National Environmental Policy Act
NIOC	Navy Installation Oversight Committee
NISA	National Invasive Species Act
NMFS	National Marine Fisheries Service
NOAA	National Oceanic & Atmospheric Administration
NPDES	National Pollution Discharge Elimination System
NRAD	Navy Research and Development
NRMP	Natural Resource Management Plan
NRRF	Naval Radio Receiving Facility
NS&T	National Status and Trends
NTC	Naval Training Center
NWR	National Wildlife Refuge
OPNAVINST	Chief of Naval Operations Instruction
OREHP	Ocean Resources Enhancement and Hatchery Program
PAHs	Polynuclear Aromatic Hydrocarbons
PBR	Potential Biological Removal
PCBs	Polychlorinated biphenyls
PERL	Pacific Estuarine Research Laboratory
RCD	Resource Conservation District
RWQCB	Regional Water Quality Control Board
SANDAG	San Diego Association of Governments
SCB	Southern California Bight
SCCWRP	Southern California Coastal Water Research Project
SDG&E	San Diego Gas & Electric Company
SDRWPCB	San Diego Regional Water Pollution Control Board
SDSU	San Diego State University
SDUPD	San Diego Unified Port District
SLC	State Lands Commission
SMNWR	Sweetwater Marsh National Wildlife Refuge
SPAWAR	Space and Naval Warfare Command
SUBASE	Submarine Base
SWRCB	State Water Resources Control Board
TAMT	Tenth Avenue Marine Terminal
TBT	Tributyltin
TMDL	Total Maximum Daily Load
TOC	Technical Oversight Committee
UCSD	University of California, San Diego
USACOE	US Army Corps of Engineers
USCG	US Coast Guard
USDA	US Department of Agriculture
USDoD	US Department of Defense
USFWS	US Fish and Wildlife Service

## **Appendix B: Glossary**

<b>Abiotic</b>	A non-living component of the environment.
<b>Adaptive Management</b>	A dynamic planning process that recognizes that the future cannot be predicted perfectly. In response to these imperfect predictions, planning and management strategies are modified frequently as better information becomes available. It is a continuous process requiring constant monitoring and analysis of past actions, which are then fed back into current decisions.
<b>Algae</b>	Any of several groups of autotrophs (organisms that produce organic material from inorganic chemicals and energy) that lack the structural features (true leaves, roots, and stems) of the higher plants.
<b>Annual Increment</b>	A management section addendum, prepared annually, to facilitate implementation of a Natural Resource Management Plan section. The annual increment concisely provides detail and cost estimates of proposed work or projects to be accomplished during a fiscal year.
<b>Artificial Hard Substrate</b>	An artificial habitat that may consist of rock riprap, seawalls, pier pilings, floating docks, mooring systems, and derelict ships/ship parts.
<b>Assessment</b>	An evaluation that can be based on a single measurement or observation, or can incorporate a series of observations to obtain a better estimate of a particular parameter; often an assessment or inventory serves as the first step towards establishing a monitoring project.
<b>Baseline</b>	Serving as a basis, such as for a survey.
<b>Bathymetry</b>	The science of mapping the contours of ocean floors or lake beds.
<b>Bayscaping</b>	Appropriate native and water-conserving landscaping designs.
<b>Beaches and Dunes</b>	Habitats along the shoreline that are subject to wind and wave turbulence, salt spray, shifting sands, high temperatures, and desiccation.
<b>Benthic</b>	Occurring or related to the bottom of the sea.
<b>Benthos</b>	All bottom habitats from intertidal to deeper dredged channels.
<b>Best Management Practices</b>	Practical, economical and effective management or control practices that will reduce or prevent water pollution. Usually applied as a system of practices based on site-specific conditions rather than a single practice. They are usually prepared by state agencies for land disturbing activities related to agriculture, forestry, and construction.
<b>Bight</b>	A bend or curve in the coastline.
<b>Bioaccumulation</b>	A measure of bioavailability and thereby the potential for chronic or food web effects of sediment contaminants in long-term exposures.
<b>Biodiversity</b>	The diversity of life and its processes; living organisms, the genetic differences among them and the communities and ecosystems in which they occur.
<b>Biological Assessment</b>	A biological evaluation conducted as part of the interagency regulations under the Endangered Species Act. The purpose of the assessment is to allow the regulatory agency to determine whether or not the proposed action is likely to adversely affect the continued existence of a species listed as endangered or threatened, or proposed for listing.
<b>Biomass</b>	The total weight of living organisms.
<b>Biotic</b>	A living component of the environment.
<b>Bittern</b>	The bitter liquid left after the crystallization of salt from brine.

<b>Bloom</b>	A sharp increase in the population of phytoplankton, as often occurs in the spring, summer, or fall in different parts of the Bay.
<b>Brackish</b>	Somewhat salty, but not as saline as open ocean water.
<b>Candidate Species</b>	Any species being considered by the Secretary of Interior or Commerce for listing under the Endangered Species Act as an endangered or a threatened species, but not yet the subject of a proposed listing.
<b>Cetaceans</b>	Marine mammals with extreme adaptations: the presence of a “blowhole” on the apparent top of the head, flippers as anterior swimming appendages, and horizontal flukes as posterior swimming appendages.
<b>Chlorophyll</b>	A green photosynthetic pigment.
<b>Coastal Created Lands and Disturbed Uplands</b>	Habitats created by deposition of dredged sediments from other locations.
<b>Coastal Zone</b>	An area specifically identified by a coastal state in its approved Coastal Zone Management Plan. It is an area of coastal waters and adjacent shorelines strongly influenced by each other, including islands, transitional and intertidal areas, salt marshes, wetlands, and beaches. Excluded from the coastal zone are lands solely subject to or held in trust by the federal government, its officers or agents.
<b>Coliform</b>	A group of bacteria found in the large intestine of humans and other warm-blooded animals. Coliform counts are used to determine the degree to which water has been polluted by sewage.
<b>Consensus</b>	A decision-making process in which all parties involved explicitly agree on the final decision. Consensus decision making does not mean that all parties are completely satisfied with the final outcome, but that the decision is acceptable to all because no one feels that his or her vital interests or values are violated by it.
<b>Conservation</b>	The prudent care, protection, and management of natural resources that best reflect sound resources stewardship for present and future generations.
<b>Copepod</b>	A type of small, crustacean zooplankton.
<b>Creosote</b>	An oil, found in pier pilings, from which polycyclic aromatic hydrocarbons are released.
<b>Critical Habitat</b>	The geographic area in which are found those physical or biological features essential to the conservation of a species listed and published by the US Fish and Wildlife Service or the National Marine Fisheries Service under the authority of the Endangered Species Act.
<b>Crystallizer</b>	Salt ponds with highest salinity content. Final stage of salt extraction process.
<b>CVN</b>	Part of the Navy’s new, more modern fleet of deep-draft ships powered by nuclear energy.
<b>Deep Subtidal</b>	Bay habitat deeper than the approximate margin of the maintained channels (>20 ft [6 m]), and including the bottom sediments to the water surface.
<b>Demersal Fish</b>	Bottom-dwelling fish.
<b>Deposit Feeders</b>	Animals that ingest detritus and associated bacteria accumulating on and within the sediment.
<b>Detritus</b>	Fresh to partly decomposed plant and animal matter.
<b>Diatoms</b>	Single-celled algae with a two part, perforated, silicious shell. Diatoms are the most common type of phytoplankton in the estuary.

<b>Dinoflagellate</b>	A unicellular organism with two unequal flagella.
<b>Dissolved Oxygen</b>	The concentration of oxygen in water at a specified temperature and atmospheric pressure. It is used as a measure of the water's ability to support aquatic life. Low concentrations do not support fish or similar organisms.
<b>Dredge Spoil</b>	Bottom sediments or materials that have been excavated from a waterway.
<b>Ecosystem</b>	A unit of land or water comprising populations of organisms considered together with their physical environment and the interacting processes between them.
<b>Ecosystem Function</b>	Interacting processes by component parts and their environment. Without the vital processes, the system is dysfunctional or nonfunctional.
<b>Ecosystem Management</b>	Ecosystem management in the Department of Defense draws on a long-term vision of desired future ecological conditions, integrating ecological, economic and social factors. The goal of ecosystem management is to maintain and improve the native biological diversity and sustainability of ecosystems, while supporting human needs, including the military mission.
<b>Eelgrass</b>	Beds of aquatic plants, primarily represented by <i>Zostera marina</i> , extending from the low tide zone to primarily 6 to 10 ft (1.8 to 3.0 m), and less commonly to 15 ft (4.6 m).
<b>Endangered or Threatened Species</b>	A species of fauna or flora that has been listed by the US Fish and Wildlife Service or the National Marine Fisheries Service for special protection and management under the Federal Endangered Species Act, or by the California Fish & Game Commission for protection under the California Endangered Species Act.
<b>Endemic</b>	Restricted to a particular location; often refers to a species that is found only in certain locations.
<b>Enhancement</b>	To increase the function and values of a low quality or degraded wetland.
<b>Entrainment</b>	To carry along, drag, or trail, as in a current.
<b>Environs</b>	Surrounding area. Vicinity.
<b>Epifauna</b>	Marine animals that cling to the surface of rocks or other substrate to avoid being swept away by wave action.
<b>Epiphyte</b>	A plant that grows upon another plant, but is not parasitic upon it.
<b>Estuary</b>	A semi-enclosed body of water that has a free connection with the open ocean and within which sea water is measurably diluted with fresh water derived from land drainage. Estuaries are found at the mouths of rivers and streams and are subject to tidal conditions. They include five habitat types: 1) Upland, 2) Freshwater, 3) Intertidal, 4) Subtidal, and 5) Saltwater.
<b>Exotic Species</b>	Species that occur in a given place, area, or region as the result of direct or indirect, deliberate or accidental introduction of the species by human activity, and for which introduction has permitted the species to cross a natural barrier to dispersal. Also called non-native, non-indigenous, or alien.
<b>Filter Feeders</b>	Organisms that feed by filtering out small food items such as detritus and plankton that are suspended in the water column; distinguished from deposit feeders that glean such items from the bottom.
<b>Fines</b>	In aquatic ecology, bed materials less than 2 millimeters (mm) in diameter, including silt, clay, and fine organic materials.

<b>Fish and Wildlife Cooperative Plan</b>	A plan for the cooperative management of fish and wildlife on a military installation by the host military activity and the appropriate federal and state fish and wildlife agencies as required by the Sikes Act.
<b>Fish and Wildlife Management</b>	A coordinated program of actions designed to preserve, enhance and regulate indigenous fish and wildlife and their habitats, including conservation of protected species and non-game species, management and harvest of game species, bird aircraft strike hazard reduction, and animal damage control.
<b>Food Web</b>	An assemblage of organisms in an ecosystem, including plants, herbivores and carnivores, showing the relationship of who eats whom.
<b>Footprint</b>	The functional planning zone used in the San Diego Bay Integrated Natural Resource Management Plan; also the site covered or impacted by a project.
<b>Fouling Organism</b>	An invertebrate, such as a barnacle or shipworm, that bores into or encrusts on submerged surfaces such as boats and pilings.
<b>Freshwater Marsh</b>	Nontidal wetland dominated by persistent, emergent, non-woody vegetation.
<b>Freshwater Wetlands and Riparian</b>	Nontidal habitat areas supported at the entry points of freshwater tributaries.
<b>Game Species</b>	Fish and wildlife that may be harvested per applicable federal and state hunting and fishing laws.
<b>Gastropods</b>	Snails and other molluscs that typically possess a coiled dorsal shell and a ventral creeping foot.
<b>Geographical Information System</b>	A computer system used to overlay large volumes of spatial data of different kinds. The data are referenced to a set of geographical coordinates and encoded in digital format so that they can be sorted, selectively retrieved, statistically and spatially analyzed.
<b>Goal</b>	Broad statement of intent, direction and purpose. An enduring, visionary description of where you want to go. A goal is not necessarily completely obtainable.
<b>Grounds</b>	All land areas not occupied by buildings, structures, pavements, and other facilities. Depending on the intensity of management, grounds may be classed as improved, i.e. those near buildings, semi-improved, or unimproved.
<b>Habitat</b>	An area where a plant or animal species lives, grows, and reproduces, and the environment that satisfies their life requirements.
<b>Habitat Conversion</b>	An approach to manipulating habitat conditions in which a habitat is converted from one type to another in order to mimic a desirable natural habitat present at another location; also called "Habitat Replacement".
<b>Habitat Creation</b>	See "Habitat Conversion"; new habitat is not really created but is converted out of another habitat.
<b>Habitat Enhancement</b>	Habitat enhancement involves the rejuvenation and improvement of the natural system to increase the values it presently has and add new ones. For wetlands, increasing the functions and values of a low-quality or degraded wetland.
<b>Habitat Replacement</b>	See "Habitat Conversion".
<b>Holoplankton</b>	Zooplankton that spend their entire lives in the open water environment.
<b>Hydrodynamic</b>	The physical features of water motion.
<b>Hypersaline</b>	Saltier than sea water.

<b>Ichthyoplankton</b>	Planktonic larvae of fishes.
<b>Infauna</b>	Marine animals that burrow in substrata (e.g., gravel, sand, mud) to avoid disturbance by wave action and other physical stresses of the environment.
<b>Injury</b>	Any adverse change in a natural resource or impairment of a service provided by a resource relative to baseline, reference, or control conditions. Injury incorporates the concepts of “destruction,” “loss”, and “loss of use.”
<b>Integrated Natural Resources Management Plan</b>	An integrated plan based on ecosystem management that shows the interrelationships of individual components of natural resources management (e.g. fish and wildlife, forestry, land management, public access) to mission requirements and other land use activities affecting an installation’s natural resources.
<b>Interstitial Fauna</b>	Tiny invertebrates that live and move around in spaces between sediment grains or attach to the grains. They pass through standard sampling sieves.
<b>Intertidal Flats</b>	Muddy to sandy habitats between -2.2 and +7.8 ft (-0.7 and +2.4 m); normally devoid of flowering aquatic plants, but may include algae.
<b>Inventory</b>	A detailed list of items (e.g., organisms, habitats, boats) taken at a specific time and place; it often serves as the first step towards establishing a monitoring project.
<b>Invertebrate</b>	Animal lacking a backbone.
<b>Isopods</b>	Small, dorsoventrally flattened crustaceans such as the sea louse.
<b>Landscape</b>	This term is gaining increasing importance in conservation planning. The landscape contains more than one natural community or habitat and allows attention to be paid to both biodiversity and the need to link natural communities and habitats to support biodiversity.
<b>Larva</b>	Immature stage of an animal that looks different from the adult.
<b>Life History</b>	The phases that an organism may pass through during its life.
<b>Listed</b>	A plant or animal species that has been determined by the state or federal government to be threatened with extinction.
<b>Littoral</b>	Ocean habitat between the highest high and the lowest low tide lines.
<b>Macroalgae</b>	Seaweed.
<b>Management</b>	The application of skill or care in the manipulation, use, treatment or control of things or persons, or in the conduct of an activity, project, program, etc. Includes, but is not limited to, actions or methods such as: assessment, education, enhancement, inventories, laws, mitigation, monitoring, objectives, policies, protection, regulations, research, restoration, and surveys. Also called “stewardship”.
<b>Management Strategy</b>	The combination of the objective(s) and policies used to describe the ways and means of managing.
<b>Mariculture</b>	The techniques applied to growing marine organisms in captivity.
<b>Marine Protection Area</b>	Any area of intertidal or subtidal terrain, together with its overlying water and associated flora, fauna, historical and cultural features that has been reserved by law or other effective means to protect part or all of the enclosed environment.
<b>Marsh</b>	More or less permanently wet area within the intertidal zone, typified by wetland plants within a muddy habitat.
<b>Mean High Tide</b>	A line in 1918 showing the area of the Bay to be 21 to 22 mi <sup>2</sup> (54 to 57 km <sup>2</sup> ).

<b>Meiofauna</b>	Microscale animals that live on the bottom, often used as a synonym of interstitial fauna.
<b>Meroplankton</b>	The larval forms of invertebrates that later settle to the bottom and become benthic juveniles and adults; also called “temporary plankton”.
<b>Mitigation</b>	Mitigation is the avoidance, minimization, rectification, and reduction or elimination of negative impacts or compensation by replacement or substitution.
<b>Moderately Deep Subtidal</b>	A habitat extending from the approximate lower depth of most eelgrass to the approximate edge of the shipping channel (–12 to –20 ft/–4 to –6 m MLLW). It represents areas that generally have been dredged in the past but are not maintained as navigational channels.
<b>Monitoring</b>	<p>A series of observations over time with the intent to assess change. Often an assessment or inventory serves as the first step towards establishing a monitoring project. Based on each one’s purpose, the following types of monitoring are defined:</p> <ul style="list-style-type: none"> <li>□ <b>Trend monitoring:</b> Measurements that are made at regular, well-spaced time intervals in order to determine the long-term trend in a particular parameter.</li> <li>□ <b>Baseline monitoring:</b> Measurements used to characterize existing conditions (e.g., water quality, wildlife population, habitat quality) and to establish a data base for planning or future comparisons. While the intent is to capture much of the temporal variability of the constituents of interest, there is no explicit end point at which continued baseline monitoring becomes trend monitoring. Often used synonymously with “inventory monitoring” and “assessment monitoring”.</li> <li>□ <b>Implementation monitoring:</b> Administrative determination taken to assess whether activities were carried out as planned (e.g., Best Management Practices, mitigation measures, permit conditions).</li> <li>□ <b>Effectiveness monitoring:</b> Measurements taken to evaluate whether specified individual management practices had the desired effect.</li> <li>□ <b>Project monitoring:</b> Measurements taken to assess the impact of a particular activity or project, such as on a before or after basis or on a control site versus impact site basis. May be considered by some agencies to be a subset of effectiveness monitoring.</li> <li>□ <b>Compliance monitoring:</b> Measurements taken to determine whether specified water-quality or other measurable criteria are being met. Usually the regulations associated with individual criterion specify the location, frequency, and method of measurement.</li> </ul>
<b>Mudflat</b>	Part of the continuum from open water to dry land, rich in organic matter and microorganisms, generally exposed during all but highest tides.
<b>Multiple Use</b>	The sustainable use of natural resources for the best combination of purposes to meet the long-term needs of the Department of Defense and the public.
<b>Natural Community</b>	This term generally refers to a vegetation community, such as southern coastal sage scrub, but it is used to encompass all of the habitat, ecosystems, and plant and animal species found within the community.
<b>Natural Resources</b>	Landforms, soils, waters, and their associated flora and fauna.

<b>Natural Resources Management Plan</b>	A five-year planning document that guides legally and ecologically sound, cost effective management of natural resources to maximize benefits for the installation and neighboring community. It addresses all land, agriculture, forest, fish, and wildlife and outdoor recreation resources of the installation. Superseded by Integrated Natural Resource Management Plan.
<b>Natural Resources Management Procedural Manual</b>	Reference that provides comprehensive guidance for implementing requirements of pertinent laws, executive orders, and federal regulations, Department of Defense directives, Secretary of Navy and Naval Operations instructions.
<b>Natural Resources Trustee</b>	Federal trustees are those agencies that have statutory responsibilities with regard to protection or management of natural resources or stewardship responsibilities as an manager of federally owned land. State agencies and Indian tribes may also be trustees.
<b>Nematode</b>	An invertebrates with a cylindrical body, a conspicuous body cavity, and a complete digestive tract.
<b>NIMITZ</b>	A class of carriers that are part of the Navy's new, more modern fleet of deep-draft ships powered by nuclear energy, referred to as CVNs.
<b>Non-game Species</b>	Fish and wildlife species that are not harvested for recreational or subsistence purposes.
<b>Nonpoint Source Pollution</b>	Pollution caused by diffuse sources that are not regulated as point sources and are normally associated with runoff from construction activities, urban, agricultural and silvicultural runoff, and other land disturbing activities such as military training and operations that disturb lands, soils, and waters. It can result from land runoff, precipitation, atmospheric deposition, or percolation.
<b>Noxious Weeds</b>	Plant species identified by federal or state agencies as requiring control or eradication.
<b>Objective</b>	Specific statement that describes a desired condition; can be quantitative.
<b>Pelagic</b>	Living in the water column above the bottom of the ocean.
<b>Phytoplankton</b>	Minute, floating aquatic plants.
<b>Pickling</b>	Salt ponds with second highest salinity content.
<b>Plankton</b>	Floating or drifting organisms, especially very small ones, found at various depths in the ocean and fresh water; includes protozoa, invertebrates, and larval forms of vertebrates.
<b>Planning Level Survey</b>	An inventory of sensitive and significant resources (biological, cultural, or geological) that must be identified in order to prevent impairment of the military mission or meet regulatory requirements.
<b>Policy</b>	Formally-adopted strategy or decision to carry out a course of action.
<b>Polychaetes</b>	Segmented worms that have flat lateral extensions on each body segment.
<b>Polychlorinated Biphenyls</b>	A group of man-made organic chemicals, including about 70 different, but closely related, compounds made up of carbon, hydrogen, and chlorine. If released into the environment, they persist for long periods of time and can concentrate in food chains. They are not water soluble and are suspected to cause cancer in humans. They are an example of an organic toxicant.
<b>Polycyclic (polynuclear) Aromatic Hydrocarbons</b>	A class of complex organic compounds that are among the heaviest molecular fraction of petroleum hydrocarbons, some of which are persistent and/or cancer-causing. These compounds are released through fossil fuel combustion, spills of oil, gasoline, diesel and other petroleum products, creosote oil, and asphalt production.

<b>Practical Salinity Unit</b>	A standardized measure of salinity used to adjust different salinity measurements to a constant electrical conductivity, temperature, and pressure.
<b>Primary</b>	First stage of salt extraction process and least saline in Salt Ponds.
<b>Prohibition</b>	As used here, prohibition refers to laws in California that restrict activities directly affecting rare plants. This includes the Federal Endangered Species Act, the California Endangered Species Act, and the California Native Plant Protection Act.
<b>Projects</b>	Includes studies, plans, surveys, inventories, and land/water treatments as well as physical improvements.
<b>Proposed Species</b>	Any species of plant or animal that is proposed in the Federal Register to be listed under Section 4 of the Endangered Species Act.
<b>Regulation</b>	A rule prescribed for controlling some matter. Generally refers to statutory laws and administrative rules, policies, ordinances, permits and other restrictive conditions placed on an activity by a regulatory agency. While a law is a regulation, a regulation is not a law; a regulation is an interpretation of the law.
<b>Regulatory Agency</b>	A government agency delegated powers for implementing regulations, either directly as a decision-maker or enforcer of regulations (e.g., Environmental Protection Agency, Regional Water Quality Control Board, US Army Corps of Engineers) or indirectly as an advisor on regulations (e.g., National Marine Fisheries Service and US Fish and Wildlife Service on Clean Water Act, Sec. 404).
<b>Renewable Natural Resources</b>	Natural resources such as forests and wildlife that replace themselves in a relatively short time and are capable of providing sustained yields.
<b>Research</b>	A search or investigation undertaken to discover facts and reach new conclusions by the critical study of a subject or by a course of scientific inquiry.
<b>Restoration</b>	Habitat restoration implies returning certain habitats to their former historical condition. For wetlands, restoration means establishing wetland habitat at an upland site that previously supported wetlands.
<b>Riprap</b>	Layer of large, durable fragments of broken rock, specially selected and graded. Its purpose is to prevent erosion by waves or currents and thereby preserve the shape of a surface, slope, or underlying structure.
<b>Riparian Areas</b>	Areas closely related to or bordering rivers, streams, lakes, arroyos, playas, ravine bottoms, etc. Dominated by woody vegetation and nontidal water regimes.
<b>River Mouths</b>	Areas in which water from rivers flows into the Bay. They no longer have a natural role, and are controlled by dams or diversion.
<b>Salinities</b>	The total amount of salts in seawater.
<b>Salt Marsh</b>	A marsh area having high salinities in the ambient water and substrate, typical of estuarine areas, or other areas subject to flooding with ocean water, and characterized by thick mats of salt-loving plants.
<b>Salt Works</b>	A habitat consisting of shallow, open-water cells of different salinity levels interspersed with mudflats, dry dikes and salt marsh.
<b>Seagrass</b>	Any of various grasslike plants growing in or by the sea; especially eelgrass ( <i>Zostera marina</i> ).
<b>Seaweed</b>	Any macroscopic marine algae; such plants <i>en masse</i> or collectively.
<b>Section 7</b>	Section 7 of the Federal Endangered Species Act specifies that federal agencies must consult with the US Fish and Wildlife Service regarding activities that could affect listed species.

<b>Section 9</b>	Section 9 of the Federal Endangered Species Act prohibits violations of the act, including take of listed fish and wildlife species. It prohibits the destruction of listed plant species on federal land or on private land when done in knowing violation of a state law.
<b>Section 10(a)</b>	Section 10(a) of the Federal Endangered Species Act provides for permits to take listed species under certain conditions.
<b>Sediment</b>	Particles of organic or inorganic origin that accumulate in loose form.
<b>Sensitive</b>	Highly responsive or susceptible to modification by external agents or influences.
<b>Sensitive Habitat</b>	Land, water and vegetation needed to maintain one or more sensitive species.
<b>Sensitive Species</b>	Those species federally listed as endangered or threatened under the Endangered Species Act, proposed for listing, or candidate status.
<b>Sessile</b>	Attached to one place.
<b>Shallow Subtidal</b>	Bay habitat extending from -2.2 to -12 ft (-0.7 to -3.7 m), and including the bottom sediments to the water surface.
<b>Significant</b>	Resources identified as having special importance, or as having or likely to have more influence on a particular aspect of the environment than other components.
<b>Sludge</b>	Semiliquid sewage that has been treated and partially decomposed by bacteria.
<b>Species</b>	A group of individuals that have their major characteristics in common and (usually) can only breed with each other.
<b>Species Abundance</b>	The distribution of the number of species and the number of individuals of each species in a community.
<b>State Listed Species</b>	Any species of fish, wildlife or plant that is protected by an appropriate state agency as issued in a state's endangered species law and other pertinent regulations.
<b>Stewardship</b>	The responsibility to inventory, manage, conserve, protect, and enhance the natural resources entrusted to one's care in a way that respects the intrinsic value of those resources, and the needs for present and future generations.
<b>Stratification</b>	Separation of an aquatic community into distinguishable layers on the basis of temperature, light, vegetative structure and other such factors creating zones for different plant and animal types.
<b>Strategy</b>	Explicit description of ways and means chosen to achieve objectives.
<b>Structural Surrogates</b>	Habitats being added or modified in order to sustain endangered or other sensitive species.
<b>Submergiment Vegetation</b>	Plants that are rooted in and grow in the sediments at the bottom of a saltwater or freshwater body.
<b>Substrate</b>	The material forming the bed of a body of water; the material upon which plants grow; or the nutrient medium or physical structure on which an organism feeds and develops.
<b>Subtidal</b>	Area below the low tide zone in oceans and bays, not exposed to air.
<b>Survey</b>	A comprehensive look or description; a written statement embodying the result of an inspection.
<b>Suspension Feeders</b>	Animals that capture particles suspended in the overlying water either by filtering or other means.
<b>Sustainability</b>	The ability of an ecosystem to maintain ecological processes and functions, biological diversity, and productivity over time.

<b>Sustainable Management</b>	Managing the use, development, and protection of natural and physical resources in a manner or at a rate that enables people and communities to provide for their social, economic, and cultural well-being, and for their health and safety while (1) sustaining the potential of natural and physical resources to meet reasonably foreseeable needs of future generations; (2) safeguarding the life-supporting capacity of air, water, soil, and ecosystems; and (3) avoiding, remedying, or mitigating any adverse effects of activities on the environment.
<b>Sustainable Use</b>	Use of an organism, ecosystem, or other renewable resource at a rate that does not exceed its capacity for renewal.
<b>Take</b>	The Federal Endangered Species Act defines take as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct,” with regards to threatened or endangered species.
<b>Terrestrial Habitat</b>	Habitats along Bay margins including riparian regions, fallowed agricultural lands, sandy beaches, foredunes, backdunes, coastal scrub, and eucalyptus groves.
<b>Tidal cycle</b>	A cycle in which differing amounts of Bay water leave the Bay, mix with ocean water and return with the next tide.
<b>Tidelands</b>	Land below the historic (1850) mean high tide line, some of which is now filled in and developed.
<b>Tintinnid</b>	A ciliate protozoan that secretes vase-like cases.
<b>Toxic</b>	Relating to or caused by a substance that is poisonous substance to a living organism.
<b>Trophic level</b>	Functional classification of organisms in an ecosystem according to feeding relations from first level autotrophs through herbivores and carnivores.
<b>Turbidity</b>	A measure of the amount of material suspended in the water. Increasing the turbidity of the water decreases the amount of light that penetrates the water column. Very high levels of turbidity can be harmful to aquatic life.
<b>Unvegetated Shallow Soft-Bottom</b>	Habitats in which the soft bottoms of unconsolidated sediment are unstable and shift in response to tides, wind, waves, currents, human activity, or biological activity.
<b>Upland Transition</b>	Habitat surrounding the upper edge of the marsh and the zone of highest tide, typified by non-wetland vegetation.
<b>Vegetated Shallow Subtidal</b>	A productive benthic habitat formed by beds of eelgrass.
<b>Watchable Wildlife</b>	Promotion of the recreational viewing of wildlife as a federal program.
<b>Water Column</b>	Pelagic open water environment.
<b>Water Quality</b>	The chemical, physical, and biological qualities of water.
<b>Waterbirds</b>	Birds that use moist to flooded conditions of wetlands. Nearly 800 species can be described as waterbirds, of which 260 inhabit North America. Birds lumped as “waterbirds” include cormorants, ibis, pelicans, herons, bitterns, kingfishers, cranes, rails, avocets, sandpipers and others as well as waterfowl.
<b>Waterfowl</b>	One of a group of migratory birds of the bird family Anatidae, which includes ducks, geese, and swans. In North America, this family is represented by 58 species, making it the most diverse family of waterbirds.
<b>Watershed</b>	An area of land draining water, organic matter, dissolved nutrients, and sediments into a lake, stream, or bay.

**Wetlands**

Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions, such as swamps, marshes, and bogs.

**Wetlands (designated)**

A wetland with one or more of the following attributes: 1) the land periodically supports water plants (hydrophytes), 2) the substrate is dominated by undrained hydric soil, or 3) the soil is periodically saturated or covered by shallow water.

**Wildlife  
Management**

The practical application of scientific and technical principles to wildlife populations and habitats so as to manage such populations essentially for ecological, recreational, and/or scientific purposes.

**Zooplankton**

Floating, often microscopic, animals and immature stages of large animals.

## PHYTOPLANKTON

### Diatoms and Other Groups

*Achnanthes* sp.  
*Asterionella* sp.  
*Biddulphia* sp.  
*Ceratulina* sp.  
*Chaetoceros* sp.  
*Coenobiodiscus* sp.  
*Coscinodiscus* sp.  
*Ditylum* sp.  
*Dunaliella* sp.  
*Eucampia* sp.  
*Fragilaria* sp.  
*Grammatophora* sp.  
*Gyrosigma* sp.  
*Leptocylindrus* sp.

*Licomorpha* sp.  
*Navicula* sp.  
*Nitzschia* sp.  
*Phaeodactylum tricornutum*  
*Pleurosigma* sp.  
*Rhizosolenia* sp.  
*Skeletonema* sp.  
*Stephanophysix* sp.  
*Streptotheca* sp.  
*Suriella* sp.  
*Thalassionema* sp.  
*Thalassiothrix* sp.  
other identified diatoms  
unidentified tintinnids

### Dinoflagellates

*Ceratium* sp.  
*Dinophysis* sp.  
*Lingulodinium* sp.  
*Gymnodinium oplendens*

*Noctulica* sp.  
*Peridinium* sp.  
*Prorocentrum* sp.

## ALGAE

### Chlorophyta (Green Algae)

**Bryopsidaceae**  
*Bryopsis corticulans*  
*Derbesia marina*  
**Cladophoraceae**  
*Chaetomorpha linum*  
*Cladophora* sp.

**Ulotrichaceae**  
*Ulothrix* sp. woolly hair  
*Ulotricales* sp.  
**Ulvaceae**  
*Enteromorpha* sp.  
*Ulva expansa* sea lettuce  
*Ulva tcnista*

### Phaeophyta (Brown Algae)

**Alariaceae**  
*Egregia laevigata*  
*Eisenia arborea*  
**Bangiaceae**  
*Porphyra perforata*  
**Dictyotaceae**  
*Dictyota flabellata*  
**Ectocarpaceae**  
*Ectocarpus* spp.  
**Fucaceae**  
Fucaceae sp.  
**Sargassaceae**  
*Sargassum agarhianum*

\* *Sargassum muticum* sargassum  
*Sargassum palmeri*  
**Scytosiphonaceae**  
*Colpomenia sinuosa*  
*Endarachne binghamiae*  
*Scytosiphon lomentaria*

## Rhodophyta (Red Algae)

### **Ceramiales**

*Aglaothamnium cordatum*

*Antithamnion* sp.

*Callithamnion* sp. A.

*Ceramium aerea*

*Ceramium eatonian*

*Griffithsia furcellata*

*Griffithsia pacifica*

*Tiffaniella snyderae*

### **Dasyaceae**

*Dasya pacifica*

*Dasya sinicola* var. *abyssicola*

*Dasya sinicola* var. *californica*

### **Gelidiales**

*Gelidium nudifrons* *gelidium*

*Gelidium* sp. A

### **Gigartinales**

*Gigartina* spp. Turkish towel

### **Gracilariaceae**

*Gracilaria lemaneiformis*

*Gracilaria pacifica*

### **Hypneaceae**

*Hypnea valentiae*

### **Plocamiaceae**

*Plocamium* sp.

### **Rhodomelaceae**

*Polysiphonia bajacali*

*Polysiphonia pacifica*

*Pterochondria woodii* var. *pymaea*

*Rhodomelaceae* sp.

### **Rhodymeniaceae**

*Rhodymenia californica*

*Rhodymenia* spp.

