Perfluorinated Compounds ^{j,k}	EPA 537M	5.0	μg/kg

Notes:

^a Sediment minimum detection limits are on a dry-weight basis.

^b Reporting limits provided by Physis Environmental Laboratories.

^c Standard Methods for the Examination of Water and Wastewater, 19th Ed. American Public Health Association, 1995.

^d USEPA 1988-1996 SW-846. Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, 3rd Ed.

^e Includes Acenaphthene, Acenaphthylene, Anthracene, Benz[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Benzo[e]pyrene, Benzo[g,h,i]perylene, Benzo[k]fluoranthene, Biphenyl, Chrysene, Dibenzo[a,h]anthracene, Di benzo[ghi]perylene, Fluoranthene, Fluorene, Indeno[1,2,3-c,d]pyrene, Naphthalene, Perylene, Phenanthrene, Pyrene, 2,6-Dimethylnaphthalene, 1-Methylnaphthalene, 2-Methylnaphthalene, 1-Methylphenanthrene, 2,3,5-Trimethylnaphthalene, and 1,6,7-Trimethylnaphthalene.

^f Includes cis-chlordane, trans-chlordane, o,p'-DDT, p,p'-DDT, o,p'-DDD, p,p'-DDD, o,p'-DDE, p,p'-DDE, p,p'-DDMU, aldrin, BHC-alpha, BHC-beta, BHC-gamma, cis-nonachlor, trans-nonachlor, oxychlordane, DCPA (Dacthal), dicofol, dieldrin, toxaphene, endosulfan sulfate, endosulfan-I, endosulfan-II, endrin, endrin aldehyde, endrin ketone, heptachlor, heptachlor epoxide, methoxychlor, mirex, and perthane.

^g Includes congeners: PCB-3, 5, 8, 15, 18, 27-29, 31, 33, 37, 44, 49, 52, 56, 60, 66, 70, 74, 77, 81, 87, 95, 97, 99, 101, 105, 110, 114, 118-119, 123, 126, 128, 137-138, 141, 149, 151, 153, 156-158, 167-170, 174, 177, 180, 183, 187, 189, 194-195, 200-201, 203, 206, and 209.

^h Includes BDE-17, 28, 47, 49, 66, 85, 99, 100, 138, 153, 154, 183, and 209.

Collected only at stations B13-B163, B13-8040, B13-8077; transferred to SCCWRP for analysis.

ⁱ Includes nonylphenol, nonylphenol diethoxylate, nonylphenol monoethoxylate, 4-tert-octylphenol, and bisphenol A.

^j Includes perfluorooctanoic acid and perfluorooctane sulfonate.

μg/kg - micrograms per kilogram (parts per billion)

mg/kg - milligrams per kilogram (parts per million)

N/A - not applicable

SM - Standard Methods

SOP - standard operating procedure

 Physis Project ID: 1307002-014

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/30/2013. A total of 5 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Percent Solids by SM 2540B
Ammonia as N by SM 4500-NH ₃ D
Acid Volatile Sulfides (AVS) by Plumb, 1981 and TERL
Elements
Trace Metals by EPA 6020
Trace Mercury by EPA 245.7
Total Phosphorus by EPA 6020
Simultaneously Extracted Metals Analysis (AVS-SEM) by EPA 200.8
Organics
Toxaphene w/ OCPs by EPA 8270C-NCI
Synthetic Pyrethroid Pesticides by EPA 8270C-NCI
Polynuclear Aromatic Hydrocarbons by EPA 8270C
PBDE Congeners by EPA 8270C-NCI
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 8270C
Fipronil & Degradates by EPA 8270C-NCI
Subcontract
Total Organic Carbon by SM 5310 B
Total Nitrogen by SM 4500-N

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

CASE NARRATIVE

QUALIFIER NOTES

In addition to the use of analyte specific Physis Qualifier Codes where applicable, the following were also noted.

ELEMENTS CRM: Four elements, Aluminum (Al), Antimony (Sb), Beryllium (Be), and Chromium (Cr), were above the specified acceptance limits in one or more CRM - RTC 016-050 and/or CRM - ERA 540. This occurred as a result of a more rigorous digestion employed by Physis, which causes a higher yield for some lithogenous elements. These values are in agreement with past internal results for CRM - RTC 016-050 and CRM - ERA 540.

ORGANICS: Blank spikes (BS1/BS2) for Endosulfan-II, Endrin Aldehyde and blank spikes and matrix spikes (MS1/MS2) for Resmethrin fell outside of the acceptance range required by the associated project QAPP (70% – 130%), but passed PHYSIS' internal acceptance range for this analysis (50%-150% for Endosulfan-II, 0%-125% for Endrin Aldehyde, 0%-130% for Resmethrin).

One LMW Chlorinated Pesticide surrogate (TCMX) was below the specified acceptance limits. This occurred in one or more project samples and/or QC samples as a result of the chromatography column cleanup procedure for the sediment matrix.

Relative percent difference between blank spikes (BS1/BS2) failed for PAHs due to overspiking of BS1 compared to BS2.

ORGANICS TUNE: Physis uses the software supplied with its Agilent GCMS systems to tune its instruments. Moreover, with today's technology software algorithms provided by the instrument manufacturer provide a more stable system across a wider mass range than manual tuning to achieve specific tuning targets such as DFTPP. The following quote is from EPA Method 8270D Section 11.3.1.

"The analyst is always free to choose criteria that are tighter than those included in this method or to use other documented criteria provided they are used consistently throughout the initial calibration, calibration verification, and sample analyses."

The key here is that the instrument is tuned and that those tune settings are used for the subsequent analysis of the calibration curve, calibration verification, and samples. Moreover, another key reason for tuning to specific criteria is to insure that the GCMS is generating spectra that match the spectra in the NIST Library for confirming the identification of the target analyte. Physis can provide library search results for our calibration standards indicating a very high match quality with the NIST library spectra.

Physis did analyze the DFTPP tune solution with each batch (except for the first batch where the tune solution was mis-injected) and the passing tune reports have been provided indicating that using the instrument tuning software is closely matched to DFTPP tune requirements.

ORGANICS CALIBRATION: A calibration point in the middle of the curve (100 ng) for PCB201 was not used for the calibration of the instrument. This was an error of the analyst that has since been corrected.

