Notes:

All values reported in dry weight

-- = No applicable ER-L/ER-M

ug/kg = micrograms per dry kilogram

mg/kg = milligrams per dry kilogram

umol/g = micromoles per gram

< Data reported to the method detection limit

J = estimated result, below the reporting limit, but above the MDL

% = percent

ER-L = Effects Range-Low; ER-M = Effects Range-Median

SQO CSI = Sediment Quality Objective Chemical Score Index

PAH = Polycyclic Aromatic Hydrocarbons

PCB = Polychlorinated Biphenyl

PBDE = Polybrominated diphenyl ethers

1 = The specific compounds comprising the sums of the PAH, Pi

2 = Total Detectable DDTs in the sum of 2,4'-DDD, 4,4'-DDD, 2,4'

3 = Total Chlordanes in the sum of alpha-chlordane and gamma-

 Physis Project ID: 1307002-001

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/6/2013. A total of 7 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventional
Total Orthophosphate as P by SM 4500-P E
Total Dissolved Solids by SM 2540 C
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Project Name: RHMP B'13
Physis Project ID: 1307002-003

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/8/2013. A total of 9 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Total Dissolved Solids by SM 2540 C
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

NOTES

November 08, 2013

Chris Stransky
AMEC
9210 Sky Park Court
Suite 200
San Diego, CA 92123-

Project Name: RHMP B'13
Physis Project ID: 1307002-005

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/12/2013. A total of 12 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Physis Project ID: 1307002-007

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/13/2013. A total of 4 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Physis Project ID: 1307002-009

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/28/2013. A total of 10 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Project Name: RHMP Bight '13
Physis Project ID: 1307002-011

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/29/2013. A total of 12 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Project Name: RHMP Bight '13
Physis Project ID: 1307002-013

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/30/2013. A total of 5 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS₁/MS₂, BS₁/BS₂, LCS₁/LCS₂, LCM₁/LCM₂, CRM₁/CRM₂, surrogate spikes and/or replicate project sample analysis (R₁/R₂) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored

under specific conditions after collection and prior to analysis without significantly affecting the analyte's concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Methyl-t-butyl Ether (MTBE)	EPA 8260B	1.0	µg/L

Notes: Metals analysis will consist of both total and dissolved fractions. Filtering for the dissolved fraction will occur in the field immediately after collection.

^a Reporting limits provided by Pysis Environmental Laboratories.

^b Includes acenaphthene, acenaphthylene, anthracene, benz[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[e]pyrene, benzo[g,h,i]perylene, benzo[k]fluoranthene, biphenyl, chrysene, dibenz[a,h]anthracene, di benzo[thiophene, fluoranthene, fluorene, indeno(1,2,3-c,d)pyrene, naphthalene, perylene, phenanthrene, pyrene, 2,6-dimethylnaphthalene, 1-methylnaphthalene, 2-methylnaphthalene, 1-methylphenanthrene, 2,3,5-trimethylnaphthalene, and 1,6,7-trimethylnaphthalene.

µg/L - micrograms per liter (parts per billion) mg/L - milligrams per liter

µS/cm - microSiemens per centimeter ppt - parts per thousand °C degrees Celsius

Project Name: RHMP Bight '13
Physis Project ID: 1307002-015

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 9/6/2013. A total of 2 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored under specific conditions after collection and prior to analysis without significantly affecting the analyte's

concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 9/10/2013. A total of 16 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Total Orthophosphate as P by SM 4500-P E
Oil & Grease by EPA 1664A
Nitrate as N by SM 4500-NO ₃ E
MBAS by SM 5540-C
Ammonia as N by SM 4500-NH ₃ D
Elements
Total and Dissolved Barium by EPA 200.8
Total & Dissolved Trace Metals by EPA 1640
Total & Dissolved Mercury by EPA 245.7
Organics
Polynuclear Aromatic Hydrocarbons by EPA 625
Subcontract
Total Organic Carbon by SM 5310 B
Methyl Tertiary Butyl Ether (MTBE) by EPA 624
Dissolved Organic Carbon by SM 5310 B

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored under specific conditions after collection and prior to analysis without significantly affecting the analyte's

concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

 Physis Project ID: 1307002-002

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/6/2013. A total of 7 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Percent Solids by SM 2540B
Ammonia as N by SM 4500-NH ₃ D
Acid Volatile Sulfides by Plumb, 1981 and TERL
Elements
Trace Metals by EPA 6020
Trace Mercury by EPA 245.7
Total Phosphorus by EPA 6020
Simultaneously Extracted Metals Analysis by EPA 200.8
Organics
Toxaphene w/ OCPs by EPA 8270C-NCI
Synthetic Pyrethroid Pesticides by EPA 8270C-NCI
Polynuclear Aromatic Hydrocarbons by EPA 8270C
PBDE Congeners by EPA 8270C-NCI
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 8270C
Fipronil & Degradates by EPA 8270C-NCI
Subcontract
Total Organic Carbon by SM 5310 B
Total Nitrogen by SM 4500-N

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity

to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored under specific conditions after collection and prior to analysis without significantly affecting the analyte's

concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

CASE NARRATIVE

QUALIFIER NOTES

In addition to the use of analyte specific Physis Qualifier Codes where applicable, the following were also noted.

ELEMENTS CRM: Five elements, Aluminum (Al), Antimony (Sb), Beryllium (Be), Chromium (Cr) and Iron (Fe) were above the specified acceptance limits in one or more CRM - RTC 016-050 and/or CRM - ERA 540. This occurred as a result of a more rigorous digestion employed by Physis, which causes a higher yield for some lithogenous elements. These values are in agreement with past internal results for CRM - RTC 016-050 and CRM - ERA 540.

ELEMENTS: A calibration point in the middle of the curve (50 PPB mix) was not used for the calibration of the instrument. This was due to the calibration solution not being spiked with internal standard.

ORGANICS TUNE: Physis uses the software supplied with its Agilent GCMS systems to tune its instruments. Moreover, with today's technology software algorithms provided by the instrument manufacturer provide a more stable system across a wider mass range than manual tuning to achieve specific tuning targets such as DFTPP. The following quote is from EPA Method 8270D Section 11.3.1.

"The analyst is always free to choose criteria that are tighter than those included in this method or to use other documented criteria provided they are used consistently throughout the initial calibration, calibration verification, and sample analyses."

The key here is that the instrument is tuned and that those tune settings are used for the subsequent analysis of the calibration curve, calibration verification, and samples. Moreover, another key reason for tuning to specific criteria is to insure that the GCMS is generating spectra that match the spectra in the NIST Library for confirming the identification of the target analyte. Physis can provide library search results for our calibration standards indicating a very high match quality with the NIST library spectra.