*Sarcodiotheca gaudichaudii*

## PLANTS

### Gymnosperms

#### **Pinaceae**

\* *Pinus halapensis* Aleppo pine

### Dicots

#### **Aizoaceae**

\* *Carpobrotus chilensis* sea fig

\* *Carpobrotus edulis* sea fig, hottentot-fig

\* *Mesembryanthemum crystallinum* ice plant, crystalline iceplant

\* *Mesembryanthemum nodiflorum* little ice plant, slender-leaved iceplant

#### **Anacardiaceae**

*Malosma laurina* laurel leaf sumac

*Rhus integrifolia* lemonadeberry

\* *Schinus molle* Peruvian pepper tree

\* *Schinus terebinthifolius* Brazilian pepper tree

#### **Apiaceae**

\* *Foeniculum vulgare* sweet fennel

#### **Asteraceae**

*Amblyopappus pusillus* coast weed

*Ambrosia psilostachya* western ragweed

*Artemisia californica* California sagebrush

*Baccharis salicifolia* mule fat

*Baccharis sarothroides* chaparral broom

\* *Bassia hyssopifolia* bassia

\* *Centaurea melitensis* star thistle, tocalote

\* *Chrysanthemum carinatum* tricolor chrysanthemum

\* *Chrysanthemum coronarium* garland chrysanthemum, crown daisy

\* *Conyza canadensis* Canada horseweed

\* *Cotula coronopifolia* brass buttons

*Encelia californica* California (coastal) encelia

*Gnaphalium bicolor* two-color cudweed

*Gnaphalium californicus* ladies' tobacco

*Gnaphalium canescens beneolens* everlasting cudweed

*Heterotheca grandiflora* telegraph weed

*Isocoma menziesii* golden bush

*Isocoma menziesii* var. *menziesii* golden bush

*Jaumea carnosa* jaumea

*Pluchea sericea* arrow weed

\* *Senecio bulgaris* common groundsel

\* *Sonchus asper* prickly sow thistle

\* *Sonchus oleraceus* common sow thistle

*Stephanomeria virgata* rod wirelettuce

\* *Taraxacum officinale* common dandelion

*Xanthium strumarium* cocklebur

#### **Bataceae**

*Batis maritima* saltwort

#### **Boraginaceae**

*Amsinckia menziesii* fiddleneck, ranchers fireweed

*Heliotropium curassavicum* Chinese parsley, salt hellotrope

#### **Brassicaceae**

\* *Brassica nigra* black mustard

*Cakile edentula* sea rocket

*Hutchinsia procumbens*

\* *Lobularia maritima* sweet allysum

\* *Raphanus sativus* wild radish

**Cactaceae**

\* *Opuntia ficus-indica* tuna

*Opuntia littoralis* coast prickly pear

*Opuntia oricola* chaparral prickly pear

*Opuntia prolifera* cholla

**Capparaceae**

*Isomeris arborea* bladderpod

**Caprifoliaceae**

*Sambucus mexicana* elderberry

**Caryophyllaceae**

*Cardionema ramossissima* tread lightly

*Spergularia marina* salt marsh sand spurry

\* *Spergularia rubra* red sand spurry

**Chenopodiaceae**

*Atriplex canescens*

*Atriplex canescens canescens* shadscale

*Atriplex lentiformis* big saltbush

\* *Atriplex lindleyi*

\* *Atriplex semibaccata* Australian saltbush

*Atriplex triangularis* spearscale

*Atriplex truncata*

*Atriplex watsonii* Watson salt bush

*Chenopodium californicum* California goosefoot

\* *Chenopodium murale* nettle-leaved goosefoot

*Salicornia bigelovii* annual pickleweed

*Salicornia europaea* saltflat annual pickleweed

*Salicornia subterminalis* glasswort

*Salicornia virginica* pickleweed

\* *Salsola kali* Russian thistle

\* *Salsola tragus* tumbleweed

*Suaeda californica* California sea blite

*Suaeda esteroa* estuary sea blite

*Suaeda torreyana* torrey sea blite

*Suaeda taxifolia* woolly sea blite

**Convolvulaceae**

*Calystegia macrostegia intermedia*

south coast morning glory

*Cressa truxillensis* alkali weed

**Crassulaceae**

*Crassula connata* pigmy weed

*Dudleya edulis* fingertips

**Cucurbitaceae**

*Marah macrocarpus* Cucamonga manroot

**Cuscutaceae**

*Cuscuta salina* salt marsh dodder

*Cuscuta salina* var. *major* goldenthread

**Euphorbiaceae**

*Croton californicus* California croton

*Euphorbia spathulata* warty spurge

**Fabaceae**

\* *Acacia melanoxylon* blackwood acacia

\* *Astragalus* sp. milk-vetch

\* *Lotus corniculatus* birdfoot trefoil

*Lotus nuttallianus* beach lotus

*Lotus scoparius* California broom

*Lotus strigosus*

\* *Medicago polymorpha* burclover

\* *Melilotus alba* white sweetclover

\* *Melilotus officinalis* yellow sweetclover

\* *Trifolium* spp. clover

**Frankeniaceae**

*Frankenia palmeri* yerba reuma

*Frankenia salina* alkali heath

**Geraniaceae**

\* *Erodium botrys* longbeak stork's bill

\* *Erodium cicutarium* redstem stork's bill

**Hydrophyllaceae**

*Eucrypta chrysanthemifolia* common eucrypta

**Lamiaceae**

\* *Marrubium vulgare* horehound

*Salvia mellifera* black sage

**Malvaceae**

\* *Malva parviflora* cheeseweed

**Myoporaceae**

\* *Myoporum laetum* ngaio tree

**Myrtaceae**

\* *Eucalyptus* spp. gum

**Nyctaginaceae**

*Mirabilis californica* California four o'clock

**Onagraceae**

*Camissonia cheiranthifolia* beach evening primrose

*Camissonia cheiranthifolia suffruticosa* beach evening primrose

\* *Olea europaea* olive

**Oxalidaceae**

\* *Oxalis pes-caprae* Bermuda buttercup

**Papaveraceae**

*Eschscholzia californica* California poppy

**Plumbaginaceae**

*Limonium californicum* sea lavender, western marsh rosemary

**Polygonaceae**

*Eriogonum fasciculatum* California buckwheat

*Eriogonum parvifolium*

*Nemacaulis denudata denudata* coast woolly-head

\* *Polygonum arenastrum*

\* *Polygonum aviculare*

\* *Rumex crispus* curley dock

**Salicaceae**

*Salix lasiolepis* arroyo willow

**Scrophulariaceae**

*Cordylanthus maritimus maritimus* salt marsh bird's-beak

**Solanaceae**

*Datura wrightii* toluaca

*Lycium brevipes* var. *brevipes* desert- thorn

*Lycium californicum* California box thorn

\* *Lycopersicon esculentum* tomatoe

\* *Nicotiana glauca* tree tobacco

*Solanum douglasii* Douglas' nightshade

**Tamaricaceae**

\* *Tamarix parviflora*

\* *Tamarix* sp.

**Urticaceae**

\* *Urtica urens* dwarf nettle

**Verbenaceae**

\* *Lantana camara* lantana

## Monocots

### Araceae

\* *Washingtonia filifera* California fan palm

### Cyperaceae

*Scirpus californicus* California tule

### Juncaceae

*Juncus acutus* spiny rush

### Juncaginaceae

*Triglochin maritima* arrow grass

### Liliaceae

*Dichelostemma capitatum* bluedicks

*Yucca schidigera* Mohave yucca

### Poaceae

\* *Avena fatua* wild oat

\* *Bromus diandrus* ripgut brome

\* *Bromus madritensis rubens* red brome

\* *Cortaderia jubata* Pampas grass, Andes grass

\* *Cynodon dactylon* bermuda grass

*Distichlis spicata* salt grass

\* *Hordeum murinum* sterile barley, foxtail barley

\* *Lolium perenne* English ryegrass

*Monanthochloe littoralis* shoregrass

*Nassella pulchra* purple needlegrass

\* *Parapholis incurva* sickle grass

\* *Pennisetum setaceum* crimson fountaingrass

\* *Piptatherum miliaceum* smilo grass

\* *Poa annua* annual bluegrass

\* *Polypogon monspeliensis* rabbit foot grass, annual beard grass

\* *Rhynchelytrum repens* natal grass

\* *Schismus barbatus* common Mediterranean grass

*Spartina foliosa* cordgrass

### Potamogetonaceae

*Ruppia maritima* ditch grass

### Typhaceae

*Typha domingensis* southern cattail

*Typha latifolia* common cattail

### Zosteraceae

*Zostera marina* eelgrass

## ANIMALS

### PORIFERA (SPONGES)

#### Halichondriidae

*Halichondria bower bankia* yellow sponge

*Halichondria panicea* crumb of bread sponge

#### Haliclonidae

*Haliclona ecbasis*

\* *Haliclona* sp. haliclonid sponge

#### Hymeniacidonidae

*Hymenidon* sp.

#### Leucosoleniidae

*Leucosolenia eleanor* white sponge

*Leucosolenia* sp.

#### Tetillidae

*Tetilla mutabilis* wandering sponge

#### unknown

*Esperiopsis originalis* digitate sponge

## CNIDARIA (JELLYFISHES, CORALS)

### Hydrozoa (Hydroids)

#### Campanulariidae

\* *Obelia* sp.

#### Plumulariidae

*Aglaophenia* sp. ostrich plume hydroid

*Plumularia* sp. plumarid hydroid

#### Tubulariidae

*Tubularia* sp. naked hydroid

\* *Tubularia crocea*

#### unknown

*Abietinaria* spp.

*Bineria* sp. A

*Corymorpha palma* white hydroid

*Hydroid* spp.

### Scyphozoa (Scypomedusae, large jellyfish)

*Phyllorhiza punctata*

*Rhizostome scyphomedusa*

## Anthozoa (Sea Anemones, Corals, Sea Pens)

### **Actiniidae**

*Epiactis prolifera* proliferating anemone

### **Diadumenidae**

*Diadumene franciscana*

*Diadumene* cf. *leucolena*

\* *Diadumene lineatu*

### **unknown**

*Anthozoan* spp.

*Bunodeopsis* sp.

*Cerianthus* (nr) *aestuari*

*Edwardsiella californica*

*Harenactis attenuata*

*Pachycerianthus fimbriatus* mud tube anemone

*Renilla kollikeri* sea pansy

*Scolanthus* sp.

## PLATYHELMINTHES (FLATWORMS)

*Polyclad* spp. flatworm

## NEMERTEA (RIBBONWORMS)

*Nemertea* spp.

## ASCHELMINTHES

## Nematoda (Roundworms)

*Nematode* spp.

## SIPUNCULA (PEANUTWORMS)

*Sipunculid* sp.

## ANNELIDA (SEGMENTED WORMS)

## Oligochaeta (Earthworms)

*Oligochaete* spp. oligochaete

## Polychaeta (Bristleworms, Fanworms, Clamworms)

### **Ampharetidae (Ampharetids)**

*Ampharetidae* spp.

*Ampharete labrops*

*Amphicteis scaphobranchia*

### **Arabellidae (Arabellids)**

*Arabella semimaculata*

*Arabella* sp.

*Drilonereis falcata minor*

*Drilonereis mexicana*

### **Capitellidae (Capitellids)**

*Capitella capitata*

*Capitellidae* spp.

*Capitata ambiseta*

*Heteromastus* sp.

*Mediomastus acutus*

*Mediomastus ambiseta*

*Mediomastus californiensis*

*Mediomastus* sp.

*Neomediomastus* sp.

*Notomastus* cf. *lineatus*

*Notomastus tenuis*

*Scyphoproctus oculatus*

*Scyphoproctus* spp.

### **Chaetopteridae**

*Chaetopterus variopedatus* parchment tube worm

### **Cirratulidae (Cirratulids)**

*Caulleriella* spp.

*Chaetozona* cf. *corona*

*Chaetozone* cf. *setosa*  
*Chaetozone* cf. *spinosa*  
*Cirratulus cirratus*  
*Cirratulidae*, unidentified  
*Cirratulus* spp.  
*Cirriformia luxuriosa*  
*Cirriformia spriabanchiata*  
*Cirriformia tentaculata*  
*Tharyx parvus*  
*Tharyx* sp. A.B

**Cossuridae (Cossurids)**

*Cossura candida*  
*Cossura pygodactylata*  
*Cossura* sp.

**Ctenodrilidae (Ctenodrilids)**

*Ctenodrilus serratus*

**Dorvilleidae (Dorvilleids)**

*Dorvillea articulata*  
*Dorvillea longicornis*  
*Dorvillea rudolphii*  
*Ophryotrocha puerilis*  
*Schistomeringos longicornis*

**Eunicidae (Eunicids)**

*Lysidice* sp.  
*Lysippe labiata*  
*Marphysa dysjuncta*  
*\*Marphysa sanguinea*  
*Marphysa stylobranchiata*  
*Marphysa* sp.

**Flabelligeridae (Flabelligerids)**

*Brada pleurobranchiata*  
*Flabelligerma essenbergae*  
*Flabelligera infundibularis*  
*Flabelligeridae* sp.A  
*Flabelligeridae* sp.B  
*Pherusa capulata*  
*Pherusa* cf. *neopapillata*  
*Pherusa* sp.  
*Stylaroides* sp.

**Glyceridae (Glycerids)**

*Glycera americana*  
*Glycera* cf. *americana*  
*Glycera nana*  
*Glycera rouxii*  
*Glycera tenuis*  
*Glyceridae* spp.  
*Glycinda armigera*

**Goniadidae (Gonaidids)**

*Goniada brunnea*  
*Goniada littorea*  
*Goniada* spp.

**Hesionidae (Hesionids)**

*Gyptis arenicola glabra*  
*Ophiodromus pugettensis*

**Lumbrineridae (Lumbrinerids)**

*Lumbrineris acuta*  
*Lumbrineris californiensis*  
*Lumbrineris erecta*

*Lumbrineris latreilli*  
*Lumbrineris minima*  
*Lumbrineris zonata*  
*Lumbrineris* spp.

**Maldanidae (Maldanids)**

*Maldanidae* spp.  
*Malmgreniella macginitiei*  
*Nicomache* cf. *lumbricalis*  
*Praxilella affinis pacifica*

**Nephtyidae (Nephtyids)**

*Nephtys caecoides*  
*Nephtys cornuta franciscanus*  
*Nephtys parva*  
*Nephtyidae* spp.

**Nereidae (Neriids)**

*\*Neanthes acuminata*  
*Neanthes caudata*  
*Neanthes virens* n  
*Nematonereis* cf. *unicornis*  
*Nereis brandti*  
*Nereis latescens*  
*Nereis procera* n  
*Nereidae* spp.

**Onuphidae (Onuphids)**

*Diopatra splendidissima*  
*Diopatra tridentata*  
*Diopatra* spp.

**Opheliidae (Opheliids)**

*Armandia bioculata*  
*Polyopthalmus pictus*

**Orbiniidae (Orbinids)**

*Haploscoloplos elongatus*  
*Leitoscoloplos elongatus*  
*Leitoscoloplos pugettensis*  
*Naineris uncinata*  
*Orbinidae* spp.

*Scoloplos acmeceps*

**Pectinariidae (Pectinarids)**

*Pectinaria californiensis*

**Phyllodocidae (Phyllodocids)**

*Anataides longipes*  
*Eteone alba*  
*Eteone californica*  
*Eteone dilata*  
*Eteone* spp.  
*Eteone* cf. *lighti*  
*Eumida bifliata*  
*Phyllodocidae* spp.

**Pilargiidae**

*Sigambra tentaculata*

**Polynoidae (Polynoids)**

*Halosydna brevistosa*  
*Halosydna johnsoni*  
*Harmothoe* cf. *hirsuta*  
*Harmothoe imbricata*  
*Hesperonoe* spp.  
*Malmgrenia nigralba*  
*Polynoidae* spp., sp. A.B.C. scale worm

## **Sabellidae (Sabellids)**

*Chone* cf. *gracilis*  
*Chone* cf. *mollis*  
*Euchone limnicola*  
*Fabicinae* sp.  
*Fabricia limnicola*  
*Fabricinuda limicola*  
*Megalomma circumspectum*  
*Megalomma pigmentum*  
*Sabella crassicornis*  
 Sabellidae spp.

Sabellidae, unidentified

## **Serpulidae (Serpulids)**

*Crucigera* sp.  
*Eupomatus* sp.  
*Hydroides pacificus*  
*Serpula vermicularis*  
 Serpulidae spp.  
*Spirorbis eximius*

## **Sigalionidae**

*Sthenelais tertiaglabra*  
*Sthenelanella uniformis*

## **Spionidae (Spionids)**

*Apoprionospio pygmaeus*  
*Boccardia* spp.  
*Boccardia truncata*  
*Boccardiella hamata*  
*Laonice cirrata*  
*Microspio maculata*  
*Nerinides* cf. *acuta*  
*Nerinides pigmentata*  
*Paraprionospio pinnata*  
*Polydora* cf. *cardalia*  
*Polydora cornuta*  
 \**Polydora ligni*  
*Polydora limnicola*  
*Polydora nuchalis*  
*Polydora quadrilobata*  
*Polydora socialis*  
*Polydora websteri*  
*Polydora* sp.  
*Prionospio* cf. *heterobranchiata*  
*Prionospio lighti*  
*Prionospio malmgreni*  
*Prionospio pinnata*  
*Prionospio pygmaeus*  
*Prionospio steenstrupi*  
*Pseudomalacocerus* spp.  
 \**Pseudopolydora paucibranchiata*  
*Rhynchospio glutaea*  
*Rhynchospioarenicola pallidus*  
*Scolecopsis acuta*  
*Scolecopsis foliosa occidentalis*  
*Scolecopsis quinquentata*  
*Scolecopsis tridentata*  
 Spionidae spp.  
*Spiophanes missionensis*  
 \**Streblospio benedicti*

## **Sternaspidae (Sternaspids)**

*Sternaspis fessor*

## **Syllidae (Syllids)**

*Autolytus* spp.  
*Brania brevipharyngea*  
*Brania* spp.  
*Eusyllis assimilis*  
*Exogone lourei*  
*Exogone* cf. *molesta*  
*Exogone uniformis*  
*Odontosyllis parva*  
*Odontosyllis phosphorea*  
*Pionosyllis* spp.  
 Syllidae spp.  
*Syllis gracilis*  
*Trypanosyllis* spp.  
*Typosyllis* cf. *hyalina*

## **Terebellidae (Terebellids)**

*Amaeana occidentalis*  
*Pista alata*  
*Pista* cf. *fasciata*  
*Pista* sp.  
*Streblosoma crassibranchia*  
 Terebellidae spp.

*Terebellides californica*

## **unknown**

*Aphelocheata monilaris*  
*Aphelocheata multifilis*  
*Aphelocheata* spp.  
*Apistobranchus* spp.  
*Diplocirrus* spp.  
*Eranno lagunae*  
*Euclymeninae* spp. indef.  
*Expolytmnia* spp.  
*Leitoscoloplos pugettensis*  
*Levinsenia gracilis*  
*Melinna oculata*  
*Metasychis disparidentata*  
*Montecellina* sp. C  
*Montecellina dorsobranchialis*  
*Montecellina tessellata*  
*Myriochele* sp. M  
*Paramage scutata*  
*Parougia caeca*  
*Pholoe glabra*  
*Podarkeopsis glabra*  
*Podarkeopsis perkinsi*  
*Poecilochaetus johnsoni*  
*Tenonia priops*

## ARTHROPODA

### Mandibulata

#### Crustacea

#### Ostracoda (Ostracods)

\**Aspidochoncha limnoriae*  
*Asteropella slatteryi*  
*Bathyleberis* spp.  
*Conchoecinae* sp.  
*Cylindroleberis* sp.  
*Cylindroleberis mariae*  
*Euphilomedes carcharodonta*  
*Euphilomedes producta*

*Parasterope barnsei*  
*Philomedes* spp.  
*Podocopidae* sp.  
*\*Redekea californica*  
*Rutiderma* cf. *judayi*  
*Rutiderma loma*  
*Sarsiella* spp.  
*Soleroconcha* spp.

#### Copepoda (Copepods)

##### Cyclopoida

*Cyclopoid* spp.

##### Harpacticoida

*Harpacticoid* spp. harpacticoid

##### unknown

*Parastephos esterlyi*

#### Cirripedia (Barnacles)

##### Balanidae

\**Balanus amphitrite* little striped barnacle  
*Balanus glandula* acorn barnacle  
*Balanus regalis* barnacle

\**Balanus tintinnabulum* red and white barnacle  
*Megabalanus californianus* red and white barnacle

##### Chthamalidae

*Chthamalus* sp. barnacle

#### Malacostraca

##### Cumacea (Cumaceans)

*Campylaspis rubromaculata*  
*Cumacea* sp. unident.  
*Cyclaspis* sp.  
*Diastylis* sp.  
*Eudorella pacifica*  
*Oxyurolostylis pacifica*

##### Mysidacea (Mysids, Opossum Shrimps)

*Acanthomysis macropsis*  
*Archeomysis maculata*  
*Heteromysis odontops*  
*Holmesimysis* sp.  
*Mysida* sp. unident.  
*Mysidopsis californica*

*Mysidopsis intii*

*Neomysis kadiakensis*

*Neomysis* sp.

##### Nebaliacea (Nebalians)

*Epinebalia* spp.

*Nebalia daytoni*

*Nebalia pugettensis*

##### Tanaidacea (Tanaids)

*Leptochelia* cf. *dubia*

*Leptochelia* sp.

\**Tanaid* sp.

*Tanaidacea* sp. unident.

*Zeuxo narmani*

#### Isopoda

##### Bopyridae (Bopyrids)

*Schizobopyrina striata*

##### Janiridae (Janirids)

\**Ias californica*

**Limnoriidae (Limnoriids)**

\**Limnoria quadripunctata*

\**Limnoria tripunctata*

**Munnidae (Munnids)**

*Aega* sp. isopod

*Munna* spp.

**Sphaeromatidae (Sphaeromids)**

*Cilicaea sculpta*

\**Sphaeroma quoyanum*

\**Sphaeroma walkeri* s

Sphaeromatidae sp.

**unknown**

*Austrosignum tillerae*

*Cirolana harfordi* cirolanid

*Edotea* sp.

*Paracerceis sculpta*

*Paranthura elegans* anthurid

*Seriolis carinata*

## Amphipoda (Amphipods)

### Gammaridea (Gammarids)

**Ampeliscidae (Ampeliscids)**

*Ampelisca brevisimulata*

*Ampelisca cristata*

*Ampelisca hancocki*

*Ampelisca* sp.

Ampeliscidae spp.

**Amphilochidae (Amphilodhids)**

Amphilochidae spp.

**Ampithoidae (Amphithoids)**

*Amphithoe* sp.

Ampithoidae spp.

**Aoridae (Aorids)**

*Acuminodeutopus heterurops*

*Amphideutopus oculatus*

*Lembos macromanus*

*Microdeutopus schmitti*

*Rudilembroides stenopropodus*

**Corophiidae (Corophiids)**

\**Corophium acherusicum*

\**Corophium heteroceratum*

\**Corophium uenoi*

Corophiidae spp.

*Erichthonius brasiliensis*

\**Grandidierella* cf. *japonica*

**Dexaminidae (Desaminids)**

Dexaminidae spp.

**Eusiridae**

Eusiridae spp.

**Hyalidae (Hyalid)**

*Hyale frequens*

*Hyale* spp.

Hyalidae spp.

**Isaeidae (Isaeids)**

Isaeidae spp.

**Ischyroceridae**

\**Jassa marmorata* (falcata)

*Microjassa litotes*

**Leucothoidae (Leucothoids)**

*Leucothoe alata*

**Liljeborgiidae (Liljeborgiids)**

*Listriella goleta*

*Listrella* spp.

**Lysianassidae (Lysianassids)**

Lysianassidae spp.

*Orchomene pacifica*

*Orchomene pinguis*

*Orchomene* sp.

**Oedicerotidea (Oedicarotids)**

Oedicerotidae spp.

*Synchelidium rectipalmum*

*Synchelidium shoemakeri*

**Photidae**

*Photis* sp.

**Phoxocephalidae (Phoxocephalids)**

*Paraphoxus* spp.

**Pleustidae (Pleustids)**

*Parapleustes* spp.

Pleustidae spp.

**Podoceridae (Phodocerids)**

\**Podocerus brasiliensis*

**Pontogeneia**

*Pontogeneia minuta*

*Pontogeneia rostrata*

**Stenothoidae (Stenothoids)**

\**Stenothoe valida*

**unknown**

*Elasmopus rapax*

Gammaridae spp.

*Gammaropsis thompsoni*

*Heterophoxus oculatus*

*Monoculodes hartmanae*

*Synchelidium* sp. gammarid

*Tiron biocellata* synophiid

### Caprellidae (Caprellids, Skeleton Shrimp)

**Caprellidae (Caprellids)**

*Caprella californica* California skeleton shrimp

*Caprella equilibra*

*Caprella mendax*

*Caprella* spp.

Caprelliidae spp.

*Mayerella banksia*

## Euphausiacea (Euphau)

*Euphilomedes carcharodonta* seed shrimp

## Decapoda

### Alpheidae (Alpheid shrimp)

*Alpheus californiensis*

*Alpheus* sp.A.

*Alpheus* sp.B.

*Betaeus harrimani*

*Betaeus longidactylus* long fingered shrimp

*Betaeus* sp.

### Atyidae

Atyidae spp.

### Callianassidae

*Callianassa californiensis* red ghost shrimp

*Upogebia pugettensis* callianassid shrimp

### Crangonidae (Crangonid shrimp)

*Crangon californiensis*

*Crangon franiscorum*

*Crangon* spp.

*Processa canaliculata*

### Hippolytidae (Hippolytid shrimp)

*Heptocarpus* cf. *taylori*

*Heptocarpus* sp. A

*Heptocarpus* spp.

*Hippolyte californica*

*Hippolyte californiensis* grass shrimp

*Hippolyte* spp.

*Spriontocaris* sp.

### Majidae

*Pugettia producta* kelp crab

*Pyromaia tuberculata*

### Palaemonidae

\**Palaemon macrodactylus*

### Palinuridae

*Panulirus interruptus* California spiny lobster

### Pinnotheridae (Pinnotherid crab)

*Hemigrapsus oregonensis* mudflat crab

*Pinnixa barnharti*

*Scleroplax granulata*

*Uca crenulata* fiddler crab

### Portunidae

*Portunus xantusi* swimming crab

### Xanthidae

*Cancer antennarius* common rock crab

*Cancer anthonyi* rock crab

*Lophopanopeus bellus diegensis* xanthid mud crab

*Lophopanopeus leucomanus* white handed crab

*Lophopanopeus* sp. xanthid crab

### unknown

*Brachyurs* sp. unident.

*Caridea* sp. unident.

*Hemisquilla ensigera*

*Malacoplax californiensis* mudflat crab

*Nyeotrypaea californiensis*

*Pseudosquilla mamorata*

*Schmittius politus*

*Speocarcinus californiensis*

*Squilla polita*

*Urocaris infraspinis*

## Insecta

### Coleoptera (Beetles)

#### Alleculidae (Comb-clawed beetles)

*Hymenorus* sp.

#### Anthicidae (Ant-like flower beetles)

*Anthicus* sp.

*Ischyropalpus* sp.

*Mycenotarsus* sp.

*Notoxus monodon*

#### Buprestidae (Metallic wood-boring beetles)

*Acmaeodera labrinthica*

#### Carabidae (Ground beetles)

*Acupalpus* sp.

*Agonum* sp.

*Amara californica*

*Amara* sp.

*Anysodactylus* sp.

*Bembidion* sp. minute ground beetle

*Brachinus tschernkhi* bombardier beetle

*Bradycellus* sp.

*Calathus ruficollis ruficollis*

*Callida* sp.

*Calosoma frigidum*

*Calosoma semilaeve*

*Carabus nemoralis*

*Claenius* sp.

*Dyschirius* sp.

*Galeritula lecontei*

*Limnichus* sp.

*Loricera pilicornis*

*Microlestes* sp.

*Omophron ovale* and *O. tanneri* round sand beetles

*Pseudaptinus* sp.

*Pterostichus lustrans*

*Pterostichus* sp.

*Scarites subterraneus*

*Tachys corax*

*Tetragonoderus* sp.

**Cerambycidae (Long-horned beetles)**

*Crossidius testaceus testaceus*

**Chrysomelidae (Leaf beetles)**

*Altica* sp. flea beetles

*Chalepus* sp.

*Cryptocephalus* sp.

*Diabrotica undecimpunctata* western spotted cucumber beetle

*Diachus auratus*

*Donacia* sp.

*Epitrix* sp.

*Eurynephalla morosa*

*Eurynephalla* sp.

*Exema conspersa*

*Gastrophysa cyanea* common green dock beetle

*Longitarsus* sp.

*Metachroma californicus*

*Monoxia* sp. alkali bugs

*Pachybrachys* sp.

*Plataeumaris* sp.

*Trirhabda* sp.

**Cicindelidae (Tiger beetles)**

*Cicindela gabbi* Gabb's tiger beetle

*Cicindela haemorrhagica haemorrhagica*

*Cicindela hirticollis grvida* sandy beach tiger beetle

*Cicindela latesignata latesignata* sand dune tiger beetle

*Cicindela oregona*

*Cicindela trifaciata sigmoidea* mudflat tiger beetle

**Coccinellidae (Ladybird beetles)**

*Adalia bipunctata* two-spotted ladybeetle

*Auletobius* sp.

*Coccinella californica* California ladybird

*Coleomegilla fuscilabris*

*Cryptolaemus montrouzieri* mealybug destroyer

*Didion nanus*

*Hippodamia convergens* convergent ladybird

*Hyperaspidius comparatus*

*Hyperaspis fimbriolata*

*Microwisea* sp.

*Olla abdominalis* ashy gray ladybird

*Psyllobora vigintimaculata*

*Scymnus* sp.

**Curculionidae (Weevils, snout beetles)**

*Bagous* sp.

*Endalus* sp.

*Sphenophorus discolor*

*Stenopelmus* sp.

*Trigonoscuta* sp.

*Tychius* sp.

**Dermestidae (Carpet beetles)**

*Anthrenus verbasci*

*Dermestes canisus*

*Dermestes frischi*

**Dytiscidae (Predaceous diving beetles)**

*Agabus disintegratus*

*Hydroporus* sp.

*Laccophilus diciapiens*

*Rhantus hoppingi*

**Haliplidae (Crawling water beetles)**

*Haliphus* sp.

**Helodidae (Marsh beetles)**

*Cyphon* sp.

**Heteroceridae (Variegated mud-loving beetles)**

*Neoheterocerus* sp.

**Histeridae (Hister beetles)**

*Hypocaccus lucidulus*

*Neopachylopus sulcifrons*

*Saprinus lugens*

**Hydrophilidae (Scavenger water beetles)**

*Berosus* sp.

*Cercyon luniger*

*Enochrus hamiltoni pacificus*

*Paracymus elegans*

*Tropisternus salsamentus*

**Lathridiidae (Minute brown scavenger beetles)**

*Melanophthalma* sp.

**Leiodidae (Round fungus beetles)**

unidentified specimen

**Limnebiidae (Minute moss beetles)**

*Ochthebius rectus*

**Meloidae (Blister beetles)**

*Nemognatha* sp.

**Melyridae (Soft-winged flower beetles)**

*Amecocerus* sp.

*Endeodes basalis*

*Trichochrous nigrinus*

**Mordellidae (Tumbling flower beetles)**

*Mordellistena* sp.

**Oedemeridae (False blister beetles)**

*Copidita quadrimaculata*

**Rhizophagidae (Root-eating beetles)**

*Phyconomus maritima*

**Scarabaeidae (Scarab beetles)**

*Aegialia* sp.

*Aphodius* sp.

*Cotina texana*

*Cotinus mutabilis* green fruit beetle

*Parathyce palpalis*

*Phyllophaga* sp.

**Silphidae (Carrion beetles)**

*Nicrophorus marginatus* red and black burying beetle

*Nicrophorus nigritus* black burying beetle

*Silpha lapponica* satin silphid

**Staphylinidae (Rove beetles)**

*Aleocheira sulcicollis*

*Bledius flavipennis*

*Bledius* nr. *monstratus* spiny-legged rove beetle

*Cafius canaescens*

*Cafius seminitens*

*Carpelimus* sp.

*Psamathobledius punctissimus* salt marsh rove beetle

*Staphylinus maxillosus*

*Stenus* sp.

*Tachinus* sp.

*Thinopinus pictus* pictured rove beetle

### **Tenebrionidae (Darkling beetles)**

*Amphidora littoralis*  
*Amphidora nigrapilosa* black-haired darkling beetle  
*Blaptinus* sp.  
*Coelus ciliatus* ciliated dune beetle  
*Coelus globus* globose dune beetle  
*Conibius* sp.  
*Coniontis* sp.

*Cratidus osculens* woolly darkling beetle  
*Cryptadius inflatum*  
*Eleodes armata* armored stink beetle  
*Eleodes gracilis*  
*Phaleria rotundata*  
*Phloedes diabolicus*  
*Stibia* sp.

## **Diptera (Flies)**

### **Agromyzidae (Leaf-miner flies)**

*Phytomyza albiceps*

### **Anthomyiidae (Anthomyiid flies)**

*Fucella assimilis*

*Fucella rejecta*

*Fucella rufitibia*

### **Asilidae (Robber flies)**

*Efferia* sp.

### **Bombyliidae (Bee flies)**

*Bombylius* sp.

*Exoprosopa* sp. progressive bee fly

### **Calliphoridae (Blow flies)**

*Phaenicia sericata* green bottle fly

*Eucalliphora lilea* common blow fly

### **Ceratopogonidae (Punkies, Biting Midges)**

*Culicoides variipennis occidentalis*

### **Chloropidae (Fruit flies)**

*Hippelates* sp.

*Incertella* sp.

*Meromyza saltatrix*

*Siphonella* sp.