ORGANICS CCVS: CCVs for Fipronils were done at 1000 ng, PBDEs were done at 200 ng, and Pyrethroids were done at 1000 ng. These values are at the high point of the calibration. This was an error of the analyst that has since been corrected.

Revisions 6/20/2014-

- Aroclors:
 - Updated Aroclor MDLs/RLs from 10/20 to 1/2
 - Added Aroclor 1262 and Aroclor 1268
 - After review of the data, the Technical Director made a decision to revise the data for the Aroclors
- RPDs:
 - Reviewed and updated all RPDs to 25%, per the RHMP QAPP. Revised Passes to Fails and added QA Qualifiers, where needed due to update.
- Acceptance Ranges
 - Reviewed and updated all Acceptance ranges per the RHMP QAPP. Revised Passes to Fails and added QA Qualifier, where needed due to update.
- CRM
 - After review of the data, the Technical Director made a decision to revise the Organics data for the CRM (SRM 1944).
- Matrix Spikes
 - After review of the data, the Technical Director made a decision to revise the Organics Data for the MS1/MS2.
- Recovery surrogates
 - After review of the recovery surrogates, the Technical Director made a decision to revise PAH recovery surrogates for sample B13-8058 & B13-8031 (Physis Sample ID: 22571 and 22575)

Revisions 8/20/2014-

- Analytical Report:
 - Added Time Analyzed to all analysis.
- Level 3 reports:

- Revised tune report.

Performance-Based Chemistry-

The chemistry results provided in this report are derived from “performance-based” chemistry rather than the use of specific EPA published laboratory methods. This does not eliminate our responsibility to use Good Laboratory Practices. It does allow for incorporation of improvements in technology or the use of laboratory preferences for techniques that improve the efficiency and sensitivity of the laboratory and maintain or enhance the quality of the data.

“The Environmental Protection Agency (EPA) is actively working to implement the President’s program for reinventing government and reforming regulatory policy. As part of this program, EPA has been working at breaking down barriers to using new monitoring techniques. One barrier is the requirement to use specific measurement methods or technologies in complying with some of the Agency’s regulations. EPA’s Environmental Monitoring Management Council (EMMC), members of the regulated community, and Congress agree that EPA needs to change the way it specifies monitoring requirements in regulations and permits. There is broad acceptance for Agency-wide use of a nonprescriptive performance-based measurement system (PBMS)”. PBMS conveys "what" needs to be accomplished, but not prescriptively "how" to do it. EPA defines PBMS as a set of processes wherein the data needs, mandates, or limitations of a program or project are specified, and serve as criteria for selecting appropriate methods to meet those needs in a cost-effective manner. The criteria may be published in regulations, technical guidance documents, permits, work plans, or enforcement orders. Under a performance-based approach, EPA would specify:

- Questions to be answered by monitoring.
- Decisions to be supported by the data.
- Level of uncertainty acceptable for making decisions.
- Documentation to be generated to support this approach in the RCRA monitoring program.

(Taken from OSWER PBMS Implementation Plan, October 9, 1998, A Cooperative Effort Among: OSW, OERR, OUST, TIO, FFROL and CEPPPO).”

The US EPA has included references to being “performance-based” in many of their newer methods. The use of performance-based methods is even more critical for programs like this study in order to allow the laboratory to adapt methods that optimize the goal of the project in terms of achieving

ultra-low sensitivity and analysis of new chemicals of concern. I would also like to quote US EPA Method 8270-

“In addition, SW-846 methods, with the exception of required method use for the analysis of method-defined parameters, are intended to be guidance methods which contain general information on how to perform an analytical procedure or technique which a laboratory can use as a basic starting point for generating its own detailed Standard Operating Procedure (SOP), either for its own general use or for a specific project application.”

Performance-based chemistry was first used for NOAA’s National Status and Trends Program in the early 1980’s which is now operated under the US EPA as the National Coastal Condition Assessment Program (NCCA). The NS&T program included 3 large well-established laboratories for the analysis of samples from each of 3 regions of the United States. It was concluded at the beginning of this program that a significant improvement in the quality and comparability of the results would be achieved by allowing the participating laboratories to optimize their own individual methods. The key to this approach and any subsequent performance-based chemistry programs is the successful inclusion of an interlaboratory comparison as well as the clear detailed specification of data quality objectives (DQOs) for the project. All the Bight Survey projects from 1994 to 2013 have been performance-based and each of the surveys included interlaboratory comparisons as a key component for ensuring high quality data that is comparable between laboratories over time.

The one area that has not evolved along with the advent of performance-based chemistry is the data validation process. Today’s data validation process still relies upon collecting and evaluating laboratory analytical information and comparing it to the details of a specific EPA analytical method such as EPA 8270 for GCMS analysis or EPA 6020 for ICPMS analysis. This can occur even when the requirement in the method is out-dated and based on old technology. Data validation procedures need to be adapted to performance-based chemistry allowing for any individual laboratory to use or not use any method or any part of a method they choose as long as they can demonstrate their ability to successfully pass interlaboratory comparisons, performance evaluation samples, and meet the data quality objectives of the project QA Plan.

EPA Method Modifications-

With reference to performance-based methods, the following information is provided as a basis of comparison between the Physis methods used for this study and the associated EPA Method. Its purpose is solely to provide information and is not intended to highlight errors. Physis has successfully participated in several interlaboratory comparison studies including the Bight 13 Project demonstrating the viability of our analytical process. Physis has included the QAQC data in this

report necessary to show that the results comply with the project QA Plan and indicate acceptable accuracy and precision.

1. Internal Laboratory QAQC Frequency for GCMS Analyses- Physis uses GC columns that are longer and narrower and the GC oven is programmed at a very slow rate of 2.5°C per minute both of which are not typically used by most laboratories. The purpose for this is to maximize separation of the 100's to 1000's of compounds present in environmental samples reducing co-elution with interfering compounds, reducing background noise, and enhancing the accuracy of quantitation. At the same time this process extends the run-time for each sample to ca. 90 minutes as compared to the 15-30 minutes with typical conditions. At 90 minutes per run, the maximum number of runs for any 12-hour period is 8. Each batch of samples typically includes the DFTPP tune solution and the initial calibration verification of from 1 to 4 solutions (Depending on the target parameters) for a total of 2-5 runs leaving an opening for 3-6 samples before having to redo the QA samples if the 12-hour constraint is applied. At this rate it's not economically viable to follow the 12-hour rule and complete the analyses of the samples.

