

Grand Caribe Shoreline Park Erosion Stabilization Project

Help shape the future of coastal resilience
in Coronado

Join the Port of San Diego's public workshop to hear a presentation from the project team about the current vulnerability to erosion at Grand Caribe Shoreline Park and discuss potential nature-based design concepts to address erosion, provide shoreline stability and maintain public access with minimal impact on the adjacent habitat. Following the presentation, participants will have the opportunity to ask questions and provide input on potential design concepts with the project team.

Public feedback will help refine a preferred design concept that will be presented for additional input at a second workshop in mid-2025. The original workshop date was postponed due to weather.

About the project

Grand Caribe Shoreline Park is a 2.9-acre park on the southeastern half of an artificial peninsula in southwestern San Diego Bay near the Coronado Cays. Since the construction of the peninsula, the eastern shoreline along the park has experienced ongoing erosion that has impacted the shoreline, beach, trail and established native habitats in the area. The Port has completed a coastal site assessment for the area and is now pursuing a conceptual design solution that protects the shoreline, maintains public access and recreation, and preserves the character and ecological value of the existing park space.

Public Workshop

DATE: Tuesday, April 29

TIME: 5 p.m.

LOCATION:

**Coronado Cays Yacht Club
30 N Caribe Cays Blvd.
Coronado, CA 92118**