### **Coelopidae (Seaweed flies)**

*Coelopa vanduzeei*

### **Conopidae (Thick-headed flies)**

*Physocephala texana*

*Thecophora occidentalis*

### **Culicidae (Mosquitos)**

*Aedes squamiger* salt marsh mosquito

*Culex pipiens*

### **Dolichopodidae (Long-legged flies)**

*Asyndetus* sp.

*Hydrophorus praecox*

*Pelastoneurus cyaneus*

*Raphium* sp.

### **Drosophilidae (Small fruit flies, pomace flies)**

*Drosophila* sp.

### **Ephydriidae (Shore flies)**

*Atissa littoralis*

*Brachydeutera argentata*

*Ceropsilopa coquilletti*

*Ceropsilopa dispar*

*Clanoneurum americanum*

*Ephydra milbrae* salt marsh brine fly

*Ephydra riparia*

*Lamproscatella dicheata*

*Mosillus tibialis*

*Notiphila erythrocer*

*Notiphila pulchrifrons*

*Scatella obsoleta*

*Scatella paludum*

### **Empididae (Dance flies)**

*Platypalpus* sp.

### **Muscidae (Muscid flies)**

*Musca domestica* house fly

### **Neriidae (Cactus flies)**

*Volucella mexicana* cactus fly

### **Otitidae (Picture-winged flies)**

*Acrosticta rufiventris*

*Califortalis hirsutifrons*

*Ceroxys latiusculus*

### **Phoridae (Hump-backed flies)**

*Dohrniphora cornuta*

### **Pipunculidae (Big-headed flies)**

*Pipunculus ater*

### **Psychodidae (Sand flies)**

*Pericoma* sp.

### **Sarcophagidae (Flesh flies)**

*Sarcophaga* sp.

### **Scatopsidae (Minute black scavenger flies)**

*Rhegmoclemnia melandria*

### **Spaecoridae (Small dung flies)**

*Leptocera* sp.

### **Stratiomyidae (Soldier flies)**

*Nemotelus tristis*

### **Syrphidae (Syrphid flies)**

*Mesograpta marginata*

*Paragus tibialis*

### **Tabanidae (Horse Flies, Deer Flies)**

*Tabanus punctifer* big black horse fly

### **Tendipedidae (Water midges)**

*Chironimus* sp.

*Cricotopus spartinus*

### **Tethinidae**

*Pelomyia coronuta*

*Pelomyiella melanderi*

## Hemiptera (True bugs)

### **Berytidae (Stilt bugs)**

*Jalysus wickhami*

### **Coreidae (Leaf-footed bugs)**

*Leptoglossus clypealis* western leaf-footed bug

### **Corixidae (Water boatmen)**

*Corisella inscripta*

*Trichocorixia reticulata* saline water boatman

*Trichocorixia verticalis californica* salt marsh water boatman

### **Gerridae (Water striders)**

*Gerris remigis* common water strider

*Trepobates becki*

### **Hebridae (Velvet water bugs)**

*Morrogota hebroides*

### **Miridae (Leaf bugs, Plant bugs)**

*Creontiades* sp.

*Lygus hesperus*

*Lygus lineolaris* tarnished plant bug

*Melanopleurus* sp.

*Taylorilygus pallidus*

### **Nabidae (Damsel bugs)**

*Nabis ferus limmaeus* Damsel bug

### **Notonectidae (Backswimmers)**

*Buenoa* sp. small backswimmer

*Notonecta unifasciata* single-banded backswimmer

### **Pentatomidae (Stink bugs)**

*Chlorochroa* sp. green stink bug

*Margantia histrionica* Harlequin Cabbage Bug

*Podisus* sp. spined soldier bug

*Rhytidolomia faeta*

### **Poiariidae (Thread-legged bugs)**

*Emesinae* sp.

### **Pyrrhocoridae (Red bugs, Stainers)**

*Largus cinctus* ordered plant bug

### **Reduviidae (Assassin bugs)**

*Nabis* sp.

*Sinea* sp.

### **Saldidae (Shore bugs)**

*Pentacora signoreti*

*Pentacora sphacelata*

*Saldula fernaldi* Fernald's shore bug

*Saldula luctosa* salt marsh shore bug

*Saldula opiparia*

*Saldula pallipes* black shore bug

### **Tingidae (Lace bugs)**

*Corythuca* sp.

### **Veliidae (Riffle bugs)**

*Microvelia* sp.

## Homoptera

### **Aleyrodidae (Whiteflies)**

*Trialeuodes vaporariorum*

### **Aphididae (Aphids)**

*Aphis gossypii* cottony aphid

*Brachycaudis cardui* thistle aphid

*Brevicoryne brassicae* cabbage aphid

### **Cercopidae (Froghoppers, Spittlebugs)**

*Aphrophora annulata* annulate

*Clastoptera lineatocollis*

### **Cicadellidae (Leafhoppers)**

*Balchutha neglecta*

*Ballana vema*

*Ballana vesca*

*Carneiocephalus* sp.

*Collandonus montanus*

*Draeculaecephala minerva*

*Empoasca alboneura*

*Empoasca decora*

*Eupteryx melissae*

*Hordnia circellata* blue sharpshooter

*Idiodonus* sp.

*Macrosteles fascifrons*

*Mormoria* sp.

*Penestragania robusta*

*Stragania* sp. green leafhopper

### **Cicadidae (Cicadas)**

*Okanagana vanduzeei*

### **Cixiidae (Cixiid planthoppers)**

*Oliarus* sp.

### **Delphacidae (Delphacids, planthoppers)**

*Delphacodes propinqua*

*Deltocephalus minutus*

*Prokelisia salina*

*Stobaeria muiri*

### **Diaspididae (Armored scales)**

*Haliopsis spartina* cordgrass scale

### **Dictyopharidae (Dictyopharids, planthoppers)**

*Orgerius propius*

### **Flatidae (Flatids, planthoppers)**

*Mistharnophantia sonorana*

### **Issidae (Issids, planthoppers)**

*Danepteryx manca*

### **Margarodidae (Giant coccids)**

*Icerya purchasi* cottony-cushion scale

### **Membracidae (Treehoppers)**

*Spissistilus festinus* three-cornered alfalfa hopper

*Stictocephala* sp. buffalo treehoppers

### **Pseudococcidae (Mealy bugs)**

*Distichlicoccus salinus*

*Puto echinatus* fluffy mealy bug

### **Psyllidae (Psyllids)**

*Craspedolepta martini*

*Craspedolepta pulchella*

## Hymenoptera

### Apidae (Bees)

\* *Apis mellifera* honey bee

*Bombus sonorus* Sonoran bumble bee

*Bombus vosnesenskii* yellow-faced bumble bee

### Chalcididae (Chalcids, wasps)

*Chalcidoidea* chalcid

### Formicidae (Ants)

\* *Iridomyrmex humilis* Argentine ants

*Pogonomyrmex californicus* harvester ants

### Ichneumonidae (Ichneumonids, wasps)

*Ichneumonid* sp.

### Mutillidae (Velvet ants)

*Dasymutilla* sp.

### Pompilidae (Spider wasps)

*Hemipepsis* sp. tarantula hawk

### Sphecidae (Sphecids, wasps)

*Ammophila* sp. thread-waisted wasp

*Bembix* sp. sand wasp

*Sphex ichneumonia* golden digger wasp

### Tiphiidae (Tipiids, wasps)

*Methoca* sp.

### Vespididae (Vespids, wasps)

*Polistes* sp. paper wasp

## Lepidoptera

### Danaiidae (Milkweed butterflies)

*Danaus plexippus* monarch

### Geometridae (Geometer moths, Inchworms)

*Caenurgia togataria*

*Perizoma custodiata*

### Hesperiidae (Common skippers)

*Erynnis funeralis* funereal duskywing

*Hylephila phyleus* fiery skipper

*Panoquina errans* wandering skipper

*Panoquina panoquinoides* salt marsh wanderingskipper

*Pyrgus communis* checkered skipper

### Lycaenidae (Gossamer-winged butterflies)

*Brephidium exilis* Western pygmy blue

*Strymon melinus* common hairstreak

### Noctuidae (Millers, Cutworms)

*Tarachidia candefacta*

*Zale lunata* Moon umber

### Nymphalidae (Brush-footed butterflies)

*Nymphalis antiopa* mourning cloak

*Vanessa annabella* west coast lady

*Vanessa atalanta* red admiral

*Vanessa cardui* painted lady

### Papilionidae (Swallowtails)

*Papilio rutulus* western tiger swallowtail

*Papilio zelicaon* anise swallowtail

### Pieridae (Whites, Sulphurs, and Orange-tips)

*Colias eurytheme*

\* *Pieris rapae* cabbage butterfly

### Psychidae (Bagworm moths)

### Pterophoridae (Plume moths)

*Agdistis americana*

### Pyralidae (Snout moths)

*Lipographa fenestrella* salt marsh snout mouth

*Lipographa truncatella*

*Synclita* sp.

### Sphingidae (Sphinx or Hawk moths)

*Hyles lineata* white-lined sphinx

## Collembola

### Poduridae (Collembola, Springtails)

*Anurida maritima* marine springtail

*Archistoma interstitialis*

## Dermaptera (Earwigs)

### Aeshnidae (Darners)

*Aeshna multicolor* blue darner

*Anax junius* common gree darner

### Baetidae (Mayflies)

*Callibaetis pacificus* pacific spotted may fly

### Chrysopidae (Green lacewings)

*Chrysoperla carnea*

### Forficulidae (Earwigs)

\* *Forficula auricularia* earwig

### Hemerobiidae (Brown lacewings)

*Hemerobius pacificus*

*Symphorobius* sp.

### Libellulidae (Common skimmers)

*Libellula saturata* big red skimmer

*Pachydiplax longipennis* swift long-winged skimmer

*Sympetrum* sp.

*Tarnetrum corruptum*

*Tramea lacerata* jagged-edged saddlebag

### Myrmeleontidae (Antlions)

*Myrmeleon immaculatus*

## Odonata

### Coenagrionidae (Narrow-winged damselflies)

*Enallagama cevillae*

*Ishnura barberi* forktail damselfly

*Ishnura denticollis* forktail damselfly

## Orthoptera

### Acridiidae (Grasshoppers)

*Chloealtis gracilis* slant-faced grasshopper

*Conozoa sulcifrons* sulcifrons

*Melanoplus cirereus*

*Melanoplus obsoletus*

*Orphulella pelidona*

*Psoloessa thamnogaea*

*Trimerotropis pallidipennis* pallid-winged grasshopper

### Gryllacrididae (Ground and Camel crickets)

*Ceuthophilus californianus* California camel cricket

*Pristoceuthophilus* sp. mushroom camel cricket

*Stenopelmatus fuscus* Jerusalem cricket

### Gryllidae (Crickets)

*Cycloptilum distinctum*

*Gryllus* sp. field cricket

*Oecanthus argentinus* tree cricket

### Mantidae (Mantids)

*Litaneutria minor* minor ground mantid

## Mantodea

### Mantidae (Mantids)

*Stagmomantis californica* California mantis

### Stylopidae (Twisted-winged parasites)

*Elenchus* sp.

### Tubulifera (Thrips)

*Leptothrips mali*

## Thysanura

### Lepismatidae (Silverfish)

*Allacrotelsa spinulata* common/Becker's wife

*Lepisma saccharina*

*Neomachilis* sp.

## Chelicerata

### Arachnida (Spiders, Mites, Pseudoscorpions)

#### Agelenidae (Funnel web weavers)

*Agelenopsis* sp. grass spiders

*Calilena* sp.

#### Anyphaenidae

*Teudis mordax*

#### Araneidae (Orb weavers)

*Araneus* sp.

*Argiope argentata* silver argiope

*Eustala conchlea*

*Mastophora* sp. bola spider

#### Clubionidae (Sac spiders)

#### Ctenizidae (Trapdoor spiders)

*Bothriocyrtum californicum* California trapdoor spider

*Aptostichus* sp.

#### Dictynidae (Dictynids, spiders)

*Dictyna agressa*

*Dictyna varyna*

*Tricholathys saltona*

#### Dysderidae

\* *Dysdera crocata*

#### Eremobatidae (Wind scorpions)

*Eremobates* sp.

#### Eriogonidae

*Erigone dentosa*

*Walckeraeria* sp.

#### Garypidae (Pseudoscorpions)

*Garypus californicus*

#### Linyphiidae

*Bathypantes* sp.

#### Lycosidae (Wolf spiders)

*Allopecosa kochi*

*Arctosa littoralis*

*Clubiona pomona*

*Geolycosa* sp. burrowing wolf spider

*Lycosa* sp. wolf spider

*Pardosa ramulosa* thin-legged wolf spider

*Schizocosa mccoocki*

#### Oxyopidae (Lynx spiders)

*Peucetia viridans* green lynx spider

#### Philodromidae (Philodromid spiders)

*Ebo pepinensis*

*Tibellus chamberlini*

## Pholcidae

*Psilochorus* sp.

## Salticidae (Jumping spiders)

*Metaphidippus* sp. metaphid jumping spider

*Pellenes elegans*

*Pseudicius* sp.

## Tetragnathidae (Large-jawed orb weavers)

*Tetragnatha laboriosa* long-jawed orb weaver

## Theridiidae (Comb-footed spiders)

*Crustulina sticta*

*Latrodectus mactans* black widow

*Steatoda fulva*

## Thomisidae (Crab spiders)

*Misumenops lepidus*

*Xysticus gulosus*

## Zodariidae Araneida

*Lutica abalonea* sand spider

## unknown

*Clysoa* sp.

# MOLLUSCA

## Gastropoda (Snails, Limpets, Sea Hares, Nudibranchs)

### Acmeidae

*Acmaea limatula* file limpet

### Acteocinidae

*Acteocina culcitella*

*Acteocina inculta*

*Acteocina magdalenenis* glassy bubble

*Cylichna alba* acteocinid

*Cylichnella harpa*

*Cylichnella inculta*

### Aelidae

Aelidae spp.

### Anaspidea

*Aplysia californica* California sea hare

### Assimineidae

*Assiminea californica* assimineid snail

### Caecidae

*Caecum californicum* California caecum

*Fartulum occidentale* caecid

### Calypttraeidae

*Crepidula fornicata*

*Crepidula onyx* onyx slipper shell

*Crepidatella lingulata* half-slipper shell

### Cephalaspidae

*Aglaja diomedea* tectibranch

*Bulla gouldiana* Gould's bubble

*Chelidonura inermis* large sea slug

*Haminaea vesicula* blister paper bubble

### Cerithiopsidae

*Cerithidea californica* California horn shell

*Cerithidea fuscata* horn shell snail

### Columbellidae

Columbellidae spp.

*Mitrella carinata* dove shell

*Mitrella tuberosa*

### Fissurellaceae

*Collisela depicta* fissurellid

### Lacunidae

*Lacuna marmorata* chink shell

### Nassariidae

*Nassarius medicus*

*Nassarius perpinguis*

*Nassarius tegula* mud-dog whelk

### Naticidae

*Neverita reclusiana*

### Nudibranchia

*Discodoris sandiegensis* San Diego sea slug

Nudibranch spp.

### Olividae (Olive Shells)

*Olivella baetica* olive shell

*Olivella* sp. olive shell

### Phasianellidae

*Tricolia compta* banded pheasant

### Pyramidellidae

*Odostomia* sp. odostome

*Turbonilla* sp. pyramidellid

### Rissoidae (Rissoid snail)

*Alvinia* spp.

*Barleeia californica*

*Barleeia subtenuis*

*Rissoella* sp.

### Vitrinellidae

*Vitrinorbis diegensis* vitronorbis

Vitrinellidae spp. vitrinella

### unknown

*Aclis tectibranch*

*Acmira catherinae*

*Acmira horikoshii*

*Alabina* spp.

*Crucibulum spinosum* cup and saucer limpet

*Ophiodermella ophioderma* penciled turret shell

*Ophiodermella* spp. turret shell

*Philine* sp.

*Sulcoretusa xystrum*

*Tachyhynchus* sp. turret shell

## Bivalvia (Clams, Cockles, Mussels, Oysters, Shipworms)

### **Mactridae**

*Mactra californica* California dish clam

*Spisula catilliformis* narrow dish clam

*Spisula* spp.

### **Myidae**

*Platyodon cancellatus* checked borer

### **Mytilidae**

*Adula diegensis* San Diego pea pod

\**Geukensia (Ischadium) demissa* ribbed mussel

\**Musculista senhousia* Japanese mussel

*Mytilus edulis* bay mussel

\**Mytilus galloprovincialis*

*Volsella flabellata*(*Modiolus modiolus*) giant horsemussel

### **Psammobiidae**

*Gari californica* sunset clam

*Tagelus californianus*

*Tagelus subteres*

### **Solenidae**

*Siliqua lucida* solenid clam

*Solen rosaceus* rosy razor clam

*Solen sicarius* razor clam

### **Tellinidae**

*Macoma nasuta* bent-nosed clam

*Macoma secta* sand-flat clam

*Macoma yoldiformis* tellinid clam

### **Teredinidae**

\**Lyrodus pedicellatus* southern shipworm

\**Teredo navalis* shipworm

### **Veneridae**

\**Tapes japonica*(*semidecussata*) venerid clam

*Tivela* sp. venus clam

Veneridae spp.

### **unknown**

*Asthenothaerus villiosior* clam

*Calypptogenia* sp. A clam

*Chione undatella* wavy cockle

*Dhione fluctifraga* smooth cockle

*Laevicardium substriatum* eggshell clam

\**Theora fragilis* clam

## Cephalopoda (Octopi, Squids)

*Octopus bimaculatus* two-spotted octopus

*Octopus bimaculoides*

## ECHINODERMATA

### Echinoidea (Sea Urchins, Sand Dollars, Heart Urchins)

*Dendraster excentricus* eccentric sand dollar

### Holothuroidea (Sea Cucumbers)

Holothuroidea sp. sea cucumber

*Leptosynapata albicans* Southern California sea cucumber

### Ophiuroidea (Brittle Stars, Serpent Stars)

*Amphiodia* (nr) *occidentalis* brittle star

*Amphipholis pugetana* brittle star

*Axiognathus squamatus* brittle star

*Ophiactis simplex* brittle star

Ophiuroidea sp.

## PHORONIDA (PHORONIDS)

Phoronid spp.

## ECTOPROCTA (BRYOZOA)

*Amathia* spp.

*Bowerbankia* spp.

Bryzoan spp.

*Bugula californica*

*Bugula neritina*

*Celleporaria brunnea* whitish brown bryzoan

*Cheilostomata* sp.  
*Crisia* sp.  
*Cryptosula pallasiana*

*Cyclostome* sp.  
*Thalamoporella californica*  
*Zoobotryon verticillatum*

## CHORDATA

### Urochordata (Sea Squirts, Compound Ascidians, Tunicates)

\**Ascidia zara* tunicate  
 \**Ascidia* sp.tunicate  
 \**Botrylloides diegensis* tunicate  
 \**Botryllus schlosseri* tunicate  
 \**Ciona intestinalis* tunicate  
 \**Ciona savignyi* tunicate  
 \**Microcosmus squamiger* tunicate

\**Polyandrocarpa zorritensis* tunicate  
 \**Styela canopus* tunicate  
 \**Styela clava* (formerly *barnharti*) tunicate  
*Styela montereyensis* California styela  
 \**Styela plicata* tunicate  
 \**Symplegma brakenhielmi* tunicate

### Cephalochordata (Lancelets)

*Branchiostoma californiense* lancelet

## Vertebrata

### Chondrichthyes (Sharks and Rays)

#### **Carcharhinidae**

*Carcharhinus remotus* narrowtooth shark  
*Galeorhinus zyopterus* soupfin shark  
*Mustelus californicus* gray smoothhound  
*Mustelus henlei* brown smoothhound  
*Mustelus lunulatus* sicklefin smoothhound  
*Prionace glauca* blue shark  
*Triakis semifasciata* leopard shark

#### **Gymnuridae**

*Gymnura marmorata* California butterfly ray

#### **Heterodontidae**

*Heterodontus francisci* California horn shark

#### **Myliobatidae**

*Myliobatis californica* bat ray

#### **Platyrrhinidae**

*Platyrrhinoidis triseriata* thornback

#### **Rhinobatidae**

*Rhinobatus productus* shovelnose guitarfish  
*Urolophus halleri* round stingray  
*Zapteryx exasperatus* banded guitarfish

#### **Sphyrnidae**

*Sphyrna zygaena* smooth hammerhead shark

#### **Squalidae**

*Squalus acanthias* spiny dogfish

#### **Squatinae**

*Squatina californica* pacific angel shark

### Osteichthyes (Bony Fishes)

#### **Albulidae**

*Albula vulpes* bonefish

#### **Antherinidae**

*Atherinops affinis* topsmelt  
*Atherinopsis californiensis* jacksmelt

#### **Atherinidae**

*Leuresthes tenuis* California grunion

#### **Batrachoididae**

*Porichthys myriaster* specklefin midshipman  
*Porichthys notatus* plainfin midshipman

#### **Belonidae**

*Strongylura exilis* California needlefish

#### **Blennidae**

*Hypsoblennius gentilis* bay blenny  
*Hypsoblennius jenkensi* mussel blenny

#### **Bothidae**

*Citharichthys stigmaeus* speckled sand dab  
*Hippoglossina stomata* bigmouth sole  
*Xysteuryx liolepis* fantail sole

#### **Carangidae**

*Caranx caballus* green jack

*Caranx hippos* crevalle jack

*Trachurus symmetricus* jack mackerel

**Chanidae**

*Chanos chanos* milkfish

**Clinidae**

*Gibbonsia elegans* spotted kelpfish

*Gibbonsia montereyensis* crevice kelpfish

*Gibbonsia metzi* striped kelpfish

*Heterostichus rostratus* giant kelpfish

*Parachinus integripinnis* reef finspot

**Clupeidae**

*Clupea harengus pallasii* pacific herring

\* *Dorosoma petenense* threadfin shad

*Sardinops sagax caeruleus* pacific sardine

**Cottidae**

*Leptocottus armatus* staghorn sculpin

*Scorpaena guttata* spotted scorpionfish or sculpin

*Scorpaenichthys marmoratus* cabezon

**Cynoglossidae**

*Symphurus atricauda* California tonguefish

**Cyprinodontidae**

*Fundulus parvipinnis* California killifish

**Embiotocidae**

*Amphistichus argenteus* barred surfperch

*Cymatogaster aggregata* shiner surfperch

*Damalichthys vacca* pile surfperch

*Embiotoca jacksoni* black surfperch

*Hyperprosopon argenteum* walleye surfperch

*Micrometrus minimus* dwarf surfperch

*Phanerodon furcatus* white surfperch

*Rhacochilus toxotes* rubberlip surfperch

**Engraulidae**

*Anchoa compressa* deepbody anchovy

*Anchoa delicatissima* slough anchovy

*Cetengraulis mysticetus* anchoveta

*Engraulis mordax* northern anchovy

**Girellidae**

*Girella nigricans* opaleye

**Gobiesocidae**

*Rimicola muscarum* kelp clingfish

**Gobiidae**

\* *Acanthogobius flavimanus* yellowfin goby

*Clevelandia ios* arrow goby

*Gillichthys mirabilis* longjaw mudsucker

*Gobionellus longicaudus* longtail goby

*Ilypnus gilberti* cheekspot goby

*Lepidogobius lepidus* bay goby

*Quietula y-cauda* shadow goby

\* *Tridentiger trigonocephalus* chameleon goby

**Hacnulidae**

*Haemulon flaviguttatum* Cortez grunt

\* *Poecilia latipinna* sailfin Molly

**Hemiramphidae**

*Hyporhamphus rosae* California halfbeak

**Kyphosidae**

*Hermosilla azurea* zebra perch

**Labridae**

*Halichoeres semicinctus* rock wrasse

*Oxyjulis californica* seniorita

**Mugilidae**

*Mugil cephalus* striped mullet

**Pleuronectidae**

*Hypsopsetta guttulata* diamond turbot

*Paralichthys californicus* California halibut

*Platichthys stellatus* starry flounder

*Pleuronectes vetulus* English sole

*Pleuronichthys coenosus* C-O turbot

*Pleuronichthys ritteri* spotted turbot

*Pleuronichthys verticalis* hornyhead turbot

**Pristipomatidae**

*Anisotremus davidsonii* sargo

*Xenistius californiensis* salem

**Sciaenidae**

*Atractoscion nobilis* white seabass

*Cheilotrema saturnum* black croaker

*Cynoscion parvipinnis* shortfin corvina

*Genyonemus lineatus* white croaker

*Menticurruhus undulatus* California corbina

*Roncador stearnsii* spotfin croaker

*Seriphus politus* queenfish

*Umbrina roncadore* yellowfin croaker

**Scombridae**

*Sarda chiliensis* pacific bonito

*Scomber japonicus* pacific mackerel

*Scomberomorus sierra* sierra

**Scorpididae**

*Medialuna californiensis* halfmoon

**Serranidae**

\* *Morone (Roccus) saxatilis* striped bass

*Paralabrax clathratus* kelp bass

*Paralabrax maculatofasciatus* spotted sand bass

*Paralabrax nebulifer* barred sand bass

**Sphyrnidae**

*Sphyrna argentea* California barracuda

**Stromateidae**

*Peprilus simillimus* pacific butterfish

**Syngnathidae**

*Bryx arctos* snubnose pipefish

*Hippocampus ingens* pacific seahorse

*Syngnathus auliscus* barred pipefish

*Syngnathus californiensis* kelp pipefish

*Syngnathus exilis* barcheek pipefish

*Syngnathus griseolineatus* bay pipefish

**Synodontidae**

*Synodus lucioceps* California lizardfish

## Reptilia (Reptiles)

### Anniellidae

*Anniella pulchra pulchra* silvery legless lizard

### Cheloniidae

*Chelonia mydas* green sea turtle

### Colubridae

*Thamnophis hammondi hammondi*

Hammond's two-striped garter snake

### Sceloporus

*Phrynosoma coronatum blainvillei* San Diego horned lizard

### Scincidae

*Eumeces skiltonianus interparietalis* Coronado skink

## Aves (Birds)

### Gaviiformes

#### Gaviidae (Loons)

*Gavia immer* common loon

*Gavia pacifica* pacific loon

*Gavia stellata* red-throated loon

### Podicipediiformes

#### Podicipedidae (Grebes)

*Aechmophorus clarkii transitionalis* Clark's grebe

*Aechmophorus occidentalis occidentalis* western grebe

*Podiceps auritus cornutus* horned grebe

*Podiceps grisegena holboellii* red-necked grebe

*Podiceps nigricollis californicus* eared grebe

*Podilymbus podiceps podiceps* pied-billed grebe

### Procellariiformes

#### Hydrobatidae (Storm-Petrels)

*Oceanodroma melania* black storm-petrel

### Pelecaniformes

#### Fregatidae (Frigatebirds)

*Fregata magnificens* magnificent frigatebird

#### Pelecanidae (Pelicans)

*Pelecanus erythrorhynchos* American white pelican

*Pelecanus occidentalis californicus* brown pelican

#### Phalacrocoracidae (Cormorants)

*Phalacrocorax auritus* double-crested cormorant

*Phalacrocorax pelagicus* pelagic cormorant

*Phalacrocorax penicillatus* Brandt's cormorant

#### Sulidae (Boobies)

*Sula leucogaster brewsteri* brown booby

### Ardeiformes

#### Ardeidae (Herons)

*Ardea alba egretta* great egret

*Ardea herodias wardi* great blue heron

*Botaurus lentiginosus* American bittern

*Bubulcus ibis ibis* cattle egret

*Butorides virescens anthonyi* green heron

*Egretta caerulea* little blue heron

*Egretta rufescens dickeyi* reddish egret

*Egretta thula thula* snowy egret

*Egretta tricolor ruficollis* tricolored heron

*Ixobrychus exilis hesperis* least bittern

*Nyctansassa violaceus bancrofti* yellow-crowned night heron

*Nycticorax nycticorax hoactli* black-crowned night heron

### Ciconiiformes

#### Ciconiidae (Storks)

*Mycteria americana* wood stork

#### Threskiornithidae (Ibises)

*Plegadis chihi* white-faced ibis

## Anseriformes

### Anatidae (Swans, Geese, Ducks)

!Aix sponsa wood duck  
*Anas acuta* northern pintail  
*Anas americana* American wigeon  
*Anas crecca carolinensis* green-winged teal  
*Anas clypeata* northern shoveler  
*Anas cyanoptera septentrionalium* cinnamon teal  
*Anas discors* blue-winged teal  
*Anas penelope* Eurasian wigeon  
*Anas platyrhynchos platyrhynchos* mallard  
*Anas strepera strepera* gadwall  
*Aythya affinis* lesser scaup  
*Aythya americana* redhead  
*Aythya collaris* ring-necked duck  
!*Aythya fuligula* tufted duck  
*Aythya marila nearctica* greater scaup  
*Aythya valisineria* canvasback  
*Branta bernicla hrota* Atlantic race

*Branta bernicla nigricans* Black race  
*Branta canadensis* Canada goose  
*Bucephala albeola* bufflehead  
*Bucephala clangula* common goldeneye  
!*Bucephala islandica* Barrow's goldeneye  
!*Chen hyperborea* snow goose  
!*Chen rossii* Ross' goose  
*Clangula hyemalis* oldsquaw  
!*Dendrocygna bicolor* fulvous whistling duck  
!*Histrionicus histrionicus* harlequin duck  
*Lophodytes cucullatus* hooded merganser  
*Melanitta fusca deglandi* white-winged scoter  
*Melanitta nigra americana* black scoter  
*Melanitta perspicillata* surf scoter  
*Mergus merganser* common merganser  
*Mergus serrator* red-breasted merganser  
*Oxyura jamaicensis rubida* ruddy duck  
!*Somateria spectabilis* King eider

## Falconiformes

### Accipitridae (Hawks, Kites, Eagles)

*Accipiter cooperii* Cooper's hawk  
*Accipiter striatus velox* sharp-shinned hawk  
!*Aquila chrysaetos canadensis* golden eagle  
*Buteo jamaicensis calurus* western red-tailed hawk  
!*Buteo lagopus sanctijohannis* rough-legged hawk  
*Buteo lineatus elegans* red-shouldered hawk  
!*Buteo platypterus platypterus* broad-winged hawk  
!*Buteo regalis* ferruginous hawk  
!*Buteo swainsoni* Swainson's hawk  
*Circus cyaneus hudsonius* northern harrier  
*Elanus caeruleus* white-tailed kite

### Cathartidae (Vultures)

*Cathartes aura meridionalis* turkey vulture  
!*Gymnogyps californianus* California condor

### Falconidae (Falcons)

!*Caracara plancus auduboni* crested caracara  
*Falco columbarius columbarius* American merlin  
*Falco mexicanus* prairie falcon  
*Falco peregrinus anatum* peregrine falcon  
*Falco sparverius sparverius* American kestrel

### Pandionidae (Osprey)

*Pandion haliaetus carolinensis* osprey

## Galliformes

### Odontophoridae (Quail)

*Callipepla californica californica* California quail

### Phasianidae (Pheasant)

*Phasianus colchicus* ring-necked pheasant

## Gruiformes

### Charadriidae (Plovers)

*Charadrius alexandrinus nivosus* western snowy plover  
*Charadrius montanus* mountain plover  
*Charadrius semipalmatus* semipalmated plover  
*Charadrius vociferus vociferus* killdeer

!*Charadrius wilsonia beldingi* Wilson's plover

!*Pluvialis fulva* pacific golden-plover  
*Pluvialis squatarola* black-bellied plover

### Gruidae (Crane)

!*Grus canadensis* sandhill crane

## Charadriiformes

### Haematopodidae (Oystercatcher)

*Haematopus bachmani* black oystercatcher

### Laridae (Terns, Skimmers and Jaegers)

*Chlidonias niger surinamensis* black tern

*Larus argentatus smithsonianus* herring gull

*Larus atricilla* laughing gull

*Larus californicus californicus* California gull

*Larus canus brachyrhynchus* mew gull

*Larus delawarensis* ring-billed gull  
*Larus glaucescens* glaucous-winged gull  
*Larus heermanni* Heerman's gull  
*Larus hyperboreus barrovianus* glaucous gull  
*Larus occidentalis wymani* western gull  
*Larus philadelphia* Bonaparte's gull  
*Larus pipixcan* Franklin's gull  
*Larus sabini* Sabine's gull  
*Larus thayeri* Thayer's gull  
*Rissa tridactyla pollicaris* black-legged kittiwake  
*Rynchops niger niger* black skimmer  
*Stercorarius longicaudus pallescens* long-tailed jaeger  
*Stercorarius parasiticus* parasitic jaeger  
*Stercorarius pomarinus* pomarine jaeger  
*Sterna antillarum browni* California least tern  
*Sterna caspia* caspian tern  
*Sterna elegans* elegant tern  
*Sterna forsteri* Forster's tern  
*Sterna fuscata oahuensis/crissalis* sooty tern  
*Sterna hirundo hirundo* common tern  
*Sterna maxima maxima* royal tern  
*Sterna nilotica vanrossemi* gull-billed tern  
*Sterna paradisaea* artic tern  
*Sterna sandvicensis acuflavida* sandwich tern  
**Rallidae (Coot, Gallinules, Rails)**  
*Fulica americana americana* American coot  
*Gallinula chloropus cachinnans* common moorhen  
†! *Laterallus jamaicensis coturniculus* black rail  
*Porzana carolina* sora  
*Rallus limicola limicola* virginia rail  
*Rallus longirostris levipes* light-footed clapper rail  
**Recurvirostridae (Stilts, avocets)**  
*Himantopus mexicanus mexicanus* black-necked stilt