Since the 12-hour criteria was established when the state-of-the-art was GCs equipped with packed columns and GCMS systems were not anywhere near as stable as the electronics of today. Physis does follow the criteria's intent by analyzing the calibration verification standards at the beginning, middle, and end of each batch of no more than 20 samples rather than every 12 hours.

2. Calibration and Quantitation- Physis bases its calibration curve on the mass of each compound rather than concentration. Using the internal standard method of quantitation, use of mass rather than concentration eliminates the extract or digestate volume term from the formula used to calculate concentrations in the samples. Therefore there is no need to measure the precise volume of the extract or digestate. For GCMS analysis, extract volumes can be quite low and small volume changes will be reflected in increased variation of the internal standard response from sample to sample due to differences in the extract volume and not due to the instability of the GCMS. Through long-term experience, Physis chemists are trained to take into consideration this change in volume when evaluating whether a change in the internal standard response is caused by a change in the GCMS sensitivity or extract volume.

The "recovery" of the Internal Standard and its variability is reported in Form VII SV-1 for reporting IS peak areas. For the sample IS compared to the ICV/CCV IS peak area, this form

has a wide acceptance range at 50-200% which is considerably larger than the variation in the nominal estimate made of our extract volumes. Therefore significant deviations from expected IS responses are clearly obvious to the analyst and would require corrective action and re-analysis. The difficulty is the fact that Form VII SV-1 does not accommodate volumes and therefore does not allow for evaluation of the sample IS as it compares to the ICV/CCV on an even basis.

3. Negative Chemical Ionization- Some target analytes are analyzed using the GCMS in the Negative Chemical Ionization Mode (NCI). This results in non-standard mass spectra that cannot be compared to the EI spectra in the NIST library.
4. Aroclor PCBs- Physis analyzes PCBs using a congener-based calibration standard composed of 52 or more different congeners representing ca. 75-80% of the PCBs discharged into the environment. Physis uses the results from the congener analysis to estimate Aroclor concentrations. To do this, Physis determines the Aroclor mixture present in the sample, sums the results for the congeners present in that Aroclor mixture then corrects the result to account for the missing mass based on a previous comparison of an Aroclor calibration standard to the congener mixture. Physis does not perform blank or matrix spikes using Aroclor mixtures since PCB spiking is done via the congener solution. Aroclor-based quantitation is inherently inaccurate and imprecise and results based on our process are as accurate if not more accurate than the Aroclor-based process since the quantitation is based on individual peaks rather than summing peaks.
5. Pyrethroid/Fipronil Surrogates- Physis spikes all samples with a surrogate solution containing TCMX, PCB030, PCB112, and PCB198 for the Chlorinated Pesticides, Congener PCBs, Pyrethroids, and Fipronils; d8-Naphthalene, d10-Acenaphthene, d10-Phenanthrene, d12-Chrysene, and d12-Perylene for the PAHs; and FBDE-3002, FBDE-5004, and FBDE-8001 for the PBDEs. Since Pyrethroids and Fipronils are quantified using NCI, only the PCB112 and PCB198 surrogates are used as surrogates for these compounds.
6. Sample Preservation - According to the Standard Operating Procedure for Sample Logistics, sediment and tissue samples were placed in a freezer maintained at $-20 \pm 4^{\circ}\text{C}$ until preserved or processed.

NOVEMBER 12, 2013

EXTRACTION OF AMEC-RHMP SEDIMENTS FOR FIPRONIL, OCPs, PCBs, AROCLORS, PBDES, PAHs, PYRUTHAZOLES, TOXAPHENE. SAMPLES WERE RUN FOR PVE/PBDE/FIP AND THEN COLUMN CLEANED USING SILICA/ALUMINA ADSORBENTS.

METHOD: EPA 8270 C

Project Name: RHMP Bight '13
 Physis Project ID: 1307002-016

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 9/6/2013. A total of 2 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Percent Solids by SM 2540B
Ammonia as N by SM 4500-NH ₃ D
Acid Volatile Sulfides (AVS) by Plumb, 1981 and TERL
Elements
Trace Metals by EPA 6020
Trace Mercury by EPA 245.7
Total Phosphorus by EPA 6020
Simultaneously Extracted Metals Analysis (AVS-SEM) by EPA 200.8
Organics
Toxaphene w/ OCPs by EPA 8270C-NCI
Synthetic Pyrethroid Pesticides by EPA 8270C-NCI
Polynuclear Aromatic Hydrocarbons by EPA 8270C
PBDE Congeners by EPA 8270C-NCI
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 8270C
Fipronil & Degradates by EPA 8270C-NCI
Subcontract
Total Organic Carbon by SM 5310 B
Total Nitrogen by SM 4500-N

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

CASE NARRATIVE

QUALIFIER NOTES

In addition to the use of analyte specific Physis Qualifier Codes where applicable, the following were also noted.

ELEMENTS CRM: Several elements, Aluminum (Al), Antimony (Sb), Arsenic (As), Beryllium (Be), Chromium (Cr), Iron (Fe) and Nickel (Ni) were above the specified acceptance limits in one or more CRM - RTC 016-050 and/or CRM - ERA 540. This occurred as a result of a more rigorous digestion employed by Physis, which causes a higher yield for some lithogenous elements. These values are in agreement with past internal results for CRM - RTC 016-050 and CRM - ERA 540.

ORGANICS: Blank spikes (BS1/BS2) for Endosulfan-II, Endrin Aldehyde and Resmethrin fell outside of the acceptance range required by the associated project QAPP (70% – 130%), but passed PHYSIS' internal acceptance range for this analysis (50%-150% for Endosulfan-II, 0%-125% for Endrin Aldehyde, 0%-130% for Resmethrin).

Relative percent difference between blank spikes (BS1/BS2) failed for PAHs due to overspiking of BS1 compared to BS2.

ORGANICS TUNE: Physis uses the software supplied with its Agilent GCMS systems to tune its instruments. Moreover, with today's technology software algorithms provided by the instrument manufacturer provide a more stable system across a wider mass range than manual tuning to achieve specific tuning targets such as DFTPP. The following quote is from EPA Method 8270D Section 11.3.1.