Physis did analyze the DFTPP tune solution with each batch (except for the first batch where the tune solution was mis-injected) and the passing tune reports have been provided indicating that using the instrument tuning software is closely matched to DFTPP tune requirements.

ORGANICS CALIBRATION: A calibration point in the middle of the curve (250 ng) for DCPA (Dacthal) and Dicofol were not used for the calibration of the instrument. This was an error of the analyst that has since been corrected.

ORGANICS CCVS: CCVs for Fipronils, Pyrethroids, PAHs and Chlorinated Pesticides were done at 1000 ng, while the CCVs for PCBs were done at 500 ng. These values are either at or above the high point of the calibration. This was an error of the analyst that has since been corrected.

Revisions 6/17/2014-

- Aroclors:
 - Updated Aroclor MDLs/RLs from 10/20 to 1/2
 - Added Aroclor 1262 and Aroclor 1268
 - After review of the data, the Technical Director made a decision to revise the data for the Aroclors
- RPDs:
 - Reviewed and updated all RPDs to 25%, per the RHMP QAPP. Revised Passes to Fails and added QA Qualifiers, where needed due to update.
- Acceptance Ranges:
 - Reviewed and updated all Acceptance ranges per the RHMP QAPP. Revised Passes to Fails and added QA Qualifier, where needed due to update.
- Level 3 reports:
 - Toxaphene CCV Drift table was revised.

Revisions 8/18/2014-

- Analytical Report:
 - Revised Date Analyzed for Chlorinated Pesticides, PCBs, and PAHs.
 - Added Time Analyzed to all analysis.
- Level 3 reports:
 - Added instrument tune report.

Performance-Based Chemistry-

The chemistry results provided in this report are derived from “performance-based” chemistry rather than the use of specific EPA published laboratory methods. This does not eliminate our responsibility to use Good Laboratory Practices. It does allow for incorporation of improvements in technology or the use of laboratory preferences for techniques that improve the efficiency and sensitivity of the laboratory and maintain or enhance the quality of the data.

“The Environmental Protection Agency (EPA) is actively working to implement the President’s program for reinventing government and reforming regulatory policy. As part of this program, EPA has been working at breaking down barriers to using new monitoring techniques. One barrier is the requirement to use specific measurement methods or technologies in complying with some of the Agency’s regulations. EPA’s Environmental Monitoring Management Council (EMMC), members of the regulated community, and Congress agree that EPA needs to change the way it specifies monitoring requirements in regulations and permits. There is broad acceptance for Agency-wide use of a nonprescriptive performance-based measurement system (PBMS)”. PBMS conveys "what" needs to be accomplished, but not prescriptively "how" to do it. EPA defines PBMS as a set of processes wherein the data needs, mandates, or limitations of a program or project are specified, and serve as criteria for selecting appropriate methods to meet those needs in a cost-effective manner. The criteria may be published in regulations, technical guidance documents, permits, work plans, or enforcement orders. Under a performance-based approach, EPA would specify:

- Questions to be answered by monitoring.
- Decisions to be supported by the data.
- Level of uncertainty acceptable for making decisions.
- Documentation to be generated to support this approach in the RCRA monitoring program.

(Taken from OSWER PBMS Implementation Plan, October 9, 1998, A Cooperative Effort Among: OSW, OERR, OUST, TIO, FFROL and CEPPO).”

The US EPA has included references to being “performance-based” in many of their newer methods. The use of performance-based methods is even more critical for programs like this study in order to allow the laboratory to adapt methods that optimize the goal of the project in terms of achieving ultra-low sensitivity and analysis of new chemicals of concern. I would also like to quote US EPA Method 8270-

“In addition, SW-846 methods, with the exception of required method use for the analysis of method-defined parameters, are intended to be guidance methods which contain general information on how to perform an analytical procedure or technique which a laboratory can use as a basic starting point for generating its own detailed Standard Operating Procedure (SOP), either for its own general use or for a specific project application.”

Performance-based chemistry was first used for NOAA’s National Status and Trends Program in the early 1980’s which is now operated under the US EPA as the National Coastal Condition Assessment

Program (NCCA). The NS&T program included 3 large well-established laboratories for the analysis of samples from each of 3 regions of the United States. It was concluded at the beginning of this program that a significant improvement in the quality and comparability of the results would be achieved by allowing the participating laboratories to optimize their own individual methods. The key to this approach and any subsequent performance-based chemistry programs is the successful inclusion of an interlaboratory comparison as well as the clear detailed specification of data quality objectives (DQOs) for the project. All the Bight Survey projects from 1994 to 2013 have been performance-based and each of the surveys included interlaboratory comparisons as a key component for ensuring high quality data that is comparable between laboratories over time.

The one area that has not evolved along with the advent of performance-based chemistry is the data validation process. Today's data validation process still relies upon collecting and evaluating laboratory analytical information and comparing it to the details of a specific EPA analytical method such as EPA 8270 for GCMS analysis or EPA 6020 for ICPMS analysis. This can occur even when the requirement in the method is out-dated and based on old technology. Data validation procedures need to be adapted to performance-based chemistry allowing for any individual laboratory to use or not use any method or any part of a method they choose as long as they can demonstrate their ability to successfully pass interlaboratory comparisons, performance evaluation samples, and meet the data quality objectives of the project QA Plan.

EPA Method Modifications-

With reference to performance-based methods, the following information is provided as a basis of comparison between the Physis methods used for this study and the associated EPA Method. Its purpose is solely to provide information and is not intended to highlight errors. Physis has successfully participated in several interlaboratory comparison studies including the Bight 13 Project demonstrating the viability of our analytical process. Physis has included the QAQC data in this report necessary to show that the results comply with the project QA Plan and indicate acceptable accuracy and precision.

1. Internal Laboratory QAQC Frequency for GCMS Analyses- Physis uses GC columns that are longer and narrower and the GC oven is programmed at a very slow rate of 2.5°C per minute both of which are not typically used by most laboratories. The purpose for this is to maximize separation of the 100's to 1000's of compounds present in environmental samples reducing co-elution with interfering compounds, reducing background noise, and enhancing the accuracy of quantitation. At the same time this process extends the run-time for each sample to ca. 90 minutes as compared to the 15-30 minutes with typical conditions. At 90

minutes per run, the maximum number of runs for any 12-hour period is 8. Each batch of samples typically includes the DFTPP tune solution and the initial calibration verification of from 1 to 4 solutions (Depending on the target parameters) for a total of 2-5 runs leaving an opening for 3-6 samples before having to redo the QA samples if the 12-hour constraint is applied. At this rate it's not economically viable to follow the 12-hour rule and complete the analyses of the samples.

Since the 12-hour criteria was established when the state-of-the-art was GCs equipped with packed columns and GCMS systems were not anywhere near as stable as the electronics of today. Physis does follow the criteria's intent by analyzing the calibration verification standards at the beginning, middle, and end of each batch of no more than 20 samples rather than every 12 hours.