*Recurvirostra americana* American avocet  
**Scolopacidae (Sandpipers and Phalaropes)**  
*Aphriza virgata* surfbird  
*Arenaria interpres* ruddy turnstone  
*Arenaria melanocephala* black turnstone  
*Calidris alba* sanderling  
*Calidris alpinia pacifica* dunlin  
*Calidris bairdii* Baird's sandpiper  
*Calidris canutus roselaari* red knot  
*Calidris himantopus* stilt sandpiper  
*Calidris mauri* western sandpiper  
*Calidris melanotos* pectoral sandpiper  
*Calidris minutilla* least sandpiper  
*Calidris pusilla* semipalmated sandpiper  
*Capella gallinayo delicata* common snipe  
*Catoptrophorus semipalmatus inornatus* willet  
*Limnodromus griseus caurinus* short-billed dowitcher  
*Limnodromus scolopaceus* long-billed dowitcher  
*Limosa fedoa fedoa* marbled godwit  
†! *Limosa lapponica baueri* bar-tailed godwit  
*Numenius americanus* long-billed curlew  
*Numenius phaeopus hudsonicus* whimbrel  
†! *Phalaropus fuclicarius* red phalarope  
*Phalaropus lobatus* red-necked phalarope (northern)  
*Phalaropus tricolor* Wilson's phalarope  
*Philomachus pugnax* ruff  
*Tringa flavipes* lesser yellowlegs  
*Tringa incanus* wandering tattler  
*Tringa macularia* spotted sandpiper  
*Tringa melanoleuca* greater yellowlegs  
*Tringa solitaria cinnamomea* solitary sandpiper

## Columbiformes

### Columbidae (Pigeons, doves)

\* *Columba livia* rock dove domestic pigeon  
†! *Streptopelia chinensis* spotted dove

*Zenaida asiatica mearnsi* white-winged dove  
*Zenaida macroura marginella* mourning dove

## Cuculiformes

### Cuculidae (Cuckoos)

! *Coccyzus americanus occidentalis* yellow-billed cuckoo

*Geococcyx californianus* greater roadrunner

## Strigiformes

### Strigidae (Typical owls)

*Asio flammeus flammeus* short-eared owl  
*Athene cunicularia hypugaea* burrowing owl

*Bubo virginianus* great horned owl

### Tytonidae (Barn owls)

*Tyto alba pratincola* barn owl

## Caprimulgiformes

### Caprimulgidae (Nightjars)

*Chordeiles acutipennis texensis* lesser night hawk

! *Chordeiles minor hesperis* common night hawk

## Apodiformes

### Apodidae (Swifts)

*Aeronautes saxatalis saxatalis* white-throated swift

*Chaetura vauxi vauxi* Vaux's swift

### Trochilidae (Hummingbirds)

*Archilochus alexandri* black-chinned hummingbird

*Calypte anna* Anna's hummingbird

*Calypte costae* Costa's hummingbird

*Selasphorus rufus* rufous hummingbird

*Selasphorus sasin* Allen's hummingbird

*Stellula calliope* calliope hummingbird

## Coraciiformes

### Alcedinidae (Kingfisher)

*Ceryls alcyon* belted kingfisher

## Piciformes

### Picidae (Woodpeckers)

*Colaptes auratus* northern flicker

## Passeriformes

### Aegithalidae (Long-tailed tits)

*Psaltiriparus minimus melanurus* bushtit

### Alaudidae (Larks)

*Eremophila alpestris* horned lark

### Bombycillidae (Waxwings)

*Bombycilla cedrorum* cedar waxwing

*Phainopepla nitens lepida* phainopepla

### Corvidae (Jays, crows)

*Aphelecoena californica obscura* scrub jay

*Corvus brachyrhynchos hesperis* American crow

*Corvus corax clarionensis* common raven

### Emberizidae (Warblers, sparrows, blackbirds, allies)

*Aimophila ruficeps canescens* rufous-crowned sparrow

*Agelaius phoeniceus neutralis* red-winged blackbird

*Agelaius tricolor* tricolored blackbird

*!Ammodramus caudacutus nelsoni* saltmarsh sharp-tailed sparrow

*Ammodramus sandwichensis* Savannah sparrow

*Ammodramus sandwichensis beldingi*

Belding's Savannah sparrow

*Ammodramus sandwichensis rostratus*

large-billed Savannah sparrow

*!Calamospiza melanocorys* lark bunting

*Dendroica coronata auduboni*

Audubon's warbler (yellow-rumped)

*Dendroica coronata hooveri* myrtle warbler (yellow-rumped)

*Dendroica nigrescens* black-throated gray warbler

*Dendroica occidentalis* hermit warbler

*Dendroica palmarum palmarum* palm warbler

*Dendroica petechia* yellow warbler

*Dendroica townsendi* Townsend's warbler

*Euphagus cyanocephalus* Brewer's blackbird

*Geothlypis trichas* common yellowthroat

*Icterus cucullatus nelsoni* hooded oriole

*Icterus galbula* Baltimore oriole (northern)

*Icteria virens auricollis* yellow-breasted chat

*Junco hyemalis* dark-eyed junco

*Molothrus ater* brown-headed cowbird

*Oporornis tolmiei tolmiei* MacGillivray's warbler

*Passerella iliaca* fox sparrow

*Passerella georgiana ericrypta* swamp sparrow

*Passerella lincolni* Lincoln's sparrow

*Passerella melodia cooperi* San Diego song sparrow

*Pheucticus melanocephalus maculatus* black-headed grosbeak

*Pipilo maculatus megalonyx* rufous-sided towhee

*Pipilo chlorurus* green-tailed towhee

*Piranga ludoviciana* western tanager

*Pooecetes gramineus* vesper sparrow

*Quiscalus mexicanus* great-tailed grackle

*Setophaga ruticilla* American redstart

*Spizella passerina arizonae* chipping sparrow

*Sturnella neglecta* western meadowlark

*Vermivora celata* orange-crowned warbler

*Vermivora luciae* Lucy's warbler

*Vermivora ruficapilla ridgwayi* Nashville warbler

*Vermivora virginiae* Virginia warbler

*Wilsonia pusilla* Wilson's warbler

*Xanthocephalus xanthocephalus* yellow-headed blackbird

*Zonotrichia atricapilla* golden-crowned sparrow

*Zonotrichia leucophrys* white-crowned sparrow

### Fringillidae (Finches)

*Carduelis lawrencei* Lawrence's goldfinch

*Carduelis pinus pinus* pine siskin

*Carduelis psaltria hesperophilus* lesser goldfinch

*Carduelis tristis salicamans* American goldfinch

*Carpodacus mexicanus frontalis* house finch

*!Progne subis subis* purple martin

*Riparia riparia riparia* bank swallow

*Stelgidopteryx serripennis* northern rough-winged swallow

*Tachycineta bicolor* tree swallow

*Tachycineta thalassina thalassina* violet-green swallow

### Hirundinidae (Swallows)

*Hirundo pyrrhonota tachina* cliff swallow

*Hirundo rustica erythrogaster* barn swallow

### Laniidae (Shrikes)

*Lanius ludovicianus* loggerhead shrike

### Mimidae (Mimic thrushes)

*Mimus polyglottos* northern mockingbird

*Oreoscoptes montanus* sage thrasher

*Toxostoma redivivum* California thrasher

### Motacillidae (Wagtails, pipits)

! *Anthus cervinus* red-throated pipit

*Anthus rubescens pacificus* American pipit

### Muscicapidae (Gnatcatchers)

*Polioptila caerulea* blue-gray gnatcatcher

*Polioptila californica* California gnatcatcher

### Passeridae (Old world sparrow)

\* *Passer domesticus domesticus* house sparrow

### Regulidae (Kinglets)

*Regulus calendula* ruby-crowned kinglet

! *Regulus satrapa apache* golden-crowned kinglet

### Sturnidae (Starlings)

\* *Sturnus vulgaris vulgaris* European starling

### Timaliidae (Babblers)

*Chamaea fasciata henshawi* wren

### Troglodytidae (Wrens)

! *Campylorhynchus brunneicapillus sandiegoense* cactus wren

*Cistothorus palustris* marsh wren

*Thryomanes bewickii* Bewick's wren

*Troglodytes aedon parkmanii* house wren

### Turdidae (Thrushes)

*Catharus guttatus* hermit thrush

*Catharus ustulatus* Swainson's thrush

! *Sialia currucoides* mountain bluebird

*Turdus migratorius propinquus* American robin

### Tyrannidae (Flycatchers)

*Contopus cooperi* olive-sided flycatcher

*Contopus sordidulus sordidulus* western wood-pewee

*Empidonax difficilis difficilis* western flycatcher

*Empidonax hammondi* Hammond's flycatcher

! *Empidonax oberholseri* dusky flycatcher

! *Empidonax traillii* willow flycatcher

*Empidonax wrightii* gray flycatcher

*Myiarchus cinerascens cinerascens* ash-throated flycatcher

*Sayornis nigricans semiatra* black phoebe

*Sayornis saya saya* Say's phoebe

! *Tyrannus melancholicus satrapa* tropical kingbird

*Tyrannus verticalis* western kingbird

*Tyrannus vociferans vociferans* Cassin's kingbird

### Vireonidae (Vireos)

*Vireo bellii pusillus* least Bell's vireo

*Vireo gilvus swainsoni* warbling vireo

*Vireo solitarius solitarius* solitary vireo (blue-headed)

## Mammalia (Marine Mammals)

### Cetacea

*Delphinus delphis* common dolphin

† *Eschrichtius robustus* gray whale

† *Grampus griseus* Risso's dolphin

*Lagenorhynchus obliquidens* Pacific white-sided dolphin

*Tursiops truncatus* common bottlenose dolphin

### Carnivora

*Phoca vitulina* Pacific harbor seal

*Zalophus californianus* California sea lion

\* - Non-native to San Diego Bay

† - extirpated from San Diego Bay

! - accidental, not regularly occurring at San Diego Bay

## **Appendix E: Species and Their Habitats**

Table E-1. San Diego Bay Plant Species and Their Habitats.

SPECIES		HABITAT															
Scientific Name	Common Name	Subtidal			Intertidal					Upland				Notes			
		HS	SS	(Hard / Soft Substrate)	Deep Subtidal	(Hard / Soft Substrate)	Intertidal Rocky	Intertidal Sandy	Intertidal Mudflat	Salt Marsh	Artificial Structures	Upland Transitional	Dune		Freshwater Marsh	Riparian	Disturbed
ALGAE																	
Chlorophyta	Green Algae																
Bryopsis corticulans																	
Derbesia marina																	
Chaetomorpha linum																	mat forming; opportunistic
Cladophora sp.																	mat forming; opportunistic; attached to artificial substrate
Enteromorpha sp.	sea lettuce																mud sediment surface; attached to artificial substrate
Ulva expansa																	mat forming; opportunistic
Phaeophyta	Brown Algae																
Porphyra perforata																	attached to piling surfaces or on hard, man made substrates at base of pilings
Dictyota flabellata																	rocky bottom
Ectocarpus spp.																	rocky bottom
Fucaceae sp.																	drift algae on bottom
Sargassum agathianum																	rocky bottom
Sargassum palmeri																	mud sediment surface
Colpomenia sinuosa																	rocky bottom
Rhodophyta	Red Algae																
Aglaothamnium cordatum																	rocky bottom
Antithamnion sp.																	attached to fixed object or plant; mud sediment surface
Callithamnion sp. A																	attached to piling surfaces or on hard, man-made substrates at base of pilings
Ceramium eatonian																	mat forming; opportunistic
Griffithsia furcellata																	only in clear quiet water
Griffithsia pacifica																	micro algae; rocky bottom
Tiffaniella snyderae																	psammophytic; mat forming; opportunistic
Daysea sinicola var. abyssicola																	microalgae; rocky bottom
Daysea sinicola var. californica																	microalgae; rocky bottom; succession mat
Gelidium sp. A																	mud sediment surface

Table E-1. San Diego Bay Plant Species and Their Habitats. (Continued)

SPECIES		HABITAT												
		Subtidal		Intertidal					Upland					
		(Hard / Soft Substrate)		(Hard / Soft Substrate)	Intertidal Rocky	Intertidal Sandy	Intertidal Mudflat	Salt Marsh	Artificial Structures	Upland Transitional	Dune	Freshwater Marsh	Riparian	Disturbed
Scientific Name	Common Name	HS	SS	HS	SS									Notes
<i>Pluchea sericea</i>	arrow weed													stream beds, washes, some saline; stabilizer; invasive
<i>Batis maritima</i>	saltwort													salt marsh
<i>Heliotropium curassavicum</i>	Chinese parsley													moist to dry saline soils; stabilizer; invasive
<i>Hutchinsia procumbens</i>														alkaline flats, saline seeps
*	<i>Lobularia maritima</i>													waste places
	<i>Cardionema ramosissimum</i>													sandy beaches, dunes, bluffs
	<i>Spergularia marina</i>													sandy coasts, salt marshes
	<i>Atriplex canescens</i>													clay to gravelly flats
*	<i>Atriplex lindleyi</i>													open disturbed
*	<i>Atriplex semibaccata</i>													waste places
	<i>Atriplex truncata</i>													alkaline soils, flats
	<i>Atriplex watsonii</i>													sand dunes, salt marshes
	<i>Salicornia bigelovii</i>													salt marshes
	<i>Salicornia europaea</i>													salt marsh, alkaline flat; stabilizer
	<i>Salicornia subterminalis</i>													salt marsh, alkaline flat; stabilizer
	<i>Salicornia virginica</i>													salt marsh, alkaline flat; stabilizer
*	<i>Salsola kali</i>													not listed in Jepson
	<i>Suaeda californica</i>													margins of coastal salt marsh
	<i>Cressa truxillensis</i>													saline and alkaline soil; invasive
	<i>Crassula comata</i>													open areas; locally abundant
	<i>Cuscuta salina</i>													marshes, flats, ponds; common
	<i>Lotus nuttallianus</i>													beaches, coastal scrub, urban weedy; rare
	<i>Lotus strigosus</i>													coastal scrub, disturbed areas
	<i>Frankenia palmeri</i>													alkali flats, dunes, coastal marsh; rare in CA
	<i>Frankenia salina</i>													salt marsh, alkali flats
	<i>Salvia mellifera</i>													coastal sage scrub, chaparral; stabilizer
	<i>Camissonia cheiranthifolia</i>													sandy slopes, flats, dunes

Table E-1. San Diego Bay Plant Species and Their Habitats. (Continued)

SPECIES		HABITAT																	
		Subtidal		Intertidal					Upland										
Scientific Name	Common Name	HS	SS	Deep Subtidal (Hard / Soft Substrate)	HS	SS	Shallow Subtidal	(Hard / Soft Substrate)	Intertidal Rocky	Intertidal Sandy	Intertidal Mudflat	Salt Marsh	Artificial Structures	Upland Transitional	Dune	Freshwater Marsh	Riparian	Disturbed	Notes
<i>Camissonia cheiranthifolia</i> <i>suffruticosa</i>																			sandy slopes, flats, dunes
<i>Limonium californicum</i>	sea lavender																		coastal strand, salt marsh, beaches, bays, stabilizer
<i>Eriogonum fasciculatum</i>	California buckwheat																		dry slopes, washes, scrub canyons
<i>Eriogonum parvifolium</i>																			dunes, sea bluffs
<i>Nemacaulis denudata</i>	thread stem																		coastal strand, desert scrub, sandy
* <i>Rumex crispus</i>	curly dock																		disturbed places; abundant
<i>Salix lasiolepis</i>	arroyo willow																		shores, marshes, meadows, bluffs; stabilizer; invasive
<i>Cordylanthus maritimus</i> <i>maritimus</i>	salt marsh bird's-beak																		federally endangered; coastal salt marsh
* <i>Nicotiana glauca</i>	tree tobacco																		open disturbed flats
* <i>Tamarix</i> sp.	tamarisk																		often in saline habitats
PLANTS—MONOCOTS																			
<i>Juncus acutus</i>	spiny rush																		salt marshes, saline seeps; stabilizer
<i>Triglochin maritima</i>	arrow grass																		marshes, saline-alkaline margins and mud; stabilizer
<i>Yucca schidigera</i>	Mohave yucca																		chaparral, creosote scrub, dry
* <i>Bromus madritensis rubens</i>	red brome																		open disturbed
* <i>Cortaderia jubata</i>	Pampas grass																		disturbed sites, coastal habitat; invasive
<i>Distichlis spicata</i>	salt grass																		salt marsh, moist alkaline stabilizing; invasive
* <i>Hordeum marinum</i>	sterile barley																		moist disturbed
<i>Parapholis incurva</i>	sickle grass																		salt marsh above highest tide; Jepson lists exotic
* <i>Polypogon monspeliensis</i>	rabbit foot grass																		moist places, along streams, ditches
<i>Spartina foliosa</i>	cordgrass																		salt marsh, mud flats
<i>Ruppia maritima</i>	ditch grass																		marshes, ponds, sloughs; stabilizer
* <i>Typha domingensis</i>	southern cattail																		marshes; Jepson lists not exotic
<i>Typha latifolia</i>	common cattail																		marshes, ponds, lakes
<i>Zostera marina</i>	eelgrass																		shallow water, bays, estuaries

Table E-2. San Diego Bay Invertebrate Species and Their Habitats.

SPECIES	HABITAT				Notes
	Eelgrass	Unconsolidated Sediment	Hard Substrate	Artificial Hard Substrate	
<b>Exotic</b>					
<b>Scientific Name</b>	<b>Common Name</b>				
<b>PHYLUM PORIFERA</b>					
<i>Halichondria panicea</i>					
* <i>Halicionia</i> sp.					epifauna on pilings and floats
<i>Hymeniconid</i> sp.					protected places on rocks, floating docks and tide pools; from midtidal zone to 20 ft (6 m) deep
<i>Tetilla mutabilis</i>					epifauna on pilings and floats
<i>Leucosolenia</i> sp.					on surface
<i>Eperopsis originalis</i>					epifauna on pilings and floats
<b>PHYLUM CNIDARIA</b>					
* <i>Obelia</i> sp.					epifauna on pilings and floats
<i>Aglaophenia</i> sp.					epifauna on pilings and floats
<i>Plumularia</i> sp.					epifauna on pilings and floats
<i>Tubularia</i> sp.					attached to almost any solid object continuously submerged in shallow water; commonly found on boat hulls
* <i>Tubularia crocea</i>					
<i>Corynophora palma</i>					
<i>Epiactis prolifera</i>					attached to rocks, large algae, and eelgrass; from between high and low tide line to 30 ft (9 m) deep
<i>Diadumene franciscana</i>					
<i>Diadumene</i> cf. <i>leucolena</i>					
<i>Cerianthus</i> (nr) <i>aestuarii</i>					
<i>Edwardsiella californica</i>					
<i>Harenactis attenuata</i>					
<i>Pachycerianthus fimbriatus</i>					
<i>Renilla kollikeri</i>					
<i>Scolanthus</i> sp.					
<b>PHYLUM PLATYHELMINTHES</b>					
<i>Polyclad</i> spp.					both subtidal and intertidal
<b>PHYLUM NEMERTEA</b>					
<i>Nemertea</i> spp.					both subtidal and intertidal
<b>PHYLUM ASCHELMINTHES</b>					
<i>Nematode</i> spp.					both subtidal and intertidal
<b>PHYLUM SIPUNCULA</b>					
<i>Sipunculid</i> sp.					
<b>PHYLUM ANNELIDA</b>					
<i>Oligochaete</i> spp.					both subtidal and intertidal
<i>Ampharete labrops</i>					
<i>Ampharetidae</i> spp.					
<i>Amphitrite scaphobranchia</i>

Table E-3. San Diego Bay Fishes: Their Habitats and Feeding Strategies.

SPECIES			HABITAT						Notes on Habitat Use and Feeding	DIET	
Exotic	Scientific Name	Common Name	Functional Group/Bay Region <sup>1</sup>	Relative Abundance <sup>2</sup>				Fish		Aquatic Invertebrate	Plankton
				Intertidal noveg	Nearshore noveg	veg	veg				
SHARKS AND RAYS											
	<i>Carcharhinus remotus</i>	narrowtooth shark							open water		
	<i>Galeorhinus zyopterus</i>	soupfish shark							open water; feed on fish and some squid		
	<i>Mustelus californicus</i>	gray smoothhound							open water; feed on crabs, fishes and shrimp		
	<i>Mustelus henlei</i>	brown smoothhound							open water; feed on crabs, shrimp and some fish		
	<i>Mustelus lunulatus</i>	sicklefin smoothhound							open water		
	<i>Prionace glauca</i>	blue shark							open water;shallow coastal waters over sand and mud; generally feed on small schooling fishes		
	<i>Triakis semifasciata</i>	leopard shark							demersal; over sand and mud in shallow bays and inshore waters to depths of 300 ft (91 m)		
	<i>Gymnura marmorata</i>	California butterfly ray							demersal on unconsolidated sediment		
	<i>Heterodontus francisci</i>	California hornshark							demersal on unconsolidated sediment		
	<i>Myliobatis californica</i>	bat ray							demersal on coasts to 150 ft (46 m); kelp beds.		
	<i>Platyrrhinoidis triseriata</i>	thornback							demersal on unconsolidated sediment; over sand and mud to depths of 150 ft(46 m); feed on sand-dwelling worms, snails, clams, crabs, and shrimps; ovoviviparous		
	<i>Urolophus halleri</i>	round stingray	TOP10EI N, NC, SC, S						low bays and off coast to 69 ft (21 m). Feed on shrimps, crabs, snails, and clams.		
	<i>Zapteryx exasperatus</i>	banded guitarfish							demersal on unconsolidated sediment		
	<i>Sphyrna zygaena</i>	smooth hammerhead shark							open water		
	<i>Squalus acanthias</i>	spiny dogfish							open water; soft bottoms; migratory		
	<i>Squatina californica</i>	pacific angel shark							demersal, sandy and muddy bottoms from shallow water to 600 ft (183 m); usually feed on prey such as the California halibut		
BONY FISH											
	<i>Albula vulpes</i>	bonefish	NC, S						openwater, shallow waters over soft bottoms; feed on clams, snails, shrimps, and small fishes		
	<i>Atherinops affinis</i>	topsmelt	TOP10EI N, NC, SC, S						open water; surface waters near shore, in bays, and around kelp beds; topsmelt mature in two to three years and spawn during the late winter and spring, often over estuaries and mudflats, attaching eggs to kelp and other algae, feed on plankton and algae		
	<i>Atherinopsis californiensis</i>	jacksmelt	N, NC, SC, S						open water		
	<i>Leuresthes tenuis</i>	California grunion	N, NC, SC						open water; off sandy beaches to depths of 59 ft (18 m); spawns on beaches at night during spring high tide; eggs are buried in sand and hatch when the next spring tide occurs		
	<i>Porichthys myriaster</i>	specklefin midshipman							demersal on unconsolidated sediment		
	<i>Porichthys notatus</i>	plainfin midshipman							demersal on unconsolidated sediment; over sand and mud to depths of 1,200 ft (366 m); occurs in shallow water during the late spring to spawn; male becomes emaciated while guarding the eggs and young; feeds at night on other fishes and crustaceans		
	<i>Strongylura exilis</i>	California needlefish	NC, SC, S						open water		
	<i>Hypsoblennius gentilis</i>	bay blenny	VEGSPP N, NC						on bottom		

Table E-3. San Diego Bay Fishes: Their Habitats and Feeding Strategies. (Continued)

SPECIES			HABITAT					DIET
Scientific Name	Common Name	Functional Group/Bay Region <sup>1</sup>	Intertidal noveg	Nearshore noveg	veg	Channel veg	Notes on Habitat Use and Feeding	
<b>Exotic</b>								
<i>Hypsoblennius jenkinsi</i>	mussel blenny						on hard structure in association with mussels/barnacles	Fish
<i>Citharichthys stigmatus</i>	speckled sand dab						demersal on unconsolidated sediment; over soft bottoms to 1,800 ft (549 m); spawns during the winter; some females spawn twice a season	Aquatic Invertebrate
<i>Hippoglossina stomata</i>	bigmouth sole						demersal on unconsolidated sediment	
<i>Xysteirus tirolepis</i>	fantail sole	N, NC					demersal on unconsolidated sediment	
<i>Caranx caballus</i>	green jack						open water	
<i>Caranx hippos</i>	crevalle jack						open water	
<i>Trachurus symmetricus</i>	jack mackerel						open water; offshore on surface and at midwater; around reefs and kelp; feed on krill, squids, anchovies, and lanternfishes; major food source for seals, sea lions, porpoises, swordfishes, sea basses, and pelicans	
<i>Chanos chanos</i>	milkfish						open water	
<i>Gibbopsis elegans</i>	spotted kelpfish	VEGSPP N, NC					demersal on unconsolidated sediment	
<i>Gibbopsis montereyensis</i>	crevice kelpfish						demersal on unconsolidated sediment	
<i>Heterostichus rostratus</i>	giant kelpfish	TOP10EI, VEGSPP N, NC, SC, S					demersal on unconsolidated sediment; rocky areas with eelgrass, leafy red algae, jointed coralline algae, or kelp beds to depths of 132 ft (40 m); feed on small crustaceans, mollusks, and fishes	
<i>Parachanna integripinnis</i>	reef finspot	VEGSPP					demersal on unconsolidated sediment and hard substrate; rocks and reefs in intertidal zone and below low tide level to 252 ft (77m)	
<i>Scorpaenichthys marmoratus</i>	cabezon							
<i>Scorpaena guttata</i>	spotted scorpionfish	N, NC						
<i>Symphurus atricauda</i>	California tonguefish	N, NC						
<i>Fundulus parvipinnis</i>	California killifish	BESPP NC, SC, S					demersal on unconsolidated sediment	
<i>Amphistichus argenteus</i>	barred surfperch						open water near bottom	
<i>Cymatogaster aggregata</i>	shiner surfperch						demersal	
<i>Damalichthys vacca</i>	pile surfperch	TOP10EI, VEGSPP N, NC, SC, S					demersal; in bays around piers	
<i>Embiotoca jacksoni</i>	black surfperch	VEGSPP NC					demersal	
<i>Hyperprosopon argenteum</i>	walleye surfperch						demersal; is this the same as the striped seaperch ( <i>Embiotoca lateralis</i> )	
<i>Micrometrus minimus</i>	dwarf surfperch	VEGSPP N					demersal; surf, over snad, around piers, reefs, and kelp beds, bays up to depths of 59 ft (18 m); breeds October through December, giving birth to between five and twelve young in the spring; feeds on small crustaceans	
<i>Phanerodon furcatus</i>	white surfperch						demersal	
<i>Rhacochilus toxotes</i>	rubberlip surfperch						demersal; reefs, piers, and kelp beds, from shallow bays to 150 ft (46 m); feeds on shrimp, amphipods, small crabs, and other crustaceans	
<i>Anchoa compressa</i>	deepbody anchovy	BESPP NC, SC, S					open water	

Table E-3. San Diego Bay Fishes: Their Habitats and Feeding Strategies. (Continued)

SPECIES			HABITAT							Notes on Habitat Use and Feeding	DIET	
Exotic	Scientific Name	Common Name	Functional Group/Bay Region <sup>1</sup>	Relative Abundance <sup>2</sup>								
				Intertidal	Nearshore	Channel						
	<i>Anchoa delicatissima</i>	slough anchovy	TOP10EI, BESPP N, NC, SC, S							open water		Fish Aquatic Invertebrate Aquatic Vegetation Plankton
	<i>Cetengraulis mysticetus</i>	anchoveta	TOP10EI, RCSPP N, NC, SC, S							open water		
	<i>Engraulis mordax</i>	northern anchovy									open water; spawns during winter and early spring, and the pelagic eggs take only 2–4 days to hatch; schools move large distances up and down the coast; important food source for other fishes, birds, and mammals	
	<i>Sardinops sagax</i>	Pacific sardine	TOP10EI, RCSPP N, NC, SC							open water		
	<i>Girella nigricans</i>	opaleye								demersal; unconsolidated sediment and hard substrate; shallow reefs and kelp beds to depths of 96 ft (29 m); spawn from April–May and area mature at two to three years; feed on algae and eelgrass, get nourishment from small animals living on the plants		
*	<i>Acanthogobius flavimanus</i>	yellowfin goby	SC, S							on/in unconsolidated sediment		
	<i>Clevelandia ios</i>	arrow goby	BESPP N, NC, SC, S							on/in unconsolidated sediment		
	<i>Gillichthys mirabilis</i>	longjaw mudsucker	BESPP							on/in unconsolidated sediment		
	<i>Gobionellus longicaudus</i>	longtail goby								on/in unconsolidated sediment		
	<i>Ilypnus gilberti</i>	cheekspot goby	BESPP N, NC, SC, S							on/in unconsolidated sediment		
	<i>Lepidogobius lepidus</i>	bay goby								on/in unconsolidated sediment		
	<i>Quietula y-cauda</i>	shadow goby	BESPP N, NC, SC, S							on/in unconsolidated sediment		
	<i>Tridentiger trigonocephalus</i>	chameleon goby								on/in unconsolidated sediment		
	<i>Haemulon flaviguttatum</i>	Cortez grunt								demersal		
	<i>Hyporhamphus rosae</i>	California halfbeak	BESPP N, NC, SC, S							open water		
	<i>Hermosilla azurea</i>	zebra perch	N							open water		
	<i>Halichoeres semichinchtus</i>	rock wrasse	N							Reefs and kelp beds to depths of 150 ft (46 m). Feed on small snails, crustaceans, worms, and larval fishes.		
	<i>Oxyjulis californica</i>	senorita								demersal on unconsolidated sediment; this species supports the only commercial fishery in the Bay; coasts, estuaries, and fresh water; important food fish that travel up rivers but spawn in the sea		
	<i>Mugil cephalus</i>	striped mullet	BESPP S									
	<i>Leptocottus armatus</i>	staghorn sculpin	N, NC, SC, S							demersal on unconsolidated sediment; over soft bottoms from 6–150 ft (2–46 m)		
	<i>Hypsopsetta guttulata</i>	diamond turbot	BESPP N, NC, SC, S							demersal on unconsolidated sediment; over soft bottoms to 600 ft (183 m); important commercial fish		
	<i>Paralichthys californicus</i>	California halibut	TOP10EI, RCSPP N, NC, SC, S

## **Appendix F: Narratives on Sensitive Species Not Listed Under Federal or State Endangered Species Acts**

**Large-billed savannah sparrow—*Passerculus sandwichensis rostratus***

The large-billed savannah sparrow is a federal and California Species of Concern and a winter visitor to the San Diego Bay area. It is found in salt marsh habitats, and from its breeding grounds along the Gulf of California it was known to range eastward from the coast to the Salton Basin, and as far north as the Channel Islands, Morro Bay, and Santa Cruz (Garrett and Dunn 1981; Unitt 1984). It was once fairly common along the coast of California, but depletion of its salt marsh breeding grounds within the Colorado River delta in Mexico led to a drastic reduction in its numbers (Small 1994). The large-billed savannah sparrow is now regularly found in south Bay, especially on Christmas bird counts (J. Coatsworth, San Diego Audubon Society, pers. comm.). It can also still be seen in the Salton Basin. Although its numbers have been on the rise, its range is still highly restricted, with California being at the extreme north of that range (Small 1994).

**Black skimmer—*Rynchops niger niger***

The black skimmer is considered a California Species of Concern that has colonized southern California from western Mexico since the 1960s and is now considered native to the area (Kaufman 1996). In San Diego Bay, it nests on the levees at the Salt Works in midsummer (Unitt 1984), where at least 400 nests were established in 1999 (Patton 1999). They are also found at the Salton Sea and Batiquitos Lagoon. Recently a resident population at Mission Bay became established, centered around Kendall-Frost Marsh and the beaches of Crown Point (J. Coatsworth, pers. comm.). Skimmers forage for small fish in tidal channels, diked ponds, shallow subtidal water, and deep water by trawling the water surface with their lower beaks, which are elongated and extend beyond the upper beaks (Small 1994). Preferred prey are northern anchovy, Pacific sardine, and topsmelt (Horn *et al.* 1996).

Black skimmers are threatened by disturbance of their nesting colonies, predation, and bioaccumulation (Kaufman 1996). Skimmer eggs tested in 1997 from the Salt Works were found to have detectable levels of a few organochlorine compounds. The compound with the highest level, *p,p'*DDE, is believed to be the most biologically active of the breakdown products of the pesticide DDT (Carol Roberts, USFWS, pers. comm. 2000). Black skimmer eggs from the Imperial Valley have higher levels than those from the Salt Works. In addition, the silty soils present in some of the saltwork levees can become cement-like when dried, decreasing the value of these areas for nesting sites (D. Stadlander, U.S. Fish and Wildlife Service, pers. comm.). The population at the Salt Works has been growing annually (Unitt 1984), and establishment of further colonies in the San Diego Bay area is possible as the range of the species expands in the west (Unitt 1984).

**Burrowing owl, coastal population—*Athene cunicularia hypugaea***

The burrowing owl is a breeding resident of upland areas around San Diego Bay. It is a California Species of Concern that is declining throughout its range, and nearing extirpation in coastal San Diego County (Unitt 1984; E. Copper, pers. comm.). It is also a federal Species of Concern. Burrowing owls form loose colonies, with both resident and migratory components (E. Copper, pers. comm.). Eggs are produced from late March to mid-June, and fledglings are active through August (Unitt 1984).

Occasionally, wintering owls appear at Silver Strand. These come during the months of September and October, and leave in January or February (C. Winchell, U.S. Fish and Wildlife Service, pers. comm.).

The burrowing owls in the San Diego Bay area represent a large part of the population county-wide, with the largest nesting colony in San Diego County on North Island (Unitt 1984; E. Copper, pers. comm.). Throughout their range, burrowing owls are threatened by habitat loss, predation, vehicle impacts, and control programs for ground squirrels (Kaufman 1996). Owl burrows are strongly correlated with ground squirrel burrow complexes.

#### **Double-crested cormorant—*Phalacrocorax auritus albociliatus***

The double-crested cormorant is a breeding resident of San Diego Bay, and a California Species of Concern. These cormorants nest and roost mainly on artificial structures, and have been observed avoiding water vessels (U.S. Fish and Wildlife Service 1995a). They forage for fish in areas of open water. Their nesting schedule in the San Diego Bay area remains undescribed (Unitt 1984).

This species suffered a population decline during the 1960s and early 1970s due to DDT residues in marine food chains, and though there was some recovery in the late 1970s and 1980s, original population levels have not been restored (Small 1994). However, in some parts of its range, the cormorant population has recovered to the point where in March of 1998 the U.S. Fish and Wildlife Service ruled to establish a depredation order to protect commercial freshwater aquaculture (see <http://www.epa.gov> for details).