“The analyst is always free to choose criteria that are tighter than those included in this method or to use other documented criteria provided they are used consistently throughout the initial calibration, calibration verification, and sample analyses.”

The key here is that the instrument is tuned and that those tune settings are used for the subsequent analysis of the calibration curve, calibration verification, and samples. Moreover, another key reason for tuning to specific criteria is to insure that the GCMS is generating spectra that match the spectra in the NIST Library for confirming the identification of the target analyte. Physis can provide library search results for our calibration standards indicating a very high match quality with the NIST library spectra.

Physis did analyze the DFTPP tune solution with each batch (except for the first batch where the tune solution was mis-injected) and the passing tune reports have been provided indicating that using the instrument tuning software is closely matched to DFTPP tune requirements.

ORGANICS CALIBRATION: A calibration point in the middle of the curve (100 ng) for PCB201 was not used for the calibration of the instrument. This was an error of the analyst that has since been corrected.

ORGANICS CCVS: CCVs for Fipronils were done at 1000 ng, PBDEs were done at 200 ng, and Pyrethroids were done at 1000 ng. These values are at the high point of the calibration. This was an error of the analyst that has since been corrected.

Revisions 6/20/2014-

- Aroclors:
 - Updated Aroclor MDLs/RLs from 10/20 to 1/2
 - Added Aroclor 1262 and Aroclor 1268
 - After review of the data, the Technical Director made a decision to revise the data for the Aroclors
- RPDs:
 - Reviewed and updated all RPDs to 25%, per the RHMP QAPP. Revised Passes to Fails and added QA Qualifiers, where needed due to update.
- Acceptance Ranges
 - Reviewed and updated all Acceptance ranges per the RHMP QAPP. Revised Passes to Fails and added QA Qualifier, where needed due to update.
- CRM
 - After review of the data, the Technical Director made a decision to revise the Organics data for the CRM (SRM 1944).

Revisions 8/20/2014-

- Analytical Report:
 - Added Time Analyzed to all analysis.
- Level 3 reports:
 - Revised tune report.

Performance-Based Chemistry-

The chemistry results provided in this report are derived from “performance-based” chemistry rather than the use of specific EPA published laboratory methods. This does not eliminate our responsibility to use Good Laboratory Practices. It does allow for incorporation of improvements in

technology or the use of laboratory preferences for techniques that improve the efficiency and sensitivity of the laboratory and maintain or enhance the quality of the data.

“The Environmental Protection Agency (EPA) is actively working to implement the President’s program for reinventing government and reforming regulatory policy. As part of this program, EPA has been working at breaking down barriers to using new monitoring techniques. One barrier is the requirement to use specific measurement methods or technologies in complying with some of the Agency’s regulations. EPA’s Environmental Monitoring Management Council (EMMC), members of the regulated community, and Congress agree that EPA needs to change the way it specifies monitoring requirements in regulations and permits. There is broad acceptance for Agency-wide use of a nonprescriptive performance-based measurement system (PBMS)”. PBMS conveys "what" needs to be accomplished, but not prescriptively "how" to do it. EPA defines PBMS as a set of processes wherein the data needs, mandates, or limitations of a program or project are specified, and serve as criteria for selecting appropriate methods to meet those needs in a cost-effective manner. The criteria may be published in regulations, technical guidance documents, permits, work plans, or enforcement orders. Under a performance-based approach, EPA would specify:

- Questions to be answered by monitoring.
- Decisions to be supported by the data.
- Level of uncertainty acceptable for making decisions.
- Documentation to be generated to support this approach in the RCRA monitoring program.

(Taken from OSWER PBMS Implementation Plan, October 9, 1998, A Cooperative Effort Among: OSW, OERR, OUST, TIO, FFROL and CEPPPO).”

The US EPA has included references to being “performance-based” in many of their newer methods. The use of performance-based methods is even more critical for programs like this study in order to allow the laboratory to adapt methods that optimize the goal of the project in terms of achieving ultra-low sensitivity and analysis of new chemicals of concern. I would also like to quote US EPA Method 8270-

“In addition, SW-846 methods, with the exception of required method use for the analysis of method-defined parameters, are intended to be guidance methods which contain general information on how to perform an analytical procedure or technique which a laboratory can use as a basic starting point for generating its own detailed Standard Operating Procedure (SOP), either for its own general use or for a specific project application.”

Performance-based chemistry was first used for NOAA's National Status and Trends Program in the early 1980's which is now operated under the US EPA as the National Coastal Condition Assessment Program (NCCA). The NS&T program included 3 large well-established laboratories for the analysis of samples from each of 3 regions of the United States. It was concluded at the beginning of this program that a significant improvement in the quality and comparability of the results would be achieved by allowing the participating laboratories to optimize their own individual methods. The key to this approach and any subsequent performance-based chemistry programs is the successful inclusion of an interlaboratory comparison as well as the clear detailed specification of data quality objectives (DQOs) for the project. All the Bight Survey projects from 1994 to 2013 have been performance-based and each of the surveys included interlaboratory comparisons as a key component for ensuring high quality data that is comparable between laboratories over time.

The one area that has not evolved along with the advent of performance-based chemistry is the data validation process. Today's data validation process still relies upon collecting and evaluating laboratory analytical information and comparing it to the details of a specific EPA analytical method such as EPA 8270 for GCMS analysis or EPA 6020 for ICPMS analysis. This can occur even when the requirement in the method is out-dated and based on old technology. Data validation procedures need to be adapted to performance-based chemistry allowing for any individual laboratory to use or not use any method or any part of a method they choose as long as they can demonstrate their ability to successfully pass interlaboratory comparisons, performance evaluation samples, and meet the data quality objectives of the project QA Plan.

EPA Method Modifications-

With reference to performance-based methods, the following information is provided as a basis of comparison between the Physis methods used for this study and the associated EPA Method. Its purpose is solely to provide information and is not intended to highlight errors. Physis has successfully participated in several interlaboratory comparison studies including the Bight 13 Project demonstrating the viability of our analytical process. Physis has included the QAQC data in this report necessary to show that the results comply with the project QA Plan and indicate acceptable accuracy and precision.