2. Calibration and Quantitation- Physis bases its calibration curve on the mass of each compound rather than concentration. Using the internal standard method of quantitation, use of mass rather than concentration eliminates the extract or digestate volume term from the formula used to calculate concentrations in the samples. Therefore there is no need to measure the precise volume of the extract or digestate. For GCMS analysis, extract volumes can be quite low and small volume changes will be reflected in increased variation of the internal standard response from sample to sample due to differences in the extract volume and not due to the instability of the GCMS. Through long-term experience, Physis chemists are trained to take into consideration this change in volume when evaluating whether a change in the internal standard response is caused by a change in the GCMS sensitivity or extract volume.

The "recovery" of the Internal Standard and its variability is reported in Form VII SV-1 for reporting IS peak areas. For the sample IS compared to the ICV/CCV IS peak area, this form has a wide acceptance range at 50-200% which is considerably larger than the variation in the nominal estimate made of our extract volumes. Therefore significant deviations from expected IS responses are clearly obvious to the analyst and would require corrective action and re-analysis. The difficulty is the fact that Form VII SV-1 does not accommodate volumes and therefore does not allow for evaluation of the sample IS as it compares to the ICV/CCV on an even basis.

3. Negative Chemical Ionization- Some target analytes are analyzed using the GCMS in the Negative Chemical Ionization Mode (NCI). This results in non-standard mass spectra that cannot be compared to the EI spectra in the NIST library.

4. Aroclor PCBs- Physis analyzes PCBs using a congener-based calibration standard composed of 52 or more different congeners representing ca. 75-80% of the PCBs discharged into the environment. Physis uses the results from the congener analysis to estimate Aroclor concentrations. To do this, Physis determines the Aroclor mixture present in the sample, sums the results for the congeners present in that Aroclor mixture then corrects the result to account for the missing mass based on a previous comparison of an Aroclor calibration standard to the congener mixture. Physis does not perform blank or matrix spikes using Aroclor mixtures since PCB spiking is done via the congener solution. Aroclor-based quantitation is inherently inaccurate and imprecise and results based on our process are as accurate if not more accurate than the Aroclor-based process since the quantitation is based on individual peaks rather than summing peaks.
5. Pyrethroid/Fipronil Surrogates- Physis spikes all samples with a surrogate solution containing TCMX, PCB030, PCB112, and PCB198 for the Chlorinated Pesticides, Congener PCBs, Pyrethroids, and Fipronils; d8-Naphthalene, d10-Acenaphthene, d10-Phenanthrene, d12-Chrysene, and d12-Perylene for the PAHs; and FBDE-3002, FBDE-5004, and FBDE-8001 for the PBDEs. Since Pyrethroids and Fipronils are quantified using NCI, only the PCB112 and PCB198 surrogates are used as surrogates for these compounds.
6. Sample Preservation - According to the Standard Operating Procedure for Sample Logistics, sediment and tissue samples were placed in a freezer maintained at $-20 \pm 4^{\circ}\text{C}$ until preserved or processed.

Calibration for GCV3.D

Batch Folder: D:\DATA\2130931L.b*
 Analysis File: 2130931L.batch.xml
 DA Date-Time: 4/8/2014 1:35:39 PM
 Calibration Title:
 Calibration Method: External Calibration
 VIS Interpolation Fit:
 Tune Step: #1 h2.u
 #2 he.u
 #3 nogas.u

Level	Standard Data File	Sample Name	Acq. Date-Time
1	0MIX.D	0 ppb mix	10/2/2013 11:46:36 AM
2	1MIX.D	1 ppb mix	10/2/2013 11:51:17 AM
3	5MIX.D	5 ppb mix	10/2/2013 11:55:59 AM
4	10MIX.D	10 ppb mix	10/2/2013 12:00:41 PM
5			
6	100MIX.D	100 ppb mix	10/2/2013 1:22:04 PM
7	500MIX.D	500 ppb mix	10/2/2013 1:26:45 PM
8	1000MIX.D	1000 ppb mix	10/2/2013 1:31:12 PM
9	1P.D	1 ppm P	10/2/2013 1:45:30 PM
10	2P.D	2 ppm P	10/2/2013 1:50:12 PM
11	5P.D	5 ppm P	10/2/2013 1:54:55 PM

OCTOBER 15, 2013

Z HONG, A HOANG

EXTRACTION OF AMEC PHMP SEDIMENTS FOR FIBRONS, OCPs, PCBs, ARACLOBS, PBDEs, PAHs, PYRETHROIDS, TOXAPHENE. SAMPLES WERE RUN FOR PYR/PBDE/FIP AND THEN COLUMN CLEANED WITH SILICA/ALUMINA ADSORBENTS.

METHOD: EPA 8270 C

100µL DDMU (1000µg, p 223)

2µL PCB MIX (200µg, p 255)

2µL PCB + G MIX (200µg, p 259)

2µL PBDE MIX (+CHC) (100µg, p 262, p 263)

0.1ML CUSTOM PAH (1000µg, p 256)

1.0ML PYRETHROIDS (1000µg, p 260)

1.0ML TOXAPHENE (1000µg, p 253)
- c) LOST ~ 5% copper added in 50mL para flask before final rotovap + vialing

Organics - GC-MS

 Physis Project ID: 1307002-002

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/6/2013. A total of 7 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventionals
Percent Solids by SM 2540B
Ammonia as N by SM 4500-NH ₃ D
Acid Volatile Sulfides by Plumb, 1981 and TERL
Elements
Trace Metals by EPA 6020
Trace Mercury by EPA 245.7
Total Phosphorus by EPA 6020
Simultaneously Extracted Metals Analysis by EPA 200.8
Organics
Toxaphene w/ OCPs by EPA 8270C-NCI
Synthetic Pyrethroid Pesticides by EPA 8270C-NCI
Polynuclear Aromatic Hydrocarbons by EPA 8270C
PBDE Congeners by EPA 8270C-NCI
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 8270C
Fipronil & Degradates by EPA 8270C-NCI
Subcontract
Total Organic Carbon by SM 5310 B
Total Nitrogen by SM 4500-N

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity

to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored under specific conditions after collection and prior to analysis without significantly affecting the analyte's

concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

CASE NARRATIVE

QUALIFIER NOTES

In addition to the use of analyte specific Physis Qualifier Codes where applicable, the following were also noted.

ELEMENTS CRM: Five elements, Aluminum (Al), Antimony (Sb), Beryllium (Be), Chromium (Cr) and Iron (Fe) were above the specified acceptance limits in one or more CRM - RTC 016-050 and/or CRM - ERA 540. This occurred as a result of a more rigorous digestion employed by Physis, which causes a higher yield for some lithogenous elements. These values are in agreement with past internal results for CRM - RTC 016-050 and CRM - ERA 540.