There is only one breeding site currently known in San Diego County, on an old dredge in the Salt Works of south San Diego Bay (Unitt 1984; U.S. Fish and Wildlife Service 1993; U.S. Fish and Wildlife Service 1995b; E. Copper, pers. comm.), where at least 80 nests were found in 1999 (Patton 1999). It once occurred at Lake Henshaw, and could establish itself elsewhere over time (Unitt 1984). The double-crested cormorant is vulnerable to bioaccumulation in its prey and to human disturbance of nesting locales.

#### **Elegant tern—*Sterna elegans***

The elegant tern is a federal and California Species of Concern and a breeding resident of San Diego Bay.

There were about 1,700 breeding pairs at the Salt Works in 1999, with approximately 3,100 nests at the height of the season (Patton 1999). They also roost on mudflats, sandy beaches, and salt flats. They will utilize subtidal and deepwater areas for foraging. Egg-laying begins in April, but duration of the breeding season is unknown (Unitt 1984).

There is one large breeding colony at the Salt Works (Unitt 1984) that has been documented as utilizing much of the south and central Bay (U.S. Fish and Wildlife Service 1995b). One elegant tern nest was found at Zuniga Jetty at the mouth of the Bay, but the eggs were predated by June (R. Patton, pers. comm.). This species was nearly undocumented in San Diego Bay prior to 1950, and the San Diego breeding colony was established in 1959 (Gallup and Bailey 1960; Small 1994). This range expansion appears to have been triggered by an increase in anchovy abundance, which may in turn have been a result of the 1957–58 El Niño conditions (Schaffner 1986; Small 1994).

### **Gull-billed tern—*Sterna nilotica vanrossemi***

The gull-billed tern is both a federal and California Species of Concern, as well as a summer breeding species in San Diego Bay. It has only recently colonized the San Diego Bay, with eleven to 20 pairs at the Salt Works, where it nests on the levees in mid-to-late summer (Unitt 1984; Small 1994; Patton 1999). It forages in marshes and upland transition habitats.

Coastal records are extremely rare, and almost all are from San Diego County, commencing in summer 1985 (Small 1994). From April through August 1987 up to six were at south San Diego Bay, fledging two young. This represented the first US west coast breeding record. By summer 1993, this colony had increased to ten breeding pairs. In 1997, a year when there may have been a food shortage for fish foraging birds in San Diego Bay, gull-billed terns were documented predating on California least tern and western snowy plover chicks at the Naval Amphibious Base (M. Kenney, USFWS, *pers. comm.*). Gull-billed terns were recorded in California at the south end of the Salton Sea in 1927 with a nesting colony of 500 pairs. In 1993, only 120 nesting pairs were present there (Small 1994). Erosion and predation at the Salton Sea have been problems for the nesting colonies there.

### **Loggerhead shrike—*Lanius ludovicianus***

The loggerhead shrike is both a federal and California Species of Concern. It is a breeding resident of upland transition habitats of the Bay, and forages over the high salt marsh. The loggerhead shrike was considered a common breeding resident of the San Diego Bay area fifteen years ago, but it is now uncommon to rare with few known nesting locations in the area (E. Copper, *pers. comm.*), although it is widely distributed throughout much of the county and state (Unitt 1984; Small 1994). This species, along with other shrikes, has been on the decline for some time. Although the reasons for this decline are not clearly known, they may be related to the bioaccumulation of pesticides from its prey (Small 1994; Kaufman 1996). Changes in habitat may also be contributing to this decline (Kaufman 1996).

The shrike requires dense shrubs for concealing its nests, with ample open ground nearby (Unitt 1984). Eggs are laid from early March through mid-June, and chicks are fledged by late July (Unitt 1984). Loggerhead shrikes prey upon insects and vertebrate species, including some of the other sensitive species around San Diego Bay (E. Copper, *pers. comm.*).

### **Long-billed curlew—*Numenius americanus***

The long-billed curlew is a California Species of Concern. It is a winter visitor to the tidal mudflats, estuaries, and salt marshes with tidal channels, as well as grasslands and sandy beaches (Garrett and Dunn 1981; Small 1994; E. Copper, *pers. comm.*). Its preferred breeding grounds are grasslands with nearby lakes or marshes (Small 1994). This is one of the largest shorebirds, and its down-curved bill can be up to 8 in (20 cm) long. It can often be seen with marbled godwits probing in the mud and sand for small prey (E. Copper, *pers. comm.*). One of its favorite prey are ghost shrimp.

This species has decreased through much of its range as a result of loss of habitat at breeding grounds and bioaccumulation (Kaufman 1996; E. Copper, *pers. comm.*). Also, many populations were subject to heavy hunting pressures in the late 1800s and early 1900s (Schoolnet, web site).

**Short-eared owl—*Asio flammeus flammeus***

The short-eared owl is a California Species of Concern. It is a rare to uncommon winter visitor in salt marshes, grasslands, and agricultural areas (E. Copper, pers. comm.).

The short-eared owl can still be found at the Sweetwater Marsh (J. Coatsworth, pers. comm.). This species once nested in many areas in California (Unitt 1984), but no longer does so along the southern coastal areas (Remsen 1978). Its numbers in general are declining, especially in coastal areas where it is now considered uncommon (Garrett and Dunn 1981; E. Copper, pers. comm.). Loss of grasslands and marsh habitats to agriculture, pastures, and development have contributed to the decline of this species. Short-eared owls and their chicks are also vulnerable to predation by skunks, feral cats, and dogs (Audubon Watch List).

**San Diego coast horned lizard—*Phrynosoma coronatum blainvillei***

Both a California and federal Species of Concern (a former federal Category 2), this species is recorded from the San Diego Bay area. Details on extant populations are sketchy, at best, though some may still remain along the Silver Strand and Coronado coastal scrub habitats (Jennings and Hayes 1994). Specific habitat requirements are loose, fine, sandy soils with limited vegetation cover. They may also be found in areas of denser shrub cover where small pockets of open habitat occur, such as those created by fire or other disturbance (Jennings and Hayes 1994). Its range extends through much of southern California west of the deserts, and into Baja California, Mexico, from sea level to 6,500 ft (2,000 m) (Smith 1946; Stebbins 1985). Historically, it was most abundant in riparian and coastal sage habitats of the coastal plains of southern California, but has disappeared from about 45% of the areas it once inhabited (Jennings and Hayes 1994).

The San Diego coast horned lizard is threatened by habitat fragmentation, non-native ant species (causing a degradation of the food base for horned lizards), off road vehicle activity, predation by domestic pets, and especially by collectors, though commercial collecting was banned in 1981 (Schoenherr 1992; Jennings and Hayes 1994). Since horned lizards rely primarily on camouflage to avoid predators, they are very easy for humans to catch, but survival in captivity is poor and few are ever returned to the wild.

**Silvery legless lizard—*Anniella pulchra pulchra***

The silvery legless lizard is a California and a federal Species of Concern. Historically, the silvery legless lizard was common in areas of suitable habitat, including the Silver Strand. It may still occur there, and at the neighboring Naval Radio Receiving Facility where coastal dune vegetation also occurs, but the species has not been noted at either locale in recent surveys (U.S. Department of Agriculture 1989). There are no other documented occurrences for the legless lizard elsewhere in the San Diego Bay area, and little suitable habitat occurs except along the beaches of the Silver Strand and the Pacific side of Coronado. Preferred habitat appears to be coastal dunes with native shrubs for cover (Jennings and Hayes 1994).

Legless lizards spend most of their time buried in the soil (usually 1–4 inches/3–10 cm deep), emerging onto the surface primarily in the mornings and at night (Stebbins 1985; Jennings and Hayes 1994; Germano and Morafka 1996). They can also be found under surface objects such as logs, rocks, etc. They feed upon insect larvae, small adult insects, and spiders either at the surface or just below it (Stebbins 1985). Primary predators include alligator lizards, snakes, birds, deer

mice, and domestic cats (Zeiner *et al.* 1988; Jennings and Hayes 1994). Legless lizards bear one to four young per year between September and November (Jennings and Hayes 1994).

Activities that are likely to result in soil compaction can be expected to negatively impact legless lizards. Also of concern are alterations to the plant community, where removal of vegetation can result in a drying of the soils, or invasion of certain non-native plants (e.g. *Carpobrotus edulis*) can alter the soil structure. *Carpobrotus* and other invasive weeds also tend to support a much lower arthropod community (Nagano 1979; Snover 1992 and unpublished data), providing much less food for lizards and other animals.

### **Globose dune beetle—*Coelus globosus***

The globose dune beetle is a federal Species of Concern that inhabits coastal sand dunes and sand hummocks in scattered localities from Bodega Head, Sonoma County to Ensenada, Baja California, as well as the channel islands (except San Clemente) (Nagano 1979; Snover 1992). Throughout much of its range it co-occurs with the closely related *Coelus ciliatus*. Its population status has declined in recent years due to development of coastal areas and recreational use of remaining coastal dune habitats. Many of southern California's coastal dunes have also seen significant invasions by non-native plant species, which tend to be detrimental to native fauna, especially arthropods. *Coelus* spends the days burrowed into the sand beneath dune vegetation, and comes to the surface at night, leaving distinctive furrows in the sand around the perimeter of the vegetation. It feeds upon the leaves, twigs, seeds, and detritus of dune vegetation, both on the sand surface and below. It will also climb up into the plant canopies to feed. Overall it shows a marked preference for native plant species over invasive non-natives. One exception is sea rocket (*Cakile maritima*) which is actually preferred by adults over the native dune ragweed (*Ambrosia chamissonis*). However, in coastal areas sea rocket is an annual plant that dies off at the time of year when *Coelus* larvae are approaching the end of their development period. Particularly detrimental is the hottentot fig or sea fig (*Carpobrotus* spp.), which provides little or no food for dune beetles and most other dune arthropods. There are generally very few beetles and other dune arthropods found in the sands beneath *Carpobrotus* stands (Nagano 1979; Snover 1992 and unpublished data).

The globose dune beetle was proposed for listing as threatened in 1979, and was also a Category 2 species. In the San Diego Bay area, it has been found on the dunes at Silver Strand, as well as the coastal dune habitats near the Naval Radio Receiving Facility. *Carpobrotus* does occur in both areas and poses a direct threat to the continued persistence of the species.

### **Tiger beetles—*Cicindela* spp.**

All tiger beetles are highly active, fast-moving predators, preying upon any small arthropods they can overpower, especially flies, moths, ants, and isopods. The adults can be seen on warm sunny days in the spring, summer, or fall on open mud or sand. The larvae inhabit burrows in the soils of the same regions, where they capture prey as it passes near the burrow entrance. Tiger beetles are generally considered beneficial insects, as they prey upon significant numbers of small flies, such as kelp flies, that can become quite numerous and bothersome to humans in the area.

Tiger beetles in general are severely threatened by urban expansion, insecticide use, and recreational use of the beaches and coastal habitats of southern California and elsewhere. Seven species of the genus *Cicindela* are known to inhabit the southern California coast, six of which have been recorded in the San Diego Bay area, though two of these have not been relocated in recent surveys (*C. oregona* and *C. hirticollis grvida*). Four of the six species are considered rare (see below for accounts on individual species). The species *C. haemorrhagica haemorrhagica*, which has been recorded at Sweetwater Marsh National Wildlife Refuge, is not considered rare. The sand dune tiger beetle was described earlier, since it has a federal threatened status. The three species described below have experienced declines in recent years and can now only be found at a handful of their former locales due to habitat loss.

**Sandy beach tiger beetle—*Cicindela hirticollis grvida***

This beetle is a federal Species of Concern usually found on sandy areas subject to tidal flow. Historically it has been found in several locations adjacent to San Diego Bay, including Silver Strand and Coronado. It may still occur on the Silver Strand near the Naval Amphibious Base, but this area was not surveyed by Nagano in 1979.

**Mudflat tiger beetle—*C. trifasciata sigmoidea***

This beetle is a California Species of Concern that inhabits mudflats and other areas with dark-colored, moist-to-wet sands. Adults can sometimes be seen running through sparse stands of *Salicornia*. The mudflat tiger beetle currently persists at various localities in Ventura, Los Angeles, Orange, and San Diego Counties, including the Sweetwater Marsh National Wildlife Refuge.

**Gabb's tiger beetle—*C. gabbi***

Gabb's tiger beetle is a California Species of Concern that frequents the mudflats and salt flats of coastal marshes. Current populations are known from Sweetwater Marsh National Wildlife Refuge and Silver Strand, as well as Border Field and one location in Orange County. The population at Sweetwater Marsh National Wildlife Refuge was the largest of the populations surveyed in 1979.

**Nuttall's lotus—*Lotus nuttalianus***

Nuttall's lotus, a California Native Plant Society List 1B species, is an annual herb in the family Fabaceae (Legumes). It occurs in coastal strand and coastal scrub habitats in San Diego County and Baja California, Mexico, below 98 ft (30 m) elevation (Hickman 1993; California Native Plant Society 1994). It produces small yellow flowers from March through June. It occurs in association with another rare plant, coast woolly heads (see below) (Reiser 1994).

In recent years Nuttall's lotus has been declining rapidly due to development and other human activities and the invasion of its habitat by non-native weedy species (California Native Plant Society 1994). It is now known to occur in less than ten locales in the state, including the following sites in the San Diego Bay area: Silver Strand beach, southwest of Emory Cove west of the freeway, north of Crown Cove, and the Naval Radio Receiving Facility (California Native Plant Society 1994; Reiser 1994). A historic site on North Island has been extirpated. Other known current locales are Border Field and Torrey Pines State Parks, and the mouths of both the San Luis Rey and Santa Margarita Rivers.

**Coast woolly heads—*Nemacaulis denudata* var. *denudata***

Coast woolly heads, a California Native Plant Society List 2 species, is an annual herb in the family Polygonaceae (the Buckwheat family) that occurs on coastal strand habitats in southern California and Baja California, Mexico. Its flowers are small and clustered within heads of woolly fibers (Hickman 1993; California Native Plant Society 1994). Its distribution has been greatly reduced due to development, recreational activities, and invasive weeds. Extant populations in California include Silver Strand west of Emory Cove (Reiser 1994). It also occurs at the mouth of the Santa Margarita river, Penasquitos Lagoon, and Border Field State Park. Historical occurrences in the San Diego Bay area include a fill site in National City, Coronado, and Imperial Beach (Reiser 1994).

**Palmer's frankenia—*Frankenia palmeri***

Palmer's frankenia, a California Native Plant Society List 2 species, is a perennial shrub of the family Frankeniaceae (the genus *Frankenia* is the only genus in the family) that can be found on coastal dunes and salt marshes in southwestern San Diego County and northern Baja California, Mexico, below 1,476 ft (450 m) (Hickman 1993; California Native Plant Society 1994). Its flowers are white to pink, appearing from May to July. It grows on raised mounds in association with *Salicornia subterminalis* and *Suaeda* spp. (Reiser 1994).

Its status is seriously threatened by development (California Native Plant Society 1994). There is only one known native population in San Diego County, at Gunpowder Point. Two other transplanted populations may be found at the D Street Fill site and at Tijuana River National Wildlife Refuge (Reiser 1994). Historically it also occurred on the Bay portion of the Silver Strand (Reiser 1994).

# **Appendix G: Ecological History of San Diego Bay**

Table G-1. Ecological History of San Diego Bay.<sup>1</sup>

Natural Formation	Bay formation product of long term geologic process	12-2 million years ago	Bay margin is created in the Pliocene age, the result of subduction of tectonic plates and modified by glacial deposits, as the Ice Age warmed.
Pre-European Settlement	Prehistoric	48,000 years ago	Late in the Ice Age there was no Bay; Coronado, North Island and Point Loma were islands. Silt laden waters of the Tijuana River to the south were carried north by natural current action eventually building the Silver Strand and connecting Coronado and North Island. The Pacific shore was 20 miles farther west than today. Ice melt brought muddy San Diego River waters that built up a delta, tying Point Loma to the mainland and creating two Bays; Mission Bay on one side, and San Diego Bay on the other.
	San Diego Bay Estuary	10,000 years ago	The ocean had spread inland through a gap in the outer Coast Range, and seawater began to fill the bay. For thousands of years the waters rose at nearly an inch per year, which was enough to advance the shoreline nearly 100 feet each year along the imperceptibly sloping floor of the South Bay. Gradually, the rate of rise slowed. Beginning several thousand years ago, sediments accumulated in the shallows faster than the sea could cover them. These sediments sea level has risen about 400 feet since the last Ice Age supporting the expansion of tidal mudflats and marshes, and filling the Estuary to its current depth.
	Kumeyaay	1000 B.C.	Native American Indians hunted the land, fished the sea and harvested plants. They were attracted to the Bay for fish and shellfish resources. "Fish constitutes the principle food of the Indians who inhabit the shore of this port, and they consume much shellfish because of the greater ease they have in procuring them. They use rafts made of reeds, which they manage dexterously by means of a paddle or double-bladed oar. Their harpoons are several yards long, and the point is a very sharp bone inserted in the wood; they are so adroit in throwing this weapon that they very seldom miss their mark." (Captain Vicente Vila 1769, cited in Pourade 1960).
Spanish and Mexican Occupation	Juan Rodriguez Cabrillo discovers Bay	1542	Explorer Juan Cabrillo, of Portuguese birth, set foot at Point Loma laying claim to California lands for Spain. He had found the narrow natural channel opening to an embayment where seven river systems and tidal influences created a shore lined with deltas, mudflats and salt marshes. While sitting out a storm of six days in this well-sheltered bay and before moving north, Cabrillo logged reports of fishing with nets. Cabrillo named the Bay San Miguel. It was sixty years before Sebastian Vizcaino returned to rename it San Diego Bay. Vizcaino recorded good water and many fish, along with visits from the native Indian population, with whom he traded skins for beads.
	Sebastian Vizcaino renames San Diego Bay	1602	With the arrival of Fr. Serra and the establishment of the San Diego de Alcalá Mission came a new era of occupation. Use of the Bay as an active harbor commenced for the Spanish fleet of wooden sailing vessels. Spanish maritime law forbade foreign traffic in their harbor. Traffic from the French, British, Americans, Dutch and Russian fleets increased with Mexican rule.
	Spanish Army constructs military post	1769	By the time of settlement, Bay conditions were occasionally influenced by floodwater deposits of silt and clay. This natural process reshaped intertidal habitats and altered the depth of the Bay. Turbidity and salinity were changed for short periods of time with temporary loss of marine species.
	San Diego mission established by Father Junipero Serra	1769	Early settlers noted that the Pacific gray whale used the Bay for calving (Scammon, 1968). Whaling in and outside of the Bay led to its recognition as a whaling center. Trade in hides also increased commerce. Use of the Bay as a harbor and center for whaling and hide trade, to this point, had little effect with a low level of waste from processing of whales and tanning of hides handled by tidal flushing. Whaling was most active from 1850-70 and declined by the 1890's.
	Mexican rule begins	1821	Years of Spanish/Mexican rule ended in 1846, when San Diego ( <b>population 500</b> ) was claimed for America. The first Navy boat entered the Bay.
	Cattle hide export	1827	
	Whaling vessels operated out of San Diego Bay	1830	
	John Fremont claimed for America	1846	
	U.S.S. Cyane enters harbor	1846	

Table G-1. Ecological History of San Diego Bay.<sup>1</sup> (Continued)

Bay Front Development, Water Diversion, Dredging Begin		
Mail boat arrives	1849	<p>With statehood, came mandated US Mail delivery and the first steam-powered vessel to the Bay. The first pier was constructed in 1850 (end of Market St.) over mudflats and required little dredging or filling. In 1868, piers from the foot of 5th Street (Horton) and from F Street (Culverwell) were constructed, and in 1871 the National City Pier was completed. In 1888, construction began of a 15,000-ton capacity coal bunker wharf by Spreckles at the foot of G Street. Waterfront commerce was developing and changing in an attempt to handle the need for fuel to service a new breed of boat, incoming and outgoing cargo, and needs of the growing community.</p> <p>The Bay charted in 1859 documented 2,674 acres of intertidal salt marsh and 4,057 acres of intertidal mud flats. The wooden piers did not change the shore configuration although water quality began to be impacted with coal dumped directly on wharfs. Waters of the San Diego River continued to flow over the delta to either Bay until the Derby Dike was built in 1853–54 (reconstructed in 1877). The river was forced to Mission Bay, and therefore, San Diego Bay kept from further siltation while the character of the mudflat and salt marsh habitats around the former mouth of the river was changed. By 1915, Mission Bay, or False Bay as it was known to early settlers, was prime habitat for California least tern. At the time, Sechrist described a typical least tern colony with “about 1000 pairs of birds breeding all the way from Pacific Beach down to False Bay with about 500 pairs nesting at the entrance to False Bay”.</p> <p>Diverting the San Diego River was the first reduction of freshwater input. Later, dams were built on the Sweetwater and Otay River affecting inflow of fresh water, as well as siltation. Fresh water for a growing population’s needs became an issue and then an industry. Private companies developed mountain reservoirs and sold water to the City under contract. A well was drilled by the San Diego Water Company in Pound Canyon with two reservoirs, and in 1875, an additional well and reservoir at 8th and Hawthorne was drilled. A flood in 1891 was followed by an eleven year drought (1895–1905). Lack of water with infrequent floods had long been San Diego’s pattern.</p> <p>San Diego’s population continued to grow encouraged by a Chamber of Commerce that was anxious to promote the city’s growth and prosperity. The men who ran the chamber had much to gain having invested in property and wharves, determined to develop the harbor’s potential for commerce and industry while selling adjacent land.</p> <p>The 1880s experienced a land boom.</p> <p>Building of the Point Loma light house aided and encouraged traffic to the Bay. The lighthouse was deactivated in 1891 and replaced by Ballast Point Light House, which was low enough to provide light underneath the fog. The 1848 discovery of gold by James Marshall on the American River set off a huge migration to California, but this had little effect on San Diego until 1870, when gold was discovered in the Cuyamaca Mountains. This discovery brought prospectors, many from San Francisco where the gold rush boom was winding down. The Julian run lasted five years. The transcontinental railroad connection completed to San Diego in 1885, made the area accessible to many more people and increased opportunities for incoming and outgoing trade. San Diego became a fashionable winter resort, owing to the remarkable steadfastness of its climate and was advocated for its healthy climate at a time when tuberculosis was a common affliction.</p> <p>A survey by Eigenman in 1888 documented 56 species of fish; marine life was continuing to flourish.</p> <p>Problems related to a fast-growing community became evident. In an effort to keep up with accumulations of garbage, disposal at sea using a garbage scow hauled out past Pt. Loma began. Tidal currents returned garbage to the Bay waters making it necessary to travel further out to sea. Scows were unable to handle the volume of garbage which then piled up on docks, creating a terrible stench and eventually becoming a health hazard. When the Dixon Crematory was built to burn rubbish, the scows were discontinued. In 1889, the Harbor Commission wrote an ordinance prohibiting the dumping of garbage into the Bay in an effort to isolate control of waste.</p> <p>In 1887, a new San Diego City sewage disposal system dumped raw waste directly into the Bay. This was the beginning of a decline in water quality. Coinciding with the construction of Hotel del Coronado (more bathrooms per room of any building in the US in 1890) the City of Coronado added a sewage system dumping into the Bay. With funding from the Improvement Act of 1893, National City built a sewer system which also dumped raw sewage into Bay waters.</p> <p>The first dredging occurred in 1888 in Glorietta Bay, with the use of a steam suction dredge. In order to protect the narrow channel entrance to the Bay, the Zuniga jetty was constructed in the years 1893–1907.</p> <p>Construction of reservoirs on Bay watersheds reduced silt supply and natural filling, resulting in a tendency to stabilize some nearshore habitats.</p>

Table G-1. Ecological History of San Diego Bay.<sup>1</sup> (Continued)

Increasing Commerce, Industry and Population		
Pt. Loma Navy Coaling Station established	1901	At the turn of the century, San Diego was becoming a major west coast harbor with a <b>population of 30,000</b> . Charting by the U.S. Coast Guard indicated relatively undisturbed tide flats and salt marshes. Saltworks operations and development of Dutch Flats were offset by changes created when the San Diego River was diverted.  Natural sloping conditions of the south bay were ideal for South Bay Saltworks system of dikes forming evaporation ponds to produce salt. The ponds replaced natural areas of salt marsh and mudflats. In the north bay, Campbell Machinery (later converted to a shipyard), Joe Fellows Boat Plant and Benson Lumber Company set up bayside. One to five 900 foot long log rafts/year were brought in by the lumber company from Oregon, until 1941. Industry had been slow to come to San Diego Bay; lack of water supply and shallow waters were problems.  Military presence in the Bay dated back to 1850, when Davis offered the U.S. Government land near his wharf to build a barracks. Point Loma Naval Coaling Station was the first permanent installation. A Naval Radio Station had also been commissioned for Point Loma, and Fort Rosecrans protected the harbor. The first military reservation on North Island was built on Zuniga Shoal. Fort Pio Pico was a substation of Rosecrans, and from there work to build a jetty to protect the channel opening took place. In 1907, the channel was dredged to 28 feet. Additional dredging would be necessary for the harbor to be useful for the new, larger, steam-powered, propeller-driven ships.  Completion of the Panama Canal would make San Diego the first American port of call. San Diego's Chamber board of directors and more than 100 citizens wrote to the Secretary of the Navy stressing the strategic importance of their Bay encouraging a Naval Training Center, Naval Hospital, wireless telegraph station and additional dredging for a dry dock and repair station.  In 1912, William Kettner became the first representative to Congress from San Diego and was able to secure funding to improve the harbor for Navy and commercial vessels. Good will between the Navy and San Diegans had been purposefully fostered by Kettner and other city fathers.  California state relinquished control of tidelands to the City with terms tied to port improvements. In 1914, a gas powered suction dredge dug a thirty foot channel to the foot of Broadway to construct the first concrete pier. (Broadway Pier)  The Panama California Exposition of 1915 celebrated the new route, and was an opportunity for San Diego to gain recognition. In 1916, reservoirs were dry and water supplies diminished. A rainmaker was hired in hopes that he could summon rains. Thirteen inches of rain fell, and floodwaters washed away the salt evaporation ponds. F. Stephens journalized, "The big flood of January, 1916, covered most of the salt marshes near San Diego and drowned most of the Little Black Rails ( <i>Crexiscus coturniculus</i> ). I have not been able to find one since the flood."  North Island property was offered to Glen Curtis, by the Coronado Beach Company, to set up a flying school and from there the first hydro-aeroplane departed. Aviation camps for the Navy and Army Signal Corps were established. North Island was the birthplace of Naval aviation, and the center of aviation activities in WWI.  Open burning of trash and tideland dumping continued at least until 1935, possibly longer, despite building of an incinerator. Differences of opinion over what San Diego's future should be was characterized as "smokestacks vs geraniums." Military presence was perceived by some as a controlled, conservative industrialism.

Table G-1. Ecological History of San Diego Bay.<sup>1</sup> (Continued)

War, Water and Agriculture			
Harbor Commission appointed	1919	In 1917, when the U.S. declared war on Germany, North Island became a permanent Army/Navy aviation school.	
Otay Reservoir built	1919	In 1919, the San Diego Chamber purchased tidelands at the foot of 32nd Street ("Dutch Flats") for the Navy to dump dredge spoils gained from extending deep water areas. Later, major dredging deposits were used for filling in Spanish Bight on North Island increasing the island by 620 acres. McGrew reported "50,000 to 100,000" Brant in Spanish Bight in the 1880s, and contrasted this to the species' rarity by the 1920s.	
Dutch Flat Salt Marsh covered with dredge spoil	1919		
Salt Works rebuilt	1920-33	The Bay was being reshaped to accommodate larger vessels and fill the demand for waterfront development. Shelter Island was created from dredge spoil on mudflats. Spoil was targeted for beaches eroding from the effect of damming the Tijuana River. Damming stopped transport of replacement sand to northern beaches. From 1940 to 1970, 28,300,000 cubic yards of dredge spoils was placed on beaches. South Bay Saltworks was rebuilt over time, eventually occupying 900 acres of diked ponds. Intertidal mudflats and salt marshes were decreased and the Bay floor modified, destroying large areas of eelgrass beds. There was some hope that increased depth would serve to lessen the effects of growing waste deposits; however, the added volume actually reduced the natural tidal flushing action.	
San Diego: headquarters for 11th Naval District	1922		
First Chula Vista sewer collector	1926		
Spirit of St. Louis flight	1927		
Lindbergh Field dedicated	1928		
Construction of Hoover Dam initiated	1930	After the war, as expense money diminished, aviation and shipping activities suffered. In 1922, 450,000 tons of U.S. ships were destroyed and hundreds were put into ports and named "moth ball fleets" (Rush 1958)	
Shelter Island created	1934		
Rubbish Reduction plant in operation	1934	<b>Population was approaching 75,000</b> in 1919, and sewage was still a problem. At five sites: Olive Street, Market Street, Commercial Street, Beardsly and 32nd Street, raw sewage was dumped into the Bay from shoreline outfalls. Untreated wastes from the main industries: olive, pimiento, citrus, and fish and meat packing, were entering the Bay through city sewers or industrial outfalls. The first Chula Vista collector was added in 1926, at the foot of G Street, dumping raw sewage. Primary treatment was added in 1943, and secondary treatment in 1948. By 1930, there were nine sites; two having partial treatment in settling tanks. Sludge was usually pumped directly into the Bay at high tide. Deterioration of water quality was becoming a serious problem, but a depressed economy of the 1930's stalled efforts to upgrade the systems.	
Consolidated Aircraft relocates to San Diego	1935		
Naval Air Station North Island established	1935	By 1941, there were more than 26 sewage outfalls serving the San Diego area, at least fifteen entering into the Bay. Between 1938-45 sixteen storm drains had been built discharging industrial waste directly into the Bay. Other wastes were discharged from military and commercial vessels in the Bay.	
California Pacific Exposition	1935		
Tijuana River dammed	1937		
Controls placed on whaling	1937	The San Diego City Manager wrote to the Secretary of the Navy, soliciting others to do so as well, informing him of the degraded condition, and asked for federal assistance. A series of projects were funded including construction of a 14 million gallon/day sewage treatment plant completed in 1943. The new plant added clarification and chlorination, using oxidizers for sludge digestion.	
16 storm drains built	1938-45		
Leading tuna port in the Pacific established	1941	With the buildup of military personnel as well as defense industries, the <b>population reached 250,000</b> in 1942, and the system was almost always overloaded. Many organisms apparently disappeared from the Bay due to poor water quality.	
North Island increased by 620 acres by the filling of Spanish Bight	1941	Garbage continued to be a problem with the incinerator plant having failed. Garbage was dumped on tidelands and burned leaving widespread ash contamination. A new Rubbish Reduction Plant was built.	
U.S. enters WWII	1941		
"No eelgrass in the Bay" reported by Game Warden	1941	San Diego felt the depression less than most with funded projects banking a payroll. Aviation related industry flourished with Consolidated Aircraft (later General Dynamics) moving its entire plant to San Diego. Ryan Aeronautical and Solar Aircraft Co. manufactured aircraft parts, also a new industry. Charles Lindbergh started his historic transatlantic flight from North Island in the Spirit of St. Louis built by Curtis, out of San Diego. "Dutch Flats" had been converted to a municipal airport and was dedicated Lindbergh Field, later accommodating a Coast Guard Air Station.	
New sewage plants constructed	1943		
San Diego Aqueduct Completed	1947		
Dickey Act of California sets up state and 9 regional water quality control boards	1949	When war was declared, San Diego was home to six aircraft carriers while Pearl Harbor had ported battleships. The "mothball fleet" ships were re-activated and sent to do battle. Anti-submarine nets were placed across the entrances of San Diego harbor to prevent Japanese hit and run attacks. After the war, the nets were towed out to sea and dropped into deep water (Rush 1958).	
Korean War, work on Atlas missile	1950		
		In 1946, having endured another drought, San Diego bought annexation to the Metropolitan Water District with water rights to the Colorado River that had been granted in 1926. The City exceeded original rights within ten years, and by 1991 was using 562,000 acre-feet, five times the original allocation. Without the aqueduct feed, the San Diego area had no hopes of supporting their growing agricultural industry. Groves and nursery stock along with indoor decorative plants made the county one of the leading farm regions in California.	