1. Internal Laboratory QAQC Frequency for GCMS Analyses- Physis uses GC columns that are longer and narrower and the GC oven is programmed at a very slow rate of 2.5°C per minute both of which are not typically used by most laboratories. The purpose for this is to maximize separation of the 100's to 1000's of compounds present in environmental samples

reducing co-elution with interfering compounds, reducing background noise, and enhancing the accuracy of quantitation. At the same time this process extends the run-time for each sample to ca. 90 minutes as compared to the 15-30 minutes with typical conditions. At 90 minutes per run, the maximum number of runs for any 12-hour period is 8. Each batch of samples typically includes the DFTPP tune solution and the initial calibration verification of from 1 to 4 solutions (Depending on the target parameters) for a total of 2-5 runs leaving an opening for 3-6 samples before having to redo the QA samples if the 12-hour constraint is applied. At this rate it's not economically viable to follow the 12-hour rule and complete the analyses of the samples.

Since the 12-hour criteria was established when the state-of-the-art was GCs equipped with packed columns and GCMS systems were not anywhere near as stable as the electronics of today. Physis does follow the criteria's intent by analyzing the calibration verification standards at the beginning, middle, and end of each batch of no more than 20 samples rather than every 12 hours.

2. Calibration and Quantitation- Physis bases its calibration curve on the mass of each compound rather than concentration. Using the internal standard method of quantitation, use of mass rather than concentration eliminates the extract or digestate volume term from the formula used to calculate concentrations in the samples. Therefore there is no need to measure the precise volume of the extract or digestate. For GCMS analysis, extract volumes can be quite low and small volume changes will be reflected in increased variation of the internal standard response from sample to sample due to differences in the extract volume and not due to the instability of the GCMS. Through long-term experience, Physis chemists are trained to take into consideration this change in volume when evaluating whether a change in the internal standard response is caused by a change in the GCMS sensitivity or extract volume.

The "recovery" of the Internal Standard and its variability is reported in Form VII SV-1 for reporting IS peak areas. For the sample IS compared to the ICV/CCV IS peak area, this form has a wide acceptance range at 50-200% which is considerably larger than the variation in the nominal estimate made of our extract volumes. Therefore significant deviations from expected IS responses are clearly obvious to the analyst and would require corrective action and re-analysis. The difficulty is the fact that Form VII SV-1 does not accommodate volumes and therefore does not allow for evaluation of the sample IS as it compares to the ICV/CCV on an even basis.

3. Negative Chemical Ionization- Some target analytes are analyzed using the GCMS in the Negative Chemical Ionization Mode (NCI). This results in non-standard mass spectra that cannot be compared to the EI spectra in the NIST library.
4. Aroclor PCBs- Physis analyzes PCBs using a congener-based calibration standard composed of 52 or more different congeners representing ca. 75-80% of the PCBs discharged into the environment. Physis uses the results from the congener analysis to estimate Aroclor concentrations. To do this, Physis determines the Aroclor mixture present in the sample, sums the results for the congeners present in that Aroclor mixture then corrects the result to account for the missing mass based on a previous comparison of an Aroclor calibration standard to the congener mixture. Physis does not perform blank or matrix spikes using Aroclor mixtures since PCB spiking is done via the congener solution. Aroclor-based quantitation is inherently inaccurate and imprecise and results based on our process are as accurate if not more accurate than the Aroclor-based process since the quantitation is based on individual peaks rather than summing peaks.
5. Pyrethroid/Fipronil Surrogates- Physis spikes all samples with a surrogate solution containing TCMX, PCB030, PCB112, and PCB198 for the Chlorinated Pesticides, Congener PCBs, Pyrethroids, and Fipronils; d8-Naphthalene, d10-Acenaphthene, d10-Phenanthrene, d12-Chrysene, and d12-Perylene for the PAHs; and FBDE-3002, FBDE-5004, and FBDE-8001 for the PBDEs. Since Pyrethroids and Fipronils are quantified using NCI, only the PCB112 and PCB198 surrogates are used as surrogates for these compounds.
6. Sample Preservation - According to the Standard Operating Procedure for Sample Logistics, sediment and tissue samples were placed in a freezer maintained at $-20 \pm 4^{\circ}\text{C}$ until preserved or processed.

NOVEMBER 12, 2013

EXTRACTION OF AMEC-RHMP SEDIMENTS FOR FIPRONIL, OCPs, PCBs, AROCLORS, PBDES, PAHs, PYRUTHAZOLES, TOXAPHENE. SAMPLES WERE RUN FOR PVE/PBDE/FIP AND THEN COLUMN CLEANED USING SILICA/ALUMINA ADSORBENTS.

METHOD: EPA 8270 C

Quant Time: Jun 03 11:33:54 2014
 Quant Method : C:\msdchem\1\DATA\Q3_140524 EI O-6004\Q_PAH140411.M
 Quant Title : PAH
 QLast Update : Tue Jun 03 11:29:59 2014
 Response via : Initial Calibration

Compound	R.T.	QIon	Response	Conc	Units	Dev(Min)
Internal Standards						
1) d10-Anthracene	31.783	188	17294450	2000.00		0.00
29) d12-Benzo[g,h,i]perylene	76.306	288	12336687	2000.00		0.00
System Monitoring Compounds						
2) (d8-Naphthalene)	12.755	136	8382739	1102.92		0.00
3) (d10-Acenaphthene)	20.615	164	4977593	995.22		0.00
4) (d10-Phenanthrene)	31.374	188	8153550	900.57		0.00
5) (d12-Chrysene)	55.056	240	8719891	844.59		0.02
6) (d12-Perylene)	67.191	264	8293354	818.81		0.01
Target Compounds						Qvalue
7) Naphthalene	12.813	128	3987124	411.57		100
8) 2-Methylnaphthalene	15.210	142	2773251	404.02		98
9) 1-Methylnaphthalene	15.639	142	2481032	407.47		99
10) Biphenyl	17.443	154	3469986	408.84		100
11) 2,6-Dimethylnaphthalene	18.239	156	2606601	420.99		99
12) Acenaphthylene	19.670	152	3943309	431.47		100
13) Acenaphthene	20.809	153	2583556	435.74		98
14) 2,3,5-Trimethylnaphtha...	23.505	170	2480681	480.05		98
15) Fluorene	24.240	166	2915245	472.69		97
16) Dibenzothiophene	30.531	184	3861933	449.80		100
17) Phenanthrene	31.551	178	4158243	451.87		100
18) Anthracene	31.927	178	4194729	459.51		100
19) 1-Methylphenanthrene	37.019	192	2987880	428.68		98
20) Fluoranthene	41.951	202	4194723	407.71		100
21) Pyrene	43.795	202	4349973	419.15		100
22) Benz[a]anthracene	54.947	228	3767813	377.68		100
23) Chrysene	55.278	228	4089631	417.25		100
24) Benzo[b]fluoranthene	64.281	252	3834927	365.31		100
25) Benzo[k]fluoranthene	64.477	252	4321996	378.28		100
26) Benzo[e]pyrene	66.340	252	3863132	375.92		100
27) Benzo[a]pyrene	66.723	252	3843950	376.08		100
28) Perylene	67.379	252	4024005	388.54		100
30) Indeno[1,2,3-c,d]pyrene	74.886	276	3434400	402.19		100
31) Dibenz[a,h]anthracene	75.193	278	3566536	428.14		100
32) Benzo[g,h,i]perylene	76.470	276	3970276	453.83		100