ELEMENTS: A calibration point in the middle of the curve (50 PPB mix) was not used for the calibration of the instrument. This was due to the calibration solution not being spiked with internal standard.

ORGANICS TUNE: Physis uses the software supplied with its Agilent GCMS systems to tune its instruments. Moreover, with today's technology software algorithms provided by the instrument manufacturer provide a more stable system across a wider mass range than manual tuning to achieve specific tuning targets such as DFTPP. The following quote is from EPA Method 8270D Section 11.3.1.

“The analyst is always free to choose criteria that are tighter than those included in this method or to use other documented criteria provided they are used consistently throughout the initial calibration, calibration verification, and sample analyses.”

The key here is that the instrument is tuned and that those tune settings are used for the subsequent analysis of the calibration curve, calibration verification, and samples. Moreover, another key reason for tuning to specific criteria is to insure that the GCMS is generating spectra that match the spectra in the NIST Library for confirming the identification of the target analyte. Physis can provide library search results for our calibration standards indicating a very high match quality with the NIST library spectra.

Physis did analyze the DFTPP tune solution with each batch (except for the first batch where the tune solution was mis-injected) and the passing tune reports have been provided indicating that using the instrument tuning software is closely matched to DFTPP tune requirements.

ORGANICS CALIBRATION: A calibration point in the middle of the curve (250 ng) for DCPA (Dacthal) and Dicofol were not used for the calibration of the instrument. This was an error of the analyst that has since been corrected.

ORGANICS CCVS: CCVs for Fipronils, Pyrethroids, PAHs and Chlorinated Pesticides were done at 1000 ng, while the CCVs for PCBs were done at 500 ng. These values are either at or above the high point of the calibration. This was an error of the analyst that has since been corrected.

Revisions 6/17/2014-

- Aroclors:
 - Updated Aroclor MDLs/RLs from 10/20 to 1/2
 - Added Aroclor 1262 and Aroclor 1268
 - After review of the data, the Technical Director made a decision to revise the data for the Aroclors
- RPDs:
 - Reviewed and updated all RPDs to 25%, per the RHMP QAPP. Revised Passes to Fails and added QA Qualifiers, where needed due to update.
- Acceptance Ranges:
 - Reviewed and updated all Acceptance ranges per the RHMP QAPP. Revised Passes to Fails and added QA Qualifier, where needed due to update.
- Level 3 reports:
 - Toxaphene CCV Drift table was revised.

Revisions 8/18/2014-

- Analytical Report:
 - Revised Date Analyzed for Chlorinated Pesticides, PCBs, and PAHs.
 - Added Time Analyzed to all analysis.
- Level 3 reports:
 - Added instrument tune report.

Performance-Based Chemistry-

The chemistry results provided in this report are derived from “performance-based” chemistry rather than the use of specific EPA published laboratory methods. This does not eliminate our responsibility to use Good Laboratory Practices. It does allow for incorporation of improvements in technology or the use of laboratory preferences for techniques that improve the efficiency and sensitivity of the laboratory and maintain or enhance the quality of the data.

“The Environmental Protection Agency (EPA) is actively working to implement the President’s program for reinventing government and reforming regulatory policy. As part of this program, EPA has been working at breaking down barriers to using new monitoring techniques. One barrier is the requirement to use specific measurement methods or technologies in complying with some of the Agency’s regulations. EPA’s Environmental Monitoring Management Council (EMMC), members of the regulated community, and Congress agree that EPA needs to change the way it specifies monitoring requirements in regulations and permits. There is broad acceptance for Agency-wide use of a nonprescriptive performance-based measurement system (PBMS)”. PBMS conveys "what" needs to be accomplished, but not prescriptively "how" to do it. EPA defines PBMS as a set of processes wherein the data needs, mandates, or limitations of a program or project are specified, and serve as criteria for selecting appropriate methods to meet those needs in a cost-effective manner. The criteria may be published in regulations, technical guidance documents, permits, work plans, or enforcement orders. Under a performance-based approach, EPA would specify:

- Questions to be answered by monitoring.
- Decisions to be supported by the data.
- Level of uncertainty acceptable for making decisions.
- Documentation to be generated to support this approach in the RCRA monitoring program.

(Taken from OSWER PBMS Implementation Plan, October 9, 1998, A Cooperative Effort Among: OSW, OERR, OUST, TIO, FFROL and CEPPO).”

The US EPA has included references to being “performance-based” in many of their newer methods. The use of performance-based methods is even more critical for programs like this study in order to allow the laboratory to adapt methods that optimize the goal of the project in terms of achieving ultra-low sensitivity and analysis of new chemicals of concern. I would also like to quote US EPA Method 8270-

“In addition, SW-846 methods, with the exception of required method use for the analysis of method-defined parameters, are intended to be guidance methods which contain general information on how to perform an analytical procedure or technique which a laboratory can use as a basic starting point for generating its own detailed Standard Operating Procedure (SOP), either for its own general use or for a specific project application.”

Performance-based chemistry was first used for NOAA’s National Status and Trends Program in the early 1980’s which is now operated under the US EPA as the National Coastal Condition Assessment

Program (NCCA). The NS&T program included 3 large well-established laboratories for the analysis of samples from each of 3 regions of the United States. It was concluded at the beginning of this program that a significant improvement in the quality and comparability of the results would be achieved by allowing the participating laboratories to optimize their own individual methods. The key to this approach and any subsequent performance-based chemistry programs is the successful inclusion of an interlaboratory comparison as well as the clear detailed specification of data quality objectives (DQOs) for the project. All the Bight Survey projects from 1994 to 2013 have been performance-based and each of the surveys included interlaboratory comparisons as a key component for ensuring high quality data that is comparable between laboratories over time.

The one area that has not evolved along with the advent of performance-based chemistry is the data validation process. Today's data validation process still relies upon collecting and evaluating laboratory analytical information and comparing it to the details of a specific EPA analytical method such as EPA 8270 for GCMS analysis or EPA 6020 for ICPMS analysis. This can occur even when the requirement in the method is out-dated and based on old technology. Data validation procedures need to be adapted to performance-based chemistry allowing for any individual laboratory to use or not use any method or any part of a method they choose as long as they can demonstrate their ability to successfully pass interlaboratory comparisons, performance evaluation samples, and meet the data quality objectives of the project QA Plan.

EPA Method Modifications-

With reference to performance-based methods, the following information is provided as a basis of comparison between the Physis methods used for this study and the associated EPA Method. Its purpose is solely to provide information and is not intended to highlight errors. Physis has successfully participated in several interlaboratory comparison studies including the Bight 13 Project demonstrating the viability of our analytical process. Physis has included the QAQC data in this report necessary to show that the results comply with the project QA Plan and indicate acceptable accuracy and precision.