Table G-1. Ecological History of San Diego Bay.<sup>1</sup> (Continued)

Pollution Overload	Regional Water Quality Control Board formed		1950	<p>Early in the 1950's, three Chula Vista shoreline outfalls were directly polluting the Bay; two with disinfected intermediate effluent from its sewage plants, and the other an adjacent aircraft manufacturing facility discharging untreated, highly toxic chemical waste. Studies began after the San Diego Regional Water Pollution Control Board was established in 1950, to determine the extent of the Bay's degraded water. Distributions of dissolved oxygen concentrations and coliform densities from 1951-55 were lower than would support most fish and many invertebrates for all of the central Bay area and portions of the north and south Bay. Coliform bacteria counts were in excess of 10 mpm/ml. Planning had begun for a new Metropolitan Sewage System while the Bay continued to degrade. Additional studies found turbidity and discoloration due to blooms of phytoplankton stimulated by nutrients in the sewage effluent. Red tide blooms existed throughout most of the Bay. The Regional Board concluded that even secondary treatment with a high degree of disinfection were inadequate to prevent pollution. The Bay was no longer able to assimilate the accumulated pollution, and in 1955 quarantine signs were posted along the Coronado coastline.</p> <p>Chlorination programs in 1956 reduced coliform levels, however, by 1960 the Bay was again quarantined. Fifty-six million gallons per day of domestic waste were being discharged into San Diego Bay. Over 80% of dissolved oxygen levels were lower than 4mg/l, resulting in disappearance of bait and game fish. California Department of Fish and Game declared much of the Bay a virtual "marine desert". Sludge beds on the east shore had increased in thickness from 3 to 7.5 feet in the twelve years from 1951 to 1963.</p> <p>Pollution peaked in the Late 1950's and early 1960's. There was the putrid smell of algae, oil and sewage. If you had the misfortune of falling overboard, you didn't know whether to hurry home and take a shower, or go to the hospital for a tetanus shot. The health department had posted much of the shore, warning that the water was too contaminated for contact (San Diego Union 1971).</p> <p>The State of California was first to address the Bay pollution problem, even before the Federal Clean Water Act was written. In August of 1963, the new San Diego Metropolitan Sewage System with ocean outfall went into operation, and by February of 1964, all domestic sewage was changed over to the new system.</p> <p>The San Diego Unified Port District was established in 1962 to manage the harbor, operate Lindbergh Field and administer public tidelands on San Diego Bay. Voters passed a bond issue to construct the 10th Avenue Marine Terminal. Large-scale dredging and filling for National City and Chula Vista Bay fronts and Harbor and Shelter islands was begun. The shipping channel was dredged with a turning basin to 42 feet. Coronado Cays was constructed over a previous city burn dump site adjacent to mudflats and salt marsh in 1968, requiring no environmental impact statement. San Diego Unified Port District funds an access channel and L shaped boat basin in the south Bay.</p> <p>San Diego Gas and Electric power generating plant was operational in the south Bay. Studies monitor effects of the plants operation on surrounding marine life, and the plant adds generating units.</p> <p>Today it takes x-ray eyes to find the scars that were left by more than half a century of sewage disposal (San Diego Union 1971).</p> <p>"In a matter of months a difference in the clarity of water could be noticed, and within a year, fish were seen again breaking the surface and could be caught in the channels. Swimming in the bay could be safely permitted again. Sea lions and porpoises returned to the harbor, pelicans and terns plunged into shoals of anchovy, and San Diegans could congratulate themselves on their bay's salvation." (Herbert L. Mamish)</p> <p>Nuclear submarines were stationed in the Bay, and the industry changed from aircraft to missile production.</p> <p>The Navy installed a million dollar treatment plant to eliminate outflow. The Kelco Company's kelp-processing plant developed a clean-up program to end daily dumping of four million gallons of waste into the Bay. In 1971, the Westgate tuna packing plant, the only remaining cannery in the Bay, installed a filter system at its unloading docks. The Coast Guard kept an eye on oil spills from the Navy.</p>

# **Appendix H: Habitat Protection Policies: Preliminary Concepts**

## **H.1 Draft Policy for Protection of Intertidal Flats**

## **H.2 Draft Policy for Protection of Unvegetated Shallows**

## **H.3 Background Paper on Habitat Values of Unvegetated Shallows**

## **H.4 Current Southern California Eelgrass Mitigation Policy**

*The following pages are intended to support the development of a formal, Baywide policy on habitat protection and mitigation for certain habitats that are considered most at risk. While the Technical Oversight Committee also considered salt marsh and upland transition habitats as also requiring a similar policy, drafts have only been developed for Intertidal Flats and Unvegetated Shallows.*

## **Proposed Policy to Protect Southern California Intertidal Flat Habitat of Bays and Estuaries (Modeled After Existing Eelgrass Mitigation Policy)**

### **I. BACKGROUND**

#### **A. FINDINGS: Past Losses of Habitat Area and Value**

Intertidal habitat encompasses the area between the low end of the salt marsh (or the higher high tide if salt marsh vegetation does not occur) and lower low tide. Losses of intertidal habitat to fill and other conversion in bays and estuaries of southern California are between 60 and 90 percent. Most intertidal shorelines have been modified by steepening and by stabilization structures, and so no longer provide their full habitat value to fish, wildlife and plants that depend on them.

#### **B. FINDINGS: Necessary Values to be Protected (see also Section 2.4.4)**

Intertidal flats occur between the highest high and lowest low tide zones, or otherwise between the lowest cordgrass (beginning of the salt marsh) and highest eelgrass, approximately 3 to 0 ft (1 to 0 m) MLLW.

Mudflats contain abundant organic matter and microorganisms. Normally devoid of flowering plants, these areas may be covered with algae. Burrows and siphon-holes of benthic invertebrates, tiny invertebrates that live among the grains of substrate (meiofauna), and algae and detritus fill the sediment with hidden activity, and are all necessary to support the food chain and mineral cycles of Southern California bays and estuaries. Snails, crabs and polychaete worms (deposit feeders) glean the surface for detrital bits and algae. Filter-feeders such as clams, mussels and small crustaceans collect plankton, algae and detritus as it washes by when the tide is in. The deposit and filter feeders together are extremely efficient processors of living and dead plankton.

When the tide recedes, a great diversity of shorebirds congregate sometimes by the thousands to consume the invertebrate prey. Foraging birds include the threatened western snowy plover and the endangered California least tern. Other terns and the black skimmer forage in the waters over submerged mudflats during high tide.

Also when the tide comes in, numerous fishes and rays move in to take advantage of the productivity, such as various flounders, skates and sharks, and deep-bodied forms such as surfperches. While most mudflat fishes are tidal visitors, and some remain at low tide in shallow drainage channels, a short list of species are full-time residents. These are commonly the ones that can live in the burrows of marine invertebrates. Other fishes are seasonal visitors during juvenile life stages: California halibut, California halfbeak, and striped mullet. Studies on tidal flats elsewhere have demonstrated that it is frequently only the juvenile decapod crustaceans such as shrimp and demersal fish that forage on tidal flats, while the adults and pelagic larvae stay offshore. Sub-adults migrate to the sub-tidal to avoid low tide conditions—the tidal flats function as nurseries for the resident juveniles and the sub-adults (which are flood tide visitors). These larvae drift onto tidal flats from open coastal waters so that the juvenile stages of these fishes may take advantage of high temperatures, abundant food, and the absence of large predators.

## **II. NEED FOR A STANDARD, CONSISTENT POLICY**

Intertidal flats function as important habitat for a variety of invertebrates, birds, and fishes. In order to maintain a consistent policy regarding mitigating adverse impacts in intertidal flats, the following standards are proposed.

## **III. DEFINITIONS**

For clarity, the following definitions apply. "Project" refers to work performed on-site to accomplish the applicant's purpose. "Mitigation" refers to work performed to compensate for any adverse impacts caused by the "project."

"Resource agencies" refers to National Marine Fisheries Service, U.S. Fish and Wildlife Service, and the California Department of Fish and Game.

## **IV. CRITERIA FOR MITIGATION NEED**

- A.** Mitigation for intertidal flats shall be considered only after the normal provisions and policies regarding avoidance and minimization, as addressed in the Section 404 Mitigation Memorandum of Agreement between the Corps of Engineers and Environmental Protection Agency, have been pursued to the fullest extent possible prior to the development of any mitigation program.
- B.** When considering the need for avoiding impacts, minimizing impacts, and mitigating unavoidable impacts to intertidal habitat, at least some differences in site value and restoration potential should be recognized (see VIII below).
- C.** Coordinated environmental impact review should take place during the site selection and design stages, not after.
- D.** When new armoring or reconstruction of degraded armoring is unavoidable, incorporate maximum practical habitat value for native species, giving priority to solutions that use types of material indigenous to the bay or estuary.
- E.** Examination of shoreline modification alternatives is required. A project proponent should provide in their review an inventory of existing shoreline stabilization devices and unarmored areas that may be impacted adjacent to and near the project site; predicted impact upon area shore and hydraulic processes, adjacent properties, shoreline and water uses, and upland stability; and alternative measures (including non-structural) that will achieve the same purpose.
- F.** Technical peer review of hard structural solution applications is required. Hard shoreline modifications should be allowed only after it is demonstrated that non-structural solutions are not able to reduce the damage.
- G.** Riprapping and other bank stabilization measures should be located, designed, and constructed primarily to prevent damage to *existing* development.

## **V. PROTOCOL FOR MAPPING MITIGATION SITES**

- A.** The project sponsor shall map thoroughly the area and relationship to depth contours of any site likely to be impacted by project construction. This includes areas immediately adjacent to the project site which have the potential to be indirectly or inadvertently impacted as well as areas having the proper depth and substrate requirements.
- B.** Protocol for mapping shall consist of the following format:
  - 1. Coordinates  
Horizontal datum—Universal Transverse Mercator (UTM), NAD 83, Zone 11  
Vertical datum—Mean Lower Low Water (MLLW), depth in feet.
  - 2. Units
  - 3. Mapping shall be accomplished within \_\_\_\_ of the beginning of project construction. Mapping is expected to be valid for \_\_\_\_ months. Adjacent shorelines and habitats for a distance of \_\_\_\_ shall also be mapped for an adequate assessment of potential adverse effects.
- C.** Delineate areas based on a commonly agreed-upon definition and at a project-planning scale (1 in = 600 ft).

## **VI. PROTOCOL FOR SELECTING A MITIGATION SITE**

- A.** The location of mitigation for adverse effects to intertidal flat habitats shall be in areas similar to those where the initial impact occurs. Factors such as distance from project, depth, sediment type, distance from ocean connection, water quality, and currents are among those that should be considered in evaluating potential sites.
- B.** Whenever feasible, mitigation siting should select broad, gently-sloping intertidal areas rather than small, narrow ones in order to maximize the benefit received from mitigation.

## **VII. MITIGATION SIZE / RATIO**

In the case of mitigation activities that take place concurrent with the project that results in damage to the resource, a mitigation ratio of 1 to 1 shall apply.

Mitigation completed one year in advance of the impact (i.e., mitigation banks) will not incur the additional 10% requirement and, therefore, can be constructed on a one-for-one basis. However, all other monitoring requirements (outlined below) remain the same irrespective of when the mitigation is completed. Project proponents should consider increasing the size of the required mitigation area by 10–20% to provide greater assurance that the success criteria, as specified below, will be met.

## **VIII. MITIGATION TECHNIQUE**

- A.** Intertidal flats shall be seeded with invertebrate fauna, especially those species that do not have swimming larval stages and are unlikely to disperse effectively to a site within a short time frame. Techniques to be

employed at the mitigation site shall be consistent with the best available technology at the time of the project. Donor material shall be taken from area of direct impact whenever possible, but also should include a minimum of two additional distinct sites to better ensure genetic diversity of the donor. Written permission for collection of donor material shall be acquired from the appropriate landowner. It is understood that whatever techniques are employed, they must comply with the stated requirements and criteria.

- B.** Investigate and then consider the relative importance of the following as a basis for habitat valuation when planning or evaluating mitigation projects:
  - Area affected.
  - Patch size.
  - Abundance/density of infauna.
  - Diversity of infaunal lifestyles (dwelling modes and feeding modes). High density of one species or lifestyle (e.g. subsurface-deposit feeders) can indicate a fairly degraded system. Suspension feeders, burrowers, tube builders etc. all coexisting denote a fairly healthy system.
  - Presence of larger infauna (ghost shrimp, clams, etc.).
  - Sediment stability with wave action, flooding or migrating sand.
  - Drainage/flushing at low tide.
  - Use by foraging fishes/rays when the tide is in.
  - Use as a nursery by juvenile fishes and decapod invertebrates.
  - Limited habitation by exotic species (e.g. *Musculista senhousia*).
  - Use by foraging shorebirds.
  - Time since last disturbance by dredging or other disturbance.
  - Natural vs. armored condition of shoreline.
  - Position of shoreline armoring within the tidal prism.
- C.** Consider the following principles when determining mitigation techniques:
  - Enhance the flow environment as affected by surrounding structures to ensure stability/persistence of intertidal sediments.
  - Grade to appropriate tide levels—high intertidal supports few organisms.
  - Improve drainage conditions.
  - Place structures subtidally to stabilize.
- D.** Pursue exotic species control measures to prevent invasion of mudflats.
- E.** Set targets for use by western snowy plover, foraging California least tern, juvenile California halibut, and other declining birds or fishes, when baseline data are available.
- F.** Enhance the interchange of nutrients, organisms, and organic matter between mudflats and other habitats in the project design.

- G.** General guidelines to increase the habitat value of necessary stabilization structures to make them more like natural rocky shores are as follows:
  - 1. Bank stabilization should be located, designed and constructed primarily to prevent damage to existing development.
  - 2. New development should be located and designed to prevent or minimize the need for shoreline stabilization measures. New development requiring shoreline stabilization should be discouraged.
  - 3. Consider confining bulkheading and filling to the upper one-third of the intertidal zone.
  - 4. If important nursery or foraging areas are identified for fish of the intertidal zone, then restrict the extent to which bulkheads or riprap may encroach on these zones.
  - 5. Encourage crenulation of the shoreline to create more shallow water niches and intertidal accretion in small inlets while maintaining the functionality of the stabilization structures.
- H.** There should be a preference for using natural materials similar to those indigenous to the bay or estuary.
  - 1. Require the design and use of naturally regenerating systems for prevention and control of beach erosion over bulkheads or other structures where:
    - a. the length and configuration of the beach will accommodate such systems;
    - b. such solutions do not detrimentally interrupt littoral drift, or redirect waves, currents or sediments to other shorelines.
    - c. beach enhancement may be permitted as a conditional use when the applicant has demonstrated that no significant change in littoral drift will result that will adversely affect properties or habitat.
    - d. such protection is a reasonable solution to the needs of the site;
    - e. it will reduce otherwise erosional conditions.
  - 2. Supplementary beach nourishment to impacted beaches in a drift cell may be required where structural stabilization projects are necessary.
  - 3. Proposals should demonstrate the use of natural materials and processes and that non-structural solutions to bank stabilization are unworkable in protecting existing development.
  - 4. Bulkheads may be allowed only when evidence demonstrates that a) serious wave erosion threatens an established use or existing building(s) on upland property and/or b) bulkheads are necessary to the operation and location of water-dependent and water-related activities provided that all alternatives have proven infeasible.
  - 5. Use of a bulkhead to protect a platted lot where no structure presently exists is discouraged.
  - 6. Shoreline uses should be located in a manner so that bulkheading is not likely to become necessary in the future.

7. Affected property owners and public agencies should be encouraged to coordinate bulkhead development for an entire drift sector or homogenous reach in order to avoid exacerbating erosion on adjacent properties.
8. The cumulative effects of allowing bulkheads segments of shoreline should be evaluated prior to granting individual permits or exemptions.
9. Bulkheads should not be approved as a solution to geophysical problems caused by factors other than wave erosion.

#### **IX. MITIGATION TIMING**

For off-site mitigation, mitigation should be started prior to or concurrent with the initiation of shoreline construction resulting in the impact. Any off-site mitigation project which fails to initiate work within 135 days following the initiation of the shoreline construction resulting in impact will be subject to additional mitigation requirements as specified below. For on-site mitigation, on-site mitigation should be started no later than 135 days after initiation of shoreline construction activities. A construction schedule which includes specific starting and ending dates for all work including mitigation activities shall be provided to the resource agencies for approval at least 30 days prior to initiating shoreline construction.

#### **X. MITIGATION DELAY PENALTY**

If, according to the construction schedule or because of any delays, mitigation cannot be started within 135 days of initiating shoreline construction, the replacement ratio shall be increased above the 1.0:1 ratio specified in section 4 at a rate of three percent for each month of delay. This increase in mitigation obligation is necessary to ensure that all productivity losses incurred during this period are sufficiently offset within two years.

#### **XI. MITIGATION MONITORING**

Monitoring the success of mitigation shall be required for a period of one year for most projects. The monitoring of an adjacent or other acceptable control area (subject to the approval of the resource agencies) to account for any natural changes or fluctuations must be included as an element of the overall program.

A monitoring schedule that indicates when each of required monitoring events will be completed shall be provided to the resource agencies prior to or concurrent with the initiation of the mitigation.

Monitoring reports shall be provided to the resource agencies within 30 days after the completion of each required monitoring period.

#### **XII. MITIGATION SUCCESS CRITERIA**

Criteria for determination of success shall be based upon a comparison of coverage (area), depth and slope between the project and mitigation sites. Specific criteria are as follows:.....

**XIII.MITIGATION BANKING**

**XIV.EXCLUSIONS**

## **Proposed Policy to Protect Unvegetated Shallows of Southern California Bays and Estuaries (Modeled After Existing Southern California Eelgrass Mitigation Policy)**

### **I. BACKGROUND**

#### **A. FINDINGS: Past Losses of Habitat Area and Value**

Historic losses of this habitat in Southern California due to dredging and other conversion are high, approaching 50 percent.

#### **B. FINDINGS: Necessary Values to be Protected (see also Appendix G3)**

Unvegetated areas of shallow soft bottom support species assemblages of benthic invertebrates and demersal fishes that are distinct from vegetated areas. Many of these invertebrate species serve as food sources for demersal fishes that are restricted to or occur primarily in these unvegetated shallow areas of soft sediment. The small juveniles of certain species such as the California halibut (*Paralichthys californicus*) are restricted primarily to unvegetated shallow areas of unconsolidated sediment in bays and estuaries, where they feed on the invertebrate fauna of those habitats. These habitats therefore provide an important nursery area for this species. Other species of demersal fishes which appear to depend primarily on invertebrates of unvegetated shallow habitats as their food source include the diamond turbot, the round stingray and several species of gobies. In addition, many fishes which also occur in eelgrass and other vegetated shallow habitats feed both there and in unvegetated areas.

### **II. NEED FOR A STANDARD, CONSISTENT POLICY**

Unvegetated shallows function as important habitat for a variety of fish and other wildlife. In order to standardize and maintain a consistent policy regarding mitigating adverse impacts, the following standards are proposed.

### **III. DEFINITIONS**

For clarity, the following definitions apply. "Unvegetated Shallows" refers to the area between the lower low tide -1.8 ft and about -12 ft in depth that does not grow eelgrass or other submerged aquatic vegetation. "Project" refers to work performed on-site to accomplish the applicant's purpose. "Mitigation" refers to work performed to compensate for any adverse impacts caused by the "project." "Resource agencies" refers to National Marine Fisheries Service, U.S. Fish and Wildlife Service, and the California Department of Fish and Game.

### **IV. CRITERIA FOR MITIGATION NEED**

- A.** Mitigation for impacts to unvegetated shallows shall be considered only after the normal provisions and policies regarding avoidance and minimization, as addressed in the Section 404 Mitigation Memorandum of Agreement between the Corps of Engineers and Environmental Protection Agency, have been pursued to the fullest extent possible prior to the development of any mitigation program.
- B.** Implement Best Management Practices (BMPs) during construction and dredging projects to keep temporary turbidity increases to a minimum, for the protection of foraging birds and fishes.

- C.** Alternative, innovative designs should be encouraged and considered early in the project planning stages that minimize impacts. Adjustments in project siting should also be considered to avoid or minimize impacts.

**V. PROTOCOL FOR MITIGATION SITE MAPPING**

The project sponsor shall map thoroughly the area to depth contours likely to be impacted by project construction. This includes areas immediately adjacent to the project site which have the potential to be indirectly or inadvertently impacted as well as areas having the proper depth and substrate requirements.

Protocol for mapping shall consist of the following format:

- 1) Coordinates
- 2) Units
- 3) Mapping, How long mapping is valid

**VI. PROTOCOL FOR SELECTING A MITIGATION SITE**

The location of mitigation shall be in areas similar to those where the initial impact occurs. Factors such as distance from project, depth, sediment type, distance from ocean connection, water quality, and currents are among those that should be considered in evaluating potential sites.

**VII. MITIGATION SIZE / RATIO**

- A.** In the case of mitigation activities that occur concurrent with the project that results in damage to the existing resource, a ratio of 1 to 1 shall apply. That is, for each square meter adversely impacted, 1 square meters of new suitable habitat must be created. The rationale for this ratio is based on, 1) the time (i.e., generally 6 months to 3 years) necessary for a mitigation site to reach full utilization by fishes and 2) the need to offset any productivity losses during this recovery period within 3 years. Recolonization rates vary depending on several factors which include degree of disturbance, proximity of propagules, and the life span of individual species.
- B.** Mitigation completed one year in advance of the impact (e.g. mitigation banks) will not incur the additional 10% requirement and, therefore, can be constructed on a one-for-one basis. However, all other monitoring requirements (outlined below) remain the same irrespective of when the transplant is completed. Project proponents should consider increasing the size of the required mitigation area by 10–20% to provide greater assurance that the success criteria, as specified below, will be met.

**VIII. MITIGATION TECHNIQUE**

- A.** Techniques for the construction of the mitigation site shall be consistent with the best available technology at the time of the project. Donor material shall be taken from area of direct impact whenever possible, but also should include a minimum of two additional distinct sites to better ensure genetic diversity of the donor plants. Written permission to acquire donor material shall be received from the appropriate land-

owner. Specific rates of seeding units shall be at the discretion of the project sponsor. However, it is understood that whatever techniques are employed, they must comply with the stated requirements and criteria.

- B.** Since project impacts are relatively infrequent and small-scale in unvegetated shallows, implement mitigation requirements on a case-by-case basis using the following as a guide:
  - 1. Mitigate unavoidable impacts, recognizing and providing a means to define at least some differences in site value and restoration potential.
    - a. Differences in site value could be determined by:
      - 1. Area affected.
      - 2. Patch size/fragmentation.
      - 3. Abundance/density of infauna.
      - 4. Diversity of infaunal lifestyles (dwelling modes and feeding modes). High density of one species or lifestyle (e.g. subsurface-deposit feeders) can indicate a fairly degraded system. Suspension feeders, burrowers, tube builders, etc. all coexisting denote a fairly healthy system.
      - 5. Presence of larger infauna (ghost shrimp, clams etc.).
      - 6. Site maturity (time since last disturbance).
      - 7. Use as a nursery by halibut or other fishes.
  - 2. Facilitate the local, beneficial use of dredge material for enhancement projects when the material has appropriate characteristics. When replacement shallow subtidal habitat sites are needed to mitigate for project-caused losses, convert from medium or deep subtidal habitats as a first choice.

#### **IX. MITIGATION TIMING**

Off-site mitigation should be started prior to or concurrent with the initiation of in-water construction resulting in the impact to the resource. Any off-site mitigation project which fails to initiate work within 135 days following the completion of the in-water construction resulting in impact will be subject to additional mitigation requirements as specified below. For on-site mitigation, on-site mitigation should be started no later than 135 days after completion of in-water construction activities. A construction schedule which includes specific starting and ending dates for all work including mitigation activities shall be provided to the resource agencies for approval at least 30 days prior to initiating in-water construction.

#### **X. MITIGATION DELAY PENALTY**

If, according to the construction schedule or because of any delays, mitigation cannot be started within 135 days of initiating in-water construction, replacement ratio shall be increased above the 1:1 ratio specified in section 4 at a rate of three percent for each month of delay. This increase in mitigation obligation is necessary to ensure that all productivity losses incurred during this period are sufficiently offset within 6 months–3 years.

## **XI. MITIGATION MONITORING**

- A.** Monitoring the success of..... mitigation shall be required for a period of one year for most projects. Monitoring activities shall determine the percent coverage and density invertebrates at the site and shall be conducted at 12 months after completion. All monitoring work must be conducted during the peak use period and shall avoid the winter months.
- B.** Sufficient flexibility in the scheduling of the 3 and 6 month surveys shall be allowed to ensure the work is completed during this period. Additional monitoring beyond the 12-month period may be required in those instances where stability of the proposed site is questionable.
- C.** A measure of the effectiveness of turbidity control BMPs shall be included in the monitoring report.
- D.** The monitoring of an adjacent or other acceptable control area (subject to the approval of the resource agencies) to account for any natural changes or fluctuations in fish use of an area must be included as an element of the overall program.
- E.** A monitoring schedule that indicates when each of required monitoring events will be completed shall be provided to the resource agencies prior to or concurrent with the initiation of the mitigation.
- F.** Monitoring reports shall be provided to the resource agencies within 30 days after the completion of each required monitoring period.

## **XII. MITIGATION SUCCESS CRITERIA**

Criteria for determination of success shall be based upon a comparison of coverage (area) and density (per square meter) between the project and mitigation sites. Extent of coverage is defined as that area..... is present and where gaps in coverage are less than one meter between ..... present in representative samples within the control .. Specific criteria are as follows:

## **XIII. MITIGATION BANKING**

Any mitigation success that, after 3 years, exceeds the mitigation requirements, as defined above, may be considered as credit in a "mitigation bank." Establishment of any "mitigation bank" and use of any credits accrued from such a bank must be with the approval of the resource agencies and be consistent with the provisions stated in this policy. Monitoring of any approved mitigation bank shall be conducted on an annual basis until all credits are exhausted.

## **XIV. EXCLUSIONS**

### **Background Paper on Soft-Bottom Shallow Subtidal Functions, Values, and Response to Disturbance: A Basis of Policy Development**

Unvegetated habitats of shallow subtidal support distinct values. These habitats of unconsolidated sediment (0–10 ft below MLLW) which do not support eelgrass are of great importance to the ecological functioning of San Diego Bay. Together with eelgrass beds, these shallow, unvegetated areas of soft bottom represent the two primary subtidal habitats and their associated fauna and flora in San Diego Bay prior to its development for human activities. This in itself makes the conservation and rehabilitation of both eelgrass and shallow unvegetated habitats of considerable importance. The rate of loss of shallow subtidal habitat has abated with vigilant implementation and enhancement of the Clean Water Act and Southern California Eelgrass Mitigation Policy.

Both habitats merit equal attention in this management and conservation process. The shallow unvegetated habitats support distinct species assemblages of benthic invertebrates and demersal fishes (Takahashi 1992, Kramer 1990, Allen 1997) as shown in Tables 1–3. Takahashi (1992) compared the numbers of species of infaunal and epifaunal invertebrates which occurred at both shallow vegetated (eelgrass) and unvegetated study sites in central San Diego Bay. In doing so, she employed her data obtained from four eelgrass bed sampling sites with those from typical unvegetated, soft bottom sites of the same depth, located nearby, that were sampled by Kinnetic Laboratories (1988, 1989, 1990, 1991; KLI Station N2 and MacDonald *et. al.* 1990; SPUPD Station G1). As shown in Tables 1–3, overall there were very low numbers of invertebrate species occurring in both shallow subtidal vegetated and unvegetated habitats, ranging from only three to nine of the 19–33 species present at the unvegetated sites. Also shown in Table 4 are rank order of abundance data for invertebrates sampled at the KLI Station N2 site. This illustrates very clearly that shallow unvegetated habitats primarily support a distinct invertebrate fauna. This is significant because it means that these eelgrass and shallow unvegetated areas provide distinct habitat conditions for two almost completely separate species assemblages of invertebrates. Since both of these major subtidal habitats represent what mostly San Diego Bay was like before human intervention, both must be considered of equal and high ecological importance. Considering that most of the original shallow subtidal habitats have been lost, it is essential to protect and preserve what remains. This invertebrate fauna of shallow, unvegetated habitats in San Diego Bay is important to ecological functioning of the Bay, both because it serves as the main food source for a wide variety of demersal fishes that occur in this habitat, and because it is a major species assemblage in its own right.

An important example is the California halibut (*Paralichthys californicus*), a flatfish species of commercial and recreational importance. The small juveniles of this species are restricted primarily to shallow unvegetated areas of unconsolidated sediment in bays and estuaries (Allen 1982, Kramer 1990), where they feed on the invertebrate fauna of those habitats (Drawbridge 1990). These habitats therefore provide an important nursery area for this species. The substantially greater abundance of juvenile California halibut in Mission Bay, as opposed to San Diego Bay (Kramer 1990), may be due in part to the reduced area of shallow unvegetated habitat that now remains available in San Diego Bay. Other species of demersal fishes which appear to depend primarily on invertebrates of shallow unvegetated habitats as their food source include the diamond turbot, the round stingray and several species of gobies. In addition, many species of fishes which also occur in eelgrass and other shallow vegetated habitats feed both there and in unvegetated habitats. This occurrence of many of the same species of demersal

and open water fishes in both shallow unvegetated and vegetated habitats is illustrated in Table 4, based on recent work by Allen (1996). One of the things this indicates is that for fish species that occupy both of these habitats, both habitats probably also serve as important feeding areas.

The benthos provides other functional roles besides serving as a prey base for fish and birds. The less conspicuous mollusc, polychaete worms, small crustaceans, and other invertebrates living at the bottom of the bay mineralize organic wastes as it accumulates, consume macroalgae, and return essential chemicals and organic matter to the water column. Some invertebrate and fish species are harvested by humans for food or bait.

Eelgrass beds are considered to be biologically rich and productive compared to shallow unvegetated habitats. Clearly, basing management and mitigation decisions on these criteria alone is short-sighted. Shallow unvegetated soft bottom habitats in San Diego Bay have, by comparison, been called "biological deserts." This is a false conception. On the basis of their role as a major feeding area for demersal fishes, a nursery area for juvenile California halibut, and other ecological functions, shallow unvegetated habitats in San Diego Bay merit equal consideration when it comes to their conservation and their qualification as sites for mitigation if disturbance of them is proposed.

### **Factors Affecting Invertebrates in Soft Bottom Habitats**

Such unconsolidated sediment or soft bottom habitats in the intertidal and subtidal areas of San Diego Bay are fairly unstable. They can be disturbed easily by such factors as human activity, wind waves, tidal currents and feeding by bottom fishes and shore birds. Because of this, both plants and invertebrate animals living in soft bottom habitats normally do not have solid and stable attachment sites.

Because they lack solid places for attachment, a large majority of the invertebrates in soft bottom intertidal and subtidal habitats of San Diego Bay are part of the infauna, animals that burrow into the substrate for protection and to avoid being carried away by water movement. Relatively few species form part of the epifauna, invertebrates such as sponges, gastropod molluscs, and some larger crustaceans and tunicates that spend most of their time on the sediment surface.

Some soft bottom invertebrates are so small that they live and move around in the spaces between the sediment grains or attach to the grains. These are called the interstitial fauna. They include protozoans, nematodes, hydroids, polychaete and oligochaete worms, flatworms, and copepods, as well as five phyla or classes of invertebrates that are found primarily in this interstitial environment. These five groups are the gastrotrichs, kinorhynchans, rotifers, archiannelids, and gnathostomulids.

It is important to note that most of these interstitial species do not appear in the species list for San Diego Bay (Table 1) or are represented in that list only by notations such as unidentified oligochaete spp or nematode spp. The reason for this is that, because of their very small size, most interstitial pass through the 0.5 mm sieves normally used to process standard infauna samples. No special sampling has been conducted for the interstitial in San Diego Bay thus far. As a result, we know very little about its species composition.

The major physical and chemical factors which determine the structure of a soft bottom community and affect the population dynamics of its epifaunal and infaunal species involve a variety of characteristics of the sediment. They include grain size distribution, degree of grain compaction and porosity, water

content, dissolved oxygen levels, levels of suspended and deposited organic material and the short-term and long-term stability of the sediment. These characteristics are affected by depth, slope of the bottom, wave action, currents, and other physical and chemical characteristics of the water above the bottom. Productivity of the overlying water, predation and other species interactions are the primary biological factors involved. Predation by fishes and larger invertebrates, particularly by larger, active predators such as the round stingray and flatfishes, may play a very important role in shaping the infauna and the dynamics of species which form the community.

### **Feeding Relationships of Invertebrates in Soft Bottom Habitats**

Most infaunal species of intertidal and subtidal soft bottom communities in San Diego Bay and other estuaries feed on the abundant detritus suspended in the water and deposited in the sediments (Table I-2). This detritus consists of both dead organic matter and the bacteria and other decomposer organisms that live on it. Both these dead and living components are important in the diet of invertebrate detritus feeders.

Deposit feeding species tend to predominate in soft bottom sediment areas with large amounts of silt and clay (mud); this is the primary sediment type throughout most of San Diego Bay. The main reason for this relationship is that more detritus accumulates in the interstitial spaces between fine sediment particles than between those of larger grain size. In contrast, suspension feeders are more common in soft bottom areas where sandy sediments predominate, such as in some areas of north San Diego Bay.

Detritus is also considered to be the most important source of food for the meiofauna, as it is for larger infaunal invertebrates. However, many meiofauna species are predators or scavengers. Other meiofauna are grazing herbivores that feed on diatoms living in the upper few millimeters of the sediment.

Many of the species which occur in the intertidal habitats of south bay also occur subtidally as well (Ford & Chambers, 1973, 1974). This is not surprising, because the subtidal areas of south San Diego Bay are nearly all quite shallow and sediment characteristics at a given location are much the same both intertidally and subtidally. However, the number of intertidal species present generally appear to be much smaller than the number of subtidal species (Ford and Chambers 1973, 1974; Macdonald *et al.* 1989).

Some species of the common intertidal and subtidal bivalve molluscs of inner San Diego Bay are used as food by man, and the area has long been considered good for clam digging. These include the banded, smooth, and wavy cockle clams (*Chione californiensis*, *C. fluctifraga*, and *C. undatella*), the bent-nosed clam (*Macoma nasuta*), and the littleneck clam (*Protothaca staminea*). However, the size of most individuals of these species appears to be small compared with those in nearby clamming areas, such as the San Diego River mouth. The jackknife clams (*Tagelus californianus* and *T. subteres*), the rosy razor clam (*Solen rosaceus*) and other small bivalves are used commonly as bait for fishing. The ghost shrimp (*Callinassa californiensis*) is also caught and sold as bait. While the other invertebrates present are not of direct value to man, they are extremely important to the biological economy of estuarine areas. The feeding of nematode and polychaete worms, gastropod molluscs, brittlestars, crabs, isopods, and a wide variety of smaller crustaceans serves to transform detritus and small invertebrates into usable food for larger invertebrates and fishes; the latter, in turn, are eaten by other large fishes and aquatic birds, many of which are of sport fishing value or

esthetic value to man. Bivalve molluscs and other suspension feeders serve a similar function in transforming plankton and suspended detrital material into food for fishes and birds.

Several species of marine algae associated with the shallow, soft bottom habitats of south San Diego Bay appear to be important habitat features for epifaunal invertebrates and fishes. At least during the summer months, shallow subtidal soft bottom areas throughout the south bay are covered by extensive mats of living marine algae, which are interspersed with areas of exposed sediment (Ford 1968, Ford and Chambers 1974). The dense, heavily branched red alga *Gracilaria verrucosa* forms the bulk of this mat, which also includes the red algae *Hypnea valentiae* and *Griffithsia pacifica*. Some of these plants are loosely anchored in the sediment, while others drift just above the bottom.