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 9/10/2013. A total of 17 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventional
Nitrate as N by SM 4500-NO ₃ E
Acid Volatile Sulfides (AVS) by Plumb, 1981 and TERL
Ammonia as N by SM 4500-NH ₃ D
Nitrite as N by SM 4500-NO ₂ B
Total Suspended Solids by SM 2540 D
Percent Solids by SM 2540B
Elements
Trace Metals by EPA 6020
Total Mercury by EPA 245.7
Simultaneously Extracted Metals Analysis (AVS-SEM) by EPA 200.8
Total Phosphorus by EPA 200.8
Total Phosphorus by EPA 6020
Total Trace Metals by EPA 200.8
Trace Mercury by EPA 245.7
Organics
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 625
Fipronil & Degradates by EPA 625-NCI
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 8270C
PBDE Congeners by EPA 625-NCI
Fipronil & Degradates by EPA 8270C-NCI
PBDE Congeners by EPA 8270C-NCI

Polynuclear Aromatic Hydrocarbons by EPA 625
Synthetic Pyrethroid Pesticides by EPA 625-NCI
Synthetic Pyrethroid Pesticides by EPA 8270C-NCI
Toxaphene w/ OCPs by EPA 625-NCI
Toxaphene w/ OCPs by EPA 8270C-NCI
Polynuclear Aromatic Hydrocarbons by EPA 8270C
Subcontract
Total Kjeldahl Nitrogen by EPA 351.2
Total Nitrogen by SM 4500-N
Total Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

CASE NARRATIVE

QUALIFIER NOTES

In addition to the use of analyte specific Physis Qualifier Codes where applicable, the following were also noted.

ELEMENTS: Several elements, Aluminum (Al), Arsenic (As), Antimony (Sb), Beryllium (Be), Chromium (Cr), Iron (Fe) and Nickel (Ni) were above the specified acceptance limits in one or more CRM - RTC 016-050 and/or CRM - ERA 540. This occurred as a result of a more rigorous digestion employed by Physis, which causes a higher yield for some lithogenous elements. These values are in agreement with past internal results for CRM - RTC 016-050 and CRM - ERA 540.

Run Log: The run log file for the Equipment Blank analysis (EPA 200.8) was lost due to a computer software failure and could not be recreated.

ORGANICS: Blank spikes (BS1/BS2) for Endosulfan-I, Endosulfan-II, Endrin Aldehyde and Resmethrin fell outside of the acceptance range required by the associated project QAPP (70% – 130%), but passed PHYSIS' internal acceptance range for this analysis (50%-150% for Endosulfan-II, 0%-125% for Endrin Aldehyde, 0%-130% for Resmethrin).

Organophosphorus Pesticides: One surrogate (TCMX) was below the specified acceptance limits in one or more project sample as a result of excessive vacuum of the rotovap during sample concentration prior to analysis. All other surrogate recoveries in QC and other project samples were within acceptance limits and were therefore not affected.

Fipronil & Degradates: At the time of analysis for the Equipment Blank (EPA 625 NCI), the standards had not yet arrived and a calibration was not completed. The samples were analyzed because the holding time was about to expire. This sample was an equipment blank sample and no fipronil & degradates were detected in the sample and based on the sensitivity we observed for the other internal standards, recovery surrogates and calibration data we conclude that if there were fipronil & degradates present in the sample, we would have detected them.

ORGANICS TUNE: Physis uses the software supplied with its Agilent GCMS systems to tune its instruments. Moreover, with today's technology software algorithms provided by the instrument manufacturer provide a more stable system across a wider mass range than manual tuning to achieve specific tuning targets such as DFTPP. The following quote is from EPA Method 8270D Section 11.3.1.

“The analyst is always free to choose criteria that are tighter than those included in this method or to use other documented criteria provided they are used consistently throughout the initial calibration, calibration verification, and sample analyses.”

The key here is that the instrument is tuned and that those tune settings are used for the subsequent analysis of the calibration curve, calibration verification, and samples. Moreover, another key reason for tuning to specific criteria is to insure that the GCMS is generating spectra that match the spectra in the NIST Library for confirming the identification of the target analyte. Physis can provide library search results for our calibration standards indicating a very high match quality with the NIST library spectra.

Physis did analyze the DFTPP tune solution with each batch (except for the first batch where the tune solution was mis-injected) and the passing tune reports have been provided indicating that using the instrument tuning software is closely matched to DFTPP tune requirements.

ORGANICS CALIBRATION: A calibration point in the middle of the curve (250 ng) for DCPA (Dacthal) and Dicofol were not used for the calibration of the instrument. This was an error of the analyst that has since been corrected.

ORGANICS CCVS: CCVs for Fipronils, Pyrethroids, PAHs and Chlorinated Pesticides were done at 1000 ng, while the CCVs for PCBs were done at 500 ng. These values are either at or above the high point of the calibration. This was an error of the analyst that has since been corrected.