1. Internal Laboratory QAQC Frequency for GCMS Analyses- Physis uses GC columns that are longer and narrower and the GC oven is programmed at a very slow rate of 2.5°C per minute both of which are not typically used by most laboratories. The purpose for this is to maximize separation of the 100's to 1000's of compounds present in environmental samples reducing co-elution with interfering compounds, reducing background noise, and enhancing the accuracy of quantitation. At the same time this process extends the run-time for each sample to ca. 90 minutes as compared to the 15-30 minutes with typical conditions. At 90

minutes per run, the maximum number of runs for any 12-hour period is 8. Each batch of samples typically includes the DFTPP tune solution and the initial calibration verification of from 1 to 4 solutions (Depending on the target parameters) for a total of 2-5 runs leaving an opening for 3-6 samples before having to redo the QA samples if the 12-hour constraint is applied. At this rate it's not economically viable to follow the 12-hour rule and complete the analyses of the samples.

Since the 12-hour criteria was established when the state-of-the-art was GCs equipped with packed columns and GCMS systems were not anywhere near as stable as the electronics of today. Physis does follow the criteria's intent by analyzing the calibration verification standards at the beginning, middle, and end of each batch of no more than 20 samples rather than every 12 hours.

2. Calibration and Quantitation- Physis bases its calibration curve on the mass of each compound rather than concentration. Using the internal standard method of quantitation, use of mass rather than concentration eliminates the extract or digestate volume term from the formula used to calculate concentrations in the samples. Therefore there is no need to measure the precise volume of the extract or digestate. For GCMS analysis, extract volumes can be quite low and small volume changes will be reflected in increased variation of the internal standard response from sample to sample due to differences in the extract volume and not due to the instability of the GCMS. Through long-term experience, Physis chemists are trained to take into consideration this change in volume when evaluating whether a change in the internal standard response is caused by a change in the GCMS sensitivity or extract volume.

The "recovery" of the Internal Standard and its variability is reported in Form VII SV-1 for reporting IS peak areas. For the sample IS compared to the ICV/CCV IS peak area, this form has a wide acceptance range at 50-200% which is considerably larger than the variation in the nominal estimate made of our extract volumes. Therefore significant deviations from expected IS responses are clearly obvious to the analyst and would require corrective action and re-analysis. The difficulty is the fact that Form VII SV-1 does not accommodate volumes and therefore does not allow for evaluation of the sample IS as it compares to the ICV/CCV on an even basis.

3. Negative Chemical Ionization- Some target analytes are analyzed using the GCMS in the Negative Chemical Ionization Mode (NCI). This results in non-standard mass spectra that cannot be compared to the EI spectra in the NIST library.

4. Aroclor PCBs- Physis analyzes PCBs using a congener-based calibration standard composed of 52 or more different congeners representing ca. 75-80% of the PCBs discharged into the environment. Physis uses the results from the congener analysis to estimate Aroclor concentrations. To do this, Physis determines the Aroclor mixture present in the sample, sums the results for the congeners present in that Aroclor mixture then corrects the result to account for the missing mass based on a previous comparison of an Aroclor calibration standard to the congener mixture. Physis does not perform blank or matrix spikes using Aroclor mixtures since PCB spiking is done via the congener solution. Aroclor-based quantitation is inherently inaccurate and imprecise and results based on our process are as accurate if not more accurate than the Aroclor-based process since the quantitation is based on individual peaks rather than summing peaks.
5. Pyrethroid/Fipronil Surrogates- Physis spikes all samples with a surrogate solution containing TCMX, PCB030, PCB112, and PCB198 for the Chlorinated Pesticides, Congener PCBs, Pyrethroids, and Fipronils; d8-Naphthalene, d10-Acenaphthene, d10-Phenanthrene, d12-Chrysene, and d12-Perylene for the PAHs; and FBDE-3002, FBDE-5004, and FBDE-8001 for the PBDEs. Since Pyrethroids and Fipronils are quantified using NCI, only the PCB112 and PCB198 surrogates are used as surrogates for these compounds.
6. Sample Preservation - According to the Standard Operating Procedure for Sample Logistics, sediment and tissue samples were placed in a freezer maintained at $-20 \pm 4^{\circ}\text{C}$ until preserved or processed.

SAMPLE INTEGRITY UPON RECEIPT

1. COC(s) included and completely filled out..... **YES**
2. All sample containers arrived intact..... **YES**
3. All samples listed on COC(s) are present..... **YES**
4. Information on containers consistent with information on COC(s)..... **YES**
5. Correct containers and volume for all analyses indicated..... **YES**
6. All samples received within method holding time..... **YES**
7. Correct preservation used for all analyses indicated..... **YES**

NOTES

The SID's that sampled on 8/5 had a temperature of -10.0°C.
The SID's that sampled on 8/6 had a temperature of 11.1°C.

1307002-002 / 004

OCTOBER 15, 2013

Z HONG, A HOANG

EXTRACTION OF AMEC PHMP SEDIMENTS FOR FIBRONS, OCPs, PCBs, ARYLOPS, PBDEs, PAHs, PYRETHROIDS, TOXAPHENE. SAMPLES WERE RUN FOR PYR/PBDE/FIP AND THEN COLUMN CLEANED WITH SILICA/ALUMINA ADSORBENTS.

METHOD: EPA 8270 C

Dear Chris,

Enclosed are the analytical results for samples submitted to PHYSIS Environmental Laboratories, Inc. (PHYSIS) on 8/8/2013. A total of 9 samples were received for analysis in accordance with the attached chain of custody (COC). Per the COC, the samples were analyzed for:

Conventional
Percent Solids by SM 2540B
Ammonia as N by SM 4500-NH ₃ D
Acid Volatile Sulfides (AVS) by Plumb, 1981 and TERL
Elements
Trace Metals by EPA 6020
Trace Mercury by EPA 245.7
Total Phosphorus by EPA 6020
Simultaneously Extracted Metals Analysis (AVS-SEM) by EPA 200.8
Organics
Toxaphene w/ OCPs by EPA 8270C-NCI
Synthetic Pyrethroid Pesticides by EPA 8270C-NCI
Polynuclear Aromatic Hydrocarbons by EPA 8270C
PBDE Congeners by EPA 8270C-NCI
Organochlorine Pesticides & PCB Congeners/Aroclors by EPA 8270C
Fipronil & Degradates by EPA 8270C-NCI
Subcontract
Total Organic Carbon by SM 5310 B
Total Nitrogen by SM 4500-N

Analytical results in this report apply only to samples submitted to PHYSIS in accordance with the COC and are intended to be considered in their entirety.