Underwater observations indicate that these algal mats are an important micro-habitat feature, because they provide cover or refuge from predators for many species of motile invertebrates and fishes, much as marsh vegetation does for aquatic birds. The algae also appear to serve as a food source for some invertebrates.

An unusual colonial ectoproct or bryozoan animal, *Zoobotryon verticillatum*, is present on the bottom sediment throughout much of inner San Diego Bay, where it forms large, flexible, tree-like masses during the warmer months of the year. Some clumps are attached to shell material embedded in the sediment or to algae, while much of it simply moves around freely on the bottom. Like the benthic plants discussed above, it serves as food for a variety of invertebrates and as refuge or cover for both motile invertebrates and small fishes.

Another unusual epifaunal species is a large purple and green basket sponge. These sponges are so large and abundant in some areas of inner San Diego Bay that they give the bottom of the bay the appearance of an underwater "cabbage patch." This sponge has been identified in previous studies of south San Diego Bay as *Tetilla mutabilis*, originally described from inner Newport Bay. However, recent examination by specialists indicates that it may be an undescribed species.

### **Invertebrate Fauna in Soft Bottom Habitats of Central and North San Diego Bay**

There has been only one multi-season study of soft bottom communities in outer San Diego Bay, that conducted by Ford and Chambers (1973) in the downtown area adjacent to and offshore from the Broadway and Navy piers. All of the sampling stations employed were in relatively deep subtidal areas. In addition, the recent study by Faurey *et al.* (1996: Tables 7–11) provided important information about infaunal invertebrate assemblages at a large number of sites throughout central and outer San Diego Bay (Table I-1). Other environmental impact studies of limited scope have also provided useful information about the invertebrate fauna of soft bottom habitats in other areas of the central and outer bay.

Of the 218 invertebrates species in soft bottom habitats sampled during four seasons in 1972–1978 near and offshore of the Broadway and Navy piers, 81 (37%) were polychaete worms, 47 (22%) were crustaceans, and 24 (11%) were bivalve and gastropod molluscs (Ford and Chambers 1973). While the number of species in each category is smaller at the outer bay location, the percentages are very similar to those reported for inner San Diego Bay. This indicates that polychaetes, crustaceans and molluscs are the dominant invertebrates in both areas. Data on abundance and biomass also confirm the dominance of these three invertebrate groups at the north bay location.

Comparison of the data for infaunal invertebrates reported from north and central San Diego Bay by Ford and Chambers (1973) and Fairey *et al.* (1996) with those for the south bay (Macdonald *et al.* 1990) indicates that there is considerable overlap, with many of the same species occurring in all three areas.

The 22 species of multicellular algae present in the relatively deep bottom area near and offshore from the piers apparently do not form extensive mats, as they do in south San Diego Bay. This probably is the result of low light levels at greater depths and the relatively turbid water in this area of substantial vessel activity.

The colonial ectoproct, or bryozoan, *Zoobotryon verticillatum*, is also present in some areas near the downtown piers, where it forms large tree-like masses during the warmer months of the year. Most clumps are attached to the bases of pier pilings, while some are attached to shell material embedded in the unconsolidated sediment or simply drift above the bottom. In common with the benthic algae discussed above, this ectoproct serves as food for a variety of invertebrates and as a refuge for both invertebrates and small fishes near the pier pilings and on the soft bottom sediment.

### **Recolonization Rates after Disturbance**

The environmental effects of dredging and disposal of dredged sediments on benthic invertebrates have been widely reviewed (O'Neal and Sceva 1971; Morton 1977; U.S. Army Corps of Engineers 1977; DiSalvo 1978, Hirsch *et al.* 1978). During the course of dredging, as well as the subsequent soil disposal, the water becomes turbid with resuspended silt and clay, and dissolved oxygen is consumed (JBF Scientific Corporation 1975; U.S. Army Corps of Engineers 1976). These effects are usually greater during disposal than during dredging (U.S. Army Corps of Engineers 1976). The formation of a thick suspension of dredged sediments called fluid mud smothers some infaunal species but not others (Diaz and Boesch 1977). The resulting turbidity is relatively short-lived and probably no worse than the natural turbidity caused by storm water discharge through rivers and smaller watercourses in winter, wind waves, and tidal currents. Laboratory studies concerning the effects of sediment suspensions on mussels, clams, polychaete worms, and crustaceans (Peddicord *et al.* 1975) showed that these mud-dwelling invertebrates would not be harmed by the levels of field suspensions measured during actual dredging operations (U.S. Army Corps of Engineers 1976). The depression of dissolved oxygen concentration was found to be small and brief, probably because of the bulk of the sediment rapidly sinks to the bottom before all the reduced substances can be oxidized. Advection and mixing quickly restore equilibrium conditions. (Nichols and Pamatmat 1988)

The Marine Board (1985) concluded that the potential for persistent environmental effects of benthic populations due to maintenance dredging is very small. The dredged bottom, as well as the areas where dredge spoil is deposited, are usually recolonized rapidly (McCauley *et al.* 1977). Soule and Oguri (1976) studied recolonization of infaunal species after dredging, compared to a reference site. They found that the re-colonizing species assemblages were less diverse than the established assemblages, and that two to three years were required for the community to stabilize. This time requirement was similar to the one Reish (1961) reported for the initial colonization of the benthos in newly established marinas. These studies lead to a conclusion that dredged areas gradually return to their previous population and community levels.

Moreover, the areas of dredging and disposition at any one time are small fractions of the total area of the estuary. Thus, the influx of organisms from the surrounding undisturbed areas can be rapid. In addition, benthic communities normally subject to wave scour, high turbidity, and sediment redeposition rapidly recover from dredging and sediment disposal. This appears to be because the residents are rapidly reproducing, opportunistic species with short life cycles (Oliver *et al.* 1977). Because many of the species in the benthos remain reproductively active for much of the year, they can quickly colonize a newly exposed sediment surface (Nichols and Pamatmat 1988), thereby facilitating the recovery process.

### **Southern California Eelgrass Mitigation Policy (Adopted July 31, 1991)**

Eelgrass *Zostera marina* vegetated areas function as important habitat for a variety of fish and other wildlife. In order to standardize and maintain a consistent policy regarding mitigating adverse impacts to eelgrass resources, the following policy has been developed by the Federal and State resource agencies (National Marine Fisheries Service, U.S. Fish and Wildlife Service, and the California Department of Fish and Game). This policy should be cited as the Southern California Eelgrass Mitigation Policy (revision 8).

For clarity, the following definitions apply. "Project" refers to work performed on-site to accomplish the applicant's purpose. "Mitigation" refers to work performed to compensate for any adverse impacts caused by the "project."

"Resource agencies" refers to National Marine Fisheries Service, U.S. Fish and Wildlife Service, and the California Department of Fish and Game.

**1. Mitigation Need.** Eelgrass transplants shall be considered only after the normal provisions and policies regarding avoidance and minimization, as addressed in the Section 404 Mitigation Memorandum of Agreement between the Corps of Engineers and Environmental Protection Agency, have been pursued to the fullest extent possible prior to the development of any mitigation program.

**2. Mitigation Map.** The project applicant shall map thoroughly the area, distribution, density and relationship to depth contours of any eelgrass beds likely to be impacted by project construction. This includes areas immediately adjacent to the project site which have the potential to be indirectly or inadvertently impacted as well as areas having the proper depth and substrate requirements for eelgrass but which currently lack vegetation.

Protocol for mapping shall consist of the following format:

**1) Coordinates**

Horizontal datum—Universal Transverse Mercator (UTM), NAD 83, Zone 11

Vertical datum—Mean Lower Low Water (MLLW), depth in feet.

**2) Units**

Transects and grids in meters.

Area measurements in square meters/hectares.

All mapping efforts must be completed during the active growth phase for the vegetation (typically March through October) and shall be valid for a period of 120 days with the exception of surveys completed in August–October.

A survey completed in August–October shall be valid until the resumption of active growth (i.e., March 1). After project construction, a post-project survey shall be completed within 30 days. The actual area of impact shall be determined from this survey.

**3. Mitigation Site.** The location of eelgrass transplant mitigation shall be in areas similar to those where the initial impact occurs. Factors such as, distance from project, depth, sediment type, distance from ocean connection, water quality, and currents are among those that should be considered in evaluating potential sites.

**4. Mitigation Size.** In the case of transplant mitigation activities that occur concurrent to the project that results in damage to the existing eelgrass resource, a ratio of 1.2 to 1 shall apply. That is, for each square meter adversely impacted, 1.2 square meters of new suitable habitat, vegetated with eelgrass, must be created. The rationale for this ratio is based on, 1) the time (i.e., generally three

years) necessary for a mitigation site to reach full fishery utilization and 2) the need to offset any productivity losses during this recovery period within five years. An exception to the 1.2 to 1 requirement shall be allowed when the impact is temporary and the total area of impact is less than 100 square meters. Mitigation on a one-for-one basis shall be acceptable for projects that meet these requirements (see section 11 for projects impacting less than 10 square meters).

Transplant mitigation completed three years in advance of the impact (i.e., mitigation banks) will not incur the additional 20% requirement and, therefore, can be constructed on a one-for-one basis. However, all other annual monitoring requirements (see sections 8–9) remain the same irrespective of when the transplant is completed.

Project applicants should consider increasing the size of the required mitigation area by 20–30% to provide greater assurance that the success criteria, as specified in Section 9, will be met. In addition, alternative contingent mitigation must be specified, and included in any required permits, to address situation where performance standards (see section 9) are not met.

**5. Mitigation Technique.** Techniques for the construction and planting of the eelgrass mitigation site shall be consistent with the best available technology at the time of the project. Donor material shall be taken from the area of direct impact whenever possible, but also should include a minimum of two additional distinct sites to better ensure genetic diversity of the donor plants. No more than 10% of an existing bed shall be harvested for transplanting purposes. Plants harvested shall be taken in a manner to thin an existing bed without leaving any noticeable bare areas. Written permission to harvest donor plants must be obtained from the California Department of Fish and Game.

Plantings should consist of bare-root bundles consisting of 8–12 individual turions. Specific spacing of transplant units shall be at the discretion of the project applicant. However, it is understood that whatever techniques are employed, they must comply with the stated requirements and criteria.

**6. Mitigation Timing.** For off-site mitigation, transplanting should be started prior to or concurrent with the initiation of in-water construction resulting in the impact to the eelgrass bed. Any off-site mitigation project which fails to initiate transplanting work within 135 days following the initiation of the in-water construction resulting in impact to the eelgrass bed will be subject to additional mitigation requirements as specified in section 7. For on-site mitigation, transplanting should be postponed when construction work is likely to impact the mitigation. However, transplanting of on-site mitigation should be started no later than 135 days after initiation of in-water construction activities. A construction schedule which includes specific starting and ending dates for all work including mitigation activities shall be provided to the resource agencies for approval at least 30 days prior to initiating in-water construction.

**7. Mitigation Delay.** If, according to the construction schedule or because of any delays, mitigation cannot be started within 135 days of initiating in-water construction, the eelgrass replacement mitigation obligation shall increase at a rate of seven percent for each month of delay. This increase is necessary to ensure that all productivity losses incurred during this period are sufficiently offset within five years.

**8. Mitigation Monitoring.** Monitoring the success of eelgrass mitigation shall be required for a period of five years for most projects. Monitoring activities shall determine the area of eelgrass and density of plants at the transplant site and shall be conducted at 3, 6, 12, 24, 36, 48, and 60 months after completion of the trans-

plant. All monitoring work must be conducted during the active vegetative growth period and shall avoid the winter months of November through February. Sufficient flexibility in the scheduling of the 3 and 6 month surveys shall be allowed in order to ensure the work is completed during this active growth period. Additional monitoring beyond the 60 month period may be required in those instances where stability of the proposed transplant site is questionable or where other factors may influence the long-term success of transplant.

The monitoring of an adjacent or other acceptable control area (subject to the approval of the resource agencies) to account for any natural changes or fluctuations in bed width or density must be included as an element of the overall program.

A monitoring schedule that indicates when each of the required monitoring events will be completed shall be provided to the resource agencies prior to or concurrent with the initiation of the mitigation.

Monitoring reports shall be provided to the resource agencies within 30 days after the completion of each required monitoring period.

**9. Mitigation Success.** Criteria for determination of transplant success shall be based upon a comparison of vegetation coverage (area) and density (turions per square meter) between the project and mitigation sites. Extent of vegetated cover is defined as that area where eelgrass is present and where gaps in coverage are less than one meter between individual turion clusters. Density of shoots is defined by the number of turions per area present in representative samples within the control or transplant bed. Specific criteria are as follows:

- a. a minimum of 70 percent area of eelgrass bed and 30 percent density after the first year.
- b. a minimum of 85 percent area of eelgrass bed and 70 percent density after the second year.
- c. a sustained 100 percent area of eelgrass bed and at least 85 percent density for the third, fourth and fifth years.

Should the required eelgrass transplant fail to meet the established criteria, then a Supplementary Transplant Area (STA) shall be constructed, if necessary, and planted. The size of this STA shall be determined by the following formula:

$$STA = MTA \times (|A_t + D_t| - |A_c + D_c|)$$

MTA = mitigation transplant area.

$A_t$  = transplant deficiency or excess in area of coverage criterion (%).

$D_t$  = transplant deficiency in density criterion (%).

$A_c$  = natural decline in area of control (%).

$D_c$  = natural decline in density of control (%).

Four conditions apply:

- 1) For years 2–5, an excess of only up to 30% in area of coverage over the stated criterion with a density of at least 60% as compared to the project area may be used to offset any deficiencies in the density criterion.
- 2) Only excesses in area criterion equal to or less than the deficiencies in density shall be entered into the STA formula.
- 3) Densities which exceed any of the stated criteria shall not be used to offset any deficiencies in area of coverage.

4) Any required STA must be initiated within 120 days following the monitoring event that identifies a deficiency in meeting the success criteria. Any delays beyond 120 days in the implementation of the STA shall be subject to the penalties as described in Section 7.

**10. Mitigation Bank.** Any mitigation transplant success that, after five years, exceeds the mitigation requirements, as defined in section 9, may be considered as credit in a "mitigation bank." Establishment of any "mitigation bank" and use of any credits accrued from such a bank must be with the approval of the resource agencies and be consistent with the provisions stated in this policy. Monitoring of any approved mitigation bank shall be conducted on an annual basis until all credits are exhausted.

#### **11. Exclusions.**

1) Placement of a single pipeline, cable, or other similar utility line across an existing eelgrass bed with an impact corridor of no more than 2 meter wide may be excluded from the provisions of this policy with concurrence of the resource agencies. After project construction, a post-project survey shall be completed within 30 days and the results shall be sent to the resource agencies. The actual area of impact shall be determined from this survey. An additional survey shall be completed after 12 months to insure that the project or impacts attributable to the project have not exceeded the allowed 2 meter corridor width. Should the post-project or 12 month survey demonstrate a loss of eelgrass greater than the 2 meter wide corridor, then mitigation pursuant to sections 1–11 of this policy shall be required.

2) Projects impacting less than 10 square meters. For these projects, an exemption may be requested by a project applicant from the mitigation requirements as stated in this policy, provided suitable out-of-kind mitigation is proposed. A case-by-case evaluation and determination regarding the applicability of the requested exemption shall be made by the resource agencies.

# **Appendix I: Public Comments and Responses**

Written comments received from the public on the Public Draft are presented in their entirety in this Appendix, and summarized in the Table below. Also presented following these comments is a summary of public comments from two public workshops.

Comment Location	Commenter	Comment	Response
General Comments			
	Save Our Bay Inc.	The massive plan of more than 590 pages, including Appendices A-H (excluding C, the six (?) oversize maps), is impressive and should forestall for the foreseeable future any similar planning efforts. It would seem nearly impossible to expand its 34 page bibliography.	Thanks.
	Save Our Bay Inc.	We could find no reference in the plan to the effects sea level rise caused by global warming. If that rise is three feet (3'), which is likely, and violent storms cause a breaching of the Silver Strand first at Emory Cove, also likely, all manner of adverse impacts will occur. The plan should address this problem and call for planning to deal with it.	We address sea level rise in Sections 2.7.4 "Disturbance Regimes and Time Scales of Change," and consider it as an issue and information gap in sections 4.2.1.6 "Salt Marsh," 4.2.1.9 "Upland Transitions," and 4.2.2 "Mitigation and Enhancement."
	Save Our Bay Inc.	It is now known that past major climate changes have occurred in a very short time, i.e., an abrupt (just a couple of decades) 16 degree warming at the end of what is considered the last ice age, 15,000 years ago, (Severinghaus of SIO in San Diego Union-Tribune 29 Oct. 1999). That was followed 8,200 years ago by a change "from warm back to ice age" that took just 70 years. (James Burke in "After the Warming 2050" by Ambrose Publishing 1990).	Acknowledged.
	San Diego Audubon Society	Organize, schedule and publicize shoreside tours in South Bay, especially in mid-winter and again in May-June. These might serve to get the attention of people who now have little or no awareness of what is there and why it is of interest.	We added this to Environmental Education section in Ch. 5.
	Environmental Health coalition	Please do an index. This is a great accumulation of information and would be made more usable with an index.	We could not find a way to do an index within our budget, but hope that the detailed Table of Contents helps.
	Environmental Health coalition	The framework of this report appears to be structured as a mechanism for enabling planning and to facilitate expanded (and, generally, environmentally destructive) military, industrial, and commercial use of the Bay by creating mechanisms whereby proposed projects can be facilitated through creation of habitat management plans, establishment of mitigation banks, etc. Without the specific project plan and areas to be protected, enhanced etc. and the mechanisms by which they will be protected and managed and the enforceable commitments by which that protection and enhancement will occur, one cannot know if this plan will protect the Bay's natural resources or not. The San Diego Bay Ecosystems plan would benefit by development of a specific Action Plan. The Action Plan would take the valuable elements out of the Ecosystem plan and identify a series of projects that could be implemented. This gives immediate focus and momentum for implementation. The Action Plan should consist of a significant number (20-30+) sanctioned projects grouped around Habitat Preservation (Creation, Restoration, Enhancement), Maintenance, Monitoring, Education, etc. Each project description should include: Purpose, Objectives, Approach, Monitoring and Remediation, and Costs.	A primary purpose of this Plan was always to make project planning more predictable for Bay users, as well as to facilitate commitment by project proponents to environmental protection and enhancement.  A workshop was held after the Public Draft comments were received, and first-year priorities were identified that are presented in Chapter 7.

Comment Location	Commenter	Comment	Response
	San Diego Archeological Society	While making the document available on the Internet is a good idea, the size of this document effectively makes it inaccessible. I found that, even over a T-1 line, it took a significant period for the download to be completed.	Detail in the graphics is the reason the download is slow. We can provide a version of the document in which the graphics may remain fuzzy, but it will download quickly.
	San Diego Archeological Society	When I did a search in the document for references to archeological and historical sites, and archeological, historical and cultural resources, I found essentially no instances other than a high level overview. The potential for management for enhancement of biological resources cannot be discounted or ignored. It appears that no real effort has been made to identify cultural resources, on shore or underwater, which could be impacted by the project. Furthermore, to the extent that any federal government funds are expended or permits are required for any portions of this project, cultural resources must be addressed and the requirements of 36 CFR 79 will apply. As admirable as the intent of the plan is, it cannot be adopted without being modified to address cultural resources. We would like the opportunity to review these revisions.	Addressing cultural resources was out of scope for the contractor, since natural and cultural resources are routinely handled in separate planning documents by agencies. However, public review of the Environmental Assessment for this plan and later reviews of projects should allow for cultural review. Some additional strategies that incorporate cultural resource interpretation into educational activities have been added to Ch. 5.
<b>Specific Comments</b>			
Table of Contents	Save Our Bay Inc.	We suggest placing the word "Chapter" (or Chap.) ahead of the 1.0, 2.0, 3.0, etc.	Done.
Executive Summary pg. xxi	Save Our Bay Inc.	In the third paragraph (para) under habitats, we wonder if the emphasis on intertidal flats detracts from the importance of shallow subtidal, particularly for "juvenile California halibut." It is our belief that these juveniles require water habitat at all times which they would not have on intertidal when the tide is out. Or can juveniles lie buried until the tide returns?	California halibut use both intertidal and shallow subtidal areas. We think the plan emphasizes increased protection of both intertidal and shallow subtidal areas.
Pg. 2-104 (Sec. 2.5.5, Waterfowl)	Save Our Bay Inc.	We note margin comment: "Black brant depend upon eelgrass beds for food." The "Comprehensive Management Plan for San Diego Bay" says they may sometimes depend on sea lettuce.]	Statement amended.
Pg. 4-11 (Sec. 4.2.1.3, Proposed Mgmt. Strategy III)	Save Our Bay Inc.	It would be helpful to add the Section # after Chapter 6.	Done.
Ch. 5	Save Our Bay Inc.	We found no reference to use by the now Port District - owned South Bay Power Plant of bay waters for cooling purposes. This is extremely important if the shallow subtidal nursery habitat for California halibut is ever to produce any mature halibut. July/August water temperatures are increased by the power plant hot water outflow so that juvenile halibut cannot survive. If they retreat to the deeper cooler Chula Vista boat channel, they are probably eaten by the large halibut found there. They are cannibalistic. For your information, we have attached SAVE OUR BAY, INC (SOBI) Sept. 29, 1996 letter to the San Diego Regional Water Quality Control Board.	This concern is complicated by the impending closure of the South Bay Power Plant, and by the fact that the warm water emissions from the plant have apparently attracted and enhanced the growth rate of the endangered green sea turtle. The Power Plant area is proposed for enhancement in Section 4.2.2.
Pg. 5-70 Paragraph 2	San Diego Audubon Soc.	The Park and Rec Dept. of San Diego has set up some excellent story board displays/educational sites along the Flood Control Frontage Road on Sea World Drive, Mission Bay and also at the Observation platform at Kendall-Frost Marsh, Mission Bay. No idea what these cost, but they seem to work and do not seem subject to vandalism. Many more access points to the Bay, especially South Bay are needed, especially to include maps of hard to observe areas like the Salt Works ponds, and as per items E1, 2, 4, 5 pg. 5-72, observation pts/board walks/short towers to provide exposure to these protected habitats. There is a very effective board walk at the Bolsa Chica wetland preserve near Seal Beach.	Comments added to Environmental Education section in Ch. 5.

Comment Location	Commenter	Comment	Response
Pg. 5-70 Paragraph 3	San Diego Audubon Soc.	How does "wind-blown trash" end up in the Sweetwater NWR? The prevailing wind is westerly. What's the source(s)? Some control of this would lessen the burden of volunteers forever cleaning up other people's messes. And all trash is not equal-plastic can loops, plastic bags, and items containing lead need particular attention.	We are not sure how trash ends up at the Refuge. Anything floating in the Bay seems to end up there, and the Sweetwater Channel brings down flood debris. Some of the larger items like dock parts, tires and couches are difficult to dispose of. This has been added as a concern.
Pg. 5-70 Paragraph 6	San Diego Audubon Soc.	Again, a message needs to be clearly sent to the Bay community that violating existing regulations and ignoring posted signage will result in substantial penalties and that enforcement is current. Negative things, which occur now are due in part at least to little or no enforcement and minimal penalties.	Acknowledged.
Pg. 6-6 Paragraph 2	San Diego Audubon Soc.	Bird Atlas grid blocks are 3mi x 3mi. Surveys are winter (Dec., Jan., Feb.) and summer (breeding), which can extend Feb/Mar. through July, but is concentrated in April, May and June. There is no Fall monitoring i.e., August through November, winter surveys of each block cover 3 years; breeding only one of all criteria are met. Hours per volunteer are minimum 25 hrs. winter plus 25 hrs. breeding season.	Incorporated.
Pg. 6-11 Paragraph 1	San Diego Audubon Soc.	San Diego Bay is certainly part of the Pacific Flyway for migratory birds, especially shore birds. Pt. Reyes Bird Observatory and San Francisco Bay Bird Observatory have been and are doing much work on SF Bay. So SF Bay has much in common with South SD Bay, just larger scale. There is even a salt extraction operation there, also being converted away from commercial salt production.	Thanks for the information.
Pg. 6-14, Table 6-4	San Diego Audubon Soc.	Some additional candidates for bird list:	Incorporated
	San Diego Audubon Soc.	osprey: HI, SS, PS, maybe CI (open water)	Incorporated
	San Diego Audubon Soc.	Belding's savannah sparrow: C1, H1, SS, DS, PI, salt marsh	Incorporated
	San Diego Audubon Soc.	Large billed sparrow (now considered a separate species, but best to check status with Phil Unitt@SDNHM): HI, SS. This bird was once widespread here in salt marsh, then essentially disappeared and is now present again.	Incorporated
P. 6-17 to 6-18	San Diego Audubon Soc.	Mitigation: From Joy Zedler research, tidal wetland restoration is marginal at best (Paradise Marsh and Connector marsh were particular sites).	Acknowledged. She also found it takes a very long time.
	San Diego Audubon Soc.	Populations: PRBO and SFBBO should have shorebird data, shorebird surveys of SD Bay, shoreline need to be facilitated by greatly improved ease of access-plenty of volunteers, but access is hard.	Thanks for the information. Access has been added as an issue to the Environmental Education and Long-term Monitoring sections. Information on PRBO and SFBBO added to Section 6.3 "Data Integration, Access and Reporting."
Pg. 6-25 to 6-26	San Diego Audubon Soc.	Should be flip-flopped, so text in 6-26 is contiguous with text on 6-24 instead of separated, as now.	Done.
D-28	San Diego Audubon Soc.	Phil Pride; name is spelled Pryde. He is a professor of geography at SDSU.	Corrected.
Pg. 2-20	Environmental Health Coalition	The discussion of contaminated site remediation is rosier than reality. Only Campbell's has a proper Cleanup and Abatement Order and the levels are not as protective as those cited in the earlier paragraph. There is no formal or enforceable cleanup agreement for NASCO or SWM. These polluters refuse to cleanup to protective standard for the Bay and it is unclear how much of their polluted site will be remediated. The Navy's Naval Station sediment study has been apparently tabled for a few years and not shown to the public.	Comments noted. RWQCB is in process of developing cleanup agreements with NASCO and SWM. The Naval Station's sediment study has been released as a Technical Document through SPAWAR.

Comment Location	Commenter	Comment	Response
Pg. 3-32	Environmental Health Coalition	Fish discussion should reflect that it has been reported to us that workers at NASCO will fish from the piers during the lunch hour for fish for meals for their families	Comment noted. County of San Diego has posted fish advisory signs in several languages.
	Environmental Health Coalition	The assessment of the Navy future plans should include the Scheme 1A expansion plan for five carriers. A discussion of the concentration of carriers in San Diego waters for training grounds should be included.	Comment acknowledged. If the Navy brings in new carriers, they will be addressed in a separate EIS process.
Pg. 3-29	Environmental Health Coalition	The recreational boat survey seems designed to overestimate recreational boat traffic. Labor Day weekend has got to be one of the busiest weekends of the year.	Labor Day weekend data were extrapolated very conservatively to the rest of the year, due to the knowledge that it is an exceptionally busy weekend.
Pg. 4-4	Environmental Health Coalition	Evaluation of Current Management, again, paints a too-rosy picture of the current situation. It should rather read that unregulated oil spills and discharges from Navy vessels continue unregulated and Naval Facilities still have no discharge permit beyond the General Industrial Storm water permit. Toxic flows of runoff still enter the Bay from boatyards and shipyards and SDGE continues to discharge up to 600 mgd of hot water and wastes from chlorination into South Bay. The cooling discharges of carriers and submarine nuclear power plants are uncharacterized. In addition, dewatering discharges from Great American bldg and the Convention Center still discharge dewatering wastes into San Diego Bay. This is a more accurate picture of the current discharges currently entering San Diego Bay.	Comments acknowledged. It is widely agreed that once sewage was re-routed, the Bay's health improved dramatically. Monthly monitoring is conducted for metals, and quarterly monitoring for toxins in fish. The Navy and Port both report spills to the Marine Safety Office. Chlorinated discharges from the Power Plant are being addressed by examining the area of influence. SDG&E is in compliance with current requirements. Naval facilities are in a period of transition during which only a single permit is required. Dewatering discharges have not occurred since the Convention Center went on line.
	Environmental Health Coalition	The action items on this should include an immediate moratorium on any fill of any more deep water. This should begin with refusing to site the USS Midway in San Diego Bay as a de-facto permanent fill.	The Midway will need camels and dolphins to keep it in place away from the pier. We know of only tenuous justification for calling it a fill.
Pg. 4-7	Environmental Health Coalition	Restate to "Prohibit" new navigation channels in this habitat.	We have no authority to prohibit new navigation channels.
Pg. 4-8	Environmental Health Coalition	Under current management of shallow subtidal, current management has done little to protect this habitat. The net loss of this habitat type from the Stennis Homeporting project should be cited here.	It is not clear that shallow subtidal habitat was involved.
Pg. 4-91	Environmental Health Coalition	Please add Environmental Health Coalition as an organization that frequently comments on development projects in the Bay. EHC has been in San Diego for 20 years and the Clean Bay Campaign has been a dedicated San Diego Bay effort since 1987.	Done.
Section 5	Environmental Health Coalition	Needs a section on use of San Diego Bay as a cooling water system for multiple power plants. This should include the South Bay Power Plant, but also specifically the 6-14 nuclear submarines and the cooling systems of three nuclear powered aircraft carriers that will soon come to the Bay.	We have not been able to find any evidence that nuclear carriers, subs, or any vessel discharging cooling water have an adverse effect on Bay ecology.

Comment Location	Commenter	Comment	Response
	Environmental Health Coalition	There also needs to be a discussion of radiological impacts to the Bay. This must include the discovery of elevated levels of radiation in the fish in the 1990 health risk study and the elevated levels of Cesium at the Naval Station and the Sub Base noted in the most recent EPA study. Further, a plan to reduce or manage these risks should include a mention that the next CVX generation of carriers should be non-nuclear so that the radiological risks to the Bay are ultimately abated.	We are aware of these findings, but considered radiological impacts to be out of scope for this iteration of the Plan, perhaps to be taken up in updates. The planners never intended to deal in depth with water quality issues, since this was accomplished in the "Comprehensive Management Plan for San Diego Bay."
	Environmental Health Coalition	Compatible Use strategies should include development of ecotourism.	This has been added under Environmental Education in Ch. 5.
Pg. 5-50	Environmental Health Coalition	There are additional runoff strategies that should be recommended and pursued. To effectively and positively reduce pollution in storm water runoff some or all of the following actions should be pursued.	The planners agree that non-point source pollution remains a problem in San Diego Bay, but not all of the specific recommendations mentioned. However, it was never intended that this Plan deal in depth with water quality issues, since this was a primary focus of the "Comprehensive Management Plan for San Diego Bay."
	Environmental Health Coalition	Ban use of certain problematic pesticides in the region such as has been done in San Francisco/Santa Barbara area. Legislative or ordinances. Bans of persistent chemicals is all that has ever worked to reduce load to the environment but will be unpopular with those that profit from their sale. If we want to see ecological improvement, we must be able to pursue this in spite of certain corporate opposition. Short of this, stiff "storm water pollution" taxes should be applied to all pesticides, fertilizers, etc. that are used outdoors with a label as to why the tax is needed and what the non-taxed alternatives to this product are.	Comment acknowledged. This is beyond the current scope of this Plan.
	Environmental Health Coalition	Required IPM for open space, park cemeteries, and gold courses. A low-cost or free contractor could be offered to support jurisdictions that wish to pursue IPM for their parks and open spaces. This could also be achieved legislatively.	The Port is implementing an Integrated Pest Management Program on its tidelands.
	Environmental Health Coalition	Support land acquisition to allow widening of rivers to support urban storm flow. This would avoid the continued highly detrimental activity of concreting and rip-rapping natural stream beds.	We agree that something needs to be done to correct the problem, but this was not an issue raised at our meetings, and perhaps should be tackled in the next Plan iteration.
	Environmental Health Coalition	Aggressive pursuit of E.V. and other non-polluting vehicles and fleets. Fund a subsidy program for purchase and lease of EVs. Initiate and support legislative efforts to strengthen EV mandate and development of EV and fuel cell technology.	The Port has an Electric Vehicle and propane "clean burning" vehicle program. However, this is beyond the current scope of this Plan.
	Environmental Health Coalition	Development of a structural UR element for the San Diego Bay watershed. Develop issue areas, Functional Assessment, Improvement Plan, Implementation. (Cost: existing FA plans for Otay and Penasquitos are \$500,000 combined). This plan could find, identify areas that could be enhanced for filter strips, strategic locations for interceptors, marsh treatment sites, sediment/oil/grease etc...traps. Could be combined or separate from a non-structural plan.	We agree that something needs to be done to help, but this was not an issue raised at our meetings, and perhaps should be tackled in the next Plan iteration.

Comment Location	Commenter	Comment	Response
Environmental Health Coalition	Environmental Health Coalition	Full implementation of the SANDAG Regional Water Quality Element. This is a very important document and should be given the weight of law through requirements or ordinances. Permit for all new development should require structural and non-structural BMPs (for construction phase and the project) and to identify a perpetual funding source for said measures. BMPs should be required for all projects regardless of size (NPDES only required on 5 acres or more).	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Enforcement. On the ground enforcement within the watershed. Enforcement of construction runoff and erosion standards. Enforcement team for discharges to storm drain system.	Comment acknowledged. This is beyond the current scope of this Plan.
Environmental Health Coalition	Environmental Health Coalition	Major inclusion and coordination of SANDAG and CALTRANS regarding vehicle pollution. Water quality and vehicle pollution are very closely related. Issues regarding traffic methods, patterns, mass transit, must give increased consideration to vehicle impacts on water quality.	Comment acknowledged. This is beyond the current scope of this Plan.
Environmental Health Coalition	Environmental Health Coalition	Education program that emphasizes pollution prevention. (See discussion in the Water Quality Element, Cholla Creek Project).	This is ongoing. See Environmental Education section.
Environmental Health Coalition	Environmental Health Coalition	Development of integrated system of sinks, sediment traps, oil/water separators etc...within the watershed. Could be done with a pilot program first.	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Development of a system of upland buffer strips and grassed water courses in lieu of pipes. Should also include major commitment to native, drought-tolerant vegetation for watershed.	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Development of diversion and interceptor systems upstream of the Bay where they could be smaller.	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Identify areas in the watershed where increases of infiltration rates can be accomplished. Identify areas where pavement could be removed and other surfaces be used. Also, methods in which to slow down storm water and increase infiltration time i.e. unpave bottoms of flood channels, widen them, and use cattails and other wetland species where possible to absorb pollutants and water.	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Cover Navy gas stations under NPDES SW requirements and require BMP plans. Currently, we think they are only covered under CZARA.	Comment acknowledged. This was beyond the scope of our current Plan.
Environmental Health Coalition	Environmental Health Coalition	Cover Navy facilities under NPDES SW requirements comparable to those requirements covering shipyards.	Modifications to Navy NPDES permits are being considered.
Environmental Health Coalition	Environmental Health Coalition	Watershed BMP plan by regional hydro geographic unit focusing on specific plans and BMPs and plans for known uses i.e. gas stations, auto shops, painting and sanding, etc...	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Pollution Prevention Basin Plan amendment to encourage dischargers to become educated about their options for P2.	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
Environmental Health Coalition	Environmental Health Coalition	Develop and require an aggressive model for an industrial and commercial SWPP. These plans could/should include berming, structural BMPs, vacuuming of wastes, covering of waste areas, parking lot filter strips etc...	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.