Revisions 6/20/2014-

- Aroclors:
 - Updated Aroclor MDLs/RLs from 10/20 to 1/2
 - Added Aroclor 1262 and Aroclor 1268
 - After review of the data, the Technical Director made a decision to revise the data for the Aroclors
- RPDs:
 - Reviewed and updated all RPDs to 25%, per the RHMP QAPP. Revised Passes to Fails and added QA Qualifiers, where needed due to update.
- Acceptance Ranges
 - Reviewed and updated all Acceptance ranges per the RHMP QAPP. Revised Passes to Fails and added QA Qualifier, where needed due to update.
- CRM
 - After review of the data, the Technical Director made a decision to revise the Organics data for the CRM (SRM 1944).

Revisions 8/20/2014-

- Analytical Report:
 - Added Time Analyzed to all analysis.
- Level 3 reports:
 - Revised tune report.
 - Added level 3 report pages for the Equipment Blank sample

Performance-Based Chemistry-

The chemistry results provided in this report are derived from “performance-based” chemistry rather than the use of specific EPA published laboratory methods. This does not eliminate our responsibility to use Good Laboratory Practices. It does allow for incorporation of improvements in technology or the use of laboratory preferences for techniques that improve the efficiency and sensitivity of the laboratory and maintain or enhance the quality of the data.

“The Environmental Protection Agency (EPA) is actively working to implement the President’s program for reinventing government and reforming regulatory policy. As part of this program, EPA has been working at breaking down barriers to using new monitoring techniques. One barrier is the requirement to use specific measurement methods or technologies in complying with some of the Agency’s regulations. EPA’s Environmental Monitoring Management Council (EMMC), members of the regulated community, and Congress agree that EPA needs to change the way it specifies monitoring requirements in regulations and permits. There is broad acceptance for Agency-wide use of a nonprescriptive performance-based measurement system (PBMS)”. PBMS conveys "what" needs to be accomplished, but not prescriptively "how" to do it. EPA defines PBMS as a set of processes wherein the data needs, mandates, or limitations of a program or project are specified, and serve as criteria for selecting appropriate methods to meet those needs in a cost-effective manner. The criteria may be published in regulations, technical guidance documents, permits, work plans, or enforcement orders. Under a performance-based approach, EPA would specify:

- Questions to be answered by monitoring.
- Decisions to be supported by the data.
- Level of uncertainty acceptable for making decisions.
- Documentation to be generated to support this approach in the RCRA monitoring program.

(Taken from OSWER PBMS Implementation Plan, October 9, 1998, A Cooperative Effort Among: OSW, OERR, OUST, TIO, FFROL and CEPPPO).”

The US EPA has included references to being “performance-based” in many of their newer methods. The use of performance-based methods is even more critical for programs like this study in order to allow the laboratory to adapt methods that optimize the goal of the project in terms of achieving ultra-low sensitivity and analysis of new chemicals of concern. I would also like to quote US EPA Method 8270-

“In addition, SW-846 methods, with the exception of required method use for the analysis of method-defined parameters, are intended to be guidance methods which contain general information on how to perform an analytical procedure or technique which a laboratory can use as a basic starting point for generating its own detailed Standard Operating Procedure (SOP), either for its own general use or for a specific project application.”

Performance-based chemistry was first used for NOAA’s National Status and Trends Program in the early 1980’s which is now operated under the US EPA as the National Coastal Condition Assessment Program (NCCA). The NS&T program included 3 large well-established laboratories for the analysis of samples from each of 3 regions of the United States. It was concluded at the beginning of this program that a significant improvement in the quality and comparability of the results would be achieved by allowing the participating laboratories to optimize their own individual methods. The key to this approach and any subsequent performance-based chemistry programs is the successful inclusion of an interlaboratory comparison as well as the clear detailed specification of data quality objectives (DQOs) for the project. All the Bight Survey projects from 1994 to 2013 have been performance-based and each of the surveys included interlaboratory comparisons as a key component for ensuring high quality data that is comparable between laboratories over time.

The one area that has not evolved along with the advent of performance-based chemistry is the data validation process. Today’s data validation process still relies upon collecting and evaluating laboratory analytical information and comparing it to the details of a specific EPA analytical method such as EPA 8270 for GCMS analysis or EPA 6020 for ICPMS analysis. This can occur even when the requirement in the method is out-dated and based on old technology. Data validation procedures need to be adapted to performance-based chemistry allowing for any individual laboratory to use or not use any method or any part of a method they choose as long as they can demonstrate their ability to successfully pass interlaboratory comparisons, performance evaluation samples, and meet the data quality objectives of the project QA Plan.

EPA Method Modifications-

With reference to performance-based methods, the following information is provided as a basis of comparison between the Physis methods used for this study and the associated EPA Method. Its purpose is solely to provide information and is not intended to highlight errors. Physis has

successfully participated in several interlaboratory comparison studies including the Bight 13 Project demonstrating the viability of our analytical process. Physis has included the QAQC data in this report necessary to show that the results comply with the project QA Plan and indicate acceptable accuracy and precision.

1. Internal Laboratory QAQC Frequency for GCMS Analyses- Physis uses GC columns that are longer and narrower and the GC oven is programmed at a very slow rate of 2.5°C per minute both of which are not typically used by most laboratories. The purpose for this is to maximize separation of the 100's to 1000's of compounds present in environmental samples reducing co-elution with interfering compounds, reducing background noise, and enhancing the accuracy of quantitation. At the same time this process extends the run-time for each sample to ca. 90 minutes as compared to the 15-30 minutes with typical conditions. At 90 minutes per run, the maximum number of runs for any 12-hour period is 8. Each batch of samples typically includes the DFTPP tune solution and the initial calibration verification of from 1 to 4 solutions (Depending on the target parameters) for a total of 2-5 runs leaving an opening for 3-6 samples before having to redo the QA samples if the 12-hour constraint is applied. At this rate it's not economically viable to follow the 12-hour rule and complete the analyses of the samples.

Since the 12-hour criteria was established when the state-of-the-art was GCs equipped with packed columns and GCMS systems were not anywhere near as stable as the electronics of today. Physis does follow the criteria's intent by analyzing the calibration verification standards at the beginning, middle, and end of each batch of no more than 20 samples rather than every 12 hours.