Please feel free to contact me at any time with any questions. PHYSIS appreciates the opportunity

to provide you with our analytical and support services.

Regards,

Misty Mercier

ABBREVIATIONS and ACRONYMS

QM	Quality Manual
QA	Quality Assurance
QC	Quality Control
MDL	method detection limit
RL	reporting limit
R1	project sample
R2	project sample replicate
MS1	matrix spike
MS2	matrix spike replicate
B1	procedural blank
B2	procedural blank replicate
BS1	blank spike
BS2	blank spike replicate
LCS1	laboratory control spike
LCS2	laboratory control spike replicate
LCM1	laboratory control material
LCM2	laboratory control material replicate
CRM1	certified reference material
CRM2	certified reference material replicate
RPD	relative percent difference
LMW	low molecular weight
HMW	high molecular weight

QUALITY ASSURANCE SUMMARY

LABORATORY BATCH: Physis' QM defines a laboratory batch as a group of 20 or fewer project samples of similar matrix, processed together under the same conditions and with the same reagents. QC samples are associated with each batch and are used to assess the validity of the sample analyses.

PROCEDURAL BLANK: Laboratory contamination introduced during method use was assessed through the analysis of procedural blanks at a minimum frequency of one per batch. Physis' QM requires that all procedural blanks be below 10 times the MDL and all detectable constituents in the procedural blanks be flagged in the project sample results with a B qualifier.

ACCURACY: Accuracy of analytical measurements is the degree of closeness based on percent recovery calculations between measured values and the actual or true value and includes a combination of reproducibility error and systematic bias due to sampling and analytical operations. Accuracy of the project data was indicated by analysis of MS, BS, LCS, LCM, CRM, and/or surrogate spikes on a minimum frequency of one per batch. Physis' QM requires that 95% of the target compounds greater than 10 times the MDL be within the specified acceptance limits.

PRECISION: Precision is the agreement among a set of replicate measurements without assumption of knowledge of the true value and is based on RPD calculations between repeated values. Precision of the project data was determined by analysis of replicate MS1/MS2, BS1/BS2, LCS1/LCS2, LCM1/LCM2, CRM1/CRM2, surrogate spikes and/or replicate project sample analysis (R1/R2) on a minimum frequency of one per batch. Physis' QM requires that for 95% of the compounds greater than 10 times the MDL, the percent RPD should be within the specified acceptance range.

MATRIX SPIKES: MS samples were employed to assess the effect a particular project sample matrix has on the accuracy of a measurement. It is prepared by adding a known amount of the target analyte(s) to an aliquot of the project sample. Matrix spikes indicate the bias of analytical measurements due to chemical interferences inherent in the sample matrix. If the matrix spike recovery does not fall within the specified acceptance limits, it may be an indication of sample matrix interference in the specific project sample used for the MS. Intrinsic target analyte concentration in the specific project sample can also significantly impact MS recovery.

BLANK SPIKES: BS demonstrates performance of the preparation and analytical methods on a clean matrix void of potential matrix related interferences. The BS is performed in laboratory deionized water, making these recoveries a better indicator of the efficiency of the laboratory method per se.

CERTIFIED REFERENCE MATERIALS: CRMs are pre-homogenized materials of various matrices for which analytical information has been determined and certified by a recognized authority. These are used to provide a quantitative assessment of the accuracy of a preparation and analytical method. CRMs are analyzed to provide evidence that the laboratory method produces results that are comparable to those obtained by an independent organization.

SURROGATES: Where CRMs are unavailable, target analyte recovery can be assessed by monitoring added surrogate compounds/elements. A surrogate is a pure analyte unlikely to be found in any project sample and most often used with organic analytical procedures. Percent recovery is calculated for each surrogate and is used to monitor method performance within each discrete sample and is indicative of the procedure's ability to recover the actual analytes of interest.

HOLDING TIME: Method recommended holding times are the length of time a project sample can be stored under specific conditions after collection and prior to analysis without significantly affecting the analyte's

concentration. Holding times can be extended if preservation techniques are employed to reduce biodegradation, volatilization, oxidation, sorption, precipitation, and other physical and chemical processes. Physis' QM requires that all samples analyzed beyond the method recommended holding time be flagged in the sample results with an H qualifier.

TOTAL/DISSOLVED FRACTION: In some instances, the results for the dissolved fraction may be higher than the total fraction for a particular analyte (e.g. trace metals). This is typically caused by the analytical variation for each result and indicates that the target analyte is primarily in the dissolved phase, within the sample.

PHYSIS QUALIFIER CODES

CODE	DEFINITION
*	see Case Narrative
ND	analyte not detected at or above the MDL
B	analyte was detected in the procedural blank greater than 10 times the MDL
E	analyte concentration exceeds the upper limit of the linear calibration range, reported value is estimated
H	sample received and/or analyzed past the recommended holding time
J	analyte was detected at a concentration below the RL and above the MDL, reported value is estimated
N	insufficient sample, analysis could not be performed
M	analyte was outside the specified recovery and/or RPD acceptance limits due to matrix interference. The associated B/BS were within limits, therefore the sample data was reported without further clarification
SH	analyte concentration in the project sample exceeded the spike concentration, therefore MS recovery and/or RPD acceptance limits do not apply
SL	analyte results for R1 and/or R2 were lower than 10 times the MDL, therefore RPD acceptance limits do not apply
NH	project sample was heterogeneous and sample homogeneity could not be readily achieved using routine laboratory practices, therefore MS recovery and/or RPD were outside the specified acceptance limits
R	Physis' QM allows for 5% of the target compounds greater than 10 times the MDL to be outside the specified acceptance limits for precision and/or accuracy. This is often due to random error and does not indicate any significant problems with the analysis of these project samples

CASE NARRATIVE

QUALIFIER NOTES

In addition to the use of analyte specific Physis Qualifier Codes where applicable, the following were also noted.

ELEMENTS CRM: Five elements, Aluminum (Al), Antimony (Sb), Beryllium (Be), Chromium (Cr) and Iron (Fe) were above the specified acceptance limits in one or more CRM - RTC 016-050 and/or CRM - ERA 540. This occurred as a result of a more rigorous digestion employed by Physis, which causes a higher yield for some lithogenous elements. These values are in agreement with past internal results for CRM - RTC 016-050 and CRM - ERA 540.

ELEMENTS: A calibration point in the middle of the curve (50 PPB mix) was not used for the calibration of the instrument. This was due to the calibration solution not being spiked with internal standard.

ORGANICS TUNE: Physis uses the software supplied with its Agilent GCMS systems to tune its instruments. Moreover, with today's technology software algorithms provided by the instrument manufacturer provide a more stable system across a wider mass range than manual tuning to achieve specific tuning targets such as DFTPP. The following quote is from EPA Method 8270D Section 11.3.1.