Comment Location	Commenter	Comment	Response
	Environmental Health Coalition	Providing for adequate room for end of pipe treatments for new development projects. When projects such as the North Embarcadero are designed, adequate space and resources should be developed to allow for sediment traps, oil/grease/water separators, and filtration wetlands.	RWQCB prefers tougher source controls over end-of-pipe treatments. However, this is beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
	Environmental Health Coalition	Support of existing pilot or demonstration programs. These are three projects that are underway, all of which will or are attempting to incorporate consideration of storm water in the design and management Paradise Creek Restoration Chollas Creek Linear Park (unsure of status) C.V. Bayfront Development Otay River Wetlands Working Group watershed management study	These are supported in the Environmental Education section of Ch. 5.
	Environmental Health Coalition	Requirement of watershed cities to pool funds for NPS programs within the watershed or through tax exercise ability of the Port.	Comment acknowledged. This was beyond the scope of our current Plan, but perhaps should be tackled in the next Plan iteration.
	Environmental Health Coalition	Replacement of rip-rap with wetlands, mudflats where possible. Consider in front of hotels, etc.	This is recommended in Ch. 4 and elsewhere in the document.
	Environmental Health Coalition	Interceptors systems around key areas of the bay to collect and divert dry weather flows. Mission Bay trap dry weather flows go into a tank in the ground and later gets pumped into the sewer system. There is also an interceptor at Famosa Slough.	There is an existing low-flow diversion system. Improvements may be discussed in a future iteration of the Plan.
	Environmental Health Coalition	End of Pipe Treatments: Oil and grease separator. Sediment traps are important because contaminants travel on sediments and can be removed and prevented from the Bay	RWQCB prefers tougher source controls to end-of-pipe treatment, which has not worked well.
	Environmental Health Coalition	Fund a storm water/BMP/whatever team to address and assist tenants with storm water compliance.	Added to Section 5.2.2 "Stormwater Management."
	Environmental Health Coalition	Fund and implement a Hazardous Materials Collection event/station for marinas.	Added to Section 5.2.2 "Stormwater Management."
	Environmental Health Coalition	Recommend strengthened Municipal and industrial storm water permits	These were strengthened January 2000.
	Environmental Health Coalition	Design a progressive and effective "blueprint" for Standardized Minimum Requirements to comply with the permit.	Comment acknowledged. This was beyond the scope of our current Plan.
	Environmental Health Coalition	Facilitate a staffed storm water hotline.	Co-permittees currently support this as part of the "Think Blue" campaign.
Pg. 7-20	Environmental Health Coalition	Revise third bullet to read that the NEP could be used to carry out..."developing and implementing corrective actions..."	Done.
Pg. 7-20	Environmental Health Coalition	NEP was not defeated by a generalized local distrust. It was defeated by local industry, specifically Industrial Environmental Association, Port Tenants Association, and the Mayor's Port Advisory Council comprised of Bayside industries and the Navy. This should be reflected accurately in the document.	Statement modified to say that NEP was defeated by local industry.
	Environmental Health Coalition	We are assuming that we will have a chance to comment on the actual recommendations for preservation, restoration and action.	A follow-up workshop was held and comments were received.
Pg. 7-20	Environmental Health Coalition	NEP could be used for funding if the nominations would open again and accept new estuary applications. This should not be discounted as a viable option.	This is kept as a viable option in the document.

# San Diego County Archaeological Society

Environmental Review Committee

15 November 1999

To: Ms. Melissa A. Mailander  
Environmental Review Coordinator  
Unified Port District  
P.O. Box 488  
San Diego, California 92112-0488

Subject: Draft Integrated Natural Resources Management Plan

Dear Ms. Mailander:

I have reviewed the subject document on behalf of this committee of the San Diego County Archaeological Society.

While making documents available on the Internet is a good idea, the size of this document effectively makes it inaccessible. I found that, even over a T-1 line, it took a significant period for the download to be completed.

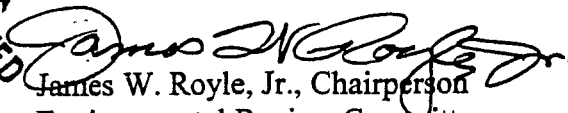

When I did a search in the document for references to archaeological and historical sites, and archaeological, historical and cultural resources, I found essentially no instances other than a high level overview. The potential for management for enhancement of biological resources to adversely impact cultural resources cannot be discounted or ignored. It appears that no real effort has been made to identify cultural resources, on shore or underwater, which could be impacted by the project. Furthermore, to the extent that any federal government funds are expended or permits are required for any portions of this project, cultural resources must be addressed and the requirements of 36 CFR 79 will apply.

As admirable as the intent of the plan is, it cannot be adopted without being modified to address cultural resources. We would like the opportunity to review these revisions.

Thank you for notifying us of the public review period for the INRMP.

Sincerely,

RECEIVED  
NOV 17 1999  
LAND USE &  
PLANNING

• Bay Ecosystem Plan Technical Oversight Committee  
c/o Tierra Data Systems  
Attn: Elizabeth Kellogg  
10110 West Lilac Road  
Escondido CA 92026

Dear Dr. Kellogg:

The massive plan of more than 590 pages, including Appendices A-H (excluding C, the six (?) oversize maps), is impressive and should forestall for the foreseeable future any similar planning efforts. It would seem nearly impossible to expand its 34 page bibliography.

We have several minor comments and several we consider of more consequence.

In the "Table of Contents" we suggest placing the word "Chapter" (or Chap.) ahead of the 1.0, 2.0, 3.0, etc.

In the Executive Summary, page (p) xxi, in the third paragraph (para) under habitats, we wonder if the emphasis on intertidal flats detracts from the importance of shallow subtidal, particularly for "juvenile California halibut". It is our belief that these juveniles require water habitat at all times which they would not have on intertidal when the tide is out. Or can juveniles lie buried until the tide returns?

On page 2-104 (Sec. 2.5.5, Waterfowl) we note margin comment: "Black brant depend upon eelgrass beds for food."

For whatever it's worth, we cite the South San Diego Bay Enhancement Plan, Volume Two, page 7-2, last paragraph: "\_\_\_ but in 1943 he noted that there was no eelgrass in San Diego Bay and presumed that the birds were feeding on sea lettuce (as they do in the bay to this day.)." So one ecosystem rule is that animals may have highly preferred foods but can survive on many others, just as wintering mule deer might prefer bitterbrush and mountain mahogany but can survive quite well on a mixture of sagebrush and juniper. Even humans might prefer beefsteak but can survive probably better on tofu and other

vegetable proteins.

On page 4-11 (Sec. 4.2.1.3, Proposed Mgmt. Strategy III.), it would be helpful to add the Section # after Chapter 6.

In the "State of the Bay - Human Use" Chapter, we found no reference to use by the now Port District-owned South Bay Power Plant of bay waters for cooling purposes. This is extremely important if the shallow subtidal nursery habitat for California halibut is ever to produce any mature halibut. July/August water temperatures are increased by the power plant hot water outflow so that juvenile halibut cannot survive. If they retreat to the deeper cooler Chula Vista boat channel, they are probably eaten by the large halibut found there. They are cannibalistic. For your information we have attached SAVE OUR BAY, INC (SOBI) Sept. 29, 1996, letter to the San Diego Regional Water Quality Control Board.

We could find no reference in the plan to the effects sea level rise caused by global warming. If that rise is three feet (3'), which is likely, and violent storms cause a breaching of the Silver Strand first at Emory Cove, also likely, all manner of adverse impacts will occur. The plan should address this problem and call for planning to deal with it.

It is now known that past major climate changes have occurred in a very short time, i.e., an abrupt (just a couple of decades) 16 degree warming at the end of what is considered the last ice age, 15,000 years ago (Severinghaus of SIO in San Diego Union-Tribune 29 Oct. 1999). That was followed 8,200 years ago by a change "from warm back to ice age" that took just 70 years. (James Burke in "After the Warming 2050" by Ambrose Publishing 1990).

We hope this "Bay Ecosystem Plan" won't immediately go morbid as did the "Comprehensive Management Plan for San Diego Bay". On the other hand maybe, just maybe, the CMPSOB did help get the South Bay National Wildlife Refuge for whatever it may be worth after sea level rise.

Sincerely,

  
William E. Graycomb, President

September 29, 1996

Chairman and Board Members AND  
Mr. John Robertus, Executive Officer,  
San Diego Region, Regional Water Quality Control Board  
9771 Clairemont Mesa Blvd., Suite A  
San Diego, CA 92124-1331

Dear Mr. Chairman and Executive Officer Robertus, et al:

Based upon information in our three previous letters to you dated Aug. 7, Sept. 11 and Sept. 26, 1996, we feel confident in preparing a billing for California halibut loss caused by SDG&E's SBPP.

We have a calculation, 13,759, the standing stock of California halibut (Paca) in San Diego Bay. Equating San Diego Bay with Mission Bay we calculate that it should be at least 110,410, an annual loss of 96,651. We say "annual" because during each year water temperature rises to the point of forcing juvenile Paca into deeper water where they are eaten as previously mentioned.

Rounding off, what the San Diego Bay standing stock/<sup>loss</sup> should be, to 96,700 and multiplying by 7.502 pounds (#) per fish, we find an annual halibut fishery loss of 725,400 pounds. The 7.502 is the average weight of the four year catch (1993 - 3.49 Kg, 1994 - 3.4 Kg, 1995 - 3.11 Kg, 1996 - 3.63 Kg) according to the Marine Recreational Fisheries Statistics Survey of the Pacific States Marine Fisheries Commission. Multiplying 725,400 pounds by \$2.50 per pound (the present dead fish price, according to California Fish and Game, Long Beach - live fish bring \$4.50 to \$6.00 to commercial fishermen unloading at the dock), we find the annual monetary value to be \$1,813,500.00.

SDG&E got the SBPP four steam turbines in operation by 1971, so we assume they have been depleting halibut stocks, as calculated above, since that date, a period of 25 years. SDG&E should, therefore, be billed for \$45,337,500. We would, of course, allow them to take inflation (or deflation) into account, but we would charge interest depending upon interest rates in

effect each year.

A separate billing statement for loss of rosy razor and jackknife clams will be prepared in the future. It will not be so exact because of the limited distribution of only five (5) sampling stations near the power plant.

Sincerely,

*William E. Claycomb*  
William E. Claycomb  
President

## We Welcome Your Comments

San Diego Bay

Integrated Natural Resource Management Plan

"Bay Ecosystem Plan"

Your comments are important to us. Please use this sheet to tell us your comments on the Bay Ecosystem Plan. Please feel free to use additional comment sheets if more space is needed. To ensure that your comments are addressed in the INRMP, comments should be received no later than November 17, 1999.

① What follows are assorted comments, first from the 2 page Environmental Education handout for the Ed. workshop I was not able to attend.

page -2, P2: I could not find in the preceding text any explanation for what RCD refers to.

P3: Imperial Beach Bird Fest either has or soon will have a name change. Check Mike Klein @ 619 563-6695 to check this.

page -3, P1 Children don't (or seldom) operate down jet skis, power boats & wind surfers - the major disruptive impacters in So. Bay of wildlife. They also don't dump trash, spill oil, & dispose of hazardous chemicals in the Bay. Adults do all these. Children are also probably not going to heed boundary markers & posted notices re speed limits trespass etc. Adults can & probably will pay heed especially if regulations are enforced and penalties for not heeding become obvious. Much more educational exposure to So. Bay and its components, for adults is needed.

page -4 Item C-2 In the face of almost complete lack of basic natural history/environmental instruction in the schools, how much can you expect any child to get from discussion of ecosystem concepts? This item is a good idea, but my point is that it may be a very tough sell.

## Additional Comments

San Diego Bay

Integrated Natural Resource Management Plan

"Bay Ecosystem Plan"

② These comments are from inspection of the INRMP at Coronado Library:

5-70 IP2 The Park & Rec Dept. of San Diego has set up some excellent story board displays/educational sites along the Flood Control Frontage Road on Sea World Drive, Mission Bay and also at the obs. platform at Kendall-Frost Marsh, Mission Bay. No idea what these cost but they seem to work & do not seem subject to vandalism.

Many more access points to the Bay, especially South Bay are needed, espec. to include maps of hard to observe areas like the Salt Works ponds and as per items E1, 2, 4, 5, p. 5-72, observation pts/boardwalks/look towers to provide exposure to these protected habitats. There is a very effective boardwalk at the Bolsa Chica wetland present near Seal Beach.

IP3 How does "wind-blown trash" end up in the Sweetwater NWR. The prevailing wind is westerly. What's the source(s)? Some control of this would lessen the burden of volunteers forever cleaning up other peoples messes. And all trash is not equal - plastic can traps plastic bags and items containing lead need particular attention.

IP6 Again a message needs to be clearly sent to the Bay community that violating existing regulations & ignoring posted signage will result in substantial penalties and that enforcement is current. Negative things which occur now are due in part at least to little or no enforcement & minimal penalties.

A suggestion: Organize, schedule & publicize shoreside tours in South Bay, especially in mid-winter & again in May-June. These might serve to get the attention of people who now have little or no awareness of what is there and why it is of interest.

Please fold in half and attach to "Comment Sheet" to mail

## Additional Comments

"Bay Ecosystem Plan"

### Monitoring

6-6 P2 Bird Atlas grid blocks are 3 mi. x 3 mi. Surveys are winter (Dec, Jan, Feb) and Summer (breeding) which can extend Feb/mar. through July, but is concentrated in April, May, & June. There is no Fall monitoring, i.e. August through November. Winter surveys of each block cover 3 years; breeding only 1. If all criteria are met. Hours per volunteer are minimum 25 hrs. winter plus 25 hrs. breeding season.

6-11 P1 San Diego Bay is certainly part of the Pacific Flyway, for migratory birds, espec. shore birds. Pt. Reyes Bird Observatory and San Francisco Bay Bird Observatory have been and are doing much work on SF Bay. So SF Bay has much in common w/ So. SD Bay, just larger scale. There is even a salt extraction operation there also being converted away from commercial salt production.

6-14, Table 6-4 Some additional candidates for bird list:

Osprey: HI, SS, PS, maybe CI (open water)

Salt marsh [Belding's Savannah Sparrow? CI, HI, SS, PS, P1 Large billed Sparrow (now considered a spp. sp. but best to check status w/ phil unit @ SDNHM); HI, SS. This bird was once widespread here in salt marsh, then essentially disappeared & is now present again.

Mitigation: From Jay Zedler researches, tidal wetland restoration is marginal at best (Paradise Marsh & Connector marsh were particular sites).

populations PRBO & SFBO should have shorebird data. Shorebird surveys of SD Bay shoreline need to be facilitated by greatly improved ease of access - plenty of volunteers, but access is hard.

6-25 & 6-26 should be flip flopped, so text on 6-26 is contiguous w/ text on 6-24 instead of separated, as now.

Please fold in half and attach to "Comment Sheet" to mail

Note, for D-28 Phil Pride's name is spelled Pryde - he is a professor of Geography @ SDSU.

## Mission Statement

Environmental Health Coalition is dedicated to the prevention and cleanup of toxic pollution threatening our health, our communities, and the environment. We promote environ- mental justice, monitor government and industry actions that cause pollution, educate communities about toxic hazards and toxics use lication, and empower the public to join our cause.

Printed on recycled paper  
with soybased inks.

Ms. Liz Kellog  
Tierra Data Systems  
10110 West Lilac  
Escondido, CA 92026

Dear: Ms. Kellog:

Environmental Health Coalition (EHC) has the following comments on the Ecosystems Plan.

## General Comments

Please do an index! This is a great accumulation of information and would be made more usable with and index.

The framework of this report appears to be structured as a mechanism for enabling planning and to facilitate expanded (and, generally, environmentally destructive) military, industrial, and commercial use of the bay by creating mechanisms whereby proposed projects can be facilitated through creation of habitat management plans, establishment of mitigation banks, etc. Without the specific project plan and areas to be protected, enhanced etc..and the mechanisms by which they will be protected and managed and the enforceable commitments by which that protection and enhancement will occur, one cannot know if this plan will protect the Bay's natural resources or not. The San Diego Bay Ecosystems plan would benefit by development of a specific Action Plan. The Action Plan would take the valuable elements out of the Ecosystem plan and identify a series of projects that could be implemented. This gives immediate focus and momentum for implementation. The Action Plan should consist of a significant number (20 - 30+) sanctioned projects grouped around Habitat Preservation (Creation, Restoration, Enhancement), Maintenance, Monitoring, Education, etc. Each project description should include: Purpose, Objectives, Approach, Monitoring and Remediation, and Costs.

Lack of this specific action plan is a significant failing.

## Specific Comments

2-20

The discussion of contaminated site remediation is rosier than reality. Only

Campbell's has a proper Cleanup and Abatement Order and the levels are not as protective as those cited in the earlier paragraph. There is no formal or enforceable cleanup agreement for NASSCO or SWM. These polluters refuse to cleanup to a protective standard for the Bay and it is unclear how much of their polluted site will be remediated. The Navy's Naval Station sediment study has been apparently tabled for a few years and not shown to the public.

Fish consumption discussion should reflect that it has been reported to us that workers at NASSCO will fish from the piers during the lunch hour for fish for meals for their families.

3-32

The assessment of the Navy future plans should include the Scheme 1A expansion plan for five carriers. A discussion of the concentration of carriers in San Diego waters for training grounds should be included.

3-29

The recreational boat survey seems designed to overestimate recreational boat traffic. Labor Day weekend has got to be one of the busiest weekends of the year.

4-4

Evaluation of Current Management, again, paints a too-rosy picture of the current situation. It should rather read that unregulated oil spills and discharges from Navy vessels continue unregulated and Naval Facilities are still have no discharge permit beyond the General Industrial Storm water permit. Toxic flows of runoff still enter the Bay from boatyards and shipyards and SDGE continues to discharge up to 600 mgd of hot water and wastes from chlorination into South Bay. The cooling discharges of carriers and submarine nuclear power plants are uncharacterized.. In addition, dewatering discharges from Great American bldg and the Convention Center still discharge dewatering wastes into San Diego Bay. This is a more accurate picture of the current discharges currently entering San Diego Bay.

The action items on this should include an immediate moratorium on any fill of any more deep water. This should begin with refusing to site the USS Midway in San Diego Bay as a de-facto permanent fill.

4-7

Restate to "Prohibit" new navigation channels in this habitat.

4-8

Under current management of shallow subtidal, current management has done little to protect this habitat. The net loss of this habitat type from the Stennis Homeporting project should be cited here.

4-91

Please add Environmental Health Coalition as an organization that frequently comments on development projects in the Bay. EHC has been in San Diego for 20 years and the Clean Bay Campaign has been a dedicated San Diego Bay effort since 1987.

## Section 5 Compatible Use Strategies

Needs a section on use of San Diego Bay as a cooling water system for multiple power plants. This should include the South Bay Power Plant but also specifically the 6-14 nuclear submarines and the cooling systems of three nuclear powered aircraft carriers that will soon come to the Bay.

There also needs to be a discussion of radiological impacts to the Bay. This must include the discovery of elevated levels of radiation in the fish in the 1990 health risk study and the elevated levels of Cesium at the Naval Station and the Sub Base noted in the most recent EPA study. Further, a plan to reduce or manage these risks should include a mention that the next CVX generation of carriers should be non-nuclear so that the radiological risks to the Bay are ultimately abated.

Compatible Use strategies should include development of ecotourism.

### 5-50

There are additional runoff strategies that should be recommended and pursued. To effectively and positively reduce pollution in storm water runoff some or all of the following actions should be pursued.

- Ban use of certain problematic pesticides in the region such as has been done in San Francisco/Santa Barbara area. Legislative or ordinances. Bans of persistent chemicals is all that has ever worked to reduce load to the environment but will be unpopular with those that profit from their sale. If we want to see ecological improvement, we must be able to pursue this in spite of certain corporate opposition. Short of this, stiff "storm water pollution" taxes should be applied to all pesticides, fertilizers etc.. That are used outdoors with a label as to why the tax is needed and what the non-taxed alternatives to this product are.
- Required IPM for open space, park cemeteries, and golf courses. A low-cost or free contractor could be offered to support jurisdictions that wish to pursue IPM for their parks and open spaces. This could also be achieved legislatively.
- Support land acquisition to allow widening of rivers to support urban storm flow. This would avoid the continued highly detrimental activity of concreting and rip-rapping natural stream beds.
- Aggressive pursuit of E.V. and other non-polluting vehicles and fleets. Fund a subsidy program for purchase and lease of Evs. Initiate and support legislative efforts to strengthen EV mandate and development of EV and fuel cell technology.
- Development of an structural UR element for the San Diego Bay watershed. Develop issue areas, Functional Assessment, Improvement Plan, Implementation. (Cost: existing FA plans for Otay and Penasquitos are \$500,000 combined.) This plan could find, identify areas that could be enhanced for filter strips, strategic locations for interceptors, marsh treatment sites, sediment/oil/grease etc... traps. Could be combined or separate from a non-structural plan.
- Full implementation of the SANDAG Regional Water Quality Element. This is a very important document and should be given the weight of law through requirements or ordinances. Permit for all new development should require structural and non-structural

BMPs (for construction phase and the project) and to identify an perpetual funding source for said measures. BMPs should be required for all projects regardless of size (NPDES only required on 5 acres or more).

- Enforcement. On the ground enforcement within the watershed Enforcement of construction runoff and erosion standards. Enforcement team for discharges to storm drain system.
- Major inclusion and coordination of SANDAG and CALTRANS regarding vehicle pollution. Water quality and vehicle pollution are very closely related. Issues regarding traffic methods, patterns, mass transit, must give increased consideration to vehicle impacts on water quality.
- Education program that emphasizes pollution prevention. (See discussion in the Water Quality Element, Cholla Creek Project).
- Development of integrated system of sinks, sediment traps, oil/water separators etc... within the watershed. Could be done with a pilot program first.
- Development of a system of upland buffer strips and grassed water courses in lieu of pipes. Should also include major commitment to native, drought-tolerant vegetation for watershed.
- Development of diversion and interceptor systems upstream of the Bay where they could be smaller.
- Identify areas in the watershed where increases of infiltration rates can be accomplished. Identify areas where pavement could be removed and other surfaces be used. Also, methods in which to slow down storm water and increase infiltration time i.e. unpave bottoms of flood channels, widen them, and use cattails and other wetland species where possible to absorb pollutants and water.
- Cover Navy gas stations under NPDES SW requirements and require BMP plans. Currently, we think they are only covered under CZARA.
- Cover Navy facilities under NPDES SW requirements comparable to those requirements covering shipyards.
- Watershed BMP plan by regional hydro geographic unit focusing on specific plans and BMPs and plans for known uses i.e. gas stations, auto shops, painting and sanding, etc...
- Pollution Prevention Basin Plan amendment to encourage dischargers to become educated about their options for P2.
- Develop and require an aggressive model for an industrial and commercial SWPP. These plans could/should include berming, structural BMPs, vacuuming of wastes, covering of waste areas, parking lot filter strips etc...
- Providing for adequate room for end of pipe treatments for new development projects. When projects such as the North Embarcadero are designed, adequate space a resources should be developed to allow for sediment traps, oil/grease/water separators, and filtration wetlands.
- Support of existing pilot or demonstration programs. These are three projects that are underway, all of which will or are attempting to incorporate consideration of storm water in the design and management.
  - Paradise Creek Restoration
  - Chollas Creek Linear Park (unsure of status)
  - C.V. Bayfront Development

- Otay River Wetlands Working Group watershed management study
- Requirement of watershed cities to pool funds for NPS programs within the watershed or through tax exercise ability of the Port.
- Replacement of rip-rap with wetlands, mudflats where possible. Consider in front of hotels etc..
- Interceptors systems around key areas of the Bay to collect and divert dry weather flows. Mission Bay trap dry weather flows go into a tank in the ground and later gets pumped into the sewer system. There is also an interceptor at Famosa Slough.
- End of Pipe Treatments. Oil and grease separator. Sediment traps are important because contaminants travel on sediments and can be removed and prevented from the Bay
- Fund an storm water/BMP/whatever team to address and assist tenants with storm water compliance.
- Fund and implement a Hazardous Materials Collection event/station for marinas.
- Recommend strengthened Municiple and industrial storm water permits
- Design a progressive and effective "blueprint" for Standardized Minimum Requirements to comply with the permit.
- Facilitate a staffed storm water hotline

7-10

Revise third bullet to read that the NEP could be used to carry out.. "developing and implementing corrective actions...."

NEP was **not** defeated by a generalized local distrust. **It was defeated by local industry,** specifically Industrial Environmental Association, Port Tenants Association, and the Mayor's Port Advisory Council comprised of Bayside industries and the Navy. This should be reflected accurately in the document. .

NEP could be used for funding if the nominations would open again and accept new estuary applications. This should not be discounted as a viable option.

Since my copy did not have an Appendix C, we are assuming that we will have a chance to comment on the actual recommendations for preservation, restoration and action. **Without these recommendations, this report is incomplete as an action or management plan.**

Thank you for the opportunity to comment on this Draft.

Sincerely,

  
Laura Hunter, Director  
Clean Bay Campaign

**U.S. Navy / Port of San Diego**  
**San Diego Bay Integrated Natural Resource Management Plan**  
**Technical Oversight Committee**

7/31/97

---

## **Issues From 7/16/97 Public Workshop:**

### **Mitigation Banking**

- Preserving what we have should be the first priority.
- How does it relate to *preservation* of the wetlands?
- There is a mitigation deficit from historical impacts that has not yet been compensated. How do we deal with this?
- Mitigate to enhance existing wetlands *and* rehabilitate damaged areas, as opposed to making up for damage from new projects.
- Are shallow, sub-tidal & intertidal to be the only mitigation areas?
- There are conflicts with existing uses, i.e., airport, with seeking the historical condition. Have to come up with a new concept for the Bay.
- Please consider changing from in-kind, site-specific mitigation to a broader context.
- Mitigation is the most important thing for the Bay concept. This should be evolving.
- Mitigation Banking is one of the last things we should be doing.
- Terminology is inconsistent—there are too many different definitions; the lost area is not equal to the restored area.
- What does mitigation mean? Common language needed.
- “Enhance” is a better term, than mitigate.

### **Impacts of Human Use**

- Historically it was a shallow bay, it is now deeper.
- Look at resource needs and not human needs.
- Consider what Bay ducks need in the context of the Pacific Flyway.
- Include upper watershed areas as a type for banking/mitigation.

### **Tourism/Ecotourism**

- Public outreach for ecotourism is not seen yet. Not Navy's job.
- Birdwatchers come to visit the Bay in an organized way. Small but increasing phenomenon. Could be encouraged by the Port.
- Chula Vista Nature Center is a good example.
- SANDAG may be getting involved in ecotourism/public outreach.
- Canoers, sailboaters, and kayakers are also users of the Bay that need to be acknowledged and planned for.
- What is the impact of jetskiers on birds--chasing.
- Can we get a carrying capacity estimate for human water use? Can this be done?

### **Wildlife Refuge**

- A National Wildlife Refuge is one way of bringing in federal monies, once designated.
- The "Coastal America Program" (ask Pete Seligman @NRaD) provides a potential federal matching program.
- Ecotourism, to make money, needs a long-term commitment such as a Refuge before the private sector would be willing to make an investment. Infrastructure is needed too.
- The Salt Works is integral to a Refuge. It needs to continue to operate as it is now, not be developed.
- The Planning Study Area for a refuge is mapped already; don't just wait for EA by USFWS; the South Bay is only one part of the FWS proposal.

## Bay Values

- The west half of Central Bay and North Bay are also important. (See Navy studies on bird use.)
- Halibut, with less than three feet deep habitat, are important too.
- The Point Loma area with upper Coastal Sage Scrub, provides roosting sites and edge values.
- There are Fish Habitat Enhancement approaches that could be taken instead of eelgrass planting or traditional mitigation approaches, like halibut. Juvenile fish nursery areas--not as visible as birds.
- Look at what the Bay is about--the Big Picture.
- Make the Plan and description of Bay values something a politician can understand.
- Private sector covered by the Plan? The private sector is not well represented in planning process.
- The Salt Works is one of the first private businesses historically and is still the only private landowner.
- Using guilds of birds instead of individual species is one way to view it.
- Present comprehensive Ecosystem Picture.

## Watershed Issue

- Protect the Bay from upland impacts, stormwater.
- Get the government involved with "Push-Pull" process between the Navy and Port and upland government entities and with regulatory agencies.
- SANDAG has the potential to help.
- There is not much left to enhance on the Bay; it is the watershed that is important.

## Values and Priorities

- The Bay is not very big and there are lots of demands on it.
- Redevelopment of underutilized sites is a more efficient use than developing new sites.
- Consider priorities for water dependent users, such as sports fishermen and boaters.
- Criteria for priorities: Priority for those things that are irreplaceable and vulnerable.
- Water-dependent uses, such as shipyards, should receive higher priority.
- Monitoring of exotic organisms is important also.
- Single species management to-date is not right.
- A Remediation Plan to assist resources is already here.
- MSCP is getting away from in-kind mitigation.
- This should not be an Endangered Species Mgt. Plan—it must be visionary and include "all the species not lucky enough to be endangered."

## Goals and Bay Health

- What *should* this resource be today, instead of what it is? Historic condition not attainable.
- Take a biological look of what it takes to be a healthy Bay.
- Get a handle on the healthy, representative species that should be there and what's ecologically healthy.
- Goal is to recover to what? 1859 vs. 1997?
- Example: Dredging impacts on tidal flushing--Navy.
- Some things, such as cleaning up old sediment, may not seem do-able in a ten to twenty year time frame? Timeframe is too short -- a century is better.
- Don't preclude anything.
- Need to take actions rather than planning.
- Public outreach and non-point source pollution--What public education of the citizens is needed to change their habits? What can the Plan do?
- The Speakers Bureau is a possibility for outreach. If the public "owns" the Bay, they will change their habits.
- Assist existing outreach efforts.
- The Navy should educate/train their own personnel on Bay resources.
- Comprehensive planning in the Bay include a big scope: north-south-east-west areas of Bay boundaries.
- Bay shoreline and multi-focus with local jurisdictions. Disclosure of information and dissemination.
- Take piers and bulkheads already developed and relate these areas to the more natural ecosystem.
- There have been lots of nifty plans in the past, but they were not implemented. Will this one be implemented?

San Diego Bay  
Integrated Natural Resources Management Plan  
Questions & Comments from **Public Workshop July 7, 1998**

1. What happened to the idea of the COC (Citizen Oversight Committee) for this plan? This is my second meeting!
2. Please elaborate on the current integration of the FWS's proposal for a South Bay National Wildlife Refuge and the INRMP.
3. It is not clear to me how the USFWS Refuge Plan is integrating with this plan. Can you explain the process? Are there joint meetings or sharing of data?
4. Please elaborate on interaction and agreements between this and the Bay Panel's plan.
5. Were City and County officials invited? Who? How? And When?
6. Why aren't there any handouts? There is so much information, how can we absorb it all? This is my second meeting!
7. Mitigation, is it possible?
8. Eelgrass, do we have too much?
9. Sea level rise, when will it be considered?
10. Does fueling predominantly occur during daylight hours or after dark when spills are less likely to be detected by operators?
11. I have been sorely disappointed in HCP's protection of specific rare species due to lack of adequate data. How does this process differ? How are needs of stationary or limited mobility species analyzed in this ecosystem approach?
12. Salt marsh habitat is dependent upon upland habitat for pollinator health. Does the plan area cover a broad enough range of habitats to accomplish its goal of healthy ecosystems?
13. The dredge and fill map is inaccurate. Particularly the CVN homeporting footprint.
14. #3 on map of planned capital improvements by Navy have been completed; #5 is incorrect.
15. Will there be specific timelines for removal of iceplant from dune systems with this plan? Will the effort involve volunteer labor or paid labor?
16. If this is supposed to be a comprehensive plan, you need to consider urban runoff and the fact that EPA will soon list the Bay as an impaired water body. This will effect total loading into the Bay, which affects stormwater runoff, etc.
17. Look at comparable studies in other Bays to help us with our gaps; don't reinvent the wheel if possible.
18. Pacific Brant is in many places but needs Bay too; widespread trends important to follow.
19. National Estuary Program for our Plan?
20. Scholarships to encourage studies of the Bay?
  - a. Corporate?
  - b. Educational opportunity with tourists that something needs to be done. (Headsets for bike riders along Bay?)
21. Public availability of plan?
22. Web page being considered? One way to get info exchange (consider seriously) Use Port's website or Bay Panel's.
23. Small size of Bay = puddle and that's why we can't afford to lose any more of it.
24. If so small, then why can't something get done?
25. Time perspective for "defining success" – 10 years too short for ecosystem, why not 100 years?
26. "Defining success" – if environmental groups feel like they have to sue or amend the law, then probably not successful.