2. Calibration and Quantitation- Physis bases its calibration curve on the mass of each compound rather than concentration. Using the internal standard method of quantitation, use of mass rather than concentration eliminates the extract or digestate volume term from the formula used to calculate concentrations in the samples. Therefore there is no need to measure the precise volume of the extract or digestate. For GCMS analysis, extract volumes can be quite low and small volume changes will be reflected in increased variation of the internal standard response from sample to sample due to differences in the extract volume and not due to the instability of the GCMS. Through long-term experience, Physis chemists are trained to take into consideration this change in volume when evaluating whether a change in the internal standard response is caused by a change in the GCMS sensitivity or extract volume.

The “recovery” of the Internal Standard and its variability is reported in Form VII SV-1 for reporting IS peak areas. For the sample IS compared to the ICV/CCV IS peak area, this form has a wide acceptance range at 50-200% which is considerably larger than the variation in the nominal estimate made of our extract volumes. Therefore significant deviations from expected IS responses are clearly obvious to the analyst and would require corrective action and re-analysis. The difficulty is the fact that Form VII SV-1 does not accommodate volumes and therefore does not allow for evaluation of the sample IS as it compares to the ICV/CCV on an even basis.

3. Negative Chemical Ionization- Some target analytes are analyzed using the GCMS in the Negative Chemical Ionization Mode (NCI). This results in non-standard mass spectra that cannot be compared to the EI spectra in the NIST library.
4. Aroclor PCBs- Physis analyzes PCBs using a congener-based calibration standard composed of 52 or more different congeners representing ca. 75-80% of the PCBs discharged into the environment. Physis uses the results from the congener analysis to estimate Aroclor concentrations. To do this, Physis determines the Aroclor mixture present in the sample, sums the results for the congeners present in that Aroclor mixture then corrects the result to account for the missing mass based on a previous comparison of an Aroclor calibration standard to the congener mixture. Physis does not perform blank or matrix spikes using Aroclor mixtures since PCB spiking is done via the congener solution. Aroclor-based quantitation is inherently inaccurate and imprecise and results based on our process are as accurate if not more accurate than the Aroclor-based process since the quantitation is based on individual peaks rather than summing peaks.
5. Pyrethroid/Fipronil Surrogates- Physis spikes all samples with a surrogate solution containing TCMX, PCB030, PCB112, and PCB198 for the Chlorinated Pesticides, Congener PCBs, Pyrethroids, and Fipronils; d8-Naphthalene, d10-Acenaphthene, d10-Phenanthrene, d12-Chrysene, and d12-Perylene for the PAHs; and FBDE-3002, FBDE-5004, and FBDE-8001 for the PBDEs. Since Pyrethroids and Fipronils are quantified using NCI, only the PCB112 and PCB198 surrogates are used as surrogates for these compounds.
6. Sample Preservation - According to the Standard Operating Procedure for Sample Logistics, sediment and tissue samples were placed in a freezer maintained at $-20 \pm 4^{\circ}\text{C}$ until preserved or processed.

PCB Congeners ^g	EPA 8270C ^d	0.2	µg/kg
PBDEs ^h	EPA 8270 C NCI	0.1	µg/kg
Alkylphenol ^{i,j,k,l}	GC/MS SIM	0.02-0.6	mg/kg
Perfluorinated Compounds ^{l,m,n}	EPA 537M	5.0	µg/kg

Notes:

^a Sediment minimum detection limits are on a dry-weight basis.

^b Reporting limits provided by Physis Environmental Laboratories.

^c Standard Methods for the Examination of Water and Wastewater, 19th Ed. American Public Health Association, 1995.

^d USEPA, 1986-1996. SW-846. Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, 3rd Ed.

^e Includes: Acenaphthene, Acenaphthylene, Anthracene, Benz[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Benzo[e]pyrene, Benzo[g,h,i]perylene, Benzo[k]fluoranthene, Biphenyl, Chrysene, Dibenzo[a,h]anthracene, Di benzo[ghi]perylene, Fluoranthene, Fluorene, Indeno(1,2,3-c,d)pyrene, Naphthalene, Perylene, Phenanthrene, Pyrene, 2,6-Dimethylnaphthalene, 1-Methylnaphthalene, 2-Methylnaphthalene, 1-Methylphenanthrene, 2,3,5-Trimethylnaphthalene, and 1,6,7-Trimethylnaphthalene.

^f Includes: cis-chlordane, trans-chlordane, o,p'-DDT, p,p'-DDT, o,p'-DDD, p,p'-DDD, o,p'-DDE, p,p'-DDE, p,p'-DDMU, aldrin, BHC-alpha, BHC-beta, BHC-gamma, cis-nonachlor, trans-nonachlor, oxychlordane, DCPA (Dacthal), dicofol, dieldrin, toxaphene, endosulfan sulfate, endosulfan-I, endosulfan-II, endrin, endrin aldehyde, endrin ketone, heptachlor, heptachlor epoxide, methoxychlor, mirex, and perthane.

^g Includes congeners: PCB-3, 5, 8, 15, 18, 27-29, 31, 33, 37, 44, 49, 52, 56, 60, 66, 70, 74, 77, 81, 87, 95, 97, 99, 101, 105, 110, 114, 118-119, 123, 126, 128, 137-138, 141, 142, 151, 153, 156-158, 167-170, 174, 177, 180, 183, 187, 189, 194-195, 200-201, 203, 206, and 209.

^h Includes BDE-17, 28, 47, 49, 66, 85, 99, 100, 138, 153, 154, 183, and 209.

ⁱ Collected only at stations B13-8163, B13-8040, B13-8077; transferred to SCCWHIP for analysis.

^j Includes nonylphenol, nonylphenol diethoxylate, nonylphenol monoethoxylate, 4-tert-octylphenol, and bisphenol A.

^k Includes perfluorooctanoic acid and perfluorooctane sulfonate.

µg/kg - micrograms per kilogram (parts per billion) SM - Standard Methods.

mg/kg - milligrams per kilogram (parts per million) SOP - standard operating procedure

N/A - not applicable

2.0 µL Tralomethrin

December 2, 2013

Extraction of AMEC-RHMP SEDIMENTS for Fipronils, OCPs, PCBs, aroclors, PBDE's, PAHs, Pyrethroids, Toxaphene. Samples were run for Pyr/PBDE/Fip and then column cleaned using silica/alumina absorbants.

Method: EPA 8270C