“The analyst is always free to choose criteria that are tighter than those included in this method or to use other documented criteria provided they are used consistently throughout the initial calibration, calibration verification, and sample analyses.”

The key here is that the instrument is tuned and that those tune settings are used for the subsequent analysis of the calibration curve, calibration verification, and samples. Moreover, another key reason for tuning to specific criteria is to insure that the GCMS is generating spectra that match the spectra in the NIST Library for confirming the identification of the target analyte. Physis can provide library search results for our calibration standards indicating a very high match quality with the NIST library spectra.

Physis did analyze the DFTPP tune solution with each batch (except for the first batch where the tune solution was mis-injected) and the passing tune reports have been provided indicating that using the instrument tuning software is closely matched to DFTPP tune requirements.

ORGANICS CALIBRATION: A calibration point in the middle of the curve (250 ng) for DCPA (Dacthal) and Dicofol were not used for the calibration of the instrument. This was an error of the analyst that has since been corrected.

ORGANICS CCVS: CCVs for Fipronils, Pyrethroids, PAHs and Chlorinated Pesticides were done at 1000 ng, while the CCVs for PCBs were done at 500 ng. These values are either at or above the high point of the calibration. This was an error of the analyst that has since been corrected.

Revisions 6/17/2014-

- Aroclors:
 - Updated Aroclor MDLs/RLs from 10/20 to 1/2
 - Added Aroclor 1262 and Aroclor 1268
 - After review of the data, the Technical Director made a decision to revise the data for the Aroclors
- RPDs:
 - Reviewed and updated all RPDs to 25%, per the RHMP QAPP. Revised Passes to Fails and added QA Qualifiers, where needed due to update.
- Acceptance Ranges:
 - Reviewed and updated all Acceptance ranges per the RHMP QAPP. Revised Passes to Fails and added QA Qualifier, where needed due to update.
- Level 3 reports:
 - Toxaphene CCV Drift table was revised.

Revisions 8/18/2014-

- Analytical Report:
 - Revised Date Analyzed for Chlorinated Pesticides, PCBs, and PAHs.
 - Added Time Analyzed to all analysis.
- Level 3 reports:
 - Added instrument tune report.

Performance-Based Chemistry-

The chemistry results provided in this report are derived from “performance-based” chemistry rather than the use of specific EPA published laboratory methods. This does not eliminate our responsibility to use Good Laboratory Practices. It does allow for incorporation of improvements in technology or the use of laboratory preferences for techniques that improve the efficiency and sensitivity of the laboratory and maintain or enhance the quality of the data.

“The Environmental Protection Agency (EPA) is actively working to implement the President’s program for reinventing government and reforming regulatory policy. As part of this program, EPA has been working at breaking down barriers to using new monitoring techniques. One barrier is the requirement to use specific measurement methods or technologies in complying with some of the Agency’s regulations. EPA’s Environmental Monitoring Management Council (EMMC), members of the regulated community, and Congress agree that EPA needs to change the way it specifies monitoring requirements in regulations and permits. There is broad acceptance for Agency-wide use of a nonprescriptive performance-based measurement system (PBMS)”. PBMS conveys "what" needs to be accomplished, but not prescriptively "how" to do it. EPA defines PBMS as a set of processes wherein the data needs, mandates, or limitations of a program or project are specified, and serve as criteria for selecting appropriate methods to meet those needs in a cost-effective manner. The criteria may be published in regulations, technical guidance documents, permits, work plans, or enforcement orders. Under a performance-based approach, EPA would specify:

- Questions to be answered by monitoring.
- Decisions to be supported by the data.
- Level of uncertainty acceptable for making decisions.
- Documentation to be generated to support this approach in the RCRA monitoring program.

(Taken from OSWER PBMS Implementation Plan, October 9, 1998, A Cooperative Effort Among: OSW, OERR, OUST, TIO, FFROL and CEPPO).”

The US EPA has included references to being “performance-based” in many of their newer methods. The use of performance-based methods is even more critical for programs like this study in order to allow the laboratory to adapt methods that optimize the goal of the project in terms of achieving ultra-low sensitivity and analysis of new chemicals of concern. I would also like to quote US EPA Method 8270-

“In addition, SW-846 methods, with the exception of required method use for the analysis of method-defined parameters, are intended to be guidance methods which contain general information on how to perform an analytical procedure or technique which a laboratory can use as a basic starting point for generating its own detailed Standard Operating Procedure (SOP), either for its own general use or for a specific project application.”

Performance-based chemistry was first used for NOAA’s National Status and Trends Program in the early 1980’s which is now operated under the US EPA as the National Coastal Condition Assessment

Program (NCCA). The NS&T program included 3 large well-established laboratories for the analysis of samples from each of 3 regions of the United States. It was concluded at the beginning of this program that a significant improvement in the quality and comparability of the results would be achieved by allowing the participating laboratories to optimize their own individual methods. The key to this approach and any subsequent performance-based chemistry programs is the successful inclusion of an interlaboratory comparison as well as the clear detailed specification of data quality objectives (DQOs) for the project. All the Bight Survey projects from 1994 to 2013 have been performance-based and each of the surveys included interlaboratory comparisons as a key component for ensuring high quality data that is comparable between laboratories over time.

The one area that has not evolved along with the advent of performance-based chemistry is the data validation process. Today's data validation process still relies upon collecting and evaluating laboratory analytical information and comparing it to the details of a specific EPA analytical method such as EPA 8270 for GCMS analysis or EPA 6020 for ICPMS analysis. This can occur even when the requirement in the method is out-dated and based on old technology. Data validation procedures need to be adapted to performance-based chemistry allowing for any individual laboratory to use or not use any method or any part of a method they choose as long as they can demonstrate their ability to successfully pass interlaboratory comparisons, performance evaluation samples, and meet the data quality objectives of the project QA Plan.

EPA Method Modifications-

With reference to performance-based methods, the following information is provided as a basis of comparison between the Physis methods used for this study and the associated EPA Method. Its purpose is solely to provide information and is not intended to highlight errors. Physis has successfully participated in several interlaboratory comparison studies including the Bight 13 Project demonstrating the viability of our analytical process. Physis has included the QAQC data in this report necessary to show that the results comply with the project QA Plan and indicate acceptable accuracy and precision.

1. Internal Laboratory QAQC Frequency for GCMS Analyses- Physis uses GC columns that are longer and narrower and the GC oven is programmed at a very slow rate of 2.5°C per minute both of which are not typically used by most laboratories. The purpose for this is to maximize separation of the 100's to 1000's of compounds present in environmental samples reducing co-elution with interfering compounds, reducing background noise, and enhancing the accuracy of quantitation. At the same time this process extends the run-time for each sample to ca. 90 minutes as compared to the 15-30 minutes with typical conditions. At 90

minutes per run, the maximum number of runs for any 12-hour period is 8. Each batch of samples typically includes the DFTPP tune solution and the initial calibration verification of from 1 to 4 solutions (Depending on the target parameters) for a total of 2-5 runs leaving an opening for 3-6 samples before having to redo the QA samples if the 12-hour constraint is applied. At this rate it's not economically viable to follow the 12-hour rule and complete the analyses of the samples.

Since the 12-hour criteria was established when the state-of-the-art was GCs equipped with packed columns and GCMS systems were not anywhere near as stable as the electronics of today. Physis does follow the criteria's intent by analyzing the calibration verification standards at the beginning, middle, and end of each batch of no more than 20 samples rather than every 12 hours.

2. Calibration and Quantitation- Physis bases its calibration curve on the mass of each compound rather than concentration. Using the internal standard method of quantitation, use of mass rather than concentration eliminates the extract or digestate volume term from the formula used to calculate concentrations in the samples. Therefore there is no need to measure the precise volume of the extract or digestate. For GCMS analysis, extract volumes can be quite low and small volume changes will be reflected in increased variation of the internal standard response from sample to sample due to differences in the extract volume and not due to the instability of the GCMS. Through long-term experience, Physis chemists are trained to take into consideration this change in volume when evaluating whether a change in the internal standard response is caused by a change in the GCMS sensitivity or extract volume.

The "recovery" of the Internal Standard and its variability is reported in Form VII SV-1 for reporting IS peak areas. For the sample IS compared to the ICV/CCV IS peak area, this form has a wide acceptance range at 50-200% which is considerably larger than the variation in the nominal estimate made of our extract volumes. Therefore significant deviations from expected IS responses are clearly obvious to the analyst and would require corrective action and re-analysis. The difficulty is the fact that Form VII SV-1 does not accommodate volumes and therefore does not allow for evaluation of the sample IS as it compares to the ICV/CCV on an even basis.

3. Negative Chemical Ionization- Some target analytes are analyzed using the GCMS in the Negative Chemical Ionization Mode (NCI). This results in non-standard mass spectra that cannot be compared to the EI spectra in the NIST library.

4. Aroclor PCBs- Physis analyzes PCBs using a congener-based calibration standard composed of 52 or more different congeners representing ca. 75-80% of the PCBs discharged into the environment. Physis uses the results from the congener analysis to estimate Aroclor concentrations. To do this, Physis determines the Aroclor mixture present in the sample, sums the results for the congeners present in that Aroclor mixture then corrects the result to account for the missing mass based on a previous comparison of an Aroclor calibration standard to the congener mixture. Physis does not perform blank or matrix spikes using Aroclor mixtures since PCB spiking is done via the congener solution. Aroclor-based quantitation is inherently inaccurate and imprecise and results based on our process are as accurate if not more accurate than the Aroclor-based process since the quantitation is based on individual peaks rather than summing peaks.
5. Pyrethroid/Fipronil Surrogates- Physis spikes all samples with a surrogate solution containing TCMX, PCB030, PCB112, and PCB198 for the Chlorinated Pesticides, Congener PCBs, Pyrethroids, and Fipronils; d8-Naphthalene, d10-Acenaphthene, d10-Phenanthrene, d12-Chrysene, and d12-Perylene for the PAHs; and FBDE-3002, FBDE-5004, and FBDE-8001 for the PBDEs. Since Pyrethroids and Fipronils are quantified using NCI, only the PCB112 and PCB198 surrogates are used as surrogates for these compounds.
6. Sample Preservation - According to the Standard Operating Procedure for Sample Logistics, sediment and tissue samples were placed in a freezer maintained at $-20 \pm 4^{\circ}\text{C}$ until preserved or processed.

PCB Congeners ^g	EPA 8270C ^d	0.2	μg/kg
PBDEs ^h	EPA 8270 C NCI	0.1	μg/kg
Alkylphenol ^{i,j}	GC/MS SIM	0.02-0.6	mg/kg
Perfluorinated Compounds ^{k,l}	EPA 537M	5.0	μg/kg

Notes:

^a Sediment minimum detection limits are on a dry-weight basis.

^b Reporting limits provided by Physis Environmental Laboratories.

^c Standard Methods for the Examination of Water and Wastewater, 19th Ed. American Public Health Association, 1995.

^d USEPA 1986-1996, SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, 3rd Ed.

^e Includes Acenaphthene, Acenaphthylene, Anthracene, Benz[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Benzo[e]pyrene, Benzo[g,h,i]perylene, Benzo[k]fluoranthene, Biphenyl, Chrysene, Dibenzo[a,h]anthracene, Di benzo[ghi]perylene, Fluoranthene, Fluorene, Indeno(1,2,3-c,d)pyrene, Naphthalene, Perylene, Phenanthrene, Pyrene, 2,6-Dimethylnaphthalene, 1-Methylnaphthalene, 2-Methylnaphthalene, 1-Methylphenanthrene, 2,3,5-Trimethylnaphthalene, and 1,6,7-Trimethylnaphthalene.

^f Includes cis-chlordane, trans-chlordane, o,p'-DDT, p,p'-DDT, o,p'-DDD, p,p'-DDD, o,p'-DDE, p,p'-DDE, p,p'-DDMU, aldrin, BHC-alpha, BHC-beta, BHC-gamma, cis-nonachlor, trans-nonachlor, oxychlordane, DCPA (Dacthal), dicofol, dieldrin, toxaphene, endosulfan sulfate, endosulfan-I, endosulfan-II, endrin, endrin aldehyde, endrin ketone, heptachlor, heptachlor epoxide, methoxychlor, mirex, and perthane.

^g Includes congeners: PCB-3, 5, 8, 15, 19, 27-29, 31, 33, 37, 44, 49, 52, 56, 60, 66, 70, 74, 77, 81, 87, 95, 97, 99, 101, 105, 110, 114, 118-119, 123, 126, 128, 137-138, 141, 149, 151, 153, 156-158, 167-170, 174, 177, 180, 183, 187, 189, 194-195, 200-201, 203, 206, and 209.

^h Includes BDE-17, 28, 47, 49, 66, 85, 99, 100, 138, 153, 154, 183, and 209.

ⁱ Collected only at stations B13-B163, B13-8040, B13-8077; transferred to SCCWRP for analysis.

^j Includes nonylphenol, nonylphenol diethoxylate, nonylphenol monoethoxylate, 4-tert-octylphenol, and bisphenol A.

^k Includes perfluorooctanoic acid and perfluorooctane sulfonate.

μg/kg - micrograms per kilogram (parts per billion) SM - Standard Methods
mg/kg - milligrams per kilogram (parts per million) SOP - standard operating procedure
N/A - not applicable
